For representing the parts of speech which indicate relations between thoughts - 'because', 'therefore', 'however', etc. - you will have no similar aids at your disposal; those constituents of the text will be lost so far as translation into pictures goes. In the same way, the dream-work reduces the content of the dream-thoughts to its raw material of objects and activities. You will feel pleased if there is a possibility of in some way hinting, through the subtler details of the pictures, at certain relations not in themselves capable of being represented. And just so does the dream-work succeed in expressing some of the content of the latent dream-thoughts by peculiarities in the form of the manifest dream-by its clarity or obscurity, by its division into several pieces, and so on. The number of part dreams into which a dream is divided usually corresponds to the number of main topics or groups of thoughts in the latent dream. A short introductory dream will often stand in the relation of a prelude to a following, more detailed, main dream or may give the motive for it; a subordinate clause in the dream-thoughts will be replaced by the interpolation of a change of scene into the manifest dream, and so on. Thus the form of dreams is far from being without significance and itself calls for interpretation. When several dreams occur during the same night, they often have the same meaning and indicate that an attempt is being made to deal more and more efficiently with a stimulus of increasing insistence. In individual dreams a particularly difficult element may be represented by several symbols - by 'doublets'.

[1916-1917, 3268]

In some analyses, or in some periods of an analysis, a divorce may become apparent between dream-life and waking life, like the divorce between the activity of phantasy and waking life which is found in the 'continued story' (a novel in day-dreams). In that case one dream leads off from another, taking as its central point some element which was lightly touched upon in its predecessor, and so on. But we find far more frequently that dreams are not attached to one another but are interpolated into a successive series of portions of waking thought.

[1923c, 4032]

It is by no means easy to arrive at general conclusions upon the value of correctly translated dreams. If a conflict due to ambivalence is taking place in a patient, then the emergence in him of a hostile thought certainly does not imply a permanent overcoming of his affectionate impulse - that is to say, a resolution of the conflict: neither does any such implication follow from a dream with a similarly hostile content. During a conflict such as this arising from ambivalence, there are often two dreams every night, each of them representing an opposite attitude. In that case the progress lies in the fact that a complete isolation of the two contrasted impulses has been achieved and that each of them, with the help of its unconscious reinforcements, can be followed and understood to its extreme limits. And if it sometimes happens that one of the two ambivalent dreams has been forgotten, one must not be deceived into assuming that a decision has been made in favour of the one side. The fact that one of the dreams has been forgotten shows, it is true, that for the moment one tendency is in the ascendant, but that is true only of the one day, and may be changed. The next night may perhaps bring the opposite expression into the foreground. The true state of the conflict can only be determined by taking into account all the other indications, including those of waking life.

[1923c, 4034]
Again, you may remember that in my earlier lectures I already told you (and illustrated the fact by examples) that we had learnt to make use for our interpretations even of the purely formal features of the manifest dream - that is, to transform them into material coming from the latent dream-thoughts. As you already know, all dreams that are dreamt in a single night belong in a single context. But it is not a matter of indifference whether these dreams appear to the dreamer as a continuum or whether he divides them into several parts and into how many. The number of such parts often corresponds to an equal number of separate focal points in the structural formation of the latent dream-thoughts or to contending trends in the dreamer's mental life, each of which finds a dominant, even though never an exclusive, expression in one particular part of the dream. A short introductory dream and a longer main dream following it often stand in the relation of protasis and apodosis, of which a very clear instance will be found in the old lectures. A dream which is described by the dreamer as 'somehow interpolated' will actually correspond to a dependent clause in the dream-thoughts. Franz Alexander (1925) has shown in a study on pairs of dreams that it not infrequently happens that two dreams in one night share the carrying-out of the dream's task by producing a wish-fulfilment in two stages if they are taken together, though each dream separately would not effect that result. Suppose, for instance, that the dream-wish had as its content some illicit action in regard to a particular person. Then in the first dream the person will appear undisguised, but the action will be only timidly hinted at. The second dream will behave differently. The action will be named without disguise, but the person will either be made unrecognizable or replaced by someone indifferent. This, you will admit, gives one an impression of actual cunning. Another and similar relation between the two members of a pair of dreams is found where one represents a punishment and the other the sinful wish-fulfilment. It amounts to this: 'If one accepts the punishment for it, one can go on to allow oneself the forbidden thing.'

[1933a, 4639]
The same dream admits of another and subtler interpretation, which in fact becomes unavoidable if we take a subsidiary detail into account. (The two interpretations are not mutually contradictory, but both cover the same ground; they are a good instance of the fact that dreams, like all other psychopathological structures, regularly have more than one meaning.) My patient, it will be remembered, at the same time as she was occupied with her dream of the renunciation of a wish, was also trying to bring about a renounced wish (for the caviare sandwich) in real life. Her friend had also given expression to a wish - to become stouter - and it would not have been surprising if my patient had dreamt that her friend's wish was unfulfilled; for my patient's own wish was that her friend's wish (to put on weight) should not be fulfilled. But instead of this she dreamt that one of her own wishes was not fulfilled. Thus the dream will acquire a new interpretation if we suppose that the person indicated in the dream was not herself but her friend, that she had put herself in her friend's place, or, as we might say, that she had 'identified' herself with her friend. I believe she had in fact done this; and the circumstance of her having brought about a renounced wish in real life was evidence of this identification.

There is, however, another inference following from these last dream-analyses to which I will draw attention at once. Dreams frequently seem to have more than one meaning. Not only, as our examples have shown, may they include several wish-fulfilments one alongside the other; but a succession of meanings or wish-fulfilments may be superimposed on one another, the bottom one being the fulfilment of a wish dating from earliest childhood. And here again the question arises whether it might not be more correct to assert that this occurs 'invariably' rather than 'frequently.'¹

¹ [Footnote added 1914:] The fact that the meanings of dreams are arranged in superimposed layers is one of the most delicate, though also one of the most interesting, problems of dream-interpretation. Anyone who forgets this possibility will easily go astray and be led into making untenable assertions upon the nature of dreams. Yet it is still a fact that far too few investigations have been made into this matter. Hitherto the only thorough piece of research has been Otto Rank's into the fairly regular stratification of symbols in dreams provoked by pressure of the bladder.

¹ Here is an 'over-interpretation' of the same dream. Since 'spuken [haunting]' is an activity of spirits, 'spucken [spitting] on the stairs' might be loosely rendered as 'esprit d'escalier'. This last phrase is equivalent to lack of ready repartee ['Schlagfertigkeit', literally 'readiness to strike'] - a failing to which I must in fact plead guilty. Was my nurse, I wonder, equally wanting in that quality?

The first thing that becomes clear to anyone who compares the dream-content with the dream-thoughts is that a work of condensation on a large scale has been carried out. Dreams are brief, meagre and laconic in comparison with the range and wealth of the dream-thoughts. If a dream is written out it may perhaps fill half a page. The analysis setting out the dream-thoughts underlying it may occupy six, eight or a dozen times as much space. This relation varies with different dreams; but so far as my experience goes its direction never varies. As a rule one underestimates the amount of compression that has taken place, since one is inclined to regard the dream-thoughts that have been brought to light as the complete material, whereas if the work of interpretation is carried further it may reveal still more thoughts concealed behind the dream. I have already had occasion to point out that it is in fact never possible to be sure that a dream has been completely interpreted. Even if the solution seems satisfactory and without gaps, the possibility always remains that the dream may have yet another meaning. Strictly speaking, then, it is impossible to determine the amount of condensation.
Though the later investigations since the time of Scherner have made it impossible to dispute the existence of dream symbolism - even Havelock Ellis admits that there can be no doubt that our dreams are full of symbolism - yet it must be confessed that the presence of symbols in dreams not only facilitates their interpretation but also makes it more difficult. As a rule the technique of interpreting according to the dreamer's free associations leaves us in the lurch when we come to the symbolic elements in the dream-content. Regard for scientific criticism forbids our returning to the arbitrary judgement of the dream-interpreter, as it was employed in ancient times and seems to have been revived in the reckless interpretations of Stekel. We are thus obliged, in dealing with those elements of the dream-content which must be recognized as symbolic, to adopt a combined technique, which on the one hand rests on the dreamer's associations and on the other hand fills the gaps from the interpreter's knowledge of symbols. We must combine a critical caution in resolving symbols with a careful study of them in dreams which afford particularly clear instances of their use, in order to disarm any charge of arbitrariness in dream-interpretation. The uncertainties which still attach to our activities as interpreters of dreams spring in part from our incomplete knowledge, which can be progressively improved as we advance further, but in part from certain characteristics of dream-symbols themselves. They frequently have more than one or even several meanings, and, as with Chinese script, the correct interpretation can only be arrived at on each occasion from the context. This ambiguity of the symbols links up with the characteristic of dreams for admitting of 'over-interpretation' - for representing in a single piece of content thoughts and wishes which are often widely divergent in their nature.

[1900a, 820]

We can assert of many dreams, if they are carefully interpreted, that they are bisexual, since they unquestionably admit of an 'over-interpretation' in which the dreamer's homosexual impulses are realized - impulses, that is, which are contrary to his normal sexual activities. To maintain, however, as do Stekel (1911) and Adler (1910, etc.), that all dreams are to be interpreted bisexual - appears to me to be a generalization which is equally undemonstrable and unplausible and which I am not prepared to support. In particular, I cannot dismiss the obvious fact that there are numerous dreams which satisfy needs other than those which are erotic in the widest sense of the word: dreams of hunger and thirst, dreams of convenience, etc. So, too, such statements as that 'the spectre of death is to be found behind every dream' (Stekel), or that 'every dream shows an advance from the feminine to the masculine line' (Adler), appear to me to go far beyond anything that can be legitimately maintained in dream-interpretation.

[1900a, 853]

It is only with the greatest difficulty that the beginner in the business of interpreting dreams can be persuaded that his task is not at an end when he has a complete interpretation in his hands - an interpretation which makes sense, is coherent and throws light upon every element of the dream's content. For the same dream may perhaps have another interpretation as well, an 'over-interpretation', which has escaped him. It is, indeed, not easy to form any conception of the abundance of the unconscious trains of thought, all striving to find expression, which are active in our minds. Nor is it easy to credit the skill shown by the dream-work in always hitting upon forms of expression that can bear several meanings - like the Little Tailor in the fairy story who hit seven flies at a blow. My readers will always be inclined to accuse me of introducing an unnecessary amount of ingenuity into my interpretations; but actual experience would teach them better.

[1900a, 957]
On the other hand, I cannot confirm the opinion, first stated by Silberer, that all dreams (or many dreams, or certain classes of dreams) require two different interpretations, which are even stated to bear a fixed relation to each other. One of these interpretations, which Silberer calls the 'psycho-analytic' one, is said to give the dream some meaning or other, usually of an infantile-sexual kind; the other and more important interpretation, to which he gives the name of 'anagogic', is said to reveal the more serious thoughts, often of profound import, which the dream-work has taken as its material. Silberer has not given evidence in support of this opinion by reporting a series of dreams analysed in the two directions. And I must object that the alleged fact is non-existent. In spite of what he says, the majority of dreams require no 'over-interpretation' and, more particularly, are insusceptible to an anagogic interpretation. As in the case of many other theories put forward in recent years, it is impossible to overlook the fact that Silberer's views are influenced to some extent by a purpose which seeks to disguise the fundamental circumstances in which dreams are formed and to divert interest from their instinctual roots. In a certain number of cases I have been able to confirm Silberer's statements. Analysis showed that in such cases the dream-work found itself faced with the problem of transforming into a dream a series of highly abstract thoughts from waking life which were incapable of being given any direct representation. It endeavoured to solve the problem by getting hold of another group of intellectual material, somewhat loosely related (often in a manner which might be described as 'allegorical') to the abstract thoughts, and at the same time capable of being represented with fewer difficulties. The abstract interpretation of a dream that has arisen in this way is given by the dreamer without any difficulty; the correct interpretation of the material that has been interpolated must be looked for by the technical methods which are now familiar to us.

[1900a, 958]

It by no means rarely happens that in the course of a comparatively long, complicated and on the whole confused dream one particularly clear portion stands out, which contains an unmistakable wish-fulfilment, but which is bound up with some other, unintelligible material. But in the case of adults, anyone with some experience in analysing their dreams will find to his surprise that even those dreams which have an appearance of being transparently clear are seldom as simple as those of children, and that behind the obvious wish-fulfilment some other meaning may lie concealed.

[1901a, 1064]

It is only rarely that a dream represents, or, as we might say, 'stages', a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream-thoughts, which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.

[1907a, 1856]
I also ascribe to considerations of representability the fact which is insisted on and perhaps overestimated by Silberer that some dreams admit of two simultaneous, and yet essentially different interpretations, one of which he calls the 'analytic' and the other the 'anagogic'. When this happens, we are invariably concerned with thoughts of a very abstract nature, which must have made their representation in the dream very difficult. We might compare it with the problem of representing in pictures a leading article from a political newspaper. In such cases, the dream-work must first replace the text that consists of abstract thoughts by one more concrete, connected with the former in some way - by comparison, symbolism, allegorical allusion, or best of all, genetically - so that the more concrete text then takes the place of the abstract one as material for the dream-work. The abstract thoughts yield the so-called anagogic interpretation, which, in our interpretative work, we discover more easily than the true analytic one. Otto Rank has justly remarked that certain dreams about their treatment, dreamt by patients in analysis, are the best models on which to form a view of these dreams which admit of more than one interpretation.

The achievements of condensation can be quite extraordinary. It is sometimes possible by its help to combine two quite different latent trains of thought into one manifest dream, so that one can arrive at what appears to be a sufficient interpretation of a dream and yet in doing so can fail to notice a possible 'over-interpretation'.

(1) You may have formed an impression that, even though the technique is correctly carried out, the findings of our interpretative work on dreams admit of so many uncertainties as to defeat any secure translation of the manifest dream into the latent dream-thoughts. You will argue in support of this that in the first place one never knows whether a particular element of the dream is to be understood in its actual sense or as a symbol, since the things employed as symbols do not cease on that account to be themselves. If, however, one has no objective clue for deciding this, the interpretation must at that point be left to the arbitrary choice of the interpreter. Furthermore, as a result of the fact that in the dream-work contraries coalesce, it is always left undetermined whether a particular element is to be understood in a positive or negative sense - as itself or as its contrary. Here is a fresh opportunity for the interpreter to exercise an arbitrary choice. Thirdly, in consequence of the reversals of every kind of which dreams are so fond, it is open to the interpreter to carry out a reversal like this in connection with any passage in the dream he chooses. And lastly, you will mention having heard that one is never certain whether the interpretation one has found for a dream is the only possible one. We run the risk of overlooking a perfectly admissible 'over-interpretation' of the same dream. In these circumstances, you will conclude, so much room is left to the interpreter's arbitrary decision as to be incompatible with objective certainty in the findings. Or alternatively you may suppose that the fault does not lie with dreams but that the inadequacies of our dream-interpretation are to be attributed to errors in our views and premisses.

When the interpretation of a dream has been discovered, it is not always easy to decide whether it is a 'complete' one - that is, whether further preconscious thoughts may not also have found expression in the same dream. In that case we must consider the meaning proved which is based on the dreamer's associations and our estimate of the situation, without on that account feeling bound to reject the other meaning. It remains possible, though unproven; one must become accustomed to a dream being thus capable of having many meanings. Moreover, the blame for this is not always to be laid upon incompleteness of the work of interpretation; it may just as well be inherent in the latent dream-thoughts themselves. Indeed it may happen in waking life, quite apart from the situation of dream-interpretation, that one is uncertain whether some remark that one has heard or some piece of information that one has received is open to construction this way or that, or whether it is hinting at something else beyond its obvious meaning.
The following observations may help us towards clearing up this point. If in the course of a single day we have two or more experiences suitable for provoking a dream, the dream will make a combined reference to them as a single whole; it is under a necessity to combine them into a unity. Here is an instance. One afternoon during the summer I entered a railway compartment in which I found two acquaintances who were strangers to each other. One of them was an eminent medical colleague and the other was a member of a distinguished family with which I had professional relations. I introduced the two gentlemen to each other, but all through the long journey they conducted their conversation with me as a go-between, so that I presently found myself discussing various topics alternately, first with the one and then with the other. I asked my doctor friend to use his influence on behalf of a common acquaintance of ours who was just starting a medical practice. The doctor replied that he was convinced of the young man's capacity, but that his homely appearance would make it hard for him to make his way in families of the better class; to which I replied that that was the very reason why he needed influential assistance. Turning to my other fellow-traveller, I enquired after the health of his aunt - the mother of one of my patients - who was lying seriously ill at the time. During the night following the journey I had a dream that the young friend on whose behalf I had pleaded was sitting in a fashionable drawing-room in a select company composed of all the distinguished and wealthy people of my acquaintance and, with the easy bearing of a man of the world, was delivering a funeral oration on the old lady (who was already dead so far as my dream was concerned), the aunt of my second fellow-traveller. (I must confess that I had not been on good terms with that lady.) Thus my dream had, once again, worked out connections between the two sets of impressions of the previous day and had combined them into a single situation.

There is, however, another inference following from these last dream-analyses to which I will draw attention at once. Dreams frequently seem to have more than one meaning. Not only, as our examples have shown, may they include several wish-fulfilments one alongside the other; but a succession of meanings or wish-fulfilments may be superimposed on one another, the bottom one being the fulfilment of a wish dating from earliest childhood. And here again the question arises whether it might not be more correct to assert that this occurs "invariably" rather than "frequently."

[1900a, 699]
We have already taken the first step in this direction by advancing the thesis (see p. 666 f.) that the dream-work is under the necessity of combining into a unity all instigations to dreaming which are active simultaneously. We found that, when two or more experiences capable of creating an impression are left over from the previous day, the wishes derived from them are combined in a single dream, and similarly that the psychically significant impressions and the indifferent experiences from the previous day are brought together in the dream-material, provided always that it is possible to set up communicating ideas between them. Thus a dream appears to be a reaction to everything that is simultaneously present in the sleeping mind as currently active material. So far as we have hitherto analysed the material of dreams, we have seen it as a collection of psychical residues and memory-traces, to which (on account of the preference shown for recent and infantile material) we have been led to attribute a hitherto indefinable quality of being 'currently active'. We can foresee, then, without any great difficulty, what will happen if fresh material in the form of sensations is added during sleep to these currently active memories. It is once again owing to the fact of their being currently active that these sensory excitations are of importance for the dream; they are united with the other currently active psychical material to furnish what is used for the construction of the dream. To put it another way, stimuli arising during sleep are worked up into a wish-fulfilment the other constituents of which are the familiar psychical 'day's residues'. This combination need not occur; as I have already pointed out, there is more than one way of reacting to a somatic stimulus during sleep. When it does occur, it means that it has been possible to find ideational material to serve as the content of the dream of such a sort as to be able to represent both kinds of source of the dream - the somatic and the psychical.

[1900a, 707]

The tertium comparationis in the analogy that I have just used - the quantity put at the disposal of the entrepreneur in an appropriate amount - is capable of being applied in still greater detail to the purpose of elucidating the structure of dreams. In most dreams it is possible to detect a central point which is marked by peculiar sensory intensity, as I have shown on p. 778. This central point is as a rule the direct representation of the wish-fulfilment, for, if we undo the displacements brought about by the dream-work, we find that the psychical intensity of the elements in the dream-thoughts has been replaced by the sensory intensity of the elements in the content of the actual dream. The elements in the neighbourhood of the wish-fulfilment often have nothing to do with its meaning, but turn out to be derivatives of distressing thoughts that run contrary to the wish. But owing to their being in what is often an artificially established connection with the central element, they have acquired enough intensity to become capable of being represented in the dream. Thus the wish-fulfilment's power of bringing about representation is diffused over a certain sphere surrounding it, within which all the elements - including even those possessing no means of their own - become empowered to obtain representation. In the case of dreams that are actuated by several wishes, it is easy to delimit the spheres of the different wish-fulfilments, and gaps in the dream may often be understood as frontier zones between those spheres.

[1900a, 992]
It is only rarely that a dream represents, or, as we might say, 'stages', a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream-thoughts, which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.
[1907a, 1856]
The first thing that becomes clear to anyone who compares the dream-content with the
dream-thoughts is that a work of condensation on a large scale has been carried out. Dreams
are brief, meagre and laconic in comparison with the range and wealth of the dream-thoughts. If
a dream is written out it may perhaps fill half a page. The analysis setting out the dream-
thoughts underlying it may occupy six, eight or a dozen times as much space. This relation
varies with different dreams; but so far as my experience goes its direction never varies. As a
rule one underestimates the amount of compression that has taken place, since one is inclined
to regard the dream-thoughts that have been brought to light as the complete material, whereas
if the work of interpretation is carried further it may reveal still more thoughts concealed behind
the dream. I have already had occasion to point out that it is in fact never possible to be sure
that a dream has been completely interpreted. Even if the solution seems satisfactory and
without gaps, the possibility always remains that the dream may have yet another meaning.
Strictly speaking, then, it is impossible to determine the amount of condensation.
[1900a, 752]

It may be asked whether it is possible to give a complete and assured translation into the
language of waking life (that is, an interpretation) of every product of dream-life. This question
will not be treated here in the abstract but with reference to the conditions under which one
works at interpreting dreams.
[1925i, 4044]

When the interpretation of a dream has been discovered, it is not always easy to decide
whether it is a 'complete' one - that is, whether further preconscious thoughts may not also have
found expression in the same dream. In that case we must consider the meaning proved which
is based on the dreamer's associations and our estimate of the situation, without on that
account feeling bound to reject the other meaning. It remains possible, though unproven; one
must become accustomed to a dream being thus capable of having many meanings. Moreover,
the blame for this is not always to be laid upon incompleteness of the work of interpretation; it
may just as well be inherent in the latent dream-thoughts themselves. Indeed it may happen in
waking life, quite apart from the situation of dream-interpretation, that one is uncertain whether
some remark that one has heard or some piece of information that one has received is open to
construction this way or that, or whether it is hinting at something else beyond its obvious
meaning.
[1925i, 4047]
The dream of the burning child at the beginning of this chapter gives us a welcome opportunity of considering the difficulties with which the theory of wish-fulfilment is faced. It will no doubt have surprised all of us to be told that dreams are nothing other than fulfilments of wishes, and not only on account of the contradiction offered by anxiety-dreams. When analysis first revealed to us that a meaning and a psychical value lay concealed behind dreams, we were no doubt quite unprepared to find that that meaning was of such a uniform character. According to Aristotle’s accurate but bald definition, a dream is thinking that persists (in so far as we are asleep) in the state of sleep. Since, then, our daytime thinking produces psychical acts of such various sorts - judgements, inferences, denials, expectations, intentions, and so on - why should it be obliged during the night to restrict itself to the production of wishes alone? Are there not, on the contrary, numerous dreams which show us psychical acts of other kinds - worries, for instance - transformed into dream-shape? And was not the dream with which we began this chapter (a quite particularly transparent one) precisely a dream of this sort? When the glare of light fell on the eyes of the sleeping father, he drew the worrying conclusion that a candle had fallen over and might have set the dead body on fire. He turned this conclusion into a dream by clothing it in a sensory situation and in the present tense. What part was played in this by wish-fulfilment? Can we fail to see in it the predominating influence of a thought persisting from waking life or stimulated by a new sense-impression? All this is quite true and compels us to enter more closely into the part played by wish-fulfilment in dreams and into the importance of waking thoughts which persist into sleep.

[1900a, 982]
If I proceed to put forward the assertion that the meaning of every dream is the fulfilment of a wish, that is to say that there cannot be any dreams but wishful dreams, I feel certain in advance that I shall meet with the most categorical contradiction.

When the analysis of the dream of Irma's injection showed us that a dream could be the fulfilment of a wish, our interest was at first wholly absorbed by the question of whether we had come upon a universal characteristic of dreams, and for the time being we stifled our curiosity about any other scientific problems that may have arisen during the work of the interpretation. Having followed one path to its end, we may now retrace our steps and choose another starting-point for our rambles through the problems of dream-life: for the time being, we may leave the topic of wish-fulfilment on one side, though we are still far from having exhausted it.

When external nervous stimuli and internal somatic stimuli are intense enough to force psychical attention to themselves, then - provided that their outcome is dreaming and not waking up - they serve as a fixed point for the formation of a dream, a nucleus in its material; a wish-fulfilment is then looked for that shall correspond to this nucleus, just as (see above) intermediate ideas are looked for between two psychical dream stimuli. To that extent it is true that in a number of dreams the content of the dream is dictated by the somatic element. In this extreme instance it may even happen that a wish which is not actually a currently active one is called up for the sake of constructing a dream. A dream, however, has no alternative but to represent a wish in the situation of having been fulfilled; it is, as it were, faced with the problem of looking for a wish which can be represented as fulfilled by the currently active sensation. If this immediate material is of a painful or distressing kind, that does not necessarily mean that it cannot be used for the construction of a dream. The mind has wishes at its disposal whose fulfilment produces unpleasure. This seems self-contradictory; but it becomes intelligible when we take into account the presence of two psychical agencies and a censorship between them.
In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his daytime existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word 'analysis', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are 'psycho-analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a parvenu, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a parvenu's pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, she was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: 'Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young.'
It may perhaps be useful to continue our examination of the same question by considering how a dream behaves when the dream-thoughts present it with material which is the complete reverse of a wish-fulfilment - well-justified worries, painful reflections, distressing realizations. The many possible outcome can be classed under the two following groups. (A) The dream-work may succeed in replacing all the distressing ideas by contrary ones and in suppressing the unpleasurable affects attaching to them. The result will be a straightforward dream of satisfaction, a palpable 'wish-fulfilment', about which there seems no more to be said. (B) The distressing ideas may make their way, more or less modified but none the less quite recognizable, into the manifest content of the dream. This is the case which raises doubts as to the validity of the wish theory of dreams and needs further investigation. Dreams of this sort with a distressing content may either be experienced with indifference, or they may be accompanied by the whole of the distressing affect which their ideational content seems to justify, or they may even lead to the development of anxiety and to awakening.

Analysis is able to demonstrate that these unpleasurable dreams are wish-fulfilments no less than the rest. An unconscious and repressed wish, whose fulfilment the dreamer's ego could not fail to experience as something distressing, has seized the opportunity offered to it by the persisting cathexis of the distressing residues of the previous day; it has lent them its support and by that means rendered them capable of entering a dream. But whereas in Group A the unconscious wish coincided with the conscious one, in Group B the gulf between the unconscious and the conscious (between the repressed and the ego) is revealed and the situation in the fairy tale of the three wishes which were granted by the fairy to the husband and wife is realized. (See below, p. 1009 f., n.) The satisfaction at the fulfilment of the repressed wish may turn out to be so great that it counterbalances the distressing feelings attaching to the day's residues; in that case the feeling-tone of the dream is indifferent, in spite of its being on the one hand the fulfilment of a wish and on the other the fulfilment of a fear. Or it may happen that the sleeping ego takes a still larger share in the construction of the dream, that it reacts to the satisfying of the repressed wish with violent indignation and itself puts an end to the dream with an outburst of anxiety. Thus there is no difficulty in seeing that unpleasurable dreams and anxiety-dreams are just as much wish-fulfilments in the sense of our theory as are straightforward dreams of satisfaction.
Once again it is impossible for me to present a complete analysis. I must restrict myself to bringing out a few salient points. Distressing anticipations from the previous day were what gave rise to the dream: we had once more been without news of our son at the front for over a week. It is easy to see that the content of the dream expressed a conviction that he had been wounded or killed. Energetic efforts were clearly being made at the beginning of the dream to replace the distressing thoughts by their contrary. I had some highly agreeable news to communicate - something about money being sent . . . distinction . . . distribution. (The sum of money was derived from an agreeable occurrence in my medical practice; it was an attempt at a complete diversion from the topic.) But these efforts failed. My wife suspected something dreadful and refused to listen to me. The disguises were too thin and references to what it was sought to repress pierced through them everywhere. If my son had been killed, his fellow-officers would send back his belongings and I should have to distribute what he left among his brothers and sisters and other people. A 'distinction' is often awarded to an officer who has fallen in battle. Thus the dream set about giving direct expression to what it had first sought to deny, though the inclination towards wish-fulfilment was still shown at work in the distortions. (The change of locality during the dream is no doubt to be understood as what Silberer has described as 'threshold symbolism'. We cannot tell, it is true, what it was that provided the dream with the motive force for thus giving expression to my distressing thoughts. My son did not appear as someone 'falling' but as someone 'climbing.' He had in fact been a keen mountaineer. He was not in uniform but in sports clothes; this meant that the place of the accident that I now feared had been taken by an earlier, sporting one; for he had had a fall during a skiing expedition and broken his thigh. The way in which he was dressed, on the other hand, which made him look like a seal, at once recalled someone younger - our funny little grandson; while the grey hair reminded me of the latter's father, our son-in-law, who had been hard hit by the war. What could this mean? . . . but I have said enough of it. - The locality in a store-closet and the cupboard from which he wanted to take something ('on which he wanted to put something' in the dream) - these allusions reminded me unmistakably of an accident of my own which I had brought on myself when I was between two and three years old. I had climbed up on to a stool in the store-closet to get something nice that was lying on a cupboard or table. The stool had tipped over and its corner had struck me behind my lower jaw; I might easily, I reflected, have knocked out all my teeth. The recollection was accompanied by an admonitory thought: 'that serves you right'; and this seemed as though it was a hostile impulse aimed at the gallant soldier. Deeper analysis at last enabled me to discover what the concealed impulse was which might have found satisfaction in the dreaded accident to my son: it was the envy which is felt for the young by those who have grown old, but which they believe they have completely stifled. And there can be no question that it was precisely the strength of the painful emotion which would have arisen if such a misfortune had really happened that caused that emotion to seek out a repressed wish-fulfilment of this kind in order to find some consolation.

[1900a, 991]
The qualification 'in so far as the two wishes are compatible with each other' implies a hint at the possible case in which the function of dreaming may come to grief. The dream-process is allowed to begin as a fulfilment of an unconscious wish; but if this attempted wish-fulfilment jars upon the preconscious so violently that it is unable to continue sleeping, then the dream has made a breach in the compromise and has failed to carry out the second half of its task. In that case the dream is immediately broken off and replaced by a state of complete waking. Here again it is not really the fault of the dream if it has now to appear in the role of a *disturber* of sleep instead of in its normal one of a *guardian* of sleep; and this fact need not prejudice us against its having a useful purpose. This is not the only instance in the organism of a contrivance which is normally useful becoming useless and disturbing as soon as the conditions that give rise to it are somewhat modified; and the disturbance at least serves the new purpose of drawing attention to the modification and of setting the organism's regulative machinery in motion against it. What I have in mind is of course the case of anxiety-dreams, and in order that I may not be thought to be evading this evidence against the theory of wish-fulfilment whenever I come across it, I will at all events give some hints of their explanation.

[1900a, 1008]

There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the *Ucs*, while it has been repudiated and suppressed by the other system, the *Pcs*.¹ Even where psychical health is perfect, the subjugation of the *Ucs* by the *Pcs* is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the *Ucs* an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand they make it possible for the *Pcs* to control the *Ucs* to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

[1900a, 1009]

There are also clear dreams with a distressing content, which, however, is not felt[experienced] as distressing in the dream itself. For this reason they cannot be counted as anxiety-dreams; but they have always been taken as evidence of the fact that dreams are without meaning and have no psychical value. An analysis of a dream of this kind will show that we are dealing with well-disguised fulfiments of repressed wishes, that is to say with a dream of the second class; it will also show how admirably the process of displacement is adapted for disguising wishes.

[1901a, 1088]
At this point I shall interrupt my report of the analysis in order to compare this small piece of dream-interpretation with the general statements I have made upon the mechanism of the formation of dreams. I argued in my book, *The Interpretation of Dreams* (1900a), that every dream is a wish which is represented as fulfilled, that the representation acts as a takes disguise if the wish is a repressed one, belonging to the unconscious, and that except in the case of children's dreams only an unconscious wish or one which reaches down into the unconscious has the force necessary for the formation of a dream. I fancy my theory would have been more certain of general acceptance if I had contented myself with maintaining that every dream had a meaning, which could be discovered by means of a certain process of interpretation; and that when the interpretation had been completed the dream could be replaced by thoughts which would fall into place at an easily recognizable point in the waking mental life of the dreamer. I might then have gone on to say that the meaning of a dream turned out to be of as many different sorts as the processes of waking thought; that in one case it would be a fulfilled wish, in another a realized fear, or again a reflection persisting on into sleep, or an intention (as in the instance of Dora's dream), or a piece of creative thought during sleep, and so on. Such a theory would no doubt have proved attractive from its very simplicity, and it might have been supported by a great many examples of dreams that had been satisfactorily interpreted, as for instance by the one which has been analysed in these pages.

[1905e, 1404]

But instead of this I formulated a generalization according to which the meaning of dreams is limited to a single form, to the representation of wishes, and by so doing I aroused a universal inclination to dissent. I must, however, observe that I did not consider it either my right or my duty to simplify a psychological process so as to make it more acceptable to my readers, when my researches had shown me that it presented a complication which could not be reduced to uniformity until the inquiry had been carried into another field. It is therefore of special importance to me to show that apparent exceptions such as this dream of Dora's, which has shown itself in the first instance to be the continuation into sleep of an intention formed during the day - nevertheless lend fresh support to the rule which is in dispute.

[1905e, 1405]

I might at this point hesitate whether I should first consider the light thrown by this dream on the history of the case, or whether I should rather begin by dealing with the objection to my theory of dreams which may be based on it interpretation. I shall take the former course.

[1905e, 1411]

For Hanold's dream was an anxiety-dream. Its content was frightening, the dreamer felt anxiety while he slept and he was left with painful feelings afterwards. Now this is far from convenient for our attempt at an explanation; and we must once again borrow heavily from the theory of dream-interpretation. We are warned by that theory not to fall into the error of tracing the anxiety that may be felt in a dream to the content of the dream, and not to treat the content of the dream as though it were the content of an idea occurring in waking life. It points out to us how often we dream the most ghastly things without feeling a trace of anxiety. The true situation, we learn, is quite a different one, which cannot be easily guessed, but which can be proved with certainty. The anxiety in anxiety-dreams, like neurotic anxiety in general, corresponds to a sexual affect, a libidinal feeling, and arises out of libido by the process of repression.¹ When we interpret a dream, therefore, we must replace anxiety by sexual excitement. The anxiety that originates in this way has - not invariably, but frequently - a selective influence on the content of the dream and introduces into it ideational elements which seem, when the dream is looked at from a conscious and mistaken point of view, to be appropriate to the affect of anxiety. As I have said, this is not invariably so, for there are plenty of anxiety-dreams in which the content is not in the least frightening and where it is therefore impossible to give an explanation on conscious lines of the anxiety that is felt.

[1907a, 1856]
Lastly, I must warn you not to let yourselves be put out by the objection that the occurrence of anxiety-dreams contradicts our view of dreams as the fulfilments of wishes. Apart from the fact that these anxiety-dreams, like the rest, require interpretation before any judgement can be formed on them, it must be stated quite generally that the anxiety does not depend on the content of the dream in such a simple manner as one might imagine without having more knowledge and taking more account of the determinants of neurotic anxiety. Anxiety is one of the ego's reactions in repudiation of repressed wishes that have become powerful; and its occurrence in dreams as well is very easily explicable when the formation of the dream has been carried out with too much of an eye to the fulfilment of these repressed wishes.

[1910a, 2224]

A short time ago we submitted a series of dreams to interpretation, but we left wish-fulfilment completely out of account. I feel sure that you must have repeatedly been driven to ask yourselves: 'But where is the wish-fulfilment, which is supposed to be the aim of the dream-work?' The question is an important one, for it has become the question raised by our lay critics. Human beings, as you know, have an instinctive tendency to fend off intellectual novelties. One of the ways in which this tendency is manifested is by immediately reducing the novelty to the smallest proportions, by compressing it if possible into a single catch-word. 'Wish-fulfilment' has become the catch word for the new theory of dreams. The layman asks: 'Where is the wish-fulfilment?' And instantly, having heard that dreams are supposed to be wish-fulfilments, and in the very act of asking the question, he answers it with a rejection. He immediately thinks of countless experiences of his own with dreams, in which the dream has been accompanied by feelings ranging from the unpleasurable to severe anxiety, so that the assertion made by the psychoanalytic theory of dreams seems to him most improbable. We have no difficulty in replying that in distorted dreams the wish-fulfilment cannot be obvious but must be looked for, so that it cannot be pointed out until the dream has been interpreted. We know too that the wishes in these distorted dreams are forbidden ones - rejected by the censorship - whose existence was precisely the cause of the dream's distortion, the reason for the intervention of the dream censorship. But it is difficult to make the lay critic understand that before a dream has been interpreted one cannot enquire about the fulfilment of its wish. He will keep on forgetting this. His rejection of the theory of wish-fulfilment is actually nothing other than a consequence of the dream-censorship, a substitute for the rejection of the censored dream-wishes and an effluence from it.

[1916-1917, 3302]

We too, of course, feel the need to explain to ourselves why there are so many dreams with a distressing content and, especially why there are anxiety-dreams. Here for the first time we come upon the problem of affects in dreams; it would deserve a monograph of its own, but unfortunately we cannot enter into it. If dreams are the fulfilment of wishes, distressing feelings should be impossible in them: the lay critics would appear to be right there. But three kinds of complications must be taken into account which they have not thought of.

[1916-1917, 3302]
Firstly, it may be that the dream-work has not completely succeeded in creating a wish-fulfilment; so that a portion of the distressing affect in the dream-thoughts has been left over in the manifest dream. In that case analysis would have to show that these dream-thoughts were far more distressing than the dream-constructed out of them. That much can always be proved. If so, we must admit that the dream-work has not achieved its aim any more than the dream of drinking, formed in response to the stimulus of thirst, succeeded in quenching the thirst. The dreamer remains thirsty and has to wake up in order to drink. Nevertheless it was a genuine dream, and had lost nothing of a dream's essential nature. We can only say: "Ut desint vires, tamen est laudanda voluntas."¹ The intention, at least, which can clearly be recognized, remains praiseworthy. Such instances of failure are no rare event. This is helped by that fact that it is so much harder for the dream-work to alter the sense of a dream's affects than of its content; affects are sometimes highly resistant. What then happens is that the dream-work transforms the distressing content of the dream-thoughts into the fulfilment of a wish, while the distressing affect persists unaltered. In dreams of this kind the affect is quite inappropriate to the content, and our critics can say that dreams are so far from being wish-fulfilments that even one with a harmless content can be felt as distressing. We can answer this foolish remark by pointing out that it is precisely in dreams like this that the wish-fulfilling purpose of the dream-work appears most clearly, because in isolation. The error arises because those who are unfamiliar with the neuroses picture the link between content and affect as too intimate and therefore cannot imagine the content being altered without a simultaneous alteration of the expression of affect attached to it.

[1916-1917, 3303]

A second factor, which is much more important and far reaching, but which is equally overlooked by laymen, is the following. No doubt a wish-fulfilment must bring pleasure; but the question then arises "To whom?" To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them - he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream-wishes can only be compared to an amalgamation of two separate people who are linked by some strong element in common. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish-fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish-fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one - man and wife - the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.

[1916-1917, 3304]
We may suppose that what is true of undistorted anxiety dreams applies also to those which are partly distorted as well as to other unpleasurable dreams, in which the distressing feelings probably correspond to an approach to anxiety. Anxiety-dreams are as a rule also arousal dreams; we usually interrupt our sleep before the repressed wish in the dream has put its fulfilment through completely in spite of the censorship. In that case the function of the dream has failed, but its essential nature is not altered by this. We have compared dreams to the night-watchman or guardian of sleep, who tries to protect our sleep from disturbance. The night-watchman, too, may reach the point of waking the sleeper if he feels he is too weak alone to drive off the disturbance or the danger. Nevertheless we sometimes succeed in holding on to our sleep even when the dream begins to be precarious and to be turning into anxiety. We say to ourselves in our sleep 'after all it's only a dream', and sleep on.

If, in the third place, you will recall our idea that the dreamer fighting against his own wishes is to be compared with a summation of two separate, though in some way intimately connected, people, you will understand another possibility. For there is a possibility that the fulfilment of a wish may bring about something very far from pleasant - namely, a punishment. Here we can once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate were the direct fulfilment of the wish of the first person, the woman. The sausages on her nose were the fulfilment of the wish of the second person, the man, but were at the same time a punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third wish, the last remaining one in the fairy tale.) There are many such punitive trends in the mental life of human beings; they are very powerful, and we may hold them responsible for some of the distressing dreams. Perhaps you will now say that this leaves very little over of the famous wish-fulfilment. But if you look more closely you will admit that you are wrong. Compared with the multiplicity (which I shall mention later) of the things that dreams might be and according to many authorities actually are, our solution - wish-fulfilment, anxiety-fulfilment, punishment-fulfilment - is a very restricted one. We may add that the anxiety is the direct opposite of the wish, that opposites are especially close to one another in associations and that in the unconscious they coalesce; and further, that the punishment is also the fulfilment of a wish - of the wish of the other, censoring person.
On the whole, therefore, I have made no concession to your objection to the theory of wish-fulfilment. It is our duty, however, to be able to indicate the wish-fulfilment in any distorted dream we may come across, and we shall certainly not evade the task. Let us go back to the dream we have already interpreted of the three bad theatre-tickets for 1 florin 50, from which we have already learnt so much. I hope you still recollect it. A lady, whose husband had told her during the day that her friend Elise, who was only three months her junior, had become engaged, dreamt that she was at the theatre with her husband. One side of the stalls was almost empty. Her husband said to her that Elise and her fiancé had wanted to go to the theatre too but had not been able to, since they had only got bad seats - three for 1 florin 50. She thought it would not really have done any harm if they had. We found that the dream-thoughts related to her anger at having married so early and to her dissatisfaction with her husband. We may be curious to discover how these gloomy thoughts were transformed into the fulfilment of a wish and where any trace of it is to be found in the manifest content of the dream. We already know that the element ‘too early, in a hurry’ was eliminated from the dream by the censorship. The empty stalls were an allusion to it. The mysterious ‘three for 1 florin 50’ now becomes more intelligible to us with the help of the symbolism with which we have meanwhile become acquainted. The ‘3’¹ really means a man and the manifest element is easy to translate: buying a husband with her dowry. (‘I could have got one ten times better with my dowry.’) ‘Marrying’ is clearly replaced by ‘going to the theatre’. ‘Taking the theatre tickets too early’ is, indeed, an immediate substitute for ‘marrying too early’. This substitution is, however, the work of a wish-fulfilment. Our dreamer was not always so dissatisfied with her early marriage as she was on the day when she received the news of her friend’s engagement. She had been proud of it at one time and regarded herself as at an advantage over her friend. Simple-minded girls, after becoming engaged, are reputed often to express their joy that they will soon be able to go to the theatre, to all the plays which have hitherto been prohibited, and will be allowed to see everything. The pleasure in looking, or curiosity, which is revealed in this was no doubt originally a sexual desire to look, directed towards sexual happenings and especially on to the girls’ parents, and hence it became a powerful motive for urging them to an early marriage. In this way a visit to the theatre became an obvious substitute, by way of allusion, for being married. Thus the dreamer, in her present anger at her early marriage, harked back to the time at which early marriage was the fulfilment of a wish because it satisfied her scopophilia, and, under the lead of this old wishful impulse, she replaced marriage by going to the theatre.

[1916-1917, 3308]

I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking of it. Anyone who accepts it as something self-evident that their dreams should put them back at night into the situation that caused them to fall ill has misunderstood the nature of dreams. It would be more in harmony with their nature if they showed the patient pictures from his healthy past or of the cure for which he hopes. If we are not to be shaken in our belief in the wish-fulfilling tenor of dreams by the dreams of traumatic neurotics, we still have one resource open to us: we may argue that the function of dreaming, like so much else, is upset in this condition and diverted from its purposes, or we may be driven to reflect on the mysterious masochistic trends of the ego.

[1920g, 3719]
This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

A dream-structure of this kind will excite less astonishment if one considers how frequently dream-distortion, acting in the service of the censorship, replaces a particular element by something that is in some sense or other its opposite or contrary. It is only a short step from there to the replacement of a characteristic portion of the content of the dream by a defensive contradiction, and one further step will lead to the whole objectionable dream-content being replaced by the punishment dream. I should like to give a couple of characteristic examples of the intermediate phase in the falsification of the manifest content.
Astonishment is sometimes expressed at the fact that the dreamer's ego can appear two or more times in the manifest dream, once as himself and again disguised behind the figures of other people. During the course of the construction of the dream, the secondary revision has evidently sought to obliterate this multiplicity of the ego, which cannot fit in with any possible scenic situation; but it is re-established by the work of interpretation. In itself this multiplicity is no more remarkable than the multiple appearance of the ego in a waking thought, especially when the ego divides itself into subject and object, puts one part of itself as an observing and critical agency in contrast to the other, or compares its present nature with its recollected past, which was also ego once; for instance, in such sentences as 'When I think what I've done to this man' or 'When I think that I too was a child once'. But I should reject as a meaningless and unjustifiable piece of speculation the notion that all figures that appear in a dream are to be regarded as fragmentations and representatives of the dreamer's own ego. It is enough that we should keep firmly to the fact that the separation of the ego from an observing, critical, punishing agency (an ego ideal) must be taken into account in the interpretation of dreams as well.

[1923c, 4041]

I have dealt so exhaustively in these pages with this characteristic of dreams, which indeed provides the motive for their distortion, that I can pass at once from this topic to the problem that lies before us: Must one assume responsibility for the content of one's dreams? For the sake of completeness, it should, however, be added that dreams do not always offer immoral wish-fulfillments, but often energetic reactions against them in the form of 'punishment dreams'. In other words, the dream-censorship cannot only express itself in distortions and the generation of anxiety, but can go so far as to blot out the immoral subject-matter completely and replace it by something else that serves as an atonement, though it allows one to see what lies behind. But the problem of responsibility for the immoral content of dreams no longer exists for us as it formerly did for writers who knew nothing of latent dream-thoughts and the repressed part of our mental life. Obviously one must hold oneself responsible for the evil impulses of one's dreams. What else is one to do with them? Unless the content of the dream (rightly understood) is inspired by alien spirits, it is a part of my own being. If I seek to classify the impulses that are present in me according to social standards into good and bad, I must assume responsibility for both sorts; and if, in defence, I say that what is unknown, unconscious and repressed in me is not my 'ego', then I shall not be basing my position upon psycho-analysis, I shall not have accepted its conclusions - and I shall perhaps be taught better by the criticisms of my fellow-men, by the disturbances in my actions and the confusion of my feelings. I shall perhaps learn that what I am disavowing not only 'is' in me but sometimes 'acts' from out of me as well.

[1925i, 4050]
Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.

[1933a, 4622]

Here we are presented with a means of answering the question of whether dreams have a function too, whether they are entrusted with any useful achievement. The condition of rest free from stimulus, which the state of sleep wishes to establish, is threatened from three directions: in a relatively accidental manner by external stimuli during sleep, and by interests of the previous day which cannot be broken off, and in an unavoidable manner by unsated repressed instinctual impulses which are on the watch for an opportunity of finding expression. In consequence of the diminishing of repressions at night there would be a risk that the rest afforded by sleep would be interrupted whenever an instigation from outside or from inside succeeded in linking up with an unconscious instinctual source. The process of dreaming allows the product of a collaboration of this kind to find an outlet in a harmless hallucinatory experience and in that way assures a continuation of sleep. The fact that a dream occasionally awakens the sleeper, to the accompaniment of a generation of anxiety, is no contradiction of this function but rather, perhaps, a signal that the watchman regards the situation as too dangerous and no longer feels able to control it. And very often then, while we are still asleep, a consolation occurs to us which seeks to prevent our waking up: "But after all it's only a dream!"

[1933a, 4630]

I cannot detain you any longer over such minor discoveries or over the discussions relating to the employment of dream-interpretation in the work of analysis. I feel sure you are impatient to hear what changes have been made in our fundamental views on the nature and significance of dreams. I have already warned you that precisely on this there is little to report to you. The most disputed point in the whole theory was no doubt the assertion that all dreams are the fulfilments of wishes. The inevitable and ever recurring objection raised by the layman that there are nevertheless so many anxiety-dreams was, I think I may say, completely disposed of in my earlier lectures. With the division into wishful dreams, anxiety-dreams and punishment dreams, we have kept our theory intact.

[1933a, 4640]
Punishment-dreams, too, are fulfilments of wishes, though not of wishes of the instinctual impulses but of those of the critical, censoring and punishing agency in the mind. If we have a pure punishment-dream before us, an easy mental operation will enable us to restore the wishful dream to which the punishment-dream was the correct rejoinder and which, owing to this repudiation, was replaced as the manifest dream. As you know, Ladies and Gentlemen, the study of dreams was what first helped us to understand the neuroses, and you will find it natural that our knowledge of the neuroses was later able to influence our view of dreams. As you will hear, we have been obliged to postulate the existence in the mind of a special critical and prohibiting agency which we have named the 'super-ego'. Since recognizing that the censorship of dreams is also a function of this agency, we have been led to examine the part played by the super-ego in the construction of dreams more carefully.

[1933a, 4640]

Only two serious difficulties have arisen against the wish-fulfilment theory of dreams. A discussion of them leads far afield and has not yet, indeed, brought us to any wholly satisfying conclusion.

[1933a, 4641]

The first of these difficulties is presented in the fact that people who have experienced a shock, a severe psychical trauma - such as happened so often during the war and such as affords the basis for traumatic hysteria - are regularly taken back in their dreams into the traumatic situation. According to our hypotheses about the function of dreams this should not occur. What wishful impulse could be satisfied by harking back in this way to this exceedingly distressing traumatic experience? It is hard to guess.

[1933a, 4641]

We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psycho-analysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been repressed; but, that being so, we cannot understand how it is that they have such free access to dream-life, that they provide the pattern for so many dream-phantasies and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment.

[1933a, 4641]
With the traumatic neuroses things are different. In their case the dreams regularly end in the
 generation of anxiety. We should not, I think, be afraid to admit that here the function of the
dream has failed. I will not invoke the saying that the exception proves the rule: its wisdom seems
to me most questionable. But no doubt the exception does not overturn the rule. If, for the sake of
studying it, we isolate one particular psychical function, such as dreaming, from the psychical
machinery as a whole, we make it possible to discover the laws that are peculiar to it; but when
we insert it once more into the general context we must be prepared to discover that these
findings are obscured or impaired by collision with other forces. We say that a dream is the
fulfilment of a wish; but if you want to take these latter objections into account, you can say
nevertheless that a dream is an attempt at the fulfilment of a wish. No one who can properly
appreciate the dynamics of the mind will suppose that you have said anything different by this. In
certain circumstances a dream is only able to put its intention into effect very incompletely, or
must abandon it entirely. Unconscious fixation to a trauma seems to be foremost among these
obstacles to the function of dreaming. While the sleeper is obliged to dream, because the
relaxation of repression at night allows the upward pressure of the traumatic fixation to become
active, there is a failure in the functioning of his dream-work, which would like to transform the
memory-traces of the traumatic event into the fulfilment of a wish. In these circumstances it will
happen that one cannot sleep, that one gives up sleep from dread of the failure of the function of
dreaming. Traumatic neuroses are here offering us an extreme case; but we must admit that
childhood experiences, too, are of a traumatic nature, and we need not be surprised if
comparatively trivial interferences with the function of dreams may arise under other conditions as
well.
[1933a, 4642]

Naturally, every case is not so simple. Especially in dreams which have originated from undealt-
with residues of the previous day, and which have only obtained an unconscious reinforcement
during the state of sleep, it is often no easy task to uncover the unconscious motive force and its
wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the
fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have
an actually distressing content or even wake the dreamer in anxiety, quite apart from the
numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams
cannot be sustained against analysis. It must not be forgotten that dreams are invariably the
product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction
for the unconscious id may for that very reason be a cause of anxiety for the ego.
[1940a [1938], 4980]

As the dream-work proceeds, sometimes the unconscious will press forward more successfully
and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those
whose content has undergone the least distortion. If the demand made by the unconscious is too
great for the sleeping ego to be in a position to fend it off by the means at its disposal, it
abandons the wish to sleep and returns to waking life. We shall be taking every experience into
account if we say that a dream is invariably an attempt to get rid of a disturbance of sleep by
means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed
more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken
precisely by the dream. So, too, there are occasions when that excellent fellow the night-
watchman, whose business it is to guard the little township’s sleep, has no alternative but to
sound the alarm and waken the sleeping townspeople.
[1940a [1938], 4981]
'You're always saying to me', began a clever woman patient of mine, 'that a dream is a fulfilled wish. Well, I'll tell you a dream whose subject was the exact opposite - a dream in which one of my wishes was not fulfilled. How do you fit that in with your theory? This was the dream:

[1900a, 642]

A contradiction to my theory of dreams produced by another of my women patients (the cleverest of all my dreamers) was resolved more simply, but upon the same pattern: namely that the non-fulfilment of one wish meant the fulfilment of another. One day I had been explaining to her that dreams are fulfilments of wishes. Next day she brought me a dream in which she was travelling down with her mother-in-law to the place in the country where they were to spend their holidays together. Now I knew that she had violently rebelled against the idea of spending the summer near her mother-in-law and that a few days earlier she had successfully avoided the propinquity she dreaded by engaging rooms in a far distant resort. And now her dream had undone the solution she had wished for: was not this the sharpest possible contradiction of my theory that in dreams wishes are fulfilled? No doubt; and it was only necessary to follow the dream's logical consequence in order to arrive at its interpretation. The dream showed that I was wrong. Thus it was her wish that I might be wrong, and her dream showed that wish fulfilled. But her wish that I might be wrong, which was fulfilled in connection with her summer holidays, related in fact to another and more serious matter. For at about the same time I had inferred from the material produced in her analysis that at a particular period of her life something must have occurred that was of importance in determining her illness. She had disputed this, since she had no recollection of it; but soon afterwards it had turned out that I was right. Thus her wish that I might be wrong, which was transformed into her dream of spending her holidays with her mother-in-law, corresponded to a well-justified wish that the events of which she was then becoming aware for the first time might never have occurred.

[1900a, 646]

I have ventured to interpret - without any analysis, but only by a guess - a small episode which occurred to a friend of mine who was in the same class as I was all through our career at a secondary school. One day he listened to a lecture which I gave before a small audience on the novel idea that dreams were wish-fulfilments. He went home and dreamt that he had lost all his cases (he was a barrister) and afterwards arraigned me on the subject. I evaded the issue by telling him that after all one can't win all one's cases. But to myself I thought: 'Considering that for eight whole years I sat on the front bench as top of the class while he drifted about somewhere in the middle, he can hardly fail to nourish a wish, left over from his school-days, that some day or other I may come a complete cropper.'

[1900a, 647]

A dream of a gloomier kind was also brought up against me by a patient as an objection to the theory of wishful dreams.

[1900a, 647]
The girl had early been left an orphan and had been brought up in the house of a much older sister. Among the friends who visited at the house was a man who made a lasting impression on her heart. For a time it had seemed as though her scarcely acknowledged relations with him would lead to marriage; but this happy outcome was brought to nothing by her sister, whose motives were never fully explained. After the breach the man ceased to visit the house; and shortly after the death of little Otto, on to whom she had meanwhile turned her affection, my patient herself set up on her own. She did not succeed, however, in freeing herself from her attachment to her sister's friend. Her pride bade her avoid him; but she was unable to transfer her love to any of the other admirers who presented themselves later. Whenever it was announced that the object of her affections, who was by profession a literary man, was to give a lecture anywhere, she was invariably in the audience; and she took every possible opportunity of seeing him from a distance on neutral ground. I remembered that she had told me the day before that the Professor was going to a particular concert and that she intended to go to it as well so as to enjoy a glimpse of him once more. That had been on the day before the dream, and the concert was to take place on the day on which she told me the dream. It was therefore easy for me to construct the correct interpretation, and I asked her whether she could think of anything that happened after little Otto's death. She answered at once: 'Of course! the Professor came to see us again after a long absence, and I saw him once more beside little Otto's coffin.' This was exactly what I had expected, and I interpreted the dream in this way: 'If now the other boy were to die, the same thing would happen. You would spend the day with your sister and the Professor would be certain to come to offer his condolences, so that you would see him again under the same conditions as the other time. The dream means no more than your wish to see him once more, a wish which you are inwardly struggling against. I know you have a ticket for to-day's concert in your pocket. Your dream was a dream of impatience: it anticipated the glimpse you are to have of him to-day by a few hours.'

A similar dream of another woman patient had a different explanation. When she was young the had been remarkable for her ready wit and cheerful disposition; and these characteristics were still to be seen, at all events in the ideas that occurred to her during the treatment. In the course of a longish dream, this lady imagined that she saw her only fifteen-year-old daughter lying dead 'in a case.' She had half a mind to use the scene as an objection to the wish-fulfilment theory, though she herself suspected that the detail of the 'case' must point the way to another view of the dream.¹ In the course of the analysis she recalled that at a party the evening before there had been some talk about the English word 'box' and the various ways in which it could be translated into German - such as 'Schachtel,' 'Loge,' 'Kasten,' 'Ohrfeige,' and so on. Other portions of the same dream enabled us to discover further that she had guessed that the English 'box' was related to the German 'Büchse,' and that she had then been plagued by a recollection that 'Büchse' is used as a vulgar term for the female genitals. If some allowance was made for the limits of her knowledge of topographical anatomy, it might be presumed, therefore, that the child lying in the case meant an embryo in the womb. After being enlightened up to this point, she no longer denied that the dream-picture corresponded to a wish of hers. Like so many young married women, she had been far from pleased when she became pregnant; and more than once she had allowed herself to wish that the child in her womb might die. Indeed, in a fit of rage after a violent scene with her husband, she had beaten with her fists on her body so as to hit the child inside it. Thus the dead child was in fact the fulfilment of a wish, but of a wish that had been put aside fifteen years earlier. It is scarcely to be wondered at if a wish that was fulfilled after such a long delay was not recognized. Too much had changed in the interval.

[1900a, 648]
I shall have to return to the group of dreams to which the last two examples belong (dreams dealing with the death of relatives of whom the dreamer is fond) when I come to consider ‘typical’ dreams. I shall then be able to show from further instances that, in spite of their unwished for contents, all such dreams must be interpreted as wish-fulfilments.

There are also clear dreams with a distressing content, which, however, is not felt as distressing in the dream itself. For this reason they cannot be counted as anxiety-dreams; but they have always been taken as evidence of the fact that dreams are without meaning and have no psychological value. An analysis of a dream of this kind will show that we are dealing with well-disguised fulfilments of repressed wishes, that is to say with a dream of the second class; it will also show how admirably the process of displacement is adapted for disguising wishes.

A girl had a dream of seeing her sister's only surviving child lying dead in the same surroundings in which a few years earlier she had in fact seen the dead body of her sister's first child. She felt no pain over this; but she naturally rejected the idea that this situation represented any wish of hers. Nor was there any need to suppose this. It had been beside the first child's coffin, however, that, years before, she had seen and spoken to the man she was in love with; if the second child died, she would no doubt meet the man again in her sister's house. She longed for such a meeting, but fought against the feeling. On the dream-day she had bought a ticket for a lecture which was to be given by this same man, to whom she was still devoted. Her dream was a simple dream of impatience of the kind that often occurs before journeys, visits to the theatre, and similar enjoyments that lie ahead. But in order to disguise this longing from her, the situation was displaced on to an event of a kind most unsuitable for producing a feeling of enjoyment, though it had in fact done so in the past. It is to be observed that the emotional behaviour in the dream was appropriate to the real content which lay in the background and not to what was pushed into the foreground. The dream-situation anticipated the meeting she had so long desired; it offered no basis for any painful feelings.

¹ Another child, rather older than Hans, welcomed his younger brother with the words: 'The stork can take him away again.' Compare in this connection my remarks in The Interpretation of Dreams on dreams of the death of loved relatives.

I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking of it. Anyone who accepts it as something self-evident that their dreams should put them back at night into the situation that caused them to fall ill has misunderstood the nature of dreams. It would be more in harmony with their nature if they showed the patient pictures from his healthy past or of the cure for which he hopes. If we are not to be shaken in our belief in the wish-fulfilling tenor of dreams by the dreams of traumatic neurotics, we still have one resource open to us: we may argue that the function of dreaming, like so much else, is upset in this condition and diverted from its purposes, or we may be driven to reflect on the mysterious masochistic trends of the ego.
This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do ‘punishment dreams’, for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by ‘suggestion’) to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a ‘beyond the pleasure principle’, it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

[1920g, 3735]
'There is nothing new,' I shall be told, 'in the idea that some dreams are to be regarded as wish-fulfilments; the authorities noticed that fact long ago. Cf. Radestock (1879, 137 f.), Volkelt (1875, 110 f.), Purkinje (1846, 456), Tissié (1898, 70), Šimon (1888, 42, on the hunger dreams of Baron Trenck while he was a prisoner), and a passage in Griesinger (1845, 89). But to assert that there are no dreams other than wish-fulfilment dreams is only one more unjustifiable generalization, though fortunately one which it is easy to disprove. After all, plenty of dreams occur which contain the most distressing subject matter but never a sign of any wish-fulfilment. Eduard von Hartmann, the philosopher of pessimism, is probably furthest removed from the wish-fulfilment theory. In his *Philosophie des Unbewussten* (1890, 2, 344) he writes: "When it comes to dreams, we find all the annoyances of waking life carried over into the state of sleep; the only thing we do not find is what can to some extent reconcile an educated man to life - scientific and artistic enjoyment..." But even less disgruntled observers have insisted that pain and unpleasure are more common in dreams than pleasure: for instance, Scholz (1893, 57), Volkelt (1875, 80), and others. Indeed two ladies, Florence Hallam and Sarah Weed (1896, 499), have actually given statistical expression, based on a study of their own dreams, to the preponderance of unpleasure in dreaming. They find that 57.2 per cent of dreams are "disagreeable" and only 28.6 percent positively "pleasant". And apart from these dreams, which carry over into sleep the various distressing emotions of life, there are anxiety-dreams, in which that most dreadful of all unpleasurable feelings holds us in its grasp till we awaken. And the commonest victims of these anxiety-dreams are precisely children, whose dreams you have described as undisguised wish-fulfilments.'

[1900a, 631]

It does in fact look as though anxiety-dreams make it impossible to assert as a general proposition (based on the examples quoted in my last chapter) that dreams are wish-fulfilments; indeed they seem to stamp any such proposition as an absurdity.

[1900a, 632]

When in the course of a piece of scientific work we come upon a problem which is difficult to solve, it is often a good plan to take up a second problem along with the original one - just as it is easier to crack two nuts together than each separately. Thus we are not only faced by the question "How can distressing dreams and anxiety-dreams be wish-fulfilments?"; our reflections enable us to add a second question: "Why is it that dreams with an indifferent content, which turn out to be wish-fulfilments, do not express their meaning undisguised?" Take, for instance, the dream which I treated at such length of Irma's injection. It was not by any means of a distressing nature and interpretation showed it as a striking example of the fulfilment of a wish. But why should it have needed any interpretation at all? Why did it not say what it meant straight out? At first sight the dream of Irma's injection gave no impression that it represented a wish of the dreamer's as fulfilled. My readers will have had no such impression; but neither did I myself before I carried out the analysis. Let us describe this behaviour of dreams, which stands in so much need of explanation, as 'the phenomenon of distortion in dreams'. Thus our second problem is: what is the origin of dream-distortion?

[1900a, 633]

The fact that dreams really have a secret meaning which represents the fulfilment of a wish must be proved afresh in each particular case by analysis. I shall therefore select a few dreams with a distressing content and attempt to analyse them. Some of them are the dreams of hysterical patients which require lengthy preambles and an occasional excursus into the psychical processes characteristic of hysteria. But I cannot escape this aggravation of the difficulties of presenting my argument.

[1900a, 641]
There remain to be discussed anxiety-dreams as a special sub-species of dreams with a distressing content. The notion of regarding these as wishful dreams will meet with very little sympathy from the unenlightened. Nevertheless I can deal with anxiety-dreams very briefly at this point. They do not present us with a new aspect of the dream-problem; what they face us with is the whole question of neurotic anxiety. The anxiety that we feel in a dream is only apparently explained by the dream's content. If we submit the content of the dream to analysis, we find that the anxiety in the dream is no better justified by the dream's content than, let us say, the anxiety in a phobia is justified by the idea to which the phobia relates. No doubt it is true, for instance, that it is possible to fall out of a window and that there is therefore reason for exercising a certain degree of caution in the neighbourhood of a window; but we cannot see why the anxiety felt in a phobia on this subject is so great and pursues the patient far beyond its occasion. We find then that the same thing may be validly asserted both of phobias and of anxiety-dreams: in both cases the anxiety is only superficially attached to the idea that accompanies it; it originates from another source.

This state of affairs is what makes possible one group of anxiety-dreams - dream-structures unpropitious from the point of view of the wish-theory. A second group of them reveal a different mechanism; for anxiety in dreams may be psychoneurotic anxiety: it may originate from psychosexual excitations - in which case the anxiety corresponds to repressed libido. Where this is so, the anxiety, like the whole anxiety-dream, has the significance of a neurotic symptom, and we come near the limit at which the wish-fulfilling purpose of dreams breaks down. But there are some anxiety dreams in which the feeling of anxiety is determined somatically - where, for instance, there happens to be difficulty in breathing owing to disease of the lungs or heart - and in such cases the anxiety is exploited in order to assist the fulfilment in the form of dreams of energetically suppressed wishes which, if they had been dreamt about for psychical reasons, would have led to a similar release of anxiety. But there is no difficulty in reconciling these two apparently different groups. In both groups of dreams two psychical factors are involved: an inclination towards an affect and an ideational content; and these are intimately related to each other. If one of them is currently active, it calls up the other even in a dream; in the one case the somatically determined anxiety calls up the suppressed ideational content, and in the other the ideational content with its accompanying sexual excitation, having been set free from repression, calls up a release of anxiety. We can put it that in the first case a somatically determined affect is given a psychical interpretation; while in the other case, though the whole is psychically determined, the content which had been suppressed is easily replaced by a somatic interpretation appropriate to anxiety. The difficulties which all this offers to our understanding have little to do with dreams: they arise from the fact that we are here touching on the problem of the generation of anxiety and on the problem of repression.

The deepest and eternal nature of man, upon whose evocation in his hearers the poet is accustomed to rely, lies in those impulses of the mind which have their roots in a childhood that has since become prehistoric. Suppressed and forbidden wishes from childhood break through in the dream behind the exile's unobjectionable wishes which are capable of entering consciousness; and that is why the dream which finds concrete expression in the legend of Nausicaä ends as a rule as an anxiety-dream.
It is also instructive to consider the relation of these dreams to anxiety-dreams. In the dreams we have been discussing, a repressed wish has found a means of evading censorship - and the distortion which censorship involves. The invariable concomitant is that painful feelings are experienced in the dream. In just the same way anxiety-dreams only occur if the censorship has been wholly or partly overpowered; and, on the other hand, the overpowering of the censorship is facilitated if anxiety has already been produced as an immediate sensation arising from somatic sources. We can thus plainly see the purpose for which the censorship exercises its office and brings about the distortion of dreams: it does so in order to prevent the generation of anxiety or other forms of distressing affect.

[1900a, 744]

In other dreams, in which the 'not carrying out' of a movement occurs as a sensation and not simply as a situation, the sensation of the inhibition of a movement gives a more forcible expression to the same contradiction - it expresses a volition which is opposed by a counter-volition. Thus the sensation of the inhibition of a movement represents a conflict of will. We shall learn later that the motor paralysis accompanying sleep is precisely one of the fundamental determinants of the psychical process during dreaming. Now an impulse transmitted along the motor paths is nothing other than a volition, and the fact of our being so certain that we shall feel that impulse inhibited during sleep is what makes the whole process so admirably suited for representing an act of volition and a 'no' which opposes it. It is also easy to see, on my explanation of anxiety, why the sensation of an inhibition of will approximates so closely to anxiety and is so often linked with it in dreams. Anxiety is a libidinal impulse which has its origin in the unconscious and is inhibited by the preconscious.² When, therefore, the sensation of inhibition is linked with anxiety in a dream, it must be a question of an act of volition which was at one time capable of generating libido - that is, it must be a question of a sexual impulse.

[1900a, 806]

Robbers, burglars and ghosts, of whom some people feel frightened before going to bed, and who sometimes pursue their victims after they are asleep, all originate from one and the same class of infantile reminiscence. They are the nocturnal visitors who rouse children and take them up to prevent their wetting their beds, or who lift the bed-clothes to make sure where they have put their hands in their sleep. Analyses of some of these anxiety-dreams have made it possible for me to identify these nocturnal visitors more precisely. In every case the robbers stood for the sleeper's father, whereas the ghosts corresponded to female figures in white nightgowns.

[1900a, 859]
I have only a few more remarks to add on the subject of affect in dreams from another point of view. A dominating element in a sleeper's mind may be constituted by what we call a 'mood' - or tendency to some affect - and this may then have a determining influence upon his dreams. A mood of this kind may arise from his experiences or thoughts during the preceding day, or its sources may be somatic. In either case it will be accompanied by the trains of thought appropriate to it. From the point of view of dream-construction it is a matter of indifference whether, as sometimes happens, these ideational contents of the dream-thoughts determine the mood in a primary fashion, or whether they are themselves aroused secondarily by the dreamer's emotional disposition which is in its turn to be explained on a somatic basis. In any case the construction of dreams is subject to the condition that it can only represent something which is the fulfilment of a wish and that it is only from wishes that it can derive its psychical motive force. A currently active mood is treated in the same way as a sensation arising and becoming currently active during sleep (cf. p. 714), which can be either disregarded or given a fresh interpretation in the sense of a wish-fulfilment. Distressing moods during sleep can become the motive force of a dream by arousing energetic wishes which the dream is supposed to fulfill. The material to which moods are attached is worked over until it can be used to express the fulfilment of a wish. The more intense and dominating a part is played in the dream-thoughts by the distressing mood, the more certain it becomes that the most strongly suppressed wishful impulses will make use of the opportunity in order to achieve representation. For, since the unpleasure which they would otherwise necessarily produce themselves is already present, they find the harder part of their task - the task of forcing their way through to representation - already accomplished for them. Here once more we are brought up against the problem of anxiety-dreams; and these, as we shall find, form a marginal case in the function of dreaming.

[1900a, 927]

The dream of the burning child at the beginning of this chapter gives us a welcome opportunity of considering the difficulties with which the theory of wish-fulfilment is faced. It will no doubt have surprised all of us to be told that dreams are nothing other than fulfillments of wishes, and not only on account of the contradiction offered by anxiety-dreams. When analysis first revealed to us that a meaning and a psychical value lay concealed behind dreams, we were no doubt quite unprepared to find that that meaning was of such a uniform character. According to Aristotle's accurate but bald definition, a dream is thinking that persists (in so far as we are asleep) in the state of sleep. Since, then, our daytime thinking produces psychical acts of such various sorts - judgements, inferences, denials, expectations, intentions, and so on - why should it be obliged during the night to restrict itself to the production of wishes alone? Are there not, on the contrary, numerous dreams which show us psychical acts of other kinds - worries, for instance - transformed into dream-shape? And was not the dream with which we began this chapter (a quite particularly transparent one) precisely a dream of this sort? When the glare of light fell on the eyes of the sleeping father, he drew the worrying conclusion that a candle had fallen over and might have set the dead body on fire. He turned this conclusion into a dream by clothing it in a sensory situation and in the present tense. What part was played in this by wish-fulfilment? Can we fail to see in it the predominating influence of a thought persisting from waking life or stimulated by a new sense-impression? All this is quite true and compels us to enter more closely into the part played by wish-fulfilment in dreams and into the importance of waking thoughts which persist into sleep.

[1900a, 982]
It may perhaps be useful to continue our examination of the same question by considering how a dream behaves when the dream-thoughts present it with material which is the complete reverse of a wish-fulfilment - well-justified worries, painful reflections, distressing realizations. The many possible outcome can be classed under the two following groups. (A) The dream-work may succeed in replacing all the distressing ideas by contrary ones and in suppressing the unpleasurable affects attaching to them. The result will be a straightforward dream of satisfaction, a palpable 'wish-fulfilment', about which there seems no more to be said. (B) The distressing ideas may make their way, more or less modified but none the less quite recognizable, into the manifest content of the dream. This is the case which raises doubts as to the validity of the wish theory of dreams and needs further investigation. Dreams of this sort with a distressing content may either be experienced with indifference, or they may be accompanied by the whole of the distressing affect which their ideational content seems to justify, or they may even lead to the development of anxiety and to awakening.

[1900a, 988]

Analysis is able to demonstrate that these unpleasurable dreams are wish-fulfilments no less than the rest. An unconscious and repressed wish, whose fulfilment the dreamer's ego could not fail to experience as something distressing, has seized the opportunity offered to it by the persisting cathexis of the distressing residues of the previous day; it has lent them its support and by that means rendered them capable of entering a dream. But whereas in Group A the unconscious wish coincided with the conscious one, in Group B the gulf between the unconscious and the conscious (between the repressed and the ego) is revealed and the situation in the fairy tale of the three wishes which were granted by the fairy to the husband and wife is realized. (See below, p. 1009 f.) The satisfaction at the fulfilment of the repressed wish may turn out to be so great that it counterbalances the distressing feelings attaching to the day's residues; in that case the feeling-tone of the dream is indifferent, in spite of its being on the one hand the fulfilment of a wish and on the other the fulfilment of a fear. Or it may happen that the sleeping ego takes a still larger share in the construction of the dream, that it reacts to the satisfying of the repressed wish with violent indignation and itself puts an end to the dream with an outburst of anxiety. Thus there is no difficulty in seeing that unpleasurable dreams and anxiety-dreams are just as much wish-fulfilments in the sense of our theory as are straightforward dreams of satisfaction.

[1900a, 989]

The qualification 'in so far as the two wishes are compatible with each other' implies a hint at the possible case in which the function of dreaming may come to grief. The dream-process is allowed to begin as a fulfilment of an unconscious wish; but if this attempted wish-fulfilment jars upon the preconscious so violently that it is unable to continue sleeping, then the dream has made a breach in the compromise and has failed to carry out the second half of its task. In that case the dream is immediately broken off and replaced by a state of complete waking. Here again it is not really the fault of the dream if it has now to appear in the role of a disturber of sleep instead of in its normal one of a guardian of sleep; and this fact need not prejudice us against its having a useful purpose. This is not the only instance in the organism of a contrivance which is normally useful becoming useless and disturbing as soon as the conditions that give rise to it are somewhat modified; and the disturbance at least serves the new purpose of drawing attention to the modification and of setting the organism's regulative machinery in motion against it. What I have in mind is of course the case of anxiety-dreams, and in order that I may not be thought to be evading this evidence against the theory of wish-fulfilment whenever I come across it, I will at all events give some hints of their explanation.

[1900a, 1008]
There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the Ucs, while it has been repudiated and suppressed by the other system, the Pcs.¹ Even where psychical health is perfect, the subjugation of the Ucs by the Pcs is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the Ucs an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand they make it possible for the Pcs to control the Ucs to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

¹ [Footnote added 1919:] 'A second factor, which is much more important and far-reaching, but which is equally overlooked by laymen is the following. No doubt a wish-fulfilment must bring pleasure; but the question then arises "To whom?" To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them - he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream-wishes can only be compared to an amalgamation of two separate people who are linked by some important common element. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish-fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish-fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one - man and wife - the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.' (Introductory Lectures on Psycho-Analysis, Lecture XIV.)

Our discussion cannot be carried any further without examining the part played by the affects in these processes; but we can only do so imperfectly in the present connection. Let us assume, then, that the suppression of the Ucs is necessary above all because, if the course of ideas in the Ucs were left to itself, it would generate an affect which was originally of a pleasurable nature, but became unpleasurable after the process of 'repression' occurred. The purpose, and the result too, of suppression is to prevent this release of unpleasure. The suppression extends over the ideational content of the Ucs, since the release of unpleasure might start from that content. This presupposes a quite specific assumption as to the nature of the generation of affect. It is viewed as a motor or secretory function, the key to whose innervation lies in the ideas in the Ucs. Owing to the domination established by the Pcs these ideas are, as it were, throttled, and inhibited from sending out impulses which would generate affect. If, therefore, the catheysis from the Pcs ceases, the danger is that the unconscious excitations may release affect of a kind which (as a result of the repression which has already occurred) can only be experienced as unpleasure, as anxiety.

[1900a, 1009]
This danger materializes if the dream-process is allowed to take its course. The conditions which determine its realization are that repressions must have occurred and that the suppressed wishful impulses shall be able to grow sufficiently strong. These determinants are thus quite outside the psychological framework of dream-formation. If it were not for the fact that our topic is connected with the subject of the generation of anxiety by the single factor of the liberation of the Ucs. during sleep, I should be able to omit any discussion of anxiety-dreams and avoid the necessity for entering in these pages into all the obscurities surrounding them.

[1900a, 1010]

The theory of anxiety-dreams, as I have already repeatedly declared, forms part of the psychology of the neuroses. We have nothing more to do with it when once we have indicated its point of contact with the topic of the dream-process. There is only one thing more that I can do. Since I have asserted that neurotic anxiety arises from sexual sources, I can submit some anxiety-dreams to analysis in order to show the sexual material present in their dream-thoughts.

[1900a, 1010]

I have good reasons for leaving on one side in the present discussion the copious examples afforded by my neurotic patients, and for preferring to quote some anxiety-dreams dreamt by young people.

[1900a, 1011]

It is dozens of years since I myself had a true anxiety-dream, but I remember one from my seventh or eighth year, which I submitted to interpretation some thirty years later. It was a very vivid one, and in it I saw my beloved mother, with a peculiarly peaceful, sleeping expression on her features, being carried into the room by two (or three) people with bird's beaks and laid upon the bed. I awoke in tears and screaming, and interrupted my parents' sleep. The strangely draped and unnaturally tall figures with birds' beaks were derived from the illustrations to Philippson's Bible. I fancy they must have been gods with falcons' heads from an ancient Egyptian funerary relief. Besides this, the analysis brought to mind an ill-mannered boy, a son of a concierge, who used to play with us on the grass in front of the house when we were children, and who I am inclined to think was called Philipp. It seems to me that it was from this boy that I first heard the vulgar term for sexual intercourse, instead of which educated people always use a Latin word, 'to copulate', and which was clearly enough indicated by the choice of the falcons' heads. I must have guessed the sexual significance of the word from the face of my young instructor, who was well acquainted with the facts of life. The expression on my mother's features in the dream was copied from the view I had had of any grandfather a few days before his death as he lay snoring in a coma. The interpretation carried out in the dream by the 'secondary revision' must therefore have been that my mother was dying; the funerary relief fitted in with this. I awoke in anxiety, which did not cease till I had woken my parents up. I remember that I suddenly grew calm when I saw my mother's face, as though I had needed to be reassured that she was not dead. But this 'secondary' interpretation of the dream had already been made under the influence of the anxiety which had developed. I was not anxious because I had dreamt that my mother was dying; but I interpreted the dream in that sense in my preconscious revision of it because I was already under the influence of the anxiety. The anxiety can be traced back, when repression is taken into account, to an obscure and evidently sexual craving that had found appropriate expression in the visual content of the dream.

[1900a, 1011]
A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot. This is a good example of a very common sort of anxiety-dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often noticed blood in his mother's bed.

[1900a, 1012]

Dreams fall into three classes according to their attitude to wish-fulfilment. The first class consists of those which represent an unrepressed wish undisguisedly; these are the dreams of an infantile type which become ever rarer in adults. Secondly there are the dreams which express a repressed wish disguisedly; these no doubt form the overwhelming majority of all our dreams, and require analysis before they can be understood. In the third place there are the dreams which represent a repressed wish, but do so with insufficient or no disguise. These last dreams are invariably accompanied by anxiety, which interrupts them. In their case anxiety takes the place of dream distortion; and in dreams of the second class anxiety is only avoided owing to the dream-work. There is no great difficulty in proving that the ideational content which produces anxiety in us in dreams was once a wish but has since undergone repression.

[1901a, 1087]

There are also clear dreams with a distressing content, which, however, is not felt[experienced] as distressing in the dream itself. For this reason they cannot be counted as anxiety-dreams; but they have always been taken as evidence of the fact that dreams are without meaning and have no psychical value. An analysis of a dream of this kind will show that we are dealing with well-disguised fulfilsments of repressed wishes, that is to say with a dream of the second class; it will also show how admirably the process of displacement is adapted for disguising wishes.

[1901a, 1088]

This view is not traversed by the fact that there are marginal cases in which the dream - as happens with anxiety-dreams - can no longer perform its function of preventing an interruption of sleep, but assumes instead the other function of promptly bringing sleep to an end. In doing so it is merely behaving like a conscientious night-watchman, who first carries out his duty by suppressing disturbances so that the townsmen may not be woken up, but afterwards continues to do his duty by himself waking the townsmen up, if the causes of the disturbance seem to him serious and of a kind that he cannot cope with alone.

[1901a, 1093]
We know a dream from what seems as a rule a fragmentary memory of it which we have after waking. It appears as a mesh-work of sense-impressions, mostly visual but also of other kinds, which have simulated an experience, and with which thought-processes ('knowledge' in the dream) and expressions of affect may be mingled. What we thus remember of the dream I call 'the dream's manifest content'. It is often entirely absurd and confused - sometimes only the one or the other. But even if it is quite coherent, as it is in the case of some anxiety-dreams, it confronts our mental life as something alien, for whose origin one cannot in any way account. The explanation of these characteristics of dreams has hitherto been looked for in dreams themselves, by regarding them as indications of a disordered, dissociated and so to say 'sleepy' activity of the nervous elements.

[1905c, 1745]

Soon afterwards he had a terrifying dream, in which he found himself in ancient Pompeii on the day of the eruption of Vesuvius and witnessed the city's destruction. 'As he was standing at the edge of the forum beside the Temple of Jupiter, he suddenly saw Gradiuva at no great distance from him. Till then he had had no thought of her presence, but now it occurred to him all at once and as though it was something natural that, since she was a Pompeian, she was living in her native town, and, without his having suspected it, living as his contemporary.' (12.) Fear of the fate that lay before her provoked him to utter a warning cry, whereupon the figure, as she calmly stepped along, turned her face towards him. But she then proceeded on her way untroubled, till she reached the portico of the temple; there she took her seat on one of the steps and slowly laid her head down on it, while her face grew paler and paler, as though it were turning into marble. When he hurried after her, he found her stretched out on the broad step with a peaceful expression, like someone asleep, till the rain of ashes buried her form.

[1907a, 1817]

Let us pause for a moment at this journey, planned for such remarkably uncogent reasons, and take a closer look at our hero's personality and behaviour. He still appears to us as incomprehensible and foolish; we have no idea how his peculiar folly will be linked to human feeling and so arouse our sympathy. It is an author's privilege to be allowed to leave us in such uncertainty. The charm of his language and the ingenuity of his ideas offer us a provisional reward for the reliance we place in him and for the still unearned sympathy which we are ready to feel for his hero. Of this hero we are further told that he was pre-ordained by family tradition to become an archaeologist, that in his later isolation and independence he was wholly absorbed in his studies and had turned completely away from life and its pleasures. Marble and bronze alone were truly alive for him; they alone expressed the purpose and value of human life. But nature, perhaps with benevolent intent, had infused into his blood a corrective of an entirely unscientific sort - an extremely lively imagination, which could show itself not only in his dreams but often in his waking life as well. This division between imagination and intellect destined him to become an artist or a neurotic; he was one of those whose kingdom is not of this world. Thus it was that it could come about that his interest was attached to a relief representing a girl stepping along in a peculiar fashion, that he wove his phantasies around her, imagined a name and origin for her, placed the figure he had created in the setting of the Pompeii that was buried more than eighteen hundred years before, and finally, after a strange anxiety-dream, magnified his phantasy of the existence and death of this girl named Gradiuva into a delusion, which gained an influence over his actions. Such products of the imagination would seem to us astonishing and inexplicable if we met them in someone in real life. Since our hero, Norbert Hanold, is a fictitious person, we may perhaps put a timid question to his author, and ask whether his imagination was determined by forces other than its own arbitrary choice.

[1907a, 1819]
I can well imagine that at this point a reader may exclaim: 'The dream is quite easily explained - it is a simple anxiety dream, occasioned by the noises of the city, which were misinterpreted into the destruction of Pompeii by the archaeologist, whose mind was occupied with his Pompeian girl.' In view of the low opinion generally prevailing of the performances of dreams, all that is usually asked from an explanation of one is that some external stimulus shall be found that more or less coincides with a piece of the dream's content. This external stimulus to dreaming would be supplied by the noise which woke the sleeper; and with this, interest in the dream would be exhausted. If only we had some reason for supposing that the town was noisier than usual that morning! If only, for instance, the author had not omitted to tell us that Hanold, against his usual practice, had slept that night with his windows open! What a pity the author did not take the trouble to do that! And if only anxiety-dreams were as simple as that! But no, interest in the dream is not so easily exhausted.

[1907a, 1853]

We may perhaps find a starting-point in the after-effects left by the dream in Hanold's waking life. Up to then he had had a phantasy that Gradiva had been a Pompeian. This hypothesis now became a certainty for him, and a second certainty followed - that she was buried along with the rest in the year 79 A.D.¹ Melancholy feelings accompanied this extension of the delusional structure, like an echo of the anxiety which had filled the dream. This fresh pain about Gradiva does not seem very intelligible to us; Gradiva would have been dead for many centuries even if she had been saved from destruction in the year 79 A.D. Or ought we not to argue in this kind of way either with Norbert Hanold or with the author himself? Here again there seems no path to an understanding. Nevertheless it is worth remarking that the increment which the delusion acquired from this dream was accompanied by a feeling with a highly painful colouring.

[1907a, 1853]

For Hanold's dream was an anxiety-dream. Its content was frightening, the dreamer felt anxiety while he slept and he was left with painful feelings afterwards. Now this is far from convenient for our attempt at an explanation; and we must once again borrow heavily from the theory of dream-interpretation. We are warned by that theory not to fall into the error of tracing the anxiety that may be felt in a dream to the content of the dream, and not to treat the content of the dream as though it were the content of an idea occurring in waking life. It points out to us how often we dream the most ghastly things without feeling a trace of anxiety. The true situation, we learn, is quite a different one, which cannot be easily guessed, but which can be proved with certainty. The anxiety in anxiety-dreams, like neurotic anxiety in general, corresponds to a sexual affect, a libidinal feeling, and arises out of libido by the process of repression.¹ When we interpret a dream, therefore, we must replace anxiety by sexual excitement. The anxiety that originates in this way has - not invariably, but frequently - a selective influence on the content of the dream and introduces into it ideational elements which seem, when the dream is looked at from a conscious and mistaken point of view, to be appropriate to the affect of anxiety. As I have said, this is not invariably so, for there are plenty of anxiety-dreams in which the content is not in the least frightening and where it is therefore impossible to give an explanation on conscious lines of the anxiety that is felt.

[1907a, 1856]
I am aware that this explanation of anxiety in dreams sounds very strange and is not easy to credit; but I can only advise the reader to come to terms with it. Moreover it would be a very remarkable thing if Norbert Hanold's dream could be reconciled with this view of anxiety and could be explained in that way. On that basis, we should say that the dreamer's erotic longings were stirred up during the night and made a powerful effort to make conscious his memory of the girl he loved and so to tear him out of his delusion, but that those longings met with a fresh repudiation and were transformed into anxiety, which in its turn introduced into the content of the dream the terrifying pictures from the memories of his schooldays. In this manner the true unconscious content of the dream, his passionate longing for the Zoe he had once known, became transformed into its manifest content of the destruction of Pompeii and the loss of Gradiva.

[1907a, 1857]

We would seem to have reached the end. But an attentive reader might remind us that at the beginning we threw out an assertion that dreams are wishes represented as fulfilled and that we gave no proof of this. Well, is our reply, what we have described in these pages might show how little justification there is for trying to cover the explanations we have to give of dreams with the single formula that dreams are wish-fulfilments. Nevertheless the assertion stands and can easily be proved too for the dreams in Gradiva. The latent dream-thoughts - we know now what is meant by them - may be of the most various kinds; in Gradiva they are 'days' residues', thoughts that have been left over unnoticed and undealt-with from the mental activities of waking life. But in order for a dream to develop out of them, the co-operation of a wish (usually an unconscious one) is required; this contributes the motive force for constructing the dream, while the day's residues provide the material. In Norbert Hanold's first dream two wishes competed with each other in making the dream; one of them was actually admissible to consciousness, while the other belonged to the unconscious and operated from out of repression. The first was a wish, understandable in any archaeologist, to have been present as an eye-witness at the catastrophe in the year 79 A.D. What sacrifice would an archaeologist think too great if this wish could be realized in any way other than in a dream! The other wish, the other constructor of the dream, was of an erotic nature: it might be crudely and also incompletely stated as a wish to be there when the girl he loved lay down to sleep. This was the wish the rejection of which caused the dream to become an anxiety-dream. The wishes that were the motive forces of the second dream are perhaps less conspicuous; but if we recall its translation we shall not hesitate to describe them too as erotic. The wish to be taken captive by the girl he loved, to fall in with her wishes and to be subjected to her - for so we may construe the wish behind the situation of the lizard-catching - was in fact of a passive, masochistic character. Next day the dreamer hit the girl, as though he was dominated by the contrary erotic current . . . But we must stop here, or we may really forget that Hanold and Gradiva are only creatures of their author's mind.

[1907a, 1884]
Here, then, we have the beginning of Hans's anxiety as well as of his phobia. As we see, there is good reason for keeping the two separate. Moreover, the material seems to be amply sufficient for giving us our bearings; and no moment of time is so favourable for the understanding of a case as its initial stage, such as we have here, though unluckily that stage is as a rule neglected or passed over in silence. The disorder set in with thoughts that were at the same time fearful and tender, and then followed an anxiety dream on the subject of losing his mother and so not being able to coax with her any more. His affection for his mother must therefore have become enormously intensified. This was the fundamental phenomenon in his condition. In support of this, we may, recall his two attempts at seducing his mother, the first of which dated back to the summer, while the second (a simple commendation of his penis) occurred immediately before the outbreak of his street-anxiety. It was this increased affection for his mother which turned suddenly into anxiety - which, as we should say, succumbed to repression. We do not yet know from what quarter the impetus towards repression may have come. Perhaps it was merely the result of the intensity of the child's emotions, which had become greater than he could control; or perhaps other forces which we have not yet recognized were also at work. This we shall learn as we go on. Hans's anxiety, which thus corresponded to a repressed erotic longing, was, like every infantile anxiety, without an object to begin with: it was still anxiety and not yet fear. The child cannot tell what he is afraid of; and when Hans, on the first walk with the nursemaid, would not say what he was afraid of, it was simply that he himself did not yet know. He said all that he knew, which was that in the street he missed his mother, whom he could coax with, and that he did not want to be away from her. In saying this he quite straightforwardly confessed the primary meaning of his dislike of streets.

The first thing we learn is that the outbreak of the anxiety state was by no means so sudden as appeared at first sight. A few days earlier the child had woken from an anxiety-dream to the effect that his mother had gone away, and that now he had no mother to coax with. This dream alone points to the presence of a repressive process of ominous intensity. We cannot explain it, as we can so many other anxiety-dreams, by supposing that the child had in his dream felt anxiety arising from some somatic cause and had made use of the anxiety for the purpose of fulfilling an unconscious wish which would otherwise have been deeply repressed.¹ We must regard it rather as a genuine punishment and repression dream, and, moreover, as a dream which failed in its function, since the child woke from his sleep in a state of anxiety. We can easily reconstruct what actually occurred in the unconscious. The child dreamt of exchanging endearments with his mother and of sleeping with her; but all the pleasure was transformed into anxiety, and all the ideational content into its opposite. Repression had defeated the purpose of the mechanism of dreaming.

Lastly, I must warn you not to let yourselves be put out by the objection that the occurrence of anxiety-dreams contradicts our view of dreams as the fulfilments of wishes. Apart from the fact that these anxiety-dreams, like the rest, require interpretation before any judgement can be formed on them, it must be stated quite generally that the anxiety does not depend on the content of the dream in such a simple manner as one might imagine without having more knowledge and taking more account of the determinants of neurotic anxiety. Anxiety is one of the ego's reactions in repudiation of repressed wishes that have become powerful; and its occurrence in dreams as well is very easily explicable when the formation of the dream has been carried out with too much of an eye to the fulfilment of these repressed wishes.

¹[1909b, 2017]

[1909b, 2101]

[1910a, 2224]
The representation of the penis as a weapon, cutting knife, dagger, etc., is familiar to us from the anxiety dreams of abstinent women in particular and also lies at the root of numerous phobias in neurotic people. The complicated disguise of this present dream, however, demands that we should make an attempt to clarify our understanding of it by a psycho-analytic interpretation based on interpretations already carried out. In doing so we are not overlooking the fact that we shall be going beyond the material presented in the folk tale itself and that consequently our conclusions will lose in certainty.

[1957a [1911], 2527]

I shall have, for a special reason, to deal with this dream again elsewhere, and interpret it and consider its significance in greater detail. For it is the earliest anxiety-dream that the dreamer remembered from his childhood, and its content, taken in connection with other dreams that followed it soon afterwards and with certain events in his earliest years, is of quite peculiar interest. We must confine ourselves here to the relation of the dream to the two fairy tales which have so much in common with each other, 'Little Red Riding-Hood' and 'The Wolf and the Seven Little Goats'. The effect produced by these stories was shown in the little dreamer by a regular animal phobia. This phobia was only distinguished from other similar cases by the fact that the anxiety-animal was not an object easily accessible to observation (such as a horse or a dog), but was known to him only from stories and picture-books.

[1913d, 2601]

But other usages of language express the same sense. There are familiar proverbs such as 'Pigs dream of acorns and geese dream of maize' or 'What do hens dream of? - Of millet.' So proverbs go even lower than we do - below children to animals - and assert that the content of dreams is the satisfaction of a need. Numbers of figures of speech seem to point in the same direction: 'lovely as a dream', 'I shouldn't have dreamt of such a thing', 'I haven't imagined it in my wildest dreams'. In this, linguistic usage is evidently taking sides. For there are anxiety dreams as well, and dreams with a distressing or indifferent content; but linguistic usage has been unmoved by them. It is true that it knows of 'bad dreams', but a dream pure and simple is only the sweet fulfilment of a wish. Nor is there any proverb which might tell us that pigs or geese dream of being slaughtered.

[1916-1917, 3226]
A short time ago we submitted a series of dreams to interpretation, but we left wish-fulfilment completely out of account. I feel sure that you must have repeatedly been driven to ask yourselves: 'But where is the wish-fulfilment, which is supposed to be the aim of the dream-work?' The question is an important one, for it has become the question raised by our lay critics. Human beings, as you know, have an instinctive tendency to fend off intellectual novelties. One of the ways in which this tendency is manifested is by immediately reducing the novelty to the smallest proportions, by compressing it if possible into a single catch-word. 'Wish-fulfilment' has become the catch word for the new theory of dreams. The layman asks: 'Where is the wish-fulfilment?' And instantly, having heard that dreams are supposed to be wish-fulfilments, and in the very act of asking the question, he answers it with a rejection. He immediately thinks of countless experiences of his own with dreams, in which the dream has been accompanied by feelings ranging from the unpleasurable to severe anxiety, so that the assertion made by the psycho-analytic theory of dreams seems to him most improbable. We have no difficulty in replying that in distorted dreams the wish-fulfilment cannot be obvious but must be looked for, so that it cannot be pointed out until the dream has been interpreted. We know too that the wishes in these distorted dreams are forbidden ones - rejected by the censorship - whose existence was precisely the cause of the dream's distortion, the reason for the intervention of the dream censorship. But it is difficult to make the lay critic understand that before a dream has been interpreted one cannot enquire about the fulfilment of its wish. He will keep on forgetting this. His rejection of the theory of wish-fulfilment is actually nothing other than a consequence of the dream-censorship, a substitute for the rejection of the censored dream-wishes and an effluence from it.

[1916-1917, 3302]

We too, of course, feel the need to explain to ourselves why there are so many dreams with a distressing content and, especially why there are anxiety-dreams. Here for the first time we come upon the problem of affects in dreams; it would deserve a monograph of its own, but unfortunately we cannot enter into it. If dreams are the fulfilment of wishes, distressing feelings should be impossible in them: the lay critics would appear to be right there. But three kinds of complications must be taken into account which they have not thought of.

[1916-1917, 3302]

It will not be difficult for us now to reach a still better understanding of anxiety-dreams. We will bring up one more observation and then make up our minds to adopt a hypothesis in favour of which there is much to be said. The observation is that anxiety-dreams often have a content entirely devoid of distortion, a content which has, so to speak, evaded the censorship. An anxiety-dream is often the undisguised fulfilment of a wish - not, of course, of an acceptable wish, but of a repudiated one. The generation of anxiety has taken the place of the censorship. Whereas we can say of an infantile dream that it is the open fulfilment of a permitted wish, and of an ordinary distorted dream that it is the disguised fulfilment of a repressed wish, the only formula which fits an anxiety-dream is that it is the open fulfilment of a repressed wish. The anxiety is a sign that the repressed wish has shown itself stronger than the censorship, that it has put through, or is on the point of putting through, its wish-fulfilment in spite of the censorship. We perceive that what is for it a wish-fulfilment can only be for us, who are on the side of the censorship, an occasion for distressing feelings and for fending the wish off. The anxiety that emerges in the dream is, if you like, anxiety at the strength of these wishes which are normally held down. Why this fending-off appears in the form of anxiety cannot be discovered from the study of dreams alone; anxiety must clearly be studied elsewhere.

[1916-1917, 3305]
We may suppose that what is true of undistorted anxiety dreams applies also to those which are partly distorted as well as to other unpleasurable dreams, in which the distressing feelings probably correspond to an approach to anxiety. Anxiety-dreams are as a rule also arousal dreams; we usually interrupt our sleep before the repressed wish in the dream has put its fulfilment through completely in spite of the censorship. In that case the function of the dream has failed, but its essential nature is not altered by this. We have compared dreams to the night-watchman or guardian of sleep, who tries to protect our sleep from disturbance. The night-watchman, too, may reach the point of waking the sleeper if he feels he is too weak alone to drive off the disturbance or the danger. Nevertheless we sometimes succeed in holding on to our sleep even when the dream begins to be precarious and to be turning into anxiety. We say to ourselves in our sleep 'after all it's only a dream', and sleep on.

[1916-1917, 3305]

When does it happen that a dream-wish is in a position to overpower the censorship? The condition necessary for this may be fulfilled equally well by the dream-wish or by the dream censorship. The wish may for an unknown reason be excessively strong on some occasion; but one gets an impression that it is more often the behaviour of the dream-censorship that is responsible for this displacement of their relative strengths. We have already seen that the censorship acts with varying intensity in each particular case, that it treats each element of a dream with a different degree of severity. We can now add a further hypothesis to the effect that it is in general very variable and does not always employ equal severity to the same objectionable element. If things turn out so that on some occasion it feels itself powerless against a dream-wish which threatens to take it by surprise, instead of distortion, it makes use of its last remaining expedient and abandons the state of sleep, at the same time generating anxiety.

[1916-1917, 3306]

The dream ended in a state of anxiety, from which he did not recover until he had his Nanya with him. He fled, therefore, from his father to her. His anxiety was a repudiation of the wish for sexual satisfaction from his father - the trend which had put the dream into his head. The form taken by the anxiety, the fear of 'being eaten by the wolf', was only the (as we shall hear, regressive) transposition of the wish to be copulated with by his father, that is, to be given sexual satisfaction in the same way as his mother. His last sexual aim, the passive attitude towards his father, succumbed to repression, and fear of his father appeared in its place in the shape of the wolf phobia.

[1918b, 3534]
This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

[1920g, 3735]

The answer is not easy to come by and may perhaps not seem completely satisfying. If, in the first place, one submits these dreams to interpretation, one finds that some of them have given no offence to the censorship because au fond the have no bad meaning. They are innocent boastings or identifications that put up a mask of pretence; they have not been censored because they do not tell the truth. But others of them - and, it must be admitted, the majority - really mean what they say and have undergone no distortion from the censorship. They are an expression of immoral, incestuous and perverse impulses or of murderous and sadistic lusts. The dreamer reacts to many of these dreams by waking up in a fright, in which case the situation is no longer obscure to us. The censorship has neglected its task, this has been noticed too late, and the generation of anxiety is a substitute for the distortion that has been omitted. In still other instances of such dreams, even that expression of affect is absent. The objectionable matter is carried along by the height of the sexual excitement that has been reached during sleep, or it is viewed with the same tolerance with which even a waking person can regard a fit of rage, an angry mood or the indulgence in cruel phantasies.

[1925i, 4049]

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the Oedipus Rex, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.

[1925i, 4049]
I have dealt so exhaustively in these pages with this characteristic of dreams, which indeed provides the motive for their distortion, that I can pass at once from this topic to the problem that lies before us: Must one assume responsibility for the content of one's dreams? For the sake of completeness, it should, however, be added that dreams do not always offer immoral wish-fulfilments, but often energetic reactions against them in the form of 'punishment dreams'. In other words, the dream-censorship cannot only express itself in distortions and the generation of anxiety, but can go so far as to blot out the immoral subject-matter completely and replace it by something else that serves as an atonement, though it allows one to see what lies behind. But the problem of responsibility for the immoral content of dreams no longer exists for us as it formerly did for writers who knew nothing of latent dream-thoughts and the repressed part of our mental life. Obviously one must hold oneself responsible for the evil impulses of one's dreams. What else is one to do with them? Unless the content of the dream (rightly understood) is inspired by alien spirits, it is a part of my own being. If I seek to classify the impulses that are present in me according to social standards into good and bad, I must assume responsibility for both sorts; and if, in defence, I say that what is unknown, unconscious and repressed in me is not my 'ego', then I shall not be basing my position upon psycho-analysis, I shall not have accepted its conclusions - and I shall perhaps be taught better by the criticisms of my fellow-men, by the disturbances in my actions and the confusion of my feelings. I shall perhaps learn that what I am disavowing not only 'is' in me but sometimes 'acts' from out of me as well. [1925i, 4050]

The ethical narcissism of humanity should rest content with the knowledge that the fact of distortion in dreams, as well as the existence of anxiety-dreams and punishment-dreams, afford just as clear evidence of his moral nature as dream-interpretation gives of the existence and strength of his evil nature. If anyone is dissatisfied with this and would like to be 'better' than he was created, let him see whether he can attain anything more in life than hypocrisy or inhibition. [1925i, 4051]

Now a dream is not a morbid symptom but a product of the normal mind. The wishes which it represents as fulfilled are the same as those which are repressed in neuroses. Dreams owe the possibility of their genesis merely to the favourable circumstance that during the state of sleep, which paralyses man's power of movement, repression is mitigated into the dream-censorship. If, however, the process of dream-formation oversteps certain limits, the dreamer brings it to a stop and wakes up in a fright. Thus it is proved that the same forces and the same processes taking place between them operate in normal as in pathological mental life. From the date of The Interpretation of Dreams psycho-analysis had a twofold significance. It was not only a new method of treating the neuroses but it was also a new psychology; it claimed the attention not only of nerve-specialists but also of all those who were students of a mental science. [1924f, 4110]
There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1925d, 4220]

Here we are presented with a means of answering the question of whether dreams have a function too, whether they are entrusted with any useful achievement. The condition of rest free from stimulus, which the state of sleep wishes to establish, is threatened from three directions: in a relatively accidental manner by external stimuli during sleep, and by interests of the previous day which cannot be broken off, and in an unavoidable manner by unsated repressed instinctual impulses which are on the watch for an opportunity of finding expression. In consequence of the diminishing of repressions at night there would be a risk that the rest afforded by sleep would be interrupted whenever an instigation from outside or from inside succeeded in linking up with an unconscious instinctual source. The process of dreaming allows the product of a collaboration of this kind to find an outlet in a harmless hallucinatory experience and in that way assures a continuation of sleep. The fact that a dream occasionally awakens the sleeper, to the accompaniment of a generation of anxiety, is no contradiction of this function but rather, perhaps, a signal that the watchman regards the situation as too dangerous and no longer feels able to control it. And very often then, while we are still asleep, a consolation occurs to us which seeks to prevent our waking up: 'But after all it's only a dream!' [1933a, 4630]

I cannot detain you any longer over such minor discoveries or over the discussions relating to the employment of dream-interpretation in the work of analysis. I feel sure you are impatient to hear what changes have been made in our fundamental views on the nature and significance of dreams. I have already warned you that precisely on this there is little to report to you. The most disputed point in the whole theory was no doubt the assertion that all dreams are the fulfilments of wishes. The inevitable and ever recurring objection raised by the layman that there are nevertheless so many anxiety-dreams was, I think I may say, completely disposed of in my earlier lectures. With the division into wishful dreams, anxiety-dreams and punishment dreams, we have kept our theory intact. [1933a, 4640]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.

[1940a [1938], 4980]

As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an attempt to get rid of a disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township's sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.

[1940a [1938], 4981]
This view is not traversed by the fact that there are marginal cases in which the dream - as happens with anxiety-dreams - can no longer perform its function of preventing an interruption of sleep, but assumes instead the other function of promptly bringing sleep to an end. In doing so it is merely behaving like a conscientious night-watchman, who first carries out his duty by suppressing disturbances so that the townsmen may not be woken up, but afterwards continues to do his duty by himself waking the townsmen up, if the causes of the disturbance seem to him serious and of a kind that he cannot cope with alone.

We may suppose that what is true of undistorted anxiety dreams applies also to those which are partly distorted as well as to other unpleasant dreams, in which the distressing feelings probably correspond to an approach to anxiety. Anxiety-dreams are as a rule also arousal dreams; we usually interrupt our sleep before the repressed wish in the dream has put its fulfilment through completely in spite of the censorship. In that case the function of the dream has failed, but its essential nature is not altered by this. We have compared dreams to the night-watchman or guardian of sleep, who tries to protect our sleep from disturbance. The night-watchman, too, may reach the point of waking the sleeper if he feels he is too weak alone to drive off the disturbance or the danger. Nevertheless we sometimes succeed in holding on to our sleep even when the dream begins to be precarious and to be turning into anxiety. We say to ourselves in our sleep 'after all it's only a dream', and sleep on.

When does it happen that a dream-wish is in a position to overpower the censorship? The condition necessary for this may be fulfilled equally well by the dream-wish or by the dream censorship. The wish may for an unknown reason be excessively strong on some occasion; but one gets an impression that it is more often the behaviour of the dream-censorship that is responsible for this displacement of their relative strengths. We have already seen that the censorship acts with varying intensity in each particular case, that it treats each element of a dream with a different degree of severity. We can now add a further hypothesis to the effect that it is in general very variable and does not always employ equal severity to the same objectionable element. If things turn out so that on some occasion it feels itself powerless against a dream-wish which threatens to take it by surprise, instead of distortion, it makes use of its last remaining expedient and abandons the state of sleep, at the same time generating anxiety.

Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an attempt to get rid of a disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township's sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.

[1940a [1938], 4981]
The second motive for counter-wish dreams is so obvious that it is easy to overlook it, as I did myself for some considerable time. There is a masochistic component in the sexual constitution of many people, which arises from the reversal of an aggressive, sadistic component into its opposite. Those who find their pleasure, not in having physical pain inflicted on them, but in humiliation and mental torture, may be described as ‘mental masochists’. It will at once be seen that people of this kind can have counter-wish dreams and unpleasurable dreams, which are none the less wish-fulfilments since they satisfy their masochistic inclinations. I will quote one such dream, produced by a young man who in his earlier years had greatly tormented his elder brother, to whom he had a homosexual attachment. His character having undergone a fundamental change, he had the following dream, which was in three pieces: I. His elder brother was chaffing him. II. Two grown men were caressing each other with a homosexual purpose. III. His brother had sold the business of which he himself had looked forward to becoming the director. He awoke from the last dream with the most distressing feelings. Nevertheless it was a masochistic wishful dream, and might be translated thus: ‘It would serve me right if my brother were to confront me with this sale as a punishment for all the torments he had to put up with from me.’

[1900a, 653]
In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his day-time existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word 'analysis', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are 'psycho-analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a parvenu, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a parvenu's pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, she was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: "Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young."¹

¹ [Footnote added 1930:] Since psycho-analysis has divided the personality into an ego and a super-ego (Freud, 1921c), it has become easy to recognize in these punishment dreams fulfilsments of the wishes of the super-ego.
Unpleasurable dreams may also be 'punishment-dreams'. It must be admitted that their recognition means in a certain sense a new addition to the theory of dreams. What is fulfilled in them is equally an unconscious wish, namely a wish that the dreamer may be punished for a repressed and forbidden wishful impulse. To that extent dreams of this kind fall in with the condition that has been laid down here that the motive force for constructing a dream must be provided by a wish belonging to the unconscious. A closer psychological analysis, however, shows how they differ from other wishful dreams. In the cases forming Group B the dream-constructing wish is an unconscious one and belongs to the repressed, while in punishment-dreams, though it is equally an unconscious one, it must be reckoned as belonging not to the repressed but to the 'ego.' Thus punishment-dreams indicate the possibility that the ego may have a greater share than was supposed in the construction of dreams. The mechanism of dream-formation would in general be greatly clarified if instead of the opposition between 'conscious' and 'unconscious' we were to speak of that between the 'ego' and the 'repressed.' This cannot be done, however, without taking account of the processes underlying the psychoneuroses, and for that reason it has not been carried out in the present work. I will only add that punishment-dreams are not in general subject to the condition that the day's residues shall be of a distressing kind. On the contrary, they occur most easily where the opposite is the case - where the day's residues are thoughts of a satisfying nature but the satisfaction which they express is a forbidden one. The only trace of these thoughts that appears in the manifest dream is their diametric opposite, just as in the case of dreams belonging to Group A. The essential characteristic of punishment-dreams would thus be that in their case the dream-constructing wish is not an unconscious wish derived from the repressed (from the system Ucs.), but a punitive one reacting against it and belonging to the ego, though at the same time an unconscious (that is to say, preconscious) one.¹

The first thing we learn is that the outbreak of the anxiety state was by no means so sudden as appeared at first sight. A few days earlier the child had woken from an anxiety-dream to the effect that his mother had gone away, and that now he had no mother to coax with. This dream alone points to the presence of a repressive process of ominous intensity. We cannot explain it, as we can so many other anxiety-dreams, by supposing that the child had in his dream felt anxiety arising from some somatic cause and had made use of the anxiety for the purpose of fulfilling an unconscious wish which would otherwise have been deeply repressed.¹ We must regard it rather as a genuine punishment and repression dream, and, moreover, as a dream which failed in its function, since the child woke from his sleep in a state of anxiety. We can easily reconstruct what actually occurred in the unconscious. The child dreamt of exchanging endearments with his mother and of sleeping with her; but all the pleasure was transformed into anxiety, and all the ideational content into its opposite. Repression had defeated the purpose of the mechanism of dreaming.

[1900a, 990]

[1909b, 2101]
If, in the third place, you will recall our idea that the dreamer fighting against his own wishes is to be compared with a summation of two separate, though in some way intimately connected, people, you will understand another possibility. For there is a possibility that the fulfilment of a wish may bring about something very far from pleasant - namely, a punishment. Here we can once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate were the direct fulfilment of the wish of the first person, the woman. The sausages on her nose were the fulfilment of the wish of the second person, the man, but were at the same time a punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third wish, the last remaining one in the fairy tale.) There are many such punitive trends in the mental life of human beings; they are very powerful, and we may hold them responsible for some of the distressing dreams. Perhaps you will now say that this leaves very little over of the famous wish-fulfilment. But if you look more closely you will admit that you are wrong. Compared with the multiplicity (which I shall mention later) of the things that dreams might be and according to many authorities actually are, our solution - wish-fulfilment, anxiety-fulfilment, punishment-fulfilment - is a very restricted one. We may add that the anxiety is the direct opposite of the wish, that opposites are especially close to one another in associations and that in the unconscious they coalesce; and further, that the punishment is also the fulfilment of a wish - of the wish of the other, censoring person.

I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking of it. Anyone who accepts it as something self-evident that their dreams should put them back at night into the situation that caused them to fall ill has misunderstood the nature of dreams. It would be more in harmony with their nature if they showed the patient pictures from his healthy past or of the cure for which he hopes. If we are not to be shaken in our belief in the wish-fulfilling tenor of dreams by the dreams of traumatic neurotics, we still have one resource open to us: we may argue that the function of dreaming, like so much else, is upset in this condition and diverted from its purposes, or we may be driven to reflect on the mysterious masochistic trends of the ego.

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

A dream-structure of this kind will excite less astonishment if one considers how frequently dream-distortion, acting in the service of the censorship, replaces a particular element by something that is in some sense or other its opposite or contrary. It is only a short step from there to the replacement of a characteristic portion of the content of the dream by a defensive contradiction, and one further step will lead to the whole objectionable dream-content being replaced by the punishment dream. I should like to give a couple of characteristic examples of the intermediate phase in the falsification of the manifest content.
Punishment-dreams, too, are fulfilments of wishes, though not of wishes of the instinctual impulses but of those of the critical, censoring and punishing agency in the mind. If we have a pure punishment-dream before us, an easy mental operation will enable us to restore the wishful dream to which the punishment-dream was the correct rejoinder and which, owing to this repudiation, was replaced as the manifest dream. As you know, Ladies and Gentlemen, the study of dreams was what first helped us to understand the neuroses, and you will find it natural that our knowledge of the neuroses was later able to influence our view of dreams. As you will hear, we have been obliged to postulate the existence in the mind of a special critical and prohibiting agency which we have named the 'super-ego'. Since recognizing that the censorship of dreams is also a function of this agency, we have been led to examine the part played by the super-ego in the construction of dreams more carefully.
[1933a, 4640]
Unpleasurable dreams may also be ‘punishment-dreams’. It must be admitted that their recognition means in a certain sense a new addition to the theory of dreams. What is fulfilled in them is equally an unconscious wish, namely a wish that the dreamer may be punished for a repressed and forbidden wishful impulse. To that extent dreams of this kind fall in with the condition that has been laid down here that the motive force for constructing a dream must be provided by a wish belonging to the unconscious. A closer psychological analysis, however, shows how they differ from other wishful dreams. In the cases forming Group B the dream-constructing wish is an unconscious one and belongs to the repressed, while in punishment-dreams, though it is equally an unconscious dreams, it must be reckoned as belonging not to the repressed but to the ‘ego.’ Thus punishment-dreams indicate the possibility that the ego may have a greater share than was supposed in the construction of dreams. The mechanism of dream-formation would in general be greatly clarified if instead of the opposition between ‘conscious’ and ‘unconscious’ we were to speak of that between the ‘ego’ and the ‘repressed.’ This cannot be done, however, without taking account of the processes underlying the psychoneuroses, and for that reason it has not been carried out in the present work. I will only add that punishment-dreams are not in general subject to the condition that the day’s residues shall be of a distressing kind. On the contrary, they occur most easily where the opposite is the case - where the day's residues are thoughts of a satisfying nature but the satisfaction which they express is a forbidden one. The only trace of these thoughts that appears in the manifest dream is their diametric opposite, just as in the case of dreams belonging to Group A. The essential characteristic of punishment-dreams would thus be that in their case the dream-constructing wish is not an unconscious wish derived from the repressed (from the system Ucs.), but a punitive one reacting against it and belonging to the ego, though at the same time an unconscious (that is to say, preconscious) one.¹

¹ [Footnote added 1930:] This would be the appropriate point for a reference to the ‘super-ego’, one of the later findings of psycho-analysis.

[1900a, 990]

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

[1923c, 4039]
Astonishment is sometimes expressed at the fact that the dreamer's ego can appear two or more times in the manifest dream, once as himself and again disguised behind the figures of other people. During the course of the construction of the dream, the secondary revision has evidently sought to obliterate this multiplicity of the ego, which cannot fit in with any possible scenic situation; but it is re-established by the work of interpretation. In itself this multiplicity is no more remarkable than the multiple appearance of the ego in a waking thought, especially when the ego divides itself into subject and object, puts one part of itself as an observing and critical agency in contrast to the other, or compares its present nature with its recollected past, which was also ego once; for instance, in such sentences as 'When I think what I've done to this man' or 'When I think that I too was a child once'. But I should reject as a meaningless and unjustifiable piece of speculation the notion that all figures that appear in a dream are to be regarded as fragmentations and representatives of the dreamer's own ego. It is enough that we should keep firmly to the fact that the separation of the ego from an observing, critical, punishing agency (an ego ideal) must be taken into account in the interpretation of dreams as well.

Punishment-dreams, too, are fulfilments of wishes, though not of wishes of the instinctual impulses but of those of the critical, censoring and punishing agency in the mind. If we have a pure punishment-dream before us, an easy mental operation will enable us to restore the wishful dream to which the punishment-dream was the correct rejoinder and which, owing to this repudiation, was replaced as the manifest dream. As you know, Ladies and Gentlemen, the study of dreams was what first helped us to understand the neuroses, and you will find it natural that our knowledge of the neuroses was later able to influence our view of dreams. As you will hear, we have been obliged to postulate the existence in the mind of a special critical and prohibiting agency which we have named the 'super-ego'. Since recognizing that the censorship of dreams is also a function of this agency, we have been led to examine the part played by the super-ego in the construction of dreams more carefully.
It might perhaps occur to us that the phenomenon of dreaming could be reduced entirely to that of memory: dreams, it might be supposed, are a manifestation of a reproductive activity which is at work even in the night and which is an end in itself. This would tally with statements such as those made by Pilcz (1899), according to which there is a fixed relation observable between the time at which a dream occurs and its content-impressions from the remotest past being reproduced in dreams during deep sleep, while more recent impressions appear towards morning. But views of this sort are inherently improbable owing to the manner in which dreams deal with the material that is to be remembered. Strümpell rightly points out that dreams do not reproduce experiences. They take one step forward, but the next step in the chain is omitted, or appears in an altered form, or is replaced by something entirely extraneous. Dreams yield no more than fragments of reproductions; and this is so general a rule that theoretical conclusions may be based on it. It is true that there are exceptional cases in which a dream repeats an experience with as much completeness as is attainable by our waking memory. Delboeuf tells how one of his university colleagues had a dream which reproduced in all its details a dangerous carriage accident he had had, with an almost miraculous escape. Miss Calkins (1893) mentions two dreams whose content was an exact reproduction of an event of the previous day, and I shall myself have occasion later to report an example I came across of a childhood experience re-appearing in a dream without modification.¹

The study of dreams may be considered the most trustworthy method of investigating deep mental processes. Now dreams occurring in traumatic neuroses have the characteristic of repeatedly bringing the patient back into the situation of his accident, a situation from which he wakes up in another fright. This astonishes people far too little. They think the fact that the traumatic experience is constantly forcing itself upon the patient even in his sleep is a proof of the strength of that experience: the patient is, as one might say, fixated to his trauma. Fixations to the experience which started the illness have long been familiar to us in hysteria. Breuer and Freud declared in 1893 that 'hysterics suffer mainly from reminiscences'. In the war neuroses, too, observers like Ferenczi and Simmel have been able to explain certain motor symptoms by fixation to the moment at which the trauma occurred.

I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking of it. Anyone who accepts it as something self-evident that their dreams should put them back at night into the situation that caused them to fall ill has misunderstood the nature of dreams. It would be more in harmony with their nature if they showed the patient pictures from his healthy past or of the cure for which he hopes. If we are not to be shaken in our belief in the wish-fulfilling tenor of dreams by the dreams of traumatic neurotics, we still have one resource open to us: we may argue that the function of dreaming, like so much else, is upset in this condition and diverted from its purposes, or we may be driven to reflect on the mysterious masochistic trends of the ego.

The least dubious instance is perhaps that of traumatic dreams. But on maturer reflection we shall be forced to admit that even in the other instances the whole ground is not covered by the operation of the familiar motive forces. Enough is left unexplained to justify the hypothesis of a compulsion to repeat - something that seems more primitive, more elementary, more instinctual than the pleasure principle which it overrides. But if a compulsion to repeat does operate in the mind, we should be glad to know something about it, to learn what function it corresponds to, under what conditions it can emerge and what its relation is to the pleasure principle - to which, after all, we have hitherto ascribed dominance over the course of the processes of excitation in mental life.

¹[1900a, 534]

[1920g, 3719]

[1920g, 3727]
We may, I think, tentatively venture to regard the common traumatic neurosis as a consequence of an extensive breach being made in the protective shield against stimuli. This would seem to reinstate the old, naïve theory of shock, in apparent contrast to the later and psychologically more ambitious theory which attributes aetiological importance not to the effects of mechanical violence but to fright and the threat to life. These opposing views are not, however, irreconcilable; nor is the psycho-analytic view of the traumatic neurosis identical with the shock theory in its crudest form. The latter regards the essence of the shock as being the direct damage to the molecular structure or even to the histological structure of the elements of the nervous system; whereas what we seek to understand are the effects produced on the organ of the mind by the breach in the shield against stimuli and by the problems that follow in its train. And we still attribute importance to the element of fright. It is caused by lack of any preparedness for anxiety, including lack of hypercathexis of the systems that would be the first to receive the stimulus. Owing to their low cathexis those systems are not in a good position for binding the inflowing amounts of excitation and the consequences of the breach in the protective shield follow all the more easily. It will be seen, then, that preparedness for anxiety and the hypercathexis of the receptive systems constitute the last line of defence of the shield against stimuli. In the case of quite a number of traumas, the difference between systems that are unprepared and systems that are well prepared through being hypercathedexed may be a decisive factor in determining the outcome; though where the strength of a trauma exceeds a certain limit this factor will no doubt cease to carry weight. The fulfilment of wishes is, as we know, brought about in a hallucinatory manner by dreams, and under the dominance of the pleasure principle this has become their function. But it is not in the service of that principle that the dreams of patients suffering from traumatic neuroses lead them back with such regularity to the situation in which the trauma occurred. We may assume, rather, that dreams are here helping to carry out another task, which must be accomplished before the dominance of the pleasure principle can ever begin. These dreams are endeavouring to master the stimulus retrospectively, by developing the anxiety whose omission was the cause of the traumatic neurosis. They thus afford us a view of a function of the mental apparatus which, though it does not contradict the pleasure principle, is nevertheless independent of it and seems to be more primitive than the purpose of gaining pleasure and avoiding displeasure.

This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfillments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

[1920g, 3734]
I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

The first of these difficulties is presented in the fact that people who have experienced a shock, a severe psychical trauma - such as happened so often during the war and such as affords the basis for traumatic hysteria - are regularly taken back in their dreams into the traumatic situation. According to our hypotheses about the function of dreams this should not occur. What wishful impulse could be satisfied by harking back in this way to this exceedingly distressing traumatic experience? It is hard to guess.
With the traumatic neuroses things are different. In their case the dreams regularly end in the generation of anxiety. We should not, I think, be afraid to admit that here the function of the dream has failed. I will not invoke the saying that the exception proves the rule: its wisdom seems to me most questionable. But no doubt the exception does not overturn the rule. If, for the sake of studying it, we isolate one particular psychical function, such as dreaming, from the psychical machinery as a whole, we make it possible to discover the laws that are peculiar to it; but when we insert it once more into the general context we must be prepared to discover that these findings are obscured or impaired by collision with other forces. We say that a dream is the fulfilment of a wish; but if you want to take these latter objections into account, you can say nevertheless that a dream is an attempt at the fulfilment of a wish. No one who can properly appreciate the dynamics of the mind will suppose that you have said anything different by this. In certain circumstances a dream is only able to put its intention into effect very incompletely, or must abandon it entirely. Unconscious fixation to a trauma seems to be foremost among these obstacles to the function of dreaming. While the sleeper is obliged to dream, because the relaxation of repression at night allows the upward pressure of the traumatic fixation to become active, there is a failure in the functioning of his dream-work, which would like to transform the memory-traces of the traumatic event into the fulfilment of a wish. In these circumstances it will happen that one cannot sleep, that one gives up sleep from dread of the failure of the function of dreaming. Traumatic neuroses are here offering us an extreme case; but we must admit that childhood experiences, too, are of a traumatic nature, and we need not be surprised if comparatively trivial interferences with the function of dreams may arise under other conditions as well.

[1933a, 4642]
If anyone is curious to know, I may add that the dream concealed a phantasy of my behaving in an improper and sexually provocative manner, and of the patient putting up a defence against my conduct. If this interpretation seems incredible, I need only point to the numerous instances in which doctors have charges of the same kind brought against them by hysterical women. But in such cases the phantasy emerges into consciousness undisguised and in the form of a delusion, instead of being distorted and appearing only as a dream. 

This dream occurred at the beginning of the patient's psycho-analytic treatment. It was not until later that I learnt that she had been repeating in it the initial trauma from which her neurosis had arisen. I have since then come across the same behaviour in other patients; having been exposed to a sexual assault in their childhood, they seek, as it were, to bring about a repetition of it in their dreams.

If we take into account observations such as these, based upon behaviour in the transference and upon the life-histories of men and women, we shall find courage to assume that there really does exist in the mind a compulsion to repeat which overrides the pleasure principle. Now too we shall be inclined to relate to this compulsion the dreams which occur in traumatic neuroses and the impulse which leads children to play.

The least dubious instance is perhaps that of traumatic dreams. But on maturer reflection we shall be forced to admit that even in the other instances the whole ground is not covered by the operation of the familiar motive forces. Enough is left unexplained to justify the hypothesis of a compulsion to repeat - something that seems more primitive, more elementary, more instinctual than the pleasure principle which it overrides. But if a compulsion to repeat does operate in the mind, we should be glad to know something about it, to learn what function it corresponds to, under what conditions it can emerge and what its relation is to the pleasure principle - to which, after all, we have hitherto ascribed dominance over the course of the processes of excitation in mental life.

This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.
The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their pleasurable experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primaeval experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power.
[1920g, 3738]
But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat'. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'daemonic' character to the compulsion to repeat.

[1933a, 4710]
These considerations may lead us to feel that the interpretation of dreams may enable us to draw conclusions as to the structure of our mental apparatus which we have hoped for in vain from philosophy. I do not propose, however, to follow this line of thought; but, having cleared up the matter of distortion in dreams, I shall go back to the problem from which we started. The question raised was how dreams with a distressing content can be resolved into wish-fulfilments. We now see that this is possible if dream-distortion has occurred and if the distressing content serves only to disguise something that is wished for. Bearing in mind our assumption of the existence of two psychical agencies, we can further say that distressing dreams do in fact contain something which is distressing to the second agency, but something which at the same time fulfils a wish on the part of the first agency. They are wishful dreams in so far as every dream arises from the first agency; the relation of the second agency towards dreams is of a defensive and not of a creative kind.¹ If we were to restrict ourselves to considering what the second agency contributes to dreams, we could never arrive at an understanding of them: all the conundrums which the authorities have observed in dreams would remain unsolved.

[1900a, 641]

A contradiction to my theory of dreams produced by another of my women patients (the cleverest of all my dreamers) was resolved more simply, but upon the same pattern: namely that the non-fulfilment of one wish meant the fulfilment of another. One day I had been explaining to her that dreams are fulfilments of wishes. Next day she brought me a dream in which she was travelling down with her mother-in-law to the place in the country where they were to spend their holidays together. Now I knew that she had violently rebelled against the idea of spending the summer near her mother-in-law and that a few days earlier she had successfully avoided the propinquity she dreaded by engaging rooms in a far distant resort. And now her dream had undone the solution she had wished for: was not this the sharpest possible contradiction of my theory that in dreams wishes are fulfilled? No doubt; and it was only necessary to follow the dream's logical consequence in order to arrive at its interpretation. The dream showed that I was wrong. Thus it was her wish that I might be wrong, and her dream showed that wish fulfilled. But her wish that I might be wrong, which was fulfilled in connection with her summer holidays, related in fact to another and more serious matter. For at about the same time I had inferred from the material produced in her analysis that at a particular period of her life something must have occurred that was of importance in determining her illness. She had disputed this, since she had no recollection of it; but soon afterwards it had turned out that I was right. Thus her wish that I might be wrong, which was transformed into her dream of spending her holidays with her mother-in-law, corresponded to a well-justified wish that the events of which she was then becoming aware for the first time might never have occurred.

[1900a, 646]
A similar dream of another woman patient had a different explanation. When she was young the had been remarkable for her ready wit and cheerful disposition; and these characteristics were still to be seen, at all events in the ideas that occurred to her during the treatment. In the course of a longish dream, this lady imagined that she saw her only fifteen-year-old daughter lying dead 'in a case.' She had half a mind to use the scene as an objection to the wish-fulfilment theory, though she herself suspected that the detail of the 'case' must point the way to another view of the dream.¹ In the course of the analysis she recalled that at a party the evening before there had been some talk about the English word 'box' and the various ways in which it could be translated into German - such as 'Schachtel', 'Loge', 'Kasten', 'Ohrfeige', and so on. Other portions of the same dream enabled us to discover further that she had guessed that the English 'box' was related to the German 'Büchse', and that she had then been plagued by a recollection that 'Büchse' is used as a vulgar term for the female genitals. If some allowance was made for the limits of her knowledge of topographical anatomy, it might be presumed, therefore, that the child lying in the case meant an embryo in the womb. After being enlightened up to this point, she no longer denied that the dream-picture corresponded to a wish of hers. Like so many young married women, she had been far from pleased when she became pregnant; and more than once she had allowed herself to wish that the child in her womb might die. Indeed, in a fit of rage after a violent scene with her husband, she had beaten with her fists on her body so as to hit the child inside it. Thus the dead child was in fact the fulfilment of a wish, but of a wish that had been put aside fifteen years earlier. It is scarcely to be wondered at if a wish that was fulfilled after such a long delay was not recognized. Too much had changed in the interval.

[1900a, 649]

I shall have to return to the group of dreams to which the last two examples belong (dreams dealing with the death of relatives of whom the dreamer is fond) when I come to consider 'typical' dreams. I shall then be able to show from further instances that, in spite of their unwished for contents, all such dreams must be interpreted as wish-fulfilments.

[1900a, 650]

The very frequent dreams, which appear to stand in contradiction to my theory because their subject-matter is the frustration of a wish or the occurrence of something clearly unwished-for, may be brought together under the heading of 'counter-wish dreams'. If these dreams are considered as a whole, it seems to me possible to trace them back to two principles; I have not yet mentioned one of these, although it plays a large part not only in people's dreams but in their lives as well. One of the two motive forces leading to such dreams is the wish that I may be wrong. These dreams appear regularly in the course of my treatments when a patient is in a state of resistance to me; and I can count almost certainly on provoking one of them after I have explained to a patient for the first time my theory that dreams are fulfilments of wishes.¹ Indeed, it is to be expected that the same thing will happen to some of the readers of the present book: they will be quite ready to have one of their wishes frustrated in a dream if only their wish that I may be wrong can be fulfilled.

[1900a, 651]

¹ [Footnote added 1911:] During the last few years similar 'counter-wish dreams' have repeatedly been reported to me by people who have heard me lecturing, as a reaction to first making the acquaintance of my 'wishful' theory of dreams.

[1900a, 651]
I hope that the foregoing examples will be enough (till the next objection is raised) to make it seem plausible that even dreams with a distressing content are to be construed as wish-fulfillments. Nor will anyone regard it as a chance coincidence that the interpretation of these dreams has brought us up each time against topics about which people are loth to speak or to think. The distressing feeling aroused by these dreams is no doubt identical with the repugnance which tends (usually with success) to restrain us from discussing or mentioning such topics, and which each of us has to overcome if we nevertheless find ourselves compelled to embark on them. But the unpleasurable feeling which thus recurs in dreams does not disprove the existence of a wish. Everyone has wishes that he would prefer not to disclose to other people, and wishes that he will not admit even to himself. On the other hand, we are justified in linking the unpleasurable character of all these dreams with the fact of dream-distortion. And we are justified in concluding that these dreams are distorted and the wish-fulfilment contained in them disguised to the point of being unrecognizable precisely owing to the repugnance felt for the topic of the dream or for the wish derived from it and to an intention to repress them. The distortion in the dream is thus shown in fact to be an act of the censorship. We shall be taking into account everything that has been brought to light by our analysis of unpleasurable dreams if we make the following modification in the formula in which we have sought to express the nature of dreams:

*a dream is a (disguised) fulfilment of a (suppressed or repressed) wish.*¹

[1900a, 653]

There remain to be discussed anxiety-dreams as a special sub-species of dreams with a distressing content. The notion of regarding these as wishful dreams will meet with very little sympathy from the unenlightened. Nevertheless I can deal with anxiety-dreams very briefly at this point. They do not present us with a new aspect of the dream-problem; what they face us with is the whole question of neurotic anxiety. The anxiety that we feel in a dream is only *apparently* explained by the dream's content. If we submit the content of the dream to analysis, we find that the anxiety in the dream is no better justified by the dream's content than, let us say, the anxiety in a phobia is justified by the idea to which the phobia relates. No doubt it is true, for instance, that it is possible to fall out of a window and that there is therefore reason for exercising a certain degree of caution in the neighbourhood of a window; but we cannot see why the anxiety felt in a phobia on this subject is so great and pursues the patient far beyond its occasion. We find then that the same thing may be validly asserted both of phobias and of anxiety-dreams: in both cases the anxiety is only superficially attached to the idea that accompanies it; it originates from another source.

[1900a, 654]

Since this intimate connection exists between anxiety in dreams and in neuroses, in discussing the former I must refer to the latter. In a short paper on anxiety-neurosis (Freud, 1895b), I argued some time ago that neurotic anxiety is derived from sexual life and corresponds to libido which has been diverted from its purpose and has found no employment. Since then this formula has met the test of time; and it enables us now to infer from it that anxiety-dreams are dreams with a sexual content, the libido belonging to which has been transformed into anxiety. There will be an opportunity later to support this assertion by the analysis of some neurotic patients' dreams. In the course, too, of a further attempt to arrive at a theory of dreams, I shall have occasion to discuss once more the determinants of anxiety-dreams and their compatibility with the theory of wish-fulfilment.

[1900a, 654]

In addition to this, repression plays a part in dreams of exhibiting; for the distress felt in such dreams is a reaction on the part of the second system against the content of the scene of exhibiting having found expression in spite of the ban upon it. If the distress was to be avoided, the scene should never have been revived.

[1900a, 725]
Analysis is able to demonstrate that these unpleasurable dreams are wish-fulfilments no less than the rest. An unconscious and repressed wish, whose fulfilment the dreamer's ego could not fail to experience as something distressing, has seized the opportunity offered to it by the persisting cathexis of the distressing residues of the previous day; it has lent them its support and by that means rendered them capable of entering a dream. But whereas in Group A the unconscious wish coincided with the conscious one, in Group B the gulf between the unconscious and the conscious (between the repressed and the ego) is revealed and the situation in the fairy tale of the three wishes which were granted by the fairy to the husband and wife is realized. (See below, p. 1009 f. n.) The satisfaction at the fulfilment of the repressed wish may turn out to be so great that it counterbalances the distressing feelings attaching to the day's residues; in that case the feeling-tone of the dream is indifferent, in spite of its being on the one hand the fulfilment of a wish and on the other the fulfilment of a fear. Or it may happen that the sleeping ego takes a still larger share in the construction of the dream, that it reacts to the satisfying of the repressed wish with violent indignation and itself puts an end to the dream with an outburst of anxiety. Thus there is no difficulty in seeing that unpleasurable dreams and anxiety-dreams are just as much wish-fulfilments in the sense of our theory as are straightforward dreams of satisfaction.

A second factor, which is much more important and far reaching, but which is equally overlooked by laymen, is the following. No doubt a wish-fulfilment must bring pleasure; but the question then arises “To whom?” To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them - he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream-wishes can only be compared to an amalgamation of two separate people who are linked by some strong element in common. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish-fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish-fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one - man and wife - the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.

¹ (Footnote added 1935:) When it is considered how frequently the function of dreaming miscarries, the dream may aptly be characterized as an attempt at the fulfilment of a wish. Aristotle's old definition of the dream as mental life during sleep still holds good. There was a reason for my choosing as the title of my book not The Dream but The Interpretation of Dreams.
I cannot detain you any longer over such minor discoveries or over the discussions relating to
the employment of dream-interpretation in the work of analysis. I feel sure you are impatient to
hear what changes have been made in our fundamental views on the nature and significance of
dreams. I have already warned you that precisely on this there is little to report to you. The most
disputed point in the whole theory was no doubt the assertion that all dreams are the fulfilments
of wishes. The inevitable and ever recurring objection raised by the layman that there are
nevertheless so many anxiety-dreams was, I think I may say, completely disposed of in my
earlier lectures. With the division into wishful dreams, anxiety-dreams and punishment dreams,
we have kept our theory intact.
[1933a, 4640]

Punishment-dreams, too, are fulfilments of wishes, though not of wishes of the instinctual
impulses but of those of the critical, censoring and punishing agency in the mind. If we have a
pure punishment-dream before us, an easy mental operation will enable us to restore the
wishful dream to which the punishment-dream was the correct rejoinder and which, owing to
this repudiation, was replaced as the manifest dream. As you know, Ladies and Gentlemen, the
study of dreams was what first helped us to understand the neuroses, and you will find it natural
that our knowledge of the neuroses was later able to influence our view of dreams. As you will
hear, we have been obliged to postulate the existence in the mind of a special critical and
prohibiting agency which we have named the 'super-ego'. Since recognizing that the censorship
of dreams is also a function of this agency, we have been led to examine the part played by the
super-ego in the construction of dreams more carefully.
[1933a, 4640]

Naturally, every case is not so simple. Especially in dreams which have originated from
undealt-with residues of the previous day, and which have only obtained an unconscious
reinforcement during the state of sleep, it is often no easy task to uncover the unconscious
motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that
dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how
many dreams have an actually distressing content or even wake the dreamer in anxiety, quite
apart from the numerous dreams without any definite feeling-tone. But the objection based on
anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are
invariably the product of a conflict, that they are a kind of compromise-structure. Something that
is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the
ego.
[1940a [1938], 4980]

As the dream-work proceeds, sometimes the unconscious will press forward more
successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are
mostly those whose content has undergone the least distortion. If the demand made by the
unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its
disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every
experience into account if we say that a dream is invariably an attempt to get rid of a
disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep.
The attempt may succeed more or less completely; it may also fail, and in that case the sleeper
wakes up, apparently woken precisely by the dream. So, too, there are occasions when that
excellent fellow the night-watchman, whose business it is to guard the little township’s sleep,
has no alternative but to sound the alarm and waken the sleeping townspeople.
[1940a [1938], 4981]
Nevertheless, there is no great difficulty in meeting these apparently conclusive objections. It is only necessary to take notice of the fact that my theory is not based on a consideration of the manifest content of dreams but refers to the thoughts which are shown by the work of interpretation to lie behind dreams. We must make a contrast between the manifest and the latent content of dreams. There is no question that there are dreams whose manifest content is of the most distressing kind. But has anyone tried to interpret such dreams? to reveal the latent thoughts behind them? If not, then the two objections raised against my theory will not hold water: it still remains possible that distressing dreams and anxiety-dreams, when they have been interpreted, may turn out to be fulfilments of wishes.¹

¹ [Footnote added 1909:] It is hard to credit the obstinacy with which readers and critics of this book shut their eyes to this consideration and overlook the fundamental distinction between the manifest and latent content of dreams. - On the other hand, nothing in the literature of the subject comes so near to my hypothesis as a passage in James Sully's essay 'The Dream as a Revelation' (1893, 364). The fact that I am only now quoting it for the first time is no sign of disparagement: 'It would seem then, after all, that dreams are not the utter nonsense they have been said to be by such authorities as Chaucer, Shakespeare and Milton. The chaotic aggregations of our night-fancy have a significance and communicate new knowledge. Like some letter in cypher, the dream-inscription when scrutinized closely loses its first look of balderdash and takes on the aspect of a serious, intelligible message. Or, to vary the figure slightly, we may say that, like some palimpsest, the dream discloses beneath its worthless surface-characters traces of an old and precious communication.'

¹ [Footnote added 1914:] Havelock Ellis, a friendly critic of this book, writes (1911, 166): 'This is the point at which many of us are no longer able to follow Freud.' Havelock Ellis has not, however, carried out any analyses of dreams and refuses to believe how impossible it is to base one's judgement on their manifest content.

[1900a, 632]

[1900a, 669]
When external nervous stimuli and internal somatic stimuli are intense enough to force psychical attention to themselves, then - provided that their outcome is dreaming and not waking up - they serve as a fixed point for the formation of a dream, a nucleus in its material; a wish-fulfilment is then looked for that shall correspond to this nucleus, just as (see above) intermediate ideas are looked for between two psychical dream stimuli. To that extent it is true that in a number of dreams the content of the dream is dictated by the somatic element. In this extreme instance it may even happen that a wish which is not actually a currently active one is called up for the sake of constructing a dream. A dream, however, has no alternative but to represent a wish in the situation of having been fulfilled; it is, as it were, faced with the problem of looking for a wish which can be represented as fulfilled by the currently active sensation. If this immediate material is of a painful or distressing kind, that does not necessarily mean that it cannot be used for the construction of a dream. The mind has wishes at its disposal whose fulfilment produces unpleasure. This seems self-contradictory; but it becomes intelligible when we take into account the presence of two psychical agencies and a censorship between them. [1900a, 714]

As we have seen, there are 'repressed' wishes in the mind, which belong to the first system and whose fulfilment is opposed by the second system. In saying that there are such wishes I am not making a historical statement to the effect that they once existed and were later abolished. The theory of repression, which is essential to the study of the psychoneuroses, asserts that these repressed wishes still exist - though there is a simultaneous inhibition which holds them down. Linguistic usage hits the mark in speaking of the 'suppression' of these impulses. The psychical arrangements that make it possible for such impulses to force their way to realization remain in being and in working order. Should it happen, however, that a suppressed wish of this kind is carried into effect, and that its inhibition by the second system (the system that is admissible to consciousness) is defeated, this defeat finds expression as unpleasure. In conclusion: if sensations of an unpleasurable nature arising from somatic sources occur during sleep, the dream-work makes use of that event in order to represent - subject to the continuance of the censorship to a greater or less degree - the fulfilment of some wish which is normally suppressed. [1900a, 714]

In addition to this, repression plays a part in dreams of exhibiting; for the distress felt in such dreams is a reaction on the part of the second system against the content of the scene of exhibiting having found expression in spite of the ban upon it. If the distress was to be avoided, the scene should never have been revived. [1900a, 725]

We shall return later to the feeling of being inhibited. It serves admirably in dreams to represent a conflict in the will or a negative. The unconscious purpose requires the exhibiting to proceed; the censorship demands that it shall be stopped. [1900a, 725]
Analysis is able to demonstrate that these unpleasurable dreams are wish-fulfilments no less than the rest. An unconscious and repressed wish, whose fulfilment the dreamer's ego could not fail to experience as something distressing, has seized the opportunity offered to it by the persisting cathexis of the distressing residues of the previous day; it has lent them its support and by that means rendered them capable of entering a dream. But whereas in Group A the unconscious wish coincided with the conscious one, in Group B the gulf between the unconscious and the conscious (between the repressed and the ego) is revealed and the situation in the fairy tale of the three wishes which were granted by the fairy to the husband and wife is realized. (See below, p. 1009 f.) The satisfaction at the fulfilment of the repressed wish may turn out to be so great that it counterbalances the distressing feelings attaching to the day's residues; in that case the feeling-tone of the dream is indifferent, in spite of its being on the one hand the fulfilment of a wish and on the other the fulfilment of a fear. Or it may happen that the sleeping ego takes a still larger share in the construction of the dream, that it reacts to the satisfying of the repressed wish with violent indignation and itself puts an end to the dream with an outburst of anxiety. Thus there is no difficulty in seeing that unpleasurable dreams and anxiety-dreams are just as much wish-fulfilments in the sense of our theory as are straightforward dreams of satisfaction.

There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the Ucs., while it has been repudiated and suppressed by the other system, the Pcs.¹ Even where psychical health is perfect, the subjugation of the Ucs. by the Pcs. is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the Ucs. an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand they make it possible for the Pcs. to control the Ucs. to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

[1900a, 989]

[1900a, 1009]
A second factor, which is much more important and far-reaching, but which is equally overlooked by laymen is the following. No doubt a wish-fulfilment must bring pleasure; but the question then arises "To whom?" To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them - he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream-wishes can only be compared to an amalgamation of two separate people who are linked by some important common element. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish-fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish-fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one - man and wife - the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other. (Introductory Lectures on Psycho-Analysis, Lecture XIV.)

Our discussion cannot be carried any further without examining the part played by the affects in these processes; but we can only do so imperfectly in the present connection. Let us assume, then, that the suppression of the Ucs. is necessary above all because, if the course of ideas in the Ucs. were left to itself, it would generate an affect which was originally of a pleasurable nature, but became unpleasurable after the process of 'repression' occurred. The purpose, and the result too, of suppression is to prevent this release of unpleasure. The suppression extends over the ideational content of the Ucs., since the release of unpleasure might start from that content. This presupposes a quite specific assumption as to the nature of the generation of affect. It is viewed as a motor or secretory function, the key to whose innervation lies in the ideas in the Ucs. Owing to the domination established by the Pcs. these ideas are, as it were, throttled, and inhibited from sending out impulses which would generate affect. If, therefore, the cathexis from the Pcs. ceases, the danger is that the unconscious excitations may release affect of a kind which (as a result of the repression which has already occurred) can only be experienced as unpleasure, as anxiety.
Among these wishful impulses derived from infancy, which can neither be destroyed nor
inhibited, there are some whose fulfilment would be a contradiction of the purposive ideas of
secondary thinking. The fulfilment of these wishes would no longer generate an affect of
pleasure but of unpleasure; and it is precisely this transformation of affect which constitutes the
essence of what we term 'repression'. The problem of repression lies in the question of how it is
and owing to what motive forces that this transformation occurs; but it is a problem that we need
only touch upon here. It is enough for us to be clear that a transformation of this kind does occur
in the course of development - we have only to recall the way in which disgust emerges in
childhood after having been absent to begin with - and that it is related to the activity of the
secondary system. The memories on the basis of which the unconscious wish brings about the
release of affect were never accessible to the Pcs., and consequently the release of the affect
attaching to those memories cannot be inhibited either. It is for the very reason of this
generation of affect that these ideas are now inaccessible even by way of the preconscious
thoughts on to which they have transferred their wishful force. On the contrary, the unpleasure
principle takes control and causes the Pcs. to turn away from the transference thoughts. They
are left to themselves - 'repressed' - and thus it is that the presence of a store of infantile
memories, which has from the first been held back from the Pcs., becomes a sine qua non for
repression.
[1900a, 1031]

If, in the third place, you will recall our idea that the dreamer fighting against his own wishes is
to be compared with a summation of two separate, though in some way intimately connected,
people, you will understand another possibility. For there is a possibility that the fulfilment of a
wish may bring about something very far from pleasant - namely, a punishment. Here we can
once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate
were the direct fulfilment of the wish of the first person, the woman, The sausages on her nose
were the fulfilment of the wish of the second person, the man, but were at the same time a
punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third
wish, the last remaining one in the fairy tale.) There are many such punitive trends in the mental
life of human beings; they are very powerful, and we may hold them responsible for some of the
distressing dreams. Perhaps you will now say that this leaves very little over of the famous
wish-fulfilment. But if you look more closely you will admit that you are wrong. Compared with
the multiplicity (which I shall mention later) of the things that dreams might be and according to
many authorities actually are, our solution - wish-fulfilment, anxiety-fulfilment, punishment-
fulfilment - is a very restricted one. We may add that the anxiety is the direct opposite of the
wish, that opposites are especially close to one another in associations and that in the
unconscious they coalesce; and further, that the punishment is also the fulfilment of a wish - of
the wish of the other, censoring person.
[1916-1917, 3307]

There is no doubt that the resistance of the conscious and unconscious ego operates under
the sway of the pleasure principle: it seeks to avoid the unpleasure which would be produced by
the liberation of the repressed. Our efforts, on the other hand, are directed towards procuring
the toleration of that unpleasure by an appeal to the reality principle. But how is the compulsion
to repeat - the manifestation of the power of the repressed - related to the pleasure principle? It
is clear that the greater part of what is re-experienced under the compulsion to repeat must
cause the ego unpleasure, since it brings to light activities of repressed instinctual impulses.
That, however, is unpleasure of a kind we have already considered and does not contradict the
pleasure principle: unpleasure for one system and simultaneously satisfaction for the other. But
we come now to a new and remarkable fact, namely that the compulsion to repeat also recalls
from the past experiences which include no possibility of pleasure, and which can never, even
long ago, have brought satisfaction even to instinctual impulses which have since been
repressed.
[1920g, 3725]
Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.

[1940a [1938], 4980]
Unpleasurable dreams may also be 'punishment-dreams'. It must be admitted that their recognition means in a certain sense a new addition to the theory of dreams. What is fulfilled in them is equally an unconscious wish, namely a wish that the dreamer may be punished for a repressed and forbidden wishful impulse. To that extent dreams of this kind fall in with the condition that has been laid down here that the motive force for constructing a dream must be provided by a wish belonging to the unconscious. A closer psychological analysis, however, shows how they differ from other wishful dreams. In the cases forming Group B the dream-constructing wish is an unconscious one and belongs to the repressed, while in punishment-dreams, though it is equally an unconscious one, it must be reckoned as belonging not to the repressed but to the 'ego.' Thus punishment-dreams indicate the possibility that the ego may have a greater share than was supposed in the construction of dreams. The mechanism of dream-formation would in general be greatly clarified if instead of the opposition between 'conscious' and 'unconscious' we were to speak of that between the 'ego' and the 'repressed.' This cannot be done, however, without taking account of the processes underlying the psychoneuroses, and for that reason it has not been carried out in the present work. I will only add that punishment-dreams are not in general subject to the condition that the day's residues shall be of a distressing kind. On the contrary, they occur most easily where the opposite is the case - where the day's residues are thoughts of a satisfying nature but the satisfaction which they express is a forbidden one. The only trace of these thoughts that appears in the manifest dream is their diametric opposite, just as in the case of dreams belonging to Group A. The essential characteristic of punishment-dreams would thus be that in their case the dream-constructing wish is not an unconscious wish derived from the repressed (from the system Ucs.), but a punitive one reacting against it and belonging to the ego, though at the same time an unconscious (that is to say, preconscious) one.¹

¹[1900a, 990]

This view is not traversed by the fact that there are marginal cases in which the dream - as happens with anxiety-dreams - can no longer perform its function of preventing an interruption of sleep, but assumes instead the other function of promptly bringing sleep to an end. In doing so it is merely behaving like a conscientious night-watchman, who first carries out his duty by suppressing disturbances so that the townsmen may not be woken up, but afterwards continues to do his duty by himself waking the townsmen up, if the causes of the disturbance seem to him serious and of a kind that he cannot cope with alone.

[1901a, 1093]

If, in the third place, you will recall our idea that the dreamer fighting against his own wishes is to be compared with a summation of two separate, though in some way intimately connected, people, you will understand another possibility. For there is a possibility that the fulfilment of a wish may bring about something very far from pleasant - namely, a punishment. Here we can once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate were the direct fulfilment of the wish of the first person, the woman, The sausages on her nose were the fulfilment of the wish of the second person, the man, but were at the same time a punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third wish, the last remaining one in the fairy tale.) There are many such punitive trends in the mental life of human beings; they are very powerful, and we may hold them responsible for some of the distressing dreams. Perhaps you will now say that this leaves very little over of the famous wish-fulfilment. But if you look more closely you will admit that you are wrong. Compared with the multiplicity (which I shall mention later) of the things that dreams might be and according to many authorities actually are, our solution - wish-fulfilment, anxiety-fulfilment, punishment-fulfilment - is a very restricted one. We may add that the anxiety is the direct opposite of the wish, that opposites are especially close to one another in associations and that in the unconscious they coalesce; and further, that the punishment is also the fulfilment of a wish - of the wish of the other, censoring person.

[1916-1917, 3307]
This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfils of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatisms, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

[1920g, 3735]

I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]
¹ (Footnote added 1935:) When it is considered how frequently the function of dreaming miscarries, the dream may aptly be characterized as an attempt at the fulfilment of a wish. Aristotle’s old definition of the dream as mental life during sleep still holds good. There was a reason for my choosing as the title of my book not The Dream but The Interpretation of Dreams.

[1925d, 4221]

The first of these difficulties is presented in the fact that people who have experienced a shock, a severe psychical trauma - such as happened so often during the war and such as affords the basis for traumatic hysteria - are regularly taken back in their dreams into the traumatic situation. According to our hypotheses about the function of dreams this should not occur. What wishful impulse could be satisfied by harking back in this way to this exceedingly distressing traumatic experience? It is hard to guess.

[1933a, 4641]

With the traumatic neuroses things are different. In their case the dreams regularly end in the generation of anxiety. We should not, I think, be afraid to admit that here the function of the dream has failed. I will not invoke the saying that the exception proves the rule: its wisdom seems to me most questionable. But no doubt the exception does not overturn the rule. If, for the sake of studying it, we isolate one particular psychical function, such as dreaming, from the psychical machinery as a whole, we make it possible to discover the laws that are peculiar to it; but when we insert it once more into the general context we must be prepared to discover that these findings are obscured or impaired by collision with other forces. We say that a dream is the fulfilment of a wish; but if you want to take these latter objections into account, you can say nevertheless that a dream is an attempt at the fulfilment of a wish. No one who can properly appreciate the dynamics of the mind will suppose that you have said anything different by this. In certain circumstances a dream is only able to put its intention into effect very incompletely, or must abandon it entirely. Unconscious fixation to a trauma seems to be foremost among these obstacles to the function of dreaming. While the sleeper is obliged to dream, because the relaxation of repression at night allows the upward pressure of the traumatic fixation to become active, there is a failure in the functioning of his dream-work, which would like to transform the memory-traces of the traumatic event into the fulfilment of a wish. In these circumstances it will happen that one cannot sleep, that one gives up sleep from dread of the failure of the function of dreaming. Traumatic neuroses are here offering us an extreme case; but we must admit that childhood experiences, too, are of a traumatic nature, and we need not be surprised if comparatively trivial interferences with the function of dreams may arise under other conditions as well.

[1933a, 4642]
One objection which is frequently brought forward by opponents of psycho-analysis, and which has lately been voiced by Havelock Ellis (1911, 168), argues that though dream-symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psycho-analytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream-distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.

[1900a, 833]

In the first place I must admit that no one carries on the interpretation of dreams as his main occupation. How does it come about, then, that people do interpret them? Occasionally, with no particular end in view, one may interest oneself in the dreams of an acquaintance, or one may work through one's own dreams for a time in order to train oneself in psycho-analytic work; but for the most part what one has to deal with are the dreams of neurotic patients who are under psycho-analytic treatment. These latter dreams are excellent material and are in no way inferior to those of healthy people; but the technique of the treatment necessitates our subordinating dream-interpretation to therapeutic aims, and we have to allow a whole number of dreams to drop after we have extracted something from them that is of service to the treatment. Some dreams that occur during treatment entirely escape any full analysis: since they have arisen out of the great mass of psychical material which is still unknown to us, it is impossible to understand them before the treatment is finished. If I were to report dreams of this kind, it would oblige me to uncover all the secrets of a neurosis as well; and that will not do for us, since it is precisely to prepare us for the study of the neuroses that we have attacked the problem of dreams.

[1916-1917, 3275]

But there is something else that I cannot pass by. The reminder of dreams given to us by the mother and wife of Oedipus must not be allowed to remain fruitless. Do you recall the outcome of our dream-analyses - how the wishes that construct dreams are so often of a perverse or incestuous nature or reveal an unsuspected hostility to those who are nearest and dearest to the dreamer? At that time we gave no explanation of the origin of these evil impulses. Now you can find it for yourselves. They are allocations of the libido and object-cathexes which date from early infancy and have long since been abandoned as far as conscious life is concerned, but which prove still to be present at night-time and to be capable of functioning in a certain sense. Since, however, everyone, and not only neurotics, experiences these perverse, incestuous and murderous dreams, we may conclude that people who are normal to-day have passed along a path of development that has led through the perversions and object-cathexes of the Oedipus complex, that that is the path of normal development and that neurotics merely exhibit to us in a magnified and coarsened form what the analysis of dreams reveals to us in healthy people as well. And this is one of the reasons why I dealt with the study of dreams before that of neurotic symptoms.

[1916-1917, 3402]
But the dreams of neurotics do not differ in any important respect from those of normal people; it is possible, indeed, that they cannot be distinguished from them at all. It would be absurd to give an account of the dreams of neurotics which could not also apply to the dreams of normal people. We must therefore say that the difference between neurosis and health holds only during the day; it is not prolonged into dream-life. We are obliged to carry over to healthy people a number of hypotheses which arise in connection with neurotics as a result of the link between the latter's dreams and their symptoms. We cannot deny that healthy people as well possess in their mental life what alone makes possible the formation both of dreams and of symptoms, and we must conclude that they too have carried out repressions, that they expend a certain amount of energy in order to maintain them, that their unconscious system conceals repressed impulses which are still cathected with energy, and that a portion of their libido is withdrawn from their ego's disposal. Thus a healthy person, too, is virtually a neurotic; but dreams appear to be the only symptoms which he is capable of forming. It is true that if one subjects his waking life to a closer examination one discovers something that contradicts this appearance - namely that this ostensibly healthy life is interspersed with a great number of trivial and in practice unimportant symptoms.

The identity of the dreams of healthy and neurotic people enables us to infer thus much in regard to defining the characteristics of health. But in regard to dreams themselves we can make a further inference: we must not detach them from their connection with neurotic symptoms, we must not suppose that their essential nature is exhausted by the formula that describes them as a translation of thoughts into an archaic form of expression, but we must suppose that they exhibit to us allocations of the libido and object-cathexes that are really present.

The dreams of my jealous patient presented me with a great surprise. They were not simultaneous with the outbreaks of the attacks, it is true, but they occurred within the period which was under the dominance of the delusion; yet they were completely free from delusion and they revealed the underlying homosexual impulses with no more than the usual degree of disguise. Since I had had little experience of the dreams of paranoics, it seemed plausible at the time to suppose that it was true in general that paranoia does not penetrate into dreams. My two cases of paranoia showed an instructive contrast in the behaviour of their dreams. Whereas those of the first case were free from delusion, as has already been said, the other patient produced great numbers of persecutory dreams, which may be regarded as forerunners of or substitutes for the delusional ideas. The pursuer, whom he only managed to escape with great fear, was usually a powerful bull or some other male symbol which even in the dream itself he sometimes recognized as representing his father. One day he produced a very characteristic paranoid transference-dream. He saw me shaving in front of him, and from the scent he realized that I was using the same soap as his father had used. I was doing this in order to oblige him to make a father-transference on to me. The choice of this incident for his dream quite unmistakably betrays the patient's depreciatory attitude to his paranoic phantasies and his disbelief in them; for his own eyes could tell him every day that I was never in a position to make use of shaving-soap and that therefore there was in this respect nothing to which a father-transference could attach itself.
A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies. There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoids shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.

[1922b, 3906]

It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a compromise-formation (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind.

[1923a, 3919]
The unconscious wishful impulses clearly try to make themselves effective in daytime as well, and the fact of transference, as well as the psychoses, show us that they endeavour to force their way by way of the preconscious system into consciousness and to obtain control of the power of movement. Thus the censorship between the Ucs. and the Pcs., the assumption of whose existence is positively forced upon us by dreams, deserves to be recognized and respected as the watchman of our mental health. Must we not regard it, however, as an act of carelessness on the part of that watchman that it relaxes its activities during the night, allows the suppressed impulses in the Ucs. to find expression, and makes it possible for hallucinatory regression to occur once more? I think not. For even though this critical watchman goes to rest - and we have proof that its slumbers are not deep - it also shuts the door upon the power of movement. No matter what impulses from the normally inhibited Ucs. may prance upon the stage, we need feel no concern; they remain harmless, since they are unable to set in motion the motor apparatus by which alone they might modify the external world. The state of sleep guarantees the security of the citadel that must be guarded. The position is less harmless when what brings about the displacement of forces is not the nightly relaxation in the critical censorship's output of force, but a pathological reduction in that force or a pathological intensification of the unconscious excitations while the preconscious is still cathected and the gateway to the power of movement stands open. When this is so, the watchman is overpowered, the unconscious excitations overwhelm the Pcs., and thence obtain control over our speech and actions; or they forcibly bring about hallucinatory regression and direct the course of the apparatus (which was not designed for their use) by virtue of the attraction exercised by perceptions on the distribution of our psychical energy. To this state of things we give the name of psychosis.

[1900a, 997]
The difficulties of presentation have been further increased by the peculiarities of the material which I have had to use to illustrate the interpreting of dreams. It will become plain in the course of the work itself why it is that none of the dreams already reported in the literature of the subject or collected from unknown sources could be of any use for my purposes. The only dreams open to my choice were my own and those of my patients undergoing psycho-analytic treatment. But I was precluded from using the latter material by the fact that in its case the dream-processes were subject to an undesirable complication owing to the added presence of neurotic features. But if I was to report my own dreams, it inevitably followed that I should have to reveal to the public gaze more of the intimacies of my mental life than I liked, or than is normally necessary for any writer who is a man of science and not a poet. Such was the painful but unavoidable necessity; and I have submitted to it rather than totally abandon the possibility of giving the evidence for my psychological findings. Naturally, however, I have been unable to resist the temptation of taking the edge off some of my indiscretions by omissions and substitutions. But whenever this has happened, the value of my instance has been very definitely diminished. I can only express a hope that readers of this book will put themselves in my difficult situation and treat me with indulgence, and further, that anyone who finds any sort of reference to himself in my dreams may be willing to grant me the right of freedom of thought - in my dream-life, if nowhere else.

[1900a, 508]
In the course of my psycho-analyses of neurotics I must already have analysed over a thousand dreams; but I do not propose to make use of this material in my present introduction to the technique and theory of dream-interpretation. Apart from the fact that such a course would be open to the objection that these are the dreams of neuropaths, from which no valid inferences could be made as to the dreams of normal people, there is quite another reason which forces this decision upon me. The subject to which these dreams of my patients lead up is always, of course, the case history which underlies their neurosis. Each dream would therefore necessitate a lengthy introduction and an investigation of the nature and aetiological determinants of the psychoneuroses. But these questions are in themselves novelties and highly bewildering and would distract attention from the problem of dreams. On the contrary, it is my intention to make use of my present elucidation of dreams as a preliminary step towards solving the more difficult problems of the psychology of the neuroses. If, however, I forego my principal material, the dreams of my neurotic patients, I must not be too particular about what is left to me. All that remains are such dreams as have been reported to me from time to time by normal persons of my acquaintance, and such others as have been quoted as instances in the literature dealing with dream-life. Unluckily, however, none of these dreams are accompanied by the analysis without which I cannot discover a dream's meaning. My procedure is not so convenient as the popular decoding method which translates any given piece of a dream's content by a fixed key. I, on the contrary, am prepared to find that the same piece of content may conceal a different meaning when it occurs in various people or in various contexts. Thus it comes about that I am led to my own dreams, which offer a copious and convenient material, derived from an approximately normal person and relating to multifarious occasions of daily life. No doubt I shall be met by doubts of the trustworthiness of 'self-analyses' of this kind; and I shall be told that they leave the door open to arbitrary conclusions. In my judgement the situation is in fact more favourable in the case of self-observation than in that of other people; at all events we may make the experiment and see how far self-analysis takes us with the interpretation of dreams. But I have other difficulties to overcome, which lie within myself. There is some natural hesitation about revealing so many intimate facts about one's mental life; nor can there be any guarantee against misinterpretation by strangers. But it must be possible to overcome such hesitations. 'Tout psychologue, writes Delboeuf, 'est obligé de faire l'avoue même de ses faiblesses s'il croit par là jeter du jour sur quelque problème obscur.'¹ And it is safe to assume that my readers too will very soon find their initial interest in the indiscretions which I am bound to make replaced by an absorbing immersion in the psychological problems upon which they throw light.²

¹ I am obliged to add, however, by way of qualification of what I have said above, that in scarcely any instance have I brought forward the complete interpretation of one of my own dreams, as it is known to me. I have probably been wise in not putting too much faith in my readers' discretion.

² I will not pretend that I have completely uncovered the meaning of this dream or that its interpretation is without a gap. I could spend much more time over it, derive further information from it and discuss fresh problems raised by it. I myself know the points from which further trains of thought could be followed. But considerations which arise in the case of every dream of my own restrain me from pursuing my interpretative work. If anyone should feel tempted to express a hasty condemnation of my reticence, I would advise him to make the experiment of being franker than I am. For the moment I am satisfied with the achievement of this one piece of fresh knowledge. If we adopt the method of interpreting dreams which I have indicated here, we shall find that dreams really have a meaning and are far from being the expression of a fragmentary activity of the brain, as the authorities have claimed. When the work of interpretation has been completed, we perceive that a dream is the fulfilment of a wish.
A number of possible solutions of the problem may at once occur to us: as, for instance, that some incapacity exists during sleep for giving direct expression to our dream-thoughts. But the analysis of certain dreams forces us to adopt another explanation of distortion in dreams. I will exemplify this by another dream of my own. Once again this will involve me in a variety of indiscretions; but a thorough elucidation of the problem will compensate for my personal sacrifice.

[1900a, 633]

I owe the following dream, not to a patient, but to an intelligent jurist of my acquaintance. He told it to me, once again, in order to restrain me from rash generalizing on the theory of wishful dreams. 'I dreamt', said my informant, 'that I came up to my house with a lady on my arm. A closed carriage was standing in front of it and a man came up to me, showed me his credentials as a police officer and requested me to follow him. I asked him to allow me a little time to put my affairs in order. Can you suppose that I have a wish to be arrested?' - Of course not, I could only agree. Do you happen to know the charge on which you were arrested? - 'Yes, for infanticide, I believe.' - Infanticide? But surely you're aware that that's a crime that can only be committed by a mother on a new-born child? - 'Quite true.' - And what were the circumstances in which you had the dream? What happened on the previous evening? - 'I would prefer not to tell you. It's a delicate matter.' - Nevertheless I shall have to hear it; otherwise we shall have to give up the idea of interpreting the dream. - 'Very well then, listen. I didn't spend last night at home but with a lady who means a great deal to me. When we woke up in the morning there was a further passage between us, after which I went to sleep again and had the dream I described to you.' - Is she a married woman? - 'Yes.' - And you don't want to have a child by her? - 'Oh, no; that might give us away.' - So you don't practice normal intercourse? - 'I take the precaution of withdrawing before ejaculation.' - I think I may assume that you had used this device several times during the night, and that after repeating it in the morning you felt a little uncertain whether you had carried it out successfully. - 'That's possible, no doubt.' - In that case your dream was the fulfillment of a wish. It gave you a reassurance that you had not procreated a child, or, what amounts to the same thing, that you had killed a child. The intermediate links are easily indicated. You remember that a few days ago we were talking about marriage difficulties and how inconsistent it is that there should be no objection to carrying out intercourse in such a way that no fertilization takes place, whereas any interference when once the ovum and semen have come together and a foetus has been formed is punished as a crime. We went on to recall the mediaeval controversy over the exact point of time at which the soul enters the foetus, since it is not until after that that the concept of murder becomes applicable. No doubt, too, you know Lenau's gruesome poem in which child murder and child prevention are equated. - 'Oddly enough I happened to think of Lenau this morning, quite by chance, as it seemed.' - An after-echo of your dream. And now I can show you another incidental wish-fulfilment contained in your dream. You came up to your house with the lady on your arm. Thus you were bringing her home, instead of spending the night in her house as you did in reality. There may be more than one reason why the wish-fulfilment which constitutes the core of the dream was disguised in such a disagreeable form. Perhaps you have learned from my paper on the aetiology of anxiety neurosis that I regard coitus interruptus as one of the aetiological factors in the development of neurotic anxiety? It would tally with this if, after carrying out sexual intercourse in this way several times, you were left in an uneasy mood which afterwards became an element in the construction of your dream. Moreover, you made use of this moodiness to help disguise the wish-fulfilment. Incidentally, your reference to infanticide has not been explained. How did you come to light on this specifically feminine crime? - 'I must admit that some years ago I became involved in an occurrence of that kind. I was responsible for a girl's trying to avoid the consequence of a love-affair with me by means of an abortion. I had nothing to do with her carrying out her intention, but for a long time I naturally felt very nervous in case the business came out.' - I quite understand that. This recollection provides a second reason why you must have been worried by your suspicion that your device might have gone wrong.

[1900a, 650]
I hope that the foregoing examples will be enough (till the next objection is raised) to make it seem plausible that even dreams with a distressing content are to be construed as wish-fulfillments. Nor will anyone regard it as a chance coincidence that the interpretation of these dreams has brought us up each time against topics about which people are loth to speak or to think. The distressing feeling aroused by these dreams is no doubt identical with the repugnance which tends (usually with success) to restrain us from discussing or mentioning such topics, and which each of us has to overcome if we nevertheless find ourselves compelled to embark on them. But the unpleasurable feeling which thus recurs in dreams does not disprove the existence of a wish. Everyone has wishes that he would prefer not to disclose to other people, and wishes that he will not admit even to himself. On the other hand, we are justified in linking the unpleasurable character of all these dreams with the fact of dream-distortion. And we are justified in concluding that these dreams are distorted and the wish-fulfilment contained in them disguised to the point of being unrecognizable precisely owing to the repugnance felt for the topic of the dream or for the wish derived from it and to an intention to repress them. The distortion in the dream is thus shown in fact to be an act of the censorship. We shall be taking into account everything that has been brought to light by our analysis of unpleasurable dreams if we make the following modification in the formula in which we have sought to express the nature of dreams: a dream is a (disguised) fulfilment of a (suppressed or repressed) wish.¹

It is true that as a rule the childhood scene is only represented in the dream's manifest content by an allusion, and has to be arrived at by an interpretation of the dream. Such instances when they are recorded, cannot carry much conviction, since as a rule there is no other evidence of these childhood experiences having occurred: if they date back to a very early age they are no longer recognized as memories. The general justification for inferring the occurrence of these childhood experiences from dreams is provided by a whole number of factors in psycho-analytic work, which are mutually consistent and thus seem sufficiently trustworthy. If I record some of these inferred childhood experiences torn from their context for the purposes of dream-interpretation, they may perhaps create little impression, especially as I shall not even be able to quote all the material on which the interpretations were based. Nevertheless I shall not allow this to deter me from relating them.

I might pursue the intricate trains of thought further along these lines and explain fully the part of the dream which I have not analysed; but I must desist at this point because the personal sacrifice demanded would be too great. I will only pick out one thread, which is qualified to lead us straight to one of the dream-thoughts underlying the confusion. The stranger with the long face and pointed beard who tried to prevent my putting on the overcoat bore the features of a shop-keeper at Spalato from whom my wife had bought a quantity of Turkish stuffs. He was called Popovic, an equivocal name, on which a humorous writer, Stettenheim, has already made a suggestive comment: 'He told me his name and blushingly pressed my hand.' Once again I found myself misusing a name, as I already had done with Pélagie, Knödl, Brücke and Fleischl. It could scarcely be denied that playing about with names like this was a kind of childish naughtiness. But if I indulged in it, it was as an act of retribution; for my own name had been the victim of feeble witticisms like these on countless occasions. Goethe, I recalled, had remarked somewhere upon people's sensitiveness about their names: how we seem to have grown into them like our skin. He had said this à propos of a line written on his name by Herder.

¹ [1900a, 653]

[1900a, 682]
Turning now to the second episode of the dream, I am unable to deal with it in such detail - out of consideration for the censorship. For I was putting myself in the place of an exalted personage of those revolutionary times, who also had an adventure with an eagle [Adler] and is said to have suffered from incontinence of the bowels, and so on. I thought to myself that I should not be justified in passing the censorship at this point, even though the greater part of the story was told me by a Hofrat (a consiliarius aulicus [court councillor] - cf. Aula). The series of public rooms in the dream were derived from His Excellency's saloon carriage, of which I had succeeded in getting a glimpse. But the 'rooms' [Zimmer] also meant 'women' [Frauenzimmer], as is often the case in dreams - in this instance 'public women'. In the figure of the housekeeper I was showing my lack of gratitude towards a witty elderly lady and ill repaying her hospitality and the many good stories that I heard while I was stopping in her house. -The allusion to the lamp went back to Grillparzer, who introduced a charming episode of a similar kind, which he had actually experienced, into his tragedy about Hero and Leander, Des Meeres und der Liebe Wellen ['The Waves of the Sea and of Love'] - the Armada and the storm.¹

To provide a third opportunity for studying condensation in the formation of dreams, I will give part of the analysis of another dream, which I owe to an elderly lady undergoing psycho-analytic treatment. As was to be expected from the severe anxiety-states from which the patient suffered, her dreams contained a very large number of sexual thoughts, the first realization of which both surprised and alarmed her. Since I shall not be able to pursue the interpretation of the dream to the end, its material will appear to fall into several groups without any visible connection.

But first, even at the risk of appearing to bring our progress to a halt, I should like to take a preliminary glance at the processes involved in carrying out the interpretation of a dream. I cannot disguise from myself that the easiest way of making those processes clear and of defending their trustworthiness against criticism would be to take some particular dream as a sample, go through its interpretation (just as I have done with the dream of Irma's injection in my second chapter), and then collect the dream-thoughts which I have discovered and so on to reconstruct from them the process by which the dream was formed - in other words, to complete a dream-analysis by a dream-synthesis. I have in fact carried out that task for my own instruction on several specimens; but I cannot reproduce them here, since I am forbidden to do so for reasons connected with the nature of the psychical material involved - reasons which are of many kinds and which will be accepted as valid by any reasonable person. Such considerations interfered less in the analysis of dreams, since an analysis could be incomplete and nevertheless retain its value, even though it penetrated only a small way into the texture of the dream. But in the case of the synthesis of a dream I do not see how it can be convincing unless it is complete. I could only give a complete synthesis of dreams dreamt by people unknown to the reading public. Since, however, this condition is fulfilled only by my patients, who are neurotics, I must postpone this part of my exposition of the subject till I am able - in another volume - to carry the psychological elucidation of neuroses to a point at which it can make contact with our present topic.¹

¹ [1900a, 695]

¹ [1900a, 762]

¹ [1900a, 781]
This fine specimen includes many of the characteristics of dreams - the fact that I exercised my critical faculties during the dream and myself noticed my mistake when I said 'Non vixit' instead of 'Non vivit', my unconcerned dealings with people who were dead and were recognized as being dead in the dream itself, the absurdity of my final inference and the great satisfaction it gave me. This dream exhibits so many of these puzzling features, indeed, that I would give a great deal to be able to present the complete solution of its conundra. But in point of fact I am incapable of doing so - of doing, that is to say, what I did in the dream, of sacrificing to my ambition people whom I greatly value. Any concealment, however, would destroy what I know very well to be the dream's meaning; and I shall therefore content myself, both here and in a later context, with selecting only a few of its elements for interpretation. [1900a, 874]

Anyone who has formed even the slightest idea of the extent of condensation in dreams will easily imagine what a number of pages would be filled by a full analysis of this dream. Fortunately, however, in the present context I need only take up one point in it, which provides an example of astonishment in dreams, as exhibited in the interpolation 'strangely enough'. The following was the occasion of the dream. Louise N., the lady who was assisting me in my job in the dream, had been calling on me. 'Lend me something to read', she had said. I offered her Rider Haggard's She. 'A strange book, but full of hidden meaning', I began to explain to her; 'the eternal feminine, the immortality of our emotions . . . ' Here she interrupted me: 'I know it already. Have you nothing of your own?' - 'No, my own immortal works have not yet been written.' - 'Well, when are we to expect these so-called ultimate explanations of yours which you've promised even we shall find readable?' she asked, with a touch of sarcasm. At that point I saw that someone else was admonishing me through her mouth and I was silent. I reflected on the amount of self-discipline it was costing me to offer the public even my book upon dreams - I should have to give away so much of my own private character in it. [1900a, 899]

Unfortunately, I cannot demonstrate this in the actual case of these dreams, but an instance taken from another department of life will make my meaning clear. Let us suppose the following case. There is a person of my acquaintance whom I hate, so that I have a lively inclination to feel glad if anything goes wrong with him. But the moral side of my nature will not give way to this impulse. I do not dare to express a wish that he should be unlucky, and if he meets with some undeserved misfortune, I suppress my satisfaction at it and force myself to manifestations and thoughts of regret. Everyone must have found himself in this situation at some time or other. What now happens, however, is that the hated person, by a piece of misconduct of his own, involves himself in some well-deserved unpleasantness; when that happens, I may give free rein to my satisfaction that he has met with a just punishment and in this I find myself in agreement with many other people who are impartial. I may observe, however, that my satisfaction seems more intense than that of these other people; it has received an accession from the source of my hatred, which till then has been prevented from producing its affect, but in the altered circumstances is no longer hindered from doing so. In social life this occurs in general wherever antipathetic people or members of an unpopular minority put themselves in the wrong. Their punishment does not as a rule correspond to their wrongdoing but to their wrongdoings plus the ill-feeling directed against them which has previously been without any consequences. It is no doubt true that those who inflict the punishment are committing an injustice in this; but they are prevented from perceiving it by the satisfaction resulting from the removal of a suppression which has long been maintained within them. In cases such as this the affect is justified in its quality but not in its quantity; and self-criticism which is set at rest on the one point is only too apt to neglect examination of the second one. When once a door has been opened, it is easy for more people to push their way through it than there had originally been any intention of letting in. [1900a, 920]
It cannot be denied that to interpret and report one’s dreams demands a high degree of self-discipline. One is bound to emerge as the only villain among the crowd of noble characters who share one’s life. Thus it seemed to me quite natural that the revenants should only exist for just so long as one likes and should be removable at a wish. We have seen what my friend Josef was punished for. But the revenants were a series of reincarnations of the friend of my childhood. It was therefore also a source of satisfaction to me that I had always been able to find successive substitutes for that figure; and I felt I should be able to find a substitute for the friend whom I was now on the point of losing: no one was irreplaceable.

Once again it is impossible for me to present a complete analysis. I must restrict myself to bringing out a few salient points. Distressing anticipations from the previous day were what gave rise to the dream: we had once more been without news of our son at the front for over a week. It is easy to see that the content of the dream expressed a conviction that he had been wounded or killed. Energetic efforts were clearly being made at the beginning of the dream to replace the distressing thoughts by their contrary. I had some highly agreeable news to communicate - something about money being sent . . . distinction . . . distribution. (The sum of money was derived from an agreeable occurrence in my medical practice; it was an attempt at a complete diversion from the topic.) But these efforts failed. My wife suspected something dreadful and refused to listen to me. The disguises were too thin and references to what it was sought to repress pierced through them everywhere. If my son had been killed, his fellow-officers would send back his belongings and I should have to distribute what he left among his brothers and sisters and other people. A ‘distinction’ is often awarded to an officer who has fallen in battle. Thus the dream set about giving direct expression to what it had first sought to deny, though the inclination towards wish-fulfilment was still shown at work in the distortions. (The change of locality during the dream is no doubt to be understood as what Silberer has described as ‘threshold symbolism’. We cannot tell, it is true, what it was that provided the dream with the motive force for thus giving expression to my distressing thoughts. My son did not appear as someone ‘falling’ but as someone ‘climbing.’ He had in fact been a keen mountaineer. He was not in uniform but in sports clothes; this meant that the place of the accident that I now feared had been taken by an earlier, sporting one; for he had had a fall during a skiing expedition and broken his thigh. The way in which he was dressed, on the other hand, which made him look like a seal, at once recalled someone younger - our funny little grandson; while the grey hair reminded me of the latter’s father, our son-in-law, who had been hard hit by the war. What could this mean? . . . but I have said enough of it. - The locality in a store-closet and the cupboard from which he wanted to take something (‘on which he wanted to put something’ in the dream) - these allusions reminded me unmistakably of an accident of my own which I had brought on myself when I was between two and three years old. I had climbed up on to a stool in the store-closet to get something nice that was lying on a cupboard or table. The stool had tipped over and its corner had struck me behind my lower jaw; I might easily, I reflected, have knocked out all my teeth. The recollection was accompanied by an admonitory thought: ‘that serves you right’; and this seemed as though it was a hostile impulse aimed at the gallant soldier. Deeper analysis at last enabled me to discover what the concealed impulse was which might have found satisfaction in the dreaded accident to my son: it was the envy which is felt for the young by those who have grown old, but which they believe they have completely stifled. And there can be no question that it was precisely the strength of the painful emotion which would have arisen if such a misfortune had really happened that caused that emotion to seek out a repressed wish-fulfilment of this kind in order to find some consolation.

[1900a, 991]
I will pause here to survey the results I had so far reached in my dream-analysis. By following the associations which arose from the separate elements of the dream divorced from their context, I arrived at a number of thoughts and recollections, which I could not fail to recognize as important products of my mental life. This material revealed by the analysis of the dream was intimately connected with the dream's content, yet the connection was of such a kind that I could never have inferred the fresh material from that content. The dream was unemotional, disconnected and unintelligible; but while I was producing the thoughts behind the dream, I was aware of intense and well-founded affective impulses; the thoughts themselves fell at once into logical chains, in which certain central ideas made their appearance more than once. Thus, the contrast between 'selfish' and 'unselfish', and the elements 'being in debt' and 'without paying for it' were central ideas of this kind, not represented in the dream itself. I might draw closer together the threads in the material revealed by the analysis, and I might then show that they converge upon a single nodal point, but considerations of a personal and not of a scientific nature prevent my doing so in public. I should be obliged to betray many things which had better remain my secret, for on my way to discovering the solution of the dream all kinds of things were revealed which I was unwilling to admit even to myself. Why then, it will be asked, have I not chosen some other dream, whose analysis is better suited for reporting, so that I could produce more convincing evidence of the meaning and connectedness of the material uncovered by analysis? The answer is that every dream with which I might try to deal would lead to things equally hard to report and would impose an equal discretion upon me. Nor should I avoid this difficulty by bringing up someone else's dream for analysis, unless circumstances enabled me to drop all disguise without damage to the person who had confided in me.

The heart of the problem lies in displacement, which is by far the most striking of the special achievements of the dream-work. If we enter deeply into the subject, we come to realize that the essential determining condition of displacement is a purely psychological one: something in the nature of a motive. One comes upon its track if one takes into consideration certain experiences which one cannot escape in analysing dreams. In analysing my specimen dream I was obliged to break off my report of the dream-thoughts on p. 1059, because, as I confessed, there were some among them which I should prefer to conceal from strangers and which I could not communicate to other people without doing serious mischief in important directions. I added that nothing would be gained if I were to choose another dream instead of that particular one with a view to reporting its analysis: I should come upon dream-thoughts which required to be kept secret in the case of every dream with an obscure or confused content. If, however, I were to continue the analysis on my own account, without any reference to other people (whom, indeed, an experience so personal as my dream cannot possibly have been intended to reach), I should eventually arrive at thoughts which would surprise me, whose presence in me I was unaware of, which were not only alien but also disagreeable to me, and which I should therefore feel inclined to dispute energetically, although the chain of thoughts running through the analysis insisted upon them remorselessly. There is only one way of accounting for this state of affairs, which is of quite universal occurrence; and that is to suppose that these thoughts really were present in my mind, and in possession of a certain amount of psychical intensity or energy, but that they were in a peculiar psychological situation, as a consequence of which they could not become conscious to me. (I describe this particular condition as one of 'repression.') We cannot help concluding, then, that there is a causal connection between the obscurity of the dream-content and the state of repression (in admissibility to consciousness) of certain of the dream-thoughts, and that the dream had to be obscure so as not to betray the proscribed dream-thoughts. Thus we are led to the concept of a 'dream-distortion', which is the product of the dream-work and serves the purpose of dissimulation, that is, of disguise.
Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.
[1901b, 1293]

Unfortunately I am unable, for familiar reasons, to enter into the history of the case as far as I should like, and I must restrict myself to the account which follows. Up to the time of her falling ill the patient had been a happy and almost completely satisfied wife. She wanted to have children, from motives based on an infantile fixation of her wishes, and she fell ill when she learned that it was impossible for her to have any by the husband who was the only object of her love. The anxiety hysteria with which she reacted to this frustration corresponded, as she herself soon learned to understand, to the repudiation of phantasies of seduction in which her firmly implanted wish for a child found expression. She now did all she could to prevent her husband from guessing that she had fallen ill owing to the frustration of which he was the cause. But I have had good reason for asserting that everyone possesses in his own unconscious an instrument with which he can interpret the utterances of the unconscious in other people. Her husband understood, without any admission or explanation on her part, what his wife's anxiety meant; he felt hurt, without showing it, and in his turn reacted neurotically by - for the first time - failing in sexual intercourse with her. Immediately afterwards he started on a journey. His wife believed that he had become permanently impotent, and produced her first obsessional symptoms on the day before his expected return.
[1913i, 2626]

For reasons which will be easily understood I cannot communicate very much about these or other case histories. Nor do I propose to go into the obvious analogy between deformities of character resulting from protracted sickliness in childhood and the behaviour of whole nations whose past history has been full of suffering. Instead, however, I will take the opportunity of pointing to a figure created by the greatest of poets - a figure in whose character the claim to be an exception is closely bound up with and is motivated by the circumstance of congenital disadvantage.
[1916d, 3101]

Analytic work has no difficulty in showing us that it is forces of conscience which forbid the subject to gain the long hoped for advantage from the fortunate change in reality. It is a difficult task, however, to discover the essence and origin of these judging and punishing trends, which so often surprise us by their existence where we do not expect to find them. For the usual reasons I shall not discuss what we know or conjecture on the point in relation to cases of clinical observation, but in relation to figures which great writers have created from the wealth of their knowledge of the mind.
[1916d, 3106]
This dreamer had been long familiar with the requirement of dream-interpretation. Another person might perhaps have taken objection to such a trivial detail as the shape of a table being made the subject of investigation. But in fact we regard nothing in a dream as accidental or indifferent, and we expect to obtain information precisely from the explanation of such trivial and pointless details. You may perhaps also feel surprised that the thought that 'the same thing was true of us and of them' should have been expressed by, in particular, the choice of a table [Tisch]. But this too becomes clear when you learn that the name of the family in question was Tischler [literally, 'carpenter']. By making his relations sit at this Tisch, he was saying that they too were Tischlers. Incidentally, you will notice how inevitably one is led into being indiscreet when one reports these dream-interpretations. And you will guess that this is one of the difficulties I have hinted at over the choice of examples. I could easily have taken another example in place of this one, but I should probably merely have avoided this indiscretion at the price of committing another.

[1916-1917, 3215]

You, however, would be glad to dispense with this material and would prefer to be given an explanation of the dreams of healthy people or of your own dreams. But this cannot be done, on account of their content. It is impossible to submit either oneself or anyone else whose confidence one enjoys to the ruthless exposure that would be involved in a detailed analysis of his dreams, which, as you already know, are concerned with the most intimate part of one's personality. But there is another difficulty in the way apart from that of providing the material. You are aware that dreams present an alien appearance to the dreamer himself, and much more so to anyone who is unacquainted with him personally. Our literature is not poor in good and detailed dream-analyses. I myself have published a few within the framework of case histories. Perhaps the best example of the interpretation of a dream is the one reported by Otto Rank consisting of two interrelated dreams dreamt by a young girl, which occupy about two pages of print: but their analysis extends to seventy-six pages. So I should need something like a whole term to conduct you through a piece of work of the sort. If one takes up any comparatively long and much distorted dream, one has to give so many explanations of it, to bring up so much material in the way of associations and memories, to follow up so many by-paths, that a lecture about it would be quite confusing and unsatisfactory. I must therefore ask you to be content with what can be had more easily - an account of small pieces of the dreams of neurotic patients, in which it is possible to recognize this or that point in isolation. What is easiest to demonstrate are dream-symbols and, after them, some characteristics of the regressive representation in dreams. In the case of each of the dreams that follow, I will indicate why it is that I think it worth reporting.

[1916-1917, 3276]
Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words 'suppressed' and 'repressed.' It should have been clear, however, that the latter lays more stress than the former upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream-thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one. And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the Oneirocritica of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion.

[1900a, 1033]
Thus I would look for the theoretical value of the study of dreams in the contributions it makes to psychological knowledge and in the preliminary light it throws on the problems of the psychoneuroses. Who can guess the importance of the results which might be obtained from a thorough understanding of the structure and functions of the mental apparatus, since even the present state of our knowledge allows us to exert a favourable therapeutic influence on the curable forms of psychoneurosis? But what of the practical value of this study - I hear the question raised - as a means towards an understanding of the mind, towards a revelation of the hidden characteristics of individual men? Have not the unconscious impulses brought out by dreams the importance of real forces in mental life? Is the ethical significance of suppressed wishes to be made light of - wishes which, just as they lead to dreams, may some day lead to other things? [1900a, 1044]

I do not feel justified in answering these questions. I have not considered this side of the problem of dreams further. I think however, that the Roman emperor was in the wrong when he had one of his subjects executed because he had dreamt of murdering the emperor. He should have begun by trying to find out what the dream meant; most probably its meaning was not what it appeared to be. And even if a dream with another content had had this act of lèse majesté as its meaning, would it not be right to bear in mind Plato's dictum that the virtuous man is content to dream what a wicked man really does? I think it is best, therefore, to acquit dreams. Whether we are to attribute reality to unconscious wishes, I cannot say. It must be denied, of course, to any transitional or intermediate thoughts. If we look at unconscious wishes reduced to their most fundamental and truest shape, we shall have to conclude, no doubt, that psychical reality is a particular form of existence not to be confused with material reality. Thus there seems to be no justification for people's reluctance in accepting responsibility for the immorality of their dreams. When the mode of functioning of the mental apparatus is rightly appreciated and the relation between the conscious and the unconscious understood, the greater part of what is ethically objectionable in our dream and phantasy lives will be found to disappear. In the words of Hanns Sachs: 'If we look in our consciousness at something that has been told up by a dream about a contemporary (real) situation, we ought not to be surprised to find that the monster which we saw under the magnifying glass of analysis turns out to be a tiny infusorian.' [1900a, 1044]
Thus I would look for the theoretical value of the study of dreams in the contributions it makes to psychological knowledge and in the preliminary light it throws on the problems of the psychoneuroses. Who can guess the importance of the results which might be obtained from a thorough understanding of the structure and functions of the mental apparatus, since even the present state of our knowledge allows us to exert a favourable therapeutic influence on the curable forms of psychoneurosis? But what of the practical value of this study - I hear the question raised - as a means towards an understanding of the mind, towards a revelation of the hidden characteristics of individual men? Have not the unconscious impulses brought out by dreams the importance of real forces in mental life? In the words of Hanns Sachs: 'If we look in our consciousness at something that has been told up by a dream about a contemporary (real) situation, we ought not to be surprised to find that the monster which we saw under the magnifying glass of analysis turns out to be a tiny infusorian.'

Actions and consciously expressed opinions are as a rule enough for practical purposes in judging men's characters. Actions deserve to be considered first and foremost; for many impulses which force their way through to consciousness are then brought to nothing by the real forces of mental life before they can mature into deeds. In fact, such impulses often meet with no psychical obstacles to their progress, for the very reason that the unconscious is certain that they will be stopped at some other stage. It is in any case instructive to get to know the much trampled soil from which our virtues proudly spring. Very rarely does the complexity of a human character, driven hither and thither by dynamic forces, submit to a choice between simple alternatives, as our antiquated morality would have us believe.

In the introductory chapter of this book (which discusses 'The Scientific Literature Dealing with the Problem of Dreams') I have shown the way in which writers have reacted to what is felt as the distressing fact that the unbridled content of dreams is so often at odds with the moral sense of the dreamer. (I deliberately avoid speaking of 'criminal' dreams, as such a description, which would overstep the limits of psychological interest, seems to me quite uncalled-for.) The immoral character of dreams has naturally provided a fresh motive for denying them any psychical value: if dreams are the meaningless product of disordered mental activity, then there can be no ground for assuming responsibility for their apparent content.
We know now that the manifest content is a deception, a façade. It is not worth while to submit it to an ethical examination or to take its breaches of morality any more seriously than its breaches of logic or mathematics. When the 'content' of the dream is spoken of, what must be referred to can only be the content of the preconscious thoughts and of the repressed wishful impulse which are revealed behind the façade of the dream by the work of interpretation. Nevertheless, this immoral façade has a question to put to us. We have heard that the latent dream-thoughts have to submit to a severe censorship before they are allowed access to the manifest content. How can it happen, then, that this censorship, which makes difficulties over more trivial things, breaks down so completely over these manifestly immoral dreams?

I have dealt so exhaustively in these pages with this characteristic of dreams, which indeed provides the motive for their distortion, that I can pass at once from this topic to the problem that lies before us: Must one assume responsibility for the content of one's dreams? For the sake of completeness, it should, however, be added that dreams do not always offer immoral wishfulfilments, but often energetic reactions against them in the form of 'punishment dreams'. In other words, the dream-censorship cannot only express itself in distortions and the generation of anxiety, but can go so far as to blot out the immoral subject-matter completely and replace it by something else that serves as an atonement, though it allows one to see what lies behind. But the problem of responsibility for the immoral content of dreams no longer exists for us as it formerly did for writers who knew nothing of latent dream-thoughts and the repressed part of our mental life. Obviously one must hold oneself responsible for the evil impulses of one's dreams. What else is one to do with them? Unless the content of the dream (rightly understood) is inspired by alien spirits, it is a part of my own being. If I seek to classify the impulses that are present in me according to social standards into good and bad, I must assume responsibility for both sorts; and if, in defence, I say that what is unknown, unconscious and repressed in me is not my 'ego', then I shall not be basing my position upon psycho-analysis, I shall not have accepted its conclusions - and I shall perhaps be taught better by the criticisms of my fellow-men, by the disturbances in my actions and the confusion of my feelings. I shall perhaps learn that what I am disavowing not only 'is' in me but sometimes 'acts' from out of me as well.

It is true that in the metapsychological sense this bad repressed content does not belong to my 'ego' - that is, assuming that I am a morally blameless individual - but to an 'id' upon which my ego is seated. But this ego developed out of the id, it forms with it a single biological unit, it is only a specially modified peripheral portion of it, and it is subject to the influences and obeys the suggestions that arise from the id. For any vital purpose, a separation of the ego from the id would be a hopeless undertaking.

Moreover, if I were to give way to my moral pride and tried to decree that for purposes of moral valuation I might disregard the evil in the id and need not make my ego responsible for it, what use would that be to me? Experience shows me that I nevertheless do take that responsibility, that I am somehow compelled to do so. Psycho-analysis has made us familiar with a pathological condition, obsessional neurosis, in which the poor ego feels itself responsible for all sorts of evil impulses of which it knows nothing, impulses which are brought up against it in consciousness but which it is unable to acknowledge. Something of this is present in every normal person. It is a remarkable fact that the more moral he is the more sensitive is his 'conscience'. It is just as though we could say that the healthier a man is, the more liable he is to contagions and to the effects of injuries. This is no doubt because conscience is itself a reaction-formation against the evil that is perceived in the id. The more strongly the latter is suppressed, the more active is the conscience.
The ethical narcissism of humanity should rest content with the knowledge that the fact of distortion in dreams, as well as the existence of anxiety-dreams and punishment-dreams, afford just as clear evidence of his moral nature as dream-interpretation gives of the existence and strength of his evil nature. If anyone is dissatisfied with this and would like to be ‘better’ than he was created, let him see whether he can attain anything more in life than hypocrisy or inhibition. [1925i, 4051]
Since the rejection of the mythological hypothesis, however, dreams have stood in need of explanation. The conditions of their origin, their relation to waking mental life, their dependence upon stimuli which force their way upon perception during the state of sleep, the many peculiarities of their content which are repugnant to waking thought, the inconsistency between their ideational images and the affects attaching to them, and lastly their transitory character, the manner in which waking thought pushes them on one side as something alien to it, and mutilates or extinguishes them in memory - all of these and other problems besides have been awaiting clarification for many hundreds of years, and till now no satisfactory solution of them has been advanced. But what stands in the foreground of our interest is the question of the *significance* of dreams, a question which bears a double sense. It enquires in the first place as to the psychical significance of dreaming, as to the relation of dreams to other mental processes, and as to any biological function that they may have; in the second place it seeks to discover whether dreams can be interpreted, whether the content of individual dreams has a 'meaning', such as we are accustomed to find in other psychical structures. [1901a, 1051]

But we have gone a long way ahead. It is not a question yet of establishing whether the meaning of a dream can always be rendered by a fulfilled wish, or whether it may not just as often stand for an anxious expectation, an intention, a reflection, and so on. On the contrary, the question that first arises is whether dreams have a meaning at all, whether they ought to be assessed as mental events. Science answers 'no': it explains dreaming as a purely physiological process, behind which, accordingly, there is no need to look for sense, meaning or purpose. Somatic stimuli, so it says, play upon the mental instrument during sleep and thus bring to consciousness now one idea and now another, robbed of all mental content: dreams are comparable only to twitchings, not to expressive movements, of the mind. [1907a, 1813]
¹ [Footnote added 1914:] Is this the only function that can be assigned to dreams? I know of no other. It is true that Maeder has attempted to show that dreams have other, 'secondary', functions. He started out from the correct observation that some dreams contain attempts at solving conflicts, attempts which are later carried out in reality and which thus behave as though they were trial practices for waking actions. He therefore drew a parallel between dreams and the play of animals and children, which may be regarded as practice in the operation of innate instincts and as preparation for serious activity later on, and put forward the hypothesis that dreams have a 'fonction ludique' ['play function']. Shortly before Maeder, Alfred Adler, too, had insisted that dreams possessed a function of 'thinking ahead.' (In an analysis which I published in 1905, a dream, which could only be regarded as expressing an intention, was repeated every night until it was carried out.)
[1900a, 1007]

But we have gone a long way ahead. It is not a question yet of establishing whether the meaning of a dream can always be rendered by a fulfilled wish, or whether it may not just as often stand for an anxious expectation, an intention, a reflection, and so on. On the contrary, the question that first arises is whether dreams have a meaning at all, whether they ought to be assessed as mental events. Science answers 'no': it explains dreaming as a purely physiological process, behind which, accordingly, there is no need to look for sense, meaning or purpose. Somatic stimuli, so it says, play upon the mental instrument during sleep and thus bring to consciousness now one idea and now another, robbed of all mental content: dreams are comparable only to twitchings, not to expressive movements, of the mind.
[1907a, 1813]
In which of these systems, then, are we to locate the impetus to the construction of dreams? For simplicity's sake, in the system \textit{Ucs}. It is true that in the course of our future discussion we shall learn that this is not entirely accurate, and that the process of forming dreams is obliged to attach itself to dream-thoughts belonging to the preconscious system. But when we consider the dream-wish, we shall find that the motive force for producing dreams is supplied by the \textit{Ucs}; and owing to this latter factor we shall take the unconscious system as the starting-point of dream-formation. Like all other thought structures, this dream-instigator will make an effort to advance into the \textit{Pcs} and from there to obtain access to consciousness. [1900a, 974]

The view that dreams carry on the occupations and interests of waking life has been entirely confirmed by the discovery of the concealed \textit{dream-thoughts}. These are only concerned with what seems important to us and interests us greatly. Dreams are never occupied with minor details. But we have also found reason for accepting the contrary view, that dreams pick up indifferent refuse left over from the previous day and that they cannot get control of any major day time interest until it has been to some extent withdrawn from waking activity. We have found that this holds good of the dream's \textit{content}, which gives expression to the dream-thoughts in a form modified by distortion. For reasons connected with the mechanism of association, as we have seen, the dream-process finds it easier to get control of recent or indifferent ideational material which has not yet been requisitioned by waking thought-activity; and for reasons of censorship it transfers psychical intensity from what is important but objectionable on to what is indifferent. [1900a, 1016]

Thus we are driven to conclude that two fundamentally different kinds of psychical process are concerned in the formation of dreams. One of these produces perfectly rational dream-thoughts, of no less validity than normal thinking; while the other treats these thoughts in a manner which is in the highest degree bewildering and irrational. We have already in Chapter VI segregated this second psychical process as being the dream-work proper. What light have we now to throw upon its origin? [1900a, 1024]
There is, however, another point to which I attach importance; and I must confess that it is solely on its account that I have embarked here upon all these discussions of the two psychical systems and their modes of activity and of repression. It is not now a question of whether I have formed an approximately correct opinion of the psychological factors with which we are concerned, or whether, which is quite possible in such difficult matters, my picture of them is distorted and incomplete. However many changes may be made in our reading of the psychical censorship and of the rational and abnormal revisions made of the dream-content, it remains true that processes of this sort are at work in the formation of dreams and that they show the closest analogy in their essentials to the processes observable in the formation of hysterical symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance of psychological equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made that no conclusions as to the dreams of normal people can be drawn from my dreams or those of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may argue back from the phenomena to their motive forces, we must recognize that the psychical mechanism employed by neuroses is not created by the impact of a pathological disturbance upon the mind but is present already in the normal structure of the mental apparatus. The two psychical systems, the censorship upon the passage from one of them to the other, the inhibition and overlaying of one activity by the other, the relations of both of them to consciousness - or whatever more correct interpretations of the observed facts may take their place - all of these form part of the normal structure of our mental instrument, and dreams show us one of the paths leading to an understanding of its structure. If we restrict ourselves to the minimum of new knowledge which has been established with certainty, we can still say this of dreams: they have proved that what is suppressed continues to exist in normal people as well as abnormal, and remains capable of psychical functioning.

[1900a, 1034]

It would scarcely repay the trouble if we were to treat the historical significance of dreams as a separate topic. A dream may have impelled some chieftain to embark upon a bold enterprise the success of which has changed history. But this only raises a fresh problem so long as a dream is regarded as an alien power in contrast to the other more familiar forces of the mind; no such problem remains if a dream is recognized as a form of expression of impulses which are under the pressure of resistance during the day but which have been able to find reinforcement during the night from deep-lying sources of excitation.¹ The respect paid to dreams in antiquity is, however, based upon correct psychological insight and is the homage paid to the uncontrolled and indestructible forces in the human mind, to the 'daemonic' power which produces the dream-wish and which we find at work in our unconscious.

[1900a, 1039]
Hitherto philosophers have had no occasion to concern themselves with a psychology of repression. We may therefore be permitted to make a first approach to this hitherto unknown topic by constructing a pictorial image of the course of events in dream-formation. It is true that the schematic picture we have arrived at - not only from the study of dreams - is a fairly complicated one; but we cannot manage with anything simpler. Our hypothesis is that in our mental apparatus there are two thought-constructing agencies, of which the second enjoys the privilege of having free access to consciousness for its products whereas the activity of the first is in itself unconscious and can only reach consciousness by way of the second. On the frontier between the two agencies, where the first passes over to the second, there is a censorship, which only allows what is agreeable to it to pass through and holds back everything else. According to our definition, then, what is rejected by the censorship is in a state of repression. Under certain conditions, of which the state of sleep is one, the relation between the strength of the two agencies is modified in such a way that what is repressed can no longer be held back. In the state of sleep this probably occurs owing to a relaxation of the censorship; when this happens it becomes possible for what has hitherto been repressed to make a path for itself to consciousness. Since, however, the censorship is never completely eliminated but merely reduced, the repressed material must submit to certain alterations which mitigate its offensive features. What becomes conscious in such cases is a compromise between the intentions of one agency and the demands of the other. Repression - relaxation of the censorship - the formation of a compromise, this is the fundamental pattern for the generation not only of dreams but of many other psychopathological structures; and in the latter cases too we may observe that the formation of compromises is accompanied by processes of condensation and displacement and by the employment of superficial associations, which we have become familiar with in the dream-work.

[1901a, 1089]

¹ [Footnote added 1920:] The phantasies of the pubertal period have as their starting-point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'Family Romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909).
[1905d, 1539]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
I can imagine that to point out the existence of lying dreams of this kind, 'obliging' dreams, will arouse a positive storm of helpless indignation in some readers who call themselves analysts. 'What!' they will exclaim, 'the unconscious, the real centre of our mental life, the part of us that is so much nearer the divine than our poor consciousness - it too can lie! Then how can we still build on the interpretations of analysis and the accuracy of our findings?' To which one must reply that the recognition of these lying dreams does not constitute any shattering novelty. I know, indeed, that the craving of mankind for mysticism is ineradicable, and that it makes ceaseless efforts to win back for mysticism the territory it has been deprived of by The Interpretation of Dreams, but surely in the case under consideration everything is simple enough. A dream is not the 'unconscious'; it is the form into which a thought left over from preconscious, or even from conscious, waking life, can, thanks to the favouring state of sleep, be recast. In the state of sleep this thought has been reinforced by unconscious wishful impulses and has thus experienced distortion through the dream-work, which is determined by the mechanisms prevailing in the unconscious. With our dreamer, the intention to mislead me, just as she did her father, certainly emanated from the preconscious, and may indeed have been conscious; it could come to expression by entering into connection with the unconscious wishful impulse to please her father (or father-substitute), and in this way it created a lying dream. The two intentions, to betray and to please her father, originated in the same complex; the former resulted from the repression of the latter, and the later one was brought back by the dream-work to the earlier one. There can therefore be no question of any devaluation of the unconscious, nor of a shattering of our confidence in the results of analysis.

[1920a, 3854]

And now I have reached the point I wish to put before you. We have endeavoured to maintain the strictest impartiality and have allowed two conceptions of the dream to rank as equally probable and equally unproved. According to the first the dream is a reaction to a telepathic message: 'your daughter has just brought twins into the world.' According to the second an unconscious process of thought underlies the dream, which may be reproduced somewhat as follows: "To-day is the day the confinement should take place if the young people in Berlin are really out in their reckoning by a month, as I suspect. And if my (first) wife were still alive, she certainly would not be content with one grandchild. To please her there would have to be at least twins!" If this second view is right, no new problems arise. It is simply a dream like any other. The (preconscious) dream-thoughts as outlined above are reinforced by the (unconscious) wish that no other than the daughter should be the dreamer's second wife, and thus the manifest dream as described to us arises.

[1922a, 3886]
I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]

A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies. There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.

[1922b, 3906]
What conclusions can one draw from a correctly translated dream? I have an impression that analytic practice has not always avoided errors and over-estimations on this point, partly owing to an exaggerated respect for the 'mysterious unconscious'. It is only too easy to forget that a dream is as a rule merely a thought like any other, made possible by a relaxation of the censorship and by unconscious reinforcement, and distorted by the operation of the censorship and by unconscious revision.

[1923c, 4033]

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as _anxiety-dreams._) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of _arousal-dreams._) I have given the name of _dream-work_ to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become _condensed_, its psychical emphasis becomes _displaced_, and the whole of it is translated into visual images or _dramatized_, and completed by a deceptive _secondary revision_. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a _symbolism_ (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1925d, 4220]

In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of _The Psychopathology of Everyday Life_. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.
Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathected with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.
After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth facade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfillment of a wish.

[1933a, 4634]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.
We find our way to the understanding (‘interpretation’) of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream-process but only a façade behind which that process lies concealed. Here we have our distinction between the manifest content of a dream and the latent dream-thoughts. The process which produces the former out of the latter is described as the dream-work. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconscious and, as a result of the ego’s opposition, undergoes the changes which we know as dream-distortion. There are no features of a dream which cannot be explained in this way.

[1940a [1938], 4975]

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.

[1940a [1938], 4977]

As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an attempt to get rid of a disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township’s sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.

[1940a [1938], 4981]
These recollections might have been described as hallucinations if a belief in their actual presence had been added to their clearness. The importance of this analogy seemed greater when I noticed that true hallucinations occasionally occurred in the case of other patients who were certainly not psychotic. My line of thought proceeded as follows. Perhaps it may be a general characteristic of hallucinations to which sufficient attention has not hitherto been paid that in them something that has been experienced in infancy and then forgotten returns - something that the child has seen or heard at a time when he could still hardly speak and that now forces its way into consciousness, probably distorted and displaced owing to the operation of forces that are opposed to this return. And, in view of the close relation between hallucinations and particular forms of psychosis, our line of thought may be carried still further. It may be that the delusions into which these hallucinations are so constantly incorporated may themselves be less independent of the upward drive of the unconscious and the return of the repressed than we usually assume. In the mechanism of a delusion we stress as a rule only two factors: the turning away from the real world and its motive forces on the one hand, and the influence exercised by wish-fulfilment on the content of the delusion on the other. But may it not be that the dynamic process is rather that the turning away from reality is exploited by the upward drive of the repressed in order to force its content into consciousness, while the resistances stirred up by this process and the trend to wish-fulfilment share the responsibility for the distortion and displacement of what is recollected? This is after all the familiar mechanism of dreams, which intuition has equated with madness from time immemorial.

[1937d, 5058]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfillment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety-dreams*.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal-dreams.*) I have given the name of *dream-work* to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed*, its psychical emphasis becomes *displaced*, and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive *secondary revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]

It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

[1925d, 4238]
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained. [1933a, 4629]

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work. [1933a, 4632]
Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

[1933a, 4632]

Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathected with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.

[1933a, 4633]
After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.

[1933a, 4634]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
We find our way to the understanding ("interpretation") of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream-process but only a façade behind which that process lies concealed. Here we have our distinction between the manifest content of a dream and the latent dream-thoughts. The process which produces the former out of the latter is described as the dream-work. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconscious and, as a result of the ego's opposition, undergoes the changes which we know as dream-distortion. There are no features of a dream which cannot be explained in this way.

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.

As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an attempt to get rid of a disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township's sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.
These recollections might have been described as hallucinations if a belief in their actual presence had been added to their clearness. The importance of this analogy seemed greater when I noticed that true hallucinations occasionally occurred in the case of other patients who were certainly not psychotic. My line of thought proceeded as follows. Perhaps it may be a general characteristic of hallucinations to which sufficient attention has not hitherto been paid that in them something that has been experienced in infancy and then forgotten returns - something that the child has seen or heard at a time when he could still hardly speak and that now forces its way into consciousness, probably distorted and displaced owing to the operation of forces that are opposed to this return. And, in view of the close relation between hallucinations and particular forms of psychosis, our line of thought may be carried still further. It may be that the delusions into which these hallucinations are so constantly incorporated may themselves be less independent of the upward drive of the unconscious and the return of the repressed than we usually assume. In the mechanism of a delusion we stress as a rule only two factors: the turning away from the real world and its motive forces on the one hand, and the influence exercised by wish-fulfilment on the content of the delusion on the other. But may it not be that the dynamic process is rather that the turning away from reality is exploited by the upward drive of the repressed in order to force its content into consciousness, while the resistances stirred up by this process and the trend to wish-fulfilment share the responsibility for the distortion and displacement of what is recollected? This is after all the familiar mechanism of dreams, which intuition has equated with madness from time immemorial.

[1937d, 5058]
Since we cannot obtain any insight into the causes of the first illness (a knowledge of which is undoubtedly indispensable for properly elucidating the second and severer illness) we must now plunge at random into an unknown concatenation of circumstances. During the incubation period of his illness, as we are aware (that is, between June 1893, when he was appointed to his new post, and the following October, when he took up his duties), he repeatedly dreamt that his old nervous disorder had returned. Once, moreover, when he was half asleep, he had a feeling that after all it must be nice to be a woman submitting to the act of copulation. The dreams and the phantasy are reported by Schreber in immediate succession; and if we also bring together their subject-matter, we shall be able to infer that, at the same time as his recollection of his illness, a recollection of his doctor was also aroused in his mind, and that the feminine attitude which he assumed in the phantasy was from the first directed towards the doctor. Or it may be that the dream of his illness having returned simply expressed some such longing as: 'I wish I could see Flechsig again!' Our ignorance of the mental content of the first illness bars our way in this direction. Perhaps that illness had left behind in him a feeling of affectionate dependence upon his doctor, which had now, for some unknown reason, become intensified to the pitch of an erotic desire. This feminine phantasy which was still kept impersonal, was met at once by an indignant repudiation - a true 'masculine protest', to use Adler's expression, but in a sense different from his.¹ But in the severe psychosis which broke out soon afterwards the feminine phantasy carried everything before it; and it only requires a slight correction of the characteristic paranoic indefiniteness of Schreber's mode of expression to enable us to divine the fact that the patient was in fear of sexual abuse at the hands of his doctor himself. The exciting cause of his illness, then, was an outburst of homosexual libido; the object of this libido was probably from the very first his doctor, Flechsig; and his struggles against the libidinal impulse produced the conflict which gave rise to the symptoms.

¹ [1911c, 2416]

Think of our first patient's obsessional action. The woman was without her husband, whom she loved intensely but with whom she could not share her life on account of his deficiencies and weaknesses. She had to remain faithful to him; she could not put anyone else in his place. Her obsessional symptom gave her what she longed for, set her husband on a pedestal, denied and corrected his weaknesses and above all his impotence. This symptom was fundamentally a wish-fulfilment, just like a dream - and moreover, what is not always true of a dream, an erotic wish-fulfilment. In the case of our second patient you could at least gather that her ceremonial sought to obstruct intercourse between her parents or prevent it from producing a new baby. You will also probably have guessed that it was at bottom endeavouring to put her herself in her mother's place. Once again, therefore, a setting-aside of interferences with sexual satisfaction and a fulfilment of the patient's own sexual wishes. I shall soon come to the complication I have hinted at.

¹[1916-1917, 3372]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No!' on the contrary! to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]

I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking of it. Anyone who accepts it as something self-evident that their dreams should put them back at night into the situation that caused them to fall ill has misunderstood the nature of dreams. It would be more in harmony with their nature if they showed the patient pictures from his healthy past or of the cure for which he hopes. If we are not to be shaken in our belief in the wish-fulfilling tenor of dreams by the dreams of traumatic neurotics, we still have one resource open to us: we may argue that the function of dreaming, like so much else, is upset in this condition and diverted from its purposes, or we may be driven to reflect on the mysterious masochistic trends of the ego.

[1920g, 3719]
We may, I think, tentatively venture to regard the common traumatic neurosis as a consequence of an extensive breach being made in the protective shield against stimuli. This would seem to reinstate the old, naïve theory of shock, in apparent contrast to the later and psychologically more ambitious theory which attributes aetiological importance not to the effects of mechanical violence but to fright and the threat to life. These opposing views are not, however, irreconcilable; nor is the psycho-analytic view of the traumatic neurosis identical with the shock theory in its crudest form. The latter regards the essence of the shock as being the direct damage to the molecular structure or even to the histological structure of the elements of the nervous system; whereas what we seek to understand are the effects produced on the organ of the mind by the breach in the shield against stimuli and by the problems that follow in its train. And we still attribute importance to the element of fright. It is caused by lack of any preparedness for anxiety, including lack of hypercathexis of the systems that would be the first to receive the stimulus. Owing to their low cathexis those systems are not in a good position for binding the inflowing amounts of excitation and the consequences of the breach in the protective shield follow all the more easily. It will be seen, then, that preparedness for anxiety and the hypercathexis of the receptive systems constitute the last line of defence of the shield against stimuli. In the case of quite a number of traumas, the difference between systems that are unprepared and systems that are well prepared through being hypercathected may be a decisive factor in determining the outcome; though where the strength of a trauma exceeds a certain limit this factor will no doubt cease to carry weight. The fulfilment of wishes is, as we know, brought about in a hallucinatory manner by dreams, and under the dominance of the pleasure principle this has become their function. But it is not in the service of that principle that the dreams of patients suffering from traumatic neuroses lead them back with such regularity to the situation in which the trauma occurred. We may assume, rather, that dreams are here helping to carry out another task, which must be accomplished before the dominance of the pleasure principle can ever begin. These dreams are endeavouring to master the stimulus retrospectively, by developing the anxiety whose omission was the cause of the traumatic neurosis. They thus afford us a view of a function of the mental apparatus which, though it does not contradict the pleasure principle, is nevertheless independent of it and seems to be more primitive than the purpose of gaining pleasure and avoiding displeasure.

[1920g, 3734]

This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfillments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

[1920g, 3735]
And now I have reached the point I wish to put before you. We have endeavoured to maintain the strictest impartiality and have allowed two conceptions of the dream to rank as equally probable and equally unproved. According to the first the dream is a reaction to a telepathic message: 'your daughter has just brought twins into the world.' According to the second an unconscious process of thought underlies the dream, which may be reproduced somewhat as follows: 'To-day is the day the confinement should take place if the young people in Berlin are really out in their reckoning by a month, as I suspect. And if my (first) wife were still alive, she certainly would not be content with one grandchild. To please her there would have to be at least twins!' If this second view is right, no new problems arise. It is simply a dream like any other. The (preconscious) dream-thoughts as outlined above are reinforced by the (unconscious) wish that no other than the daughter should be the dreamer's second wife, and thus the manifest dream as described to us arises.

[1922a, 3886]

If you prefer to assume that a telepathic message about the daughter's confinement reached the sleeper, further questions arise of the relation of a message such as this to a dream and of its influence on the formation of dreams. The answer is not far to seek and is quite unambiguous. A telepathic message will be treated as a portion of the material that goes to the formation of a dream, like any other external or internal stimulus, like a disturbing noise in the street or an insistent organic sensation in the sleeper's own body. In our example it is evident how the message, with the help of a lurking repressed wish, became remodelled into a wish-fulfilment; it is unfortunately less easy to show that it combined with other material that had become active at the same time and was blended into a dream. Telepathic messages - if we are justified in recognizing their existence - can thus make no alteration in the process of forming a dream; telepathy has nothing to do with the nature of dreams. And in order to avoid the impression that I am trying to conceal a vague notion behind abstract and fine-sounding words, I am willing to repeat: the essential nature of dreams consists in the peculiar process of 'dream-work' which, with the help of an unconscious wish, carries the preconscious thoughts (day's residues) over into the manifest content of the dream. The problem of telepathy concerns dreams as little as does the problem of anxiety.

[1922a, 3887]
I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]

The Dynamic Theory of Dream-Formation. The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the 'dream-censorship', which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

[1923a, 3918]
It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a compromise-formation (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind.

[1923a, 3919]

The majority of dreams in a difficult analysis are of this kind; so that one cannot learn much from them about the nature and mechanism of dream-formation. Least of all can one learn anything from them upon the recurring question of where the dream's wish-fulfilment may lie hidden. When the pressure of resistance is quite extremely high, one meets with the phenomenon of the dreamer's associations broadening instead of deepening. In place of the desired associations to the dream that has already been narrated, there appear a constant succession of new fragments of dream, which in their turn remain without associations.

[1923c, 4031]

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

[1923c, 4039]

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the Oedipus Rex, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.

[1925i, 4049]
The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in *The Interpretation of Dreams*. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psycho-analysis, we are led from their manifest content to a secret meaning, to the latent dream-thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream-censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream-wish into the manifest content of the dream - a process known as the 'dream-work' - has taught us the best part of what we know of unconscious mental life.

[1924f, 4109]

There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a censorship of dreams and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of dream-distortion, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

[1925d, 4219]
We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploites the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

¹ (Footnote added 1935:) When it is considered how frequently the function of dreaming miscarries, the dream may aptly be characterized as an attempt at the fulfilment of a wish. Aristotle's old definition of the dream as mental life during sleep still holds good. There was a reason for my choosing as the title of my book not The Dream but The Interpretation of Dreams.

It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

[1925d, 4221]

[1925d, 4238]
For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one's parents. One had reason to fear them, and especially one's father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied. In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals - that would not do justice to the overpowering impression which those forces make on him - but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one.

Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.
In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or less amount of affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream-thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream-interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream-thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream-thoughts have to thank this same link for the power to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other instinctual impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream an instinctual wish has to be represented as fulfilled. The shutting-off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for instinctual satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream-thoughts, that is to say, are dramatized and illustrated.

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.
After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.

Again, you may remember that in my earlier lectures I already told you (and illustrated the fact by examples) that we had learnt to make use for our interpretations even of the purely formal features of the manifest dream - that is, to transform them into material coming from the latent dream-thoughts. As you already know, all dreams that are dreamt in a single night belong in a single context. But it is not a matter of indifference whether these dreams appear to the dreamer as a continuum or whether he divides them into several parts and into how many. The number of such parts often corresponds to an equal number of separate focal points in the structural formation of the latent dream-thoughts or to contending trends in the dreamer's mental life, each of which finds a dominant, even though never an exclusive, expression in one particular part of the dream. A short introductory dream and a longer main dream following it often stand in the relation of protasis and apodosis, of which a very clear instance will be found in the old lectures. A dream which is described by the dreamer as 'somehow interpolated' will actually correspond to a dependent clause in the dream-thoughts. Franz Alexander (1925) has shown in a study on pairs of dreams that it not infrequently happens that two dreams in one night share the carrying-out of the dream's task by producing a wish-fulfilment in two stages if they are taken together, though each dream separately would not effect that result. Suppose, for instance, that the dream-wish had as its content some illicit action in regard to a particular person. Then in the first dream the person will appear undisguised, but the action will be only timidly hinted at. The second dream will behave differently. The action will be named without disguise, but the person will either be made unrecognizable or replaced by someone indifferent. This, you will admit, gives one an impression of actual cunning. Another and similar relation between the two members of a pair of dreams is found where one represents a punishment and the other the sinful wish-fulfilment. It amounts to this: 'if one accepts the punishment for it, one can go on to allow oneself the forbidden thing.'
I cannot detain you any longer over such minor discoveries or over the discussions relating to
the employment of dream-interpretation in the work of analysis. I feel sure you are impatient to
hear what changes have been made in our fundamental views on the nature and significance of
dreams. I have already warned you that precisely on this there is little to report to you. The most
disputed point in the whole theory was no doubt the assertion that all dreams are the fulfilments
of wishes. The inevitable and ever recurring objection raised by the layman that there are
nevertheless so many anxiety-dreams was, I think I may say, completely disposed of in my
earlier lectures. With the division into wishful dreams, anxiety-dreams and punishment dreams,
we have kept our theory intact.
[1933a, 4640]

Only two serious difficulties have arisen against the wish-fulfilment theory of dreams. A
discussion of them leads far afield and has not yet, indeed, brought us to any wholly satisfying
conclusion.
[1933a, 4641]

We meet with the second of these facts almost every day in the course of our analytic work;
and it does not imply such an important objection as the other does. One of the tasks of psycho-
analysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood
and to bring to conscious memory the manifestations of early infantile sexual life which are
contained in them. Now these first sexual experiences of a child are linked to painful
impressions of anxiety, prohibition, disappointment and punishment. We can understand their
having been repressed; but, that being so, we cannot understand how it is that they have such
free access to dream-life, that they provide the pattern for so many dream-phantasies and that
dreams are filled with reproductions of these scenes from childhood and with allusions to them.
It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling
purpose seem far from mutually compatible. But it may be that in this case we are magnifying
the difficulty. After all, these same infantile experiences have attached to them all the
imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the
construction of dreams, and to which we may no doubt credit the possibility, in their mighty
uprush, of forcing to the surface, along with the rest, the material of distressing events. And on
the other hand the manner and form in which this material is reproduced shows unmistakably
the efforts of the dream-work directed to denying the unpleasure by means of distortion and to
transforming disappointment into attainment.
[1933a, 4641]
With the traumatic neuroses things are different. In their case the dreams regularly end in the generation of anxiety. We should not, I think, be afraid to admit that here the function of the dream has failed. I will not invoke the saying that the exception proves the rule: its wisdom seems to me most questionable. But no doubt the exception does not overturn the rule. If, for the sake of studying it, we isolate one particular psychical function, such as dreaming, from the psychical machinery as a whole, we make it possible to discover the laws that are peculiar to it; but when we insert it once more into the general context we must be prepared to discover that these findings are obscured or impaired by collision with other forces. We say that a dream is the fulfilment of a wish; but if you want to take these latter objections into account, you can say nevertheless that a dream is an attempt at the fulfilment of a wish. No one who can properly appreciate the dynamics of the mind will suppose that you have said anything different by this. In certain circumstances a dream is only able to put its intention into effect very incompletely, or must abandon it entirely. Unconscious fixation to a trauma seems to be foremost among these obstacles to the function of dreaming. While the sleeper is obliged to dream, because the relaxation of repression at night allows the upward pressure of the traumatic fixation to become active, there is a failure in the functioning of his dream-work, which would like to transform the memory-traces of the traumatic event into the fulfilment of a wish. In these circumstances it will happen that one cannot sleep, that one gives up sleep from dread of the failure of the function of dreaming. Traumatic neuroses are here offering us an extreme case; but we must admit that childhood experiences, too, are of a traumatic nature, and we need not be surprised if comparatively trivial interferences with the function of dreams may arise under other conditions as well.

[1933a, 4642]

It remains for us to give a dynamic explanation of why the sleeping ego takes on the task of the dream-work at all. The explanation is fortunately easy to find. With the help of the unconscious, every dream that is in process of formation makes a demand upon the ego - for the satisfaction of an instinct, if the dream originates from the id; for the solution of a conflict, the removal of a doubt or the forming of an intention, if the dream originates from a residue of preconscious activity in waking life. The sleeping ego, however, is focused on the wish to maintain sleep; it feels this demand as a disturbance and seeks to get rid of the disturbance. The ego succeeds in doing this by what appears to be an act of compliance: it meets the demand with what is in the circumstances a harmless fulfilment of a wish and so gets rid of it. This replacement of the demand by the fulfilment of a wish remains the essential function of the dream-work. It may perhaps be worth while to illustrate this by three simple examples - a hunger dream, a dream of convenience and a dream prompted by sexual desire. A need for food makes itself felt in a dreamer during his sleep: he has a dream of a delicious meal and sleeps on. The choice, of course, was open to him either of waking up and eating something or of continuing his sleep. He decided in favour of the latter and satisfied his hunger by means of the dream - for the time being, at all events, for if his hunger had persisted he would have had to wake up nevertheless. Here is the second example. A sleeper had to wake up so as to be in time for his work at the hospital. But he slept on, and had a dream that he was already at the hospital - but as a patient, who has no need to get up. Or again, a desire becomes active during the night for the enjoyment of a forbidden sexual object, the wife of a friend of the sleeper. He has a dream of sexual intercourse - not, indeed, with this person but with someone else of the same name to whom he is in fact indifferent; or his struggle against the desire may find expression in his mistress remaining altogether anonymous.

[1940a [1938], 4980]
Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilsments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.

These recollections might have been described as hallucinations if a belief in their actual presence had been added to their clearness. The importance of this analogy seemed greater when I noticed that true hallucinations occasionally occurred in the case of other patients who were certainly not psychotic. My line of thought proceeded as follows. Perhaps it may be a general characteristic of hallucinations to which sufficient attention has not hitherto been paid that in them something that has been experienced in infancy and then forgotten returns - something that the child has seen or heard at a time when he could still hardly speak and that now forces its way into consciousness, probably distorted and displaced owing to the operation of forces that are opposed to this return. And, in view of the close relation between hallucinations and particular forms of psychosis, our line of thought may be carried still further. It may be that the delusions into which these hallucinations are so constantly incorporated may themselves be less independent of the upward drive of the unconscious and the return of the repressed than we usually assume. In the mechanism of a delusion we stress as a rule only two factors: the turning away from the real world and its motive forces on the one hand, and the influence exercised by wish-fulfilment on the content of the delusion on the other. But may it not be that the dynamic process is rather that the turning away from reality is exploited by the upward drive of the repressed in order to force its content into consciousness, while the resistances stirred up by this process and the trend to wish-fulfilment share the responsibility for the distortion and displacement of what is recollected? This is after all the familiar mechanism of dreams, which intuition has equated with madness from time immemorial.

[1937d, 5058]
It is easy to prove that dreams often reveal themselves without any disguise as fulfilments of wishes; so that it may seem surprising that the language of dreams was not understood long ago. For instance, there is a dream that I can produce in myself as often as I like - experimentally, as it were. If I eat anchovies or olives or any other highly salted food in the evening, I develop thirst during the night which wakes me up. But my waking is preceded by a dream; and this always has the same content, namely, that I am drinking. I dream I am swallowing down water in great gulps, and it has the delicious taste that nothing can equal but a cool drink when one is parched with thirst. Then I wake up and have to have a real drink. This simple dream is occasioned by the thirst which I become aware of when I wake. The thirst gives rise to a wish to drink, and the dream shows me that wish fulfilled. In doing so it is performing a function - which it was easy to divine. I am a good sleeper and not accustomed to be woken by any physical need. If I can succeed in appeasing my thirst by dreaming that I am drinking, then I need not wake up in order to quench it. This, then, is a dream of convenience. Dreaming has taken the place of action, as it often does elsewhere in life. Unluckily my need for water to quench my thirst cannot be satisfied by a dream in the same way as my thirst for revenge against my friend Otto and Dr. M.; but the good intention is there in both cases. Not long ago this same dream of mine showed some modification. I had felt thirsty even before I fell asleep, and I had emptied a glass of water that stood on the table beside my bed. A few hours later during the night I had a fresh attack of thirst, and this had inconvenient results. In order to provide myself with some water I should have had to get up and fetch the glass standing on the table by my wife's bed. I therefore had an appropriate dream that my wife was giving me a drink out of a vase; this vase was an Etruscan cinerary urn which I had brought back from a journey to Italy and had since given away. But the water in it tasted so salty (evidently because of the ashes in the urn) that I woke up. It will be noticed how conveniently everything was arranged in this dream. Since its only purpose was to fulfil a wish, it could be completely egoistical. A love of comfort and convenience is not really compatible with consideration for other people. The introduction of the cinerary urn was probably yet another wish-fulfilment. I was sorry that the vase was no longer in my possession - just as the glass of water on my wife's table was out of my reach. The urn with its ashes fitted in, too, with the salty taste in my mouth which had now grown stronger and which I knew was bound to wake me.¹

Dreams of convenience like these were very frequent in my youth. Having made it a practice as far back as I can remember to work late into the night, I always found it difficult to wake early. I used then to have a dream of being out of bed and standing by the washing-stand; after a while I was no longer able to disguise from myself the fact that I was really still in bed, but in the meantime I had had a little more sleep. A slothful dream of this kind, which was expressed in a particularly amusing and elegant form, has been reported to me by a young medical colleague who seems to share my liking for sleep. The landlady of his lodgings in the neighbourhood of the hospital had strict instructions to wake him in time every morning but found it no easy job to carry them out. One morning sleep seemed peculiarly sweet. The landlady called through the door: 'Wake up, Herr Pepi! It's time to go to the hospital!' In response to this he had a dream that he was lying in bed in a room in the hospital, and that there was a card over the bed on which was written: 'Pepi H., medical student, age 22.' While he was dreaming, he said to himself 'As I'm already in the hospital, there's no need for me to go there' - and turned over and went on sleeping. In this way he openly confessed the motive for his dream.

¹[1900a, 623]
This theory of dream-interpretation cannot be said to have been very favourably received by other writers on the subject. Its main feature seems to be its extravagance; and there has even been hesitation in recognizing such justification as, in my opinion, it can lay claim to. As will have been seen, it involves a revival of dream-interpretation by means of symbolism - the same method that was employed in antiquity, except that the field from which interpretations are collected is restricted within the limits of the human body. Its lack of any technique of interpreting that can be grasped scientifically must greatly narrow the application of Scherner’s theory. It seems to leave the door open to arbitrary interpretations, especially as in its case, too, the same stimulus can be represented in the dream content in a variety of different ways. Thus even Scherner’s disciple, Volkelt, found himself unable to confirm the view that the body was represented by a house. Objections are also bound to arise from the fact that once again the mind is saddled with the dream-work as a useless and aimless function; for, according to the theory we are discussing, the mind is content with making phantasies about the stimulus with which it is occupied, without the remotest hint at anything in the nature of disposing of the stimulus.

[1900a, 705]

Let us compare this dream of the first Napoleon (who, incidentally, was an extremely sound sleeper) with that of the sleepy student who was roused by his landlady and told that it was time to go to the hospital, and who proceeded to dream that he was in bed at the hospital and then slept on, under the pretext that as he was already in the hospital there was no need for him to get up and go there. This latter dream was clearly a dream of convenience. The dreamer admitted his motive for dreaming without any disguise; but at the same time he gave away one of the secrets of dreaming in general. All dreams are in a sense dreams of convenience: they serve the purpose of prolonging sleep instead of waking up. Dreams are the GUARDIANS of sleep and not its disturbers. We shall have occasion elsewhere to justify this view of them in relation to awakening factors of a psychical kind; but we are already in a position to show that it is applicable to the part played by objective external stimuli. Either the mind pays no attention at all to occasions for sensation during sleep - if it is able to do this despite the intensity of the stimuli and the significance which it knows attaches to them; or it makes use of a dream in order to deny the stimuli; or, thirdly, if it is obliged to recognize them, it seeks for an interpretation of them which will make the currently active sensation into a component part of a situation which is wished for and which is consistent with sleeping. The currently active sensation is woven into a dream in order to rob it of reality. Napoleon could sleep on - with a conviction that what was trying to disturb him was only a dream-memory of the thunder of the guns at Arcole.¹

[1900a, 712]
Thus the wish to sleep (which the conscious ego is concentrated upon, and which, together with the dream-censorship and the 'secondary revision' which I shall mention later, constitute the conscious ego's share in dreaming) must in every case be reckoned as one of the motives for the formation of dreams, and every successful dream is a fulfilment of that wish. We shall discuss elsewhere the relations subsisting between this universal, invariably present and unchanging wish to sleep and the other wishes, of which now one and now another is fulfilled by the content of the dream. But we have found in the wish to sleep the factor that is able to fill the gap in the theory of Strümpell and Wundt and to explain the perverse and capricious manner in which external stimuli are interpreted. The correct interpretation, which the sleeping mind is perfectly capable of making, would involve an active interest and would require that sleep should be brought to an end; for that reason, of all the possible interpretations, only those are admitted which are consistent with the absolute censorship exercised by the wish to sleep. 'It is the nightingale and not the lark.' For if it were the lark it would mean the end of the lovers' night. Among the interpretations of the stimulus which are accordingly admissible, that one is then selected which can provide the best link with the wishful impulses lurking in the mind. Thus everything is unambiguously determined and nothing is left to arbitrary decision. The misinterpretation is not an illusion but, as one might say, an evasion. Here once again, however, just as when, in obedience to the dream-censorship, a substitution is effected by displacement, we have to admit that we are faced by an act which deviates from normal psychical processes. [1900a, 713]

The series of drawings were found by Ferenczi in a Hungarian comic paper called *Fidibusz*, and he at once saw how well they could be used to illustrate the theory of dreams. Otto Rank has already reproduced them in a paper (1912a). [1900a, 829]

According to the theory of wish-fulfilment, this dream would not have become possible if the antithetical megalomaniac train of thought (which, it is true, was suppressed, but had a pleasurable tone) had not emerged in addition to the feeling of disgust. For what is distressing may not be represented in a dream; nothing in our dream-thoughts which is distressing can force an entry into a dream unless it at the same time lends a disguise to the fulfilment of a wish. [1900a, 913]

Psycho-analytic experience has provided us with yet an other proof that the forgetting of dreams depends far more upon resistance than upon the fact, stressed by the authorities, that the waking and sleeping states are alien to each other. It not infrequently happens to me, as well as to other analysts and to patients under treatment, that, having been woken up, as one might say, by a dream, I immediately afterwards, and in full possession of my intellectual powers, set about interpreting it. In such cases I have often refused to rest till I have arrived at a complete understanding of the dream; yet it has sometimes been my experience that after finally waking up in the morning I have entirely forgotten both my interpretative activity and the content of the dream, though knowing that I have had a dream and interpreted it. It happens far more often that the dream draws the findings of my interpretative activity back with it into oblivion than that my intellectual activity succeeds in preserving the dream in my memory. Yet there is no such psychical gulf between my interpretative activity and my waking thoughts as the authorities suppose to account for the forgetting of dreams. [1900a, 955]

I have only one thing more to add about the day's residues. There can be no doubt that it is they that are the true disturbers of sleep and not dreams, which, on the contrary are concerned to guard it. I shall return to this point later. [1900a, 994]
I must assume that the state of sleep makes the sensory surface of consciousness which is directed towards the \textit{Pcs.} far more insusceptible to excitation than the surface directed towards the \textit{Pcpt.} systems. Moreover, this abandonment of interest in thought-processes during the night has a purpose: thinking is to come to a standstill, for the \textit{Pcs.} requires sleep. Once, however, a dream has become a \textit{perception}, it is in a position to excite consciousness, by means of the qualities it has now acquired. This sensory excitation proceeds to perform what is its essential function: it directs a part of the available cathectic energy in the \textit{Pcs.} into attention to what is causing the excitation. It must therefore be admitted that every dream has an \textit{arousing} effect, that it sets a part of the quiescent force of the \textit{Pcs.} in action. The dream is then submitted by this force to the influence which we have described as secondary revision with an eye to consecutiveness and intelligibility. That is to say, the dream is treated by it just like any other perceptual content; it is met by the same anticipatory ideas, in so far as its subject-matter allows. So far as this third portion of the dream-process has any direction it is once again a progressive one.

[1900a, 1004]

It has already been pointed out by Dugas that Goblot would have to disregard many facts before he could assert his thesis generally. Dreams occur from which we do not awaken for instance, some in which we dream that we are dreaming. With our knowledge of the dream-work, we could not possibly agree that it only covers the period of awakening. It seems probable, on the contrary, that the first portion of the dream-work has already begun during the day, under the control of the preconscious. Its second portion - the modification imposed by the censorship, the attraction exercised by unconscious scenes, and the forcing of its way to perception - no doubt proceeds all through the night; and in this respect we may perhaps always be right when we express a feeling of having been dreaming all night long, though we cannot say what.

[1900a, 1004]

Greater theoretical interest, however, attaches to the dreams which have the power to rouse us in the middle of our sleep. Bearing in mind the expediency which is everywhere else the rule, we may ask why a dream, that is, an unconscious wish, is given the power to interfere with sleep, that is, with the fulfilment of the preconscious wish. The explanation no doubt lies in relations of energy of which we have no knowledge. If we possessed such knowledge, we should probably find that allowing the dream to take its course and expending a certain amount of more or less detached attention on it is an economy of energy compared with holding the unconscious as tightly under control at night as in the daytime. Experience shows that dreaming is compatible with sleeping, even if it interrupts sleep several times during the night. One wakes up for an instant and then falls asleep again at once. It is like brushing away a fly in one’s sleep: a case of \textit{ad hoc} awakening. If one falls asleep again, the interruption has been disposed of. As is shown by such familiar examples as the sleep of a nursing mother or wet nurse, the fulfilment of the wish to sleep is quite compatible with maintaining a certain expenditure of attention in some particular direction.

[1900a, 1006]
Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being discharged, may be bound by the preconscious. This second alternative is the one which occurs in the process of dreaming.

The cathexis from the Pcs. which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really has brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually is more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious work - rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the Ucs. which has been left free; in so doing, it discharges the Ucs. excitation, serves it as a safety valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise; it is in the service of both of the two systems since it fulfills the two wishes in so far as they are compatible with each other.

The qualification 'in so far as the two wishes are compatible with each other' implies a hint at the possible case in which the function of dreaming may come to grief. The dream-process is allowed to begin as a fulfilment of an unconscious wish; but if this attempted wish-fulfilment jars upon the preconscious so violently that it is unable to continue sleeping, then the dream has made a breach in the compromise and has failed to carry out the second half of its task. In that case the dream is immediately broken off and replaced by a state of complete waking. Here again it is not really the fault of the dream if it has now to appear in the role of a disturber of sleep instead of in its normal one of a guardian of sleep; and this fact need not prejudice us against its having a useful purpose. This is not the only instance in the organism of a contrivance which is normally useful becoming useless and disturbing as soon as the conditions that give rise to it are somewhat modified; and the disturbance at least serves the new purpose of drawing attention to the modification and of setting the organism's regulative machinery in motion against it. What I have in mind is of course the case of anxiety-dreams, and in order that I may not be thought to be evading this evidence against the theory of wish-fulfilment whenever I come across it, I will at all events give some hints of their explanation.
It has naturally not occurred to us to throw any doubt on the significance, which has been experimentally demonstrated, of external sensory stimuli during sleep; but we have shown that such material stands in the same relation to the dream-wish as do the residues of thought left over from day time activity. Nor have we seen any reason to dispute the view that dreams interpret objective sensory stimuli just as illusions do; but we have found the motive which provides the reason for that interpretation, a reason which has been left unspecified by other writers. Interpretation is carried out in such a way that the object perceived shall not interrupt sleep and shall be usable for purposes of wish-fulfilment. As regards subjective states of excitation in the sense organs during sleep, the occurrence of which seems to have been proved by Trumbull Ladd, it is true that we have not accepted them as a particular source of dreams; but we have been able to explain them as resulting from the regressive revival of memories that are in operation behind the dream.

[1900a, 1016]

I should, of course, not draw such far-reaching conclusions if only a single dream-analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from any dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream re-appear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the 'manifest content of the dream' and the latter - without, in the first instance, making any further distinction - as the 'latent content of the dream.' I am now faced by two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work.' The counterpart to this activity - one which brings about a transformation in the opposite direction - is already known to us as the work of analysis. The remaining problems arising out of dreams - questions as to the instigators of dreams, as to the origin of their material, as to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten - all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream-content. Since I attribute all the contradictory and incorrect views upon dream-life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the manifest dream with the latent dream-thoughts.

[1901a, 1059]

When once we have recognized that the content of a dream is the representation of a fulfilled wish and that its obscurity is due to alterations in repressed material made by the censorship, we shall no longer have any difficulty in discovering the function of dreams. It is commonly said that sleep is disturbed by dreams; strangely enough, we are led to a contrary view and must regard dreams as the guardians of sleep.

[1901a, 1091]
This view is not traversed by the fact that there are marginal cases in which the dream - as happens with anxiety-dreams - can no longer perform its function of preventing an interruption of sleep, but assumes instead the other function of promptly bringing sleep to an end. In doing so it is merely behaving like a conscientious night-watchman, who first carries out his duty by suppressing disturbances so that the townsmen may not be woken up, but afterwards continues to do his duty by himself waking the townsmen up, if the causes of the disturbance seem to him serious and of a kind that he cannot cope with alone. [1901a, 1093]

The function of the dream as a guardian of sleep becomes particularly evident when an external stimulus impinges upon the senses of a sleeper. It is generally recognized that sensory stimuli arising during sleep influence the content of dreams; this can be proved experimentally and is among the few certain (but, incidentally, greatly overvalued) findings of medical investigation into dreams. But this finding involves a puzzle which has hitherto proved insoluble. For the sensory stimulus which the experimenter causes to impinge upon the sleeper is not correctly recognized in the dream; it is subjected to one of an indefinite number of possible interpretations, the choice being apparently left to an arbitrary psychical determination. But there is, of course, no such thing as arbitrary determination in the mind. There are several ways in which a sleeper may react to an external sensory stimulus. He may wake up or he may succeed in continuing his sleep in spite of it. In the latter case he may make use of a dream in order to get rid of the external stimulus, and here again there is more than one method open to him. For instance, he may get rid of the stimulus by dreaming that he is in a situation which is absolutely incompatible with the stimulus. Such was the line taken by a sleeper who was subject to disturbance by a painful abscess on the perineum. He dreamt that he was riding on a horse, making use of the poultice that was intended to mitigate his pain as a saddle, and in this way he avoided being disturbed. Or, as happens more frequently, the external stimulus is given an interpretation which brings it into the context of a repressed wish which is at the moment awaiting fulfilment; in this way the external stimulus is robbed of its reality and is treated as though it were a portion of the psychical material. Thus someone dreamt that he had written a comedy with a particular plot; it was produced in a theatre, the first act was over, and there were thunders of applause; the clapping was terrific. . . . The dreamer must have succeeded in prolonging his sleep till after the interference had ceased; for when he woke up he no longer heard the noise, but rightly concluded that someone must have been beating a carpet or mattress. Every dream which occurs immediately before the sleeper is woken by a loud noise has made an attempt at explaining away the arousing stimulus by providing another explanation of it and has thus sought to prolong sleep, even if only for a moment. [1901a, 1093]
The achievements of the dream-work can, however, be described as follows. A tissue of thoughts, usually a very complicated one, which has been built up during the day and has not been completely dealt with - 'a day's residue' - continues during the night to retain the quota of energy - the 'interest' - claimed by it, and threatens to disturb sleep. This 'day's residue' is transformed by the dream-work into a dream and made innocuous to sleep. In order to provide a fulcrum for the dream-work, the 'day's residue' must be capable of constructing a wish - which is not a very hard condition to fulfil. The wish arising from the dream-thoughts forms the preliminary stage and later the core of the dream. Experience derived from analyses - and not the theory of dreams - informs us that in children any wish left over from waking life is sufficient to call up a dream, which emerges as connected and ingenious but usually short, and which is easily recognized as a 'wish-fulfilment'. In the case of adults it seems to be a generally binding condition that the wish which creates the dream shall be one that is alien to conscious thinking - a repressed wish - or will possibly at least have reinforcements that are unknown to consciousness. Without assuming the existence of the unconscious in the sense explained above, I should not be able to develop the theory of dreams further or to interpret the material met with in dream-analyses. The action of this unconscious wish upon the consciously rational material of the dream-thoughts produces the dream. While this happens, the dream is, as it were, dragged down into the unconscious, or, more precisely, is submitted to a treatment such as is met with at the level of unconscious thought-processes and is characteristic of that level. Hitherto it is only from the results of the 'dream-work' that we are in fact acquainted with the characteristics of unconscious thinking and its differences from thinking that is capable of becoming conscious - 'preconscious' thinking.

[1905c, 1746]

The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psycho-analysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is the interpretation of dreams, which brought psycho-analysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning or significance, and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psycho-analysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream. There is no half-way house between these two views of dreams. What argues against the physiological hypothesis is its unfruitfulness, and what may be argued in favour of the psycho-analytic one is the fact that it has translated and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

[1913j, 2806]

The dream-work has only one function - namely to maintain sleep. 'Dreams are the guardians of sleep.' The dream-thoughts themselves may serve the purposes of the most various mental functions. The dream-work accomplishes its task by representing a wish that arises from the dream-thoughts as fulfilled in a hallucinatory fashion.

[1913j, 2808]
A dream tells us that something was going on which tended to interrupt sleep, and it enables us to understand in what way it has been possible to fend off this interruption. The final outcome is that the sleeper has dreamt and is able to go on sleeping; the internal demand which was striving to occupy him has been replaced by an external experience, whose demand has been disposed off. A dream is, therefore, among other things, a *projection*: an externalization of an internal process. We may recall that we have already met with projection elsewhere among the means adopted for defence. The mechanism of a hysterical phobia, too, culminates in the fact that the subject is able to protect himself by attempts at flight against an external danger which has taken the place of an internal instinctual claim. We will, however, defer the full treatment of projection till we come to analyse the narcissistic disorder in which this mechanism plays the most striking part.

(5) This gives us the most direct approach to understanding the function of dreams. In so far as a dream is a reaction to a psychical stimulus, it must be equivalent to dealing with the stimulus in such a way that it is got rid of and that sleep can continue. We do not yet know how this dealing with the stimulus by the dream is made possible dynamically, but we see already that *dreams are not disturbers of sleep*, as they are abusively called, but *guardians of sleep which get rid of disturbances of sleep*. We think we should have slept more soundly if there had been no dream, but we are wrong; in fact, without the help of the dream we should not have slept at all. It is due to it that we have slept as soundly as we have. It could not avoid disturbing us a little, just as the night-watchman often cannot help making a little noise while he chases away the disturbers of the peace who seek to waken us with their noise.

But consider what a large amount of light has been thrown on things by our examination of children's dreams, and with scarcely any effort: the functions of dreams as the guardians of sleep; their origin from two concurrent purposes, one of which, the desire for sleep, remains constant, while the other strives to satisfy a psychical stimulus; proof that dreams are psychical acts with a sense; their two chief characteristics - wish-fulfilment and hallucinatory experience. And in discovering all this we were almost able to forget that we were engaged on psycho-analysis. Apart from its connection with parapraxes, our work has carried no specific mark. Any psychologist, knowing nothing of the postulates of psycho-analysis, might have been able to give this explanation of children's dreams. Why have they not done so?

LADIES AND GENTLEMEN, - The study of the dreams of children has taught us the origin, the essential nature and the function of dreams. *Dreams are things which get rid of (psychical) stimuli disturbing to sleep, by the method of hallucinatory satisfaction*. We have, however, only been able to explain one group of the dreams of adults - those which we have described as dreams of an infantile type. What the facts are about the others we cannot yet say, but we do not understand them. We have arrived at a provisional finding, however, whose importance we must not under-estimate. Whenever a dream has been completely intelligible to us, it has turned out to be the hallucinated fulfilment of a wish. This coincidence cannot be a chance one nor a matter of indifference.
But you must not blame the dream itself on account of its evil content. Do not forget that it performs the innocent and indeed useful function of preserving sleep from disturbance. This wickedness is not part of the essential nature of dreams. Indeed you know too that there are dreams which can be recognized as the satisfaction of justified wishes and of pressing bodily needs. These, it is true, have no dream-distortion; but they have no need of it, for they can fulfil their function without insulting the ethical and aesthetic purposes of the ego. Bear in mind, too, that dream-distortion is proportionate to two factors. On the one hand it becomes greater the worse the wish that has to be censored; but on the other hand it also becomes greater the more severe the demands of the censorship at the moment. Thus a strictly brought-up and prudish young girl, with a relentless censorship, will distort dream-impulses which we doctors, for instance, would have to regard as permissible, harmless, libidinal wishes, and on which in ten years' time the dreamer herself will make the same judgement.
[1916-1917, 3238]

We may suppose that what is true of undistorted anxiety dreams applies also to those which are partly distorted as well as to other unpleasurable dreams, in which the distressing feelings probably correspond to an approach to anxiety. Anxiety-dreams are as a rule also arousal dreams; we usually interrupt our sleep before the repressed wish in the dream has put its fulfilment through completely in spite of the censorship. In that case the function of the dream has failed, but its essential nature is not altered by this. We have compared dreams to the night-watchman or guardian of sleep, who tries to protect our sleep from disturbance. The night-watchman, too, may reach the point of waking the sleeper if he feels he is too weak alone to drive off the disturbance or the danger. Nevertheless we sometimes succeed in holding on to our sleep even when the dream begins to be precarious and to be turning into anxiety. We say to ourselves in our sleep 'after all it's only a dream', and sleep on.
[1916-1917, 3305]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathectic energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathectic belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfillment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their original function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur outside analysis as well? And the reply can only be a decided affirmative.

[1920g, 3735]

The Dynamic Theory of Dream-Formation. The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the 'dream-censorship', which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

[1923a, 3918]

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

[1923c, 4039]
Our mental activities pursue either a useful aim or an immediate yield of pleasure. In the former case what we are dealing with are intellectual judgements, preparations for action or the conveyance of information to other people. In the latter case we describe these activities as play or phantasy. What is useful is itself (as is well known) only a circuitous path to pleasurable satisfaction. Now, dreaming is an activity of the second kind, which is indeed, from the point of view of evolution, the earlier one. It is misleading to say that dreams are concerned with the tasks of life before us or seek to find a solution for the problems of our daily work. That is the business of preconscious thought. Useful work of this kind is as remote from dreams as is any intention of conveying information to another person. When a dream deals with a problem of actual life, it solves it in the manner of an irrational wish and not in the manner of a reasonable reflection. There is only one useful task, only one function, that can be ascribed to a dream, and that is the guarding of sleep from interruption. A dream may be described as a piece of phantasy working on behalf of the maintenance of sleep.

It follows from this that it is on the whole a matter of indifference to the sleeping ego what may be dreamt during the night so long as the dream performs its task, and that those dreams best fulfil their function about which one knows nothing after waking. If it so often happens otherwise, if we remember dreams - even after years and decades - it always means that there has been an irruption of the repressed unconscious into the normal ego. Without this concession to it the repressed would not have consented to lend its help to the removal of the threat of disturbance to sleep. We know that it is the fact of this irruption that gives dreams their importance for psychopathology. If we can uncover a dream's motivating force, we shall obtain unsuspected information about the repressed impulses in the unconscious; and on the other hand, if we can undo its distortions, we shall overhear preconscious thought taking place in states of internal reflection which would not have attracted consciousness to themselves during the day-time.
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a *dream is the (disguised) fulfilment of a (repressed) wish*. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety-dreams*.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal-dreams*.) I have given the name of *dream-work* to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed*, its psychical emphasis becomes *displaced*, and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive secondary *revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1925d, 4219]

[1925d, 4220]
Here we are presented with a means of answering the question of whether dreams have a function too, whether they are entrusted with any useful achievement. The condition of rest free from stimulus, which the state of sleep wishes to establish, is threatened from three directions: in a relatively accidental manner by external stimuli during sleep, and by interests of the previous day which cannot be broken off, and in an unavoidable manner by unsated repressed instinctual impulses which are on the watch for an opportunity of finding expression. In consequence of the diminishing of repressions at night there would be a risk that the rest afforded by sleep would be interrupted whenever an instigation from outside or from inside succeeded in linking up with an unconscious instinctual source. The process of dreaming allows the product of a collaboration of this kind to find an outlet in a harmless hallucinatory experience and in that way assures a continuation of sleep. The fact that a dream occasionally awakens the sleeper, to the accompaniment of a generation of anxiety, is no contradiction of this function but rather, perhaps, a signal that the watchman regards the situation as too dangerous and no longer feels able to control it. And very often then, while we are still asleep, a consolation occurs to us which seeks to prevent our waking up: 'But after all it's only a dream!'

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the distortion which the dream-work had carried out upon the rational and intelligible material.
It remains for us to give a dynamic explanation of why the sleeping ego takes on the task of the dream-work at all. The explanation is fortunately easy to find. With the help of the unconscious, every dream that is in process of formation makes a demand upon the ego - for the satisfaction of an instinct, if the dream originates from the id; for the solution of a conflict, the removal of a doubt or the forming of an intention, if the dream originates from a residue of preconscious activity in waking life. The sleeping ego, however, is focused on the wish to maintain sleep; it feels this demand as a disturbance and seeks to get rid of the disturbance. The ego succeeds in doing this by what appears to be an act of compliance: it meets the demand with what is in the circumstances a harmless fulfillment of a wish and so gets rid of it. This replacement of the demand by the fulfilment of a wish remains the essential function of the dream-work. It may perhaps be worth while to illustrate this by three simple examples - a hunger dream, a dream of convenience and a dream prompted by sexual desire. A need for food makes itself felt in a dreamer during his sleep: he has a dream of a delicious meal and sleeps on. The choice, of course, was open to him either of waking up and eating something or of continuing his sleep. He decided in favour of the latter and satisfied his hunger by means of the dream - for the time being, at all events, for if his hunger had persisted he would have had to wake up nevertheless. Here is the second example. A sleeper had to wake up so as to be in time for his work at the hospital. But he slept on, and had a dream that he was already at the hospital - but as a patient, who has no need to get up. Or again, a desire becomes active during the night for the enjoyment of a forbidden sexual object, the wife of a friend of the sleeper. He has a dream of sexual intercourse - not, indeed, with this person but with someone else of the same name to whom he is in fact indifferent; or his struggle against the desire may find expression in his mistress remaining altogether anonymous.

As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an attempt to get rid of a disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township's sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.

A dream, then, is a psychosis, with all the absurdities, delusions and illusions of a psychosis. A psychosis of short duration, no doubt, harmless, even entrusted with a useful function, introduced with the subject's consent and terminated by an act of his will. None the less it is a psychosis, and we learn from it that even so deep-going an alteration of mental life as this can be undone and can give place to the normal function. Is it too bold, then, to hope that it must also be possible to submit the dreaded spontaneous illnesses of mental life to our influence and bring about their cure?
Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being discharged, may be bound by the preconscious. This second alternative is the one which occurs in the process of dreaming. The cathexis from the Pcs. which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really has brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually is more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious work - rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the Ucs. which has been left free; in so doing, it discharges the Ucs. excitation, serves it as a safety valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise: it is in the service of both of the two systems since it fulfils the two wishes in so far as they are compatible with each other. If we turn back to the 'excretion theory' of dreams put forward by Robert, which I explained on p. 586 ff., we shall see at a glance that in its essence we must accept his account of the function of dreams, though differing from him in his premises and in his view of the dream-process itself.¹ [1900a, 1007]
The reader will rightly conclude from the foregoing arguments that I am asserting that there are no indifferent dream-instigators - and consequently no 'innocent' dreams. Those are, in the strictest and most absolute sense, my opinions - if I leave on one side the dreams of children and perhaps brief reactions in dreams to sensations felt during the night. Apart from this, what we dream is either manifestly recognizable as psychically significant, or it is distorted and cannot be judged till the dream has been interpreted, after which it will once more be found to be significant. Dreams are never concerned with trivialities; we do not allow our sleep to be disturbed by trifles.¹ The apparently innocent dreams turn out to be quite the reverse when we take the trouble to analyse them. They are, if I may say so, wolves in sheep's clothing. Since this is another point upon which I may expect to be contradicted, and since I am glad of an opportunity of showing dream-distortion at work, I will select a number of 'innocent' dreams from my records and submit them to analysis.

An intelligent and cultivated young woman, reserved and undemonstrative in her behaviour, reported as follows: *I dreamt that I arrived too late at the market and could get nothing either from the butcher or from the woman who sells vegetables.* An innocent dream, no doubt; but dreams are not as simple as that, so I asked to be told it in greater detail. She thereupon gave me the following account. *She dreamt she was going to the market with her cook, who was carrying the basket. After she had asked for something, the butcher said to her: 'That's not obtainable any longer', and offered her something else, adding 'This is good too.' She rejected it and went on to the woman who sells vegetables, who tried to get her to buy a peculiar vegetable that was tied up in bundles but was of a black colour. She said: 'I don't recognize that; I won't take it.'*

¹[1900a, 670]
Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.

[1901b, 1293]

In my Interpretation of Dreams, published in 1900, I showed that dreams in general can be interpreted, and that after the work of interpretation has been completed they can be replaced by perfectly correctly constructed thoughts which can be assigned a recognizable position in the chain of mental events. I wish to give an example in the following pages of the only practical application of which the art of interpreting dreams seems to admit. I have already mentioned in my book¹ how it was that I came upon the problem of dreams. The problem crossed my path as I was endeavouring to cure psychoneuroses by means of a particular psychotherapeutic method. For, among their other mental experiences, my patients told me their dreams, and these dreams seemed to call for insertion in the long thread of connections which spun itself out between a symptom of the disease and a pathogenic idea. At that time I learnt how to translate the language of dreams into the forms of expression of our own thought-language, which can be understood without further help. And I may add that this knowledge is essential for the psycho-analyst; for the dream is one of the roads along which consciousness can be reached by the psychical material which, on account of the opposition aroused by its content, has been cut off from consciousness and repressed, and has thus become pathogenic. The dream, in short, is one of the détours by which repression can be evaded; it is one of the principal means employed by what is known as the indirect method of representation in the mind. The following fragment from the history of the treatment of a hysterical girl is intended to show the way in which the interpretation of dreams plays a part in the work of analysis. It will at the same time give me a first opportunity of publishing at sufficient length to prevent further misunderstanding some of my views upon the psychical processes of hysteria and upon its organic determinants. I need no longer apologize on the score of length, since it is now agreed that the exacting demands which hysteria makes upon physician and investigator can be met only by the most sympathetic spirit of inquiry and not by an attitude of superiority and contempt. For,

[1905e, 1357]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]

A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.

[1922b, 3906]
It is possible to distinguish between dreams from above and dreams from below, provided the distinction is not made too sharply. Dreams from below are those which are provoked by the strength of an unconscious (repressed) wish which has found a means of being represented in some of the day's residues. They may be regarded as inroads of the repressed into waking life. Dreams from above correspond to thoughts or intentions of the day before which have contrived during the night to obtain reinforcement from repressed material that is debarrèd from the ego. When this is so, analysis as a rule disregards this unconscious ally and succeeds in inserting the latent dream-thoughts into the texture of waking thought. This distinction calls for no modification in the theory of dreams.

[1923c, 4032]

It follows from this that it is on the whole a matter of indifference to the sleeping ego what may be dreamt during the night so long as the dream performs its task, and that those dreams best fulfil their function about which one knows nothing after waking. If it so often happens otherwise, if we remember dreams - even after years and decades - it always means that there has been an irruption of the repressed unconscious into the normal ego. Without this concession to it the repressed would not have consented to lend its help to the removal of the threat of disturbance to sleep. We know that it is the fact of this irruption that gives dreams their importance for psychopathology. If we can uncover a dream's motivating force, we shall obtain unsuspected information about the repressed impulses in the unconscious; and on the other hand, if we can undo its distortions, we shall overhear preconscious thought taking place in states of internal reflection which would not have attracted consciousness to themselves during the day-time.

[1925i, 4045]

Now a dream is not a morbid symptom but a product of the normal mind. The wishes which it represents as fulfilled are the same as those which are repressed in neuroses. Dreams owe the possibility of their genesis merely to the favourable circumstance that during the state of sleep, which paralyses man's power of movement, repression is mitigated into the dream-censorship. If, however, the process of dream-formation oversteps certain limits, the dreamer brings it to a stop and wakes up in a fright. Thus it is proved that the same forces and the same processes taking place between them operate in normal as in pathological mental life. From the date of The Interpretation of Dreams psycho-analysis had a twofold significance. It was not only a new method of treating the neuroses but it was also a new psychology; it claimed the attention not only of nerve-specialists but also of all those who were students of a mental science.

[1924f, 4110]
We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.²

¹[1925d, 4221]  
²[1933a, 4632]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
Hitherto philosophers have had no occasion to concern themselves with a psychology of repression. We may therefore be permitted to make a first approach to this hitherto unknown topic by constructing a pictorial image of the course of events in dream-formation. It is true that the schematic picture we have arrived at - not only from the study of dreams - is a fairly complicated one; but we cannot manage with anything simpler. Our hypothesis is that in our mental apparatus there are two thought-constructing agencies, of which the second enjoys the privilege of having free access to consciousness for its products whereas the activity of the first is in itself unconscious and can only reach consciousness by way of the second. On the frontier between the two agencies, where the first passes over to the second, there is a censorship, which only allows what is agreeable to it to pass through and holds back everything else. According to our definition, then, what is rejected by the censorship is in a state of repression. Under certain conditions, of which the state of sleep is one, the relation between the strength of the two agencies is modified in such a way that what is repressed can no longer be held back. In the state of sleep this probably occurs owing to a relaxation of the censorship; when this happens it becomes possible for what has hitherto been repressed to make a path for itself to consciousness. Since, however, the censorship is never completely eliminated but merely reduced, the repressed material must submit to certain alterations which mitigate its offensive features. What becomes conscious in such cases is a compromise between the intentions of one agency and the demands of the other. Repression - relaxation of the censorship - the formation of a compromise, this is the fundamental pattern for the generation not only of dreams but of many other psychopathological structures; and in the latter cases too we may observe that the formation of compromises is accompanied by processes of condensation and displacement and by the employment of superficial associations, which we have become familiar with in the dream-work.

[1901a, 1089]

Now while this agency, in which we recognize our normal ego, is concentrated on the wish to sleep, it appears to be compelled by the psycho-physiological conditions of sleep to relax the energy with which it is accustomed to hold down the repressed material during the day. In itself, no doubt, this relaxation does no harm; however much the suppressed impulses of the childish mind may prance around, their access to consciousness is still difficult and their access to movement is barred as the result of this same state of sleep. The danger of sleep being disturbed by them must, however, be guarded against. We must in any case suppose that even during deep sleep a certain amount of free attention is on duty as a guard against sensory stimuli, and that this guard may sometimes consider waking more advisable than a continuation of sleep. Otherwise there would be no explanation of how it is that we can be woken up at any moment by sensory stimuli of some particular quality. As the physiologist Burdach insisted long ago, a mother, for instance, will be roused by the whimpering of her baby, or a miller if his mill comes to a stop, or most people if they are called softly by their own name. Now the attention which is thus on guard is also directed towards internal wishful stimuli arising from the repressed material, and combines with them to form the dream which, as a compromise, simultaneously satisfies both of the two agencies. The dream provides a kind of psychical consummation for the wish that has been suppressed (or formed with the help of repressed material) by representing it as fulfilled; but it also satisfies the other agency by allowing sleep to continue. In this respect our ego is ready to behave like a child; it gives credence to the dream images, as though what it wanted to say was: 'Yes, yes! you're quite right, but let me go on sleeping!' The low estimate which we form of dreams when we are awake, and which we relate to their confused and apparently illogical character, is probably nothing other than the judgement passed by our sleeping ego upon the repressed impulses, a judgement based, with better right, upon the motor impotence of these disturbers of sleep. We are sometimes aware in our sleep of this contemptuous judgement. If the content of a dream goes too far in overstepping the censorship, we think: 'After all, it's only a dream!' - and go on sleeping.

[1901a, 1092]
A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the 'dream-work' in my Interpretation of Dreams. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.

On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one, and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one by the psychical stimulus, or let us say by the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.
There were now a whole series of questions to be answered, among the most important of
them being whether the formation of dreams had a motive, under what conditions it took place,
by what methods the dream-thoughts (which are invariably full of sense) become converted into
the dream (which is often senseless), and others besides. I attempted to solve all of these
problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find
space here for the briefest abstract of my investigation. When the latent dream-thoughts that
are revealed by the analysis of a dream are examined, one of them is found to stand out from
among the rest, which are intelligible and well known to the dreamer. These latter thoughts are
residues of waking life (the *day's residues*, as they are called technically); but the isolated
thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the
waking life of the dreamer and is consequently disavowed by him with surprise or indignation.
This impulse is the actual constructor of the dream: it provides the energy for its production and
makes use of the day's residues as material. The dream which thus originates represents a
situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for
this process to take place without being favoured by the presence of something in the nature of
a state of sleep. The necessary mental precondition of sleep is the concentration of the ego
upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since
at the same time all the paths of approach to motility are blocked, the ego is also able to reduce
the expenditure by which at other times it maintains the repressions. The unconscious impulse
makes use of this nocturnal relaxation of repression in order to push its way into consciousness
with the dream. But the repressive resistance of the ego is not abolished in sleep but merely
reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the
unconscious impulse to express itself in the forms which it would properly assume. In
consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged
to submit to being altered and softened so as to make the forbidden meaning of the dream
unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking
characteristics of the manifest dream. We are therefore justified in asserting that *a dream is the
(disguised) fulfilment of a (repressed) wish*. It will now be seen that dreams are constructed like
a neurotic symptom: they are compromises between the demands of a repressed impulse and
the resistance of a censoring force in the ego. Since they have a similar origin they are equally
unintelligible and stand in equal need of interpretation.

[1925d, 4219]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of The Psychopathology of Everyday Life. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]

It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

[1925d, 4238]
But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force here which is seeking to express something and another which is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it by something that reveals not a trace of it. The commonest and most characteristic cases of dream-construction are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted - only in a softened down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream-thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures akin to them, we named this agency the censor of dreams.

[1933a, 4628]

You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overpowers the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

[1933a, 4629]
This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.
[1933a, 4632]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.

Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilsments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.
The view which postulates that in all psychoses there is a splitting of the ego could not call for so much notice if it did not turn out to apply to other states more like the neuroses and, finally, to the neuroses themselves. I first became convinced of this in cases fetishism. This abnormality, which may be counted as one of the perversions, is, as is well known, based on the patient (who is almost always male) not recognizing the fact that females have no penis - a fact which is extremely undesirable to him since it is a proof of the possibility of his being castrated himself. He therefore disavows his own sense-perception which showed him that the female genitals lack a penis and holds fast to the contrary conviction. The disavowed perception does not, however, remain entirely without influence for, in spite of everything, he has not the courage to assert that he actually saw a penis. He takes hold of something else instead - a part of the body or some other object - and assigns it the role of the penis which he cannot do without. It is usually something that he in fact saw at the moment at which he saw the female genitals, or it is something that can suitably serve as a symbolic substitute for the penis. Now it would be incorrect to describe this process when a fetish is constructed as a splitting of the ego; it is a compromise formed with the help of displacement, such as we have been familiar with in dreams. But our observations show us still more. The creation of the fetish was due to an intention to destroy the evidence for the possibility of castration, so that fear of castration could be avoided. If females, like other living creatures, possess a penis, there is no need to tremble for the continued possession of one's own penis. Now we come across fetishists who have developed the same fear of castration as non-fetishists and react in the same way to it. Their behaviour is therefore simultaneously expressing two contrary premisses. On the one hand they are disavowing the fact of their perception - the fact that they saw no penis in the female genitals; and on the other hand they are recognizing the fact that females have no penis and are drawing the correct conclusions from it. The two attitudes persist side by side throughout their lives without influencing each other. Here is what may rightly be called a splitting of the ego. This circumstance also enables us to understand how it is that fetishism is so often only partially developed. It does not govern the choice of object exclusively but leaves room for a greater or lesser amount of normal sexual behaviour; sometimes, indeed, it retires into playing a modest part or is limited to a mere hint. In fetishists, therefore, the detachment of the ego from the reality of the external world has never succeeded completely.

[1940a [1938], 5008]
Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being discharged, may be bound by the preconscious. *This second alternative is the one which occurs in the process of dreaming.* The cathexis from the *Pcs.* which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really has brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually *is* more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious work - rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the *Ucs.* which has been left free; in so doing, it discharges the *Ucs.* excitation, serves it as a safety valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise: it is in the service of both of the two systems since it fulfills the two wishes in so far as they are compatible with each other. If we turn back to the ‘excretion theory’ of dreams put forward by Robert, which I explained on p. 586 ff., we shall see at a glance that in its essence we must accept his account of the *function* of dreams, though differing from him in his premises and in his view of the dream-process itself.¹

[1900a, 1007]
There is, however, another point to which I attach importance; and I must confess that it is solely on its account that I have embarked here upon all these discussions of the two psychical systems and their modes of activity and of repression. It is not now a question of whether I have formed an approximately correct opinion of the psychological factors with which we are concerned, or whether, which is quite possible in such difficult matters, my picture of them is distorted and incomplete. However many changes may be made in our reading of the psychical censorship and of the rational and abnormal revisions made of the dream-content, it remains true that processes of this sort are at work in the formation of dreams and that they show the closest analogy in their essentials to the processes observable in the formation of hysterical symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance of psychical equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made that no conclusions as to the dreams of normal people can be drawn from my dreams or those of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may argue back from the phenomena to their motive forces, we must recognize that the psychical mechanism employed by neuroses is not created by the impact of a pathological disturbance upon the mind but is present already in the normal structure of the mental apparatus. The two psychical systems, the censorship upon the passage from one of them to the other, the inhibition and overlaying of one activity by the other, the relations of both of them to consciousness - or whatever more correct interpretations of the observed facts may take their place - all of these form part of the normal structure of our mental instrument, and dreams show us one of the paths leading to an understanding of its structure. If we restrict ourselves to the minimum of new knowledge which has been established with certainty, we can still say this of dreams: they have proved that what is suppressed continues to exist in normal people as well as abnormal, and remains capable of psychical functioning. Dreams themselves are among the manifestations of this suppressed material; this is so theoretically in every case, and it can be observed empirically in a great number of cases at least, and precisely in cases which exhibit most clearly the striking peculiarities of dream-life. In waking life the suppressed material in the mind is prevented from finding expression and is cut off from internal perception owing to the fact that the contradictions present in it are eliminated - one side being disposed of in favour of the other; but during the night, under the sway of an impetus towards the construction of compromises, this suppressed material finds methods and means of forcing its way into consciousness.

[1900a, 1034]

What is officially described as an ‘obsessional idea’ exhibits, therefore, in its distortion from its original wording, traces of the primary defensive struggle. Its distortion enables it to persist, since conscious thought is thus compelled to misapprehend it, just as though it were a dream; for dreams also are a product of compromise and distortion, and are also misapprehended by waking thought.

[1909d, 2175]

(7) On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one, and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one by the psychical stimulus, or let us say by the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.

[1916-1917, 3225]
It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a compromise-formation (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind.

[1923a, 3919]

There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the day's residues, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a censorship of dreams and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of dream-distortion, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

[1925d, 4219]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of The Psychopathology of Everyday Life. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.
But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force here which is seeking to express something and another which is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it by something that reveals not a trace of it. The commonest and most characteristic cases of dream-construction are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted - only in a softened down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream-thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures akin to them, we named this agency the censor of dreams.

[1933a, 4628]

You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overpowers the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

[1933a, 4629]
This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.
[1933a, 4632]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis. [1932c, 4809]
But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.

Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.
The view which postulates that in all psychoses there is a *splitting of the ego* could not call for so much notice if it did not turn out to apply to other states more like the neuroses and, finally, to the neuroses themselves. I first became convinced of this in cases *fetishism*. This abnormality, which may be counted as one of the perversions, is, as is well known, based on the patient (who is almost always male) not recognizing the fact that females have no penis - a fact which is extremely undesirable to him since it is a proof of the possibility of his being castrated himself. He therefore disavows his own sense-perception which showed him that the female genitals lack a penis and holds fast to the contrary conviction. The disavowed perception does not, however, remain entirely without influence for, in spite of everything, he has not the courage to assert that he actually saw a penis. He takes hold of something else instead - a part of the body or some other object - and assigns it the role of the penis which he cannot do without. It is usually something that he in fact saw at the moment at which he saw the female genitals, or it is something that can suitably serve as a symbolic substitute for the penis. Now it would be incorrect to describe this process when a fetish is constructed as a splitting of the ego; it is a compromise formed with the help of displacement, such as we have been familiar with in dreams. But our observations show us still more. The creation of the fetish was due to an intention to destroy the evidence for the possibility of castration, so that fear of castration could be avoided. If females, like other living creatures, possess a penis, there is no need to tremble for the continued possession of one's own penis. Now we come across fetishists who have developed the same fear of castration as non-fetishists and react in the same way to it. Their behaviour is therefore simultaneously expressing two contrary premisses. On the one hand they are disavowing the fact of their perception - the fact that they saw no penis in the female genitals; and on the other hand they are recognizing the fact that females have no penis and are drawing the correct conclusions from it. The two attitudes persist side by side throughout their lives without influencing each other. Here is what may rightly be called a splitting of the ego. This circumstance also enables us to understand how it is that fetishism is so often only partially developed. It does not govern the choice of object exclusively but leaves room for a greater or lesser amount of normal sexual behaviour; sometimes, indeed, it retires into playing a modest part or is limited to a mere hint. In fetishists, therefore, the detachment of the ego from the reality of the external world has never succeeded completely.

[1940a [1938], 5008]
We have already explored the fiction of a primitive psychical apparatus whose activities are regulated by an effort to avoid an accumulation of excitation and to maintain itself so far as possible without excitation. For that reason it is built upon the plan of a reflex apparatus. The power of movement, which is in the first instance a means of bringing about internal alterations in its body, is at its disposal as the path to discharge. We went on to discuss the psychical consequences of an 'experience of satisfaction'; and in that connection we were already able to add a second hypothesis, to the effect that the accumulation of excitation (brought about in various ways that need not concern us) is felt as unpleasure and that it sets the apparatus in action with a view to repeating the experience of satisfaction, which involved a diminution of excitation and was felt as pleasure. A current of this kind in the apparatus, starting from unpleasure and aiming at pleasure, we have termed a 'wish'; and we have asserted that only a wish is able to set the apparatus in motion and that the course of the excitation in it is automatically regulated by feelings of pleasure and unpleasure. The first wishing seems to have been a hallucinatory cathecting of the memory of satisfaction. Such hallucinations, however, if they were not to be maintained to the point of exhaustion, proved to be inadequate to bring about the cessation of the need or, accordingly, the pleasure attaching to satisfaction.

A second activity - or, as we put it, the activity of a second system - became necessary, which would not allow the mnemonic cathexis to proceed as far as perception and from there to bind the psychical forces; instead, it diverted the excitation arising from the need along a roundabout path which ultimately, by means of voluntary movement, altered the external world in such a way that it became possible to arrive at a real perception of the object of satisfaction. We have already outlined our schematic picture of the psychical apparatus up to this point; the two systems are the germ of what, in the fully developed apparatus, we have described as the Ucs. and Pcs.

In order to be able to employ the power of movement to make alterations in the external world that shall be effective, it is necessary to accumulate a great number of experiences in the mnemonic systems and a multiplicity of permanent records of the associations called up in this mnemonic material by different purposive ideas. We can now carry our hypotheses a step further. The activity of this second system, constantly feeling its way, and alternately sending out and withdrawing cathexes, needs on the one hand to have the whole of the material of memory freely at its command; but on the other hand it would be an unnecessary expenditure of energy if it sent out large quantities of cathexis along the various paths of thought and thus caused them to drain away to no useful purpose and diminish the quantity available for altering the external world. I therefore postulate that for the sake of efficiency the second system succeeds in retaining the major part of its cathexes of energy in a state of quiescence and in employing only a small part on displacement. The mechanics of these processes are quite unknown to me; anyone who wished to take these ideas seriously would have to look for physical analogies to them and find a means of picturing the movements that accompany excitation of neurones. All that I insist upon is the idea that the activity of the first Ψ-system is directed towards securing the free discharge of the quantities of excitation, while the second system, by means of the cathexes emanating from it, succeeds in inhibiting this discharge and in transforming the cathexis into a quiescent one, no doubt with a simultaneous raising of its level. I presume, therefore, that under the dominion of the second system the discharge of excitation is governed by quite different mechanical conditions from those in force under the dominion of the first system. When once the second system has concluded its exploratory thought-activity, it releases the inhibition and damming-up of the excitations and allows them to discharge themselves in movement.
Adults have learnt to make this distinction; they have also grasped the uselessness of wishing, and after lengthy practice know how to postpone their desires until they can find satisfaction by the long and roundabout path of altering the external world. In their case, accordingly, wish-fulfilments along the short psychical path are rare in sleep too; it is even possible, indeed, that they never occur at all, and that anything that may seem to us to be constructed on the pattern of a child's dream in fact requires a far more complicated solution. On the other hand, in the case of adults - and this no doubt applies without exception to everyone in full possession of his senses - a differentiation has occurred in the psychical material, which was not present in children. A psychical agency has come into being, which, taught by experience of life, exercises a dominating and inhibiting influence upon mental impulses and maintains that influence with jealous severity, and which, owing to its relation to consciousness and to voluntary movement, is armed with the strongest instruments of psychical power. A portion of the impulses of childhood has been suppressed by this agency as being useless to life, and any thought-material derived from those impulses is in a state of repression. [1901a, 1092]

I shall be returning to lines of thought which I have developed elsewhere¹ when I suggest that the state of psychical rest was originally disturbed by the peremptory demands of internal needs. When this happened, whatever was thought of (wished for) was simply presented in a hallucinatory manner, just as still happens to-day with our dream-thoughts every night.² It was only the non-occurrence of the expected satisfaction, the disappointment experienced, that led to the abandonment of this attempt at satisfaction by means of hallucination. Instead of it, the psychical apparatus had to decide to form a conception of the real circumstances in the external world and to endeavour to make a real alteration in them. A new principle of mental functioning was thus introduced; what was presented in the mind was no longer what was agreeable but what was real, even if it happened to be disagreeable.³ This setting-up of the reality principle proved to be a momentous step. [1911b, 2553]

I will try to simplify the above schematic account with some further details. It will rightly be objected that an organization which was a slave to the pleasure principle and neglected the reality of the external world could not maintain itself alive for the shortest time, so that it could not have come into existence at all. The employment of a fiction like this is, however, justified when one considers that the infant - provided one includes with it the care it receives from its mother - does almost realize a psychical system of this kind. It probably hallucinates the fulfilment of its internal needs; it betrays its unpleasure, when there is an increase of stimulus and an absence of satisfaction, by the motor discharge of screaming and beating about with its arms and legs, and it then experiences the satisfaction it has hallucinated. Later, as an older child, it learns to employ these manifestations of discharge intentionally as methods of expressing its feelings. Since the later care of children is modelled on the care of infants, the dominance of the pleasure principle can really come to an end only when a child has achieved complete psychical detachment from its parents. - A neat example of a psychical system shut off from the stimuli of the external world, and able to satisfy even its nutritional requirements autistically (to use Bleuler's term), is afforded by a bird's egg with its food supply enclosed in its shell; for it, the care provided by its mother is limited to the provision of warmth. - I shall not regard it as a correction, but as an amplification of the schematic picture under discussion, if it is insisted that a system living according to the pleasure principle must have devices to enable it to withdraw from the stimuli of reality. Such devices are merely the correlative of 'repression', which treats internal unpleasurable stimuli as if they were external - that is to say, pushes them into the external world. [1911b, 2553]

¹ I will try to simplify the above schematic account with some further details. It will rightly be objected that an organization which was a slave to the pleasure principle and neglected the reality of the external world could not maintain itself alive for the shortest time, so that it could not have come into existence at all. The employment of a fiction like this is, however, justified when one considers that the infant - provided one includes with it the care it receives from its mother - does almost realize a psychical system of this kind. It probably hallucinates the fulfilment of its internal needs; it betrays its unpleasure, when there is an increase of stimulus and an absence of satisfaction, by the motor discharge of screaming and beating about with its arms and legs, and it then experiences the satisfaction it has hallucinated. Later, as an older child, it learns to employ these manifestations of discharge intentionally as methods of expressing its feelings. Since the later care of children is modelled on the care of infants, the dominance of the pleasure principle can really come to an end only when a child has achieved complete psychical detachment from its parents. - A neat example of a psychical system shut off from the stimuli of the external world, and able to satisfy even its nutritional requirements autistically (to use Bleuler's term), is afforded by a bird's egg with its food supply enclosed in its shell; for it, the care provided by its mother is limited to the provision of warmth. - I shall not regard it as a correction, but as an amplification of the schematic picture under discussion, if it is insisted that a system living according to the pleasure principle must have devices to enable it to withdraw from the stimuli of reality. Such devices are merely the correlative of 'repression', which treats internal unpleasurable stimuli as if they were external - that is to say, pushes them into the external world. [1911b, 2553]
Children are in an analogous psychical situation, though their motor efficiency is still undeveloped. I have elsewhere (1911b) put forward the hypothesis that, to begin with, they satisfy their wishes in a hallucinatory manner, that is, they create a satisfying situation by means of centrifugal excitations of their sense organs. An adult primitive man has an alternative method open to him. His wishes are accompanied by a motor impulse, the will, which is later destined to alter the whole face of the earth in order to satisfy his wishes. This motor impulse is at first employed to give a representation of the satisfying situation in such a way that it becomes possible to experience the satisfaction by means of what might be described as motor hallucinations. This kind of representation of a satisfied wish is quite comparable to children's play, which succeeds their earlier purely sensory technique of satisfaction. If children and primitive men find play and imitative representation enough for them, that is not a sign of their being unassuming in our sense or of their resignedly accepting their actual impotence. It is the easily understandable result of the paramount virtue they ascribe to their wishes, of the will that is associated with those wishes and of the methods by which those wishes operate. As time goes on, the psychological accent shifts from the motives for the magical act on to the measures by which it is carried out - that is, on to the act itself. (It would perhaps be more correct to say that it is only these measures that reveal to the subject the excessive valuation which he attaches to his psychical acts.) It thus comes to appear as though it is the magical act itself which, owing to its similarity with the desired result, alone determines the occurrence of that result. There is no opportunity, at the stage of animistic thinking, for showing any objective evidence of the true state of affairs. But a possibility of doing so does arrive at a later time, when, though all of these procedures are still being carried out, the psychical phenomenon of doubt has begun to emerge as an expression of a tendency to repression. At that point, men will be ready to admit that conjuring up spirits has no result unless it is accompanied by faith, and that the magical power of prayer fails if there is no piety at work behind it.¹

Let us, furthermore, bear in mind the great practical importance of distinguishing perceptions from ideas, however intensely recalled. Our whole relation to the external world, to reality, depends on our ability to do so. We have put forward the fiction that we did not always possess this ability and that at the beginning of our mental life we did in fact hallucinate the satisfying object when we felt the need for it. But in such a situation satisfaction did not occur, and this failure must very soon have moved us to create some contrivance with the help of which it was possible to distinguish such wishful perceptions from a real fulfilment and to avoid them for the future. In other words, we gave up hallucinatory satisfaction of our wishes at a very early period and set up a kind of 'reality-testing'. The question now arises in what this reality-testing consisted, and how the hallucinatory wishful psychosis of dreams and amentia and similar conditions succeeds in abolishing it and in re-establishing the old mode of satisfaction.

Let us now bring together what our researches into child psychology have contributed to our understanding of dreams. We have not only found that the material of the forgotten experiences of childhood is accessible to dreams, but we have also seen that the mental life of children with all its characteristics, its egoism, its incestuous choice of love-objects, and so on, still persists in dreams - that is, in the unconscious, and that dreams carry us back every night to this infantile level. The fact is thus confirmed that what is unconscious in mental life is also what is infantile. The strange impression of there being so much evil in people begins to diminish. This frightful evil is simply the initial, primitive, infantile part of mental life, which we can find in actual operation in children, but which, in part, we overlook in them on account of their small size, and which in part we do not take seriously since we do not expect any high ethical standard from children. Since dreams regress to this level, they give the appearance of having brought to light the evil in us. But this is a deceptive appearance, by which we have allowed ourselves to be scared. We are not so evil as we were inclined to suppose from the interpretation of dreams.
It thus seems plausible to suppose that in the dream-work a psychical force is operating which on the one hand strips the elements which have a high psychical value of their intensity, and on the other hand, by means of overdetermination, creates from elements of low psychical value new values, which afterwards find their way into the dream-content. If that is so, a transference and displacement of psychical intensities occurs in the process of dream-formation, and it is as a result of these that the difference between the text of the dream-content and that of the dream thoughts comes about. The process which we are here presuming is nothing less than the essential portion of the dream work; and it deserves to be described as 'dream-displacement.' Dream-displacement and dream-condensation are the two governing factors to whose activity we may in essence ascribe the form assumed by dreams. [1900a, 779]

Strange to say, it does. The sense is merely disguised in a particular way so that it is not immediately recognizable. Hanold learned in the dream that the girl he was looking for was living in a town and contemporaneously with him. Now this was true of Zoe Bertgang; only in the dream the town was not the German university town but Pompeii, and the time was not the present but the year 79 A.D. It is, as it were, a distortion by displacement: what we have is not Gradiva in the present but the dreamer transported into the past. Nevertheless, in this manner, the essential and new fact is stated: he is in the same place and time as the girl he is looking for. But whence come this displacement and disguise which were bound to deceive both us and the dreamer over the true meaning and content of the dream? Well, we already have the means at our disposal for giving a satisfactory answer to that question. [1907a, 1855]

The fourth of my reflections takes us back to the beginning and directs us along our prescribed path. I have said that even if there were no dream-censorship dreams would still not be easily intelligible to us, for we should still be faced with the task of translating the symbolic language of dreams into that of our waking thought. Thus symbolism is a second and independent factor in the distortion of dreams, alongside of the dream-censorship. It is plausible to suppose, however, that the dream-censorship finds it convenient to make use of symbolism, since it leads towards the same end - the strangeness and incomprehensibility of dreams. [1916-1917, 3261]
I can imagine that to point out the existence of lying dreams of this kind, 'obliging' dreams, will arouse a positive storm of helpless indignation in some readers who call themselves analysts. 'What!' they will exclaim, 'the unconscious, the real centre of our mental life, the part of us that is so much nearer the divine than our poor consciousness - it too can lie! Then how can we still build on the interpretations of analysis and the accuracy of our findings?' To which one must reply that the recognition of these lying dreams does not constitute any shattering novelty. I know, indeed, that the craving of mankind for mysticism is ineradicable, and that it makes ceaseless efforts to win back for mysticism the territory it has been deprived of by The Interpretation of Dreams, but surely in the case under consideration everything is simple enough. A dream is not the 'unconscious'; it is the form into which a thought left over from preconscious, or even from conscious, waking life, can, thanks to the favouring state of sleep, be recast. In the state of sleep this thought has been reinforced by unconscious wishful impulses and has thus experienced distortion through the dream-work, which is determined by the mechanisms prevailing in the unconscious. With our dreamer, the intention to mislead me, just as she did her father, certainly emanated from the preconscious, and may indeed have been conscious; it could come to expression by entering into connection with the unconscious wishful impulse to please her father (or father-substitute), and in this way it created a lying dream. The two intentions, to betray and to please her father, originated in the same complex; the former resulted from the repression of the latter, and the later one was brought back by the dream-work to the earlier one. There can therefore be no question of any devaluation of the unconscious, nor of a shattering of our confidence in the results of analysis.

[1920a, 3854]
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the day's residues, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force here which is seeking to express something and another which is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it by something that reveals not a trace of it. The commonest and most characteristic cases of dream-construction are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted - only in a softened down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream-thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures akin to them, we named this agency the *censor of dreams*.

[1925d, 4219]

[1933a, 4628]
Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

[1933a, 4632]

Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathetted with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.

[1933a, 4633]

The myth tells us that Prometheus the Titan, a culture-hero who was still a god¹ and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of quenching fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material.

[1932a, 4782]
The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to condensation, an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream-thoughts as though it were a combined allusion to all of them; and in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities (cathexes) are displaced from one element to another, so that it often happens that an element which was of little importance in the dream-thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, vice versa, that essential elements of the dream-thoughts are represented in the manifest dream only by slight allusions. Moreover, as a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one by the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream-thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging quantities of excitation than by any other consideration;¹ and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.
[1940a [1938], 4978]
It thus seems plausible to suppose that in the dream-work a psychical force is operating which on the one hand strips the elements which have a high psychical value of their intensity, and on the other hand, \textit{by means of overdetermination}, creates from elements of low psychical value new values, which afterwards find their way into the dream-content. If that is so, a \textit{transference and displacement of psychical intensities} occurs in the process of dream-formation, and it is as a result of these that the difference between the text of the dream-content and that of the dream thoughts comes about. The process which we are here presuming is nothing less than the essential portion of the dream work; and it deserves to be described as 'dream-displacement.' Dream-displacement and dream-condensation are the two governing factors to whose activity we may in essence ascribe the form assumed by dreams.

[1900a, 779]

The question of the interplay of these factors - of displacement, condensation and overdetermination - in the construction of dreams, and the question which is a dominant factor and which a subordinate one - all of this we shall leave aside for later investigation. But we can state provisionally a second condition which must be satisfied by those elements of the dream-thoughts which make their way into the dream: \textit{they must escape the censorship imposed by resistance}. And henceforward in interpreting dreams we shall take dream-displacement into account as an undeniable fact.

[1900a, 780]

Omission, modification, fresh grouping of the material - these, then, are the activities of the dream-censorship and the instruments of dream-distortion. The dream-censorship itself is the originator, or one of the originators, of the dream-distortion which we are now engaged in examining. We are in the habit of combining the concepts of modification and re-arrangement under the term 'displacement'.

[1916-1917, 3236]

Perhaps you recognize, moreover, what it is that supports our hypotheses of the two systems, and their relation to each other and to consciousness? After all, the watchman between the unconscious and the preconscious is nothing else than the \textit{censorship}, to which, as we found, the form taken by the manifest dream is subject. The day's residues, which we recognized as the instigators of the dream, were preconscious material which, at night-time and in the state of sleep, had been under the influence of unconscious and repressed wishful impulses; they had been able, in combination with those impulses and thanks to their energy, to construct the latent dream. Under the dominance of the unconscious system this material had been worked over (by condensation and displacement) in a manner which is unknown or only exceptionally permissible in normal mental life - that is, in the preconscious system. We came to regard this difference in their manner of operating as what characterizes the two systems; the relation which the preconscious has to consciousness was regarded by us merely as an indication of its belonging to one of the two systems. Dreams are not pathological phenomena; they can appear in any healthy person under the conditions of a state of sleep. Our hypothesis about the structure of the mental apparatus, which allows us to understand the formation alike of dreams and of neurotic symptoms, has an incontrovertible claim to being taken into account in regard to normal mental life as well.

[1916-1917, 3370]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfillment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]

*The Dynamic Theory of Dream-Formation.* The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the 'dream-censorship', which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

[1923a, 3918]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction.

[1923a, 3923]

What conclusions can one draw from a correctly translated dream? I have an impression that analytic practice has not always avoided errors and over-estimations on this point, partly owing to an exaggerated respect for the 'mysterious unconscious'. It is only too easy to forget that a dream is as a rule merely a thought like any other, made possible by a relaxation of the censorship and by unconscious reinforcement, and distorted by the operation of the censorship and by unconscious revision.

[1923c, 4033]

In my case, too, the originality of many of the new ideas employed by me in the interpretation of dreams and in psycho-analysis has evaporated in this way. I am ignorant of the source of only one of these ideas. It was no less than the key to my view of dreams and helped me to solve their riddles, so far as it has been possible to solve them hitherto. I started out from the strange, confused and senseless character of so many dreams, and hit upon the notion that dreams were bound to become like that because something was struggling for expression in them which was opposed by a resistance from other mental forces. In dreams hidden impulses were stirring which stood in contradiction to what might be called the dreamer's official ethical and aesthetic creed; the dreamer was thus ashamed of these impulses, turned away from them and refused to acknowledge them in day-time, and if during the night he could not withhold expression of some kind from them, he submitted them to a 'dream-distortion' which made the content of the dream appear confused and senseless. To the mental force in human beings which keeps watch on this internal contradiction and distorts the dream's primitive instinctual impulses in favour of conventional or of higher moral standards, I gave the name of 'dream-censorship'.

[1923f, 4159]
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day’s residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day’s residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

[1925d, 4219]

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety-dreams.* A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal-dreams.*) I have given the name of *dream-work* to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed*, its psychical emphasis becomes *displaced*, and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive *secondary revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1925d, 4220]
But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force here which is seeking to express something and another which is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it by something that reveals not a trace of it. The commonest and most characteristic cases of dream-construction are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted - only in a softened down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream-thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures akin to them, we named this agency the censor of dreams. [1933a, 4628]

You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained. [1933a, 4629]
This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathexed with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
Now, if we leave psychological terminology out of account, this was the very same explanation of dream-distortion that I had arrived at from my study of dreams. Distortion was a compromise, something in its very nature disingenuous, the product of a conflict between thought and feeling, or, as I had put it, between what is conscious and what is repressed. Where a conflict of this kind was not present and repression was unnecessary, dreams could not be strange or senseless. The man who dreamed in a way no different from that in which he thought while awake was granted by Popper the very condition of internal harmony which, as a social reformer, he aimed at producing in the body politic. And if Science informs us that such a man, wholly without evil and falseness and devoid of all repressions, does not exist and could not survive, yet we may guess that, so far as an approximation to this ideal is possible, it had found its realization in the person of Popper himself.

[1932c, 4810]

The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to condensation, an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream-thoughts as though it were a combined allusion to all of them; and in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities (cathexes) are displaced from one element to another, so that it often happens that an element which was of little importance in the dream-thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, vice versa, that essential elements of the dream-thoughts are represented in the manifest dream only by slight allusions. Moreover, as a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one by the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream-thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging quantities of excitation than by any other consideration;¹ and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.

[1940a [1938], 4978]
As regards my share of the book, too, the only possible decision has been that the text of the first edition shall be reprinted without alteration. The developments and changes in my views during the course of thirteen years of work have been too far-reaching for it to be possible to attach them to my earlier exposition without entirely destroying its essential character. Nor have I any reason for wishing to eliminate this evidence of my initial views. Even to-day I regard them not as errors but as valuable first approximations to knowledge which could only be fully acquired after long and continuous efforts. The attentive reader will be able to detect in the present book the germs of all that has since been added to the theory of catharsis: for instance, the part played by psychosexual factors and infantilism, the importance of dreams and of unconscious symbolism. And I can give no better advice to any one interested in the development of catharsis into psycho-analysis than to begin with Studies on Hysteria and thus follow the path which I myself have trodden.

[1895d, 4]

Hypnosis. - She had had some fearful dreams. The legs and arms of the chairs were all turned into snakes; a monster with a vulture's beak was tearing and eating at her all over her body; other wild animals leapt upon her, etc. She then passed on to other animal-deliria, which, however, she qualified with the addition 'That was real' (not a dream): how (on an earlier occasion) she had been going to pick up a ball of wool, and it was a mouse and ran away; how she had been on a walk, and a big toad suddenly jumped out at her, and so on. I saw that my general prohibition had been ineffective and that I should have to take her frightening impressions away from her one by one.¹ I took an opportunity of asking her, too, why she had gastric pains and what they came from. (I believe that all her attacks of zoöpsia are accompanied by gastric pains.) Her answer, which she gave rather grudgingly, was that she did not know. I requested her to remember by tomorrow. She then said in a definitely grumbling tone that I was not to keep on asking her where this and that came from, but to let her tell me what she had to say, I fell in with this, and she went on without preface: 'When they carried him out, I could not believe he was dead.' (So she was talking of her husband again, and I saw now that the cause of her ill-humour was that she had been suffering from the residues of this story which had been kept back.) After this, she said, she had hated her child for three years, because she always told herself that she might have been able to nurse her husband back to health if she had not been in bed on account of the child. And then after her husband's death there had been nothing but insults and agitations. His relatives, who had always been against the marriage and had then been angry because they had been so happy together, had spread a rumour that she had poisoned him, so that she had wanted to demand an enquiry. Her relatives had involved her in all kinds of legal proceedings with the help of a shady journalist. The wretch had sent round agents to stir people up against her. He got the local papers to print libellous articles about her, and then sent her the cuttings. This had been the origin of her unsociability and her hatred of all strangers. After I had spoken some calming words about what she had told me, she said she felt easier.

[1895d, 60]

I have attempted in this volume to give an account of the interpretation of dreams; and in doing so I have not, I believe, trespassed beyond the sphere of interest covered by neuro-pathology. For psychological investigation shows that the dream is the first member of a class of abnormal psychical phenomena of which further members, such as hysterical phobias, obsessions and delusions, are bound for practical reasons to be a matter of concern to physicians. As will be seen in the sequel, dreams can make no such claim to practical importance; but their theoretical value as a paradigm is on the other hand proportionately greater. Anyone who has failed to explain the origin of dream-images can scarcely hope to understand phobias, obsessions or delusions or to bring a therapeutic influence to bear on them.

[1900a, 508]
If within ten years of the publication of this book (which is very far from being an easy one to read) a second edition is called for, this is not due to the interest taken in it by the professional circles to whom my original preface was addressed. My psychiatric colleagues seem to have taken no trouble to overcome the initial bewilderment created by my new approach to dreams. The professional philosophers have become accustomed to polishing off the problems of dream-life (which they treat as a mere appendix to conscious states) in a few sentences - and usually in the same ones; and they have evidently failed to notice that we have something here from which a number of inferences can be drawn that are bound to transform our psychological theories. The attitude adopted by reviewers in the scientific periodicals could only lead one to suppose that my work was doomed to be sunk into complete silence; while the small group of gallant supporters, who practise medical psycho-analysis under my guidance and who follow my example in interpreting dreams and make use of their interpretations in treating neurotics, would never have exhausted the first edition of the book. Thus it is that I feel indebted to a wider circle of educated and curious-minded readers, whose interest has led me to take up once more after nine years this difficult, but in many respects fundamental, work.

[1900a, 509]

An equal durability and power to withstand any far-reaching alterations during the process of revision has been shown by the material of the book, consisting as it does of dreams of my own which have for the most part been overtaken or made valueless by the march of events and by which I illustrated the rules of dream-interpretation. For this book has a further subjective significance for me personally - a significance which I only grasped after I had completed it. It was, I found, a portion of my own self-analysis, my reaction to my father's death - that is to say, to the most important event, the most poignant loss, of a man's life. Having discovered that this was so, I felt unable to obliterate the traces of the experience. To my readers, however, it will be a matter of indifference upon what particular material they learn to appreciate the importance of dreams and how to interpret them.

[1900a, 509]

Even the Interpretation of Dreams has not been left untouched by the advance of scientific knowledge. When I wrote it in 1899, my theory of sexuality was not yet in existence and the analysis of the more complicated forms of psycho-neurosis was only just beginning. It was my hope that dream-interpretation would help to make possible the psychological analysis of the neuroses; since then a deeper understanding of neuroses has reacted in turn upon our view of dreams. The theory of dream-interpretation has itself developed further in a direction on which insufficient stress had been laid in the first edition of this book. My own experience, as well as the works of Wilhelm Stekel and others, have since taught me to form a truer estimate of the extent and importance of symbolism in dreams (or rather in unconscious thinking). Thus in the course of these years much has accumulated which demands attention. I have endeavoured to take these innovations into account by making numerous interpolations in the text and by additional footnotes. If these additions threaten at times to burst the whole framework of the book or if I have not everywhere succeeded in bringing the original text up to the level of our present knowledge, I must ask the reader's indulgence for these deficiencies: they are the results and signs of the present increasingly rapid development of our science. I may even venture to prophesy in what other directions later editions of this book - if any should be needed - will differ from the present one. They will have on the one hand to afford a closer contact with the copious material presented in imaginative writing, in myths, in linguistic usage and in folklore; while on the other hand they will have to deal in greater detail than has here been possible with the relations of dreams to neuroses and mental diseases.

[1900a, 510]
Until recently most writers on the subject have felt obliged to treat sleep and dreams as a single topic, and as a rule they have dealt in addition with analogous conditions on the fringe of pathology, and dream-like states, such as hallucinations, visions and so on. The latest works, on the contrary, show a preference for a restricted theme and take as their subject, perhaps, some isolated question in the field of dream-life. I should be glad to see in this change of attitude the expression of a conviction that in such obscure matters it will only be possible to arrive at explanations and agreed results by a series of detailed investigations. A piece of detailed research of that kind, predominantly psychological in character, is all I have to offer in these pages. I have had little occasion to deal with the problem of sleep, for that is essentially a problem of physiology, even though one of the characteristics of the state of sleep must be that it brings about modifications in the conditions of functioning of the mental apparatus. The literature on the subject of sleep is accordingly disregarded in what follows.

[1900a, 520]

We have here reached the theory of the origin of dreams which is preferred by all the medical authorities. The obscurity in which the centre of our being (the 'moi splanchnique', as Tissié calls it) is veiled from our knowledge and the obscurity surrounding the origin of dreams tally too well not to be brought into relation to each other. The line of thought which regards vegetative organic sensation as the constructor of dreams has, moreover, a particular attraction for medical men since it allows of a single aetiology for dreams and mental diseases, whose manifestations have so much in common; for coenaesthetic changes and stimuli arising from the internal organs are also held largely responsible for the origin of the psychoses. It is not surprising, therefore, that the origin of the theory of somatic stimulation may be traced back to more than one independent source.

[1900a, 548]

Thus Havelock Ellis (1899, 721), without dwelling on the apparent absurdity of dreams, speaks of them as 'an archaic world of vast emotions and imperfect thoughts', the study of which might reveal to us primitive stages in the evolution of mental life.

[1900a, 568]

The same view is expressed by James Sully (1893, 362) in a manner that is both more sweeping and more penetrating. His words deserve all the more attention when we bear in mind that he was more firmly convinced, perhaps, than any other psychologist that dreams have a disguised meaning. 'Now our dreams are a means of conserving these successive personalities. When asleep we go back to the old ways of looking at things and of feeling about them, to impulses and activities which long ago dominated us.'

[1900a, 568]

A more revealing light is thrown upon the psychological position of these incompatible thoughts by another remark of Hildebrandt's (1875, 55), to the effect that dreams give us an occasional glimpse into depths and recesses of our nature to which we usually have no access in our waking state. Kant expresses the same idea in a passage in his Anthropologie in which he declares that dreams seem to exist in order to show us our hidden natures and to reveal to us, not what we are, but what we might have been if we had been brought up differently. Radestock (1879, 84), too, says that dreams often do no more than reveal to us what we would not admit to ourselves and that it is therefore unfair of us to stigmatize them as liars and deceivers. Erdmann writes: 'Dreams have never shown me what I ought to think of a man; but I have occasionally learnt from a dream, greatly to my own astonishment, what I do think of a man and how I feel towards him.' Similarly I. H. Fichte (1864, I, 539) remarks: 'The nature of our dreams gives a far more truthful reflection of our whole disposition than we are able to learn of it from self-observation in waking life.'

[1900a, 577]
The question next arises as to the significance of the appearance of involuntary ideas in dreams, as to the light which the emergence during the night of these morally incompatible impulses throws upon the psychology of the waking and dreaming mind. And here we find a fresh division of opinion and yet another different grouping of the authorities. The line of thought adopted by Hildebrandt and others who share his fundamental position inevitably leads to the view that immoral impulses possess a certain degree of power even in waking life, though it is an inhibited power, unable to force its way into action, and that in sleep something is put out of action which acts like an inhibition in the daytime and has prevented us from being aware of the existence of such impulses. Thus dreams would reveal the true nature of man, though not his whole nature, and they would constitute one means of rendering the hidden interior of the mind accessible to our knowledge. Only upon some such premises as these can Hildebrandt base his attribution to dreams of warning powers, which draw our attention to moral infirmities in our mind, just as physicians admit that dreams can bring unobserved physical illnesses to our conscious notice. So, too, Spitta must be adopting this view when, in speaking of the sources of excitation which impinge upon the mind (at puberty, for instance), he consoles the dreamer with the assurance that he will have done all that lies within his power if he leads a strictly virtuous life in his waking hours, and if he takes care to suppress sinful thoughts whenever they arise and to prevent their maturing and turning into acts. According to this view we might define the 'involuntary ideas' as ideas which had been 'suppressed' during the day, and we should have to regard their emergence as a genuine mental phenomenon.

When we speak of the relation of dreams to mental disorders we may have three things in mind: (1) aetiological and clinical connections, as when a dream represents a psychotic state, or introduces it, or is left over from it; (2) modifications to which dream-life is subject in cases of mental disease; and (3) intrinsic connections between dreams and psychoses, analogies pointing to their being essentially akin. These numerous relations between the two groups of phenomena were a favourite topic among medical writers in earlier times and have become so once again to-day, as is shown by the bibliographies of the subject collected by Spitta, Radestock, Maury and Tissié. Quite recently Sante de Sanctis has turned his attention to this subject.¹ It will be enough for the purpose of my thesis if I do no more than touch upon this important question.

¹ [1900a, 579] [1900a, 594]
In the course of my psycho-analyses of neurotics I must already have analysed over a thousand dreams; but I do not propose to make use of this material in my present introduction to the technique and theory of dream-interpretation. Apart from the fact that such a course would be open to the objection that these are the dreams of neuropaths, from which no valid inferences could be made as to the dreams of normal people, there is quite another reason which forces this decision upon me. The subject to which these dreams of my patients lead up is always, of course, the case history which underlies their neurosis. Each dream would therefore necessitate a lengthy introduction and an investigation of the nature and aetiological determinants of the psychoneuroses. But these questions are in themselves novelties and highly bewildering and would distract attention from the problem of dreams. On the contrary, it is my intention to make use of my present elucidation of dreams as a preliminary step towards solving the more difficult problems of the psychology of the neuroses. If, however, I forego my principal material, the dreams of my neurotic patients, I must not be too particular about what is left to me. All that remains are such dreams as have been reported to me from time to time by normal persons of my acquaintance, and such others as have been quoted as instances in the literature dealing with dream-life. Unluckily, however, none of these dreams are accompanied by the analysis without which I cannot discover a dream's meaning. My procedure is not so convenient as the popular decoding method which translates any given piece of a dream's content by a fixed key. I, on the contrary, am prepared to find that the same piece of content may conceal a different meaning when it occurs in various people or in various contexts. Thus it comes about that I am led to my own dreams, which offer a copious and convenient material, derived from an approximately normal person and relating to multifarious occasions of daily life. No doubt I shall be met by doubts of the trustworthiness of 'self-analyses' of this kind; and I shall be told that they leave the door open to arbitrary conclusions. In my judgement the situation is in fact more favourable in the case of self-observation than in that of other people; at all events we may make the experiment and see how far self-analysis takes us with the interpretation of dreams. But I have other difficulties to overcome, which lie within myself. There is some natural hesitation about revealing so many intimate facts about one's mental life; nor can there be any guarantee against misinterpretation by strangers. But it must be possible to overcome such hesitations. 'Tout psychologue, écrit Delboeuf, `est obligé de faire l'aveu même de ses faiblesses s'il croit par là jeter du jour sur quelque problème obscur.'¹ And it is safe to assume that my readers too will very soon find their initial interest in the indiscretions which I am bound to make replaced by an absorbing immersion in the psychological problems upon which they throw light.²

¹[1900a, 606]
²[1900a, 641]

These considerations may lead us to feel that the interpretation of dreams may enable us to draw conclusions as to the structure of our mental apparatus which we have hoped for in vain from philosophy. I do not propose, however, to follow this line of thought; but, having cleared up the matter of distortion in dreams, I shall go back to the problem from which we started. The question raised was how dreams with a distressing content can be resolved into wish-fulfilments. We now see that this is possible if dream-distortion has occurred and if the distressing content serves only to disguise something that is wished for. Bearing in mind our assumption of the existence of two psychical agencies, we can further say that distressing dreams do in fact contain something which is distressing to the second agency, but something which at the same time fulfils a wish on the part of the first agency. They are wishful dreams in so far as every dream arises from the first agency; the relation of the second agency towards dreams is of a defensive and not of a creative kind.¹ If we were to restrict ourselves to considering what the second agency contributes to dreams, we could never arrive at an understanding of them: all the conundrums which the authorities have observed in dreams would remain unsolved.

¹[1900a, 641]
The same point is illustrated by one last dream of the kind which I will quote from a patient under treatment. This was the dream of a girl who had succeeded in her struggle to continue her treatment with me against the will of her relatives and of the authorities whose opinions had been consulted. She dreamt that her people forbade her to go on coming to me. She then reminded me of a promise I had given her that if necessary I would continue the treatment without a fee. To this I replied: 'I cannot make any allowances in money matters.' It must be admitted that it was not easy to point to the wish-fulfilment in this instance. But in all such cases one discovers a second riddle, the solution of which helps one to solve the original one. What was the origin of the words she put into my mouth? Of course I had said nothing of the kind to her; but one of her brothers, and the one by whom she was most influenced, had been good enough to attribute this sentiment to me. The dream was thus intended to prove her brother right. And it was not only in her dreams that she insisted on his being right; the same idea dominated her whole life and it was the motive of her illness.

[1900a, 652]

Of the three characteristics of memory in dreams enumerated at the beginning of this chapter, one - the preference for non-essential material in the content of dreams - has been satisfactorily cleared up by being traced back to dream-distortion. We have been able to confirm the existence of the other two - the emphasis upon recent and upon infantile material - but we have not been able to account for them on the basis of the motives that lead to dreaming. These two characteristics inclusion of both recent and infantile material, whose explanation and appreciation remain to be discovered, must be kept in mind. Their proper place must be looked for elsewhere - either in the psychology of the state of sleep or in the discussion of the structure of the mental apparatus upon which we shall later embark, after we have learnt that the interpretation of dreams is like a window through which we can get a glimpse of the interior of that apparatus.

[1900a, 699]

¹ [Footnote added 1909:] Not long ago I found a single exception to this rule in the case of a young man who suffered from obsessions while retaining intact his highly developed intellectual powers. The spoken words which occurred in his dreams were not derived from remarks which he had heard or made himself. They contained the undistorted text of his obsessional thoughts, which in his waking life only reached his consciousness in a modified form.

[1900a, 777]

Nor can we leave the subject of regression in dreams without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psycho-neuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the instinctual impulses which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood - a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's assertion that in dreams 'some primaeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psycho-analysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race.

[1900a, 981]
We are now well on the way to proceeding further with the erection of the psychological scaffolding, which we stopped at the point at which we introduced the two systems \textit{Ucs.} and \textit{Pcs.} But there are reasons for continuing a little with our consideration of wishes as the sole psychical motive force for the construction of dreams. We have accepted the idea that the reason why dreams are invariably wish-fulfilments is that they are products of the system \textit{Ucs.}, whose activity knows no other aim than the fulfilment of wishes and which has at its command no other forces than wishful impulses. If we insist, for even a moment longer, upon our right to base such far-reaching psychological speculations upon the interpretation of dreams, we are in duty found to prove that those speculations have enabled us to insert dreams into a nexus which can include other psychical structures as well. If such a thing as a system \textit{Ucs.} exists (or something analogous to it for the purposes of our discussion), dreams cannot be its only manifestation; every dream may be a wish-fulfilment, but apart from dreams there must be other forms of abnormal wish-fulfilments. And it is a fact that the theory governing all psychoneurotic symptoms culminates in a single proposition, which asserts that they too are to be regarded as \textit{fulfilments of unconscious wishes}.¹ Our explanation makes the dream only the first member of a class which is of the greatest significance to psychiatrists and an understanding of which implies the solution of the purely psychological side of the problem of psychiatry.²

² [Footnote added 1914:] As Hughlings Jackson said: ‘Find out all about dreams and you will have found out all about insanity.’

In venturing on an attempt to penetrate more deeply into the psychology of dream-processes, I have set myself a hard task and one to which my powers of exposition are scarcely equal. Elements in this complicated whole which are in fact simultaneous can only be represented successively in my description of them, while, in putting forward each point, I must avoid appearing to anticipate the grounds on which it is based: difficulties such as these it is beyond my strength to master. In all this I am paying the penalty for the fact that in my account of dream-psychology I have been unable to follow the historical development of my own views. Though my own line of approach to the subject of dreams was determined by my previous work on the psychology of the neuroses, I had not intended to make use of the latter as a basis of reference in the present work. Nevertheless I am constantly being driven to do so, instead of proceeding, as I should have wished, in the contrary direction and using dreams as a means of approach to the psychology of the neuroses. I am conscious of all the trouble in which my readers are thus involved, but I can see no means of avoiding it.

Finally, we have by no means abandoned the relation between dreams and mental disorders, but have established it more firmly on fresh ground.

[1900a, 998]
It would not be possible for us to answer this question if we had not made some headway in the study of the psychology of the neuroses, and particularly of hysteria. We have found from this that the same irrational psychical processes, and others that we have not specified, dominate the production of hysterical symptoms. In hysteria, too, we come across a series of perfectly rational thoughts, equal in validity to our conscious thoughts; but to begin with we know nothing of their existence in this form and we can only reconstruct them subsequently. If they force themselves upon our notice at any point, we discover by analysing the symptom which has been produced that these normal thoughts have been submitted to abnormal treatment: they have been transformed into the symptom by means of condensation and the formation of compromises, by way of superficial associations and in disregard of contradictions, and also, it may be, along the path of regression. In view of the complete identity between the characteristic features of the dream-work and those of the psychical activity which issues in psychoneurotic symptoms, we feel justified in carrying over to dreams the conclusions we have been led to by hysteria.

[1900a, 1024]

There is, however, another point to which I attach importance; and I must confess that it is solely on its account that I have embarked here upon all these discussions of the two psychical systems and their modes of activity and of repression. It is not now a question of whether I have formed an approximately correct opinion of the psychological factors with which we are concerned, or whether, which is quite possible in such difficult matters, my picture of them is distorted and incomplete. However many changes may be made in our reading of the psychical censorship and of the rational and abnormal revisions made of the dream-content, it remains true that processes of this sort are at work in the formation of dreams and that they show the closest analogy in their essentials to the processes observable in the formation of hysterical symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance of psychical equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made that no conclusions as to the dreams of normal people can be drawn from my dreams or those of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may argue back from the phenomena to their motive forces, we must recognize that the psychical mechanism employed by neuroses is not created by the impact of a pathological disturbance upon the mind but is present already in the normal structure of the mental apparatus. The two psychical systems, the censorship upon the passage from one of them to the other, the inhibition and overlaying of one activity by the other, the relations of both of them to consciousness - or whatever more correct interpretations of the observed facts may take their place - all of these form part of the normal structure of our mental instrument, and dreams show us one of the paths leading to an understanding of its structure. If we restrict ourselves to the minimum of new knowledge which has been established with certainty, we can still say this of dreams: they have proved that what is suppressed continues to exist in normal people as well as abnormal, and remains capable of psychical functioning. Dreams themselves are among the manifestations of this suppressed material; this is so theoretically in every case, and it can be observed empirically in a great number of cases at least, and precisely in cases which exhibit most clearly the striking peculiarities of dream-life. In waking life the suppressed material in the mind is prevented from finding expression and is cut off from internal perception owing to the fact that the contradictions present in it are eliminated - one side being disposed of in favour of the other; but during the night, under the sway of an impetus towards the construction of compromises, this suppressed material finds methods and means of forcing its way into consciousness.

[1900a, 1034]

The interpretation of dreams is the royal road to a knowledge of the unconscious activities of the mind.

[1900a, 1035]
By analysing dreams we can take a step forward in our understanding of the composition of that most marvellous and most mysterious of all instruments. Only a small step, no doubt; but a beginning. And this beginning will enable us to proceed further with its analysis, on the basis of other structures which must be termed pathological. For illnesses - those, at least, which are rightly named 'functional' - do not presuppose the disintegration of the apparatus or the production of fresh splits in its interior. They are to be explained on a *dynamic* basis - by the strengthening and weakening of the various components in the interplay of forces, so many of whose effects are hidden from view while functions are normal. I hope to be able to show elsewhere how the compounding of the apparatus out of two agencies makes it possible for the normal mind too to function with greater delicacy than would be possible with only one of them.²

[1900a, 1035]

So far we have been psychologizing on our own account. It is time now to consider the theoretical views which govern present-day psychology and to examine their relation to our hypotheses. The problem of the unconscious in psychology is, in the forcible words of Lipps (1897), less a psychological problem than the problem of psychology. So long as psychology dealt with this problem by a verbal explanation to the effect that 'psychical' meant 'conscious' and that to speak of 'unconscious psychical processes' was palpable nonsense, any psychological evaluation of the observations made by physicians upon abnormal mental states was out of the question. The physician and the philosopher can only come together if they both recognize that the term 'unconscious psychical processes' is 'the appropriate and justified expression of a solidly established fact'. The physician can only shrug his shoulders when he is assured that 'consciousness is an indispensable characteristic of what is psychical', and perhaps, if he still feels enough respect for the utterances of philosophers, he may presume that they have not been dealing with the same thing or working at the same science. For even a single understanding observation of a neurotic's mental life or a single analysis of a dream must leave him with an unshakeable conviction that the most complicated and most rational thought-processes, which can surely not be denied the name of psychical processes, can occur without exciting the subject's consciousness.¹ It is true that the physical cannot learn of these unconscious processes until they have produced some effect upon consciousness which can be communicated or observed. But this conscious effect may exhibit a psychical character quite different from that of the unconscious process, so that internal perception cannot possibly regard the one as a substitute for the other. The physician must feel at liberty to proceed by *inference* from the conscious effect to the unconscious psychical process. He thus learns that the conscious effect is only a remote psychical result of the unconscious process and that the latter has not become conscious as such; and moreover that the latter was present and operative even without betraying its existence in any way to consciousness.

[1900a, 1037]

¹ [Footnote added 1914:] I am happy to be able to point to an author who has drawn from the study of dreams the same conclusions as I have on the relation between conscious and unconscious activity. Du Prel (1885, 47) writes: 'The problem of the nature of the mind evidently calls for a preliminary investigation as to whether consciousness and mind are identical. This preliminary question is answered in the negative by dreams, which show that the concept of the mind is a wider one than that of consciousness, in the same kind of way in which the gravitational force of a heavenly body extends beyond its range of luminosity.' And again (ibid., 306): 'It is a truth which cannot be too distinctly borne in mind that consciousness is not co-extensive with mind.'

[1900a, 1037]
Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini’s sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

[1900a, 1038]

Thus I would look for the theoretical value of the study of dreams in the contributions it makes to psychological knowledge and in the preliminary light it throws on the problems of the psychoneuroses. Who can guess the importance of the results which might be obtained from a thorough understanding of the structure and functions of the mental apparatus, since even the present state of our knowledge allows us to exert a favourable therapeutic influence on the curable forms of psychoneurosis? But what of the practical value of this study - I hear the question raised - as a means towards an understanding of the mind, towards a revelation of the hidden characteristics of individual men? Have not the unconscious impulses brought out by dreams the importance of real forces in mental life? Is the ethical significance of suppressed wishes to be made light of - wishes which, just as they lead to dreams, may some day lead to other things?

[1900a, 1044]

And the value of dreams for giving us knowledge of the future? There is of course no question of that. It would be truer to say instead that they give us knowledge of the past. For dreams are derived from the past in every sense. Nevertheless the ancient belief that dreams foretell the future is not wholly devoid of truth. By picturing our wishes as fulfilled, dreams are after all leading us into the future. But this future, which the dreamer pictures as the present, has been moulded by his indestructible wish into a perfect likeness of the past.

[1900a, 1045]
Having been made acquainted with the dream-work by the foregoing discussion, we shall no doubt be inclined to pronounce it a quite peculiar psychical process, the like of which, so far as we are aware, does not exist elsewhere. It is as though we were carrying over on to the dream-work all the astonishment which used formerly to be aroused in us by its product, the dream. In fact, however, the dream-work is only the first to be discovered of a whole series of psychical processes, responsible for of hysterical symptoms, of phobias, obsessions and delusions. Condensation and, above all, displacement are invariable characteristics of these other processes as well. Modification into a pictorial form, on the other hand, remains a peculiarity of the dream-work. If this explanation places dreams in a single series alongside the structures produced by psychical illness, this makes it all the more important for us to discover the essential determining conditions of such processes as those of dream-formation. We shall probably be surprised to hear that neither the state of sleep nor illness is among these indispensable conditions. A whole number of the phenomena of the everyday life of healthy people - such as forgetting, slips of the tongue, bungled actions and a particular class of errors - owe their origin to a psychical mechanism analogous to that of dreams and of the other members of the series.

[1901a, 1084]

I have laid it down as the task of dream-interpretation to replace the dream by the latent dream-thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream-thoughts - a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream-content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream-thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

[1901a, 1098]
I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (*The Interpretation of Dreams*) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

[1905e, 1353]
In my *Interpretation of Dreams*, published in 1900, I showed that dreams in general can be interpreted, and that after the work of interpretation has been completed they can be replaced by perfectly correctly constructed thoughts which can be assigned a recognizable position in the chain of mental events. I wish to give an example in the following pages of the only practical application of which the art of interpreting dreams seems to admit. I have already mentioned in my book how it was that I came upon the problem of dreams. The problem crossed my path as I was endeavouring to cure psychoneuroses by means of a particular psychotherapeutic method. For, among their other mental experiences, my patients told me their dreams, and these dreams seemed to call for insertion in the long thread of connections which spun itself out between a symptom of the disease and a pathogenic idea. At that time I learnt how to translate the language of dreams into the forms of expression of our own thought-language, which can be understood without further help. And I may add that this knowledge is essential for the psychoanalyst; for the dream is one of the roads along which consciousness can be reached by the psychical material which, on account of the opposition aroused by its content, has been cut off from consciousness and repressed, and has thus become pathogenic. The dream, in short, is one of the *détours by which repression can be evaded*; it is one of the principal means employed by what is known as the indirect method of representation in the mind. The following fragment from the history of the treatment of a hysterical girl is intended to show the way in which the interpretation of dreams plays a part in the work of analysis. It will at the same time give me a first opportunity of publishing at sufficient length to prevent further misunderstanding some of my views upon the psychical processes of hysteria and upon its organic determinants. I need no longer apologize on the score of length, since it is now agreed that the exacting demands which hysteria makes upon physician and investigator can be met only by the most sympathetic spirit of inquiry and not by an attitude of superiority and contempt. For,

[1905e, 1357]

I should like, further, to draw special attention to the fact that the analysis of this dream has given us access to certain details of the pathogenically operative events which had otherwise been inaccessible to memory, or at all events to reproduction. The recollection of the bed-wetting in childhood had, as we have seen, already been repressed. And Dora had never mentioned the details of her persecution by Herr K.; they had never occurred to her mind.

[1905e, 1424]

Nevertheless, in publishing this paper, incomplete though it is, I had two objects in view. In the first place, I wished to supplement my book on the interpretation of dreams by showing how an art, which would otherwise be useless, can be turned to account for the discovery of the hidden and repressed parts of mental life. (Incidentally, in the process of analysing the two dreams dealt with in the paper, the technique of dream-interpretation, which is similar to that of psychoanalysis, has come under consideration.) In the second place, I wished to stimulate interest in a whole group of phenomena of which science is still in complete ignorance to-day because they can only be brought to light by the use of this particular method. No one, I believe, can have had any true conception of the complexity of the psychological events in a case of hysteria - the juxtaposition of the most dissimilar tendencies, the mutual dependence of contrary ideas, the repressions and displacements, and so on. The emphasis laid by Janet upon the *idée fixe* which becomes transformed into a symptom amounts to no more than an extremely meagre attempt at schematization. Moreover, it is impossible to avoid the suspicion that, when the ideas attaching to certain excitations are incapable of becoming conscious, those excitations must act upon one another differently, run a different course, and manifest themselves differently from those other excitations which we describe as 'normal' and which have ideas attaching to them of which we become conscious. When once things have been made clear up to this point, no obstacle can remain in the way of understanding of a therapeutic method which removes neurotic symptoms by transforming ideas of the former kind into normal ones.

[1905e, 1448]
Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called *The Interpretation of Dreams*, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.

It is easier to perceive the characteristics of these unconscious thought-processes in the remarks made by sufferers from certain mental diseases. We should most probably be able (as Griesinger suggested long ago) to understand the deliria of the insane and to make use of them as pieces of information, if we ceased to apply the demands of conscious thinking to them and if we treated them, like dreams, with our interpretative technique.¹ Indeed we have confirmed the fact that 'there is a return of the mind in dreams to an embryonic point of view'.²

¹ In doing so we should not forget to take into account the distortion due to the censorship which is still at work even in psychoses.

² The application of a few of the rules of dream-interpretation to Hanold's first dream has thus resulted in making it intelligible to us in its main features and in inserting it into the nexus of the story. Surely, then, the author must have observed these rules in creating it? We might ask another question, too: why did the author introduce a dream at all to bring about the further development of the delusion? In my opinion it was an ingenious notion and once again true to reality. We have already heard that in real illnesses a delusion very often arises in connection with a dream, and, after what we have learnt about the nature of dreams, there is no need to see a fresh riddle in this fact. Dreams and delusions arise from the same source - from what is repressed. Dreams are, as one might say, the physiological delusions of normal people. Before what is repressed has become strong enough to break through into waking life as a delusion, it may easily have achieved a first success, under the more favourable conditions of the state of sleep, in the form of a dream with persisting effects. For during sleep, along with a general lowering of mental activity, there is a relaxation in the strength of the resistance with which the dominant psychical forces oppose what is repressed. It is this relaxation that makes the formation of dreams possible, and that is why dreams give us our best access to a knowledge of the unconscious part of the mind - except that, as a rule, with the re-establishment of the psychical cathexes of waking life, the dream once more takes to flight and the ground that had been won by the unconscious is evacuated once again.

[1904a, 1558]

[1905c, 1755]

[1907a, 1858]
There are, besides this, two special ways in which a more precise knowledge of obsessional structures can be gained. In the first place, experience shows that an obsessional command (or whatever it may be), which in waking life is known only in a truncated and distorted form, like a mutilated telegraph message, may have its actual text brought to light in a dream. Such texts appear in dreams in the shape of speeches, and are thus an exception to the rule that speeches in dreams are derived from speeches in real life. Secondly, in the course of the analytic examination of a case history, one becomes convinced that if a number of obsessions succeed one another they are often - even though their wording is not identical - ultimately one and the same. The obsession may have been successfully shaken off on its first appearance, but it comes back a second time in a distorted form and without being recognized, and may then perhaps be able to hold its own in the defensive struggle more effectively, precisely because of its distortion. But the original form is the correct one, and often displays its meaning quite openly. When we have at great pains elucidated an unintelligible obsessional idea, it often happens that the patient informs us that just such a notion, wish, or temptation as the one we have constructed did in fact make its appearance on one occasion before the obsessional idea had arisen, but that it did not persist. It would unfortunately involve us in too lengthy a digression if we were to give instances of this from the history of our present patient.

I must admit, Ladies and Gentlemen, that I hesitated for a long time whether, instead of giving you this condensed general survey of the whole field of psycho-analysis, it might not be better to present you with a detailed account of dream-interpretation. I was held back by a purely subjective and seemingly secondary motive. It seemed to me almost indecent in a country which is devoted to practical aims to make my appearance as a 'dream-interpreter', before you could possibly know the importance that can attach to that antiquated and derided art. The interpretation of dreams is in fact the royal road to a knowledge of the unconscious; it is the securest foundation of psycho-analysis and the field in which every worker must acquire his convictions and seek his training. If I am asked how one can become a psycho-analyst, I reply: 'By studying one's own dreams.' Every opponent of psycho-analysis hitherto has, with a nice discrimination, either evaded any consideration of The Interpretation of Dreams, or has sought to skirt over it with the most superficial objections. If, on the contrary, you can accept the solutions of the problems of dream-life, the novelties with which psycho-analysis confronts your minds will offer you no further difficulties.

You should bear in mind that the dreams which we produce at night have, on the one hand, the greatest external similarity and internal kinship with the creations of insanity, and are, on the other hand, compatible with complete health in waking life. There is nothing paradoxical in the assertion that no one who regards these 'normal' illusions, delusions and character-changes with astonishment instead of comprehension has the slightest prospect of understanding the abnormal structures of pathological mental states otherwise than as a layman. You may comfortably count almost all psychiatrists among such laymen.

As you see, research into dreams would be justified for its own sake merely by the information it gives us on matters that can with difficulty be discovered in other ways. But we were in fact led to the subject in connection with the psycho-analytic treatment of neurotics. You will easily understand from what I have already said how it is that dream-interpretation, if it is not made too difficult by the patient's resistances, leads to a knowledge of his hidden and repressed wishes and of the complexes nourished by them; and I can now pass on to the third group of mental phenomena whose study has become one of the technical instruments of psycho-analysis.
To these phantasies which have succeeded in dominating the man's love in real life, the urge to *rescue* the loved one seems to bear merely a loose and superficial relation, and one that is fully accounted for by conscious reasons. By her propensity to be fickle and unfaithful the loved one brings herself into dangerous situations, and thus it is understandable that the lover should be at pains to protect her from these dangers by watching over her virtue and counterring her bad inclinations. However, the study of people's screen-memories, phantasies and nocturnal dreams shows that we have here a particularly felicitous 'rationalization' of an unconscious motive, a process which may be compared to a successful secondary revision of a dream. In actual fact the 'rescue-motif' has a meaning and history of its own, and is an independent derivative of the mother-complex, or more accurately, of the parental complex. When a child hears that he *owes his life* to his parents, or that his mother *gave him life*, his feelings of tenderness unite with impulses which strive at power and independence, and they generate the wish to return this gift to the parents and to repay them with one of equal value. It is as through the boy's defiance were to make him say: 'I want nothing from my father; I will give him back all I have cost him.' He then forms the phantasy of *rescuing his father from danger and saving his life*; in this way he puts his account square with him. This phantasy is commonly enough displaced on to the emperor, king or some other great man; after being thus distorted it becomes admissible to consciousness, and may even be made use of by creative writers. In its application to a boy's father it is the defiant meaning in the idea of rescuing which is by far the most important; where his mother is concerned it is usually its tender meaning. The mother gave the child life, and it is not easy to find a substitute, of equal value for this unique gift. With a slight change of meaning, such as is easily effected in the unconscious and is comparable to the way in which in consciousness concepts shade into one another, rescuing his mother takes on the significance of giving her a child or making a child for her - needless to say, one like himself. This is not too remote from the original sense of rescuing, and the change in meaning is not an arbitrary one. His mother gave him a life - his own life - and in exchange he gives her another life, that of a child which has the greatest resemblance to himself. The son shows his gratitude by wishing to have by his mother a son who is like himself: in other words, in the rescue-phantasy he is completely identifying himself with his father. All his instincts, those of tenderness, gratitude, lustfulness, defiance and independence, find satisfaction in the single wish to *be his own father*. Even the element of danger has not been lost in the change of meaning; for the act of birth itself is the danger from which he was saved by his mother's efforts. Birth is both the first of all dangers to life and the prototype of all the later ones that cause us to feel anxiety, and the experience of birth has probably left behind in us the expression of affect which we call anxiety. Macduff of the Scottish legend, who was not born of his mother but ripped from her womb, was for that reason unacquainted with anxiety.

Another advantage of a wider character is presented in particular by erotic *jokes*, in the strict sense, just as it is by jokes in general. I have shown in my study of jokes that the revelation of what is normally the repressed unconscious element in the mind can, under certain provisions, become a source of pleasure and thus a technique for the construction of jokes. In psychoanalysis to-day we describe a congeries of ideas and its associated affect as a 'complex'; and we are prepared to assert that many of the most admired jokes are 'complexive jokes' and that they owe their exhilarating and cheerful effect to the ingenious uncovering of what are as a rule repressed complexes. It would carry me too far afield if I were to bring forward instances here in proof of this thesis, but I can assert that the outcome of such an examination of the evidence is that the jokes, both erotic and of other sorts, which are in popular circulation provide an excellent auxiliary means of investigating the unconscious human mind - in the same way as do dreams, myths and legends, with the exploitation of which psycho-analysis is already actively engaged.
Recognition of the simultaneous presence of the three factors of 'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psycho-analytic theory, and marks its distinction from other views of pathological mental life. At the same time, psycho-analysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only difference is that he deals with these events with less trouble and better success. The psycho-analytic method of investigation can accordingly be applied equally to the explanation of normal psychical phenomena, and has made it possible to discover the close relationship between pathological psychical products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been carried furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psycho-analytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychical life.

[1913m, 2548]

But the distinction between foreconscious and unconscious activity, and the recognition of the barrier which keeps them asunder, is not the last or the most important result of the psycho-analytic investigation of psychical life. There is one psychical product to be met with in the most normal persons, which yet presents a very striking analogy to the wildest productions of insanity, and was no more intelligible to philosophers than insanity itself. I refer to dreams. Psycho-analysis is founded upon the analysis of dreams; the interpretation of dreams is the most complete piece of work the young science has done up to the present. One of the most common types of dream-formation may be described as follows: a train of thoughts has been aroused by the working of the mind in the daytime, and retained some of its activity, escaping from the general inhibition of interests which introduces sleep and constitutes the psychical preparation for sleeping. During the night this train of thoughts succeeds in finding connections with one of the unconscious tendencies present ever since his childhood in the mind of the dreamer, but ordinarily repressed and excluded from his conscious life. By the borrowed force of this unconscious help, the thoughts, the residue of the day's work, now become active again, and emerge into consciousness in the shape of the dream. Now three things have happened:

[1912g, 2582]

The latent thoughts of the dream differ in no respect from the products of our regular conscious activity; they deserve the name of foreconscious thoughts, and may indeed have been conscious at some moment of waking life. But by entering into connection with the unconscious tendencies during the night they have become assimilated to the latter, degraded as it were to the condition of unconscious thoughts, and subjected to the laws by which unconscious activity is governed. And here is the opportunity to learn what we could not have guessed from speculation, or from another source of empirical information - that the laws of unconscious activity differ widely from those of the conscious. We gather in detail what the peculiarities of the Unconscious are, and we may hope to learn still more about them by a profounder investigation of the processes of dream-formation.

[1912g, 2582]

This inquiry is not yet half finished, and an exposition of the results obtained hitherto is scarcely possible without entering into the most intricate problems of dream-analysis. But I would not break off this discussion without indicating the change and progress in our comprehension of the Unconscious which are due to our psycho-analytic study of dreams.

[1912g, 2583]
There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are 'parapraxes' (slips of the tongue or pen, forgetfulness, etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (in so far as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find 'physiological' explanations of them, though these were invariably unsatisfactory. Psycho-analysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus on the one hand psycho-analysis has narrowed the region subject to the physiological point of view and on the other hand has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psycho-analysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

I shall now discuss in greater detail two of the normal phenomena with which we are here concerned (phenomena, that is, which can be observed in normal people) - namely, parapraxes and dreams.

The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psycho-analysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is the interpretation of dreams, which brought psycho-analysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning or significance, and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psycho-analysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream. There is no half-way house between these two views of dreams. What argues against the physiological hypothesis is its unfruitfulness, and what may be argued in favour of the psycho-analytic one is the fact that it has translated and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

I devoted a volume published in 1900 to the important subject of dream-interpretation and have had the satisfaction of seeing the theories put forward in it confirmed and amplified by contributions from almost every worker in the field of psycho-analysis.¹ It is generally agreed that dream-interpretation is the foundation stone of psycho-analytic work and that its findings constitute the most important contribution made by psycho-analysis to psychology.
The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

[1913j, 2807]

It is quite impossible to exhaust the psychological interest of dream-interpretation within the limits of my present paper. Let us bear in mind that what I have so far stressed is merely that dreams have a meaning and are objects for psychological study, and let us now proceed with our consideration of the new territory which has been annexed by psychology in the domain of pathology.

[1913j, 2808]

The psychological novelties inferred from dreams and parapraxes must be applicable as an explanation of other phenomena if we are to believe in the value of these novelties, or, indeed, in their existence. And we do in fact find that psycho-analysis has shown that the hypotheses of unconscious mental activity, of censorship and repression and of distortion and substitution, at which we have arrived from our study of these normal phenomena, also afford us a first understanding of a number of pathological phenomena and, as one might say, put into our hands the key to all the riddles of the psychology of the neuroses. Thus dreams are to be regarded as the normal prototypes of all psychopathological structures. Anyone who understands dreams can also grasp the psychical mechanism of the neuroses and psychoses.

[1913j, 2809]

Similar considerations apply to the deliria and hallucinations, as well as to the delusional systems, exhibited by various psychotic patients. Where hitherto nothing but the most freakish capriciousness has seemed to prevail, psycho-analytic research has introduced law, order and connection, or has at least allowed us to suspect their presence where its work is still incomplete. The most heterogeneous forms of mental disorder are revealed as the results of processes which are at bottom identical and which can be understood and described by means of psychological concepts. What had already been discovered in the formation of dreams is operative everywhere - psychical conflict, the repression of certain instinctual impulses which have been pushed back into the unconscious by other mental forces, reaction formations set up by the repressing forces, and substitutes constructed by the instincts which have been repressed but have not been robbed of all their energy. The accompanying processes of condensation and displacement, so familiar to us in dreams, are also to be found everywhere. The multiplicity of clinical pictures observed by psychiatrists depends upon two other things: the multiplicity of the psychical mechanisms at the disposal of the repressive process and the multiplicity of developmental dispositions which give the repressed impulses an opportunity for breaking through into substitutive structures.

[1913j, 2811]
In the first place, it seems quite possible to apply the psycho-analytic views derived from dreams to products of ethnic imagination such as myths and fairy tales.¹ The need to interpret such productions has long been felt; some 'secret meaning' has been suspected to lie behind them and it has been presumed that that meaning is concealed by changes and transformations. The study made by psycho-analysis of dreams and neuroses has given it the necessary experience to enable it to guess the technical procedures that have governed these distortions. But in a number of instances it can also reveal the hidden motives which have led to this modification in the original meaning of myths. It cannot accept as the first impulse to the construction of myths a theoretical craving for finding an explanation of natural phenomena or for accounting for cult observances and usages which have become unintelligible. It looks for that impulse in the same psychical 'complexes', in the same emotional trends, which it has discovered at the base of dreams and symptoms.

[1913j, 2821]

Among the other new factors which were added to the cathartic procedure as a result of my work and which transformed it into psycho-analysis, I may mention in particular the theory of repression and resistance, the recognition of infantile sexuality, and the interpreting and exploiting of dreams as a source of knowledge of the unconscious.

[1914d, 2884]

It was only my success in this direction that enabled me to persevere. The result is that I have acquired a habit of gauging the measure of a psychologist's understanding by his attitude to dream-interpretation; and I have observed with satisfaction that most of the opponents of psycho-analysis avoid this field altogether or else display remarkable clumsiness if they attempt to deal with it. Moreover, I soon saw the necessity of carrying out a self-analysis, and this I did with the help of a series of my own dreams which led me back through all the events of my childhood; and I am still of the opinion to-day that this kind of analysis may suffice for anyone who is a good dreamer and not too abnormal.

[1914d, 2889]

Unconscious processes only become cognizable by us under the conditions of dreaming and of neurosis - that is to say, when processes of the higher, Pcs., system are set back to an earlier stage by being lowered (by regression). In themselves they cannot be cognized, indeed are even incapable of carrying on their existence; for the system Ucs. is at a very early moment overlaid by the Pcs. which has taken over access to consciousness and to motility. Discharge from the system Ucs. passes into somatic innervation that leads to development of affect; but even this path of discharge is, as we have seen, contested by the Pcs. By itself, the system Ucs. would not in normal conditions be able to bring about any expedient muscular acts, with the exception of those already organized as reflexes.

[1915e, 3010]

What we have put together in the preceding discussions is probably as much as we can say about the Ucs. so long as we only draw upon our knowledge of dream-life and the transference neuroses. It is certainly not much, and at some points it gives an impression of obscurity and confusion; and above all it offers us no possibility of co-ordinating or subsuming the Ucs. into any context with which we are already familiar. It is only the analysis of one of the affections which we call narcissistic psychoneuroses that promises to furnish us with conceptions through which the enigmatic Ucs. will be brought more within our reach and, as it were, made tangible.

[1915e, 3018]
It is, of course, the study of dreams which has taught us what we know of the psychical characteristics of the state of sleep. It is true that dreams only show us the dreamer in so far as he is not sleeping; nevertheless they are bound to reveal at the same time characteristics of sleep itself. We have come to observe some peculiarities of dreams which we could not at first understand, but which we can now fit into the picture without difficulty. Thus, we know that dreams are completely egoistic and that the person who plays the chief part in their scenes is always to be recognized as the dreamer. This is now easily to be accounted for by the narcissism of the state of sleep. Narcissism and egoism, indeed, coincide; the word 'narcissism' is only intended to emphasize the fact that egoism is a libidinal phenomenon as well; or, to put it in another way, narcissism may be described as the libidinal complement of egoism. The 'diagnostic' capacity of dreams - a phenomenon which is generally acknowledged, but regarded as puzzling - becomes equally comprehensible, too. In dreams, incipient physical disease is often detected earlier and more clearly than in waking life, and all the current bodily sensations assume gigantic proportions. This magnification is hypochondriacal in character; it is conditional upon the withdrawal of all psychical cathexes from the external world back on to the ego, and it makes possible early recognition of bodily changes which in waking life would still for a time have remained unobserved.

Psycho-analysis has inferred from the dreams and parapraxes of healthy people, as well as from the symptoms of neurotics, that the primitive, savage and evil impulses of mankind have not vanished in any of its individual members but persist, although in a repressed state, in the unconscious (to use our technical terms), and lie wait for opportunities of becoming active once more. It has further taught us that our intellect is a feeble and dependent thing, a plaything and tool of our instincts and affects, and that we are all compelled to behave cleverly or stupidly according to the commands of our attitudes and internal resistances.

We will not, however, follow this historical path, but will proceed in the opposite direction. We will demonstrate the sense of dreams by way of preparing for the study of the neuroses. This reversal is justified, since the study of dreams is not only the best preparation for the study of the neuroses, but dreams are themselves a neurotic symptom, which, moreover, offers us the priceless advantage of occurring in all healthy people. Indeed, supposing all human beings were healthy, so long as they dreamt we could arrive from their dreams at almost all the discoveries which the investigation of the neuroses has led to.

I am also aware that we are not yet able to make a survey of the whole of the new acquisitions which these studies have brought to psychology. I will only point out the fresh proofs they have provided of the existence of unconscious mental acts - for this is what the latent dream-thoughts are - and what an unimaginably broad access to a knowledge of unconscious mental life we are promised by the interpretation of dreams.
Perhaps you recognize, moreover, what it is that supports our hypotheses of the two systems, and their relation to each other and to consciousness? After all, the watchman between the unconscious and the preconscious is nothing else than the censorship, to which, as we found, the form taken by the manifest dream is subject. The day's residues, which we recognized as the instigators of the dream, were preconscious material which, at night-time and in the state of sleep, had been under the influence of unconscious and repressed wishful impulses; they had been able, in combination with those impulses and thanks to their energy, to construct the latent dream. Under the dominance of the unconscious system this material had been worked over (by condensation and displacement) in a manner which is unknown or only exceptionally permissible in normal mental life - that is, in the preconscious system. We came to regard this difference in their manner of operating as what characterizes the two systems; the relation which the preconscious has to consciousness was regarded by us merely as an indication of its belonging to one of the two systems. Dreams are not pathological phenomena; they can appear in any healthy person under the conditions of a state of sleep. Our hypothesis about the structure of the mental apparatus, which allows us to understand the formation alike of dreams and of neurotic symptoms, has an incontrovertible claim to being taken into account in regard to normal mental life as well.

[1916-1917, 3370]

And now you will be eager to hear what this terrible Oedipus complex contains. Its name tells you. You all know the Greek legend of King Oedipus, who was destined by fate to kill his father and take his mother to wife, who did everything possible to escape the oracle's decree and punished himself by blinding when he learned that he had none the less unwittingly committed both these crimes. I hope many of you may yourselves have felt the shattering effect of the tragedy in which Sophocles has treated the story. The work of the Athenian dramatist exhibits the way in which the long-past deed of Oedipus is gradually brought to light by an investigation ingeniously protracted and fanned into life by ever fresh relays of evidence. To this extent it has a certain resemblance to the progress of a psycho-analysis. In the course of the dialogue Jocasta, the deluded mother and wife, declares herself opposed to the continuance of the enquiry. She appeals to the fact that many people have dreamt of lying with their mothers, but that dreams should be despised. We do not despise dreams - least of all, typical dreams which occur to many people; and we do not doubt that the dream referred to by Jocasta has an intimate connection with the strange and terrifying content of the legend.

[1916-1917, 3398]

But there is something else that I cannot pass by. The reminder of dreams given to us by the mother and wife of Oedipus must not be allowed to remain fruitless. Do you recall the outcome of our dream-analyses - how the wishes that construct dreams are so often of a perverse or incestuous nature or reveal an unsuspected hostility to those who are nearest and dearest to the dreamer? At that time we gave no explanation of the origin of these evil impulses. Now you can find it for yourselves. They are allocations of the libido and object-cathexes which date from early infancy and have long since been abandoned as far as conscious life is concerned, but which prove still to be present at night-time and to be capable of functioning in a certain sense. Since, however, everyone, and not only neurotics, experiences these perverse, incestuous and murderous dreams, we may conclude that people who are normal to-day have passed along a path of development that has led through the perversions and object-cathexes of the Oedipus complex, that that is the path of normal development and that neurotics merely exhibit to us in a magnified and coarsened form what the analysis of dreams reveals to us in healthy people as well. And this is one of the reasons why I dealt with the study of dreams before that of neurotic symptoms.

[1916-1917, 3402]
With the help of these ideas we are now able to explain a whole number of mental states or, to express it more modestly, to describe them in terms of the libido theory - states which we must reckon as belonging to normal life, such as the psychical behaviour of a person in love, during an organic illness or when asleep. As regards the state of sleep, we assumed that it was based on turning-away from the external world and adopting a wish to sleep. The mental activity during the night which is manifested in dreams takes place, we found, in obedience to a wish to sleep and is moreover dominated by purely egoistic motives. We may now add, on the lines of the libido theory, that sleep is a state in which all object-cathexes, libidinal as well as egoistic, are given up and withdrawn into the ego. May not this throw a fresh light on the recuperating effect of sleep and on the nature of fatigue in general? The picture of the blissful isolation of intra-uterine life which a sleeper conjures up once more before us every night is in this way completed on its psychical side as well. In a sleeper the primal state of distribution of the libido is restored - total narcissism, in which libido and ego-interest, still united and indistinguishable, dwell in the self-sufficing ego.

[1916-1917, 3462]

From the standpoint of the libido theory, too, we may say a last word on dreams. A neurotic's dreams help us, like his parapraxes and his free associations to them, to discover the sense of his symptoms and to reveal the way in which his libido is allocated. They show us, in the form of a wish-fulfilment, what wishful impulses have been subjected to repression and to what objects the libido withdrawn from the ego has become attached. For this reason the interpretation of dreams plays a large part in a psycho-analytic treatment, and in some cases it is over long periods the most important instrument of our work. We already know that the state of sleep in itself leads to a certain relaxation of the repressions. A repressed impulse, owing to this reduction in the pressure weighing down upon it, becomes able to express itself far more clearly in a dream than it can be allowed to be expressed by a symptom during the day. The study of dreams therefore becomes the most convenient means of access to a knowledge of the repressed unconscious, of which the libido withdrawn from the ego forms a part.

[1916-1917, 3496]

The identity of the dreams of healthy and neurotic people enables us to infer thus much in regard to defining the characteristics of health. But in regard to dreams themselves we can make a further inference: we must not detach them from their connection with neurotic symptoms, we must not suppose that their essential nature is exhausted by the formula that describes them as a translation of thoughts into an archaic form of expression, but we must suppose that they exhibit to us allocations of the libido and object-cathexes that are really present.

[1916-1917, 3496]
It is easy to understand that the first suspicion fell upon the English governess, for the change in the boy made its appearance while she was there. Two screen memories had persisted, which were incomprehensible in themselves, and which related to her. On one occasion, as she was walking along in front of them, she said: 'Do look at my little tail!' Another time, when they were on a drive, her hat flew away, to the two children's great satisfaction. This pointed to the castration complex, and might permit of a construction being made to the effect that a threat uttered by her against the boy had been largely responsible for originating his abnormal conduct. There is no danger at all in communicating constructions of this kind to the person under analysis; they never do any damage to the analysis if they are mistaken; but at the same time they are not put forward unless there is some prospect of reaching a nearer approximation to the truth by means of them. The first effect of this supposition was the appearance of some dreams, which it was not possible to interpret completely, but all of which seemed to centre around the same material. As far as they could be understood, they were concerned with aggressive actions on the boy's part against his sister or against the governess and with energetic reproofs and punishments on account of them. It was as though . . . after her bath . . . he had tried . . . to undress his sister . . . to tear off her coverings . . . or veils - and so on. But it was not possible to get at any firm content from the interpretation; and since these dreams gave an impression of always working over the same material in various different ways, the correct reading of these ostensible reminiscences became assured: it could only be a question of phantasies, which the dreamer had made on the subject of his childhood at some time or other, probably at the age of puberty, and which had now come to the surface again in this unrecognizable form.

[1918b, 3512]

I am not of opinion, however, that such scenes must necessarily be phantasies because they do not reappear in the shape of recollections. It seems to me absolutely equivalent to a recollection, if the memories are replaced (as in the present case) by dreams the analysis of which invariably leads back to the same scene and which reproduce every portion of its content in an inexhaustible variety of new shapes. Indeed, dreaming is another kind of remembering, though one that is subject to the conditions that rule at night and to the laws of dream-formation. It is this recurrence in dreams that I regard as the explanation of the fact that the patients themselves gradually acquire a profound conviction of the reality of these primal scenes, a conviction which is in no respect inferior to one based on recollection.¹

[1918b, 3538]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

The study of dreams may be considered the most trustworthy method of investigating deep mental processes. Now dreams occurring in traumatic neuroses have the characteristic of repeatedly bringing the patient back into the situation of his accident, a situation from which he wakes up in another fright. This astonishes people far too little. They think the fact that the traumatic experience is constantly forcing itself upon the patient even in his sleep is a proof of the strength of that experience: the patient is, as one might say, fixated to his trauma. Fixations to the experience which started the illness have long been familiar to us in hysteria. Breuer and Freud declared in 1893 that 'hysterics suffer mainly from reminiscences'. In the war neuroses, too, observers like Ferenczi and Simmel have been able to explain certain motor symptoms by fixation to the moment at which the trauma occurred.

¹ In the interpretation of dreams, to which, indeed, we owe our best knowledge of unconscious mental life, we follow a technical rule of disregarding doubt and uncertainty in the narrative of the dream, and of treating every element of the manifest dream as being quite certain. We attribute doubt and uncertainty to the influence of the censorship to which the dream-work is subjected, and we assume that the primary dream-thoughts are not acquainted with doubt and uncertainty as critical processes. They may of course be present, like anything else, as part of the content of the day's residues which lead to the dream.
The Interpretation of Dreams. - A new approach to the depths of mental life was opened when the technique of free association was applied to dreams, whether one’s own or those of patients in analysis. In fact, the greater and better part of what we know of the processes in the unconscious levels of the mind is derived from the interpretation of dreams. Psycho-analysis has restored to dreams the importance which was generally ascribed to them in ancient times, but it treats them differently. It does not rely upon the cleverness of the dream-interpreter but for the most part hands the task over to the dreamer himself by asking him for his associations to the separate elements of the dream. By pursuing these associations further we obtain knowledge of thoughts which coincide entirely with the dream but which can be recognized - up to a certain point - as genuine and completely intelligible portions of waking mental activity. Thus the recollected dream emerges as the *manifest dream content*, in contrast to the *latent dream-thoughts* discovered by interpretation. The process which has transformed the latter into the former, that is to say into 'the dream', and which is undone by the work of interpretation, may be called the *dream-work*.

[1923a, 3917]

It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a *compromise-formation* (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind.

[1923a, 3919]
The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1923a, 3929]

It follows from this that it is on the whole a matter of indifference to the sleeping ego what may be dreamt during the night so long as the dream performs its task, and that those dreams best fulfil their function about which one knows nothing after waking. If it so often happens otherwise, if we remember dreams - even after years and decades - it always means that there has been an irruption of the repressed unconscious into the normal ego. Without this concession to it the repressed would not have consented to lend its help to the removal of the threat of disturbance to sleep. We know that it is the fact of this irruption that gives dreams their importance for psychopathology. If we can uncover a dream's motivating force, we shall obtain unsuspected information about the repressed impulses in the unconscious; and on the other hand, if we can undo its distortions, we shall overhear preconscious thought taking place in states of internal reflection which would not have attracted consciousness to themselves during the day-time.

[1925i, 4045]
Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in *The Interpretation of Dreams*. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psycho-analysis, we are led from their manifest content to a secret meaning, to the latent dream-thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream-censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream-wish into the manifest content of the dream - a process known as the 'dream-work' - has taught us the best part of what we know of unconscious mental life.

Now a dream is not a morbid symptom but a product of the normal mind. The wishes which it represents as fulfilled are the same as those which are repressed in neuroses. Dreams owe the possibility of their genesis merely to the favourable circumstance that during the state of sleep, which paralyses man's power of movement, repression is mitigated into the dream-censorship. If, however, the process of dream-formation oversteps certain limits, the dreamer brings it to a stop and wakes up in a fright. Thus it is proved that the same forces and the same processes taking place between them operate in normal as in pathological mental life. From the date of *The Interpretation of Dreams* psycho-analysis had a twofold significance. It was not only a new method of treating the neuroses but it was also a new psychology; it claimed the attention not only of nerve-specialists but also of all those who were students of a mental science.
But the importance of psycho-analysis for psychiatry would never have drawn the attention of the intellectual world to it or won it a place in The History of our Times. This result was brought about by the relation of psycho-analysis to normal, not to pathological, mental life. Originally, analytic research had indeed no other aim than to establish the determinants of the onset (the genesis) of a few morbid mental states. In the course of its efforts, however, it succeeded in bringing to light facts of fundamental importance, in actually creating a new psychology, so that it became obvious that the validity of such findings could not possibly be restricted to the sphere of pathology. We have seen already when it was that the decisive proof was produced of the correctness of this conclusion. It was when dreams were successfully interpreted by analytic technique - dreams, which are a part of the mental life of normal people and which yet may in fact be regarded as pathological products that can regularly appear under healthy conditions.

If the psychological discoveries gained from the study of dreams were firmly kept in view, only one further step was needed before psycho-analysis could be proclaimed as the theory of the deeper mental processes not directly accessible to consciousness - as a 'depth-psychology' - and before it could be applied to almost all the mental sciences. This step lay in the transition from the mental activity of individual men to the psychical functions of human communities and peoples - that is, from individual to group psychology; and many surprising analogies forced this transition upon us. It had been found, for instance, that in the deep strata of unconscious mental activity contraries are not distinguished from each other but are expressed by the same element. But already in 1884 Karl Abel the philologist had put forward the view (in his 'Über den Gegensinn der Uworte') that the oldest languages known to us treat contraries in the same way. Thus Ancient Egyptian, for example, had in the first instance only one word for 'strong' and 'weak', and not till later were the two sides of the antithesis distinguished by slight modifications. Even in the most modern languages clear relics of such antithetical meanings are to be found. So in German 'Boden' means the highest as well as the lowest thing in the house; similarly in Latin 'altus' means 'high' and 'deep'. Thus the equivalence of contraries in dreams is a universal archaic trait in human thinking.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1924f, 4115]

[1925d, 4220]
We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

[1925d, 4221]

In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
The source of our findings does not seem to me to deprive them of their value. Embryology, to take an example, would not deserve to be trusted if it could not give a plain explanation of the origin of innate malformations. I have told you of people whose thoughts go their own way, so that they are obliged to worry over problems to which they are perfectly indifferent. Do you think that academic psychology could ever make the smallest contribution towards explaining an abnormality such as that? And, after all, we all of us have the experience at night-time of our thoughts going their own way and creating things which we do not understand, which puzzle us, and which are suspiciously reminiscent of pathological products. Our dreams, I mean. The common people have always firmly believed that dreams have a sense and a value - that they mean something. Academic psychology has never been able to inform us what this meaning is. It could make nothing of dreams. If it attempted to produce explanations, they were non-psychological - such as tracing them to sensory stimuli, or to an unequal depth of sleep in different portions of the brain, and so on. But it is fair to say that a psychology which cannot explain dreams is also useless for an understanding of normal mental life, that it has no claim to be called a science.

There is really a great deal of truth in what you say. It is true that the interpretation of dreams has come to have unequalled importance both for the theory and the practice of analysis. If I seem to be aggressive, that is only a way of defending myself. And when I think of all the mischief some analysts have done with the interpretation of dreams I might lose heart and echo the pessimistic pronouncement of our great satirist Nestroy when he says that every step forward is only half as big as it looks at first. But have you ever found that men do anything but confuse and distort what they get hold of? By the help of a little foresight and self-discipline most of the dangers of dream-interpretation can be avoided with certainty. But you will agree that I shall never come to my exposition if we let ourselves be led aside like this.

Let us suppose, then, that someone - a patient in analysis, for instance - tells us one of his dreams. We shall assume that in this way he is making us one of the communications to which he has pledged himself by the fact of having started an analytic treatment. It is, to be sure, a communication made by inappropriate means, for dreams are not in themselves social utterances, not a means of giving information. Nor, indeed, do we understand what the dreamer was trying to say to us, and he himself is equally in the dark. And now we have to make a quick decision. On the one hand, the dream may be, as non-analytic doctors assure us, a sign that the dreamer has slept badly, that not every part of his brain has come to rest equally, that some areas of it, under the influence of unknown stimuli, endeavoured to go on working but were only able to do so in a very incomplete fashion. If that is the case, we shall be right to concern ourselves no further with the product of a nocturnal disturbance which has no psychical value: for what could we expect to derive from investigating it that would be of use for our purposes? Or on the other hand - but it is plain that we have from the first decided otherwise. We have - quite arbitrarily, it must be admitted - made the assumption, adopted as a postulate, that even this unintelligible dream must be a fully valid psychical act, with sense and worth, which we can use in analysis like any other communication. Only the outcome of our experiment can show whether we are right. If we succeed in turning the dream into an utterance of value of that kind, we shall evidently have a prospect of learning something new and of receiving communications of a sort which would otherwise be inaccessible to us.
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we inaccurately describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained. [1933a, 4629]

The process of the dream-work, then, is something entirely new and strange, nothing resembling which was known before. It has given us our first glimpse of the processes which take place in the unconscious system and has shown us that they are quite other than what we know from our conscious thinking and are bound to appear to the latter preposterous and incorrect. The importance of this finding was then increased by the discovery that in the construction of neurotic symptoms the same mechanisms (we do not venture to say 'processes of thought') are operative as those which have transformed the latent dream-thoughts into the manifest dream. [1933a, 4630]
In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients’ dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne’s thread is the umbilical cord.

[1933a, 4638]

Punishment-dreams, too, are fulfilments of wishes, though not of wishes of the instinctual impulses but of those of the critical, censoring and punishing agency in the mind. If we have a pure punishment-dream before us, an easy mental operation will enable us to restore the wishful dream to which the punishment-dream was the correct rejoinder and which, owing to this repudiation, was replaced as the manifest dream. As you know, Ladies and Gentlemen, the study of dreams was what first helped us to understand the neuroses, and you will find it natural that our knowledge of the neuroses was later able to influence our view of dreams. As you will hear, we have been obliged to postulate the existence in the mind of a special critical and prohibiting agency which we have named the ‘super-ego’. Since recognizing that the censorship of dreams is also a function of this agency, we have been led to examine the part played by the super-ego in the construction of dreams more carefully.

[1933a, 4640]
You will not expect me to have much to tell you that is new about the id apart from its new name. It is the dark, inaccessible part of our personality; what little we know of it we have learnt from our study of the dream-work and of the construction of neurotic symptoms, and most of that is of a negative character and can be described only as a contrast to the ego. We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations. We picture it as being open at its end to somatic influences, and as there taking up into itself instinctual needs which find their psychical expression in it, but we cannot say in what substratum. It is filled with energy reaching it from the instincts, but it has no organization, produces no collective will, but only a striving to bring about the satisfaction of the instinctual needs subject to the observance of the pleasure principle. The logical laws of thought do not apply in the id, and this is true above all of the law of contradiction. Contrary impulses exist side by side, without cancelling each other out or diminishing each other: at the most they may converge to form compromises under the dominating economic pressure towards the discharge of energy. There is nothing in the id that could be compared with negation; and we perceive with surprise an exception to the philosophical theorem that space and time are necessary forms of our mental acts. There is nothing in the id that corresponds to the idea of time; there is no recognition of the passage of time, and - a thing that is most remarkable and awaits consideration in philosophical thought - no alteration in its mental processes is produced by the passage of time. Wishful impulses which have never passed beyond the id, but impressions, too, which have been sunk into the id by repression, are virtually immortal; after the passage of decades they behave as though they had just occurred. They can only be recognized as belonging to the past, can only lose their importance and be deprived of their cathexis of energy, when they have been made conscious by the work of analysis, and it is on this that the therapeutic effect of analytic treatment rests to no small extent.

[1933a, 4682]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was
thrown on it by the following consideration, which placed dreams in a class along with other
psychopathological formations and revealed them, as it were, as the normal psychoses of
human beings. For our mind, that precious instrument by whose means we maintain ourselves
in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in
which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent
superior class. The whole flux of our mental life and everything that finds expression in our
thoughts are derivations and representatives of the multifarious instincts that are innate in our
physical constitution. But these instincts are not all equally susceptible to direction and
education, or equally ready to fall in with the demands of the external world and of human
society. A number of them have retained their primitive, ungovernable nature; if we let them
have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we
have developed organizations in our mind which, in the form of inhibitions, set themselves up
against the direct manifestations of the instincts. Every impulse in the nature of a wish that
arises from the sources of instinctual energy must submit itself to examination by the highest
agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any
influence upon our movements - that is, from coming into execution. Often enough, indeed,
such wishes are even forbidden to enter consciousness, which is habitually unaware even of
the existence of these dangerous instinctual sources. We describe such impulses as being
repressed from the point of view of consciousness, and as surviving only in the unconscious. If
what is repressed contrives somehow to force its way into consciousness or into movement or
into both, we are no longer normal: at that point the whole range of neurotic and psychotic
symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon
our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity
for this seems to be offered at night by the state of sleep, since sleep involves a cessation of
our motor functions. The situation seems safe, and the severity of our internal police-force may
therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the
unconscious never sleeps at all. And now the reduction of pressure upon the repressed
unconscious produces its effect. Wishes arise from it which during sleep might find the entrance
to consciousness open. If we were to know them we should be appalled, alike by their subject-
matter, their unrestraint and indeed the mere possibility of their existence. This, however,
occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But
as a rule our consciousness does not experience the dream as it really was. It is true that the
inhibitory forces (the dream censorship, as we may call them) are not completely awake, but
neither are they wholly asleep. They have had an influence on the dream while it was struggling
to find an expression in words and pictures, they have got rid of what was most objectionable,
they have altered other parts of it till they are unrecongnizable, they have severed real
connections while introducing false ones, until the honest but brutal wishful phantasy which lay
behind the dream has turned into the manifest dream as we remember it - more or less
confused and almost always strange and incomprehensible. Thus the dream (or the distortion
which characterizes it) is the expression of a compromise, the evidence of a conflict between
the mutually incompatible impulses and strivings of our mental life. And do not let us forget that
the same process, the same interplay of forces, which explains the dreams of a normal sleeper,
gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
These derealizations are remarkable phenomena which are still little understood. They are spoken of as 'sensations', but they are obviously complicated processes, attached to particular mental contents and bound up with decisions made about those contents. They arise very frequently in certain mental diseases, but they are not unknown among normal people, just as hallucinations occasionally occur in the healthy. Nevertheless they are certainly failures in functioning and, like dreams, which, in spite of their regular occurrence in healthy people, serve us as models of psychological disorder, they are abnormal structures. These phenomena are to be observed in two forms: the subject feels either that a piece of reality or that a piece of his own self is strange to him. In the latter case we speak of 'depersonalizations'; derealizations and depersonalizations are intimately connected. There is another set of phenomena which may be regarded as their positive counterparts - what are known as 'fausse reconnaissance', 'déjà vu', 'déjà raconté' etc., illusions in which we seek to accept something as belonging to our ego, just as in the derealizations we are anxious to keep something out of us. A naïvely mystical and unpsychological attempt at explaining the phenomena of 'déjà vu' endeavours to find evidence in it of a former existence of our mental self. Depersonalization leads us on to the extraordinary condition of 'double conscience', which is more correctly described as 'split personality'. But all of this is so obscure and has been so little mastered scientifically that I must refrain from talking about it any more to you.

[1936a, 4828]

An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.

[1940a [1938], 4975]

We find our way to the understanding ('interpretation') of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream-process but only a façade behind which that process lies concealed. Here we have our distinction between the manifest content of a dream and the latent dream-thoughts. The process which produces the former out of the latter is described as the dream-work. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconsciously and, as a result of the ego's opposition, undergoes the changes which we know as dream-distortion. There are no features of a dream which cannot be explained in this way.

[1940a [1938], 4975]
The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.
The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to condensation, an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream-thoughts as though it were a combined allusion to all of them; and in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities (cathexes) are displaced from one element to another, so that it often happens that an element which was of little importance in the dream-thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, vice versa, that essential elements of the dream-thoughts are represented in the manifest dream only by slight allusions. Moreover, as a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one by the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream-thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging quantities of excitation than by any other consideration;¹ and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.

¹[1940a [1938], 4978]

The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must only mention a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong-weak', 'light-dark' and 'high-deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as 'altus' ('high' and 'deep') and 'sacer' ('sacred' and 'infamous').

¹[1940a [1938], 4979]

I will close this discussion with a comment which will justify the length of time I have spent on the problem of the interpretation of dreams. Experience has shown that the unconscious mechanisms which we have come to know from our study of the dream-work and which gave us the explanation of the formation of dreams also help us to understand the puzzling symptoms which attract our interest to neuroses and psychoses. A conformity of such a kind cannot fail to excite high hopes in us.

¹[1940a [1938], 4981]
The study of a mental disorder occurring during sleep, which is transient and harmless and which, indeed, performs a useful function, has given us a key to the understanding of the mental diseases which are permanent and injurious to life. And we may now venture on the assertion that the psychology of consciousness was no better capable of understanding the normal functioning of the mind than of understanding dreams. The data of conscious self-perception, which alone were at its disposal, have proved in every respect inadequate to fathom the profusion and complexity of the processes of the mind, to reveal their interconnections and so to recognize the determinants of their disturbances.

[1940a [1938], 5002]

We have repeatedly had to insist on the fact that the ego owes its origin as well as the most important of its acquired characteristics to its relation to the real external world. We are thus prepared to assume that the ego's pathological states, in which it most approximates once again to the id, are founded on a cessation or slackening of that relation to the external world. This tallies very well with what we learn from clinical experience - namely, that the precipitating cause of the outbreak of a psychosis is either that reality has become intolerably painful or that the instincts have become extraordinarily intensified - both of which, in view of the rival claims made on the ego by the id and the external world, must lead to the same result. The problem of psychoses would be simple and perspicuous if the ego's detachment from reality could be carried through completely. But that seems to happen only rarely or perhaps never. Even in a state so far removed from the reality of the external world as one of hallucinatory confusion, one learns from patients after their recovery that at the time in some corner of their mind (as they put it) there was a normal person hidden, who, like a detached spectator, watched the hubbub of illness go past him. I do not know if we may assume that this is so in general, but I can report the same of other psychoses with a less tempestuous course. I call to mind a case of chronic paranoia in which after each attack of jealousy a dream conveyed to the analyst a correct picture of the precipitating cause, free from any delusion. An interesting contrast was thus brought to light: while we are accustomed to discover from the dreams of neurotics jealousies which are alien to their waking lives, in this psychotic case the delusion which dominated the patient in the day-time was corrected by his dream. We may probably take it as being generally true that what occurs in all these cases is a psychical split. Two psychical attitudes have been formed instead of a single one - one, the normal one, which takes account of reality, and another which under the influence of the instincts detaches the ego from reality. The two exist alongside of each other. The issue depends on their relative strength. If the second is or becomes the stronger, the necessary precondition for a psychosis is present. If the relation is reversed, then there is an apparent cure of the delusional disorder. Actually it has only retreated into the unconscious - just as numerous observations lead us to believe that the delusion existed ready-made for a long time before its manifest irruption.

[1940a [1938], 5007]
Since we are now engaged in looking for sources of dreams inside the organism instead of outside it, we must bear in mind that almost all our internal organs, though they give us scarcely any news of their working so long as they are in a healthy state, become a source of what are mainly distressing sensations when they are in what we describe as states of excitation, or during illnesses. These sensations must be equated with the sensory or painful stimuli reaching us from the outside. The experience of ages is reflected in — to take an example — Strümpell's remarks on the subject (1877, 107): 'During sleep the mind attains a far deeper and wider sensory consciousness of somatic events than during the waking state. It is obliged to receive and be affected by impressions of stimuli from parts of the body and from changes in the body of which it knows nothing when awake.' So early a writer as Aristotle regarded it as quite possible that the beginnings of an illness might make themselves felt in dreams before anything could be noticed of it in waking life, owing to the magnifying effect produced upon impressions by dreams. (See above, p. 518.) Medical writers, too, who were certainly far from believing in the prophetic power of dreams, have not disputed their significance as premonitors of illness. (Cf. Simon, 1888, 31, and many earlier writers.)¹

¹ [Footnote added 1914:] Apart from the diagnostic value ascribed to dreams (e.g. in the works of Hippocrates), their therapeutic importance in antiquity must also be borne in mind. In Greece there were dream oracles, which were regularly visited by patients in search of recovery. A sick man would enter the temple of Apollo or Aesculapius, would perform various ceremonies there, would be purified by lustration, massage and incense, and then, in a state of exaltation, would be stretched on the skin of a ram that had been sacrificed. He would then fall asleep and would dream of the remedies for his illness. These would be revealed to him either in their natural form or in symbols and pictures which would afterwards be interpreted by the priests. For further information upon therapeutic dreams among the Greeks see Lehmann (1908, 1, 74), Bouché-Leclercq (1879-1882), Hermann (1858, §41, 262 ff., and 1882, §38, 356), Böttinger (1795, 163 ff.), Lloyd (1877), Döllinger (1857, 130).

Instances of the diagnostic power of dreams seem to be vouched for in more recent times. Thus Tissié (1898, 62 f.) quotes from Artigues (1884, 43) the story of a forty-three-year old woman, who, while apparently in perfect health, was for some years tormented by anxiety-dreams. She was then medically examined and found to be in the early stages of an affection of the heart, to which she eventually succumbed.
The question next arises as to the significance of the appearance of involuntary ideas in dreams, as to the light which the emergence during the night of these morally incompatible impulses throws upon the psychology of the waking and dreaming mind. And here we find a fresh division of opinion and yet another different grouping of the authorities. The line of thought adopted by Hildebrandt and others who share his fundamental position inevitably leads to the view that immoral impulses possess a certain degree of power even in waking life, though it is an inhibited power, unable to force its way into action, and that in sleep something is put out of action which acts like an inhibition in the daytime and has prevented us from being aware of the existence of such impulses. Thus dreams would reveal the true nature of man, though not his whole nature, and they would constitute one means of rendering the hidden interior of the mind accessible to our knowledge. Only upon some such premises as these can Hildebrandt base his attribution to dreams of warning powers, which draw our attention to moral infirmities in our mind, just as physicians admit that dreams can bring unobserved physical illnesses to our conscious notice. So, too, Spitta must be adopting this view when, in speaking of the sources of excitation which impinge upon the mind (at puberty, for instance), he consoles the dreamer with the assurance that he will have done all that lies within his power if he leads a strictly virtuous life in his waking hours, and if he takes care to suppress sinful thoughts whenever they arise and to prevent their maturing and turning into acts. According to this view we might define the 'involuntary ideas' as ideas which had been 'suppressed' during the day, and we should have to regard their emergence as a genuine mental phenomenon.

It is not so easy for us to say what the author intended with this dream and what caused him to link the development of the delusion precisely to a dream. Zealous investigators, it is true, have collected plenty of examples of the way in which mental disturbances are linked to dreams and arise out of dreams.¹ It appears, too, that in the lives of a few eminent men impulses to important actions and decisions have originated from dreams. But these analogies are not of much help to our understanding; so let us keep to our present case, our author's imaginary case of Norbert Hanold the archaeologist. By which end are we to take hold of a dream like this so as to fit it into the whole context, if it is not to remain no more than an unnecessary decoration of the story?

The application of a few of the rules of dream-interpretation to Hanold's first dream has thus resulted in making it intelligible to us in its main features and in inserting it into the nexus of the story. Surely, then, the author must have observed these rules in creating it? We might ask another question, too: why did the author introduce a dream at all to bring about the further development of the delusion? In my opinion it was an ingenious notion and once again true to reality. We have already heard that in real illnesses a delusion very often arises in connection with a dream, and, after what we have learnt about the nature of dreams, there is no need to see a fresh riddle in this fact. Dreams and delusions arise from the same source - from what is repressed. Dreams are, as one might say, the physiological delusions of normal people. Before what is repressed has become strong enough to break through into waking life as a delusion, it may easily have achieved a first success, under the more favourable conditions of the state of sleep, in the form of a dream with persisting effects. For during sleep, along with a general lowering of mental activity, there is a relaxation in the strength of the resistance with which the dominant psychical forces oppose what is repressed. It is this relaxation that makes the formation of dreams possible, and that is why dreams give us our best access to a knowledge of the unconscious part of the mind - except that, as a rule, with the re-establishment of the psychical cathexes of waking life, the dream once more takes to flight and the ground that had been won by the unconscious is evacuated once again.
It is, of course, the study of dreams which has taught us what we know of the psychical characteristics of the state of sleep. It is true that dreams only show us the dreamer in so far as he is not sleeping; nevertheless they are bound to reveal at the same time characteristics of sleep itself. We have come to know from observation some peculiarities of dreams which we could not at first understand, but which we can now fit into the picture without difficulty. Thus, we know that dreams are completely egoistic and that the person who plays the chief part in their scenes is always to be recognized as the dreamer. This is now easily to be accounted for by the narcissism of the state of sleep. Narcissism and egoism, indeed, coincide; the word 'narcissism' is only intended to emphasize the fact that egoism is a libidinal phenomenon as well; or, to put it in another way, narcissism may be described as the libidinal complement of egoism. The 'diagnostic' capacity of dreams - a phenomenon which is generally acknowledged, but regarded as puzzling - becomes equally comprehensible, too. In dreams, incipient physical disease is often detected earlier and more clearly than in waking life, and all the current bodily sensations assume gigantic proportions. This magnification is hypochondriacal in character; it is conditional upon the withdrawal of all psychical cathexes from the external world back on to the ego, and it makes possible early recognition of bodily changes which in waking life would still for a time have remained unobserved.

[1917d, 3028]
It is, I believe, a reaction against the overvaluation of dreams in earlier days. The reconstruction of the past is, as we know, no easy matter, but we may assume with certainty, if I may put it as a joke, that our ancestors three thousand or more years ago already had dreams like ours. So far as we know, all the peoples of antiquity attached great significance to dreams and thought they could be used for practical purposes. They deduced signs for the future from them and searched in them for auguries. For the Greeks and other oriental nations, there may have been times when a campaign without dream-interpreters seemed as impossible as one without air-reconnaissance seems to-day. When Alexander the Great started on his conquests, his train included the most famous dream-interpreters. The city of Tyre, which at that time still stood on an island, offered the king such a stiff resistance that he considered the possibility of raising the siege. Then one night he had a dream of a satyr who seemed to be dancing in triumph, and when he reported it to his dream-interpreters they informed him that it foreshadowed his conquest of the city. He ordered an assault and captured Tyre. Among the Etruscans and Romans other methods of foretelling the future were in use; but throughout the whole of the Hellenistic-Roman period the interpretation of dreams was practised and highly esteemed. Of the literature dealing with the subject the principal work at least has survived: the book by Artemidorus of Daldis, who probably lived during the reign of the Emperor Hadrian. How it came about after this that the art of interpreting dreams declined and that dreams fell into discredit I cannot tell you. The spread of enlightenment cannot have had much to do with it, for many things more absurd than the dream-interpretation of antiquity were faithfully preserved in the obscurity of the Middle Ages. The fact remains that interest in dreams gradually sank to the level of superstition and could survive only among the uneducated classes. The final abuse of dream-interpretation was reached in our days with attempts to discover from dreams the numbers fated to be drawn in the game of lotto. On the other hand the exact science of to-day has repeatedly concerned itself with dreams but always with the sole aim of applying its physiological theories to them. Medical men, of course, looked on dreams as non-psychical acts, as the expression in mental life of somatic stimuli. Binz (1878) pronounced that dreams are 'somatic processes, which are in every case useless and in many cases positively pathological, to which the soul of the universe and immortality are as sublimely superior as the blue sky above some weed-grown, low-lying stretch of sand.' Maury compares dreams to the disordered twitchings of St. Vitus's dance as contrasted with the co-ordinated movements of a healthy man. According to an old analogy, the contents of a dream are like the sounds produced when 'the ten fingers of a man who knows nothing of music wander over the keys of a piano.'

I think that, like me, you must be tired of pursuing enquiries like those we have so far been making. All one's interest in a problem is evidently insufficient unless one knows as well of a path of approach that will lead to its solution. We have not yet found such a path. Experimental psychology has brought us nothing but some very valuable information on the significance of stimuli as instigators to dreaming. We have nothing to expect from philosophy except that it will once again haughtily point out to us the intellectual inferiority of the object of our study. Nor have we any wish to borrow anything from the occult sciences. History and popular opinion tell us that dreams have a sense and a meaning: that they look into the future - which is hard to accept and certainly incapable of proof. So our first effort leaves us completely at a loss.
If we make a series of comparisons between the dream-thoughts and the manifest dreams which replace them, we shall come upon all kinds of things for which we are unprepared: for instance, that nonsense and absurdity in dreams have their meaning. At this point, indeed, the contrast between the medical and the psycho-analytic view of dreams reaches a pitch of acuteness not met with elsewhere. According to the former, dreams are senseless because mental activity in dreams has abandoned all its powers of criticism; according to our view, on the contrary, dreams become senseless when a piece of criticism included in the dream-thoughts - a judgement that 'this is absurd' - has to be represented. The dream you are familiar with of the visit to the theatre ('three tickets for 1 florin 50') is a good example of this. The judgement it expressed was: 'it was absurd to marry so early.'

[1916-1917, 3269]

There would seem to be two categories of dreams with a claim to being reckoned as occult phenomena: prophetic dreams and telepathic ones. A countless multitude of witnesses speak in favour of both of them, while against both of them there is the obstinate aversion, or maybe prejudice, of science.

[1925i, 4052]

With the help of the method of free association and of the related art of interpretation, psycho-analysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that dreams have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the manifest dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These latent dream-thoughts contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.

[1925d, 4218]
Let us suppose, then, that someone - a patient in analysis, for instance - tells us one of his dreams. We shall assume that in this way he is making us one of the communications to which he has pledged himself by the fact of having started an analytic treatment. It is, to be sure, a communication made by inappropriate means, for dreams are not in themselves social utterances, not a means of giving information. Nor, indeed, do we understand what the dreamer was trying to say to us, and he himself is equally in the dark. And now we have to make a quick decision. On the one hand, the dream may be, as non-analytic doctors assure us, a sign that the dreamer has slept badly, that not every part of his brain has come to rest equally, that some areas of it, under the influence of unknown stimuli, endeavoured to go on working but were only able to do so in a very incomplete fashion. If that is the case, we shall be right to concern ourselves no further with the product of a nocturnal disturbance which has no psychical value: for what could we expect to derive from investigating it that would be of use for our purposes? Or on the other hand - but it is plain that we have from the first decided otherwise. We have - quite arbitrarily, it must be admitted - made the assumption, adopted as a postulate, that even this unintelligible dream must be a fully valid psychical act, with sense and worth, which we can use in analysis like any other communication. Only the outcome of our experiment can show whether we are right. If we succeed in turning the dream into an utterance of value of that kind, we shall evidently have a prospect of learning something new and of receiving communications of a sort which would otherwise be inaccessible to us.

[1933a, 4623]

When they fell in with my instructions they told me their dreams, amongst other things, as though they were of the same kind as their other thoughts. This was a plain hint that I should assign as much importance to these dreams as to other, intelligible, phenomena. They, however, were not intelligible, but strange, confused, absurd: like dreams, in fact - which for that very reason, were condemned by science as random and senseless twitchings of the organ of the mind. If my patients were right - and they seemed only to be repeating the ancient beliefs held by unscientific men for thousands of years - I was faced by the task of 'interpreting dreams' in a way that could stand up against scientific criticism.
[1932c, 4808]
If we undo dream-displacement by means of analysis, we obtain what seems to be completely trustworthy information on two much-disputed problems concerning dreams: as to their instigators and as to their connection with waking life. There are dreams which immediately reveal their derivation from events of the day; there are others in which no trace of any such derivation is to be discovered. If we seek the help of analysis, we find that every dream without any possible exception goes back to an impression of the past few days, or, it is probably more correct to say, of the day immediately preceding the dream, of the 'dream-day.' The impression which plays the part of dream-instigator may be such an important one that we feel no surprise at being concerned with it in the daytime, and in that case we rightly speak of the dream as carrying on with the significant interests of our waking life. As a rule, however, if a connection is to be found in the content of the dream with any impression of the previous day, that impression is so trivial, insignificant and unmemorable, that it is only with difficulty that we ourselves can recall it. And in such cases the content of the dream itself, even if it is connected and intelligible, seems to be concerned with the most indifferent trivialities, which would be unworthy of our interest if we were awake. A good deal of the contempt in which dreams are held is due to the preference thus shown in their content for what is indifferent and trivial.

[1901a, 1071]

Analysis does away with the misleading appearance upon which this derogatory judgement is founded. If the content of a dream puts forward some indifferent impression as being its instigator, analysis invariably brings to light a significant experience, and one by which the dreamer has good reason to be stirred. This experience has been replaced by the indifferent one, with which it is connected by copious associative links. Where the content of the dream treats of insignificant and uninteresting ideational material, analysis uncovers the numerous associative paths connecting these trivialities with things that are of the highest psychical importance in the dreamer's estimation. If what makes their way into the content of dreams are impressions and material which are indifferent and trivial rather than justifiably stirring and interesting, that is only the effect of the process of displacement. If we answer our questions about dream-instigators and the connection between dreaming and daily affairs on the basis of the new insight we have gained from replacing the manifest by the latent content of dreams, we arrive at these conclusions: dreams are never concerned with things with which we should not think it worth while to be concerned during the day, and trivialities which do no affect us during the day are unable to pursue us in our sleep.

[1901a, 1072]
Now while this agency, in which we recognize our normal ego, is concentrated on the wish to sleep, it appears to be compelled by the psycho-physiological conditions of sleep to relax the energy with which it is accustomed to hold down the repressed material during the day. In itself, no doubt, this relaxation does no harm; however much the suppressed impulses of the childish mind may prance around, their access to consciousness is still difficult and their access to movement is barred as the result of this same state of sleep. The danger of sleep being disturbed by them must, however, be guarded against. We must in any case suppose that even during deep sleep a certain amount of free attention is on duty as a guard against sensory stimuli, and that this guard may sometimes consider waking more advisable than a continuation of sleep. Otherwise there would be no explanation of how it is that we can be woken up at any moment by sensory stimuli of some particular quality. As the physiologist Burdach insisted long ago, a mother, for instance, will be roused by the whimpering of her baby, or a miller if his mill comes to a stop, or most people if they are called softly by their own name. Now the attention which is thus on guard is also directed towards internal wishful stimuli arising from the repressed material, and combines with them to form the dream which, as a compromise, simultaneously satisfies both of the two agencies. The dream provides a kind of psychical consummation for the wish that has been suppressed (or formed with the help of repressed material) by representing it as fulfilled; but it also satisfies the other agency by allowing sleep to continue. In this respect our ego is ready to behave like a child; it gives credence to the dream images, as though what it wanted to say was: "Yes, yes! you're quite right, but let me go on sleeping!" The low estimate which we form of dreams when we are awake, and which we relate to their confused and apparently illogical character, is probably nothing other than the judgement passed by our sleeping ego upon the repressed impulses, a judgement based, with better right, upon the motor impotence of these disturbers of sleep. We are sometimes aware in our sleep of this contemptuous judgement. If the content of a dream goes too far in overstepping the censorship, we think: "After all, it's only a dream!" - and go on sleeping.

Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1901a, 1092]

[1905c, 1686]
When they fell in with my instructions they told me their dreams, amongst other things, as though they were of the same kind as their other thoughts. This was a plain hint that I should assign as much importance to these dreams as to other, intelligible, phenomena. They, however, were not intelligible, but strange, confused, absurd: like dreams, in fact - which for that very reason, were condemned by science as random and senseless twitchings of the organ of the mind. If my patients were right - and they seemed only to be repeating the ancient beliefs held by unscientific men for thousands of years - I was faced by the task of 'interpreting dreams' in a way that could stand up against scientific criticism.

[1932c, 4808]
Since we are now engaged in looking for sources of dreams inside the organism instead of outside it, we must bear in mind that almost all our internal organs, though they give us scarcely any news of their working so long as they are in a healthy state, become a source of what are mainly distressing sensations when they are in what we describe as states of excitation, or during illnesses. These sensations must be equated with the sensory or painful stimuli reaching us from the outside. The experience of ages is reflected in - to take an example - Strümpell's remarks on the subject (1877, 107): 'During sleep the mind attains a far deeper and wider sensory consciousness of somatic events than during the waking state. It is obliged to receive and be affected by impressions of stimuli from parts of the body and from changes in the body of which it knows nothing when awake.' So early a writer as Aristotle regarded it as quite possible that the beginnings of an illness might make themselves felt in dreams before anything could be noticed of it in waking life, owing to the magnifying effect produced upon impressions by dreams. (See above, p. 518.) Medical writers, too, who were certainly far from believing in the prophetic power of dreams, have not disputed their significance as premonitors of illness. (Cf. Simon, 1888, 31, and many earlier writers.)¹

Instances of the diagnostic power of dreams seem to be vouched for in more recent times. Thus Tissié (1898, 62 f.) quotes from Artigues (1884, 43) the story of a forty-three-year old woman, who, while apparently in perfect health, was for some years tormented by anxiety-dreams. She was then medically examined and found to be in the early stages of an affection of the heart, to which she eventually succumbed.

Pronounced disorders of the internal organs obviously act as instigators of dreams in a whole number of cases. The frequency of anxiety-dreams in diseases of the heart and lungs is generally recognized. Indeed, this side of dream-life is placed in the foreground by so many authorities that I am content with a mere reference to the literature: Radestock, Spitta, Maury, Simon (1888), Tissié. Tissié is even of the opinion that the particular organ affected gives a characteristic impress to the content of the dream. Thus the dreams of those suffering from diseases of the heart are usually short and come to a terrifying end at the moment of waking; their content almost always includes a situation involving a horrible death. Sufferers from diseases of the lungs dream of suffocation, crowding and fleeing, and are remarkably subject to the familiar nightmare. (It may be remarked, incidentally, that Börner (1855) has succeeded in provoking the latter experimentally by lying on his face or covering the respiratory apertures.) In the case of digestive disorders dreams contain ideas connected with enjoyment of food or disgust. Finally, the influence of sexual excitement on the content of dreams can be adequately appreciated by everyone from his own experience and provides the theory that dreams are instigated by organic stimuli with its most powerful support.

Lastly, dreams are reputed to have the power of divining the future. Here we have a conflict in which almost insuperable scepticism is met by obstinately repeated assertions. No doubt we shall be acting rightly in not insisting that this view has no basis at all in fact, since it is possible that before long a number of the instances cited may find an explanation within the bounds of natural psychology.
The question next arises as to the significance of the appearance of involuntary ideas in dreams, as to the light which the emergence during the night of these morally incompatible impulses throws upon the psychology of the waking and dreaming mind. And here we find a fresh division of opinion and yet another different grouping of the authorities. The line of thought adopted by Hildebrandt and others who share his fundamental position inevitably leads to the view that immoral impulses possess a certain degree of power even in waking life, though it is an inhibited power, unable to force its way into action, and that in sleep something is put out of action which acts like an inhibition in the daytime and has prevented us from being aware of the existence of such impulses. Thus dreams would reveal the true nature of man, though not his whole nature, and they would constitute one means of rendering the hidden interior of the mind accessible to our knowledge. Only upon some such premises as these can Hildebrandt base his attribution to dreams of warning powers, which draw our attention to moral infirmities in our mind, just as physicians admit that dreams can bring unobserved physical illnesses to our conscious notice. So, too, Spitta must be adopting this view when, in speaking of the sources of excitation which impinge upon the mind (at puberty, for instance), he consoles the dreamer with the assurance that he will have done all that lies within his power if he leads a strictly virtuous life in his waking hours, and if he takes care to suppress sinful thoughts whenever they arise and to prevent their maturing and turning into acts. According to this view we might define the 'involuntary ideas' as ideas which had been 'suppressed' during the day, and we should have to regard their emergence as a genuine mental phenomenon.

¹ [Footnote added 1925:] I used at one time to find it extraordinarily difficult to accustom readers to the distinction between the manifest content of dreams and the latent dream-thoughts. Again and again arguments and objections would be brought up based upon some uninterpreted dream in the form in which it had been retained in the memory, and the need to interpret it would be ignored. But now that analysts at least have become reconciled to replacing the manifest dream by the meaning revealed by its interpretation, many of them have become guilty of falling into another confusion which they cling to with equal obstinacy. They seek to find the essence of dreams in their latent content and in so doing they overlook the distinction between the latent dream-thoughts and the dream-work. At bottom, dreams are nothing other than a particular form of thinking, made possible by the conditions of the state of sleep. It is the dream-work which creates that form, and it alone is the essence of dreaming - the explanation of its peculiar nature. I say this in order to make it possible to assess the value of the notorious 'prospective purpose' of dreams. The fact that dreams concern themselves with attempts at solving the problems by which our mental life is faced is no more strange than that our conscious waking life should do so; beyond this it merely tells us that that activity can also be carried on in the preconscious - and this we already knew.

[1900a, 579]

It would scarcely repay the trouble if we were to treat the historical significance of dreams as a separate topic. A dream may have impelled some chieftain to embark upon a bold enterprise the success of which has changed history. But this only raises a fresh problem so long as a dream is regarded as an alien power in contrast to the other more familiar forces of the mind; no such problem remains if a dream is recognized as a form of expression of impulses which are under the pressure of resistance during the day but which have been able to find reinforcement during the night from deep-lying sources of excitation.¹ The respect paid to dreams in antiquity is, however, based upon correct psychological insight and is the homage paid to the uncontrolled and indestructible forces in the human mind, to the 'daemonic' power which produces the dream-wish and which we find at work in our unconscious.

[1900a, 1039]
And the value of dreams for giving us knowledge of the future? There is of course no question of that. It would be truer to say instead that they give us knowledge of the past. For dreams are derived from the past in every sense. Nevertheless the ancient belief that dreams foretell the future is not wholly devoid of truth. By picturing our wishes as fulfilled, dreams are after all leading us into the future. But this future, which the dreamer pictures as the present, has been moulded by his indestructible wish into a perfect likeness of the past.

Frau B., an estimable woman who moreover possesses a critical sense, told me in another connection and without the slightest arrière pensée that once some years ago she dreamt she had met Dr. K., a friend and former family doctor of hers, in the Kärntnerstrasse in front of Hiess's shop. The next morning, while she was walking along the same street, she in fact met the person in question at the very spot she had dreamt of. So much for my theme. I will only add that no subsequent event proved the importance of this miraculous coincidence, which cannot therefore be accounted for by what lay in the future.

Analysis of the dream was helped by questioning, which established the fact that there was no evidence of her having had any recollection at all of the dream on the morning after she dreamt it, until after her walk - evidence such as her having written the dream down or told it to someone before it was fulfilled. On the contrary, she was obliged to accept the following account of what happened, which seems to me more plausible, without raising any objection to it. She was walking along the Kärntnerstrasse one morning and met her old family doctor in front of Hiess's shop. On seeing him she felt convinced that she had dreamt the night before of having this very meeting at that precise spot. According to the rules that apply to the interpretation of neurotic symptoms, her conviction must have been justified; its content may, however, require to be re-interpreted.
Between the scene in which her wish had been fulfilled and the time of the dream more than twenty-five years elapsed. In the meantime Frau B. had become the widow of a second husband who left her with a child and a fortune. The old lady's affection was still centred on Dr. K., who was now her adviser and the administrator of her estate and whom she saw frequently. Let us suppose that during the few days before the dream she had been expecting a visit from him, but that this had not taken place - he was no longer so pressing as he used to be. She may then have quite well had a nostalgic dream one night which took her back to the old days. Her dream was probably of a rendez-vous at the time of her love affair, and the chain of her dream-thoughts carried her back to the occasion when, without any pre-arrangement, he had come in at the very moment at which she had been longing for him. She probably had dreams of this kind quite often now; they were a part of the belated punishment with which a woman pays for her youthful cruelty. But such dreams - derivatives of a suppressed current of thought, filled with memories of rendez-vous of which, since her second marriage, she no longer liked to think - such dreams were put aside on waking. And that was what happened to our ostensibly prophetic dream. She then went out, and in the Kärntnerstrasse, at a spot which was in itself indifferent, she met her old family doctor, Dr. K. It was a very long time since she had seen him. He was intimately associated with the excitements of that happy-unhappy time. He too had been a helper, and we may suppose that he had been used in her thoughts, and perhaps in her dreams as well, as a screen figure behind which she concealed the better-loved figure of the other Dr. K. This meeting now revived her recollection of the dream. She must have thought: 'Yes, I had a dream last night of my rendez-vous with Dr. K.' But this recollection had to undergo the distortion which the dream escaped only because it had been completely forgotten. She inserted the indifferent K. (who had reminded her of the dream) in place of the beloved K. The content of the dream - the rendez-vous - was transferred to a belief that she had dreamt of that particular spot, for a rendez-vous consists in two people coming to the same spot at the same time. And if she then had an impression that a dream had been fulfilled, she was only giving effect in that way to her memory of the scene in which she had longed in her misery for him to come and her longing had at once been fulfilled.

Thus the creation of a dream after the event, which alone makes prophetic dreams possible, is nothing other than a form of censoring, thanks to which the dream is able to make its way through into consciousness.

Now that we have established the concept of repression and have brought dream-distortion into relation with repressed psychical material, we can express in general terms the principal finding to which we have been led by the analysis of dreams. In the case of dreams which are intelligible and have a meaning, we have found that they are undisguised wish-fulfilments; that is, that in their case the dream-situation represents as fulfilled a wish which is known to consciousness, which is left over from daytime life, and which is deservedly of interest. Analysis has taught us something entirely analogous in the case of obscure and confused dreams: once again the dream-situation represents a wish as fulfilled - a wish which invariably arises from the dream-thoughts, but one which is represented in an unrecognizable form and can only be explained when it has been traced back in analysis. The wish in such cases is either itself a repressed one and alien to consciousness, or it is intimately connected with repressed thoughts and is based upon them. Thus the formula for such dreams is as follows: they are disguised fulfilments of repressed wishes. It is interesting in this connection to observe that the popular belief that dreams always foretell the future is confirmed. Actually the future which the dream shows us is not the one which will occur but the one which we should like to occur. The popular mind is behaving here as it usually does: what it wishes, it believes.

[1900a, 1048]

[1901a, 1087]
Though we admit that these remarks of ours in no way exhaust the psychology of superstition, we shall at least have to touch on the question of whether we are to deny entirely that superstition has any real roots: whether there are definitely no such things as true presentiments, prophetic dreams, telepathic experiences, manifestations of supernatural forces and the like. I am far from meaning to pass so sweeping a condemnation of these phenomena, of which so many detailed observations have been made even by men of outstanding intellect, and which it would be best to make the subject of further investigations. We may even hope that some portion of these observations will then be explained by our growing recognition of unconscious mental processes, without necessitating radical alterations in the views we hold today. If the existence of still other phenomena - those, for example, claimed by spiritualists - were to be established, we should merely set about modifying our 'laws' in the way demanded by the new discovery, without being shaken in our belief in the coherence of things in the world.

Belief in prophetic dreams can claim many adherents, because it can take support from the fact that a number of things do in reality turn out in the future in the way in which the wish had previously arranged them in the dream.¹ But there is little that is surprising in that, and as a rule, too, there are extensive differences between the dream and its fulfilment, which the dreamer's credulity prefers to neglect. A good example of a dream which may justly be called prophetic was once brought to me for detailed analysis by an intelligent and truthful woman patient. Her story was that she had once dreamt she met a former friend of hers and family doctor in front of a certain shop in a certain street; and that when next morning she went into the Inner Town she in fact met him at the very spot named in the dream. I may observe that no subsequent event proved the importance of this miraculous coincidence,² which could not therefore be accounted for by what lay in the future.

Careful questioning established that there was no evidence of her having had any recollection of the dream on the morning after she dreamt it - that is, until after her walk and the meeting. She could produce no objection to an account of what happened which robbed the episode of anything miraculous and left nothing but an interesting psychological problem. She was walking along the street in question one morning and met her old family doctor in front of a particular shop, and thereupon, on seeing him, she felt convinced that she had dreamt the night before of having this meeting at that precise spot. Analysis was then able to show with great probability how she arrived at this sense of conviction, which, according to general rules, cannot fairly be denied a certain right to be considered authentic. A meeting at a particular place, which has been expected beforehand, amounts in fact to a rendezvous. The old family doctor awakened her memory of former days, when meetings with a third person, also a friend of the doctor, had played a very important part in her life. Since then she had continued her relations with that gentleman and had waited for him in vain on the day before the dream was supposed to have taken place. If I were able to report the circumstances of the case in greater detail it would be easy for me to show that her illusion, when she saw her friend of former days, of having had a prophetic dream was equivalent to some such remark as this: 'Ah! doctor - you remind me now of past times when I never had to wait in vain for N. if we'd arranged a meeting.'
A group of men who regarded it as a settled fact that the essential riddles of dreaming have been solved by the efforts of the author of the present work¹ found their curiosity aroused one day by the question of the class of dreams that have never been dreamt at all - dreams created by imaginative writers and ascribed to invented characters in the course of a story. The notion of submitting this class of dreams to an investigation might seem a waste of energy and a strange thing to undertake; but from one point of view it could be considered justifiable. It is far from being generally believed that dreams have a meaning and can be interpreted. Science and the majority of educated people smile if they are set the task of interpreting a dream. Only the common people, who cling to superstitions and who on this point are carrying on the convictions of antiquity, continue to insist that dreams can be interpreted. The author of *The Interpretation of Dreams* has ventured, in the face of the reproaches of strict science, to become a partisan of antiquity and superstition. He is, it is true, far from believing that dreams foretell the future, for the unveiling of which men have vainly striven from time immemorial by every forbidden means. But even he has not been able entirely to reject the relation of dreams to the future. For the dream, when the laborious work of translating it had been accomplished, revealed itself to him as a wish of the dreamer's represented as fulfilled; and who could deny that wishes are predominantly turned towards the future?

[1907a, 1812]

I invite you now to follow me on a brief excursion through the region of dream-problems. When we are awake we are in the habit of treating dreams with the same contempt with which patients regard the associations that are demanded of them by the psycho-analyst. We dismiss them, too, by forgetting them as a rule, quickly and completely. Our low opinion of them is based on the strange character even of those dreams that are not confused and meaningless, and on the obvious absurdity and nonsensicalness of other dreams. Our dismissal of them is related to the uninhibited shamelessness and immorality of the tendencies openly exhibited in some dreams. It is well known that the ancient world did not share this low opinion of dreams. Nor are the lower strata of our own society to-day in any doubt about the value of dreams; like the peoples of antiquity, they expect them to reveal the future. I confess that I feel no necessity for making any mystical assumptions in order to fill the gaps in our present knowledge, and accordingly I have never been able to find anything to confirm the prophetic nature of dreams. There are plenty of other things - sufficiently wonderful too - to be said about them.

[1910a, 2221]

The application of analysis to this case does more than this, however; it further increases its significance. It teaches us that what has been communicated by this means of induction from one person to another is not merely a chance piece of indifferent knowledge. It shows that an extraordinarily powerful wish harbourd by one person and standing in a special relation to his consciousness has succeeded, with the help of a second person, in finding conscious expression in a slightly disguised form - just as the invisible end of the spectrum reveals itself to the senses on a light-sensitive plate as a coloured extension. It seems possible to reconstruct the young man's train of thought after the illness and recovery of the brother-in-law who was his hated rival: 'Well, he's got over it this time; but he won't give up his dangerous taste on that account, and let's hope that next time it will be the end of him.' It was this 'let's hope' that was changed into the prophecy. I could quote a parallel to this from a dream (dreamt by another person), in which a prophecy was part of the subject-matter. The analysis of the dream showed that the content of the prophecy coincided with the fulfilment of a wish.

[1941d [1921], 3869]

There would seem to be two categories of dreams with a claim to being reckoned as occult phenomena: prophetic dreams and telepathic ones. A countless multitude of witnesses speak in favour of both of them, while against both of them there is the obstinate aversion, or maybe prejudice, of science.

[1925i, 4052]
There can, indeed, be no doubt that there are such things as prophetic dreams, in the sense that their content gives some sort of picture of the future; the only question is whether these predictions coincide to any noticeable extent with what really happens subsequently. I must confess that upon this point my resolution in favour of impartiality deserts me. The notion that there is any mental power, apart from acute calculation, which can foresee future events in detail is on the one hand too much in contradiction to all the expectations and presumptions of science and on the other hand corresponds too closely to certain ancient and familiar human desires which criticism must reject as unjustifiable pretensions. I am therefore of opinion that after one has taken into account the untrustworthiness, credulity and unconvincingness of most of these reports, together with the possibility of falsifications of memory facilitated by emotional causes and the inevitability of a few lucky shots, it may be anticipated that the spectre of veridical prophetic dreams will disappear into nothing. Personally, I have never experienced anything or learnt of anything that could encourage a more favourable presumption. [1925i, 4053]
But the same correlation that is responsible for the importance of the subject must also bear the blame for the deficiencies of the present work. The broken threads which so frequently interrupt my presentation are nothing less than the many points of contact between the problem of the formation of dreams and the more comprehensive problems of psycho pathology. These cannot be treated here, but, if time and strength allow and further material comes to hand, will form the subject of later communications.

¹ [Footnote added 1909:] In this respect neuroses behave exactly like dreams. I know a patient one of whose symptoms is that, involuntarily and against her will she hears - i.e. hallucinates - songs or fragments of songs, without being able to understand what part they play in her mental life. (Incidentally, she is certainly not paranoic.) Analysis has shown that, by allowing herself a certain amount of licence, she puts the text of these songs to false uses. For instance in the lines 'Leise, leise, Fromme Weise' [literally, 'Softly, softly, devout melody'] the last word was taken by her unconscious as though it was spelt 'Waise' [= 'orphan', thus making the lines read 'Softly, softly, pious orphan'], the orphan being herself. Again 'O du selige, o du fröhliche' ['Oh thou blessed and happy . . .'] is the opening of a Christmas carol; by not continuing the quotation to the word 'Christmastide' she turned it into a bridal song. -The same mechanism of distortion can also operate in the occurrence of an idea unaccompanied by hallucination. Why was it that one of my patients was pestered by the recollection of a poem that he had had to learn in his youth: 'Nächtlich am Busento lispeln . . . .' ['By night on the Busento whispering . . .']? Because his imagination went no further than the first part of this quotation: 'Nächtlich am Busen' ['By night on the bosom'].

An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysteric, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in Studies on Hysteria of the first hysterical attack which a woman of over forty had had in her fifteenth year.¹

¹ [1900a, 956]
It would not be possible for us to answer this question if we had not made some headway in the study of the psychology of the neuroses, and particularly of hysteria. We have found from this that the same irrational psychical processes, and others that we have not specified, dominate the production of hysterical symptoms. In hysteria, too, we come across a series of perfectly rational thoughts, equal in validity to our conscious thoughts; but to begin with we know nothing of their existence in this form and we can only reconstruct them subsequently. If they force themselves upon our notice at any point, we discover by analysing the symptom which has been produced that these normal thoughts have been submitted to abnormal treatment: they have been transformed into the symptom by means of condensation and the formation of compromises, by way of superficial associations and in disregard of contradictions, and also, it may be, along the path of regression. In view of the complete identity between the characteristic features of the dream-work and those of the psychical activity which issues in psychoneurotic symptoms, we feel justified in carrying over to dreams the conclusions we have been led to by hysteria.

This, however, is not the gap in the functional efficiency of our mental apparatus which makes it possible for thoughts, which represent themselves as products of the secondary thought activity, to become subject to the primary psychical process - for such is the formula in which we can now describe the activity which leads to dreams and to hysterical symptoms. Inefficiency arises from the convergence of two factors derived from our developmental history. One of these factors devolves entirely upon the mental apparatus and has had a decisive influence on the relation between the two systems, while the other makes itself felt to a variable degree and introduces instinctual forces of organic origin into mental life. Both of them originate in childhood and are a precipitate of the modifications undergone by our mental and somatic organism since our infancy.

The theory of the psychoneuroses asserts as an indisputable and invariable fact that only sexual wishful impulses from infancy, which have undergone repression (i.e. a transformation of their affect) during the developmental period of childhood, are capable of being revived during later developmental periods (whether as a result of the subject's sexual constitution, which is derived from an initial bisexuality, or as a result of unfavourable influences acting upon the course of his sexual life) and are thus able to furnish the motive force for the formation of psychoneurotic symptoms of every kind. It is only by reference to these sexual forces that we can close the gaps that are still patent in the theory of repression. I will leave it an open question whether these sexual and infantile factors are equally required in the theory of dreams: I will leave that theory incomplete at this point, since I have already gone a step beyond what can be demonstrated in assuming that dream-wishes are invariably derived from the unconscious.¹ Nor do I propose to enquire further into the nature of the distinction between the play of psychical forces in the formation of dreams and in that of hysterical symptoms: we are still without a sufficiently accurate knowledge of one of the two objects of the comparison.

¹ [1900a, 1033]
There is, however, another point to which I attach importance; and I must confess that it is
solely on its account that I have embarked here upon all these discussions of the two psychical
systems and their modes of activity and of repression. It is not now a question of whether I have
formed an approximately correct opinion of the psychological factors with which we are
concerned, or whether, which is quite possible in such difficult matters, my picture of them is
distorted and incomplete. However many changes may be made in our reading of the psychical
censorship and of the rational and abnormal revisions made of the dream-content, it remains
ture that processes of this sort are at work in the formation of dreams and that they show the
closest analogy in their essentials to the processes observable in the formation of hysterical
symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance
of psychical equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made
that no conclusions as to the dreams of normal people can be drawn from my dreams or those
of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may
argue back from the phenomena to their motive forces, we must recognize that the psychical
mechanism employed by neuroses is not created by the impact of a pathological disturbance
upon the mind but is present already in the normal structure of the mental apparatus. The two
psychical systems, the censorship upon the passage from one of them to the other, the
inhibition and overlaying of one activity by the other, the relations of both of them to
consciousness - or whatever more correct interpretations of the observed facts may take their
place - all of these form part of the normal structure of our mental instrument, and dreams show
us one of the paths leading to an understanding of its structure. If we restrict ourselves to the
minimum of new knowledge which has been established with certainty, we can still say this of
dreams: they have proved that what is suppressed continues to exist in normal people as well
as abnormal, and remains capable of psychical functioning. Dreams themselves are among the
manifestations of this suppressed material; this is so theoretically in every case, and it can be
observed empirically in a great number of cases at least, and precisely in cases which exhibit
most clearly the striking peculiarities of dream-life. In waking life the suppressed material in the
mind is prevented from finding expression and is cut off from internal perception owing to the
fact that the contradictions present in it are eliminated - one side being disposed of in favour of
the other; but during the night, under the sway of an impetus towards the construction of
compromises, this suppressed material finds methods and means of forcing its way into
consciousness.

One day I discovered to my great astonishment that the view of dreams which came nearest
to the truth was not the medical but the popular one, half-involved though it still was in
superstition. For I had been led to fresh conclusions on the subject of dreams by applying to
them a new method of psychological investigation which had done excellent service in the
solution of phobias, obsessions and delusions, etc. Since then, under the name of 'psycho-
analysis', it has found acceptance by a whole school of research workers. The numerous
analogies that exist between dream-life and a great variety of conditions of psychical illness in
waking life have indeed been correctly observed by many medical investigators. There seemed,
therefore, good ground for hoping that a method of investigation which had given satisfactory
results in the case of psychopathic structures would also be of use in throwing light upon
dreams. Phobias and obsessions are as alien to normal consciousness as dreams are to
waking consciousness; their origin is as unknown to consciousness as that of dreams. In the
case of these psychopathic structures practical considerations led to an investigation of their
origin and mode of development; for experience had shown that the discovery of the trains of
thought which, concealed from consciousness, connect the pathological ideas with the
remaining contents of the mind is equivalent to a resolution of the symptoms and has as its
consequence the mastering of ideas which till then could not be inhibited. Thus psychotherapy
was the starting-point of the procedure of which I made use for the explanation of dreams.

[1900a, 1034]

[1901a, 1053]
When one carries out the psycho-analysis of a hysterical woman patient whose complaint is manifest in attacks, one soon becomes convinced that these attacks are nothing else but phantasies translated into the motor sphere, projected on to motility and portrayed in pantomime. It is true that the phantasies are unconscious; but apart from this they are of the same nature as the phantasies which can be observed directly in day-dreams or which can be elicited by interpretation from dreams at night. Often a dream takes the place of an attack, and still more often it explains it, since the same phantasy finds a different expression in a dream and in an attack. We might expect then that by observing an attack we should be able to get to know the phantasy represented in it; but this is seldom possible. As a rule, owing to the influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions which are completely analogous to the hallucinatory distortions of a dream, so that both of them have, in the first resort, become unintelligible to the subject's own consciousness as well as to the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same interpretative revision as we employ for night-dreams. But not only are the forces from which the distortion proceeds and the purpose of the distortion the same as those we have come to know through the interpretation of dreams; the technique employed in the distortion is the same too.

[1909a, 1981]

(1) The attack becomes unintelligible through the fact that it represents several phantasies in the same material simultaneously - that is to say through condensation. The elements common to the two (or more) phantasies constitute the nucleus of the representation, as they do in dreams. The phantasies which are thus made to coincide are often of quite a different nature. They may, for instance, be a recent wish and the re-activation of an infantile impression. The same innervations are in that case made to serve both purposes, often in a most ingenious way. Hysterical patients who make a very extensive use of condensation may find a single form of attack sufficient; others express their numerous pathogenic phantasies by a multiplication of the forms of attack.

[1909a, 1982]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]
The first and most serious objection is that the content of adults' dreams is as a rule unintelligible and could not look more unlike the fulfilment of a wish. And here is the answer. Such dreams have been subjected to distortion; the psychical process underlying them might originally have been expressed in words quite differently. You must distinguish the manifest content of the dream, as you vaguely recollect it in the morning and laboriously (and, as it seems, arbitrarily) clothe it in words, and the latent dream-thoughts, which you must suppose were present in the unconscious. This distortion in dreams is the same process that you have already come to know in investigating the formation of hysterical symptoms. It indicates, too, that the same interplay of mental forces is at work in the formation of dreams as in that of symptoms. The manifest content of the dream is the distorted substitute for the unconscious dream-thoughts and this distortion is the work of the ego's forces of defence - of resistances. In waking life these resistances altogether prevent the repressed wishes of the unconscious from entering consciousness; and during the lowered state of sleep they are at least strong enough to oblige them to adopt a veil of disguise. Thereafter, the dreamer can no more understand the meaning of his dreams than the hysteric can understand the connection and significance of his symptoms.

[1910a, 2222]

The interpretation of dreams became a solace and a support to me in those arduous first years of analysis, when I had to master the technique, clinical phenomena and therapy of the neuroses all at the same time. At that period I was completely isolated and in the network of problems and accumulation of difficulties I often dreaded losing my bearings and also my confidence. There were often patients with whom an unaccountably long time elapsed before my hypothesis, that a neurosis was bound to become intelligible through analysis, proved true; but these patients' dreams, which might be regarded as analogues of their symptoms, almost always confirmed the hypothesis.

[1914d, 2889]

With the help of the method of free association and of the related art of interpretation, psycho-analysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that dreams have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the manifest dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These latent dream-thoughts contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.

[1925d, 4218]
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a censorship of dreams and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of dream-distortion, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

[1925d, 4219]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis. [1932c, 4809]
The other members of this class of wish-fulfilments - hysterical symptoms, for instance - possess one essential characteristic, however, which I cannot discover in dreams. I have learnt from the researches which I have mentioned so often in the course of this work that in order to bring about the formation of a hysterical symptom both currents of our mind must converge. A symptom is not merely the expression of a realized unconscious wish; a wish from the preconscious which is fulfilled by the same symptom must also be present. So that the symptom will have of at least two determinants, one arising from each of the systems involved in the conflict. As in the case of dreams, there are no limits to the further determinants that may be present - to the 'overdetermination' of the symptoms. The determinant which does not arise from the Ucs. is invariably, so far as I know, a train of thought reacting against the unconscious wish - a self-punishment, for instance. I can therefore make the quite general assertion that a hysterical symptom develops only where the fulfilments of two opposing wishes, arising each from a different psychical system, are able to converge in a single expression. (Compare in this connection my most recent formulations on the origin of hysterical symptoms in my paper on hysterical phantasies and their relation to bisexuality.) Examples would serve very little purpose here, since nothing but an exhaustive elucidation of the complications involved could carry conviction. I will therefore leave my assertion to stand for itself and only quote an example in order to make the point clear, and not to carry conviction. In one of my women patients, then, hysterical vomiting turned out to be on the one hand the fulfilment of an unconscious phantasy dating from her puberty - of a wish, that is, that she might be continuously pregnant and have innumerable children, with a further wish, added later, that she might have them by as many men as possible. A powerful defensive impulse had sprung up against this unbridled wish. And, since the patient might lose her figure and her good looks as a result of her vomiting, and so might cease to be attractive to anyone, the symptom was acceptable to the punitive train of thought as well; and since it was permitted by both sides it could become a reality. This was the same method of treating a wish-fulfilment as was adopted by the Parthian queen towards the Roman triumvir Crassus. Believing that he had embarked on his expedition out of love of gold, she ordered molten gold to be poured down his throat when he was dead: 'Now', she said, 'you have what you wanted.' But all that we so far know about dreams is that they express the fulfilment of a wish from the unconscious; it seems as though the dominant, preconscious system acquiesces in this after insisting upon a certain number of distortions. Nor is it possible as a general rule to find a train of thought opposed to the dream-wish and, like its counterpart, realized in the dream. Only here and there in dream-analyses do we come upon signs of reactive creations, like, for instance, my affectionate feelings for my friend R. in the dream of my uncle (cf. p. 637 ff.). But we can find the missing ingredient from the preconscious elsewhere. Whereas the wish from the Ucs. is able to find expression in the dream after undergoing distortions of every kind, the dominant system withdraws into a wish to sleep, realizes that wish by bringing about the modifications which it is able to produce in the cathexes within the psychical apparatus, and persists in that wish throughout the whole duration of sleep.¹

[1900a, 999]
The theory of the psychoneuroses asserts as an indisputable and invariable fact that only sexual wishful impulses from infancy, which have undergone repression (i.e. a transformation of their effect) during the developmental period of childhood, are capable of being revived during later developmental periods (whether as a result of the subject's sexual constitution, which is derived from an initial bisexuality, or as a result of unfavourable influences acting upon the course of his sexual life) and are thus able to furnish the motive force for the formation of psychoneurotic symptoms of every kind. It is only by reference to these sexual forces that we can close the gaps that are still patent in the theory of repression. I will leave it an open question whether these sexual and infantile factors are equally required in the theory of dreams: I will leave that theory incomplete at this point, since I have already gone a step beyond what can be demonstrated in assuming that dream-wishes are invariably derived from the unconscious.¹ Nor do I propose to enquire further into the nature of the distinction between the play of psychical forces in the formation of dreams and in that of hysterical symptoms: we are still without a sufficiently accurate knowledge of one of the two objects of the comparison.

[1900a, 1033]

The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the ‘unconscious repressed’ and the ‘conscious’, dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overpowers the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychological energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

[1933a, 4629]
We have nothing new to say on the question of the origin of these dispositional hypnoid states. They often, it would seem, grow out of the day-dreams which are so common even in healthy people and to which needlework and similar occupations render women especially prone. Why it is that the 'pathological associations' brought about in these states are so stable and why they have so much more influence on somatic processes than ideas are usually found to do - these questions coincide with the general problem of the effectiveness of hypnotic suggestions. Our observations contribute nothing fresh on this subject. But they throw a light on the contradiction between the dictum 'hysteria is a psychosis' and the fact that among hysterics may be found people of the clearest intellect, strongest will, greatest character and highest critical power. This characterization holds good of their waking thoughts; but in their hypnoid states they are insane, as we all are in dreams. Whereas, however, our dream-psychoses have no effect upon our waking state, the products of hypnoid states intrude into waking life in the form of hysterical symptoms.

[1895d, 15]

I will amplify this description of Frau von N.'s psychical state by considering the pathological changes of consciousness which could be observed in her. Like her neck-cramps, distressing present-day events (cf. her last delirium in the garden) or anything which powerfully recalled any of her traumas brought her into a state of delirium. In such states - and the few observations I made led me to no other conclusion - there was a limitation of consciousness and a compulsion to associate similar to that prevailing in dreams; hallucinations and illusions were facilitated to the highest degree and feeble-minded or even nonsensical inferences were made. This state, which was comparable to one of hallucinatory alienation probably represented an attack. It might be regarded as an acute psychosis (serving as the equivalent of an attack) which would be classified as a condition of 'hallucinatory confusion'. A further resemblance between such states of hers and a typical hysterical attack was shown by the fact that a portion of the old-established traumatic memories could usually be detected underlying the delirium. The transition from a normal state to a delirium often occurred quite imperceptibly. She would be talking quite rationally at one moment about matters of small emotional importance, and as her conversation passed on to ideas of a distressing kind I would notice, from her exaggerated gestures or the appearance of her regular formulas of speech, etc., that she was in a state of delirium. At the beginning of the treatment the delirium lasted all day long; so that it was difficult to decide with certainty whether any given symptoms - like her gestures - formed part of her psychical state merely as symptoms of an attack, or whether - like the clacking and stammering - they had become genuine chronic symptoms. It was often only possible after the event to distinguish between what had happened in a delirium and what had happened in her normal state. For the two states were separated in her memory, and she would sometimes be highly astonished to hear of the things which the delirium had introduced piecemeal into her normal conversation. My very first interview with her was the most remarkable instance of the way in which the two states were interwoven without paying any attention to each other. Only at one moment of this psychical see-sawing did it happen that her normal consciousness, in touch with the present day, was affected. This was when she gave me an answer which originated from her delirium and said she was 'a woman dating from last century'.

[1895d, 87]
Even the *Interpretation of Dreams* has not been left untouched by the advance of scientific knowledge. When I wrote it in 1899, my theory of sexuality was not yet in existence and the analysis of the more complicated forms of psycho-neurosis was only just beginning. It was my hope that dream-interpretation would help to make possible the psychological analysis of the neuroses; since then a deeper understanding of neuroses has reacted in turn upon our view of dreams. The theory of dream-interpretation has itself developed further in a direction on which insufficient stress had been laid in the first edition of this book. My own experience, as well as the works of Wilhelm Stekel and others, have since taught me to form a truer estimate of the extent and importance of symbolism in dreams (or rather in unconscious thinking). Thus in the course of these years much has accumulated which demands attention. I have endeavoured to take these innovations into account by making numerous interpolations in the text and by additional footnotes. If these additions threaten at times to burst the whole framework of the book or if I have not everywhere succeeded in bringing the original text up to the level of our present knowledge, I must ask the reader's indulgence for these deficiencies: they are the results and signs of the present increasingly rapid development of our science. I may even venture to prophesy in what other directions later editions of this book - if any should be needed - will differ from the present one. They will have on the one hand to afford a closer contact with the copious material presented in imaginative writing, in myths, in linguistic usage and in folklore; while on the other hand they will have to deal in greater detail than has here been possible with the relations of dreams to neuroses and mental diseases.

[1900a, 510]

We have seen that falling asleep at once involves the loss of one of our mental activities, namely our power of giving intentional guidance to the sequence of our ideas. We are now faced by the suggestion, which is in any case a plausible one, that the effects of the state of sleep may extend over all the faculties of the mind. Some of these seem to be entirely suspended; but the question now arises whether the rest continue to operate normally and whether under such conditions they are capable of normal work. And here it may be asked whether the distinguishing features of dreams cannot be explained by the lowering of psychical efficiency in the sleeping state - a notion which finds support in the impression made by dreams on our waking judgement. Dreams are disconnected, they accept the most violent contradictions without the least objection, they admit impossibilities, they disregard knowledge which carries great weight with us in the daytime, they reveal us as ethical and moral imbeciles. Anyone who when he was awake behaved in the sort of way that is shown in situations in dreams would be considered insane. Anyone who when he was awake talked in the sort of way that people talk in dreams or described the sort of thing that happens in dreams would give us the impression of being muddle-headed or feeble minded. It seems to be no more than putting the truth into words when we express our very low opinion of mental activity in dreams and assert that in dreams the higher intellectual faculties in particular are suspended or at all events gravely impaired.

[1900a, 562]
It has often been remarked, however, that the associations connecting dream-images with one another are of a quite special kind and differ from those which operate in waking thought. Thus Volkelt (1875, 15) writes: 'In dreams the associations seem to play at catch-as-catch-can in accordance with chance similarities and connections that are barely perceptible. Every dream is stuffed full of slovenly and perfunctory associations of this kind.' Maury (1878, 126) attaches very great importance to this feature of the way in which ideas are linked in dreams, since it enables him to draw a close analogy between dream-life and certain mental disorders. He specifies two main features of a 'délire': '(1) une action spontanée et comme automatique de l'esprit; (2) une association vicieuse et irrégulière des idées.' ¹ Maury himself gives two excellent instances of dreams of his own in which dream-images were linked together merely through a similarity in the sound of words. He once dreamt that he was on a pilgrimage (pélerinage) to Jerusalem or Mecca; after many adventures he found himself visiting Pelletier, the chemist, who, after some conversation, gave him a zinc shovel (pelle); in the next part of the dream this turned into a great broad-sword. (Ibid., 137.) In another dream he was walking along a highway and reading the number of kilomètres on the milestones; then he was in a grocer's shop where there was a big pair of scales, and a man was putting kilogramme weights into the scale in order to weigh Maury; the grocer then said to him: 'You're not in Paris but on the island of Gilolo.' Several other scenes followed, in which he saw a Lobelia flower, and then General Lopez, of whose death he had read shortly before. Finally, while he was playing a game of lotto, he woke up. (Ibid., 126.)²

When we speak of the relation of dreams to mental disorders we may have three things in mind: (1) aetiological and clinical connections, as when a dream represents a psychotic state, or introduces it, or is left over from it; (2) modifications to which dream-life is subject in cases of mental disease; and (3) intrinsic connections between dreams and psychoses, analogies pointing to their being essentially akin. These numerous relations between the two groups of phenomena were a favourite topic among medical writers in earlier times and have become so once again to-day, as is shown by the bibliographies of the subject collected by Spitta, Radestock, Maury and Tissié. Quite recently Sante de Sanctis has turned his attention to this subject.¹ It will be enough for the purpose of my thesis if I do no more than touch upon this important question.

[1900a, 567]

[1900a, 594]
As regards the clinical and aetiological connections between dreams and psychoses, the following observations may be given as samples. Hohnbaum, quoted by Krauss, reports that a first outbreak of delusional insanity often originates in an anxious or terrifying dream, and that the dominant idea is connected with the dream. Sante de Sanctis brings forward similar observations in cases of paranoia and declares that in some of these the dream was the ‘vraie cause déterminante de la folie’. The psychosis, says de Sanctis, may come to life at a single blow with the appearance of the operative dream which brings the delusional material to light; or it may develop slowly in a series of further dreams, which have still to overcome a certain amount of doubt. In one of his cases the significant dream was followed by mild hysterical attacks and later by a condition of anxious melancholia. Férée (quoted by Tissié, 1898) reports a dream which resulted in a hysterical paralysis. In these instances the dreams are represented as the aetiology of the mental disorder; but we should be doing equal justice to the facts if we said that the mental disorder made its first appearance in dream-life, that it first broke through in a dream. In some further examples the pathological symptoms are contained in dream-life, or the psychosis is limited to dream-life. Thus Thomayer (1897) draws attention to certain anxiety-dreams which he thinks should be regarded as equivalents of epileptic fits. Allison (quoted by Radestock, 1879) has described a ‘nocturnal insanity’, in which the patient appears completely healthy during the day but is regularly subject at night to hallucinations, fits of frenzy, etc. Similar observations are reported by de Sanctis (a dream of an alcoholic patient which was equivalent to a paranoia, and which represented voices accusing his wife of unfaithfulness) and Tissié. The latter (1898) gives copious recent examples in which acts of a pathological nature, such as conduct based on delusional premises and obsessive impulses, were derived from dreams. Guislain describes a case in which sleep was replaced by an intermittent insanity.

In cases of recovery from mental diseases it can often be quite clearly observed that, while functioning is normal during the day, dream-life is still under the influence of the psychosis. According to Krauss (1859, 270), Gregory first drew attention to this fact. Macario, quoted by Tissié, describes how a manic patient, a week after his complete recovery was still subject in his dreams to the flight of ideas and the violent passions which were characteristic of his illness.

Very little research has hitherto been carried out into the modifications occurring in dream-life during chronic psychoses. On the other hand, attention was long ago directed to the underlying kinship between dreams and mental disorders, exhibited in the wide measure of agreement between their manifestations. Maury (1854, 124) tells us that Cabanis (1802) was the first to remark on them, and after him Lélut, J. Moreau (1855) and, in particular, Maine de Biran the philosopher. No doubt the comparison goes back still earlier. Radestock (1879, 217) introduces the chapter in which he deals with it by a number of quotations drawing an analogy between dreams and madness. Kant writes somewhere: ‘The madman is a waking dreamer.’ Krauss (1859, 270) declares that ‘insanity is a dream dreamt while the senses are awake’. Schopenhauer calls dreams a brief madness and madness a long dream. Hagen describes delirium as dream-life induced not by sleep but by illness. Wundt writes: ‘We ourselves, in fact, can experience in dreams almost all the phenomena to be met with in insane asylums.’
Radestock (1879, 219) adds a few more features - analogies between the material in the two cases: 'The majority of hallucinations and illusions occur in the region of the senses of sight and hearing and of coenaesthesia. As in the case of dreams, the senses of smell and taste provide the fewest elements. - Both in patients suffering from fever and in dreamers memories arise from the remote past; both sleeping and sick men recollect things which waking and healthy men seem to have forgotten.' The analogy between dreams and psychoses is only fully appreciated when it is seen to extend to the details of expressive movement and to particular characteristics of facial expression.
[1900a, 595]

'A man tormented by physical and mental suffering obtains from dreams what reality denies him: health and happiness. So too in mental disease there are bright pictures of happiness, grandeur, eminence and wealth. The supposed possession of property and the imaginary fulfilment of wishes - the withholding or destruction of which actually affords a psychological basis for insanity - often constitute the chief content of a delirium. A woman who has lost a loved child experiences the joys of motherhood in her delirium; a man who has lost his money believes himself immensely rich; a girl who has been deceived feels that she is tenderly loved.' [1900a, 596]

'The chief feature of dreams and of insanity lies in their eccentric trains of thought and their weakness of judgement.' In both states we find an over-valuation of the subject's own mental achievements which seems senseless to a sober view; the rapid sequence of ideas in dreams is paralleled by the flight of ideas in psychoses. In both there is a complete lack of sense of time. In dreams the personality may be split - when, for instance, the dreamer's own knowledge is divided between two persons and when, in the dream, the extraneous ego corrects the actual one. This is precisely on a par with the splitting of the personality that is familiar to us in hallucinatory paranoia; the dreamer too hears his own thoughts pronounced by extraneous voices. Even chronic delusional ideas have their analogy in stereotyped recurrent pathological dreams (le rêve obsédant). - It not infrequently happens that after recovering from a delirium patients will say that the whole period of their illness seems to them like a not unpleasant dream: indeed they will sometimes tell us that even during the illness they have occasionally had a feeling that they are only caught up in a dream - as is often the case in dreams occurring in sleep.
[1900a, 596]

After all this, it is not surprising that Radestock sums up his views, and those of many others, by declaring that 'insanity, an abnormal pathological phenomenon, is to be regarded as an intensification of the periodically recurrent normal condition of dreaming'. (Ibid., 228.) [1900a, 597]

Krauss (1859, 270 f.) has sought to establish what is perhaps a still more intimate connection between dreams and insanity than can be demonstrated by an analogy between these external manifestations. This connection he sees in their aetiology or rather in the sources of their excitation. The fundamental element common to the two states lies according to him, as we have seen, in organically determined sensations, in sensations derived from somatic stimuli, in the coenaesthesia which is based upon contributions arising from all the organs. (Cf. Peisse, 1857, 2, 21, quoted by Maury, 1878, 52.) [1900a, 597]
The indisputable analogy between dreams and insanity, extending as it does down to their characteristic details, is one of the most powerful props of the medical theory of dream-life, which regards dreaming as a useless and disturbing process and as the expression of a reduced activity of the mind. Nevertheless it is not to be expected that we shall find the ultimate explanation of dreams in the direction of mental disorders; for the unsatisfactory state of our knowledge of the origin of these latter conditions is generally recognized. It is quite likely, on the contrary, that a modification of our attitude towards dreams will at the same time affect our views upon the internal mechanism of mental disorders and that we shall be working towards an explanation of the psychoses while we are endeavouring to throw some light on the mystery of dreams.

But dreams differ from day-dreams in their second characteristic: namely, in the fact of their ideational content being transformed from thoughts into sensory images, to which belief is attached and which appear to be experienced. I must add at once that not every dream exhibits this transformation from idea into sensory image. There are dreams which consist only of thoughts but which cannot on that account be denied the essential nature of dreams. My 'Autodidasker' dream was of that kind; it included scarcely more sensory elements than if I had thought its content in the daytime. And in every dream of any considerable length there are elements which have not, like the rest, been given a sensory form, but which are simply thought or known, in the kind of way in which we are accustomed to think or know things in waking life. It should also be remembered here that it is not only in dreams that such transformations of ideas into sensory images occur: they are also found in hallucinations and visions, which may appear as independent entities, so to say, in health or as symptoms in the psychoneuroses. In short, the relation which we are examining now is not in any respect an exclusive one. Nevertheless it remains true that it would be impossible for us to imagine the dream-world without it. But in order to arrive at an understanding of it we must embark upon a discussion that will take us far afield.

The unconscious wishful impulses clearly try to make themselves effective in daytime as well, and the fact of transference, as well as the psychoses, show us that they endeavour to force their way by way of the preconscious system into consciousness and to obtain control of the power of movement. Thus the censorship between the Ucs. and the Pcs., the assumption of whose existence is positively forced upon us by dreams, deserves to be recognized and respected as the watchman of our mental health. Must we not regard it, however, as an act of carelessness on the part of that watchman that it relaxes its activities during the night, allows the suppressed impulses in the Ucs. to find expression, and makes it possible for hallucinatory regression to occur once more? I think not. For even though this critical watchman goes to rest - and we have proof that its slumbers are not deep - it also shuts the door upon the power of movement. No matter what impulses from the normally inhibited Ucs. may prance upon the stage, we need feel no concern; they remain harmless, since they are unable to set in motion the motor apparatus by which alone they might modify the external world. The state of sleep guarantees the security of the citadel that must be guarded. The position is less harmless when what brings about the displacement of forces is not the nightly relaxation in the critical censorship's output of force, but a pathological reduction in that force or a pathological intensification of the unconscious excitations while the preconscious is still cathected and the gateway to the power of movement stands open. When this is so, the watchman is overpowered, the unconscious excitations overwhelm the Pcs., and thence obtain control over our speech and actions; or they forcibly bring about hallucinatory regression and direct the course of the apparatus (which was not designed for their use) by virtue of the attraction exercised by perceptions on the distribution of our psychical energy. To this state of things we give the name of psychosis.
We are now well on the way to proceeding further with the erection of the psychological scaffolding, which we stopped at the point at which we introduced the two systems Ucs. and Pcs. But there are reasons for continuing a little with our consideration of wishes as the sole psychical motive force for the construction of dreams. We have accepted the idea that the reason why dreams are invariably wish-fulfilments is that they are products of the system Ucs., whose activity knows no other aim than the fulfilment of wishes and which has at its command no other forces than wishful impulses. If we insist, for even a moment longer, upon our right to base such far-reaching psychological speculations upon the interpretation of dreams, we are in duty found to prove that those speculations have enabled us to insert dreams into a nexus which can include other psychical structures as well. If such a thing as a system Ucs. exists (or something analogous to it for the purposes of our discussion), dreams cannot be its only manifestation; every dream may be a wish-fulfilment, but apart from dreams there must be other forms of abnormal wish-fulfilments. And it is a fact that the theory governing all psychoneurotic symptoms culminates in a single proposition, which asserts that they too are to be regarded as fulfilments of unconscious wishes.¹ Our explanation makes the dream only the first member of a class which is of the greatest significance to psychiatrists and an understanding of which implies the solution of the purely psychological side of the problem of psychiatry.²

¹ Footnote added 1914: As Hughlings Jackson said: 'Find out all about dreams and you will have found out all about insanity.'

² [Footnote added 1914: As Hughlings Jackson said: 'Find out all about dreams and you will have found out all about insanity.]

Finally, we have by no means abandoned the relation between dreams and mental disorders, but have established it more firmly on fresh ground.

It is easier to perceive the characteristics of these unconscious thought-processes in the remarks made by sufferers from certain mental diseases. We should most probably be able (as Griesinger suggested long ago) to understand the deliria of the insane and to make use of them as pieces of information, if we ceased to apply the demands of conscious thinking to them and if we treated them, like dreams, with our interpretative technique.¹ Indeed we have confirmed the fact that 'there is a return of the mind in dreams to an embryonic point of view'.²

¹ In doing so we should not forget to take into account the distortion due to the censorship which is still at work even in psychoses.

² It is not so easy for us to say what the author intended with this dream and what caused him to link the development of the delusion precisely to a dream. Zealous investigators, it is true, have collected plenty of examples of the way in which mental disturbances are linked to dreams and arise out of dreams.¹ It appears, too, that in the lives of a few eminent men impulses to important actions and decisions have originated from dreams. But these analogies are not of much help to our understanding; so let us keep to our present case, our author's imaginary case of Norbert Hanold the archaeologist. By which end are we to take hold of a dream like this so as to fit it into the whole context, if it is not to remain no more than an unnecessary decoration of the story?
We may perhaps find a starting-point in the after-effects left by the dream in Hanold's waking life. Up to then he had had a phantasy that Gradiva had been a Pompeian. This hypothesis now became a certainty for him, and a second certainty followed - that she was buried along with the rest in the year 79 A.D.¹ Melancholy feelings accompanied this extension of the delusional structure, like an echo of the anxiety which had filled the dream. This fresh pain about Gradiva does not seem very intelligible to us; Gradiva would have been dead for many centuries even if she had been saved from destruction in the year 79 A.D. Or ought we not to argue in this kind of way either with Norbert Hanold or with the author himself? Here again there seems no path to an understanding. Nevertheless it is worth remarking that the increment which the delusion acquired from this dream was accompanied by a feeling with a highly painful colouring.

[1907a, 1853]

The application of a few of the rules of dream-interpretation to Hanold's first dream has thus resulted in making it intelligible to us in its main features and in inserting it into the nexus of the story. Surely, then, the author must have observed these rules in creating it? We might ask another question, too: why did the author introduce a dream at all to bring about the further development of the delusion? In my opinion it was an ingenious notion and once again true to reality. We have already heard that in real illnesses a delusion very often arises in connection with a dream, and, after what we have learnt about the nature of dreams, there is no need to see a fresh riddle in this fact. Dreams and delusions arise from the same source - from what is repressed. Dreams are, as one might say, the physiological delusions of normal people. Before what is repressed has become strong enough to break through into waking life as a delusion, it may easily have achieved a first success, under the more favourable conditions of the state of sleep, in the form of a dream with persisting effects. For during sleep, along with a general lowering of mental activity, there is a relaxation in the strength of the resistance with which the dominant psychical forces oppose what is repressed. It is this relaxation that makes the formation of dreams possible, and that is why dreams give us our best access to a knowledge of the unconscious part of the mind - except that, as a rule, with the re-establishment of the psychical cathexes of waking life, the dream once more takes to flight and the ground that had been won by the unconscious is evacuated once again.

[1907a, 1858]

The construction of the fresh delusion about Gradiva's death during the destruction of Pompeii in the year 79 A.D. was not the only result of the first dream, which we have already analysed. Immediately after it Hanold decided on his journey to Italy, which eventually brought him to Pompeii. But, before that, something else happened to him. As he was leaning out of the window, he thought he saw a figure in the street with the bearing and gait of his Gradiva. In spite of being insufficiently dressed, he hurried after her, but failed to overtake her, and was driven back into the house by the jeers of the passers-by. When he was in his room once more, the song of a canary from its cage in the window of a house opposite stirred up in him a mood in which he too seemed to be a prisoner longing for freedom; and his spring-time journey was no sooner decided on than it was carried out.

[1907a, 1859]

You should bear in mind that the dreams which we produce at night have, on the one hand, the greatest external similarity and internal kinship with the creations of insanity, and are, on the other hand, compatible with complete health in waking life. There is nothing paradoxical in the assertion that no one who regards these 'normal' illusions, delusions and character-changes with astonishment instead of comprehension has the slightest prospect of understanding the abnormal structures of pathological mental states otherwise than as a layman. You may comfortably count almost all psychiatrists among such laymen.

[1910a, 2220]
If we now recall the dream which the patient had during the incubation period of his illness, before he had moved to Dresden, it will become clear beyond a doubt that his delusion of being transformed into a woman was nothing else than a realization of the content of that dream. At that time he had rebelled against the dream with masculine indignation, and in the same way he began by striving against its fulfilment in his illness and looked upon his transformation into a woman as a disgrace with which he was threatened with hostile intention. But there came a time (it was in November, 1895) when he began to reconcile himself to the transformation and bring it into harmony with the higher purposes of God: 'Since then, and with a full consciousness of what I did, I have inscribed upon my banner the cultivation of femaleness.' (177-8.)

Of the actual nature of Flechsig's enormity and its motives the patient speaks with the characteristic vagueness and obscurity which may be regarded as marks of an especially intense work of delusion-formation, if it is legitimate to judge paranoia on the model of a far more familiar mental phenomenon - the dream. Flechsig, according to the patient, committed, or attempted to commit, 'soul-murder' upon him - an act which, he thought, was comparable with the effort made by the devil or by demons to gain possession of a soul and may have had its prototype in events which occurred between members of the Flechsig and Schreber families long since deceased (22 ff.). We should be glad to learn more of the meaning of this 'soul-murder', but at this point our sources relapse once more into a tendentious silence: 'As to what constitutes the true essence of soul-murder, and as to its technique, if I may so describe it, I am able to say nothing beyond what has already been indicated. There is only this, perhaps, to be added. . . . (The passage which follows is unsuitable for publication.)' (28.) As a result of this omission we are left in the dark on the question of what is meant by 'soul-murder'. We shall refer later on to the only hint upon the subject which has evaded censorship.

But the distinction between foreconscious and unconscious activity, and the recognition of the barrier which keeps them asunder, is not the last or the most important result of the psychoanalytic investigation of psychical life. There is one psychical product to be met with in the most normal persons, which yet presents a very striking analogy to the wildest productions of insanity, and was no more intelligible to philosophers than insanity itself. I refer to dreams. Psycho-analysis is founded upon the analysis of dreams; the interpretation of dreams is the most complete piece of work the young science has done up to the present. One of the most common types of dream-formation may be described as follows: a train of thoughts has been aroused by the working of the mind in the daytime, and retained some of its activity, escaping from the general inhibition of interests which introduces sleep and constitutes the psychical preparation for sleeping. During the night this train of thoughts succeeds in finding connections with one of the unconscious tendencies present ever since his childhood in the mind of the dreamer, but ordinarily repressed and excluded from his conscious life. By the borrowed force of this unconscious help, the thoughts, the residue of the day's work, now become active again, and emerge into consciousness in the shape of the dream. Now three things have happened:
Let us be clear that the hallucinatory wishful psychosis - in dreams or elsewhere - achieves two by no means identical results. It not only brings hidden or repressed wishes into consciousness; it also represents them, with the subject's entire belief, as fulfilled. The concurrence of these two results calls for explanation. It is quite impossible to maintain that unconscious wishes must necessarily be taken for realities when once they have become conscious; for, as we know, our judgement is very well able to distinguish realities from ideas and wishes, however intense they may be. On the other hand, it seems justifiable to assume that belief in reality is bound up with perception through the senses. When once a thought has followed the path to regression as far back as to the unconscious memory-traces of objects and thence to perception, we accept the perception of it as real. So hallucination brings belief in reality with it. We now have to ask ourselves what determines the coming into being of a hallucination. The first answer would be regression, and this would replace the problem of the origin of hallucination by that of the mechanism of regression. As regards dreams, this latter problem need not remain long unanswered. Regression of Pcs. dream-thoughts to mnemic images of things is clearly the result of the attraction which the Ucs. instinctual representatives - e.g. repressed memories of experiences - exercise upon the thoughts which have been put into words. But we soon perceive that we are on a false scent. If the secret of hallucination is nothing else than that of regression, every regression of sufficient intensity would produce hallucination with belief in its reality. But we are quite familiar with situations in which a process of regressive reflection brings to consciousness very clear visual mnemic images, though we do not on that account for a single moment take them for real perceptions. Again, we could very well imagine the dream-work penetrating to mnemic images of this kind, making conscious to us that was previously unconscious, and holding up to us a wishful phantasy which rouses our longing, but which we should not regard as a real fulfilment of the wish. Hallucination must therefore be something more than the regressive revival of mnemic images that are in themselves Ucs.

[1917d, 3035]

Let us, furthermore, bear in mind the great practical importance of distinguishing perceptions from ideas, however intensely recalled. Our whole relation to the external world, to reality, depends on our ability to do so. We have put forward the fiction that we did not always possess this ability and that at the beginning of our mental life we did in fact hallucinate the satisfying object when we felt the need for it. But in such a situation satisfaction did not occur, and this failure must very soon have moved us to create some contrivance with the help of which it was possible to distinguish such wishful perceptions from a real fulfilment and to avoid them for the future. In other words, we gave up hallucinatory satisfaction of our wishes at a very early period and set up a kind of 'reality-testing'. The question now arises in what this reality-testing consisted, and how the hallucinatory wishful psychosis of dreams and amnesia and similar conditions succeeds in abolishing it and in re-establishing the old mode of satisfaction.

[1917d, 3036]

Dreams having served us as the prototype in normal life of narcissistic mental disorders, we will now try to throw some light on the nature of melancholia by comparing it with the normal affect of mourning. This time, however, we must begin by making an admission, as a warning against any over-estimation of the value of our conclusions. Melancholia, whose definition fluctuates even in descriptive psychiatry, takes on various clinical forms the grouping together of which into a single unity does not seem to be established with certainty; and some of these forms suggest somatic rather than psychogenic affections. Our material, apart from such impressions as are open to every observer, is limited to a small number of cases whose psychogenic nature was indisputable. We shall, therefore, from the outset drop all claim to general validity for our conclusions, and we shall console ourselves by reflecting that, with the means of investigation at our disposal to-day, we could hardly discover anything that was not typical, if not of a whole class of disorders, at least of a small group of them.

[1917e, 3041]
Your second observation, too, raises a justifiable question, but it is aimed in the wrong direction. It is true that a withdrawal of the object-libido into the ego is not directly pathogenic; it takes place, indeed, as we know, every time before we go to sleep, only to be reversed when we wake up. The amoeba withdraws its protrusions only to send them out again at the first opportunity. But it is quite a different thing when a particular, very energetic process forces a withdrawal of libido from objects. Here the libido that has become narcissistic cannot find its way back to objects, and this interference with the libido's mobility certainly becomes pathogenic. It seems that an accumulation of narcissistic libido beyond a certain amount is not tolerated. We may even imagine that it was for that very reason that object-cathexes originally came about, that the ego was obliged to send out its libido so as not to fall ill as a result of its being dammed up. If it lay within our plan to go more deeply into dementia praecox, I would show you that the process which detaches the libido from objects and cuts off its return to them is closely related to the process of repression and is to be looked at as its counterpart. But you would, first and foremost, find yourselves on familiar ground when you learnt that the determinants of this process are almost identical - so far as we know at present - with those of repression. The conflict seems to be the same and to be carried on between the same forces. If the outcome is so different from, for instance, that in hysteria, the reason can only depend on a difference in innate disposition. The weak spot in the libidinal development of these patients lies in a different phase; the determining fixation, which, as you will recollect, permits the irruption that leads to the formation of symptoms, lies elsewhere, probably in the stage of primitive narcissism to which dementia praecox returns in its final outcome. It is very remarkable that in the case of all the narcissistic neuroses we have to assume fixation points for the libido going back to far earlier phases of development than in hysteria or obsessional neurosis. As you heard, however, the concepts which we arrived at during our study of the transference neuroses are adequate in helping us to find our way about in the narcissistic neuroses which are so much more severe in practice. The conformities go very far; at bottom the field of phenomena is the same. And you can imagine how small a prospect anyone has of explaining these disorders (which belong within the sphere of psychiatry) who is not forearmed for his task with an analytic knowledge of the transference neuroses.

[1916-1917, 3466]

On the other side, it is equally easy, from the knowledge we have so far gained of the mechanism of the psychoses, to adduce examples which point to a disturbance in the relationship between the ego and the external world. In Meynert's amentia - an acute hallucinatory confusion which is perhaps the most extreme and striking form of psychosis - either the external world is not perceived at all, or the perception of it has no effect whatever. Normally, the external world governs the ego in two ways: firstly, by current, present perceptions which are always renewable, and secondly, by the store of memories of earlier perceptions which, in the shape of an 'internal world', form a possession of the ego and a constituent part of it. In amentia, not only is the acceptance of new perceptions refused, but the internal world, too, which, as a copy of the external world, has up till now represented it, loses its significance (its cathexis) - The ego creates, autocratically, a new external and internal world; and there can be no doubt of two facts - that this new world is constructed in accordance with the id's wishful impulses, and that the motive of this dissociation from the external world is some very serious frustration by reality of a wish - a frustration which seems intolerable. The close affinity of this psychosis to normal dreams is unmistakable. A precondition of dreaming, moreover, is a state of sleep, and one of the features of sleep is a complete turning away from perception and the external world.

[1924b, 4066]
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

[1933a, 4629]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]

A dream, then, is a psychosis, with all the absurdities, delusions and illusions of a psychosis. A psychosis of short duration, no doubt, harmless, even entrusted with a useful function, introduced with the subject's consent and terminated by an act of his will. None the less it is a psychosis, and we learn from it that even so deep-going an alteration of mental life as this can be undone and can give place to the normal function. Is it too bold, then, to hope that it must also be possible to submit the dreaded spontaneous illnesses of mental life to our influence and bring about their cure?

[1940a [1938], 4982]
We already know a number of things preliminary to such an undertaking. According to our hypothesis it is the ego's task to meet the demands raised by its three dependent relations to reality, to the id and to the super-ego - and nevertheless at the same time to preserve its own organization and maintain its own autonomy. The necessary precondition of the pathological states under discussion can only be a relative or absolute weakening of the ego which makes the fulfilment of its tasks impossible. The severest demand on the ego is probably the keeping down of the instincual claims of the id, to accomplish which it is obliged to maintain large expenditures of energy on anticathexes. But the demands made by the super-ego too may become so powerful and so relentless that the ego may be paralysed, as it were, in the face of its other tasks. We may suspect that, in the economic conflicts which arise at this point, the id and the super-ego often make common cause against the hard-pressed ego which tries to cling to reality in order to retain its normal state. If the other two become too strong, they succeed in loosening and altering the ego's organization, so that its proper relation to reality is disturbed or even brought to an end. We have seen it happen in dreaming: when the ego is detached from the reality of the external world, it slips down, under the influence of the internal world, into psychosis.

[1940a [1938], 4982]

These recollections might have been described as hallucinations if a belief in their actual presence had been added to their clearness. The importance of this analogy seemed greater when I noticed that true hallucinations occasionally occurred in the case of other patients who were certainly not psychotic. My line of thought proceeded as follows. Perhaps it may be a general characteristic of hallucinations to which sufficient attention has not hitherto been paid that in them something that has been experienced in infancy and then forgotten returns - something that the child has seen or heard at a time when he could still hardly speak and that now forces its way into consciousness, probably distorted and displaced owing to the operation of forces that are opposed to this return. And, in view of the close relation between hallucinations and particular forms of psychosis, our line of thought may be carried still further. It may be that the delusions into which these hallucinations are so constantly incorporated may themselves be less independent of the upward drive of the unconscious and the return of the repressed than we usually assume. In the mechanism of a delusion we stress as a rule only two factors: the turning away from the real world and its motive forces on the one hand, and the influence exercised by wish-fulfilment on the content of the delusion on the other. But may it not be that the dynamic process is rather that the turning away from reality is exploited by the upward drive of the repressed in order to force its content into consciousness, while the resistances stirred up by this process and the trend to wish-fulfilment share the responsibility for the distortion and displacement of what is recollected? This is after all the familiar mechanism of dreams, which intuition has equated with madness from time immemorial.

[1937d, 5058]
The transformation of ideas into hallucinations is not the only respect in which dreams differ from corresponding thoughts in waking life. Dreams construct a situation out of these images; they represent an event which is actually happening; as Spitta (1882, 145) puts it, they 'dramatize' an idea. But this feature of dream-life can only be fully understood if we further recognize that in dreams - as a rule, for there are exceptions which require special examination - we appear not to think but to experience; that is to say, we attach complete belief to the hallucinations. Not until we wake up does the critical comment arise that we have not experienced anything but have merely been thinking in a peculiar way, or in other words dreaming. It is this characteristic that distinguishes true dreams from day-dreaming, which is never confused with reality.

I do not wish to deny categorically that this fourth power in dream-construction - which we shall soon recognize as all old acquaintance, since in fact it is the only one of the four with which we are familiar in other connections - I do not wish to deny that this fourth factor has the capacity to create new contributions to dreams. It is certain, however, that, like the others, it exerts its influence principally by its preferences and selections from psychical material in the dream-thoughts that has already been formed. Now there is one case in which it is to a great extent spared the labour of, as it were, building up a façade for the dream - the case, namely, in which a formation of that kind already exists, available for use in the material of the dream-thoughts. I am in the habit of describing the element in the dream-thoughts which I have in mind as a 'phantasy.' I shall perhaps avoid misunderstanding if I mention the 'day-dream' as something analogous to it in waking life.¹ The part played in our mental life by these structures has not yet been fully recognized and elucidated by psychiatrists, though M. Benedikt has made what seems to me a very promising start in that direction. The importance of day-dreams has not escaped the unerring vision of imaginative writers; there is, for instance, a well-known account by Alphonse Daudet in *Le Nabab* of the day-dreams of one of the minor characters in that story. The study of the psychoneuroses leads to the surprising discovery that these phantasies or day-dreams are the immediate forerunners of hysterical symptoms, or at least of a whole number of them. Hysterical symptoms are not attached to actual memories, but to phantasies erected on the basis of the bases of memories. The frequent occurrence of conscious daytime phantasies brings these structures to our knowledge; but just as there are phantasies of this kind which are conscious, so, too, there are unconscious ones in great numbers, which have to remain unconscious on account of their content and of their origin from repressed material. Closer investigation of the characteristics of these day-time phantasies shows us how right it is that these formations should bear the same name as we give to the products of our thought during the night - the name, that is, of 'dreams.' They share a large number of their properties with night-dreams, and their investigation might, in fact, have served as the shortest and best approach to an understanding of night-dreams.

Like dreams, they are wish-fulfilments; like dreams, they are based to a great extent on impressions of infantile experiences; like dreams, they benefit by a certain degree of relaxation of censorship. If we examine their structure, we shall perceive the way in which the wishful purpose that is at work in their production has mixed up the material of which they are built, has rearranged it and has formed it into a new whole. They stand in much the same relation to the childhood memories from which they are derived as do some of the Baroque palaces of Rome to the ancient ruins whose pavements and columns have provided the material for the more recent structures.
In this particular dream the change made in the thoughts by the conversion of the expectation expressed by them into the present tense may not seem particularly striking. This is because of what can only be described as the unusually subordinate part played in this dream by wish-fulfilment. Consider instead another one, in which the dream-wish was not detached from the waking thoughts that were carried over into sleep - for instance, the dream of Irma's injection. There the dream-thought that was represented was in the optative: 'If only Otto were responsible for Irma's illness!' The dream repressed the optative and replaced it by a straightforward present: 'Yes, Otto is responsible for Irma's illness.' This, then, is the first of the transformations which is brought about in the dream-thoughts even by a distortionless dream. We need not linger long over this first peculiarity of dreams. We can deal with it by drawing attention to conscious phantasies - to day-dreams - which treat their ideational content in just the same manner. While Daudet's Monsieur Joyeuse was wandering, out of work, through the streets of Paris (though his daughters believed that he had a job and was sitting in an office), he was dreaming of developments that might bring him influential help and lead to his finding employment - and he was dreaming in the present tense. Thus dreams make use of the present tense in the same manner and by the same right as day-dreams. The present tense is the one in which wishes are represented as fulfilled.

But dreams differ from day-dreams in their second characteristic: namely, in the fact of their ideational content being transformed from thoughts into sensory images, to which belief is attached and which appear to be experienced. I must add at once that not every dream exhibits this transformation from idea into sensory image. There are dreams which consist only of thoughts but which cannot on that account be denied the essential nature of dreams. My 'Autodidasker' dream was of that kind; it included scarcely more sensory elements than if I had thought its content in the daytime. And in every dream of any considerable length there are elements which have not, like the rest, been given a sensory form, but which are simply thought or known, in the kind of way in which we are accustomed to think or know things in waking life. It should also be remembered here that it is not only in dreams that such transformations of ideas into sensory images occur: they are also found in hallucinations and visions, which may appear as independent entities, so to say, in health or as symptoms in the psychoneuroses. In short, the relation which we are examining now is not in any respect an exclusive one. Nevertheless it remains true that it would be impossible for us to imagine the dream-world without it. But in order to arrive at an understanding of it we must embark upon a discussion that will take us far afield.
It would be a mistake, however, to suppose that these dream-facades are nothing other than mistaken and somewhat arbitrary revisions of the dream-content by the conscious agency of our mental life. In the erection of a dream-facade use is not infrequently made of wishful phantasies which are present in the dream-thoughts in a pre-constructed form, and are of the same character as the appropriately named 'day-dreams' familiar to us in waking life. The wishful phantasies revealed by analysis in night-dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the facade of the dream directly reveals the dream's actual nucleus, distorted by an admixture of other material.

[1901a, 1081]

I cannot pass over the relation of phantasies to dreams. Our dreams at night are nothing else than phantasies like these, as we can demonstrate from the interpretation of dreams.¹ Language, in its unrivalled wisdom, long ago decided the question of the essential nature of dreams by giving the name of 'day-dreams' to the airy creations of phantasy. If the meaning of our dreams usually remains obscure to us in spite of this pointer, it is because of the circumstance that at night there also arise in us wishes of which we are ashamed; these we must conceal from ourselves, and they have consequently been repressed, pushed into the unconscious. Repressed wishes of this sort and their derivatives are only allowed to come to expression in a very distorted form. When scientific work had succeeded in elucidating this factor of dream-distortion, it was no longer difficult to recognize that night-dreams are wishfulfilments in just the same way as day-dreams - the phantasies which we all know so well.

[1908e, 1925]

A common source and normal prototype of all these creations of phantasy is to be found in what are called the day-dreams of youth. These have already received some, though as yet insufficient, notice in the literature of the subject.¹ They occur with perhaps equal frequency in both sexes, though it seems that while in girls and women they are invariably of an erotic nature, in men they may be either erotic or ambitious. Nevertheless the importance of the erotic factor in men, too, should not be given a secondary rating; a closer investigation of a man's day-dreams generally shows that all his heroic exploits are carried out and all his successes achieved only in order to please a woman and to be preferred by her to other men.² These phantasies are satisfactions of wishes proceeding from deprivation and longing. They are justly called 'day-dreams', for they give us the key to an understanding of night-dreams - in which the nucleus of the dream-formation consists of nothing else than complicated day-time phantasies of this kind that have been distorted and are misunderstood by the conscious psychical agency.³

[1908a, 1932]
Unexpectedly, a hint reaches us from a direction in which we have not so far looked. Linguistic usage, which is no chance thing, but the precipitate of old discoveries, though, to be sure, it must not be employed incautiously - our language, then, is acquainted with things that bear the strange name of 'day dreams'. Day-dreams are phantasies (products of the imagination); they are very general phenomena, observable, once more, in healthy as well as in sick people, and are easily accessible to study in our own mind. The most remarkable thing about these imaginative structures is that they have been given the name of 'day-dreams', for there is no trace in them of the two things that are common to dreams. Their relation to sleep is already contradicted by their name; and, as regards the second thing common to dreams, we do not experience or hallucinate anything in them but imagine something, we know that we are having a phantasy, we do not see but think. These day-dreams appear in the prepubertal period, often in the later part of childhood even; they persist until maturity is reached and are then either given up or maintained till the end of life. The content of these phantasies is dominated by a very transparent motive. They are scenes and events in which the subject's egoistic needs of ambition and power or his erotic wishes and satisfaction. In young men the ambitious phantasies are the most prominent, in women, whose ambition is directed to success in love, the erotic ones. But in men, too, erotic needs are often enough present in the background: all their heroic deeds and successes seem only to aim at courting the admiration and favour of women. In other respects these day-dreams are of many different kinds and pass through changing vicissitudes. They are either, each one of them, dropped after a short time and replaced by a fresh one, or they are retained, spun out into long stories and adapted to the changes in the circumstances of the subject's life. They go along with the times, so to speak, and receive a 'date stamp' which bears witness to the influence of the new situation. They are the raw material of poetic production, for the creative writer uses his day-dreams, with certain remodellings, disguises and omissions, to construct the situations which he introduces into his short stories, his novels or his plays. The hero of the day dreams is always the subject himself, either directly or by an obvious identification with someone else.

[1916-1917, 3198]

It may be that day-dreams bear their name on account of having the same relation to reality - in order to indicate that their content is to be looked on as no less unreal than that of dreams. But perhaps they share this name because of some psychical characteristic of dreams which is still unknown to us, one which we are in search of. It is also possible that we are being quite wrong in trying to make use of this similarity of name as something significant. Only later will it be possible to clear this up.

[1916-1917, 3198]

(8) You will recall that at one point we hoped to approach an understanding of the problems of dreams from the fact that certain imaginative structures which are very transparent to us are known as 'day-dreams'. Now these day-dreams are in fact wish-fulfilments, fulfilments of ambitions and erotic wishes which are well known to us; but they are thought, even though vividly imagined, and never experienced as hallucinations. Of the two chief characteristics of dreams, then, the less well assured is preserved here, while the other, since it depends on the state of sleep and cannot be realized in waking life, is entirely absent. Linguistic usage, therefore, has a suspicion of the fact that wish-fulfilment is a chief characteristic of dreams. Incidentally, if our experience in dreams is only a modified kind of imagining made possible by the conditions of the state of sleep - that is, a 'nocturnal day-dreaming' - we can already understand how the process of constructing a dream can dispose of the nocturnal stimulus and bring satisfaction, since day dreaming too is an activity bound up with satisfaction and is only practised, indeed, on that account.

[1916-1917, 3225]
The best-known productions of phantasy are the so-called 'day-dreams', which we have already come across, imagined satisfactions of ambitious, megalomaniac, erotic wishes, which flourish all the more exuberantly the more reality counsels modesty and restraint. The essence of the happiness of phantasy - making the obtaining of pleasure free once more from the assent of reality - is shown in them unmistakably. We know that such day-dreams are the nucleus and prototype of night-dreams. A night-dream is at bottom nothing other than a day-dream that has been made utilizable owing the liberation of the instinctual impulses at night, and that has been distorted by the form assumed by mental activity at night. We have already become familiar with the idea that even a day-dream is not necessarily conscious - that there are unconscious day-dreams, as well. Such unconscious day-dreams are thus the source not only of night-dreams but also of neurotic symptoms.

[1916-1917, 3428]

I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]
¹ In waking life this same kind of analysis and synthesis of syllables - a syllabic chemistry, in fact - plays a part in a great number of jokes: 'What is the cheapest way of obtaining silver? You go down an avenue of silver poplars [Pappeln, which means both "poplars" and "babbling" and call for silence. The babbling then ceases and the silver is released.' The first reader and critic of this book - and his successors are likely to follow his example - protested that 'the dreamer seems to be too ingenious and amusing.' This is quite true so long as it refers only to the dreamer; it would only be an objection if it were to be extended to the dream-interpreter. In waking reality I have little claim to be regarded as a wit. If my dreams seem amusing, that is not on my account, but on account of the peculiar psychological conditions under which dreams are constructed; and the fact is intimately connected with the theory of jokes and the comic. Dreams become ingenious and amusing because the direct and easiest pathway to the expression of their thoughts is barred: they are forced into being so. The reader can convince himself that my patients' dreams seem at least as full of jokes and puns as my own, or even fuller. - [Added 1909:] Nevertheless this objection led me to compare the technique of jokes with the dream-work; and the results are to be found in the book which I published on Jokes and their Relation to the Unconscious (1905c).

[1900a, 770]

In a few instances a change of expression of this kind assists dream-condensation even more directly, by finding a form of words which owing to its ambiguity is able to give expression to more than one of the dream-thoughts. In this way the whole domain of verbal wit is put at the disposal of the dream-work. There is no need to be astonished at the part played by words in dream-formation. Words, since they are the nodal point of numerous ideas, may be regarded as predestined to ambiguity; and the neuroses (e.g. in framing obsessions and phobias), no less than dreams, make unashamed use of the advantages thus offered by words for purposes of condensation and disguise.¹ It is easy to show that dream-distortion too profits from displacement of expression. If one ambiguous word is used instead of two unambiguous ones the result is misleading; and if our everyday, sober method of expression is replaced by a pictorial one, our understanding is brought to a halt, particularly since a dream never tells us whether its elements are to be interpreted literally or in a figurative sense or whether they are to be connected with the material of the dream-thoughts directly or through the intermediary of some interpolated phraseology. In interpreting any dream-element it is in general doubtful [1900a, 810]
Indeed, when we look into the matter more closely, we must recognize the fact that the
dream-work is doing nothing original in making substitutions of this kind. In order to gain its
ends - in this case the possibility of a representation hampered by censorship - it merely follows
the paths which it finds already laid down in the unconscious; and it gives preference to those
transformations of the repressed material which can also become conscious in the form of jokes
or allusions and of which the phantasies of neurotic patients are so full. At this point we
suddenly reach an understanding of Scherner's dream interpretations, whose essential
correctness I have defended elsewhere. The imagination's pre-occupation with the subject's
own body is by no means peculiar to dreams or characteristic only of them. My analyses have
shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is
derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the
other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted,
is a house the only circle of ideas employed for symbolizing the body; and this is equally true of
dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have
retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far
beyond the sphere of the external genitalia.) For these patients pillars and columns represent
the legs (as they do in the *Song of Solomon*), every gateway stands for one of the bodily orifices
(a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of
ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual
images.' In the former case the way has been well prepared by linguistic usage, itself the
precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the
seed, and the maiden's garden in the *Song of Solomon*. The ugliest as well as the most intimate
details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities
in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual
symbolism can find its best hiding-place behind what is commonplace and inconspicuous.
There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or
his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics
of the natural human dread of snakes. Wherever neuroses make use of such disguises they are
following paths along which all humanity passed in the earliest periods of civilization - paths of
whose continued existence today, under the thinnest of veils, evidence is to be found in
linguistic usages, superstitions and customs.
[1900a, 815]

It would be a work in itself to collect these modes of representation and to classify them
according to their underlying principles. Some of these representations might almost be
described as jokes, and they give one a feeling that one would never have understood them
without the dreamer's help.
[1900a, 863]

(4) Another time the same dreamer told me a short dream which was almost reminiscent of
the technique of a rebus. He dreamt that *his uncle gave him a kiss in an automobile*. He went
on at once to give me the interpretation, which I myself would never have guessed: namely that
it meant auto-erotism. The content of this dream might have been produced as a joke in waking
life.
[1900a, 863]
Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (*The Interpretation of Dreams*) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the *manifest*, and often strange, *content of the dream* with the *latent*, but perfectly logical, *dream-thoughts* from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Autodidakt' + 'Lasker'.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

[1905c, 1634]

The abundant and unrestrained use in the dream-work of indirect representation, of displacements, and especially of allusions, has a result which I mention not for its own importance but because it became my subjective reason for taking up the problem of jokes. If one gives an account to an uninformed or unaccustomed person of a dream-analysis, in which are set out, therefore, the strange processes of allusions and displacements - processes so obnoxious to waking life - of which the dream-work has made use, the reader receives an uncomfortable impression and declares that these interpretations are 'in the nature of a joke'. But he clearly does not regard them as *successful* jokes, but as forced, and in some way violating the rules of jokes. It is easy to explain this impression. It arises from the fact that the dream-work operates by the same methods as jokes, but in its use of them it transgresses the limits that are respected by jokes. We shall presently learn that, as a result of the part played by the third person, jokes are bound by a certain condition which does not apply to dreams.

[1905c, 1757]
There can be no doubt that the connections between our typical dreams and fairy tales and the material of other kinds of creative writing are neither few nor accidental. It sometimes happens that the sharp eye of a creative writer has an analytic realization of the process of transformation of which he is habitually no more than the tool. If so, he may follow the process in a reverse direction and so trace back the imaginative writing to a dream. One of my friends has drawn my attention to the following passage in Gottfried Keller's *Der grüne Heinrich*: ‘I hope, my dear Lee, that you may never learn from your own personal experience the peculiar and piquant truth of the plight of Odysseus when he appeared, naked and covered with mud, before the eyes of Nausicaā and her maidens! Shall I tell you how that can happen? Let us look into our example. If you are wandering about in a foreign land, far from your home and from all that you hold dear, if you have seen and heard many things, have known sorrow and care, and are wretched and forlorn, then without fail you will dream one night that you are coming near to your home; you will see it glistening and shining in the fairest colours, and the sweetest, dearest and most beloved forms will move towards you. Then suddenly you will become aware that you are in rags, naked and dusty. You will be seized with a nameless shame and dread, you will seek to find covering and to hide yourself, and you will awake bathed in sweat. This, so long as men breathe, is the dream of the unhappy wanderer; and Homer has evoked the picture of his plight from the deepest and eternal nature of man.’ [1900a, 725]

The deepest and eternal nature of man, upon whose evocation in his hearers the poet is accustomed to rely, lies in those impulses of the mind which have their roots in a childhood that has since become prehistoric. Suppressed and forbidden wishes from childhood break through in the dream behind the exile's unobjectionable wishes which are capable of entering consciousness; and that is why the dream which finds concrete expression in the legend of Nausicaā ends as a rule as an anxiety-dream. [1900a, 725]

(1) I was sitting in a café, turning over the pages of a copy of the *Leipziger Illustrierte* (which I was holding up at an angle), when I read the following legend under a picture that stretched across the page: ‘A Wedding Celebration in the *Odysee*.' It caught my attention; in surprise I took hold of the paper in the proper way and then corrected my error: ‘A Wedding Celebration on the *Ostee*.' How did I come to make this absurd mistake in reading? My thoughts at once turned to a book by Ruths (1898), *Experimentaluntersuchungen über Musikphantome* . . . , which had occupied me a good deal recently since it trenches on the psychological problems that I have been concerned with. The author promised that he would shortly be bringing out a book to be called *Analysis and Principles of Dream Phenomena*. Seeing that I have just published an *Interpretation of Dreams* it is not surprising that I should await this book with the keenest interest. In Ruths' work on music phantoms I found at the beginning of the list of contents an announcement of a detailed inductive proof that the ancient Greek myths and legends have their main source of origin in phantoms of sleep and music, in the phenomena of dreams and also in deliria. Thereupon I at once plunged into the text to find out whether he also realized that the scene in which Odysseus appears before Nausicaā was derived from the common dream of being naked. A friend had drawn my attention to the fine passage in Gottfried Keller's *Der Grüne Heinrich* which explains this episode in the Odyssey as an objective representation of the dreams of a sailor wandering far from home; and I had pointed out the connection with exhibitionist dreams of being naked.¹ I found nothing on the subject in Ruths' book. In this instance it is obvious that my thoughts were occupied with questions of priority. [1901b, 1193]
We must not neglect, however, to go back to the kind of imaginative works which we have to recognize, not as original creations, but as the re-fashioning of ready-made and familiar material. Even here, the writer keeps a certain amount of independence, which can express itself in the choice of material and in changes in it which are often quite extensive. In so far as the material is already at hand, however, it is derived from the popular treasure-house of myths, legends and fairy tales. The study of constructions of folk-psychology such as these is far from being complete, but it is extremely probable that myths, for instance, are distorted vestiges of the wishful phantasies of whole nations, the secular dreams of youthful humanity.

Elements and situations derived from fairy tales are also frequently to be found in dreams. In interpreting the passages in question the patient will produce the significant fairy tale as an association. In the present paper I shall give two instances of this very common occurrence. But it will not be possible to do more than hint at the relations between the fairy tales and the history of the dreamer's childhood and his neurosis, though this limitation will involve the risk of breaking links which were of the utmost importance to the analyst.

Let us look once more at our material. In the Estonian epic, just as in the tale from the *Gesta Romanorum*, the subject is a girl choosing between three suitors; in the scene from *The Merchant of Venice* the subject is apparently the same, but at the same time something appears in it that is in the nature of an inversion of the theme: a man chooses between three - caskets. If what we were concerned with were a dream, it would occur to us at once that caskets are also women, symbols of what is essential in woman, and therefore of a woman herself - like coffers, boxes, cases, baskets, and so on. If we boldly assume that there are symbolic substitutions of the same kind in myths as well, then the casket scene in *The Merchant of Venice* really becomes the inversion we suspected. With a wave of the wand, as though we were in a fairy tale, we have stripped the astral garment from our theme; and now we see that the theme is a human one, a man's choice between three women.

The position is just the same, I think, in the matter of the relation of dreams to the alleged facts of the occult world. But, since dreams themselves have always been mysterious things, they have been brought into intimate connection with the other unknown mysteries. No doubt, too, they have a historic claim to that position, since in primaeval ages, when our mythology was being formed, dream-images may have played a part in the origin of ideas about spirits.
We have seen that one part of human mental activity is directed towards obtaining control over the real external world. Psycho-analysis now tells us further that another, particularly highly-prized, part of creative mental work serves for the fulfilment of wishes - for the substitutive satisfaction of the repressed wishes which, from the days of childhood, live in the spirit of each of us, unsatisfied. Among these creations, whose connection with an incomprehensible unconscious was always suspected, are myths and works of imaginative writing and of art, and the researches of psycho-analysts have in fact thrown a flood of light on the fields of mythology, the science of literature, and the psychology of artists. It is enough to mention Otto Rank’s work as an example. We have shown that myths and fairy tales can be interpreted like dreams, we have traced the convoluted paths that lead from the urge of the unconscious wish to its realization in a work of art, we have learnt to understand the emotional effect of a work of art on the observer, and in the case of the artist himself we have made clear his internal kinship with the neurotic as well as his distinction from him, and we have pointed out the connection between his innate disposition, his chance experiences and his achievements. The aesthetic appreciation of works of art and the elucidation of the artistic gift are, it is true, not among the tasks set to psycho-analysis. But it seems that psycho-analysis is in a position to speak the decisive word in all questions that touch upon the imaginative life of man.

[1924f, 4117]

In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients’ dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne’s thread is the umbilical cord.

[1933a, 4638]

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer’s early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer’s early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer’s adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]
Among the various factors, therefore, which contribute to a failure in recollection or a loss of memory, the part played by repression must not be overlooked; and it can be demonstrated not only in neurotics but (in a manner that is qualitatively the same) in normal people as well. It may be asserted quite generally that the ease (and ultimately the faithfulness, too) with which a given impression is awakened in the memory depends not only on the psychical constitution of the individual, the strength of the impression when it was fresh, the interest directed towards it at the time, the psychical constellation at the present time, the interest that is now devoted to its awakening, the connections into which the impression has been drawn, and so on - not only on such things but also on the favourable or unfavourable attitude of a particular psychical factor which refuses to reproduce anything that might liberate unpleasure, or that might subsequently lead to the liberation of unpleasure. Thus the function of memory, which we like to regard as an archive open to anyone who is curious, is in this way subjected to restriction by a trend of the will, just as is any part of our activity directed to the external world. Half the secret of hysterical amnesia is uncovered when we say that hysterical people do not know what they do not want to know; and psycho-analytic treatment, which endeavours to fill up such gaps of memory in the course of its work, leads us to the discovery that the bringing back of those lost memories is opposed by a certain resistance which has to be counterbalanced by work proportionate to its magnitude. In the case of psychical processes which are on the whole normal, it cannot, of course, be claimed that the influence of this one-sided factor in the revival of memories in any way regularly overcomes all the other factors that must be taken into account.¹

² Dreams are not the only phenomena which allow us to find a basis for psychopathology in psychology. In a short series of papers (1898b and 1899a) which is not yet completed, I have attempted to interpret number of phenomena of daily life as evidence in favour of the same conclusions. [Added 1909:] These, together with some further papers on forgetting, slips of the tongue, bungled actions, etc., have since been collected under the title of The Psychopathology of Everyday Life (1901b). [1901a, 1084]

Having been made acquainted with the dream-work by the foregoing discussion, we shall no doubt be inclined to pronounce it a quite peculiar psychical process, the like of which, so far as we are aware, does not exist elsewhere. It is as though we were carrying over on to the dream-work all the astonishment which used formerly to be aroused in us by its product, the dream. In fact, however, the dream-work is only the first to be discovered of a whole series of psychical processes, responsible for of hysterical symptoms, of phobias, obsessions and delusions. Condensation and, above all, displacement are invariable characteristics of these other processes as well. Modification into a pictorial form, on the other hand, remains a peculiarity of the dream-work. If this explanation places dreams in a single series alongside the structures produced by psychical illness, this makes it all the more important for us to discover the essential determining conditions of such processes as those of dream-formation. We shall probably be surprised to hear that neither the state of sleep nor illness is among these indispensable conditions. A whole number of the phenomena of the everyday life of healthy people - such as forgetting, slips of the tongue, bungled actions and a particular class of errors - owe their origin to a psychical mechanism analogous to that of dreams and of the other members of the series. [1901a, 1084]
Finding fault with one’s wife, a friendship which has turned into its opposite, a doctor’s error in diagnosis, a rebuff by some one with similar interests, borrowing someone else’s ideas - it can hardly be accidental that a collection of instances of forgetting, gathered at random, should require me to enter into such distressing subjects in explaining them. On the contrary, I suspect that everyone who is willing to enquire into the motives behind his lapses of memory will be able to record a similar sample list of objectionable subjects. The tendency to forget what is disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless developed with different degrees of strength in different people. It is probable that many instances of disowning which we encounter in our medical work are to be traced to forgetting.¹ It is true that our view of such forgetting limits the distinction between the two forms of behaviour to purely psychological factors and allows us to see in both modes of reaction the expression of the same motive. Of all the numerous examples of the disavowal of unpleasant memories which I have observed on the part of relatives of patients, one remains in my recollection as especially singular. A mother was giving me information about the childhood of her neurotic son, now in his puberty, in the course of which she said that, like his brothers and sisters, he had been a bed-wetter till late on - a fact which is certainly of some significance in the case history of a neurotic patient. A few weeks later, when she was wanting to find out about the progress of the treatment, I had occasion to draw her attention to the signs of a constitutional disposition to illness on the young man's part, and in doing so I referred to the bed-wetting which she had brought out in the anamnesis. To my astonishment she contested this fact in regard both to him and to the other children, and asked me how I could know it. Finally I told her that she herself had informed me a short time before. She must therefore have forgotten it.²

I am afraid all the examples I have given up to now will seem merely commonplace. But after all it can only suit my aim if I come upon things that are familiar to everyone and that everyone understands in the same way, for my whole purpose is to collect everyday material and turn it to scientific use. I fail to see why the wisdom which is the precipitate of men's common experience of life should be refused inclusion among the acquisitions of science. The essential character of scientific work derives not from the special nature of its objects of study but from its stricter method of establishing the facts and its search for far-reaching correlations.

Thus I am by no means the first to surmise that there is sense and purpose behind the minor functional disturbances in the daily life of healthy people.¹

(g) The effects produced by the parapraxes of normal people are as a rule of the most harmless kind. Precisely for this reason it is an especially interesting question whether mistakes of considerable importance which may be followed by serious consequences - for example, mistakes made by a doctor or a chemist -(are in any way open to the approach presented here.¹

We shall not be surprised if an object of such rich symbolic meaning as a ring should be made to play a part in some significant parapraxes, even where it does not, in the form of a wedding ring or an engagement ring, mark an erotic tie. The following example of an occurrence of this sort has been put at my disposal by Dr. M. Kardos:

To avoid confining myself entirely to my own errors, I shall report a few examples that might indeed have been included just as well among slips of the tongue and bungled actions; this is, however, a matter of indifference, since all these forms of parapraxis are equivalent to one another.
(10) I will add some other observations of confusion between names; they might of course have been equally well included in other chapters of this book.
[1901b, 1298]

(14) How a wish that has been reluctantly suppressed can be satisfied by means of an ‘error’ is described in a good example of Maeder’s (1908). A colleague who had a day free from duties wanted to enjoy it without any interruptions; but he was due to pay a visit in Lucerne to which he did not look forward. After long deliberation he decided to go there all the same. He passed the time on the journey from Zurich to Arth-Goldau in reading the daily papers. At the latter station he changed trains and continued reading. He travelled on till the ticket-inspector informed him that he was in the wrong train - the one travelling back from Goldau to Zurich, though he had a ticket for Lucerne.
[1901b, 1300]

The general conclusion that emerges from the previous individual discussions may be stated in the following terms. Certain shortcomings in our psychical functioning - whose common characteristics will in a moment be defined more closely - and certain seemingly unintentional performances prove, if psycho-analytic methods of investigation are applied to them, to have valid motives and to be determined by motives unknown to consciousness.
[1901b, 1311]

In order to be included in the class of phenomena explicable in this way, a psychical parapraxis must fulfil the following conditions:
[1901b, 1311]

There thus remain in this group the cases of forgetting ['Vergessen'], the errors in spite of better knowledge, the slips of the tongue ['Versprechen'], misreadings ['Verlesen'], slips of the pen ['Verschreiben'], bungled actions ['Vergreifen'] and the so-called ‘chance actions’. Language points to the internal similarity between most of these phenomena: they are compounded alike [in German] with the prefix 'ver-'.¹
[1901b, 1311]

Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient’s ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called The Interpretation of Dreams, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.
[1904a, 1558]
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

Working over the ideas that occur to patients when they submit to the main rule of psycho-analysis is not our only technical method of discovering the unconscious. The same purpose is served by two other procedures: the interpretation of patients' dreams and the exploitation of their faulty and haphazard actions.

The phenomena in question are the small faulty actions performed by both normal and neurotic people, to which as a rule no importance is attached: forgetting things that might be known and sometimes in fact are known (e.g. the occasional difficulty in recalling proper names), slips of the tongue in talking, by which we ourselves are so often affected, analogous slips of the pen and misreadings, bungling the performance of actions, losing objects or breaking them. All of these are things for which as a rule no psychological determinants are sought and which are allowed to pass without criticism as consequences of distraction or inattention or similar causes. Besides these there are the actions and gestures which people carry out without noticing them at all, to say nothing of attributing any psychological importance to them: playing about and fiddling with things, humming tunes, fingering parts of one's own body or one's clothing and so on.¹ These small things, faulty actions and symptomatic or haphazard actions alike, are not so insignificant as people, by a sort of conspiracy of silence, are ready to suppose. They always have a meaning, which can usually be interpreted with ease and certainty from the situation in which they occur. And it turns out that once again they give expression to impulses and intentions which have to be kept back and hidden from one's own consciousness, or that they are actually derived from the same repressed wishful impulses and complexes which we have already come to know as the creators of symptoms and the constructors of dreams. They therefore deserve to be rated as symptoms, and if they are examined they may lead, just as dreams do, to the uncovering of the hidden part of the mind. A man's most intimate secrets are as a rule betrayed by their help. If they occur particularly easily and frequently even in healthy people in whom the repression of unconscious impulses has on the whole been quite successful, they have their triviality and inconspicuousness to thank for it. But they can claim a high theoretical value, since they prove that repression and the formation of substitutes occur even under healthy conditions.

¹[1906c, 1889]

¹[1910a, 2220]

¹[1910a, 2224]
As we see, the note refers to the death of Leonardo's father. The small error in its form consists of the repetition of the time of day 'a ore 7' [at 7 o'clock], which is given twice, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a small detail, and anyone who was not a psycho-analyst would attach no importance to it. He might not even notice it, and if his attention was drawn to it he might say that a thing like that can happen to anyone in a moment of distraction or of strong feeling, and that it has no further significance.

Recognition of the simultaneous presence of the three factors of 'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psycho-analytic theory, and marks its distinction from other views of pathological mental life. At the same time, psycho-analysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only difference is that he deals with these events with less trouble and better success. The psycho-analytic method of investigation can accordingly be applied equally to the explanation of normal psychological phenomena, and has made it possible to discover the close relationship between pathological psychological products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been carried furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psycho-analytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychological life.

The other objection that may probably be raised would be that we apply to normal psychology conclusions which are drawn chiefly from the study of pathological conditions. We are enabled to answer it by another fact, the knowledge of which we owe to psycho-analysis. Certain deficiencies of function of most frequent occurrence among healthy people, e.g. *lapsus linguae*, errors in memory and speech, forgetting of names, etc., may easily be shown to depend on the action of strong unconscious ideas in the same way as neurotic symptoms. We shall meet with another still more convincing argument at a later stage of this discussion.
There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are 'parapraxes' (slips of the tongue or pen, forgetfulness, etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (in so far as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find 'physiological' explanations of them, though these were invariably unsatisfactory. Psycho-analysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus on the one hand psycho-analysis has narrowed the region subject to the physiological point of view and on the other hand has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psycho-analysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

[1913j, 2803]

I shall now discuss in greater detail two of the normal phenomena with which we are here concerned (phenomena, that is, which can be observed in normal people) - namely, parapraxes and dreams.

[1913j, 2803]

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

[1913j, 2804]
The stubborn denial of a psychical character to latent mental acts is accounted for by the circumstance that most of the phenomena concerned have not been the subject of study outside psycho-analysis. Anyone who is ignorant of pathological facts, who regards the parapraxes of normal people as accidental, and who is content with the old saw that dreams are froth ["Träume sind Schäume"] has only to ignore a few more problems of the psychology of consciousness in order to spare himself any need to assume an unconscious mental activity. Incidentally, even before the time of psycho-analysis, hypnotic experiments, and especially post-hypnotic suggestion, had tangibly demonstrated the existence and mode of operation of the mental unconscious.

LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a slip of the tongue [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a misreading [Verlesen]), or he may hear wrongly something that has been said to him (a mishearing [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis forgetting [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a name which he nevertheless knows and which he recognizes at once, or he may forget to carry out an intention, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of mislaying [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of losing [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of errors [ Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

[1916-1917, 3136]

All these are occurrences whose internal affinity with one another is expressed in the fact that [in German] they begin with the syllable 'ver'. They are almost all of an unimportant kind, most of them are very transitory, and they are without much significance in human life. Only rarely does one of them, such as losing an object, attain some degree of practical importance. For that reason, too, they attract little attention, give rise to no more than feeble emotions, and so on. [1916-1917, 3136]
It is to these phenomena, then, that I now propose to draw your attention. But you will protest with some annoyance: 'There are so many vast problems in the wide universe, as well as within the narrower confines of our minds, so many marvels in the field of mental disorders, which require and deserve to have light thrown upon them, that it does really seem gratuitous to waste labour and interest on such trivialities. If you could make us understand why a person with sound eyes and ears can see and hear in broad daylight things that are not there, why another person suddenly thinks he is being persecuted by the people of whom he has hitherto been most fond, or puts forward the cleverest arguments in support of delusional beliefs which any child could see were nonsensical, then we should have some opinion of psycho-analysis. But if it can do no more than ask us to consider why a speaker at a banquet uses one word instead of another or why a housewife has mislaid her keys, and similar futilities, then we shall know how to put our time and interest to better uses.'

I should reply: Patience, Ladies and Gentlemen! I think your criticism has gone astray. It is true that psycho-analysis cannot boast that it has never concerned itself with trivialities. On the contrary, the material for its observations is usually provided by the inconsiderable events which have been put aside by the other sciences as being too unimportant - the dregs, one might say, of the world of phenomena. But are you not making a confusion in your criticism between the vastness of the problems and the conspicuousness of what points to them? Are there not very important things which can only reveal themselves, under certain conditions and at certain times, by quite feeble indications? I should find no difficulty in giving you several examples of such situations. If you are a young man, for instance, will it not be from small pointers that you will conclude that you have won a girl's favour? Would you wait for an express declaration of love or a passionate embrace? Or would not a glance, scarcely noticed by other people, be enough? a slight movement, the lengthening by a second of the pressure of a hand? And if you were a detective engaged in tracing a murder, would you expect to find that the murderer had left his photograph behind at the place of the crime, with his address attached? or would you not necessarily have to be satisfied with comparatively slight and obscure traces of the person you were in search of? So do not let us under-estimate small indications; by their help we may succeed in getting on the track of something bigger. Furthermore, I think like you that the great problems of the universe and of science have the first claim on our interest. But it is as a rule of very little use to form an express intention of devoting oneself to research into this or that great problem. One is then often at a loss to know the first step to take. It is more promising in scientific work to attack whatever is immediately before one and offers an opportunity for research. If one does so really thoroughly and without prejudice or preconception, and if one has luck, then, since everything is related to everything, including small things to great, one may gain access even from such unpretentious work to a study of the great problems. That is what I should say in order to retain your interest, when we deal with such apparent trivialities as the parapraxes of healthy people.

[1916-1917, 3137]
Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue if he is slightly indisposed and tired, if he is excited and if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

[1916-1917, 3138]

This does not appear to promise much for our psycho-analytic interest. We might feel tempted to drop the subject. If, however, we examine the observations more closely, what we find does not tally entirely with this attention theory of parapraxes, or at least does not follow from it naturally. We discover that parapraxes of this kind and forgetting of this kind occur in people who are not fatigued or absent-minded or excited, but who are in all respects in their normal state - unless we choose to ascribe ex post facto to the people concerned, purely on account of their parapraxis, an excitement which, however, they themselves do not admit to. Nor can it be simply the case that a function is ensured by an increase in the attention directed upon it and endangered if that attention is reduced. There are a large number of procedures that one carries out purely automatically, with very little attention, but nevertheless performs with complete security. A walker, who scarcely knows where he is going, keeps to the right path for all that, and stops at his destination without having gone astray. Or at all events this is so as a rule. An expert pianist strikes the right keys without thinking. He may, of course, make an occasional mistake; but if automatic playing increased the danger of bungling, that danger would be at its greatest for a virtuoso, whose playing, as a result of prolonged practice, has become entirely automatic. We know, on the contrary, that many procedures are carried out with quite particular certainty if they are not the object of a specially high degree of attention, and that the mishap of a parapraxis is liable to occur precisely if special importance is attached to correct functioning and there has therefore certainly been no distraction of the necessary attention. It could be argued that this is the result of 'excitement', but it is difficult to see why the excitement should not on the contrary increase the attention directed to what is so earnestly intended. If by a slip of the tongue someone says the opposite of what he intends in an important speech or oral communication, it can scarcely be explained by the psycho-physiologica l or attention theory.

[1916-1917, 3139]
What is it you want to ask me? Do I think that this explanation applies to all parapraxes or only to a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychical nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psycho-analysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

[1916-1917, 3154]

First, then, is this the explanation of all cases of slips of the tongue? I am very much inclined to think so, and my reason is that every time one investigates an instance of a slip of the tongue an explanation of this kind is forthcoming. But it is also true that there is no way of proving that a slip of the tongue cannot occur without this mechanism. It may be so; but theoretically it is a matter of indifference to us, since the conclusions we want to draw for our introduction to psycho-analysis remain, even though - which is certainly not the case - our view holds good of only a minority of cases of slips of the tongue. The next question - whether we may extend our view to other sorts of parapraxis - I will answer in advance with a 'yes'. You will be able to convince yourselves of this when we come to examining instances of slips of the pen, bungled actions, and so on. But for technical reasons I suggest that we should postpone this task till we have treated slips of the tongue themselves still more thoroughly.

[1916-1917, 3154]

LADIES AND GENTLEMEN, - We may take it as the outcome of our efforts so far and the basis of our further investigations that parapraxes have a sense. Let me insist once again that I am not asserting - and for our purposes there is no need to do so - that every single parapraxis that occurs has a sense, even though I regard that as probably the case. It is enough for us if we can point to such a sense relatively often in the different forms of parapraxis. Moreover, in this respect these different forms behave differently. Cases of slips of the tongue and of the pen, etc., may occur on a purely physiological basis. I cannot believe that this is so in the types depending on forgetting (forgetting names or intentions, mislaying, etc.). It is very probable that there are cases of losing which can be regarded as unintended. It is in general true that only a certain proportion of the errors that occur in ordinary life can be looked at from our point of view. You should bear these limitations in mind when henceforward we start from the assumption that parapraxes are psychical acts and arise from mutual interference between two intentions.

[1916-1917, 3167]

We shall therefore not enter more deeply into parapraxes, but we may still undertake a cursory survey of the extent of this field, in the course of which we shall come once more upon things we already know but shall also discover some novelties. In this survey I shall keep to the division into three groups which I proposed to begin with: slips of the tongue together with their cognate forms (slips of the pen, misreading and mishearing); forgetting, subdivided according to the objects forgotten (proper names, foreign words, intentions or impressions); and bungled actions, mislaying and losing. Errors, in so far as they concern us, fall under the headings partly of forgetting and partly of bungled actions.

[1916-1917, 3174]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts. [1924f, 4109]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]

In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
In my judgement serious parapraxes like the present ones are brought about in exactly the same way as the innocent ones that we normally investigate.

[1901b, 1208]

If slips in speaking - which is clearly a motor function - can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term 'bungled actions' ['Vergreifen'] to describe all the cases in which a wrong result - i.e. a deviation from what was intended - seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena. It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'. Let us rather try to trace the individual examples back to their particular determinants. For this purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.

[1901b, 1242]

I do not mean to assert that cases of combined parapraxes like these can teach us anything new that could not already be observed in the simple cases. And yet this situation, of there being a change in the form taken by the parapraxis while the outcome remains the same, gives a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be struck by the fact that a conscious intention should in these examples fail so completely to prevent the success of the parapraxis. My friend failed in spite of everything to attend the meeting of the society, and the lady found it impossible to part from the medal. The unknown factor that opposed these intentions found another outlet after the first path had been barred to it. For what was required to overcome the unconscious motive was something other than a conscious counter-intention; it called for a piece of psychical work, which could make what was unknown known to consciousness.

[1901b, 1310]

The general conclusion that emerges from the previous individual discussions may be stated in the following terms. Certain shortcomings in our psychical functioning - whose common characteristics will in a moment be defined more closely - and certain seemingly unintentional performances prove, if psycho-analytic methods of investigation are applied to them, to have valid motives and to be determined by motives unknown to consciousness.

[1901b, 1311]

On the other hand we must not overlook the fact that repressed thoughts and impulses certainly do not achieve expression in symptomatic acts and parapraxes by their own unaided efforts. The technical possibility for such side-slipping on the part of the innervations must be presented independently; this will then be readily exploited by the intention of the repressed to make itself felt consciously. In the case of verbal parapraxes, detailed investigations by philosophers and philologists have endeavoured to determine what are the structural and functional relations that put themselves at the service of such an intention. If we distinguish, among the determinants of parapraxes and symptomatic acts, between the unconscious motive on the one hand and the physiological and psycho-physical relations that come to meet it on the other, it remains an open question whether there are, within the range of normality, yet other factors that can - like the unconscious motive, and in place of it - create parapraxes and symptomatic acts along the lines of these relations. It is not my task to answer this question.

[1901b, 1340]
Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that some disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

[1901b, 1340]

(F) Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline.

1. What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

[1901b, 1341]

We have now reached the moment for answering the second question - that is, what psychological determinants are responsible for a thought being compelled to seek expression not in its complete form but in a kind of parasitic form, as a modification and disturbance of another thought. The most striking examples of parapraxes make it seem probable that these determinants must be looked for in a relation to admissibility to consciousness: in the question, that is, of the greater or less degree to which they bear the marked character of being 'repressed'. But if we follow this character through the series of examples, it dissolves into ever vaguer indications. The inclination to dismiss something as a waste of time, or the consideration for pushing back a thought (which is then left to find expression by disturbing another thought), to play the same part as does the moral condemnation of an insubordinate emotional impulse or as does derivation from totally unconscious trains of thought. Insight into the general nature of how parapraxes and chance actions are determined cannot be gained along these lines. One single fact of significance emerges from these enquiries. The more innocent the motivation of a parapraxis, and the less objectionable - and therefore the less inadmissible to consciousness - the thought finding expression in it, the easier it is to explain the phenomenon, once one's attention has been turned to it. The slightest cases of slips of the tongue are noticed immediately, and spontaneously corrected. Where the motivation comes from really repressed impulses, the case has to be elucidated by careful analysis, which may itself at times come up against difficulties or prove unsuccessful.

[1901b, 1345]
We are therefore no doubt justified in taking the result of this last enquiry as evidence that the satisfactory explanation of the psychological determinants of parapraxes and chance actions is to be looked for along other lines and by a different approach. The indulgent reader may accordingly see in these discussions signs of the broken edges where this subject has been somewhat artificially detached from a wider context.
[1901b, 1345]

A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the 'dream-work' in my Interpretation of Dreams. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.
[1901b, 1346]

We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting-point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements - namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic - acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at - formes frustres¹ - of the neuroses: cases in which the symptoms are few, or occur rarely or not severely - in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way - that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life - this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.
[1901b, 1347]

But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.
[1901b, 1347]
Investigation of the childhood history of hysterical patients shows that the hysterical attack is designed to take the place of an *auto-erotic* satisfaction previously practised and since given up. In a great number of cases this satisfaction (masturbation by contact or by pressure of the thighs, or, again, by movements of the tongue, and so on) recurs during the attack itself, while the subject's consciousness is deflected. Moreover, the onset of an attack that is due to an increase of libido and is in the service of the primary purpose - as a consolation - exactly repeats the conditions under which, at the earlier time, the patient had intentionally sought this auto-erotic satisfaction. The anamnesis of the patient shows the following stages: (a) auto-erotic satisfaction, without ideational content; (b) the same satisfaction, connected with a phantasy which leads to the act of satisfaction; (c) renunciation of the act, with retention of the phantasy; (d) repression of the phantasy, which then comes into effect as a hysterical attack, either in an unchanged form, or in a modified one and adapted to new environmental impressions. Furthermore, (e) the phantasy may even reinstate the act of satisfaction belonging to it which had ostensibly been given up. This is a typical cycle of infantile sexual activity: repression, failure of repression, and return of the repressed.

[1909a, 1983]

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913j, 2804]

In other instances the analysis of a parapraxis is less simple and requires less obvious explanations, on account of the intrusion of a process which we describe as ‘displacement’. One may, for instance, forget the name of someone against whom one has no objection; analysis will show, however, that the name has stirred up the memory of someone else, who has the same or a similar-sounding name and whom one has good reason to dislike. This connection has led to the innocent person's name being forgotten; the intention to forget has, as it were, been displaced along some line of association.

[1913j, 2805]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.

[1913j, 2805]
The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

[1913], 2807

But you will have a right to ask another question. If there is no objective verification of psycho-analysis, and no possibility of demonstrating it, how can one learn psycho-analysis at all, and convince oneself of the truth of its assertions? It is true that psycho-analysis cannot easily be learnt and there are not many people who have learnt it properly. But of course there is a practicable method none the less. One learns psycho-analysis on oneself, by studying one's own personality. This is not quite the same thing as what is called self-observation, but it can, if necessary, be subsumed under it. There are a whole number of very common and generally familiar mental phenomena which, after a little instruction in technique, can be made the subject of analysis upon oneself. In that way one acquires the desired sense of conviction of the reality of the processes described by analysis and of the correctness of its views. Nevertheless, there are definite limits to progress by this method. One advances much further if one is analysed oneself by a practised analyst and experiences the effects of analysis on one's own self, making use of the opportunity of picking up the subtler technique of the process from one's analyst. This excellent method is, of course, applicable only to a single person and never to a whole lecture room of students together.

[1916-1917, 3132]

Nevertheless I hope I am not mistaken in saying that during this last enquiry we have all of us formed a fresh impression of these instances of slips of the tongue, and that it may be worth while to consider that impression further. We examined the conditions under which in general slips of the tongue occur, and afterwards the influences which determine the kind of distortion which the slip produces. But we have so far paid no attention whatever to the product of the slip considered by itself, without reference to its origin. If we decide to do so, we are bound in the end to find the courage to say that in a few examples what results from the slip of the tongue has a sense of its own. What do we mean by 'has a sense'? That the product of the slip of the tongue may perhaps itself have a right to be regarded as a completely valid psychical act, pursuing an aim of its own, as a statement with a content and significance. So far we have always spoken of 'parapraxes', but it seems now as though sometimes the faulty act was itself quite a normal act, which merely took the place of the other act which was the one expected or intended.

[1916-1917, 3145]
If it turned out, Ladies and Gentlemen, that not only a few instances of slips of the tongue and of parapraxes in general have a sense, but a considerable number of them, the sense of parapraxes, of which we have so far heard nothing, would inevitably become their most interesting feature and would push every other consideration into the background. We should then be able to leave all physiological or psycho-physiological factors on one side and devote ourselves to purely psychological investigations into the sense - that is, the meaning or purpose - of parapraxes. We shall therefore make it our business to test this expectation on a considerable number of observations.

[1916-1917, 3146]

Well, it looks now as though we have solved the problem of parapraxes, and with very little trouble! They are not chance events but serious mental acts; they have a sense; they arise from the concurrent action - or perhaps rather, the mutually opposing action - of two different intentions. But now I see too that you are preparing to overwhelm me with a mass of questions and doubts which will have to be answered and dealt with before we can enjoy this first outcome of our work. I certainly have no desire to force hasty decisions upon you. Let us take them all in due order, one after the other, and give them cool consideration.

[1916-1917, 3154]

What is it you want to ask me? Do I think that this explanation applies to all parapraxes or only to a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychical nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psycho-analysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

[1916-1917, 3154]

I am particularly interested, however, in your next question: how does one discover the two mutually interfering purposes? You do not realize, probably, what a momentous question this is. One of the two, the purpose that is disturbed, is of course unmistakable: the person who makes the slip of the tongue knows it and admits to it. It is only the other, the disturbing purpose, that can give rise to doubt and hesitation. Now, we have already seen, and no doubt you have not forgotten, that in a number of cases this other purpose is equally evident. It is indicated by the outcome of the slip, if only we have the courage to grant that outcome a validity of its own. Take the President of the Lower House, whose slip of the tongue said the contrary of what he intended. It is clear that he wanted to open the sitting, but it is equally clear that he also wanted to close it. That is so obvious that it leaves us nothing to interpret. But in the other cases, in which the disturbing purpose only distorts the original one without itself achieving complete expression, how do we arrive at the disturbing purpose from the distortion?

[1916-1917, 3156]
Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

There is no need to discuss what is to be called conscious: it is removed from all doubt. The oldest and best meaning of the word ‘unconscious’ is the descriptive one; we call a psychical process unconscious whose existence we are obliged to assume - for some such reason as that we infer it from its effects - but of which we know nothing. In that case we have the same relation to it as we have to a psychical process in another person, except that it is in fact one of our own. If we want to be still more correct, we shall modify our assertion by saying that we call a process unconscious if we are obliged to assume that it is being activated at the moment, though at the moment we know nothing about it. This qualification makes us reflect that the majority of conscious processes are conscious only for a short time; very soon they become latent, but can easily become conscious again. We might also say that they had become unconscious, if it were at all certain that in the condition of latency they are still something psychical. So far we should have learnt nothing new; nor should we have acquired the right to introduce the concept of an unconscious into psychology. But then comes the new observation that we were already able to make in parapraxes. In order to explain a slip of the tongue, for instance, we find ourselves obliged to assume that the intention to make a particular remark was present in the subject. We infer it with certainty from the interference with his remark which has occurred; but the intention did not put itself through and was thus unconscious. If, when we subsequently put it before the speaker, he recognizes it as one familiar to him, then it was only temporarily unconscious to him; but if he repudiates it as something foreign to him, then it was permanently unconscious. From this experience we retrospectively obtain the right also to pronounce as something unconscious what had been described as latent. A consideration of these dynamic relations permits us now to distinguish two kinds of unconscious - one which is easily, under frequently occurring circumstances, transformed into something conscious, and another with which this transformation is difficult and takes place only subject to a considerable expenditure of effort or possibly never at all. In order to escape the ambiguity as to whether we mean the one or the other unconscious, whether we are using the word in the descriptive or in the dynamic sense, we make use of a permissible and simple way out. We call the unconscious which is only latent, and thus easily becomes conscious, the ‘preconscious’ and retain the term ‘unconscious’ for the other. We now have three terms, ‘conscious’, ‘preconscious’ and ‘unconscious’, with which we can get along in our description of mental phenomena. Once again: the preconscious is also unconscious in the purely descriptive sense, but we do not give it that name, except in talking loosely or when we have to make a defence of the existence in mental life of unconscious processes in general.

[1924f, 4109]

[1933a, 4679]
In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
Among the various factors, therefore, which contribute to a failure in recollection or a loss of memory, the part played by repression must not be overlooked; and it can be demonstrated not only in neurotics but (in a manner that is qualitatively the same) in normal people as well. It may be asserted quite generally that the ease (and ultimately the faithfulness, too) with which a given impression is awakened in the memory depends not only on the psychical constitution of the individual, the strength of the impression when it was fresh, the interest directed towards it at the time, the psychical constellation at the present time, the interest that is now devoted to its awakening, the connections into which the impression has been drawn, and so on - not only on such things but also on the favourable or unfavourable attitude of a particular psychical factor which refuses to reproduce anything that might liberate unpleasantness, or that might subsequently lead to the liberation of unpleasantness. Thus the function of memory, which we like to regard as an archive open to anyone who is curious, is in this way subjected to restriction by a trend of the will, just as is any part of our activity directed to the external world. Half the secret of hysterical amnesia is uncovered when we say that hysterical people do not know what they do not want to know; and psycho-analytic treatment, which endeavours to fill up such gaps of memory in the course of its work, leads us to the discovery that the bringing back of those lost memories is opposed by a certain resistance which has to be counterbalanced by work proportionate to its magnitude. In the case of psychical processes which are on the whole normal, it cannot, of course, be claimed that the influence of this one-sided factor in the revival of memories in any way regularly overcomes all the other factors that must be taken into account.¹

The value of the insight that we have gained in analysing the Signorelli example naturally depends on whether we want to pronounce that instance as typical or as an isolated occurrence. I must affirm, that the forgetting of names, accompanied by paramnesia, takes place with uncommon frequency in the way in which we have explained it in the Signorelli case. In almost every instance in which I could observe this phenomenon in myself, I have also been able to explain it in the way described above, i.e. as motivated by repression. I must also draw attention to another consideration which supports the typical nature of our analysis. I think there is no justification for making a theoretical separation between those cases in which the forgetting of names is accompanied by paramnesia and the sort where incorrect substitute names have not presented themselves. These substitute names occur spontaneously in a number of cases; in others, where they have not emerged spontaneously, it is possible to force them to emerge by an effort of attention; and they then show the same relation to the repressed element and the missing name as they would if they had appeared spontaneously. Two factors seem to be decisive in bringing the substitute names to consciousness: first, the effort of attention, and secondly, an inner condition that attaches to the psychical material. We might look for the latter in the greater or lesser facility with which the necessary external association between the two elements establishes itself. A good portion of the cases of name-forgetting without paramnesia can thus be added to the cases in which substitute names are formed - to which the mechanism of the Signorelli example applies. I shall certainly not venture to affirm that all cases of name-forgetting are to be classed in the same group. There is no question that instances of it exist which are much simpler. We shall, I think, have stated the facts of the case with sufficient caution if we affirm: By the side of simple cases where proper names are forgotten there is a type which is motivated by repression.

[1901b, 1106]
Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline.

(1) What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

We have now reached the moment for answering the second question - that is, what psychological determinants are responsible for a thought being compelled to seek expression not in its complete form but in a kind of parasitic form, as a modification and disturbance of another thought. The most striking examples of parapraxes make it seem probable that these determinants must be looked for in a relation to admissibility to consciousness; in the question, that is, of the greater or less degree to which they bear the marked character of being 'repressed'. But if we follow this character through the series of examples, it dissolves into ever vaguer indications. The inclination to dismiss something as a waste of time, or the consideration that the thought in question is not properly relevant to the matter in hand, appear, as motives for pushing back a thought (which is then left to find expression by disturbing another thought), to play the same part as does the moral condemnation of an insubordinate emotional impulse or as does derivation from totally unconscious trains of thought. Insight into the general nature of how parapraxes and chance actions are determined cannot be gained along these lines. One single fact of significance emerges from these enquiries. The more innocent the motivation of a parapraxis, and the less objectionable - and therefore the less inadmissible to consciousness - the thought finding expression in it, the easier it is to explain the phenomenon, once one's attention has been turned to it. The slightest cases of slips of the tongue are noticed immediately, and spontaneously corrected. Where the motivation comes from really repressed impulses, the case has to be elucidated by careful analysis, which may itself at times come up against difficulties or prove unsuccessful.

We are therefore no doubt justified in taking the result of this last enquiry as evidence that the satisfactory explanation of the psychological determinants of parapraxes and chance actions is to be looked for along other lines and by a different approach. The indulgent reader may accordingly see in these discussions signs of the broken edges where this subject has been somewhat artificially detached from a wider context.
Now in my *Interpretation of Dreams* (1900a) I have demonstrated the part played by the work of condensation in forming what is called the manifest dream-content out of the latent dream-thoughts. A similarity of any sort between two elements of the unconscious material - a similarity between the things themselves or between their verbal presentations - is taken as an opportunity for creating a third, which is a composite or compromise idea. In the dream-content this third element represents both its components; and it is as a consequence of its originating in this way that it so frequently has various contradictory characteristics. The formation of substitutions and contaminations which occurs in slips of the tongue is accordingly a beginning of the work of condensation which we find taking a most vigorous share in the construction of dreams.

[1901b, 1149]

An important conclusion can be drawn from this conformity. The peculiar mode of working, whose most striking achievement we see in the content of dreams, cannot be attributed to the sleeping state of mental life if we possess such abundant evidence in the form of parapraxes that it operates during our waking life as well. The same connection also forbids our assuming that these psychical processes, which strike us as abnormal and strange, are determined by a deep-seated decay in mental activity or by pathological states of functioning.¹

[1901b, 1346]

We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting-point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements - namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic - acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at - *formes frustres*¹ - of the neuroses: cases in which the symptoms are few, or occur rarely or not severely - in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way - that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life - this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.

[1901b, 1347]
In other instances the analysis of a parapraxis is less simple and requires less obvious explanations, on account of the intrusion of a process which we describe as 'displacement'. One may, for instance, forget the name of someone against whom one has no objection; analysis will show, however, that the name has stirred up the memory of someone else, who has the same or a similar-sounding name and whom one has good reason to dislike. This connection has led to the innocent person's name being forgotten; the intention to forget has, as it were, been displaced along some line of association.
[1913], 2805]
Now in my *Interpretation of Dreams* (1900a) I have demonstrated the part played by the work of *condensation* in forming what is called the manifest dream-content out of the latent dream-thoughts. A similarity of any sort between two elements of the unconscious material - a similarity between the things themselves or between their verbal presentations - is taken as an opportunity for creating a third, which is a composite or compromise idea. In the dream-content this third element represents both its components; and it is as a consequence of its originating in this way that it so frequently has various contradictory characteristics. The formation of substitutions and contaminations which occurs in slips of the tongue is accordingly a beginning of the work of condensation which we find taking a most vigorous share in the construction of dreams.

(1) My daughter had made an ugly face when she took a bite at an apple, and I wanted to quote to her:

A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the ‘Apfe’). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

(G) A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the ‘dream-work’ in my *Interpretation of Dreams*. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases *the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.*

[1901b, 1149]

[1901b, 1152]

[1901b, 1342]

[1901b, 1346]
In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
The name Signorelli has undergone a division into two pieces. One of the pairs of syllables (elli) recurs without alteration in one of the substitute names: while the other, by means of the translation of Signor into Herr, has acquired a numerous and miscellaneous set of relations to the names contained in the repressed topic, but for this reason is not available for reproduction. The substitute for it has been arrived at in a way that suggests that a displacement along the connected names of 'Herzegovina and Bosnia' had taken place, without consideration for the sense or for the acoustic demarcation of the syllables. Thus the names have been treated in this process like the pictograms in a sentence which has had to be converted into a picture-puzzle (or rebus). Of the whole course of events that have in ways like these produced the substitute names instead of the name Signorelli no information has been given to consciousness. At first sight it seems impossible to discover any relation between the topic in which the name Signorelli occurred and the repressed topic which preceded it in time, apart from this recurrence of the same syllables (or rather sequence of letters).

[1901b, 1105]

'Without being aware of it. And you really mean to say that it was this anxious expectation that made me unable to produce an unimportant word like aliquis?'

[1901b, 1109]

There thus runs though my thoughts a continuous current of 'personal reference', of which I generally have no inkling, but which betrays itself by such instances of my forgetting names. It is as if I were obliged to compare everything I hear about other people with myself; as if my personal complexes were put on the alert whenever another person is brought to my notice. This cannot possibly be an individual peculiarity of my own: it must rather contain an indication of the way in which we understand 'something other than ourself' in general. I have reasons for supposing that other people are in this respect very similar to me.

[1901b, 1120]

(7) At a certain point in the analysis of another woman patient I had to tell her that I suspected her of having been ashamed of her family during the period we were just then concerned with, and of having reproached her father with something we did not yet know about. She remembered nothing of the kind and moreover declared it was unlikely. However, she continued the conversation with some remarks about her family: 'One thing must be granted them: they are certainly unusual people, they all possess Geiz - I meant to say "Geist."'. And this was in fact the reproach which she had repressed from her memory. It is a frequent occurrence for the idea one wants to withhold to be precisely the one which forces its way through in the form of a slip of the tongue. We may compare Meringer's case of 'zum Vorschwein gekommen'. The only difference is that Meringer's speaker wanted to keep back something that was in his consciousness, whereas my patient did not know what was being kept back, or, to put it in another way, did not know she was keeping something back and what that something was.

[1901b, 1155]

(10) In a second group of cases the part which the text contributes to the misreading is a much larger one. It contains something which rouses the reader's defences - some information or imputation distressing to him - and which is therefore corrected by being misread so as to fit in with a repudiation or with the fulfilment of a wish. In such cases we are of course obliged to assume that the text was first correctly understood and judged by the reader before it underwent correction, although his consciousness learnt nothing of this first reading. Example (3) above is of this kind; and I include here a further, highly topical one given by Eitingon (1915), who was at the military hospital at Igló at the time.

[1901b, 1200]
Last September I made the acquaintance of a Fräulein Z., aged 34. She was in well-to-do circumstances, and had been engaged before the war, but her fiancé had fallen in action in 1916 while serving as an officer. We came to know and become fond of each other, not at first with any thought of marrying, as the circumstances on both sides, in particular the difference in our ages (I myself was 27), seemed to rule that out. As we lived opposite each other in the same street and met every day, our relationship took an intimate turn in course of time. Thus the idea of marriage came more into view and I finally agreed to it myself. The betrothal was planned for this Easter; Fräulein Z., however, intended first to make a journey to her relatives at M., but this was suddenly prevented by a railway strike that had been called as a result of the Kapp Putsch. The gloomy prospects that the workers' victory and its consequences appeared to hold out for the future had their effect for a brief time on our mood, too, but especially on Fräulein Z., always a person of very changeable moods, since she thought she saw new obstacles in the way of our future. On Saturday, March 20, however, she was in an exceptionally cheerful frame of mind - a state of affairs that took me quite by surprise and carried me along with her, so that we seemed to see everything in the rosier colours. A few days before, we had talked of going to church together some time, without however having fixed a definite date. At 9.15 the next morning, Sunday, March 21, she telephoned to ask me to fetch her to church straight away; but I refused, as I could not have got ready in time, and had, besides, work I wanted to finish. Fräulein Z. was noticeably disappointed; she then set out alone, met an acquaintance on the stairs at her house and walked with him for the short distance along the Tauentzienstrasse to the Rankestrasse, in the best of humour and without referring at all to our conversation. The gentleman bade her good-bye with a joking remark. Fräulein Z. had only to cross the Kurfürstendamm where it widened out and one could have a clear view along it; but, close to the pavement, she was run over by a horse-drawn cab. (Contusion of the liver, which led to her death a few hours later.) - We had crossed at that point hundreds of times before; Fräulein Z. was exceedingly careful, and very often prevented me from being rash; on this morning there was almost no traffic whatever, the trams, omnibuses, etc. were on strike. Just about that time there was almost absolute quiet; even if she did not see the cab she must at all events have heard it! Everybody supposed it was an "accident". My first thought was: "That's impossible - but on the other hand there can be no question of its having been intentional." I tried to find a psychological explanation. After some considerable time I thought I had found it in your *Psychopathology of Everyday Life*. In particular, Fräulein Z. showed at various times a certain leaning in the direction of suicide and even tried to induce me to think the same way - thoughts from which I have often enough dissuaded her; for example, only two days before, after returning from a walk, she began, without any external reason at all, to talk about her death and the provisions for dealing with her estate. (She had not, by the way, done anything about this! - an indication that these remarks definitely did not have any intention behind them.) If I may venture on an opinion, I should regard this calamity not as an accident, nor as an effect of a clouding of consciousness, but as an intentional self-destruction performed with an unconscious purpose, and disguised as a chance mishap. This view of mine is confirmed by remarks which Fräulein Z. made to her relatives, both earlier, before she knew me, and also more recently, as well as by remarks to me up to within the last few days; so that I am tempted to regard the whole thing as an effect of the loss of her former fiancé, whom in her eyes nothing could replace.
This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychical processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of his kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes, the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept \( \gamma\nu\omega\theta\ \sigma\alpha\nu\tau\zeta\sigma\omicron\nu\) runs \( \nu\iota\alpha\) the study of one's own apparently accidental actions and omissions. [1901b, 1287]

Although the motivation of the parapraxes described in the preceding chapters is something of which from the very nature of the case conscious thought must lack knowledge, it would nevertheless be desirable to discover a psychological proof of the existence of that motivation; indeed, for reasons which a closer knowledge of the unconscious reveals, it is probable that such proofs are somewhere discoverable. There are in fact two spheres in which it is possible to demonstrate phenomena that appear to correspond to an unconscious, and therefore displaced, knowledge of that motivation. [1901b, 1325]
I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a self-accusation. I met her half-way by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.¹ I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step towards the confession. For on that day she wore at her waist - a thing she never did on any other occasion before or after - a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it - opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a 'symptomatic act'.² I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: 'Why should I not wear a reticule like this, as it is now the fashion to do?' But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though on the other hand the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

[1905e, 1413]

The other objection that may probably be raised would be that we apply to normal psychology conclusions which are drawn chiefly from the study of pathological conditions. We are enabled to answer it by another fact, the knowledge of which we owe to psycho-analysis. Certain deficiencies of function of most frequent occurrence among healthy people, e.g. lapsus linguae, errors in memory and speech, forgetting of names, etc., may easily be shown to depend on the action of strong unconscious ideas in the same way as neurotic symptoms. We shall meet with another still more convincing argument at a later stage of this discussion.

[1912g, 2580]

The analysis of this small symptomatic action tells you no thing you did not know before: the thesis that it was not a matter of chance but had a motive, a sense and an intention, that it had a place in an assignable mental context and that it provided information, by a small indication, of a more important mental process. But, more than anything else, it tells you that the process thus indicated was unknown to the consciousness of the person who carried out the action, since none of the patients who left the two doors open would have been able to admit- that by this omission he wanted to give evidence of his contempt. Some of them would probably have been aware of a sense of disappointment when they entered the empty waiting room; but the connection between this impression and the symptomatic action which followed certainly remained unknown to their consciousness.

[1916-1917, 3330]
Let us now bring together what this effort at a psycho-analysis, short and impeded as it was, has brought to light for an understanding of this case - assuming, of course, that our enquiries were correctly carried out, which I cannot here submit to your judgement. Firstly, the delusion has ceased to be absurd or unintelligible; it had a sense, it had good motives and it fitted into the context of an emotional experience of the patient's. Secondly, the delusion was necessary, as a reaction to an unconscious mental process which we have inferred from other indications, and it was precisely to this connection that it owed its delusional character and its resistance to every logical and realistic attack. It itself was something desired, a kind of consolation. Thirdly, the fact that the delusion turned out to be precisely a jealous one and not one of another kind was unambiguously determined by the experience that lay behind the illness. You recall of course that, the day before, she had told the scheming maid that the most dreadful thing that could happen to her would be her husband's unfaithfulness. Nor will you have overlooked the two important analogies between this case and the symptomatic action which we analysed - the explanation of its sense or intention and its relation to something unconscious that was involved in the situation.

[1916-1917, 3335]

But the study of pathogenic repressions and of other phenomena which have still to be mentioned compelled psycho-analysis to take the concept of the 'unconscious' seriously. Psycho-analysis regarded everything mental as being in the first instance unconscious; the further quality of 'consciousness' might also be present, or again it might be absent. This of course provoked a denial from the philosophers, for whom 'conscious' and 'mental' were identical, and who protested that they could not conceive of such an absurdity as the 'unconscious mental'. There was no help for it, however, and this idiosyncrasy of the philosophers could only be disregarded with a shrug. Experience (gained from pathological material, of which the philosophers were ignorant) of the frequency and power of impulses of which one knew nothing directly, and whose existence had to be inferred like some fact in the external world, left no alternative open. It could be pointed out, incidentally, that this was only treating one's own mental life as one had always treated other people's. One did not hesitate to ascribe mental processes to other people, although one had no immediate consciousness of them and could only infer them from their words and actions. But what held good for other people must be applicable to oneself. Anyone who tried to push the argument further and to conclude from it that one's own hidden processes belonged actually to a second consciousness would be faced with the concept of a consciousness of which one knew nothing, of an 'unconscious consciousness' - and this would scarcely be preferable to the assumption of an 'unconscious mental'. If on the other hand one declared, like some other philosophers, that one was prepared to take pathological phenomena into account, but that the processes underlying them ought not to be described as mental but as 'psychoid', the difference of opinion would degenerate into an unfruitful dispute about words, though even so expediency would decide in favour of keeping the expression 'unconscious mental'. The further question as to the ultimate nature of this unconscious is no more sensible or profitable than the older one as to the nature of the conscious.

[1925d, 4208]
There is no need to discuss what is to be called conscious: it is removed from all doubt. The oldest and best meaning of the word 'unconscious' is the descriptive one; we call a psychical process unconscious whose existence we are obliged to assume - for some such reason as that we infer it from its effects -, but of which we know nothing. In that case we have the same relation to it as we have to a psychical process in another person, except that it is in fact one of our own. If we want to be still more correct, we shall modify our assertion by saying that we call a process unconscious if we are obliged to assume that it is being activated at the moment, though at the moment we know nothing about it. This qualification makes us reflect that the majority of conscious processes are conscious only for a short time; very soon they become latent, but can easily become conscious again. We might also say that they had become unconscious, if it were at all certain that in the condition of latency they are still something psychical. So far we should have learnt nothing new; nor should we have acquired the right to introduce the concept of an unconscious into psychology. But then comes the new observation that we were already able to make in parapraxes. In order to explain a slip of the tongue, for instance, we find ourselves obliged to assume that the intention to make a particular remark was present in the subject. We infer it with certainty from the interference with his remark which has occurred; but the intention did not put itself through and was thus unconscious. If, when we subsequently put it before the speaker, he recognizes it as one familiar to him, then it was only temporarily unconscious to him; but if he repudiates it as something foreign to him, then it was permanently unconscious. From this experience we retrospectively obtain the right also to pronounce as something unconscious what had been described as latent. A consideration of these dynamic relations permits us now to distinguish two kinds of unconscious - one which is easily, under frequently occurring circumstances, transformed into something conscious, and another with which this transformation is difficult and takes place only subject to a considerable expenditure of effort or possibly never at all. In order to escape the ambiguity as to whether we mean the one or the other unconscious, whether we are using the word in the descriptive or in the dynamic sense, we make use of a permissible and simple way out. We call the unconscious which is only latent, and thus easily becomes conscious, the 'preconscious' and retain the term 'unconscious' for the other. We now have three terms, 'conscious', 'preconscious' and 'unconscious', with which we can get along in our description of mental phenomena. Once again: the preconscious is also unconscious in the purely descriptive sense, but we do not give it that name, except in talking loosely or when we have to make a defence of the existence in mental life of unconscious processes in general.
[1933a, 4679]
In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events. 

[1940b [1938], 5069]
This allows us, therefore, to make a radical distinction. We shall probably come to understand the case more deeply if we turn to those other components which do fulfil the two conditions that have just been mentioned. These other components were tendencies in Hans which had already been suppressed and which, so far as we can tell, had never been able to find uninhibited expression: hostile and jealous feelings towards his father, and sadistic impulses (premonitions, as it were, of copulation) towards his mother. These early suppressions may perhaps have gone to form the predisposition for his subsequent illness. These aggressive propensities of Hans's found no outlet, and as soon as there came a time of privation and of intensified sexual excitement, they tried to break their way out with reinforced strength. It was then that the battle which we call his 'phobia' burst out. During the course of it a part of the repressed ideas, in a distorted form and transposed on to another complex, forced their way into consciousness as the content of the phobia. But it was a decidedly paltry success. Victory lay with the forces of repression; and **they made use of the opportunity to extend their domain over components other than those that had rebelled.** This last circumstance, however, does not in the least alter the fact that the essence of Hans's illness was entirely dependent upon the nature of the instinctual components that had to be repulsed. The content of his phobia was such as to impose a very great measure of restriction upon his freedom of movement, and that was its purpose. It was therefore a powerful reaction against the obscure impulses to movement which were especially directed against his mother. For Hans horses had always typified pleasure in movement ('I'm a young horse', he had said as he jumped about); but since this pleasure in movement included the impulse to copulate, the neurosis imposed a restriction on it and exalted the horse into an emblem of terror. Thus it would seem as though all that the repressed instincts got from the neurosis was the honour of providing pretexts for the appearance of the anxiety in consciousness. But however clear may have been the victory in Hans's phobia of the forces that were opposed to sexuality, nevertheless, since such an illness is in its very nature a compromise, this cannot have been all that the repressed instincts obtained. After all, Hans's phobia of horses was an obstacle to his going into the street, and could serve as a means of allowing him to stay at home with his beloved mother. In this way, therefore, his affection for his mother triumphantly achieved its aim. In consequence of his phobia, the lover clung to the object of his love - though, to be sure, steps had been taken to make him innocuous. The true character of a neurotic disorder is exhibited in this twofold result. [1909b, 2117]
Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance, a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.

[1901b, 1293]

We would say that this note, like the account for Caterina's funeral and the bills of the pupils' expenses, is a case in which Leonardo was unsuccessful in suppressing his affect and in which something that had long been concealed forcibly obtained a distorted expression. Even the form is similar: there is the same pedantic exactness, and the same prominence given to numbers.²

[1910c, 2290]

In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.  
[1901b, 1347]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.  
[1913j, 2805]
Owing, once more, to the freedom with which the intensities can be transferred, 'intermediate ideas', resembling compromises, are constructed under the sway of condensation. (Cf. the numerous instances I have given of this.) This is again something unheard-of in normal chains of ideas, where the main stress is laid on the selection and retention of the 'right' ideational element. On the other hand, composite structures and compromises occur with remarkable frequency when we try to express preconscious thoughts in speech. They are then regarded as species of 'slips of the tongue.'

A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the 'dream-work' in my Interpretation of Dreams. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.

Let us recall all that we have heard about the nature and origin of the phantasies which are the precursors of delusions. They are substitutes for and derivatives of repressed memories which a resistance will not allow to enter consciousness unaltered, but which can purchase the possibility of becoming conscious by taking account, by means of changes and distortions, of the resistance's censorship. When this compromise has been accomplished, the memories have turned into the phantasies, which can easily be misunderstood by the conscious personality - that is, understood so as to fit in with the dominant psychical current. Now let us suppose that dream-images are what might be described as the creations of people's physiological delusions - the products of the compromise in the struggle between what is repressed and what is dominant which is probably present in every human being, including those who in the day-time are perfectly sound in mind. We shall then understand that dream-images have to be regarded as something distorted, behind which something else must be looked for, something not distorted, but in some sense objectionable, like Hanold's repressed memories behind his phantasies. We can give expression to the contrast which we have thus recognized, by distinguishing what the dreamer remembers when he wakes up as the manifest content of the dream from what constituted the basis of the dream before the distortion imposed by the censorship - namely, the latent dream-thoughts. Thus, interpreting a dream consists in translating the manifest content of the dream into the latent dream-thoughts, in undoing the distortion which the dream-thoughts have had to submit to from the censorship of the resistance. If we apply these notions to the dream we are concerned with, we shall find that its latent dream-thoughts can only have been: 'the girl you are looking for with the graceful gait is really living in this town with you.' But in that form the thought could not become conscious. It was obstructed by the fact that a phantasy had laid it down, as the result of an earlier compromise, that Gradiva was a Pompeian; consequently, if the real fact that she was living in the same place and at the same time was to be affirmed, there was no choice but to adopt the distortion: 'You are living at Pompeii at the time of Gradiva.' This then was the idea which was realized by the manifest content of the dream, and was represented as a present event actually being experienced.
We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, ‘combinatory paranoia’, in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life.

[1916-1917, 3173]

(7) On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one, and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one by the psychical stimulus, or let us say by the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.

[1916-1917, 3225]
LADIES AND GENTLEMEN, - We may take it as the outcome of our efforts so far and the basis of our further investigations that parapraxes have a sense. Let me insist once again that I am not asserting - and for our purposes there is no need to do so - that every single parapraxis that occurs has a sense, even though I regard that as probably the case. It is enough for us if we can point to such a sense relatively often in the different forms of parapraxis. Moreover, in this respect these different forms behave differently. Cases of slips of the tongue and of the pen, etc., may occur on a purely physiological basis. I cannot believe that this is so in the types depending on forgetting (forgetting names or intentions, mislaying, etc.). It is very probable that there are cases of losing which can be regarded as unintended. It is in general true that only a certain proportion of the errors that occur in ordinary life can be looked at from our point of view. You should bear these limitations in mind when henceforward we start from the assumption that parapraxes are psychical acts and arise from mutual interference between two intentions.

Let us pause a moment longer over the assertion that parapraxes are 'psychical acts'. Does this imply more than what we have said already - that they have a sense? I think not. I think, rather, that the former assertion is more indefinite and more easily misunderstood. Anything that is observable in mental life may occasionally be described as a mental phenomenon. The question will then be whether the particular mental phenomenon has arisen immediately from somatic, organic and material influences - in which case its investigation will not be part of psychology - or whether it is derived in the first instance from other mental processes, somewhere behind which the series of organic influences begins. It is this latter situation that we have in view when we describe a phenomenon as a mental process, and for that reason it is more expedient to clothe our assertion in the form: 'the phenomenon has a sense.' By 'sense' we understand 'meaning', 'intention,' 'purpose' and 'position in a continuous psychical context'.

[1916-1917, 3167]
We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, 'combinatory paranoia', in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life.

[1916-1917, 3173]
I have already been able again and again to produce evidence that creative writers think of parapraxes as having a meaning and a motive, just as I am arguing here. We shall not be surprised, therefore, to see from a fresh example how a writer invests a clumsy movement with significance, too, and makes it foreshadow later events.

[1901b, 1256]

Of all the writers who have from time to time passed comment on our minor symptomatic acts and parapraxes, or who have made use of them, none has understood their secret nature so clearly or exhibited them in so uncannily lifelike a manner as Strindberg - a man whose genius in recognizing such things was, it is true, assisted by grave mental abnormality. Dr. Karl Weiss of Vienna (1913) has drawn attention to the following passage in one of his works:

[1901b, 1288]

(E) When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 1194 ('Across Europe in a Tub') gave me the opportunity of showing how a symptom that is at first insoluble becomes accessible to analysis when the real interest in the repressed thoughts has passed away.¹ As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

[1901b, 1339]

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He his learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.

[1910c, 2290]
Nevertheless I hope I am not mistaken in saying that during this last enquiry we have all of us formed a fresh impression of these instances of slips of the tongue, and that it may be worth while to consider that impression further. We examined the conditions under which in general slips of the tongue occur, and afterwards the influences which determine the kind of distortion which the slip produces. But we have so far paid no attention whatever to the product of the slip considered by itself, without reference to its origin. If we decide to do so, we are bound in the end to find the courage to say that in a few examples what results from the slip of the tongue has a sense of its own. What do we mean by 'has a sense'? That the product of the slip of the tongue may perhaps itself have a right to be regarded as a completely valid psychical act, pursuing an aim of its own, as a statement with a content and significance. So far we have always spoken of 'parapraxes', but it seems now as though sometimes the faulty act was itself quite a normal act, which merely took the place of the other act which was the one expected or intended.

[1916-1917, 3145]

The fact of the parapraxis having a sense of its own seems in certain cases evident and unmistakable. When the President of the Lower House with his first words closed the sitting instead of opening it, we feel inclined, in view of our knowledge of the circumstances in which the slip of the tongue occurred, to recognize that the parapraxis had a sense. The President expected nothing good of the sitting and would have been glad if he could have brought it to an immediate end. We have no difficulty in pointing to the sense of this slip of the tongue, or, in other words, in interpreting it. Or, let us suppose that one lady says to another in tones of apparent admiration: 'That smart new hat - I suppose you aufgepatzt [a non-existent word instead of aufgeputzt (trimmed)] it yourself?' Then no amount of scientific propriety will succeed in preventing our seeing behind this slip of the tongue the words: 'This hat is a Patzerei [botched-up affair].' Or, once more, we are told that a lady who was well-known for her energy remarked on one occasion: 'My husband asked his doctor what diet he ought to follow; but the doctor told him he had no need to diet: he could eat and drink what I want.' Here again the slip of the tongue has an unmistakable other side to it: it was giving expression to a consistently planned programme.

[1916-1917, 3145]

LADIES AND GENTLEMEN, - We arrived last time at the idea of considering parapraxes not in relation to the intended function which they disturbed but on their own account; and we formed an impression that in particular cases they seemed to be betraying a sense of their own. We then reflected that if confirmation could be obtained on a wider scale that parapraxes have a sense, their sense would soon become more interesting than the investigation of the circumstances in which they come about.

[1916-1917, 3150]
The forgetting of intentions can in general be traced to an opposing current of thought, which is unwilling to carry out the intention. But this view is not only held by us psycho-analysts; it is the general opinion, accepted by everyone in their daily lives and only denied when it comes to theory. A patron who gives his protégé the excuse of having forgotten his request fails to justify himself. The protégé immediately thinks: 'It means nothing to him; it's true he promised, but he doesn't really want to do it.' For that reason forgetting is banned in certain circumstances of ordinary life; the distinction between the popular and the psycho-analytic view of these parapraxes seems to have disappeared. Imagine the lady of the house receiving her guest with the words: 'What? have you come to-day? I'd quite forgotten I invited you for to-day.' Or imagine a young man confessing to his fiancée that he had forgotten to keep their last rendez-vous. He will certainly not confess it; he will prefer to invent on the spur of the moment the most improbable obstacles which prevented his appearing at the time and afterwards made it impossible for him to let her know. We all know too that in military affairs the excuse of having forgotten something is of no help and is no protection against punishment, and we must all feel that that is justified. Here all at once everyone is united in thinking that a particular parapraxis has a sense and in knowing what that sense is. Why are they not consistent enough to extend this knowledge to the other parapraxes and to admit them fully? There is of course an answer to this question too.

Ladies and Gentlemen, I could multiply this collection of examples indefinitely; but I will not do so here. You will in any case find a profusion of case material for the study of parapraxes in my *Psychopathology of Everyday Life* (first published in 1901). All these examples lead to the same result: they make it probable that parapraxes have a sense, and they show you how that sense is discovered or confirmed by the attendant circumstances. I will be briefer to-day, because we have adopted the limited aim of using the study of these phenomena as a help towards a preparation for psycho-analysis. There are only two groups of observations into which I need enter more fully here: accumulated and combined parapraxes and the confirmation of our interpretations by subsequent events.

Accumulated and combined parapraxes are without doubt the finest flower of their kind. If we had only been concerned to prove that parapraxes have a sense we should have confined ourselves to them from the first, for in their case the sense is unmistakable even to the dull-witted and forces itself on the most critical judgement. An accumulation of these phenomena betrays an obstinacy that is scarcely ever a characteristic of chance events but fits in well with something intentional. Finally, the mutual interchangeability between different species of parapraxes demonstrates what it is in parapraxes that is important and characteristic: not their form or the method which they employ but the purpose which they serve and which can be achieved in the most various ways. For this reason I will give you an instance of repeated forgetting. Ernest Jones tells us that once, for reasons unknown to him, he left a letter lying on his desk for several days. At last he decided to send it off, but he had it returned to him by the Dead Letter Office since he had forgotten to address it. After he had addressed it he took it to the post, but this time it had no stamp. And then at last he was obliged to admit his reluctance to sending the letter off at all.
Maeder tells of a lady who, on the eve of her wedding had forgotten to try on her wedding-dress and, to her dressmaker's despair, only remembered it late in the evening. He connects this forgetfulness with the fact that she was soon divorced from her husband. I know a lady now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. - I know of other women who have lost their wedding-rings during the honeymoon, and I know too that the history of their marriages has given a sense to the accident. - And now here is one more glaring example, but with a happier ending. The story is told of a famous German chemist that his marriage did not take place, because he forgot the hour of his wedding and went to the laboratory instead of to the church. He was wise enough to be satisfied with a single attempt and died at a great age unmarried.

[Ladies and Gentlemen, - We may take it as the outcome of our efforts so far and the basis of our further investigations that parapraxes have a sense. Let me insist once again that I am not asserting - and for our purposes there is no need to do so - that every single parapraxis that occurs has a sense, even though I regard that as probably the case. It is enough for us if we can point to such a sense relatively often in the different forms of parapraxis. Moreover, in this respect these different forms behave differently. Cases of slips of the tongue and of the pen, etc., may occur on a purely physiological basis. I cannot believe that this is so in the types depending on forgetting (forgetting names or intentions, mislaying, etc.). It is very probable that there are cases of losing which can be regarded as unintended. It is in general true that only a certain proportion of the errors that occur in ordinary life can be looked at from our point of view. You should bear these limitations in mind when henceforward we start from the assumption that parapraxes are psychical acts and arise from mutual interference between two intentions.

Let us pause a moment longer over the assertion that parapraxes are 'psychical acts'. Does this imply more than what we have said already - that they have a sense? I think not. I think, rather, that the former assertion is more indefinite and more easily misunderstood. Anything that is observable in mental life may occasionally be described as a mental phenomenon. The question will then be whether the particular mental phenomenon has arisen immediately from somatic, organic and material influences - in which case its investigation will not be part of psychology - or whether it is derived in the first instance from other mental processes, somewhere behind which the series of organic influences begins. It is this latter situation that we have in view when we describe a phenomenon as a mental process, and for that reason it is more expedient to clothe our assertion in the form: 'the phenomenon has a sense.' By 'sense' we understand 'meaning', 'intention,' 'purpose' and 'position in a continuous psychical context'.
We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, 'combinatory paranoia', in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life.

[1916-1917, 3173]

Interpreting means finding a hidden sense in something; there can of course be no question of doing that if we adopt this last estimate of the function of dreams. Look at the description of dreams given by Wundt, Jodl, and other more recent philosophers. They content themselves with enumerating the respects in which dream-life differs from waking thought, always in a sense depreciatory to dreams - emphasizing the fact that associations are broken apart, that the critical faculty ceases to work, that all knowledge is eliminated, as well as other signs of diminished functioning. The only valuable contribution to the knowledge of dreams for which we have to thank exact science relates to the effect produced on the content of dreams by the impact of somatic stimuli during sleep. A recently deceased Norwegian author, J. Mourly Vold, published two stout volumes of experimental researches into dreams (German edition, 1910 and 1912), which are devoted almost exclusively to the consequences of alterations in the posture of the limbs. They have been recommended to us as models of exact research into dreams. Can you imagine what exact science would say if it learnt that we want to make an attempt to discover the sense of dreams? Perhaps it has already said it. But we will not let ourselves be frightened off. If it was possible for parapraxes to have a sense, dreams can have one too; and in a great many cases parapraxes have a sense, which has escaped exact science. So let us embrace the prejudice of the ancients and of the people and let us follow in the footsteps of the dream-interpreters of antiquity.

[1916-1917, 3189]
Thus neurotic symptoms have a sense, like parapraxes and dreams, and, like them, have a connection with the life of those who produce them. I should now like to make this important discovery plainer to you by a few examples. I can indeed only assert, I cannot prove, that it is always and in every instance so. Anyone who looks for experiences himself, will find convincing evidence. But for certain reasons I shall choose these examples from cases not of hysteria but of another, highly remarkable neurosis which is fundamentally very much akin to it and about which I have a few introductory remarks to make.

[1916-1917, 3338]

I have shown you, then, on the basis of two chosen examples, that neurotic symptoms have a sense, like parapraxes and dreams, and that they have an intimate connection with the patient's experiences. Can I expect you to believe this extremely important thesis on the evidence of two examples? No. But can you require me to go on giving you further examples till you declare yourselves convinced? No, once more. For, in view of the detailed fashion in which I deal with each single case, I should have to devote a five-hour course of lectures to settling this one point in the theory of the neuroses. So I must be content with having given you a trial proof of my assertion and, for the rest, I refer you to the reports given in the literature of the subject - to the classical interpretations of symptoms in Breuer's first case (of hysteria), to the striking light thrown upon the most obscure symptoms of what is known as dementia praecox by C. G. Jung, at a time when he was merely a psycho-analyst and had not yet aspired to be a prophet, and all the other papers that have since than filled our periodicals. There has been no lack of investigations precisely on these lines. The analysis, interpretation and translation of neurotic symptoms proved so attractive to psycho-analysts that for a time they neglected the other problems of neurosis.

[1916-1917, 3348]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
If we are right in regarding our painter's bond with the Devil as a neurotic phantasy, there is no need for any further apology for considering it psycho-analytically. Even small indications have a meaning and importance, and quite specially when they are related to the conditions under which a neurosis originates. To be sure, it is as possible to overvalue as to undervalue them, and it is a matter of judgement how far one should go in exploiting them. But anyone who does not believe in psycho-analysis - or, for the matter of that, even in the Devil - must be left to make what he can of the painter's case, whether he is able to furnish an explanation of his own or whether he sees nothing in it that needs explaining.

[1923d, 4008]

After hypnosis was replaced by the technique of free association, Breuer's cathartic procedure turned into psycho-analysis, which for more than a decade was developed by the author (Freud) alone. During that time psycho-analysis gradually acquired a theory which appeared to give a satisfactory account of the origin, meaning and purpose of neurotic symptoms and provided a rational basis for medical attempts at curing the complaint. I will once again enumerate the factors that go to make up this theory. They are: emphasis on instinctual life (affectivity), on mental dynamics, on the fact that even the apparently most obscure and arbitrary mental phenomena invariably have a meaning and a causation, the theory of psychical conflict and of the pathogenic nature of repression, the view that symptoms are substitutive satisfactions, the recognition of the aetiological importance of sexual life, and in particular of the beginnings of infantile sexuality. From a philosophical standpoint this theory was bound to adopt the view that the mental does not coincide with the conscious, that mental processes are in themselves unconscious and are only made conscious by the functioning of special organs (agencies or systems). By way of completing this list, I will add that among the affective attitudes of childhood the complicated emotional relation of children to their parents - what is known as the Oedipus complex - came into prominence. It became ever clearer that this was the nucleus of every case of neurosis, and in the patient's behaviour towards his analyst certain phenomena of his emotional transference emerged which came to be of great importance for theory and technique alike.

[1924f, 4107]

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

[1924f, 4109]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
If one of the parties involved in a serious argument makes a slip of the tongue which reverses the meaning of what he intended to say, it immediately puts him at a disadvantage with his opponent, who seldom fails to make the most of his improved position.

[1901b, 1183]

This makes it clear that people give slips of the tongue and other parapraxes the same interpretation that I advocate in this book, even if they do not endorse theoretically the view I put forward, and even if they are disinclined, so far as it applies to themselves, to renounce the convenience that goes along with tolerating parapraxes. The amusement and derision which such oral slips are certain to evoke at the crucial moment can be taken as evidence against what purports to be the generally accepted convention that a mistake in speaking is a lapsus linguae and of no psychological significance. It was no less a person than the German Imperial Chancellor Prince Bülow who protested on these lines in an effort to save the situation, when the wording of his speech in defence of his Emperor (in November, 1907) was given the opposite meaning by a slip of the tongue. 'As for the present, the new epoch of the Emperor Wilhelm II, I can only repeat what I said a year ago, namely that it would be unfair and unjust to speak of a coterie of responsible advisors round our Emperor . . . ' (loud cries of 'irresponsible') ' . . . irresponsible advisors. Forgive the lapsus linguae.' (Laughter.)

[1901b, 1183]

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He has learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.

[1910c, 2290]

If we are right in regarding our painter's bond with the Devil as a neurotic phantasy, there is no need for any further apology for considering it psycho-analytically. Even small indications have a meaning and importance, and quite specially when they are related to the conditions under which a neurosis originates. To be sure, it is as possible to overvalue as to undervalue them, and it is a matter of judgement how far one should go in exploiting them. But anyone who does not believe in psycho-analysis - or, for the matter of that, even in the Devil - must be left to make what he can of the painter's case, whether he is able to furnish an explanation of his own or whether he sees nothing in it that needs explaining.

[1923d, 4008]
I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a self-accusation. I met her half-way by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.¹ I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step towards the confession. For on that day she wore at her waist - a thing she never did on any other occasion before or after - a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it - opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a 'symptomatic act'.² I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: ‘Why should I not wear a reticule like this, as it is now the fashion to do?’ But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though on the other hand the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

¹[1905e, 1413]

²[1916-1917, 3335]

Let us now bring together what this effort at a psycho-analysis, short and impeded as it was, has brought to light for an understanding of this case - assuming, of course, that our enquiries were correctly carried out, which I cannot here submit to your judgement. Firstly, the delusion has ceased to be absurd or unintelligible: it had a sense, it had good motives and it fitted into the context of an emotional experience of the patient's. Secondly, the delusion was necessary, as a reaction to an unconscious mental process which we have inferred from other indications, and it was precisely to this connection that it owed its delusional character and its resistance to every logical and realistic attack. It itself was something desired, a kind of consolation. Thirdly, the fact that the delusion turned out to be precisely a jealous one and not one of another kind was unambiguously determined by the experience that lay behind the illness. You recall of course that, the day before, she had told the scheming maid that the most dreadful thing that could happen to her would be her husband's unfaithfulness. Nor will you have overlooked the two important analogies between this case and the symptomatic action which we analysed - the explanation of its sense or intention and its relation to something unconscious that was involved in the situation.

²[1916-1917, 3335]
In connection with the tendentious nature of our remembering and forgetting, I not long ago experienced an instructive example - instructive because of what it betrayed - of which I should like to add an account here. I was intending to pay a twenty-four-hour visit to a friend of mine who unfortunately lives very far away, and I was full of the things I was going to tell him. But before this I felt under an obligation to call on a family of my acquaintance in Vienna, one of whose members had moved to the town in question, so as to take their greetings and messages with me to the absent relative. They told me the name of the pension in which he lived, and also the name of the street and the number of the house, and, in view of my bad memory, wrote the address on a card, which I put in my wallet. The next day, when I had arrived at my friend's, I began: 'I've only one duty to carry out that may interfere with our being together; it's a call, and it shall be the first thing I do. The address is in my wallet.' To my astonishment, however, it was not to be found there. So now I had to fall back on my memory, after all. My memory for names is not particularly good, but it is incomparably better than for figures and numbers. I may have been paying medical visits at a certain house for a year on end, and yet, if I should have to be driven there by a cab driver, I should have difficulty in remembering the number of the house. But in this case I had taken special note of the house number; it was ultra-clear, as if to jeer at me - for no trace remained in my recollection of the name of the pension or the street. I had forgotten all the data in the address which might have served as a starting-point for discovering the pension; and, quite against my usual habit, I had retained the number of the house, which was useless for the purpose. In consequence, I was unable to make the call. I was consoled remarkably quickly, and I devoted myself entirely to my friend. When I was back again in Vienna and standing in front of my writing desk, I knew without a moment's hesitation where it was that, in my 'absent-mindedness', I had put the card with the address on it. In my unconscious hiding of the thing the same intention had been operative as in my curiously modified act of forgetting.

(d) It is no longer possible for me to take the forgetting of the name Signorelli as a chance event. I am forced to recognize the influence of a motive in the process. It was a motive which caused me to interrupt myself while recounting what was in my mind (concerning the customs of the Turks, etc.), and it was a motive which further influenced me so that I debarred the thoughts connected with them, the thoughts which had led to the news at Trafoi, from becoming conscious in my mind. I wanted, therefore, to forget something; I had repressed something. What I wanted to forget was not, it is true, the name of the artist at Orvieto but something else - something, however, which contrived to place itself in an associative connection with his name, so that my act of will missed its target and I forgot the one thing against my will, while I wanted to forget the other thing intentionally. The disinclination to remember was aimed against one content; the inability to remember emerged in another. It would obviously be a simpler case if disinclination and inability to remember related to the same content. Moreover the substitute names no longer strike me as so entirely unjustified as they did before the matter was elucidated: by a sort of compromise they remind me just as much of what I wanted to forget as of what I wanted to remember; and they show me that my intention to forget something was neither a complete success nor a complete failure.

[1898b, 484]

[1901b, 1104]
Perhaps it is not superfluous to remark that the conditions which psychologists assume to be necessary for reproducing and for forgetting, and which they look for in certain relations and dispositions, are not inconsistent with the above explanation. All we have done is, in certain cases, to add a motive to the factors that have been recognized all along as being able to bring about the forgetting of a name; and, in addition, we have elucidated the mechanism of false recollection (paramnesia). These dispositions are indispensable to our case as well, in order to make it possible for the repressed element to get hold of the missing name by association and draw it with itself into repression. In the case of another name with more favourable conditions for reproduction this perhaps would not happen. It is probable indeed that a suppressed element always strives to assert itself elsewhere, but is successful in this only when suitable conditions meet it half way. At other times the suppression succeeds without any functional disturbance, or, as we can justly say, without any symptom.

[1901b, 1105]

The following example of the forgetting of a set of words which I owe to my friend Sándor Ferenczi of Budapest, differs from the preceding ones in that it concerns a phrase coined by the subject himself and not a sentence taken from a writer. It may also present us with the somewhat unusual case in which the forgetting ranges itself on the side of our good sense, when the latter threatens to succumb to a momentary desire. The parapraxis thus comes to serve a useful function. When we have sobered down once more we appreciate the rightness of this internal current, which had previously only been able to express itself in a failure to function - a forgetting, a psychical impotence.

[1901b, 1116]

I hope that readers will not overlook the difference in value between these interpretations, of which no proof is possible, and the examples that I have myself collected and explained by means of an analysis. But if I still secretly cling to my expectation that even apparently simple slips of the tongue could be traced to interference by a half-suppressed idea that lies outside the intended context, I am tempted to do so by an observation of Meringer's which is highly deserving of attention. This author says that it is a curious fact that no one is ready to admit having made a slip of the tongue. There are some very sensible and honest people who are offended if they are told they have made one. I would not venture to put it so generally as does Meringer in saying 'no one'. But the trace of affect which follows the revelation of the slip, and which is clearly in the nature of shame, has a definite significance. It may be compared to the annoyance we feel when we cannot recall a forgotten name, and to our surprise at the tenacity of an apparently indifferent memory; and it invariably indicates that some motive has contributed to the occurrence of the interference.

[1901b, 1174]

(1) On a sheet of paper containing short daily notes mainly of a business kind I was surprised to find, among some entries correctly dated 'September', the wrongly written date 'Thursday, October 20'. It is not difficult to explain this anticipation - and to explain it as the expression of a wish. A few days before, I had returned fresh from my holiday travels, and I felt ready for plenty of professional work; but there were not yet many patients. On my arrival I had found a letter from a patient to say she was coming on October 20. When I made an entry for the same day of the month in September I may well have thought: 'X. should have been here already; what a waste of a whole month!', and with that thought in mind I brought the date forward a month. In this case the disturbing thought can scarcely be called an objectionable one; and for this reason I knew the solution of the slip of the pen as soon as I had noticed it. - In the autumn of the following year I made another slip of the pen which was precisely analogous and had a similar motive. - Ernest Jones has made a study of slips like these in writing dates; in most cases they could be clearly recognized as having reasons.

[1901b, 1202]
As with the functional disturbances described on earlier pages, I have made a collection of the cases of omitting to do something as a result of forgetting which I have observed in myself, and I have endeavoured to explain them. I have invariably found that they could be traced to interference by unknown and unavowed motives - or, as one may say, to a counter-will. In a number of these cases I found myself in a position which was similar to being under conditions of service; I was under a constraint, against which I had not entirely given up struggling, so that I made a demonstration against it by forgetting. This accounts for the fact that I am especially prone to forget to send congratulations on occasions such as birthdays, anniversaries, wedding celebrations and promotions. I keep on making new resolutions on the subject and become more and more convinced that I shall not succeed. I am now on the point of giving the effort up and of yielding consciously to the motives that oppose it. While I was in a transitional stage, a friend asked me to send a congratulatory telegram on a certain day on his behalf along with my own, but I warned him that I should forget both; and it was not surprising that the prophecy came true. It is due to painful experiences in the course of my life that I am unable to manifest sympathy on occasions where the expression of sympathy must necessarily be exaggerated, as an expression corresponding to the slight amount of my feeling would not be allowable. Since I have come to recognize that I have often mistaken other people's ostensible sympathy for their real feelings, I have been in revolt against these conventional expressions of sympathy, though on the other hand I recognize their social usefulness. Condolences in the case of death are excepted from this divided treatment: once I have decided to send them I do not fail to do so. Where my emotional activity no longer has anything to do with social duty, its expression is never inhibited by forgetting.

[1901b, 1235]

I have already been able again and again to produce evidence that creative writers think of parapraxes as having a meaning and a motive, just as I am arguing here. We shall not be surprised, therefore, to see from a fresh example how a writer invests a clumsy movement with significance, too, and makes it foreshadow later events.

[1901b, 1256]

As regards self-injuries of my own, there is little that I can report in uneventful times; but in extraordinary circumstances I find that I am not incapable of them. When a member of my family complains to me of having bitten his tongue, pinched a finger, or the like, he does not get the sympathy he hopes for, but instead the question: 'Why did you do that?' I myself once gave my thumb a most painful pinch when a youthful patient told me during the hour of treatment of his intention (not of course to be taken seriously) of marrying my eldest daughter. I knew that at the time she was lying critically ill in a sanatorium.

[1901b, 1260]

I do not mean to assert that cases of combined parapraxes like these can teach us anything new that could not already be observed in the simple cases. And yet this situation, of there being a change in the form taken by the parapraxis while the outcome remains the same, gives a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be struck by the fact that a conscious intention should in these examples fail so completely to prevent the success of the parapraxis. My friend failed in spite of everything to attend the meeting of the society, and the lady found it impossible to part from the medal. The unknown factor that opposed these intentions found another outlet after the first path had been barred to it. For what was required to overcome the unconscious motive was something other than a conscious counter-intention; it called for a piece of psychical work, which could make what was unknown known to consciousness.

[1901b, 1310]
Although the motivation of the parapraxes described in the preceding chapters is something of which from the very nature of the case conscious thought must lack knowledge, it would nevertheless be desirable to discover a psychological proof of the existence of that motivation; indeed, for reasons which a closer knowledge of the unconscious reveals, it is probable that such proofs are somewhere discoverable. There are in fact two spheres in which it is possible to demonstrate phenomena that appear to correspond to an unconscious, and therefore displaced, knowledge of that motivation.

Another indication that we possess unconscious and displaced knowledge of the motivation in chance actions and parapraxes is to be found in the phenomenon of superstition. I will make my meaning clear by a discussion of the small experience that started me on these reflections.

The case would have been quite different if I had made the journey on foot, and while 'deep in thought', or through 'absent-mindedness' had come to the house in the parallel street instead of the right one. This I should not explain as an accident but as an action that had an unconscious aim and required interpretation. My interpretation of 'going astray' like thus would probably have had to be that I did not expect to see the old lady for much longer.

I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. Because the superstitious person knows nothing of the motivation of his own chance actions, and because the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, is nothing but psychology projected into the external world. The obscure recognition (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a supernatural reality, which is destined to be changed back once more by science into the psychology of the unconscious. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform metaphysics into metapsychology. The gap between the paranoic's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranoids, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected Weltanschauung that superstition seems so very much out of place; in the Weltanschauung of pre-scientific times and peoples it was justified and consistent.
(F) Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline. (1) What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

¹ As I have already explained, the treatment of the case, and consequently my insight into the complex of events composing it, remained fragmentary. There are therefore many questions to which I have no solution to offer, or in which I can only rely upon hints and conjectures. This affair of the letter came up in the course of one of our sessions, and the girl showed signs of astonishment. 'How on earth', he asked, 'did they find the letter? It was shut up in my desk.' But since she knew that her parents had read this draft of a farewell letter, I conclude that she had herself arranged for it to fall into their hands.

After Gradiva's disappearance, there was only a distant sound, like the laughing call of a bird flying over the ruined city. The young man, now by himself, picked up a white object that had been left behind by Gradiva: not a sheet of papyrus, but a sketch-book with pencil drawings of various scenes in Pompeii. We should be inclined to regard her having forgotten the book there as a pledge of her return, for it is our belief that no one forgets anything without some secret reason or hidden motive.
Nevertheless, on closer consideration this delusion of Hanold's seems to me to lose the greater part of its improbability. The author, indeed, has made himself responsible for one part of it by basing his story on the premiss that Zoe was in every detail a duplicate of the relief. We must therefore avoid shifting the improbability of this premiss on to its consequence - that Hanold took the girl for Gradiva come to life. Greater value is given to the delusional explanation by the fact that the author has put no rational one at our disposal. Moreover the author has adduced contributory and mitigating circumstances on behalf of his hero's excesses in the shape of the glare of the campagna sunlight and the intoxicating magic of the wine grown on the slopes of Vesuvius. But the most important of all the explanatory and exculpatory factors remains the ease with which our intellect is prepared to accept something absurd provided it satisfies powerful emotional impulses. It is an astonishing fact, and one that is too generally overlooked, how readily and frequently under these psychological conditions people of even the most powerful intelligence react as though they were feeble-minded; and anyone who is not too conceited may see this happening in himself as often as he pleases. And this is far more so if some of the mental processes concerned are linked with unconscious or repressed motives. In this connection I am happy to quote the words of a philosopher, who writes to me: 'I have been noting down the instances I myself experience of striking mistakes and unthinking actions, for which one finds motives afterwards (in a most unreasonable way). It is an alarming thing, but typical, to find how much folly this brings to light.' It must be remembered, too, that the belief in spirits and ghosts and the return of the dead, which finds so much support in the religions to which we have all been attached, at least in our childhood, is far from having disappeared among educated people, and that many who are sensible in other respects find it possible to combine spiritualism with reason. A man who has grown rational and sceptical, even, may be ashamed to discover how easily he may for a moment return to a belief in spirits under the combined impact of strong emotion and perplexity. I know of a doctor who had once lost one of his women patients suffering from Graves' disease, and who could not get rid of a faint suspicion that he might perhaps have contributed to the unhappy outcome by a thoughtless prescription. One day, several years later, a girl entered his consulting-room, who, in spite of all his efforts, he could not help recognizing as the dead one. He could frame only a single thought: 'So after all it's true that the dead can come back to life.' His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves' disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold's temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities.

[1907a, 1865]
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

[1906c, 1889]
¹ [Footnote added 1924:] In a very large number of cases like these of injury or death in accidents the explanation remains a matter of doubt. The outsider will find no occasion to see in the accident anything other than a chance occurrence, while someone who is closely connected with the victim and is familiar with intimate details has reason to suspect the unconscious intention behind the chance occurrence. The following account by a young man whose fiancée was run over in the street gives a good example of the kind of intimate knowledge that I mean and of the type of accessory details in question:
[1901b, 1265]

(F) Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline. His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves' disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold's temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities.

[1907a, 1865]
The second point I have in mind is this. If in a large majority of instances we find confirmation of the fact that the forgetting of an intention goes back to a counter-will, we grow bold enough to extend the solution to another set of instances in which the person under analysis does not confirm but denies the counter-will we have inferred. Take as examples of this such extremely common events as forgetting to return books one has been lent or to pay bills or debts. We shall venture to insist to the person concerned that an intention exists in him to keep the books and not to pay the debts, while he will deny this intention but will not be able to produce any other explanation of his behaviour. Thenceupon we shall go on to say that he has this intention but knows nothing about it, but that it is enough for us that it reveals its presence by producing the forgetting in him. He may repeat to us that he has in fact forgotten. You will now recognize the situation as one in which we found ourselves once before. If we want to pursue our interpretations of parapraxes, which have so frequently proved justified, to a consistent conclusion, we are forced to the inescapable hypothesis that there are purposes in people which can become operative without their knowing about them. But this brings us into opposition to all the views that dominate both ordinary life and psychology.
[1916-1917, 3179]
In a very large number of cases like these of injury or death in accidents the explanation remains a matter of doubt. The outsider will find no occasion to see in the accident anything other than a chance occurrence, while someone who is closely connected with the victim and is familiar with intimate details has reason to suspect the unconscious intention behind the chance occurrence. The following account by a young man whose fiancée was run over in the street gives a good example of the kind of intimate knowledge that I mean and of the type of accessory details in question:

[1901b, 1265]

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

[1913j, 2804]

Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

[1913j, 2805]

Let us once more reach an agreement upon what is to be understood by the 'sense' of a psychical process. We mean nothing other by it than the intention it serves and its position in a psychical continuity. In most of our researches we can replace 'sense' by 'intention' or 'purpose'. Was it, then, merely a deceptive illusion or a poetic exaltation of parapraxes when we thought we recognized an intention in them?

[1916-1917, 3150]
We will continue to take slips of the tongue as our examples. If we now look through a considerable number of observations of that kind, we shall find whole categories of cases in which the intention, the sense, of the slip is plainly visible. Above all there are those in which what was intended is replaced by its contrary. The President of the Lower House said in his opening speech: ‘I declare the sitting closed.’ That is quite unambiguous. The sense and intention of his slip was that he wanted to close the sitting. ‘Er sagt es ja selbst¹ we are tempted to quote: we need only take him at his word. Do not interrupt me at this point by objecting that that is impossible, that we know that he did not want to close the sitting but to open it, and that he himself, whom we have just recognized as the supreme court of appeal, could confirm the fact that he wanted to open it. You are forgetting that we have come to an agreement that we will begin by regarding parapraxes on their own account; their relation to the intention which they have disturbed is not to be discussed till later. Otherwise you will be guilty of a logical error by simply evading the problem that is under discussion - by what is called in English ‘begging the question’.

[1916-1917, 3150]

What is it you want to ask me? Do I think that this explanation applies to all parapraxes or only to a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychical nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psycho-analysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

[1916-1917, 3154]

Accumulated and combined parapraxes are without doubt the finest flower of their kind. If we had only been concerned to prove that parapraxes have a sense we should have confined ourselves to them from the first, for in their case the sense is unmistakable even to the dull-witted and forces itself on the most critical judgement. An accumulation of these phenomena betrays an obstinacy that is scarcely ever a characteristic of chance events but fits in well with something intentional. Finally, the mutual interchangeability between different species of parapraxes demonstrates what it is in parapraxes that is important and characteristic: not their form or the method which they employ but the purpose which they serve and which can be achieved in the most various ways. For this reason I will give you an instance of repeated forgetting. Ernest Jones tells us that once, for reasons unknown to him, he left a letter lying on his desk for several days. At last he decided to send it off, but he had it returned to him by the Dead Letter Office¹ since he had forgotten to address it. After he had addressed it he took it to the post, but this time it had no stamp. And then at last he was obliged to admit his reluctance to sending the letter off at all.

[1916-1917, 3164]
Let us pause a moment longer over the assertion that parapraxes are 'psychical acts'. Does this imply more than what we have said already - that they have a sense? I think not. I think, rather, that the former assertion is more indefinite and more easily misunderstood. Anything that is observable in mental life may occasionally be described as a mental phenomenon. The question will then be whether the particular mental phenomenon has arisen immediately from somatic, organic and material influences - in which case its investigation will not be part of psychology - or whether it is derived in the first instance from other mental processes, somewhere behind which the series of organic influences begins. It is this latter situation that we have in view when we describe a phenomenon as a mental process, and for that reason it is more expedient to clothe our assertion in the form: 'the phenomenon has a sense.' By 'sense' we understand 'meaning', 'intention,' 'purpose' and 'position in a continuous psychical context'.

We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, 'combinatory paranoia', in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life.

[1916-1917, 3167]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed ‘thoughtlessly’, and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject’s suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one’s own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]

In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of The Psychopathology of Everyday Life. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest. [1925d, 4222]
Thus I am by no means the first to surmise that there is sense and purpose behind the minor functional disturbances in the daily life of healthy people.¹

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

What is it you want to ask me? Do I think that this explanation applies to all parapraxes or only to a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychical nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psycho-analysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

Let us pause a moment longer over the assertion that parapraxes are 'psychical acts'. Does this imply more than what we have said already - that they have a sense? I think not. I think, rather, that the former assertion is more indefinite and more easily misunderstood. Anything that is observable in mental life may occasionally be described as a mental phenomenon. The question will then be whether the particular mental phenomenon has arisen immediately from somatic, organic and material influences - in which case its investigation will not be part of psychology - or whether it is derived in the first instance from other mental processes, somewhere behind which the series of organic influences begins. It is this latter situation that we have in view when we describe a phenomenon as a mental process, and for that reason it is more expedient to clothe our assertion in the form: 'the phenomenon has a sense.' By 'sense' we understand 'meaning,' 'intention,' 'purpose' and 'position in a continuous psychical context'.

¹ [1901b, 1242]

[1913, 2804]

[1916-1917, 3154]

[1916-1917, 3167]
I now propose that we should introduce a change into our nomenclature which will give us more freedom of movement. Instead of speaking of 'concealed', 'inaccessible', or 'ungenuine', let us adopt the correct description and say 'inaccessible to the dreamer's consciousness' or 'unconscious'. I mean nothing else by this than what may be suggested to you when you think of a word that has escaped you or the disturbing purpose in a parapraxis - that is to say, I mean nothing else than 'unconscious at the moment'. In contrast to this, we can of course speak of the dream-elements themselves, and the substitutive ideas that have been newly arrived at from them by association, as 'conscious'. This nomenclature so far involves no theoretical construction. No objection can be made to using the word 'unconscious' as an apt and easily understandable description. [1916-1917, 3209]
Cyclamens, I reflected, were my wife's favourite flowers and I reproached myself for so rarely remembering to bring her flowers, which was what she liked. - The subject of 'bringing flowers' recalled an anecdote which I had recently repeated to a circle of friends and which I had used as evidence in favour of my theory that forgetting is very often determined by an unconscious purpose and that it always enables one to deduce the secret intentions of the person who forgets. A young woman was accustomed to receiving a bouquet of flowers from her husband on her birthday. One year this token of his affection failed to appear, and she burst into tears. Her husband came in and had no idea why she was crying till she told him that to-day was her birthday. He clasped his hand to his head and exclaimed: 'I'm so sorry, but I'd quite forgotten. I'll go out at once and fetch your flowers.' But she was not to be consoled; for she recognized that her husband's forgetfulness was a proof that she no longer had the same place in his thoughts as she had formerly. - This lady, Frau L., had met my wife two days before I had the dream, had told her that she was feeling quite well and enquired after me. Some years ago she had come to me for treatment.

In other, far more significant, cases it is self-criticism, internal opposition to one's own utterance, that obliges one to make a slip of the tongue and even to substitute the opposite of what one had intended. One then observes in astonishment how the wording of an assertion cancels out its own intention, and how the slip has exposed an inner insincerity.¹ The slip of the tongue here becomes a mode of mimetic expression - often, indeed, for the expression of something one did not wish to say: it becomes a mode of self-betrayal. This was the case, for instance, when a man who did not care for what is called normal sexual intercourse in his relations with women broke into a conversation about a girl who was said to be a flirt, with the words: 'If she had to do with me, she'd soon give up her koëttieren.' There is no doubt that it can only have been another word, namely 'koitieren', whose influence was responsible for making this change in the word that was intended, ' kokettieren' [to flirt, coquette]. - Or take the following case: 'We have an uncle who for months past had been very much offended because we never visited him. We took his move to a new house as an occasion for paying him a long overdue visit. He seemed very glad to see us, and as we were leaving he said with much feeling: "I hope from now on I shall see you still more seldom than in the past."'

When the linguistic material happens to be favourable, it often causes slips of the tongue to occur which have the positively shattering result of a revelation, or which produce the full comic effect of a joke. - This is the case in the following example observed and reported by Dr. Reitler:

We have seen from the example of 'vorschwein' that a slip of the tongue can easily occur if an effort has been made to suppress insulting words. In this way one gives vent to one's feelings:

The next example shows how a slip of the tongue resulted in a serious self-betrayal. Certain details in it justify its repetition in full from the account given by Brill in the Zentralblatt für Psychoanalyse, Volume II.¹

The self-betrayal is equally unmistakable in the following case, reported by Otto Rank:
Here is a slip of the tongue which was interpreted as a self-betrayal by the other party to the conversation. It is reported by Stärcke, who adds a pertinent comment, though it goes beyond the task of interpreting the slip.
[1901b, 1180]

In the following example, too, reported by Reik (1915), the slip of the tongue amounts to a self-betrayal:
[1901b, 1180]

Equally self-revealing is the following, which Rank (1913) describes as a 'witty slip of the tongue'.
[1901b, 1181]

A good example of this kind of self-betrayal, which did not lead to serious consequences, is reported by Tausk (1917) under the title of 'The Faith of our Fathers'. 'As my fiancée was a Christian', Herr A. related, 'and was unwilling to adopt the Jewish faith, I myself was obliged to be converted from Judaism to Christianity so that we could marry. I did not change my religion without some internal resistance, but I felt it was justified by the purpose behind it, the more so because it involved abandoning no more than an outward adherence to Judaism, not a religious conviction (which I had never had). Notwithstanding this, I always continued later on to acknowledge the fact of my being a Jew, and few of my acquaintances know I am baptized. I have two sons by this marriage, who were given Christian baptism. When the boys were sufficiently old they were told of their Jewish background, so as to prevent them from being influenced by anti-semitic views at their school and from turning against their father for such a superfluous reason. Some years ago I and my children, who were then at their primary school, were staying with the family of a teacher at the summer resort in D. One day while we were sitting at tea with our otherwise friendly hosts, the lady of the house, who had no inkling of her summer guests' Jewish ancestry, launched some very sharp attacks on the Jews. I ought to have made a bold declaration of the facts in order to set my sons the example of "having the courage of one's convictions", but I was afraid of the unpleasant exchanges that usually follow an avowal of this sort. Besides, I was alarmed at the possibility of having to leave the good lodgings we had found and of thus spoiling my own and my children's in any case limited holiday period, should our hosts' behaviour towards us take an unfriendly turn because of the fact that we were Jews. As however I had reason to expect that my sons, in their candid and ingenuous way, would betray the momentous truth if they heard any more of the conversation, I tried to get them to leave the company by sending them into the garden. I said: "Go into the garden, Juden", quickly correcting it to "Jungen". In this way I enabled the "courage of my convictions" to be expressed in a parapraxis. The others did not in fact draw any conclusions from my slip of the tongue, since they attached no significance to it; but I was obliged to learn the lesson that the "faith of our fathers" cannot be disavowed with impunity if one is a son and has sons of one's own.'
[1901b, 1182]

A good example of a slip of the tongue whose purpose is not so much to betray the speaker as to give the listener in the theatre his bearings, is to be found in Wallenstein (Piccolomini, Act I, Scene 5); and it shows us that the dramatist, who here availed himself of this device, was familiar with the mechanism and meaning of slips of the tongue. In the preceding scene Max Piccolomini has ardently espoused the Duke's cause, and has been passionately describing the blessings of peace, of which he has become aware on the course of a journey while escorting Wallenstein's daughter to the camp. As he leaves the stage, his father and Questenberg, the emissary from the court, are plunged in consternation. Scene 5 continues:
[1901b, 1185]
¹ [Footnote added 1920:] Other instances of slips of the tongue which the writer intends to be taken as having a meaning and usually as being self-revealing can be found in Shakespeare's Richard II (Act II, Scene 2), and in Schiller's Don Carlos (Act. II, Scene 8; a slip made by Princess Eboli). There would doubtless be no difficulty in extending this list.

[1901b, 1187]

The symptomatic acts that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything - and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers - made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by pointing to the egg-shell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so very much easier, and without more ado took as the basis of our discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could he reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.

[1901b, 1277]

It must be said that it is precisely such symptomatic acts that often offer the best approach to an understanding of people's intimate mental life.

[1901b, 1286]

I do not believe that an event in whose occurrence my mental life plays no part can teach me any hidden thing about the future shape of reality; but I believe that an unintentional manifestation of my own mental activity does on the other hand disclose something hidden, though again it is something that belongs only to my mental life. I believe in external (real) chance, it is true, but not in internal (psychical) accidental events. With the superstitious person it is the other way round. He knows nothing of the motivation of his chance actions and parapraxes, and believes in psychical accidental events; and, on the other hand, he has a tendency to ascribe to external chance happenings a meaning which will become manifest in real events, and to regard such chance happenings as a means of expressing something that is hidden from him in the external world. The differences between myself and the superstitious person are two: first, he projects outwards a motivation which I look for within; secondly, he interprets chance as due to an event, while I trace it back to a thought. But what is hidden from him corresponds to what is unconscious for me, and the compulsion not to let chance count as chance but to interpret it is common to both of us.¹

[1901b, 1327]
In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the Schadchen into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

¹ This is the same mechanism that governs slips of the tongue and other phenomena of self-betrayal. See The Psychopathology of Everyday Life (1901b).

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He his learnt long ago that such cases of forgetting or repetition are significant, and that it is the ‘distraction’ which allows impulses that are otherwise hidden to be revealed.

Psycho-analysis finds as a rule no credence among laymen for assertions such as these. They reject them as calumnies which are confuted by conscious experience, and they adroitly overlook the faint indications by which even the unconscious is apt to betray itself to consciousness. It is therefore relevant to point out that many thinkers who could not have been influenced by psycho-analysis have quite definitely accused our unspoken thoughts of being ready, heedless of the prohibition against murder, to get rid of anything which stands in our way. From many examples of this I will choose one that has become famous:
Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one’s possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on. [1913], 2805]
If the last examples of Meringer and Mayer show that the disturbance of speech can arise on the one hand from the influence of anticipatory or perseverating sounds and words of the same sentence which are intended to be spoken, and on the other hand from the effect of words outside the intended sentence whose excitation would not otherwise have been revealed, the first thing we shall want to know is whether the two classes of slips of the tongue can be sharply divided, and how an example of one class can be distinguished from a case of the other. At this point in the discussion one must however bear in mind the views expressed by Wundt, who deals with the phenomena of slips of the tongue in the course of his comprehensive discussion of the laws of the development of speech. [1901b, 1151]

Among the slips of the tongue that I have collected myself I can find hardly one in which I should be obliged to trace the disturbance of speech simply and solely to what Wundt calls the 'contact effect of sounds'. I almost invariably discover a disturbing influence in addition which comes from something outside the intended utterance; and the disturbing element is either a single thought that has remained unconscious, which manifests itself in the slip of the tongue and which can often be brought to consciousness only by means of searching analysis, or it is a more general psychical motive force which is directed against the entire utterance. [1901b, 1152]

In this case the ambiguity of the word 'Beförderung' forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it. [1901b, 1194]

Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting-point for a fruitful investigation. Everyone knows how frequently the reader finds that in reading aloud his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly. I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are accustomed to assume will be performed most exactly when done automatically - that is, with scarcely any conscious attention. From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a disturbance of attention by an alien thought which claims consideration. [1901b, 1216]
As with the functional disturbances described on earlier pages, I have made a collection of the cases of omitting to do something as a result of forgetting which I have observed in myself, and I have endeavoured to explain them. I have invariably found that they could be traced to interference by unknown and unavowed motives - or, as one may say, to a counter-will. In a number of these cases I found myself in a position which was similar to being under conditions of service; I was under a constraint, against which I had not entirely given up struggling, so that I made a demonstration against it by forgetting. This accounts for the fact that I am especially prone to forget to send congratulations on occasions such as birthdays, anniversaries, wedding celebrations and promotions. I keep on making new resolutions on the subject and become more and more convinced that I shall not succeed. I am now on the point of giving the effort up and of yielding consciously to the motives that oppose it. While I was in a transitional stage, a friend asked me to send a congratulatory telegram on a certain day on his behalf along with my own, but I warned him that I should forget both; and it was not surprising that the prophecy came true. It is due to painful experiences in the course of my life that I am unable to manifest sympathy on occasions where the expression of sympathy must necessarily be exaggerated, as an expression corresponding to the slight amount of my feeling would not be allowable. Since I have come to recognize that I have often mistaken other people's ostensible sympathy for their real feelings, I have been in revolt against these conventional expressions of sympathy, though on the other hand I recognize their social usefulness. Condolences in the case of death are excepted from this divided treatment: once I have decided to send them I do not fail to do so. Where my emotional activity no longer has anything to do with social duty, its expression is never inhibited by forgetting.

Of all parapraxes errors seem to have the least rigid mechanism. That is to say, the occurrence of an error is a quite general indication that the mental activity in question has had to struggle with a disturbing influence of some sort or other; but the particular form that the error takes is not determined by the quality of the concealed disturbing idea. We may add here retrospectively that the same thing can be assumed to be true of many simple cases of slips of the tongue and pen. Every time we make a slip in talking or writing we may infer that there has been a disturbance due to mental processes lying outside our intention; but it must be admitted that slips of the tongue and of the pen often obey the laws of resemblance, of indolence or of the tendency to haste, without the disturbing element succeeding in imposing any part of its own character on the resulting mistake in speech or writing. It is the compliance of the linguistic material which alone makes the determining of the mistakes possible, and at the same time sets the limits up to which the determining can go.

(6) A young lady was to pay a visit in the Habsburgergasse to a friend, a lady who had recently been married. She spoke about it while the family were at table, but said in error that she had to go to the Babenbergergasse. Some of those at the table laughingly drew her attention to her error - or slip of the tongue (according to choice) - which she had not noticed. In fact two days before this the republic had been proclaimed in Vienna; the black and yellow had vanished and been replaced by the colours of the old Ostmark - red, white and red - and the Hapsburgs had been deposed. Our speaker introduced the change of dynasty into her friend's address. In Vienna there is indeed a very well known Babenbergerstrasse, but no Viennese would speak of it as a 'Gasse'.

Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that some disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

I will begin by bringing together some material for answering the last question. In discussing the examples of slips of the tongue we found it necessary to go beyond the content of what was intended to be said, and were obliged to look for the cause of the speech-disturbance in something outside the intention. What this was was obvious in a number of cases, and was known to the speaker's consciousness. In the examples that seemed simplest and most transparent it was another version of the same thought - one which sounded as if it had an equal right, and which disturbed the expression of the thought without its being possible to explain why the one version had succumbed and the other had won the day. (These are Meringer and Mayer's 'contaminations'.) In a second group of cases the motive for the defeat of one version was a consideration which, however, did not prove strong enough to withhold it completely ('zum Vorschwein gekommen'). The version which was withheld was perfectly conscious too. Only of the third group can it be asserted unreservedly that the disturbing thought differed from the one intended, and only in their case can a distinction which is apparently essential be established. The disturbing thought is either connected with the disturbed thought by thought associations (disturbance as a result of internal contradiction), or it is unrelated to it in its nature and the disturbed word happens to be connected with the disturbing thought - which is often unconscious - by an unexpected external association. In the examples I have given from my psycho-analyses the entire speech is under the influence of thoughts which have become active but have at the same time remained entirely unconscious; either these are betrayed by the disturbance itself ('Klapperschlange' - 'Kleopatra') or they exercise an indirect influence by making it possible for the different parts of the consciously intended speech to disturb each other ('Ase natmen', where 'Hasenauer Street' and reminiscences of a Frenchwoman are in the background). The withheld or unconscious thoughts from which the disturbance in speech derives are of the most varied origin. This survey therefore does not enable us to generalize in any direction.
A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the ‘Apfe’). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

[1901b, 1342]

In misreading and slips of the pen there are also plenty of examples in which we can discern a more remote and complicated motivation. 'Across Europe in a Tub' is a disturbance in reading which is explained as being due to the influence of a remote thought, foreign in its essence, arising from a repressed impulse of jealousy and ambition, and utilizing the 'switch-word' 'Beförderung' to form a connection with the indifferent and innocent topic that was being read. In the case of 'Burckhard' the name itself forms a 'switch-word' of this kind.

[1901b, 1342]

In the forgetting of intentions another factor comes into the foreground. The conflict, which could only be surmised in the repression of what was distressing to remember, here becomes tangible, and in the analysis of the examples a counter-will can regularly be recognized which opposes the intention without putting an end to it. As in the parapraxes already described, two types of psychical process can be recognized here. Either the counter-will is turned directly against the intention (in cases where the latter's purpose is of some importance), or it is unrelated in its nature to the intention itself and establishes its connection with it by means of an external association (in the case of intentions that are almost indifferent).

[1901b, 1344]

The same conflict governs the phenomena of bungled actions. The impulsion which manifests itself in disturbing the action is often a counter-impulsion, but still more often it is an entirely unrelated one, which merely takes the opportunity of achieving expression by disturbing the action while it is being carried out. The cases where the disturbance results from an internal contradiction are the more significant ones; they also involve the more important actions.

[1901b, 1344]

(G) A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the 'dream-work' in my Interpretation of Dreams. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruitities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.

[1901b, 1346]
But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.

[1901b, 1347]

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He has learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.

[1910c, 2290]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.

[1913j, 2805]

What is it you want to ask me? Do I think that this explanation applies to all parapraxes or only to a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychical nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psycho-analysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

[1916-1917, 3154]

In the instances already familiar to you which give an impression of being contractions or abbreviations, what we have before us are corrections, additions or continuations, by means of which a second purpose makes itself felt alongside of the first. 'Facts came to Vorschein [light] - better to say it straight out - they were Schweineereien [disgusting]; well then, facts came to Vorschwein.' 'Those who understand this can be counted on the fingers of one hand - no, there's really only one person who understands it, so: can be counted on one finger.' Or: 'My husband can eat and drink what he wants. But, as you know, I don't put up with his wanting anything at all, so: he can eat and drink what I want.' In all these cases, then, the slip of the tongue arises from the content of the disturbed intention itself or is connected with it.

[1916-1917, 3169]
On my view, I can bring what happens in the third group into complete harmony with the mechanism I have described. I have only to assume that what distinguishes these three groups from one another is the differing extent to which the intention is forced back. In the first group the intention is there and makes itself noticed before the speaker's remark; only then is it rejected; and it takes its revenge in the slip of the tongue. In the second group the rejection goes further: the intention has already ceased to be noticeable before the remark is made. Strangely enough, this does not in the least prevent it from playing its part in causing the slip. But this behaviour makes it easier for us to explain what happens in the third group. I shall venture to assume that a purpose can also find expression in a parapraxis when it has been forced back and not noticed for a considerable time, for a very long time perhaps, and can for that reason be denied straight out by the speaker. But even if you leave the problem of the third group on one side, you are bound to conclude from the observations we have made in the other cases that the suppression of the speaker's intention to say something is the indispensable condition for the occurrence of a slip of the tongue.

I now propose that we should introduce a change into our nomenclature which will give us more freedom of movement. Instead of speaking of 'concealed', 'inaccessible', or 'ungenuine', let us adopt the correct description and say 'inaccessible to the dreamer's consciousness' or 'unconscious'. I mean nothing else by this than what may be suggested to you when you think of a word that has escaped you or the disturbing purpose in a parapraxis - that is to say, I mean nothing else than 'unconscious at the moment'. In contrast to this, we can of course speak of the dream-elements themselves, and the substitutive ideas that have been newly arrived at from them by association, as 'conscious'. This nomenclature so far involves no theoretical construction. No objection can be made to using the word 'unconscious' as an apt and easily understandable description.

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book The Psychopathology of Everyday Life (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.
The comic of sexuality and obscenity would deserve more detailed consideration; but we can only touch upon it here with a few comments. The starting-point would once more be exposure. A chance exposure has a comic effect on us because we compare the ease with which we have enjoyed the sight with the great expenditure which would otherwise be required for reaching this end. Thus the case approaches that of the naively comic, but is simpler. Every exposure of which we are made the spectator (or audience in the case of smut) by a third person is equivalent to the exposed person being made comic. We have seen that it is the task of jokes to take the place of smut and so once more to open access to a lost source of comic pleasure. As opposed to this, witnessing an exposure is not a case of the comic for the witness, because his own effort in doing so does away with the determining condition of comic pleasure: nothing is left but the sexual pleasure in what is seen. If the witness gives an account to someone else, the person who has been witnessed becomes comic once more, because there is a predominant sense that the latter has omitted the expenditure which would have been in place for concealing his secret. Apart from this, the spheres of sexuality and obscenity offer the amplest occasions for obtaining comic pleasure alongside pleasurable sexual excitement; for they can show human beings in their dependence on bodily needs (degradation) or they can reveal the physical demands lying behind the claim of mental love (unmasking).

[1905c, 1797]

There are two points upon which I should principally like to insist. When all is said and done, the erotic quips and comic anecdotes that you have collected and published in *Anthropophyteia* have only been produced and repeated because they gave pleasure both to their narrators and their hearers. It is not difficult to guess which components of the sexual instinct (compounded as it is from so many elements) find satisfaction in this manner. These tales give us direct information as to which of the component instincts of sexuality are retained in a given group of people as particularly efficient in producing pleasure; and in this way they give the neatest confirmation of the findings reached by the psycho-analytic examination of neurotics. Allow me to indicate the most important example of this kind. Psycho-analysis has led us to assert that the anal region - normally and not only in perverse individuals - is the site of an erotogenic sensitivity, and that in certain ways it behaves exactly like a genital organ. Doctors and psychologists, when told of there being an anal erotism and an anal character derived from it, have been highly indignant. At this point *Anthropophyteia* comes to the help of psycho-analysis by showing how universally people dwell with pleasure upon this part of the body, its performances and indeed the product of its function. If this were not so, all these anecdotes would be bound to give rise to disgust in their hearers or else the whole mass of the population would have to be 'perverse' in the sense in which the word is used in works dealing with 'psychopathia sexualis' in a moralizing tone. It would not be hard to give other instances of how the material collected by the authors of *Anthropophyteia* has been of value for the researches of sexual psychology. Its value may even be increased, perhaps, by the circumstance (not in itself an advantage) that the collectors know nothing of the theoretical findings of psycho-analysis and have brought together the material without any guiding principles.

[1910f, 2382]
Another advantage of a wider character is presented in particular by erotic jokes, in the strict sense, just as it is by jokes in general. I have shown in my study of jokes that the revelation of what is normally the repressed unconscious element in the mind can, under certain provisions, become a source of pleasure and thus a technique for the construction of jokes. In psycho-analysis to-day we describe a congeries of ideas and its associated affect as a 'complex'; and we are prepared to assert that many of the most admired jokes are 'complexive jokes' and that they owe their exhilarating and cheerful effect to the ingenious uncovering of what are as a rule repressed complexes. It would carry me too far afield if I were to bring forward instances here in proof of this thesis, but I can assert that the outcome of such an examination of the evidence is that the jokes, both erotic and of other sorts, which are in popular circulation provide an excellent auxiliary means of investigating the unconscious human mind - in the same way as do dreams, myths and legends, with the exploitation of which psycho-analysis is already actively

Psycho-analysis has taught us that in the very earliest period of childhood faeces is a highly prized substance, in relation to which coprophilic instincts find satisfaction. With the repression of these instincts, which is accelerated as much as possible by up-bringing, this substance falls into contempt and then serves conscious purposes as a means of expressing disdain and scorn. Certain forms of mental activity such as joking are still able to make the obstructed source of pleasure accessible for a brief moment, and thus show how much of the esteem in which human beings once held their faeces still remains preserved in the unconscious. The most important residue of this former esteem is, however, that all the interest which the child has had in faeces is transferred in the adult on to another material which he learns in life to set above almost everything else - gold.¹ How old this connection between excrement and gold is can be seen from an observation by Jeremias:² gold, according to ancient oriental mythology, is the excrement of hell.³

LADIES AND GENTLEMEN, - We may take it as the outcome of our efforts so far and the basis of our further investigations that parapraxes have a sense. Let me insist once again that I am not asserting - and for our purposes there is no need to do so - that every single parapraxis that occurs has a sense, even though I regard that as probably the case. It is enough for us if we can point to such a sense relatively often in the different forms of parapraxis. Moreover, in this respect these different forms behave differently. Cases of slips of the tongue and of the pen, etc., may occur on a purely physiological basis. I cannot believe that this is so in the types depending on forgetting (forgetting names or intentions, mislaying, etc.). It is very probable that there are cases of losing which can be regarded as unintended. It is in general true that only a certain proportion of the errors that occur in ordinary life can be looked at from our point of view. You should bear these limitations in mind when henceforward we start from the assumption that parapraxes are psychical acts and arise from mutual interference between two intentions.

This is the first product of psycho-analysis. Psychology has hitherto known nothing of the occurrence of such mutual interferences or of the possibility that they might result in such phenomena. We have made a quite considerable extension to the world of psychical phenomena and have won for psychology phenomena which were not reckoned earlier as belonging to it.
The most interesting questions which we have raised about parapraxes and not yet answered are perhaps these. We have said that parapraxes are the product of mutual interference between two different intentions, of which one may be called the disturbed intention and the other the disturbing one. The disturbed intentions give no occasion for further questions, but concerning the latter we should like to know, first, what sort of intentions emerge as a disturbance to others, and secondly what is the relation of the disturbing intentions to the disturbed ones?
[1916-1917, 3168]

The other sort of relation between the two mutually interfering intentions seems puzzling. If the disturbing intention has nothing to do with the disturbed one, where can it have come from and why is it that it makes itself noticeable as a disturbance at this particular point? The observation which can alone give us the answer to this shows that the disturbance arises from a train of thought which has occupied the person concerned a short time before and, whether it has already been expressed in speech or not, produces this subsequent effect. It must in fact, therefore, be described as a perseveration, though not necessarily as the perseveration of spoken words. In this case too an associative link between the disturbing and the disturbed intentions is present; but it does not lie in their content but is artificially constructed, often along extremely forced associative paths.
[1916-1917, 3170]

We can now turn, however, to the main question, which we have long postponed, of what sort of intentions these are, which find expression in this unusual fashion as disturbers of other intentions. Well, they are obviously of very different sorts, among which we must look for the common factor. If we examine a number of examples with this in view, they will soon fall into three groups. The first group contains those cases in which the disturbing purpose is known to the speaker and moreover had been noticed by him before he made the slip of the tongue. Thus, in the 'Vorschwein' slip the speaker admitted not only that he had formed the judgement 'Schweinereien' about the events in question, but also that he had had the intention, from which he afterwards drew back, of expressing his judgement in words. A second group is made up of other cases in which the disturbing purpose is equally recognized as his by the speaker, but in which he was unaware that it was active in him just before he made the slip. Thus, he accepts our interpretation of his slip, but nevertheless remains to some extent surprised at it. Instances of this kind of attitude can perhaps be found in other sorts of parapraxes more easily than in slips of the tongue. In a third group the interpretation of the disturbing intention is vigorously rejected by the speaker; he not only denies that it was active in him before he made the slip, but seeks to maintain that it is entirely foreign to him. You will recall the example of the 'hiccough' and the positively rude denial which I brought on myself from the speaker by uncovering his disturbing intention. As you know, we have not yet come to any agreement in our views on these cases. I should pay no attention to the denial put forward by the proposer of the toast and should persist in my interpretation unruffled, while you, I suppose, are still affected by his protest and raise the question of whether we ought not to give up interpreting parapraxes of this kind and regard them as purely physiological acts in the pre-analytic sense. I can well imagine what it is that deters you. My interpretation carries with it the hypothesis that intentions can find expression in a speaker of which he himself knows nothing but which I am able to infer from circumstantial evidence. You are brought up short in the face of such a novel and momentous hypothesis. I can understand that, and I see your point so far as that goes. But one thing is certain. If you want to apply consistently the view of parapraxes which has been confirmed by so many examples, you will have to make up your mind to accept the strange hypothesis I have mentioned. If you cannot do that, you will have once more to abandon the understanding of parapraxes which you have only just achieved.
[1916-1917, 3171]
We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, 'combinatory paranoia', in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life.

[1916-1917, 3173]
We have already treated *slips of the tongue* in great detail, but there are a few more points to be added. Slips of the tongue are accompanied by certain minor emotional phenomena which are not quite without interest. No one likes making slips of the tongue, and we often fail to hear our own slips, though never other people's. Slips of the tongue are also in a certain sense contagious; it is not at all easy to talk about slips of the tongue without making slips of the tongue oneself. The most trivial forms of such slips, precisely those which have no special light to throw on hidden mental processes, have reasons which are nevertheless not hard to penetrate. For instance, if someone has pronounced a long vowel short on account of a disturbance affecting the word for some reason or other, he will soon afterwards pronounce a subsequent short vowel long, thus making a fresh slip of the tongue to compensate for the earlier one. In the same way, if he pronounces a diphthong incorrectly and carelessly (for instance pronouncing an ‘*eu*’ or ‘*oi*’ as ‘*ei*’) he will try to make up for it by changing a subsequent ‘*ei*’ into an ‘*eu*’ or ‘*oi*’. The decisive factor here seems to be consideration of the impression made on the audience, who are not to suppose that it is a matter of indifference to the speaker how he treats his mother-tongue. The second, compensating distortion actually has the purpose of directing the hearer's attention to the first one and of assuring him that the speaker has noticed it too. The commonest, simplest and most trivial slips of the tongue are contractions and anticipations which occur in insignificant parts of speech. For instance, in a longish sentence one may make a slip of the tongue which anticipates the last word of what one intends to say. This gives an impression of impatience to be finished with the sentence, and is evidence in general of a certain antipathy against communicating the sentence or against the whole of one's remarks. We thus arrive at marginal cases in which the distinctions between the psycho-analytic view of slips of the tongue and the ordinary physiological one melt into one another. It is to be assumed that a purpose of disturbing the intention of the speech is present in these cases but that it can only announce its presence and not what it itself has in view. The disturbance it produces then proceeds in accordance with certain phonetic influences or associative attractions and can be regarded as a distraction of the attention from the intention of the speech. But neither this disturbance of the attention nor the inclinations to associate which have become operative touch on the essence of the process. This remains, in spite of everything, the indication of the existence of an intention which is disturbing to the intention of the speech, though the *nature* of this disturbing intention cannot be guessed from its consequences, as is possible in all the better defined cases of slips of the tongue.

[1916-1917, 3174]
With *misreading* we come to a psychical situation which differs sensibly from that in slips of the tongue or pen. Here one of the two mutually competing purposes is replaced by a sensory stimulation and is perhaps on that account less resistant. What one is going to read is not a derivative of one’s own mental life like something one proposes to write. In a great majority of cases, therefore, a misreading consists in a complete substitution. One replaces the word that is to be read by another, without there necessarily being any connection of content between the text and the product of the misreading, which depends as a rule on verbal similarity. The best member of this group is Lichtenberg's 'Agamemnon' for 'angenommen'. If we want to discover the disturbing purpose which produced the misreading we must leave the text that has been misread entirely aside and we may begin the analytic investigation with the two questions: what is the first association to the product of the misreading? and in what situation did the misreading occur? Occasionally a knowledge of the latter is alone enough to explain the misreading. For instance, a man under the pressure of an imperious need was wandering about in a strange town when he saw the word 'Closet-House' on a large notice board on the first storey of a building. He had just enough time to feel surprised at the notice-board being placed so high up before discovering that, strictly speaking, what he should have read was 'Corset-House'. In other cases a misreading precisely of the kind which is quite independent of the content of the text may call for a detailed analysis which cannot be carried through without practice in the technique of psycho-analysis and without reliance on it. As a rule, however, it is not so hard to find the explanation of a misreading: the word substituted immediately betrays, as in the Agamemnon example, the circle of ideas from which the disturbance has arisen. In this time of war, for instance, it is a very usual thing for the names of towns and generals and the military terms that are constantly buzzing around us to be read wherever a similar word meets our eyes. Whatever interests and concerns us puts itself in the place of what is strange and still uninteresting. After-images of thoughts trouble new perceptions.

[1916-1917, 3176]

In the more frequent cases of misreading which we mentioned first, we miss two factors to which we have assigned an important role in the mechanism of parapraxes: a conflict between two purposes and a forcing-back of one of them which takes its revenge by producing a parapraxis. Not that anything contrary to this occurs in misreading. But the prominence of the thought that leads to the misreading is far more noticeable than the forcing-back which it may have experienced previously.

[1916-1917, 3177]

(7) On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one, and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one by the psychical stimulus, or let us say by the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.

[1916-1917, 3225]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]
Cyclamens, I reflected, were my wife's favourite flowers and I reproached myself for so rarely remembering to bring her flowers, which was what she liked. - The subject of 'bringing flowers' recalled an anecdote which I had recently repeated to a circle of friends and which I had used as evidence in favour of my theory that forgetting is very often determined by an unconscious purpose and that it always enables one to deduce the secret intentions of the person who forgets. A young woman was accustomed to receiving a bouquet of flowers from her husband on her birthday. One year this token of his affection failed to appear, and she burst into tears. Her husband came in and had no idea why she was crying till she told him that to-day was her birthday. He clasped his hand to his head and exclaimed: 'I'm so sorry, but I'd quite forgotten. I'll go out at once and fetch your flowers.' But she was not to be consoled; for she recognized that her husband's forgetfulness was a proof that she no longer had the same place in his thoughts as she had formerly. - This lady, Frau L., had met my wife two days before I had the dream, had told her that she was feeling quite well and enquired after me. Some years ago she had come to me for treatment.
[1900a, 657]

'I must leave it to your own judgement to decide whether you can explain all these connections by the assumption that they are matters of chance. I can however tell you that every case like this that you care to analyse will lead you to "matters of chance" that are just as striking.'¹
[1901b, 1109]

Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work¹ in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.
[1906c, 1889]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]
By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

[1913j, 2804]

The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

[1913j, 2807]
Thus in the very first products of Hanold's delusional phantasies and actions we already find a double set of determinants, a derivation from two different sources. One of these is the one that was manifest to Hanold himself, the other is the one which is revealed to us when we examine his mental processes. One of them, looked at from Hanold's point of view, was conscious to him, the other was completely unconscious to him. One of them was derived wholly from the circle of ideas of the science of archaeology, the other arose from the repressed childhood memories that had become active in him and from the emotional instincts attached to them. One might be described as lying on the surface and covering the other, which was, as it were, concealed behind it. The scientific motivation might be said to serve as a pretext for the unconscious erotic one, and science had put itself completely at the service of the delusion. It should not be forgotten, however, that the unconscious determinants could not effect anything that did not simultaneously satisfy the conscious, scientific ones. The symptoms of a delusion - phantasies and actions alike - are in fact the products of compromise between the two mental currents, and in a compromise account is taken of the demands of each of the two parties to it; but each side must also renounce a part of what it wanted to achieve. Where a compromise comes about it must have been preceded by a struggle - in this case it was the conflict we have assumed between suppressed erotism and the forces that were keeping it in repression. In the formation of a delusion this struggle is in fact unending. Assault and resistance are renewed after the construction of each compromise, which is never, so to speak, entirely satisfying. Our author too is aware of this, and that is why he makes a peculiar unrest dominate this stage of his hero's disorder, as a precursor and guarantee of further developments. [1907a, 1850]
This allows us, therefore, to make a radical distinction. We shall probably come to understand the case more deeply if we turn to those other components which do fulfil the two conditions that have just been mentioned. These other components were tendencies in Hans which had already been suppressed and which, so far as we can tell, had never been able to find uninhibited expression: hostile and jealous feelings towards his father, and sadistic impulses (premonitions, as it were, of copulation) towards his mother. These early suppressions may perhaps have gone to form the predisposition for his subsequent illness. These aggressive propensities of Hans's found no outlet, and as soon as there came a time of privation and of intensified sexual excitement, they tried to break their way out with reinforced strength. It was then that the battle which we call his 'phobia' burst out. During the course of it a part of the repressed ideas, in a distorted form and transposed on to another complex, forced their way into consciousness as the content of the phobia. But it was a decidedly paltry success. Victory lay with the forces of repression; and they made use of the opportunity to extend their domain over components other than those that had rebelled. This last circumstance, however, does not in the least alter the fact that the essence of Hans's illness was entirely dependent upon the nature of the instinctual components that had to be repulsed. The content of his phobia was such as to impose a very great measure of restriction upon his freedom of movement, and that was its purpose. It was therefore a powerful reaction against the obscure impulses to movement which were especially directed against his mother. For Hans horses had always typified pleasure in movement ('I'm a young horse', he had said as he jumped about); but since this pleasure in movement included the impulse to copulate, the neurosis imposed a restriction on it and exalted the horse into an emblem of terror. Thus it would seem as though all that the repressed instincts got from the neurosis was the honour of providing pretexts for the appearance of the anxiety in consciousness. But however clear may have been the victory in Hans's phobia of the forces that were opposed to sexuality, nevertheless, since such an illness is in its very nature a compromise, this cannot have been all that the repressed instincts obtained. After all, Hans's phobia of horses was an obstacle to his going into the street, and could serve as a means of allowing him to stay at home with his beloved mother. In this way, therefore, his affection for his mother triumphantly achieved its aim. In consequence of his phobia, the lover clung to the object of his love - though, to be sure, steps had been taken to make him innocuous. The true character of a neurotic disorder is exhibited in this twofold result.
[1909b, 2117]
Among the slips of the tongue that I have collected myself I can find hardly one in which I should be obliged to trace the disturbance of speech simply and solely to what Wundt calls the 'contact effect of sounds'. I almost invariably discover a disturbing influence in addition which comes from something outside the intended utterance; and the disturbing element is either a single thought that has remained unconscious, which manifests itself in the slip of the tongue and which can often be brought to consciousness only by means of searching analysis, or it is a more general psychical motive force which is directed against the entire utterance.

[1901b, 1152]

On some other occasion I will publish a collection of these symptomatic acts as they are to be observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's reticule, which came apart at the top in the usual way, was nothing but a representation of the genitals, and her playing with it, her opening it and putting her finger in it, was an entirely unembarrassed yet unmistakable pantomimic announcement of what she would like to do with them - namely, to masturbate. A very entertaining episode of a similar kind occurred to me a short time ago. In the middle of a session the patient - a lady who was no longer young - brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made some efforts to open it, and then handed it to me so that I might convince myself how hard it was to open. I expressed my suspicion that the box must mean something special, for this was the very first time I had seen it, although its owner had been coming to me for more than a year. To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I go.' She did not calm down until I had pointed out to her with a laugh how well her words were adapted to quite another meaning. The box - Dose, πύξις - like the reticule and the jewel-case, was once again only a substitute for the shell of Venus, for the female genitals.

[1905e, 1414]

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He has learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.

[1910c, 2290]

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

[1913j, 2804]
The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psycho-analysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is the interpretation of dreams, which brought psycho-analysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning or significance, and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psycho-analysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream. There is no half-way house between these two views of dreams. What argues against the physiological hypothesis is its unfruitfulness, and what may be argued in favour of the psycho-analytic one is the fact that it has translated and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

The fact of the parapraxis having a sense of its own seems in certain cases evident and unmistakable. When the President of the Lower House with his first words closed the sitting instead of opening it, we feel inclined, in view of our knowledge of the circumstances in which the slip of the tongue occurred, to recognize that the parapraxis had a sense. The President expected nothing good of the sitting and would have been glad if he could have brought it to an immediate end. We have no difficulty in pointing to the sense of this slip of the tongue, or, in other words, in interpreting it. Or, let us suppose that one lady says to another in tones of apparent admiration: 'That smart new hat - I suppose you aufgepatzt [a non-existent word instead of aufgeputzt (trimmed)] it yourself?' Then no amount of scientific propriety will succeed in preventing our seeing behind this slip of the tongue the words: 'This hat is a Patzerei [botched-up affair].' Or, once more, we are told that a lady who was well-known for her energy remarked on one occasion: 'My husband asked his doctor what diet he ought to follow; but the doctor told him he had no need to diet: he could eat and drink what I want.' Here again the slip of the tongue has an unmistakable other side to it: it was giving expression to a consistently planned programme.

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]

In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting-point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements - namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic - acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at - formes frustres¹ - of the neuroses: cases in which the symptoms are few, or occur rarely or not severely - in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way - that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life - this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.

[1901b, 1347]
One further group of taboo observances, which have not hitherto been accounted for, deserve mention, since they admit of an explanation which is familiar to psycho-analysts. Among many savage peoples there is a prohibition against keeping sharp weapons or cutting instruments in a house. Frazer (1911b, 238) quotes a German superstition to the effect that a knife should not be left edge upwards, for fear that God and the angels might be injured on it. May we not recognize in this taboo a premonitory warning against possible 'symptomatic acts' in the execution of which a sharp weapon might be employed by unconscious evil impulses? [1912-1913, 2740]
Owing, once more, to the freedom with which the intensities can be transferred, 'intermediate ideas', resembling compromises, are constructed under the sway of condensation. (Cf. the numerous instances I have given of this.) This is again something unheard-of in normal chains of ideas, where the main stress is laid on the selection and retention of the 'right' ideational element. On the other hand, composite structures and compromises occur with remarkable frequency when we try to express preconscious thoughts in speech. They are then regarded as species of 'slips of the tongue.'

The ordinary material which we use for talking in our native language appears to be protected against being forgotten; but it succumbs all the more frequently to another disturbance, which is known as a 'slip of the tongue'. The slips of the tongue that we observe in normal people give an impression of being the preliminary stages of the so-called 'paraphasias' that appear under pathological conditions. This is a subject on which I find myself in the exceptional position of being able to acknowledge the value of a previous work. In 1895 Meringer and C. Mayer published a study on 'Slips in Speaking and Reading'. Their lines of approach differ widely from my own. One of the authors, who acts as spokesman in the text, is in fact a philologist, and it was his linguistic interests which led him to attempt to discover the rules that govern the making of slips of the tongue. He hoped to be able to conclude from these rules that there exists 'a certain mental mechanism, in which the sounds of a word, or of a sentence, and the words as well, are mutually linked and connected in a quite peculiar way' (10).¹

The examples of slips of the tongue collected by the authors are first grouped by them in purely descriptive categories. They are classed as transpositions (e. g. 'the Milo of Venus' instead of 'the Venus of Milo'); pre-sonances or anticipations (e. g. 'es war mir auf der Schwest . . . auf der Brust so schwer'); post-sonances or perseverations (e. g. 'Ich fordere Sie auf; auf das Wohl unseres Chefs aufzustossen' instead of 'anzustossen');² contaminations (e. g. 'er setzt sich auf den Hinterkopf', combined from 'er setzt sich einen Kopf auf' and 'er stellt sich auf die Hinterbeine');³ and substitutions (e. g. 'ich gebe die Präparate in den Briefkasten' instead of 'Brütkasten').⁴ There are in addition to these main categories a few others which are less important (or less significant from our own point of view). In the above arrangement into groups it makes no difference whether the transposition, distortion, amalgamation, etc., is concerned with single sounds in a word, with syllables, or with complete words forming part of the intended sentence.

To explain the various kinds of slips of the tongue he had observed, Meringer postulates that different spoken sounds have a different psychical valency. When we innervate the first sound in a word or the first word in a sentence, the excitatory process already extends to the later sounds and the following words, and in so far as these innervations are simultaneous with one another they can exercise a modifying influence on one another. The excitation of the sound that is psychically more intense anticipates other excitations or perseverates after them, and in this way disturbs the less valent process of innervation. The question has therefore to be decided which sounds in a word have the highest valency. Here is Meringer's view: 'If we want to know which sound in a word has the highest intensity, we must observe ourselves when we are searching for a forgotten word, e. g. for a name. Whichever is the first to come back into consciousness is in every case the one that had the greatest intensity before the word was forgotten' (160). 'The sounds which are of high valency are the initial sound in the root syllable, and the initial sound in the word, and the accentuated vowel or vowels' (162).
I cannot help contradicting him here. Whether the initial sound of the name is one of the elements of highest valency: a word or not, it is certainly untrue that in a forgotten word; is the first to return to consciousness. The rule stated above is therefore inapplicable. If we observe ourselves while searching for a forgotten name, we are comparatively often obliged to express a conviction that it begins with a particular letter. This conviction proves to be unfounded just as often as not. Indeed I should like to assert that in the majority of cases the initial sound which we announce is a wrong one. In our example of 'Signorelli', in fact, the substitute names had lost the initial sound and the essential syllables: it was precisely the less valent pair of syllables - elli - which returned to memory in the substitute name Botticelli.

If we allow ourselves to suppose that a mechanism similar to that which has been demonstrated for the forgetting of names could also play a part in the phenomena of slips of the tongue, we are led to form a more deeply based judgement of instances of the latter. The disturbance in speaking which is manifested in a slip of the tongue can in the first place be caused by the influence of another component of the same speech - by an anticipatory sound, that is, or by a perseveration - or by another formulation of the ideas contained within the sentence or context that it is one's intention to utter. This is the type to which all the above examples borrowed from Meringer and Mayer belong. The disturbance could, however, be of a second kind, analogous to the process in the Signorelli case: it could result from influences outside this word, sentence or context, and arise out of elements which are not intended to be uttered and of whose excitation we only learn precisely through the actual disturbance. What these two ways in which slips of the tongue arise have in common would be the simultaneity of the interfering excitation; what differentiates them would be the position of the excitation inside or outside the sentence or context. The difference does not at first appear great in so far as it concerns certain deductions that can be made from the symptomatology of slips of the tongue. It is clear, however, that only in the former case is there any prospect of drawing conclusions from the phenomena of slips of the tongue about a mechanism which links sounds and words with one another so that they mutually influence their articulation - conclusions, that is, such as the philologist hoped to arrive at from studying slips of the tongue. In the case of interference from influences outside the same sentence or context of what is being said, it would be above all a matter of getting to know that the interfering elements are - after which the question would arise whether the mechanism of this disturbance, too, can reveal the supposed laws of speech formation.

'Ru. was speaking of occurrences which, within himself he pronounced to be "Schweinereien [disgusting, literally piggish]". He tried, however, to express himself mildly, and began: "But then facts came to 'Vorschwein' . . ."' Mayer and I were present and Ru. confirmed his having thought "Schweinereien". The fact of this word which he thought being betrayed in "Vorschwein" and suddenly becoming operative is sufficiently explained by the similarity of the words.' (62)

'Here is another case. I asked R. von Schid. how his sick horse was getting on. He replied: "Ja, das draut . . . dauert vielleicht noch einen Monat." I could not understand the "draut", with an r, for the r in "dauert" could not possibly had had this result. So I drew his attention to it, whereupon he explained that his thought had been: "das ist eine traurige Geschichte [it's a sad story]." Thus the speaker had two answers in his mind and they had been intermixed.' (97)
Now in my *Interpretation of Dreams* (1900a) I have demonstrated the part played by the work of condensation in forming what is called the manifest dream-content out of the latent dream-thoughts. A similarity of any sort between two elements of the unconscious material - a similarity between the things themselves or between their verbal presentations - is taken as an opportunity for creating a third, which is a composite or compromise idea. In the dream-content this third element represents both its components; and it is as a consequence of its originating in this way that it so frequently has various contradictory characteristics. The formation of substitutions and contaminations which occurs in slips of the tongue is accordingly a beginning of the work of condensation which we find taking a most vigorous share in the construction of dreams.

[1901b, 1149]

If the last examples of Meringer and Mayer show that the disturbance of speech can arise on the one hand from the influence of anticipatory or perseverating sounds and words of the same sentence which are intended to be spoken, and on the other hand from the effect of words outside the intended sentence whose excitation would not otherwise have been revealed, the first thing we shall want to know is whether the two classes of slips of the tongue can be sharply divided, and how an example of one class can be distinguished from a case of the other. At this point in the discussion one must however bear in mind the views expressed by Wundt, who deals with the phenomena of slips of the tongue in the course of his comprehensive discussion of the laws of the development of speech.

[1901b, 1151]

Among the slips of the tongue that I have collected myself I can find hardly one in which I should be obliged to trace the disturbance of speech simply and solely to what Wundt calls the 'contact effect of sounds'. I almost invariably discover a disturbing influence in addition which comes from something outside the intended utterance; and the disturbing element is either a single thought that has remained unconscious, which manifests itself in the slip of the tongue and which can often be brought to consciousness only by means of searching analysis, or it is a more general psychical motive force which is directed against the entire utterance.

[1901b, 1152]

(1) My daughter had made an ugly face when she took a bite at an apple, and I wanted to quote to her:

(2) My daughter said: 'I am writing to Frau Schresinger . . .' The lady's name is Schlesinger. This slip of the tongue is probably connected with a trend towards making articulation easier, for an *l* is difficult to pronounce after a repeated *r*. I must add, however, that my daughter made this slip a few minutes after I had said 'Apfe' for 'Affe'. Now slips of the tongue are in a high degree contagious, like the forgetting of names - a peculiar fact which Meringer and Mayer have noticed in the case of the latter. I cannot suggest any reason for this psychical contagiousness.

[1901b, 1153]
(3) 'I shut up like a Tassenmescher - I mean Taschenmesser', said a woman patient at the start of the hour of treatment. Here again a difficulty in articulation (cf. 'Wiener Weiber Wäscherinnen waschen weisse Wäsche', 'Fischflosse' and similar tongue-twisters) could serve as an excuse for her interchanging the sounds. When her attention was drawn to her slip, she promptly replied: 'Yes, that's only because you said "Ernscht" to-day.' I had in fact received her with the remark: 'To-day we shall really be in earnest' (because it was going to be the last session before the holidays), and had jokingly broadened 'Ernst' into 'Ernscht'. In the course of the hour she repeatedly made further slips of the tongue, and I finally observed that she was not merely imitating me but had a special reason for dwelling in her unconscious on the word 'Ernst' in its capacity as a name.¹

[1901b, 1153]

(4) 'I've got such a cold, I can't durch die Ase natmen - I mean, Nase atmen,'¹ the same patient happened to say another time. She knew immediately how she had come to make the slip. 'Every day I get on the tram in Hasenauer Street, and while I was waiting for one to come along this morning it struck me that if I was French I should say "Asenauer", as the French always drop their aitches at the beginning of a word.' She then brought a series of reminiscences about French people of her acquaintance, and came in a very roundabout manner to a memory of having played the part of Picarde in the short play Kürmarker und Picarde when she was a girl of fourteen, and of having spoken broken German in the part. The chance arrival at her boarding house of a guest from Paris had awoken the whole series of memories. The interchanging of the sounds was therefore the result of a disturbance by an unconscious thought from an entirely different context.

[1901b, 1154]

(5) A slip of the tongue had a similar mechanism in the case of another woman patient, whose memory failed her in the middle of reproducing a long-lost recollection of childhood. Her memory would not tell her what part of her body had been grasped by a prying and lascivious hand. Immediately afterwards she called on a friend with whom she discussed summer residences. When she was asked where her cottage at M. was situated she answered: 'on the Berglende [hill-thigh]' instead of Berglehne [hill-side].

[1901b, 1154]

(6) When I asked another woman patient at the end of the session how her uncle was, she answered: 'I don't know, nowadays I only see him in flagranti.' Next day she began: 'I am really ashamed of myself for having given you such a stupid answer. You must of course have thought me a very uneducated person who is always getting foreign words mixed up. I meant to say: en passant.' We did not as yet know the source of the foreign phrase which she had wrongly applied. In the same session, however, while continuing the previous day's topic, she brought up a reminiscence in which the chief role was played by being caught in flagranti. The slip of the tongue of the day before had therefore anticipated the memory which at the time had not yet become conscious.

[1901b, 1154]
(7) At a certain point in the analysis of another woman patient I had to tell her that I suspected her of having been ashamed of her family during the period we were just then concerned with, and of having reproached her father with something we did not yet know about. She remembered nothing of the kind and moreover declared it was unlikely. However, she continued the conversation with some remarks about her family: 'One thing must be granted them: they are certainly unusual people, they all possess Geiz - I meant to say "Geist".' And this was in fact the reproach which she had repressed from her memory. It is a frequent occurrence for the idea one wants to withhold to be precisely the one which forces its way through in the form of a slip of the tongue. We may compare Meringer's case of 'zum Vorschwein gekommen'. The only difference is that Meringer's speaker wanted to keep back something that was in his consciousness, whereas my patient did not know what was being kept back, or, to put it in another way, did not know she was keeping something back and what that something was.

[1901b, 1155]

(8) The next example of a slip of the tongue is also to be traced back to something intentionally withheld. I once met two old ladies in the Dolomites who were dressed up in walking clothes. I accompanied them part of the way, and we discussed the pleasures and also the trials of spending a holiday in that way. One of the ladies admitted that spending the day like that entailed a good deal of discomfort. 'It is certainly not at all pleasant', she said, 'if one has been tramping all day in the sun and has perspired right through one's blouse and chemise.' In this sentence she had to overcome a slight hesitation at one point. Then she continued: 'But then when one gets "nach Hose" and can change . . .' No interpellation, I fancy, was necessary in order to explain this slip. The lady's intention had obviously been to give a more complete list of her clothes: blouse, chemise and Hose. Reasons of propriety led her to suppress any mention of the third article of linen. But in the next sentence, with its different subject-matter, the suppressed word emerged against her will, in the form of a distortion of the similar word 'nach Hause'.

[1901b, 1155]

(9) 'If you want to buy carpets,' a lady said to me, 'you must go to Kaufmann [a proper name, also meaning 'merchant'] in the Matthäusgasse [Matthew Street]. I think I can give you recommendation there.' 'At Matthäus . . .' I repeated, 'I mean Kaufmann's.' My repeating one name in the other's place looks like a result of my thoughts being distracted. They really were distracted by what the woman said, for she diverted my attention to something much more important to me than carpets. As a matter of fact, the house in which my wife lived when she was my fiancée was in the Matthäusgasse. The entrance to the house was in another street, and I now noticed that I had forgotten its name and could only make it conscious in a round about way. The name Matthäus, which I was lingering over, was therefore a substitute name for the forgotten street-name. It was more suitable for this purpose than the name Kaufmann, for Matthäus is exclusively a personal name, while Kaufmann is not, and the forgotten street also bears the name of a person: Radetzky.

[1901b, 1156]
The following case could just as appropriately be included in the chapter below on 'Errors', but I quote it here, since the phonetic relations, which were the basis of one word being put in place of another, are quite unusually clear. A woman patient told me a dream: A child had resolved to kill itself by means of a snake-bite. It carried out its resolution. She watched it writhing in convulsions, and so on. She had now to find the impressions of the previous day which the dream had taken as its starting point. She immediately recalled that on the previous evening she had listened to a public lecture on first aid for snake-bites. If an adult and a child were bitten at the same time, the child's injury should be attended to first. She also remembered what the lecturer had prescribed by way of treatment. It would very much depend, he had said, on what kind of snake caused the bite. I interrupted at this point and asked: Surely he must have said that we have very few poisonous kinds in these parts and he must have told you which are the dangerous ones? 'Yes, he particularly mentioned the "Klapperschlange [rattlesnake]".' My laughter drew her attention to her having said something wrong. She did not correct the name, but took back her statement: 'Yes, of course, they aren't found here; he was talking of the viper. How can I have got the idea of the rattlesnake?' I suspected it was due to interference by the thoughts which had hidden behind her dream. Suicide by means of a snake-bite could hardly be anything other than an allusion to the beautiful Cleopatra [in German: 'Kleopatra']. The great similarity between the sound of the two words, the occurrence in both of the same letters 'Kl. . . p. . .' in the same order, and of the same stressed 'a', was unmistakable. The close connection between the names 'Klapperschlange' and 'Kleopatra' resulted in her judgement being momentarily restricted, so that she saw no objection to asserting that the lecturer had given his audience in Vienna instructions on how to treat rattlesnake bites. In the ordinary way she knew as well as I did that that species of snake is not among the fauna of our country. We will not blame her for her equal lack of hesitation in transferring the rattlesnake to Egypt, for it is usual for us to lump together everything which is non-European and exotic, and I had myself to reflect for a moment before declaring that the rattlesnake is confined to the New World.

I will reproduce here an entirely innocent example (of perhaps one whose motives were insufficiently elucidated), because it displays a transparent mechanism.

A young man said to his sister: 'I've completely fallen out with the D.'s now. We're not on speaking terms any longer.' 'Yes indeed!' she answered, 'they're a fine Lippschaft.'¹ She meant to say 'Sippschaft' [lot, crew]', but in the slip she compressed two ideas: viz. that her brother had himself once begun a flirtation with the daughter of this family, and that this daughter was said to have recently become involved in a serious and irregular Liebschaft [love-affair].

The following two examples given by Reik (1915) have their origin in situations where slips of the tongue occur especially easily - situations in which more must be kept back than can be said.

A gentleman was offering his condolences to a young lady whose husband had recently died, and he intended to add: 'You will find consolation in devoting yourself entirely to your children.' Instead he said 'widwen.'¹ The suppressed thought referred to consolation of another kind: a young and pretty widow will soon enjoy fresh sexual pleasures.

Times of war like the present produce numerous slips of the tongue which there is not much difficulty in understanding.
(31) The next example of a slip of the tongue throws a flash of light on one of those painful conflicts which fall to the lot of a doctor. A man whose illness was in all probability a fatal one, though the diagnosis had not as yet been confirmed, had come to Vienna to await the solution of his problem, and had begged a friend whom he had known since his youth, and who had become a well-known physician, to undertake his treatment. This the friend had with some reluctance finally agreed to do. It was intended that the sick man should stay in a nursing home and the doctor proposed that it should be the 'Hera' sanatorium. 'Surely', objected the patient, 'that is a home for a special type of case only (a maternity home).' 'Oh no!' replied the doctor hastily, 'in the "Hera" they can umbringen - I mean, unterbringen - every type of patient.' He then violently disputed the interpretation of his slip. 'Surely you won't believe I have hostile impulses against you?' A quarter of an hour later, as the doctor was going out with the lady who had undertaken to nurse the invalid, he said: 'I can't find anything, and I still don't believe in it. But if it should be so, I am in favour of a strong dose of morphia and a peaceful finish.' It emerged that his friend had stipulated that he (the doctor) should shorten his sufferings by means of a drug as soon as it was confirmed that he was past helping. Thus the doctor had in fact undertaken to put an end to his friend.

[1901b, 1166]

(35) The connection between jokes and slips of the tongue is also shown in the fact that in many cases a slip of the tongue is nothing other than an abbreviation:

[1901b, 1169]

(39) There are of course more modern examples as well of sexual doubles entendres originating in a slip of the tongue. Frau F. was describing her first hour in a language course. 'It is very interesting; the teacher is a nice young Englishman. In the very first hour he gave me to understand "durch die Bluse" [through the blouse] - I mean, "durch die Blume" [literally, 'through flowers', i.e. 'indirectly'] that he would rather take me for individual tuition.' (From Storfer.)

[1901b, 1170]

In the psychotherapeutic procedure which I employ for resolving and removing neurotic symptoms I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations, a thought-content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another - that they have put them into a series which implies a recurrence of the same type in their emotional life. To give another example: a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother; he is four years older than I am.' I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. - At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view..

[1901b, 1171]
What I find, therefore, both in grosser disturbances of speech and in those more subtle ones which can still be subsumed under the heading of 'slips of the tongue', is that it is not the influence of the 'contact effects of the sounds' but the influence of thoughts that lie outside the intended speech which determines the occurrence of the slip and provides an adequate explanation of the mistake. It is not my wish to throw doubt on the laws governing the way in which sounds modify one another; but by themselves these laws do not seem to me to be sufficiently effective to disturb the process of correct speaking. In the cases that I have studied and explored in some detail these laws represent no more than the preformed mechanism which a more remote psychical motive makes use of for its convenience, though without becoming subject to the sphere of influence of these relations. In a large number of substitutions resulting from slips of the tongue such phonetic laws are completely disregarded. In this respect I find myself in full agreement with Wundt, who assumes as I do that the conditions governing slips of the tongue are complex and extend far beyond the contact effects of the sounds.

If I accept these 'remoter psychical influences' (as Wundt calls them) as established, there is nothing, on the other hand, to prevent me at the same time from allowing that, in situations where speaking is hurried and attention is to some extent diverted, the conditions governing slips of the tongue may easily be confined within the limits defined by Meringer and Mayer. For some of the examples collected by these authors a more complicated explanation nevertheless seems more plausible. Take, for instance, one of those quoted above:

Was what happened here simply that the sound 'schwe' forced back the equally valent sound 'bru' by 'anticipating' it? The idea can hardly be dismissed that the sounds making up 'schwe' were further enabled to obtrude in this manner because of a special relation. That could only be the association Schwester - Bruder; perhaps also Brust der Schwester, which leads one on to other groups of thoughts. It is this invisible helper behind the scenes which lends the otherwise innocent 'schwe' the strength to produce a mistake in speaking.

There are other slips of the tongue where we may assume that the true disturbing factor is some similarity in sound to obscene words and meanings. Deliberate distortion and deformation of words and expressions, which is so dear to vulgar minds, has the sole purpose of exploiting innocent occasions for hinting at forbidden topics; and this playing with words is so frequent that there would be nothing remarkable in its occurring even when not intended and against one's wishes. To this category no doubt belong such examples as Eischeissweibchen (for Eiweissscheibchen), Apopos Fritz (for à propos), Lokuskapitäl (for Lotuskapitäl), etc.; and perhaps also the Alabüsterbachse (Alabasterbűchse) of St. Mary Magdalen. - 'Ich fordere Sie auf, auf das Wohl unseres Chefs auf zustossen' can hardly be anything other than an unintentional parody which is a perseveration of an intended one. If I were the Principal who was being honoured at the ceremony to which the speaker contributed this slip, I should probably reflect on the cleverness of the Romans in permitting the soldiers of a general who was enjoying a Triumph openly to express in the form of satirical songs their inner criticisms of the man who was being honoured. - Meringer relates that he himself once said to someone, who by reason of being the eldest member of the company was addressed familiarly by the honorific title of 'Senexl or 'altes Senexl': 'Prost, Senex altesl!' He was himself shocked at this mistake (Meringer and Mayer, 1895, 50). We can perhaps interpret his emotion if we reflect how close 'Altesl' comes to the insulting phrase 'alter Esel'. There are powerful internal punishments for any breach of the respect due to age (that is, reduced to childhood terms, of the respect due to the father).
5 Making slips of the tongue was a symptom of a woman patient of mine which persisted until it was traced back to the childhood joke of replacing 'ruinieren' [ruin] by 'urinieren' [urinate]. - [Added 1924:] The temptation to employ the artifice of a slip of the tongue for enabling improper and forbidden words to be freely used forms the basis of Abraham's observations on parapraxes 'with an overcompensating purpose' (Abraham, 1922a). A woman patient was very liable to duplicate the first syllable of proper names by stammering. She changed the name 'Protagoras' to 'Protragoras', shortly after having said 'A-alexander' instead of 'Alexander'. Inquiry revealed that in childhood she had been especially fond of the vulgar joke of repeating the syllables 'a' and 'po' when they occurred at the beginnings of words, a form of amusement which quite commonly leads to stammering in children. ['A-a' and 'Popo' are the German nursery words for 'faeces' and 'buttocks'.] On approaching the name 'Protagoras' she became aware of the risk that she might omit the 'r' in the first syllable and say 'Po-potagoras'. As a protection against this danger she held on firmly to this 'r', and inserted another 'r' in the second syllable. She acted in the same way on other occasions, distorting the words 'Parterre [ground floor]' and 'Kondolenz [condolence]' so as to avoid 'Pater (father)' and 'Kondom [condom]' which were closely linked to them in her associations. Another of Abraham's patients confessed to an inclination to say 'Angora' every time for 'angina' - very probably because of a fear of being tempted to replace 'angina' by 'vagina'. These slips of the tongue owed their existence therefore to the fact that a defensive trend had retained the upper hand instead of the distorting one; and Abraham justly draws attention to the analogy between this process and the formation of symptoms in obsessional neurosis.

[1901b, 1173]

I hope that readers will not overlook the difference in value between these interpretations, of which no proof is possible, and the examples that I have myself collected and explained by means of an analysis. But if I still secretly cling to my expectation that even apparently simple slips of the tongue could be traced to interference by a half-suppressed idea that lies outside the intended context, I am tempted to do so by an observation of Meringer's which is highly deserving of attention. This author says that it is a curious fact that no one is ready to admit having made a slip of the tongue. There are some very sensible and honest people who are offended if they are told they have made one. I would not venture to put it so generally as does Meringer in saying 'no one'. But the trace of affect which follows the revelation of the slip, and which is clearly in the nature of shame, has a definite significance. It may be compared to the annoyance we feel when we cannot recall a forgotten name, and to our surprise at the tenacity of an apparently indifferent memory; and it invariably indicates that some motive has contributed to the occurrence of the interference.

[1901b, 1174]

In other, far more significant, cases it is self-criticism, internal opposition to one's own utterance, that obliges one to make a slip of the tongue and even to substitute the opposite of what one had intended. One then observes in astonishment how the wording of an assertion cancels out its own intention, and how the slip has exposed an inner insincerity.¹ The slip of the tongue here becomes a mode of mimetic expression - often, indeed, for the expression of something one did not wish to say: it becomes a mode of self-betrayal. This was the case, for instance, when a man who did not care for what is called normal sexual intercourse in his relations with women broke into a conversation about a girl who was said to be a flirt, with the words: 'If she had to do with me, she'd soon give up her koëttieren.' There is no doubt that it can only have been another word, namely 'koitieren', whose influence was responsible for making this change in the word that was intended, 'kokettieren' [to flirt, coquette]. - Or take the following case: 'We have an uncle who for months past had been very much offended because we never visited him. We took his move to a new house as an occasion for paying him a long overdue visit. He seemed very glad to see us, and as we were leaving he said with much feeling: "I hope from now on I shall see you still more seldom than in the past."

[1901b, 1176]
When the linguistic material happens to be favourable, it often causes slips of the tongue to occur which have the positively shattering result of a revelation, or which produce the full comic effect of a joke. - This is the following example observed and reported by Dr. Reitler:

[1901b, 1177]

We have seen from the example of 'vorschwein' that a slip of the tongue can easily occur if an effort has been made to suppress insulting words. In this way one gives vent to one's feelings:

[1901b, 1177]

The next example shows how a slip of the tongue resulted in a serious self-betrayal. Certain details in it justify its repetition in full from the account given by Brill in the Zentralblatt für Psychoanalyse, Volume II.

[1901b, 1178]

A slip of the tongue has a more cheering effect during psycho-analytic work, when it serves as a means of providing the doctor with a confirmation that may be very welcome to him if he is engaged in a dispute with the patient. I once had to interpret a patient's dream in which the name 'Jauner' occurred. The dreamer knew someone of that name, but it was impossible to discover the reason for his appearing in the context of the dream; I therefore ventured to suggest that it might be merely because of his name, which sounds like the term of abuse 'Gauner'. My patient hastily and vigorously contested this; but in doing so he made a slip of the tongue which confirmed my guess, since he confused the same letters once more. His answer was: "That seems to me too jewart."¹ When I had drawn his attention to his slip, he accepted my interpretation.

[1901b, 1183]

If one of the parties involved in a serious argument makes a slip of the tongue which reverses the meaning of what he intended to say, it immediately puts him at a disadvantage with his opponent, who seldom fails to make the most of his improved position.

[1901b, 1183]

This makes it clear that people give slips of the tongue and other parapraxes the same interpretation that I advocate in this book, even if they do not endorse theoretically the view I put forward, and even if they are disinclined, so far as it applies to themselves, to renounce the convenience that goes along with tolerating parapraxes. The amusement and derision which such oral slips are certain to evoke at the crucial moment can be taken as evidence against what purports to be the generally accepted convention that a mistake in speaking is a lapsus linguae and of no psychological significance. It was no less a person than the German Imperial Chancellor Prince Bülow who protested on these lines in an effort to save the situation, when the wording of his speech in defence of his Emperor (in November, 1907) was given the opposite meaning by a slip of the tongue. 'As for the present, the new epoch of the Emperor Wilhelm II, I can only repeat what I said a year ago, namely that it would be unfair and unjust to speak of a coterie of irresponsible advisors round our Emperor . . .' (loud cries of 'irresponsible') ' . . . irresponsible advisors. Forgive the lapsus linguae.' (Laughter.)

[1901b, 1183]

In view of the interest that is lent to our theory of slips of the tongue by support of this nature from great writers, I feel justified in citing a third such instance which has been reported by Ernest Jones (1911b, 496):

[1901b, 1187]
The view of slips of the tongue which is advocated here can meet the test even in the most trivial examples. I have repeatedly been able to show that the most insignificant and obvious errors in speaking have their meaning and can be explained in the same way as the more striking instances. A woman patient who was acting entirely against my wishes in planning a short trip to Budapest, but who was determined to have her own way, justified herself by telling me that she was going for only three days; but she made a slip of the tongue and actually said 'only three weeks'. She was betraying the fact that, to spite me, she would rather spend three weeks than three days there in the company which I considered unsuitable for her. - One evening I wanted to excuse myself for not having fetched my wife home from the theatre, and said: 'I was at the theatre at ten past ten.' I was corrected: 'You mean ten to ten.' Of course I meant ten to ten. After ten o'clock would have been no excuse. I had been told that the theatre bills said the performance ended before ten. When I reached the theatre I found the entrance-hall in darkness and the theatre empty. The performance had in fact ended earlier and my wife had not waited for me. When I looked at the clock it was only five to ten. But I decided to make my case out more favourable when I got home and to say it had been ten to ten. Unfortunately, my slip of the tongue spoilt my plan and revealed my disingenuousness, by making me confess more than there was to confess.

This leads on to those speech-disturbances which cannot any longer be described as slips of the tongue because what they affect is not the individual word but the rhythm and execution of a whole speech: disturbances like, for instance, stammering and stuttering caused by embarrassment. But here too, as in the former cases, it is a question of an internal conflict, which is betrayed to us by the disturbance in speech. I really do not think that anyone would make a slip of the tongue in an audience with his Sovereign, in a serious declaration of love of in defending his honour and name before a jury - in short, on all those occasions in which a person is heart and soul engaged. Even in forming an appreciation of an author's style we are permitted and accustomed to apply the same elucidatory principle which we cannot dispense with in tracing the origins of individual mistakes in speech. A clear and unambiguous manner of writing shows us that here the author is at one with himself; where we find a forced and involved expression which (to use an apt phrase) is aimed at more than one target, we may recognize the intervention of an insufficiently worked-out, complicating thought, or we may hear the stifled voice of the author's self-criticism.¹

Since this book first appeared friends and colleagues who speak other languages have begun to turn their attention to slips of the tongue which they have been able to observe in countries where their language is spoken. As was to be expected they have found that the laws governing parapraxes are independent of the linguistic material; and they have made the same interpretations that have been exemplified here in instances coming from speakers of the German language. Of countless examples I include only one:

In conclusion, for the benefit of readers who are prepared to make a certain effort and to whom psycho-analysis is not unfamiliar, I will add an example which will enable them to form some picture of the mental depths into which the pursuit even of a slip of the tongue can lead. It has been reported by Jekels (1913).
When we come to mistakes in reading and writing, we find that our general approach and our observations in regard to mistakes in speaking hold good here too - not surprisingly, in view of the close kinship between these functions. I shall confine myself here to reporting a few carefully analysed examples, and shall make no attempt to cover every aspect of the phenomena.

[1901b, 1193]

(2) I had received the proofs of my contribution to the *Jahresbericht für Neurologie und Psychiatrie*, and I had naturally to revise the names of authors with particular care, since they are of various nationalities and therefore usually cause the compositor very great difficulty. I did in fact find some foreign sounding names which were still in need of correction; but strangely enough there was one name which the compositor had corrected by departing from my manuscript. He was perfectly right to do so. What I had in fact written was 'Buckrhard', which the compositor guessed should be 'Burckhard'. I had actually praised the useful treatise which an obstetrician of that name had written on the influence of birth upon the origin of children's palsies, and I was not aware of having anything to hold against him; but he has the same name as a writer in Vienna who had annoyed me by an unintelligent review of my *Interpretation of Dreams*. It is just as if in writing the name Burckhard, meaning the obstetrician, I had had a hostile thought about the other Burckhard, the writer;¹ for distorting names is very often a form of insulting their owners, as I have mentioned above in discussing slips of the tongue.

[1901b, 1202]

Wundt (1900, 374) gives an explanation which deserves notice for the fact (which can easily be confirmed) that we make slips of the pen more readily than slips of the tongue. 'In the course of normal speaking the inhibitory function of the will is continuously directed to bringing the course of ideas and the articulatory movements into harmony with each other. If the expressive movement which follows the ideas is retarded through mechanical causes, as is the case in writing . . ., such anticipations make their appearance with particular ease.'

[1901b, 1215]

Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting-point for a fruitful investigation. Everyone knows how frequently the reader finds that in *reading aloud* his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly. I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are accustomed to assume will be performed most exactly when done automatically - that is, with scarcely any conscious attention. From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a *disturbance* of attention by an alien thought which claims consideration.

[1901b, 1216]
If slips in speaking - which is clearly a motor function - can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term 'bungled actions' ['Vergreifen'] to describe all the cases in which a wrong result - i.e. a deviation from what was intended - seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena. It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'. Let us rather try to trace the individual examples back to their particular determinants. For this purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.

[1901b, 1242]

Of all parapraxes errors seem to have the least rigid mechanism. That is to say, the occurrence of an error is a quite general indication that the mental activity in question has had to struggle with a disturbing influence of some sort or other; but the particular form that the error takes is not determined by the quality of the concealed disturbing idea. We may add here retrospectively that the same thing can be assumed to be true of many simple cases of slips of the tongue and pen. Every time we make a slip in talking or writing we may infer that there has been a disturbance due to mental processes lying outside our intention; but it must be admitted that slips of the tongue and of the pen often obey the laws of resemblance, of indolence or of the tendency to haste, without the disturbing element succeeding in imposing any part of its own character on the resulting mistake in speech or writing. It is the compliance of the linguistic material which alone makes the determining of the mistakes possible, and at the same time sets the limits up to which the determining can go.

[1901b, 1295]

To avoid confining myself entirely to my own errors, I shall report a few examples that might indeed have been included just as well among slips of the tongue and bungled actions; this is, however, a matter of indifference, since all these forms of parapraxis are equivalent to one another.

[1901b, 1296]

On the other hand we must not overlook the fact that repressed thoughts and impulses certainly do not achieve expression in symptomatic acts and parapraxes by their own unaided efforts. The technical possibility for such side-slipping on the part of the innervations must be presented independently; this will then be readily exploited by the intention of the repressed to make itself felt consciously. In the case of verbal parapraxes, detailed investigations by philosophers and philologists have endeavoured to determine what are the structural and functional relations that put themselves at the service of such an intention. If we distinguish, among the determinants of parapraxes and symptomatic acts, between the unconscious motive on the one hand and the physiological and psycho-physical relations that come to meet it on the other, it remains an open question whether there are, within the range of normality, yet other factors that can - like the unconscious motive, and in place of it - create parapraxes and symptomatic acts along the lines of these relations. It is not my task to answer this question.

[1901b, 1340]
Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that some disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

[1901b, 1340]

(F) Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline. (1) What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

[1901b, 1341]
I will begin by bringing together some material for answering the last question. In discussing the examples of slips of the tongue we found it necessary to go beyond the content of what was intended to be said, and were obliged to look for the cause of the speech-disturbance in something outside the intention. What this was was obvious in a number of cases, and was known to the speaker's consciousness. In the examples that seemed simplest and most transparent it was another version of the same thought - one which sounded as if it had an equal right, and which disturbed the expression of the thought without its being possible to explain why the one version had succumbed and the other had won the day. (These are Meringer and Mayer's 'contaminations'.) In a second group of cases the motive for the defeat of one version was a consideration which, however, did not prove strong enough to withhold it completely ('zum Vorschwein gekommen'). The version which was withheld was perfectly conscious too. Only of the third group can it be asserted unreservedly that the disturbing thought differed from the one intended, and only in their case can a distinction which is apparently essential be established. The disturbing thought is either connected with the disturbed thought by thought associations (disturbance as a result of internal contradiction), or it is unrelated to it in its nature and the disturbed word happens to be connected with the disturbing thought - which is often unconscious - by an unexpected external association. In the examples I have given from my psycho-analyses the entire speech is under the influence of thoughts which have become active but have at the same time remained entirely unconscious; either these are betrayed by the disturbance itself ('Klapperschlange' - 'Kleopatra') or they exercise an indirect influence by making it possible for the different parts of the consciously intended speech to disturb each other ('Ase natmen', where 'Hasenauer Street' and reminiscences of a Frenchwoman are in the background). The withheld or unconscious thoughts from which the disturbance in speech derives are of the most varied origin. This survey therefore does not enable us to generalize in any direction.

A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the 'Apfe'). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

There is no doubt that disturbances in the functions of speech occur more readily, and make smaller demands on the disturbing forces, than do those in other psychical activities.
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901I published a work¹ in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

[1906c, 1889]

² It is plausible to suppose, too, that the original antithetical meaning of words exhibits the ready-made mechanism which is exploited for various purposes by slips of the tongue that result in the opposite being said.

[1910e, 2323]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.

[1913j, 2805]
LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a *slip of the tongue* [*Versprechen*]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a *misreading* [*Verlesen*]), or he may hear wrongly something that has been said to him (a *mishearing* [*Verhören*]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis *forgetting* [*Vergessen*] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a *name* which he nevertheless knows and which he recognizes at once, or he may forget to carry out an *intention*, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of *mislaying* [*Verlegen*], when a person has put something somewhere and cannot find it again or in the precisely analogous case of *losing* [*Verlieren*]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of *errors* [*Irrtümer*], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

[1916-1917, 3136]

It is to these phenomena, then, that I now propose to draw your attention. But you will protest with some annoyance: 'There are so many vast problems in the wide universe, as well as within the narrower confines of our minds, so many marvels in the field of mental disorders, which require and deserve to have light thrown upon them, that it does really seem gratuitous to waste labour and interest on such trivialities. If you could make us understand why a person with sound eyes and ears can see and hear in broad daylight things that are not there, why another person suddenly thinks he is being persecuted by the people of whom he has hitherto been most fond, or puts forward the cleverest arguments in support of delusional beliefs which any child could see were nonsensical, then we should have some opinion of psycho-analysis. But if it can do no more than ask us to consider why a speaker at a banquet uses one word instead of another or why a housewife has mislaid her keys, and similar futilities, then we shall know how to put our time and interest to better uses.'

[1916-1917, 3137]
Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

[1916-1917, 3138]

This does not appear to promise much for our psycho-analytic interest. We might feel tempted to drop the subject. If, however, we examine the observations more closely, what we find does not tally entirely with this attention theory of parapraxes, or at least does not follow from it naturally. We discover that parapraxes of this kind and forgetting of this kind occur in people who are not fatigued or absent-minded or excited, but who are in all respects in their normal state - unless we choose to ascribe ex post facto to the people concerned, purely on account of their parapraxis, an excitement which, however, they themselves do not admit to. Nor can it be simply the case that a function is ensured by an increase in the attention directed upon it and endangered if that attention is reduced. There are a large number of procedures that one carries out purely automatically, with very little attention, but nevertheless performs with complete security. A walker, who scarcely knows where he is going, keeps to the right path for all that, and stops at his destination without having gone astray [vergangen]. Or at all events this is so as a rule. An expert pianist strikes the right keys without thinking. He may, of course, make an occasional mistake; but if automatic playing increased the danger of bungling, that danger would be at its greatest for a virtuoso, whose playing, as a result of prolonged practice, has become entirely automatic. We know, on the contrary, that many procedures are carried out with quite particular certainty if they are not the object of a specially high degree of attention, and that the mishap of a parapraxis is liable to occur precisely if special importance is attached to correct functioning and there has therefore certainly been no distraction of the necessary attention. It could be argued that this is the result of 'excitement', but it is difficult to see why the excitement should not on the contrary increase the attention directed to what is so earnestly intended. If by a slip of the tongue someone says the opposite of what he intends in an important speech or oral communication, it can scarcely be explained by the psycho-physiological or attention theory.

[1916-1917, 3139]
Perhaps you are familiar, too, with the fact that it is possible to provoke slips of the tongue, to produce them, as it were, by suggestion. An anecdote illustrates this. A stage neophyte had been cast for the important part in *Die Jungfrau von Orleans* of the messenger who announces to the King that 'der Connétable schickt sein Schwert zurück [the Constable sends back his sword]'. A leading actor amused himself during the rehearsal by repeatedly inducing the nervous young man to say, instead of the words of the text: 'der Komfortabel schickt sein Pferd zurück [the cab-driver sends back his horse].' He achieved his aim: the wretched beginner actually made his debut at the performance with the corrupt version, in spite of having been warned against it, or perhaps because he had been warned.

Let us take *slips of the tongue* as the most suitable sort of parapraxis for our purpose - though we might equally well have chosen slips of the pen or misreading. We must bear in mind that so far we have only asked when - under what conditions - people make slips of the tongue, and it is only to that question that we have had an answer. But we might direct our interest elsewhere and enquire why it is that the slip occurred in this particular way and no other; and we might take into account what it is that emerges in the slip itself. You will observe that, so long as this question is unanswered and no light thrown on the product of the slip, the phenomenon remains a chance event from the psychological point of view, even though it may have been given a physiological explanation. If I make a slip of the tongue, I might obviously do so in an infinite number of ways, the right word might be replaced by any of a thousand others, it might be distorted in countless different directions. Is there something, then, that compels me in the particular case to make the slip in one special way, or does it remain a matter of chance, of arbitrary choice, and is the question perhaps one to which no sensible answer at all can be given?

Two writers, Meringer and Mayer (a philologist and a psychiatrist), in fact made an attempt in 1895 to attack the problem of parapraxes from this angle. They collected examples and began by treating them in a purely descriptive way. This, of course, provides no explanation as yet, though it might pave the way to one. They distinguish the various kinds of distortions imposed by the slip on the intended speech as 'transpositions', pre-sonances', 'post-sonances', 'fusions (contaminations)' and 'replacements (substitutions)'. I will give you some examples of these main groups proposed by the authors. An instance of transposition would be to say 'the Milo of *Venus* instead of 'the Venus of Milo' (a transposition of the order of the words); an instance of a pre-sonance would be: 'es war mir *auf der Schwest . . . auf der Brust so schwer*';¹ and a post-sonance would be exemplified by the well-known toast that went wrong: 'Ich fordere Sie *auf, auf das Wohl unseres Chefs aufzustossen* [instead of anzustossen].² These three forms of slip of the tongue are not exactly common. You will come on much more numerous examples in which the slip results from contraction or fusion. Thus, for instance, a gentleman addressed a lady in the street in the following words: 'If you will permit me, madam, I should like to *begleit-digen* you.' The composite word,³ in addition to the 'begleiten [to accompany]', evidently has concealed in it 'beleidigen [to insult]'. (Incidentally, the young man was not likely to have much success with the lady.) As an example of a substitution Meringer and Mayer give the case of someone saying: 'Ich gebe die Präparate in den *Briefkasten* instead of 'Brütkasten'.⁴
The attempted explanation which these authors base on their collection of instances is quite peculiarly inadequate. They believe that the sounds and syllables of a word have a particular 'valency' and that the innervation of an element of high valency may have a disturbing influence on one that is less valent. Here they are clearly basing themselves on the far from common cases of pre-sonance and post-sonance; these preferences of some sounds over others (if they in fact exist) can have no bearing at all on other effects of slips of the tongue. After all, the commonest slips of the tongue are when, instead of saying one word, we say another very much like it; and this similarity is for many people a sufficient explanation of such slips. For instance, a Professor declared in his inaugural lecture: 'I am not 'geneigt [inclined]' (instead of 'geeignet [qualified]') to appreciate the services of my highly esteemed predecessor.' Or another Professor remarked: 'In the case of the female genitals, in spite of many Versuchungen [temptations] - I beg your pardon, Versuche [experiments]. . .' [1916-1917, 3143]

The most usual, and at the same time the most striking kind of slips of the tongue, however, are those in which one says the precise opposite of what one intended to say. Here, of course, we are very remote from relations between sounds and the effects of similarity; and instead we can appeal to the fact that contraries have a strong conceptual kinship with each other and stand in a particularly close psychological association with each other. There are historical examples of such occurrences. A President of the Lower House of our Parliament once opened the sitting with the words: 'Gentlemen, I take notice that a full quorum of members is present and herewith declare the sitting closed.') [1916-1917, 3143]

Any other familiar association can act in the same insidious fashion as a contrary one, and can emerge in quite unsuitable circumstances. Thus, on the occasion of a celebration in honour of the marriage of a child of Hermann von Helmholtz to a child of Werner von Siemens, the well-known inventor and industrialist, it is said that the duty of proposing the young couple's health fell to the famous physiologist Du Bois-Reymond. No doubt he made a brilliant speech, but he ended with the words: 'So, long life to the new firm of Siemens and Halske!' That was, of course, the name of the old firm. The juxtaposition of the two names must have been as familiar to a Berliner as Fortnum and Mason would be to a Londoner.¹ [1916-1917, 3144]

We must therefore include among the causes of parapraxes not only relations between sounds and verbal similarity, but the influence of word-associations as well. But that is not all. In a number of cases it seems impossible to explain a slip of the tongue unless we take into account something that had been said, or even merely thought, in an earlier sentence. Once again, then, we have here a case of perseveration, like those insisted upon by Meringer, but of more distant origin. - I must confess that I feel on the whole as though after all this we were further than ever from understanding slips of the tongue. [1916-1917, 3144]
Nevertheless I hope I am not mistaken in saying that during this last enquiry we have all of us formed a fresh impression of these instances of slips of the tongue, and that it may be worth while to consider that impression further. We examined the conditions under which in general slips of the tongue occur, and afterwards the influences which determine the kind of distortion which the slip produces. But we have so far paid no attention whatever to the product of the slip considered by itself, without reference to its origin. If we decide to do so, we are bound in the end to find the courage to say that in a few examples what results from the slip of the tongue has a sense of its own. What do we mean by 'has a sense'? That the product of the slip of the tongue may perhaps itself have a right to be regarded as a completely valid psychical act, pursuing an aim of its own, as a statement with a content and significance. So far we have always spoken of 'parapraxes', but it seems now as though sometimes the faulty act was itself quite a normal act, which merely took the place of the other act which was the one expected or intended.

[1916-1917, 3145]

The fact of the parapraxis having a sense of its own seems in certain cases evident and unmistakable. When the President of the Lower House with his first words closed the sitting instead of opening it, we feel inclined, in view of our knowledge of the circumstances in which the slip of the tongue occurred, to recognize that the parapraxis had a sense. The President expected nothing good of the sitting and would have been glad if he could have brought it to an immediate end. We have no difficulty in pointing to the sense of this slip of the tongue, or, in other words, in interpreting it. Or, let us suppose that one lady says to another in tones of apparent admiration: 'That smart new hat - I suppose you aufgepatzt [a non-existent word instead of aufgeputzt (trimmed)] it yourself?' Then no amount of scientific propriety will succeed in preventing our seeing behind this slip of the tongue the words: 'This hat is a Patzerei [botched-up affair].' Or, once more, we are told that a lady who was well-known for her energy remarked on one occasion: 'My husband asked his doctor what diet he ought to follow; but the doctor told him he had no need to diet: he could eat and drink what I want.' Here again the slip of the tongue has an unmistakable other side to it: it was giving expression to a consistently planned programme.

[1916-1917, 3145]

If it turned out, Ladies and Gentlemen, that not only a few instances of slips of the tongue and of parapraxes in general have a sense, but a considerable number of them, the sense of parapraxes, of which we have so far heard nothing, would inevitably become their most interesting feature and would push every other consideration into the background. We should then be able to leave all physiological or psycho-physiological factors on one side and devote ourselves to purely psychological investigations into the sense - that is, the meaning or purpose - of parapraxes. We shall therefore make it our business to test this expectation on a considerable number of observations.

[1916-1917, 3146]
But before carrying out this intention I should like to invite you to follow me along another track. It has repeatedly happened that a creative writer has made use of a slip of the tongue or some other parapraxis as an instrument for producing an imaginative effect. This fact alone must prove to us that he regards the parapraxis - the slip of the tongue, for instance - as having a sense, since he has produced it deliberately. For what has happened is not that the author has made an accidental slip of the pen and has then allowed it to be used by one of his characters as a slip of the tongue; he intends to bring something to our notice by means of the slip of the tongue and we can enquire what that something is - whether perhaps he wants to suggest that the character in question is absent-minded and fatigued or is going to have an attack of migraine. If the author uses the slip as though it had a sense, we have no wish, of course, to exaggerate the importance of this. After all, a slip might in fact be without a sense, a chance psychical event, or it might have a sense in only quite rare cases, but the author would still retain his right to intellectualize it by furnishing it with a sense so as to employ it for his own purposes. Nor would it be surprising if we had more to learn about slips of the tongue from creative writers than from philologists and psychiatrists.

We will continue to take slips of the tongue as our examples. If we now look through a considerable number of observations of that kind, we shall find whole categories of cases in which the intention, the sense, of the slip is plainly visible. Above all there are those in which what was intended is replaced by its contrary. The President of the Lower House said in his opening speech: 'I declare the sitting closed.' That is quite unambiguous. The sense and intention of his slip was that he wanted to close the sitting. 'Er sagt es ja selbst'¹ we are tempted to quote: we need only take him at his word. Do not interrupt me at this point by objecting that that is impossible, that we know that he did not want to close the sitting but to open it, and that he himself, whom we have just recognized as the supreme court of appeal, could confirm the fact that he wanted to open it. You are forgetting that we have come to an agreement that we will begin by regarding parapraxes on their own account; their relation to the intention which they have disturbed is not to be discussed till later. Otherwise you will be guilty of a logical error by simply evading the problem that is under discussion - by what is called in English 'begging the question'.

In other cases, where the slip does not express the precise contrary, an opposite sense can nevertheless be brought out by it. 'I am not geneigt [inclined] to appreciate the services of my predecessor'. Geneigt is not the contrary of geeignet [qualified], but it expresses openly something which contrasts sharply with the situation in which the speech was to be made.

In yet other cases the slip of the tongue merely adds a second sense to the one intended. The sentence then sounds like a contraction, abbreviation or condensation of several sentences. Thus, when the energetic lady said: 'He can eat and drink what I want', it was just as though she had said: 'He can eat and drink what he wants; but what has he to do with wanting? I will want instead of him.' A slip of the tongue often gives the impression of being an abbreviation of this sort. For instance, a Professor of Anatomy at the end of a lecture on the nasal cavities asked whether his audience had understood what he said and, after general assent, went on: 'I can hardly believe that, since even in a city with millions of inhabitants, those who understand the nasal cavities can be counted on one finger. . . . I beg your pardon, on the fingers of one hand.' The abbreviated phrase has a sense too - namely, that there is only one person who understands them.
You will recall the case of the young man who asked the unknown lady if he might 'begleitigen' her. We ventured to divide up this verbal form into 'begleiten [accompany]' and 'beleidigen [insult]', and we felt certain enough of this interpretation not to need any confirmation of it. You will see from these examples that even these obscurer cases of slips of the tongue can be explained by a convergence, a mutual 'interference', between two different intended speeches; the differences between these cases of slips arise merely from the fact that on some occasions one intention takes the place of the other completely (becomes a substitute for it), as in slips of the tongue that express the contrary, whereas on other occasions the one intention has to be satisfied with distorting or modifying the other, so that composite structures are produced, which make sense, to a greater or lesser degree, on their own account.

We seem now to have grasped the secret of a large number of slips of the tongue. If we bear this discovery in mind, we shall be able to understand other groups as well which have puzzled us hitherto. In cases of distortion of names, for instance, we cannot suppose that it is always a matter of competition between two similar but different names. It is not difficult, however, to guess the second intention. The distortion of a name occurs often enough apart from slips of the tongue; it seeks to give the name an offensive sound or to make it sound like something inferior, and it is a familiar practice (or malpractice) designed as an insult, which civilized people soon learn to abandon, but which they are reluctant to abandon. It is still often permitted as a 'joke', though a pretty poor one. As a blatant and ugly example of this way of distorting names, I may mention that in these days the name of the President of the French Republic, Poincaré, has been changed into 'Schweinskarré.' It is therefore plausible to suppose that the same insulting intention is present in these slips of the tongue and is trying to find expression in the distortion of a name. Similar explanations suggest themselves along the same lines for certain instances of slips of the tongue with comic or absurd results. 'I call on you to hiccough [aufzustossen] to the health of our Chief.' Here a ceremonial atmosphere is unexpectedly disturbed by the intrusion of a word which calls up an unsavoury idea, and, on the model of certain insulting and offensive phrases, we can scarcely avoid a suspicion that a purpose was trying to find expression which was in violent contradiction to the ostensibly respectful words. What the slip seems to have been saying was something like: 'Don't you believe it! I don't mean this seriously! I don't care a rap for the fellow!' Just the same thing applies to slips of the tongue which turn innocent words into indecent or obscene ones: thus, 'Apopos' for 'à propos' or 'Eischeissweibschen' for 'Eiweissscheibchen'.

First, then, is this the explanation of all cases of slips of the tongue? I am very much inclined to think so, and my reason is that every time one investigates an instance of a slip of the tongue an explanation of this kind is forthcoming. But it is also true that there is no way of proving that a slip of the tongue cannot occur without this mechanism. It may be so; but theoretically it is a matter of indifference to us, since the conclusions we want to draw for our introduction to psycho-analysis remain, even though - which is certainly not the case - our view holds good of only a minority of cases of slips of the tongue. The next question - whether we may extend our view to other sorts of parapraxis - I will answer in advance with a 'yes'. You will be able to convince yourselves of this when we come to examining instances of slips of the pen, bungled actions, and so on. But for technical reasons I suggest that we should postpone this task till we have treated slips of the tongue themselves still more thoroughly.
In a first group of cases this is done quite simply and securely - in the same way, in fact, as with the disturbed purpose. We get the speaker to give us the information directly. After his slip of the tongue he at once produces the wording which he originally intended: 'It draut... no, it dauert [will last] another month perhaps.' Well, in just the same way we get him to tell us the disturbing purpose. 'Why', we ask him, 'did you say "draut"?' He replies: 'I wanted to say "It's a traurige [sad] story".' Similarly, in the other case, where the slip of the tongue was 'Vorschwein', the speaker confirms the fact that he had wanted at first to say 'It's a Schweinerei [disgusting]', but had controlled himself and gone on into another remark. Here then the distorting purpose is as securely established as the distorted one. My choice of these examples has not been unintentional, for their origin and solution come neither from me nor from any of my followers. And yet in both these cases active measures of a kind were necessary in order to bring about the solution. The speaker had to be asked why he had made the slip and what he could say about it. Otherwise he might perhaps have passed over his slip without wanting to explain it. But when he was asked he gave the explanation with the first thing that occurred to him. And now please observe that this small active step and its successful outcome are already a psycho-analysis and are a model for every psycho-analytic investigation which we shall embark upon later.

[1916-1917, 3157]

I cannot easily give you illustrations of this if I limit myself to the field of slips of the tongue, though even there some good instances are to be found. The young man who wanted to 'begleitigen' a lady was certainly a timid character. The lady whose husband could eat and drink what she wanted is known to me as one of those energetic women who wear the breeches in their home. Or let us take the following example: At the General Meeting of the 'Concordia' a young member made a speech of violent opposition, in the course of which he addressed the committee as 'Vorschussmitglieder [lending members]', a word which seems to be made up of 'Vorstand [directors]' and 'Ausschuss [committee]'. We shall suspect that some disturbing purpose was at work in him, acting against his violent opposition, based on something connected with a loan. And in fact we learnt from our informant that the speaker was constantly in financial difficulties and just at that time had applied for a loan. The disturbing intention could therefore be replaced by the thought: 'Moderate your opposition; these are the same people who will have to sanction your loan.'

[1916-1917, 3160]

If you will allow me, I will once more take slips of the tongue as representatives of the whole class and I will reply to the second question before the first.

[1916-1917, 3169]

In a slip of the tongue the disturbing intention may be related in its content to the disturbed one, in which case it will contradict it or correct it or supplement it. Or - the more obscure and more interesting case - the content of the disturbing intention may have nothing to do with that of the disturbed one.

[1916-1917, 3169]
We shall have no difficulty in finding evidence of the former relation in instances we already know and in similar ones. In almost every case in which a slip of the tongue reverses the sense, the disturbing intention expresses the contrary to the disturbed one and the parapraxis represents a conflict between two incompatible inclinations. 'I declare the sitting opened, but I should prefer it to be already closed' is the sense of the President's slip of the tongue. A political periodical which had been accused of corruption defended itself in an article the climax of which should have been: 'Our readers will bear witness to the fact that we have always acted in the most unself-seeking manner for the good of the community.' But the editor entrusted with the preparation of the article wrote 'in the most self-seeking manner'. That is to say, he was thinking: 'This is what I am obliged to write; but I have different ideas.' A member of parliament who was insisting that the truth should be told to the Emperor 'rückhaltlos [unreservedly]' evidently heard an inner voice that was shocked at his boldness and, by a slip of the tongue, changed the word into 'rückgratlos [spinelessly]' ¹.

In the instances already familiar to you which give an impression of being contractions or abbreviations, what we have before us are corrections, additions or continuations, by means of which a second purpose makes itself felt alongside of the first. 'Facts came to Vorschein [light] - better to say it straight out - they were Schweinereien [disgusting]; well then, facts came to Vorschwein.' 'Those who understand this can be counted on the fingers of one hand - no, there's really only one person who understands it, so: can be counted on one finger.' Or: 'My husband can eat and drink what he wants. But, as you know, I don't put up with his wanting anything at all, so: he can eat and drink what I want.' In all these cases, then, the slip of the tongue arises from the content of the disturbed intention itself or is connected with it.

¹ [1916-1917, 3169]
We can now turn, however, to the main question, which we have long postponed, of what sort of intentions these are, which find expression in this unusual fashion as disturbers of other intentions. Well, they are obviously of very different sorts, among which we must look for the common factor. If we examine a number of examples with this in view, they will soon fall into three groups. The first group contains those cases in which the disturbing purpose is known to the speaker and moreover had been noticed by him before he made the slip of the tongue. Thus, in the 'Vorschwein' slip the speaker admitted not only that he had formed the judgement 'Schweinereien' about the events in question, but also that he had had the intention, from which he afterwards drew back, of expressing his judgement in words. A second group is made up of other cases in which the disturbing purpose is equally recognized as his by the speaker, but in which he was unaware that it was active in him just before he made the slip. Thus, he accepts our interpretation of his slip, but nevertheless remains to some extent surprised at it. Instances of this kind of attitude can perhaps be found in other sorts of parapraxes more easily than in slips of the tongue. In a third group the interpretation of the disturbing intention is vigorously rejected by the speaker; he not only denies that it was active in him before he made the slip, but seeks to maintain that it is entirely foreign to him. You will recall the example of the 'hiccough' and the positively rude denial which I brought on myself from the speaker by uncovering his disturbing intention. As you know, we have not yet come to any agreement in our views on these cases. I should pay no attention to the denial put forward by the proposer of the toast and should persist in my interpretation unruffled, while you, I suppose, are still affected by his protest and raise the question of whether we ought not to give up interpreting parapraxes of this kind and regard them as purely physiological acts in the pre-analytic sense. I can well imagine what it is that deters you. My interpretation carries with it the hypothesis that intentions can find expression in a speaker of which he himself knows nothing but which I am able to infer from circumstantial evidence. You are brought up short in the face of such a novel and momentous hypothesis. I can understand that, and I see your point so far as that goes. But one thing is certain. If you want to apply consistently the view of parapraxes which has been confirmed by so many examples, you will have to make up your mind to accept the strange hypothesis I have mentioned. If you cannot do that, you will have once more to abandon the understanding of parapraxes which you have only just achieved.

Let us consider for a moment what it is that unites the three groups, what it is that the three mechanisms of slips of the tongue have in common. It is fortunately unmistakable. In the first two groups the disturbing purpose is recognized by the speaker; furthermore, in the first group that purpose announce: itself immediately before the slip. But in both cases it is forced back. The speaker decides not to put it into words, and after that the slip of the tongue occurs; after that, that is to say, the purpose which has been forced back is put into words against the speaker's will, either by altering the expression of the intention which he has permitted, or by mingling with it, or by actually taking its place. This, then, is the mechanism of a slip of the tongue.
On my view, I can bring what happens in the third group into complete harmony with the mechanism I have described. I have only to assume that what distinguishes these three groups from one another is the differing extent to which the intention is forced back. In the first group the intention is there and makes itself noticed before the speaker's remark; only then is it rejected; and it takes its revenge in the slip of the tongue. In the second group the rejection goes further: the intention has already ceased to be noticeable before the remark is made. Strangely enough, this does not in the least prevent it from playing its part in causing the slip. But this behaviour makes it easier for us to explain what happens in the third group. I shall venture to assume that a purpose can also find expression in a parapraxis when it has been forced back and not noticed for a considerable time, for a very long time perhaps, and can for that reason be denied straight out by the speaker. But even if you leave the problem of the third group on one side, you are bound to conclude from the observations we have made in the other cases that the suppression of the speaker's intention to say something is the indispensable condition for the occurrence of a slip of the tongue. [1916-1917, 3172]

We have already treated slips of the tongue in great detail, but there are a few more points to be added. Slips of the tongue are accompanied by certain minor emotional phenomena which are not quite without interest. No one likes making slips of the tongue, and we often fail to hear our own slips, though never other people's. Slips of the tongue are also in a certain sense contagious; it is not at all easy to talk about slips of the tongue without making slips of the tongue oneself. The most trivial forms of such slips, precisely those which have no special light to throw on hidden mental processes, have reasons which are nevertheless not hard to penetrate. For instance, if someone has pronounced a long vowel short on account of a disturbance affecting the word for some reason or other, he will soon afterwards pronounce a subsequent short vowel long, thus making a fresh slip of the tongue to compensate for the earlier one. In the same way, if he pronounces a diphthong incorrectly and carelessly (for instance pronouncing an 'eu' or 'oi' as 'ei') he will try to make up for it by changing a subsequent 'ei' into an 'eu' or 'oi'. The decisive factor here seems to be consideration of the impression made on the audience, who are not to suppose that it is a matter of indifference to the speaker how he treats his mother-tongue. The second, compensating distortion actually has the purpose of directing the hearer's attention to the first one and of assuring him that the speaker has noticed it too. The commonest, simplest and most trivial slips of the tongue are contractions and anticipations which occur in insignificant parts of speech. For instance, in a longish sentence one may make a slip of the tongue which anticipates the last word of what one intends to say. This gives an impression of impatience to be finished with the sentence, and is evidence in general of a certain antipathy against communicating the sentence or against the whole of one's remarks. We thus arrive at marginal cases in which the distinctions between the psycho-analytic view of slips of the tongue and the ordinary physiological one melt into one another. It is to be assumed that a purpose of disturbing the intention of the speech is present in these cases but that it can only announce its presence and not what it itself has in view. The disturbance it produces then proceeds in accordance with certain phonetic influences or associative attractions and can be regarded as a distraction of the attention from the intention of the speech. But neither this disturbance of the attention nor the inclinations to associate which have become operative touch on the essence of the process. This remains, in spite of everything, the indication of the existence of an intention which is disturbing to the intention of the speech, though the nature of this disturbing intention cannot be guessed from its consequences, as is possible in all the better defined cases of slips of the tongue. [1916-1917, 3174]
Slips of the pen, to which I now pass, are so closely akin to slips of the tongue that we have nothing new to expect from them. Perhaps we may glean one little further point. The extremely common small slips of the pen, contractions and anticipations of later words (especially of final words) point, once again, to a general dislike of writing and impatience to be done with it. More marked products of miswriting enable one to recognize the nature and aim of the disturbing purpose. If one finds a slip of the pen in a letter, one knows in general that there was something the matter with its author, but one cannot always discover what was going on in him. A slip of the pen is just as often overlooked by the person responsible as is a slip of the tongue. The following is a noteworthy observation. There are, as we know, people who are in the habit of reading through every letter they write before sending it off. Others do not do this as a rule; but if, as an exception, they do so they always come across some conspicuous slip of the pen, which they can then correct. How is this to be explained? It looks as though these people knew that they had made a mistake in writing the letter. Are we really to believe this?

As you will remember, we found ourselves in this situation once before. It was while we were investigating certain parapraxes - a case of a slip of the tongue. Someone had said: 'Then facts came to Vorschwein' and we thereupon asked him - no, it was luckily not we but some other people who had no connection at all with psycho-analysis - these other people, then, asked him what he meant by this unintelligible remark. And he replied at once that he had intended to say 'these facts were Schweineereien [disgusting]', but had forced this intention back in favour of the milder version 'then facts came to Vorschein [light]' . I pointed out to you at the time that this piece of information was the model for every psycho-analytic investigation, and you will understand now that psycho-analysis follows the technique of getting the people under examination so far as possible themselves to produce the solution of their riddles. Thus, too, it is the dreamer himself who should tell us what his dream means.

[1916-1917, 3175]
I hope you will be surprised that this fact has been established and will ask me: 'Why did you omit to bring this proof forward earlier, in connection with the parapraxes, when we came to the point of attributing to a man who had made a slip of the tongue an intention to say things of which he knew nothing and which he denied? If a person thinks he knows nothing of experiences the memory of which he nevertheless has within him, it is no longer so improbable that he knows nothing of other mental processes within him. This argument would certainly have impressed us, and helped us to understand parapraxes.' Of course I could have brought it forward then, but I reserved it for another place, where it was more needed. The parapraxes explained themselves in part, and in part left us with a suggestion that, in order to preserve the continuity of the phenomena concerned, it would be wise to assume the existence of mental processes of which the subject knows nothing. In the case of dreams we are compelled to bring in explanations from elsewhere and moreover I expect that in their case you will find it easier to accept my carrying over of the explanations from hypnosis. The state in which a parapraxis occurs is bound to strike you as being the normal one; it has no similarity with the hypnotic state. On the other hand there an obvious kinship between the hypnotic state and the state of sleep, which is a necessary condition of dreaming. Hypnosis, indeed, is described as an artificial sleep. We tell the person we are hypnotizing to sleep, and the suggestions we make are comparable to the dreams of natural sleep. The psychical situations in the two cases are really analogous. In natural sleep we withdraw our interest from the whole external world; and in hypnotic sleep we also withdraw it from the whole world, but with the single exception of the person who has hypnotized us and with whom we remain in rapport. Incidentally, the sleep of a nursing mother, who remains in rapport with her child and can be woken only by him, is a normal counterpart of hypnotic sleep. So it scarcely seems a very bold venture to transpose a situation from hypnosis to natural sleep. The assumption that in a dreamer too a knowledge about his dreams is present, though it is inaccessible to him so that he himself does not believe it, is not something entirely out of the blue. It should be noticed, moreover, that a third line of approach to the study of dreams is opened at this point: from the stimuli which disturb sleep, from day-dreams, and now in addition from the suggested dreams of the hypnotic state.

[1916-1917, 3202]
The production of composite structures like these must be of great importance to the dream-work, since we can show that, where in the first instance the common elements necessary for them were missing, they are deliberately introduced - for instance, through the choice of the words by which a thought is expressed. We have already come across condensations and composite structures of this sort. They played a part in the production of some slips of the tongue. You will recall the young man who offered to 'begleitdigen' ['begleiten (accompany) + beleidigen (insult)'] a lady. Moreover, there are jokes of which the technique is based on a condensation like this. But apart from these cases, it may be said that the process is something quite unusual and strange. It is true that counterparts to the construction of these composite figures are to be found in some creations of our imagination, which is ready to combine into a unity components of things that do not belong together in our experience - in the centaurs, for instance, and the fabulous beasts which appear in ancient mythology or in Böcklin's pictures. The 'creative' imagination, indeed, is quite incapable of inventing anything; it can only combine components that are strange to one another. But the remarkable thing about the procedure of the dream-work lies in what follows. The material offered to the dream-work consists of thoughts - a few of which may be objectionable and unacceptable, but which are correctly constructed and expressed. The dream-work puts these thoughts into another form, and it is a strange and incomprehensible fact that in making this translation (this rendering, as it were, into another script or language) these methods of merging or combining are brought into use. After all, a translation normally endeavours to preserve the distinctions made in the text and particularly to keep things that are similar separate. The dream-work, quite the contrary, tries to condense two different thoughts by seeking out (like a joke) an ambiguous word in which the two thoughts may come together. We need not try to understand this feature all at once, but it may become important for our appreciation of the dream-work.

[1916-1917, 3264]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

[1924f, 4109]

There is no need to discuss what is to be called conscious: it is removed from all doubt. The oldest and best meaning of the word 'unconscious' is the descriptive one; we call a psychical process unconscious whose existence we are obliged to assume - for some such reason as that we infer it from its effects -, but of which we know nothing. In that case we have the same relation to it as we have to a psychical process in another person, except that it is in fact one of our own. If we want to be still more correct, we shall modify our assertion by saying that we call a process unconscious if we are obliged to assume that it is being activated at the moment, though at the moment we know nothing about it. This qualification makes us reflect that the majority of conscious processes are conscious only for a short time; very soon they become latent, but can easily become conscious again. We might also say that they had become unconscious, if it were at all certain that in the condition of latency they are still something psychical. So far we should have learnt nothing new; nor should we have acquired the right to introduce the concept of an unconscious into psychology. But then comes the new observation that we were already able to make in parapraxes. In order to explain a slip of the tongue, for instance, we find ourselves obliged to assume that the intention to make a particular remark was present in the subject. We infer it with certainty from the interference with his remark which has occurred; but the intention did not put itself through and was thus unconscious. If, when we subsequently put it before the speaker, he recognizes it as one familiar to him, then it was only temporarily unconscious to him; but if he repudiates it as something foreign to him, then it was permanently unconscious. From this experience we retrospectively obtain the right also to pronounce as something unconscious what had been described as latent. A consideration of these dynamic relations permits us now to distinguish two kinds of unconscious - one which is easily, under frequently occurring circumstances, transformed into something conscious, and another with which this transformation is difficult and takes place only subject to a considerable expenditure of effort or possibly never at all. In order to escape the ambiguity as to whether we mean the one or the other unconscious, whether we are using the word in the descriptive or in the dynamic sense, we make use of a permissible and simple way out. We call the unconscious which is only latent, and thus easily becomes conscious, the 'preconscious' and retain the term 'unconscious' for the other. We now have three terms, 'conscious', 'preconscious' and 'unconscious', with which we can get along in our description of mental phenomena. Once again: the preconscious is also unconscious in the purely descriptive sense, but we do not give it that name, except in talking loosely or when we have to make a defence of the existence in mental life of unconscious processes in general.

[1933a, 4679]
In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
This leads on to those speech-disturbances which cannot any longer be described as slips of the tongue because what they affect is not the individual word but the rhythm and execution of a whole speech: disturbances like, for instance, stammering and stuttering caused by embarrassment. But here too, as in the former cases, it is a question of an internal conflict, which is betrayed to us by the disturbance in speech. I really do not think that anyone would make a slip of the tongue in an audience with his Sovereign, in a serious declaration of love of in defending his honour and name before a jury - in short, on all those occasions in which a person is heart and soul engaged. Even in forming an appreciation of an author's style we are permitted and accustomed to apply the same elucidatory principle which we cannot dispense with in tracing the origins of individual mistakes in speech. A clear and unambiguous manner of writing shows us that here the author is at one with himself; where we find a forced and involved expression which (to use an apt phrase) is aimed at more than one target, we may recognize the intervention of an insufficiently worked-out, complicating thought, or we may hear the stifled voice of the author's self-criticism.¹

[1901b, 1189]
As we see, the note refers to the death of Leonardo's father. The small error in its form consists of the repetition of the time of day 'a ore 7' [at 7 o'clock], which is given twice, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a small detail, and anyone who was not a psycho-analyst would attach no importance to it. He might not even notice it, and if his attention was drawn to it he might say that a thing like that can happen to anyone in a moment of distraction or of strong feeling, and that it has no further significance.
[1910c, 2290]

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He is learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.
[1910c, 2290]

We call a repetition of this kind a perseveration. It is an excellent means of indicating affective colour. One recalls, for example, St. Peter's tirade in Dante's *Paradiso* against his unworthy representative on earth:
[1910c, 2291]

Without Leonardo's affective inhibition the entry in his diary might have run somewhat as follows: 'To-day at 7 o'clock my father died - Ser Piero da Vinci, my poor father!' But the displacement of the perseveration on to the most indifferent detail in the report of his death, the hour at which he died, robs the entry of all emotion, and further lets us see that here was something to be concealed and suppressed.
[1910c, 2291]
The twisting round of a name when it is intentional amounts to an insult; and it might well have the same significance in a whole number of cases where it appears in the form of an unintentional slip of the tongue. The person who, as Mayer reports, said 'Freuder' on one occasion instead of 'Freud' because he had shortly before mentioned Breuer's name (Meringer and Mayer, 1895, 38), and who another time spoke of the 'Freuer-Breudian' method of treatment (ibid., 28), was probably a professional colleague - and one who was not particularly enthusiastic about that method. In the chapter below on slips of the pen I shall report an instance of the distortion of a name which certainly cannot be explained in any other way.¹

When we come to mistakes in reading and writing, we find that our general approach and our observations in regard to mistakes in speaking hold good here too - not surprisingly, in view of the close kinship between these functions. I shall confine myself here to reporting a few carefully analysed examples, and shall make no attempt to cover every aspect of the phenomena.

(1) On a sheet of paper containing short daily notes mainly of a business kind I was surprised to find, among some entries correctly dated 'September', the wrongly written date 'Thursday, October 20'. It is not difficult to explain this anticipation - and to explain it as the expression of a wish. A few days before, I had returned fresh from my holiday travels, and I felt ready for plenty of professional work; but there were not yet many patients. On my arrival I had found a letter from a patient to say she was coming on October 20. When I made an entry for the same day of the month in September I may well have thought: 'X. should have been here already; what a waste of a whole month!', and with that thought in mind I brought the date forward a month. In this case the disturbing thought can scarcely be called an objectionable one; and for this reason I knew the solution of the slip of the pen as soon as I had noticed it. - In the autumn of the following year I made another slip of the pen which was precisely analogous and had a similar motive. - Ernest Jones has made a study of slips like these in writing dates; in most cases they could be clearly recognized as having reasons.

(3) This assertion is very neatly confirmed by a self-observation of Storfer's (1914), in which the author exposes with commendable frankness the motives that prompted him to recollect the name of a supposed rival wrongly and then to write it down in a distorted form:

(10) Since a slip of the pen on the part of a doctor who is writing a prescription possesses a significance which goes far beyond the practical importance of ordinary parapraxes, I take the opportunity of reporting in full the only analysis published up to now of such a slip made by a doctor:

(11) The next slip of the pen, reported by Sándor Ferenczi, will be thought quite especially innocent. It can he understood as being an act of condensation, resulting from impatience (compare the slip of the tongue, 'Der Apfe', above, p. 1152); and this view might have been maintained if a penetrating analysis of the occurrence had not revealed a stronger disturbing factor:

(12) On the other hand there are times when the most insignificant slip in writing can serve to express a dangerous secret meaning. An anonymous correspondent reports:
(18) Omissions in writing have naturally a claim to be considered in the same light as slips of the pen. Dattner (1911) has reported a curious instance of a 'historical parapraxis'. In one of the sections of the law dealing with the financial obligations of Austria and Hungary, settled in the 'Compromise' of 1867 between the two countries, the word 'actual' was left out of the Hungarian translation; and Dattner makes it plausible to suppose that the unconscious desire of the Hungarian parliamentary draftsmen to grant Austria the least possible advantages played a part in causing the omission.

[1901b, 1212]

We have every reason to suppose, too, that the very frequent repetitions of the same word in writing and copying - 'perseverations' - are likewise not without significance. If the writer repeats a word he has already written, this is probably an indication that it was not so easy for him to get away from it: that he could have said more at that point but had omitted to do so, or something of the kind. Perseveration in copying seems to be a substitute for saying 'I too'. I have had lengthy medico-legal 'opinions' before me which show perseverations on the copyist's part at particularly important passages. The interpretation I should have liked to give them would be that, bored with his impersonal role, the copyist was introducing his own gloss: 'Just my case' or 'it's just the same with us.'

[1901b, 1213]

(19) Furthermore, there is nothing to prevent our treating misprints as 'writing mistakes' on the compositor's part, and our regarding them as being in a very great measure motivated. I have not set about making a systematic collection of such parapraxes, which could be very amusing and instructive. In the work which I have already referred to a number of times, Jones has devoted a special section to misprints.

[1901b, 1213]

The distortions found in the text of telegrams can also at times be understood as writing mistakes on the telegraphist's part. In the summer holidays I received a telegram from my publishers, the text of which was unintelligible to me. It ran: 'Vorräte erhalten, Einladung X. dringend.' The solution of the riddle starts from the name X. mentioned in it. X. was the author of a book to which I was to write an 'Einleitung'. This 'Einleitung' was what had been turned into the 'Einladung'. I was then able to recall that some days earlier I had sent my publishers a 'Vorrede' to another book; so this was the acknowledgement of its arrival. The true text had very probably run: 'Vorrede erhalten, Einleitung X. dringend.' We may assume that it had fallen victim to a revision by the telegraphist's hunger-complex, in the course of which, moreover the two halves of the sentence became linked more closely than the sender had intended. It is, incidentally, a pretty instance of the 'secondary revision' that can be seen at work in most dreams.

[1901b, 1213]

Wundt (1900, 374) gives an explanation which deserves notice for the fact (which can easily be confirmed) that we make slips of the pen more readily than slips of the tongue. 'In the course of normal speaking the inhibitory function of the will is continuously directed to bringing the course of ideas and the articulatory movements into harmony with each other. If the expressive movement which follows the ideas is retarded through mechanical causes, as is the case in writing . . ., such anticipations make their appearance with particular ease.'

[1901b, 1215]
Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting-point for a fruitful investigation. Everyone knows how frequently the reader finds that in reading aloud his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly. I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are accustomed to assume will be performed most exactly when done automatically - that is, with scarcely any conscious attention. From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a disturbance of attention by an alien thought which claims consideration.

[1901b, 1216]

Between 'slips of the pen' and 'forgetting' may be inserted the case of someone who forgets to append a signature. An unsigned cheque comes to the same thing as a forgotten cheque. For the significance of a forgetting of a similar kind I will cite a passage from a novel, which Dr. Hanns Sachs came upon:

[1901b, 1217]

(2) I had undertaken to get a lady who was a stranger to Vienna a small strong-box for her documents and money. When I offered my services I had in my mind's eye an unusually vivid picture of a shop-window in the Inner Town in which I was sure I had seen boxes of the kind. I could not, it was true, recall the name of the street, but I felt sure that I would find the shop if I walked through the town, since my memory told me I had passed it on countless occasions. To my chagrin I had no success in finding the shop-window with the strong-boxes, though I walked all over the Inner Town in every direction. I decided that the only course left was to look up the firms of safe-manufacturers in a trades directory, so as to be able to identify the shop on a second walk round the town. Such extreme measures, however, did not prove necessary; among the addresses given in the directory was one which I immediately recognized as the one I had forgotten. It was true that I had passed the shop-window innumerable times - every time, in fact, that I had visited the M. family, who have lived for many years in the same building. Our intimate friendship later gave place to a total estrangement; after that, I fell into the habit - the reasons for which I never considered - of also avoiding the neighbourhood and the house. On my walk through the town in search of the shop-window with the strong-boxes I had passed through every street in the district but this one, which I had avoided as if it were forbidden territory. The motive of unpleasure responsible in the present case for my failure to find my way is easy to recognize. The mechanism of forgetting, however, is not so simple here as in the preceding example. My aversion naturally applied not to the safe-manufacturer but to another person, whom I did not want to think about; and from this latter person it was then transferred to this occasion where it produced the forgetting. The case of 'Burckhard' was very similar; my grudge against one person of this name induced me to make a slip in writing the same name when it referred to someone else. The part there played by identity of name in establishing a connection between two essentially different groups of thoughts was able to be replaced in the example of the shop-window by spatial contiguity, inseparable proximity. This latter case was, incidentally, more firmly knit; there was a second connection there, one involving its subject-matter, for money played a part among the reasons for my estrangement from the family living in the building.

[1901b, 1221]
Of all parapraxes, errors seem to have the least rigid mechanism. That is to say, the occurrence of an error is a quite general indication that the mental activity in question has had to struggle with a disturbing influence of some sort or other; but the particular form that the error takes is not determined by the quality of the concealed disturbing idea. We may add here retrospectively that the same thing can be assumed to be true of many simple cases of slips of the tongue and pen. Every time we make a slip in talking or writing we may infer that there has been a disturbance due to mental processes lying outside our intention; but it must be admitted that slips of the tongue and of the pen often obey the laws of resemblance, of indolence or of the tendency to haste, without the disturbing element succeeding in imposing any part of its own character on the resulting mistake in speech or writing. It is the compliance of the linguistic material which alone makes the determining of the mistakes possible, and at the same time sets the limits up to which the determining can go.

Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that some disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the ‘Apfe’). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

In misreading and slips of the pen there are also plenty of examples in which we can discern a more remote and complicated motivation. 'Across Europe in a Tub' is a disturbance in reading which is explained as being due to the influence of a remote thought, foreign in its essence, arising from a repressed impulse of jealousy and ambition, and utilizing the 'switch-word' 'Beförderung' to form a connection with the indifferent and innocent topic that was being read. In the case of 'Burckhard' the name itself forms a 'switch-word' of this kind.
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a slip of the tongue [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a misreading [Verlesen]), or he may hear wrongly something that has been said to him (a mishearing [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis forgetting [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a name which he nevertheless knows and which he recognizes at once, or he may forget to carry out an intention, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of mislaying [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of losing [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of errors [Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

[1906c, 1889]

[1916-1917, 3136]
Let us take *slips of the tongue* as the most suitable sort of parapraxis for our purpose - though we might equally well have chosen slips of the pen or misreading. We must bear in mind that so far we have only asked when - under what conditions - people make slips of the tongue, and it is only to that question that we have had an answer. But we might direct our interest elsewhere and enquire why it is that the slip occurred in this particular way and no other; and we might take into account what it is that emerges in the slip itself. You will observe that, so long as this question is unanswered and no light thrown on the product of the slip, the phenomenon remains a chance event from the psychological point of view, even though it may have been given a physiological explanation. If I make a slip of the tongue, I might obviously do so in an infinite number of ways, the right word might be replaced by any of a thousand others, it might be distorted in countless different directions. Is there something, then, that compels me in the particular case to make the slip in one special way, or does it remain a matter of chance, of arbitrary choice, and is the question perhaps one to which no sensible answer at all can be given? [1916-1917, 3141]

*Slips of the pen*, to which I now pass, are so closely akin to slips of the tongue that we have nothing new to expect from them. Perhaps we may glean one little further point. The extremely common small slips of the pen, contractions and anticipations of later words (especially of final words) point, once again, to a general dislike of writing and impatience to be done with it. More marked products of miswriting enable one to recognize the nature and aim of the disturbing purpose. If one finds a slip of the pen in a letter, one knows in general that there was something the matter with its author, but one cannot always discover what was going on in him. A slip of the pen is just as often overlooked by the person responsible as is a slip of the tongue. The following is a noteworthy observation. There are, as we know, people who are in the habit of reading through every letter they write before sending it off. Others do not do this as a rule; but if, as an exception, they do so they always come across some conspicuous slip of the pen, which they can then correct. How is this to be explained? It looks as though these people knew that they had made a mistake in writing the letter. Are we really to believe this? [1916-1917, 3175]
An interesting problem attaches to the practical importance of slips of the pen. You may perhaps remember the case of a murderer, H., who found the means of obtaining cultures of highly dangerous pathogenic organisms from scientific institutes by representing himself as a bacteriologist. He then used these cultures for the purpose of getting rid of his near connections by this most modern of methods. Now on one occasion this man complained to the Directors of one of these institutes that the cultures that had been sent to him were ineffective; but he made a slip of the pen, and instead of writing 'in my experiments on mice or guinea-pigs' he wrote quite clearly 'in my experiments on men'.¹ The doctors at the institute were struck by the slip, but, so far as I know, drew no conclusions from it. Well, what do you think? Should not the doctors, on the contrary, have taken the slip of the pen as a confession and started an investigation which would have put an early stop to the murderer's activities? Was not ignorance of our view of parapraxes responsible in this case for an omission of practical significance? Well, I think a slip of the pen like this would certainly have seemed to me most suspicious; but something of great importance stands in the way of using it as a confession. The matter is not as simple as all that. The slip was certainly a piece of circumstantial evidence; but it was not enough in itself to start an investigation. It is true that the slip of the pen said that he was concerned with thoughts of infecting men, but it did not make it possible to decide whether these thoughts were to be taken as a clear intention to injure or as a phantasy of no practical importance. It is even possible that a man who had made a slip like this would have every subjective justification for denying the phantasy and would repudiate it as something entirely foreign to him. You will understand these possibilities still better when later on we come to consider the distinction between psychical and material reality. But this is another instance of a parapraxis acquiring importance from subsequent events.

[1916-1917, 3175]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

¹[1924f, 4109]

[1940b [1938], 5069]
When we come to mistakes in reading and writing, we find that our general approach and our observations in regard to mistakes in speaking hold good here too - not surprisingly, in view of the close kinship between these functions. I shall confine myself here to reporting a few carefully analysed examples, and shall make no attempt to cover every aspect of the phenomena.

(1) I was sitting in a café, turning over the pages of a copy of the *Leipziger Illustrierte* (which I was holding up at an angle), when I read the following legend under a picture that stretched across the page: 'A Wedding Celebration in the Odysee.' It caught my attention; in surprise I took hold of the paper in the proper way and then corrected my error: 'A Wedding Celebration on the Ostee.' How did I come to make this absurd mistake in reading? My thoughts at once turned to a book by Ruths (1898), *Experimentaluntersuchungen über Musikphantome...*, which had occupied me a good deal recently since it trenches on the psychological problems that I have been concerned with. The author promised that he would shortly be bringing out a book to be called 'Analysis and Principles of Dream Phenomena'. Seeing that I have just published an *Interpretation of Dreams* it is not surprising that I should await this book with the keenest interest.

In Ruths' work on music phantoms I found at the beginning of the list of contents an announcement of a detailed inductive proof that the ancient Greek myths and legends have their main source of origin in phantoms of sleep and music, in the phenomena of dreams and also in deliria. Thereupon I at once plunged into the text to find out whether he also realized that the scene in which Odysseus appears before Nausicaä was derived from the common dream of being naked. A friend had drawn my attention to the fine passage in Gottfried Keller's *Der Grüne Heinrich* which explains this episode in the Odyssey as an objective representation of the dreams of a sailor wandering far from home; and I had pointed out the connection with exhibitionist dreams of being naked.¹ I found nothing on the subject in Ruths' book. In this instance it is obvious that my thoughts were occupied with questions of priority.

[1901b, 1193]
How did I come to read in a newspaper one day: 'Im Fass across Europe', instead of 'Zu Fuss'?

Solving this problem caused me prolonged difficulties. The first associations, it is true, indicated that it must have been the tub of Diogenes that I had in mind; and I had recently been reading about the art of the age of Alexander in a history of art. From there it was easy to recall Alexander's celebrated remark: 'If I were not Alexander I should like to be Diogenes.' I also had some dim recollection of a certain Hermann Zeitung¹ who had set out on his travels packed in a trunk. But the train of associations declined to run on further, and I did not succeed in rediscovering the page in the history of art on which the remark had caught my eye. It was not till months later that the problem, which I had meanwhile set aside, suddenly sprang to my mind once more; and this time it brought its solution with it. I recalled the comment of a newspaper article on the strange means of transport that people were then choosing in order to go to Paris for the International Exhibition; and the passage, I believe, went on with a joking account of how one gentleman intended to get himself rolled in a tub to Paris by another gentleman. Needless to say the only motive of these people would be to draw attention to themselves by such folly. Hermann Zeitung was in fact the name of the man who had provided the first instance of such extraordinary methods of transport. It then struck me that I once treated a patient whose pathological anxiety about reading newspapers was to be explained as a reaction against his pathological ambition to see himself in print and to read of his fame in the newspapers. Alexander of Macedon was undoubtedly one of the most ambitious men that ever lived. He even complained that he would find no Homer to sing of his exploits. But how could I possibly have failed to recall that there is another Alexander who is closer to me, that Alexander is the name of my younger brother? I now immediately found the objectionable thought about this other Alexander that had had to be repressed, and what it was that had given rise to it at the present time. My brother is an authority on matters connected with tariffs and transport, and at a certain date he was due to receive the title of professor for his work in teaching at a commercial college. Several years ago my own name had been suggested at the University for the same promotion, without my having obtained it. At the time, our mother expressed her surprise that her younger son was to become a professor before her elder. This had been the situation when I was unable to solve my mistake in reading. Subsequently my brother too met with difficulties; his prospects of becoming professor sank even lower than my own. But at that point the meaning of the misreading suddenly became clear to me; it was as though the fading of my brother's prospects had removed an obstacle. I had behaved as if I was reading of my brother's appointment in the newspaper and was saying to myself: 'How curious that a person can appear in the newspaper (i.e. can be appointed professor) on account of such stupidities (which is what his profession amounts to)!' Afterwards I had no difficulty in finding the passage about Hellenistic art in the age of Alexander, and to my astonishment convinced myself that in my previous search I had repeatedly read parts of the same page and had each time passed over the relevant sentence as if I was under the dominance of a negative hallucination. However, this sentence did not contain anything at all to enlighten me - anything that would have deserved to be forgotten. I suspect that the symptom consisting of my failure to find the passage in the book was only formed with the purpose of leading me astray. I was intended to search for a continuation of the train of thought in the place where my enquiries encountered an obstacle - that is, in some idea connected with Alexander of Macedon; in this way I was to be more effectively diverted from my brother of the same name. In fact the device was entirely successful; all my efforts were directed towards rediscovering the lost passage in the history of art.

[1901b, 1194]
In this case the ambiguity of the word ‘Beförderung’ forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

[1901b, 1194]

For in a very large number of cases it is the reader's preparedness that alters the text and reads into it something which he is expecting or with which he is occupied. The only contribution towards a misreading which the text itself need make is that of affording some sort of resemblance in the verbal image, which the reader can alter in the sense he requires. Merely glancing at the text, especially with uncorrected vision, undoubtedly increases the possibility of such an illusion, but it is certainly not a necessary precondition for it.

[1901b, 1198]

The reader's profession or present situation, too, determines the outcome of his misreading. A philologist, whose most recent, and excellent, works had brought him into conflict with his professional colleagues, read 'Sprachstrategie [language strategy]' in mistake for 'Schachstrategie [chess strategy]' - A man who was taking a walk in a strange town just when the action of his bowels was timed to occur by a course of medical treatment read the word 'Closet-House' on a large sign on the first storey of a tall shop-building. His satisfaction on seeing it was mixed with a certain surprise that the obliging establishment should be in such an unusual place. The next moment, however, his satisfaction vanished; a more correct reading of the word on the sign was 'Corset-House'.

[1901b, 1199]

(10) In a second group of cases the part which the text contributes to the misreading is a much larger one. It contains something which rouses the reader's defences - some information or imputation distressing to him - and which is therefore corrected by being misread so as to fit in with a repudiation or with the fulfilment of a wish. In such cases we are of course obliged to assume that the text was first correctly understood and judged by the reader before it underwent correction, although his consciousness learnt nothing of this first reading. Example (3) above is of this kind; and I include here a further, highly topical one given by Eitingon (1915), who was at the military hospital at Igló at the time.

[1901b, 1200]

Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting-point for a fruitful investigation. Everyone knows how frequently the reader finds that in reading aloud his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly. I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are accustomed to assume will be performed most exactly when done automatically - that is, with scarcely any conscious attention. From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a disturbance of attention by an alien thought which claims consideration.

[1901b, 1216]
A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the 'Apfe'). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

[1901b, 1342]

In misreading and slips of the pen there are also plenty of examples in which we can discern a more remote and complicated motivation. 'Across Europe in a Tub' is a disturbance in reading which is explained as being due to the influence of a remote thought, foreign in its essence, arising from a repressed impulse of jealousy and ambition, and utilizing the 'switch-word' 'Beförderung' to form a connection with the indifferent and innocent topic that was being read. In the case of 'Burckhard' the name itself forms a 'switch-word' of this kind.

[1901b, 1342]

Lichtenberg's jokes are outstanding above all on account of their intellectual content and the certainty with which they hit their mark. Goethe was quite right in saying of that author that in fact his joking and jesting ideas concealed problems; it would have been even more correct to say that they touch on the solution of problems. When, for instance, he remarked as a joke: 'He had read Homer so much that he always read "Agamemnon" instead of "angenommen"' - the technique used is 'stupidity' plus 'similarity of sound' - Lichtenberg had discovered nothing less than the secret of misreading.¹

[1905c, 1690]
LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a *slip of the tongue* [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a *misreading* [Verlesen]), or he may hear wrongly something that has been said to him (a *mishearing* [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis *forgetting* [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a *name* which he nevertheless knows and which he recognizes at once, or he may forget to carry out an *intention*, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of *mislaying* [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of *losing* [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of *errors* [Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

[1916-1917, 3136]

Let us take *slips of the tongue* as the most suitable sort of parapraxis for our purpose - though we might equally well have chosen slips of the pen or misreading. We must bear in mind that so far we have only asked when - under what conditions - people make slips of the tongue, and it is only to that question that we have had an answer. But we might direct our interest elsewhere and enquire why it is that the slip occurred in this particular way and no other; and we might take into account what it is that emerges in the slip itself. You will observe that, so long as this question is unanswered and no light thrown on the product of the slip, the phenomenon remains a chance event from the psychological point of view, even though it may have been given a physiological explanation. If I make a slip of the tongue, I might obviously do so in an infinite number of ways, the right word might be replaced by any of a thousand others, it might be distorted in countless different directions. Is there something, then, that compels me in the particular case to make the slip in one special way, or does it remain a matter of chance, of arbitrary choice, and is the question perhaps one to which no sensible answer at all can be given?

[1916-1917, 3141]
With *misreading* we come to a psychical situation which differs sensibly from that in slips of the tongue or pen. Here one of the two mutually competing purposes is replaced by a sensory stimulation and is perhaps on that account less resistant. What one is going to read is not a derivative of one's own mental life like something one proposes to write. In a great majority of cases, therefore, a misreading consists in a complete substitution. One replaces the word that is to be read by another, without there necessarily being any connection of content between the text and the product of the misreading, which depends as a rule on verbal similarity. The best member of this group is Lichtenberg's 'Agamemnon' for 'angenommen'. If we want to discover the disturbing purpose which produced the misreading we must leave the text that has been misread entirely aside and we may begin the analytic investigation with the two questions: what is the first association to the product of the misreading? and in what situation did the misreading occur? Occasionally a knowledge of the latter is alone enough to explain the misreading. For instance, a man under the pressure of an imperious need was wandering about in a strange town when he saw the word 'Closet-House' on a large notice board on the first storey of a building. He had just enough time to feel surprised at the notice-board being placed so high up before discovering that, strictly speaking, what he should have read was 'Corset-House'. In other cases a misreading precisely of the kind which is quite independent of the content of the text may call for a detailed analysis which cannot be carried through without practice in the technique of psycho-analysis and without reliance on it. As a rule, however, it is not so hard to find the explanation of a misreading: the word substituted immediately betrays, as in the Agamemmon example, the circle of ideas from which the disturbance has arisen. In this time of war, for instance, it is a very usual thing for the names of towns and generals and the military terms that are constantly buzzing around us to be read wherever a similar word meets our eyes. Whatever interests and concerns us puts itself in the place of what is strange and still uninteresting. After-images of thoughts trouble new perceptions.

[1916-1917, 3176]

With misreading, too, there is no lack of cases of another sort, in which the text of what is read itself arouses the disturbing purpose, which thereupon, as a rule, turns it into its opposite. What we ought to read is something unwished-for, and analysis will convince us that an intense wish to reject what we have read must be held responsible for its alteration.

[1916-1917, 3177]

In the more frequent cases of misreading which we mentioned first, we miss two factors to which we have assigned an important role in the mechanism of parapraxes: a conflict between two purposes and a forcing-back of one of them which takes its revenge by producing a parapraxis. Not that anything contrary to this occurs in misreading. But the prominence of the thought that leads to the misreading is far more noticeable than the forcing-back which it may have experienced previously.

[1916-1917, 3177]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed ‘thoughtlessly’, and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]
In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a **slip of the tongue** [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a **misreading** [Verlesen]), or he may hear wrongly something that has been said to him (a **mishearing** [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis **forgetting** [Vergessen] - not, however, a permanent forgetting but only a temporary one. I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
¹ For the sake of preserving the unity of the subject I may perhaps interrupt the general arrangement I have adopted, and, in addition to what I have said above, point out that people's memories show a particular partiality in money matters. Paramnesias of having already paid for something can often be very obstinate, as I know from my own experience. When free play is given to avaricious aims apart from the serious interests of life - for fun, in fact -, as in card-playing, the most honourable men show an inclination to make errors and mistakes in memory and counting, and, without quite knowing how, they even find themselves involved in petty cheating. The psychically refreshing nature of these games is partly due to liberties of this kind. We must admit the truth of the saying that in play we can get to know a person's character - that is, if we are not thinking of his manifest character. - If waiters still make unintentional mistakes in the bill, the same explanation obviously applies to them. - In commercial circles a certain delay can frequently be observed in paying out sums of money (for settling accounts and so on) which in point of fact brings the owner no profit and can only be understood in psychological terms - as an expression of a counter-will against paying out money. - [The next sentence was added in 1912:] Brill puts the matter with epigrammatic brevity: 'We are more apt to mislay letters containing bills than cheques.' - The fact that women in particular evince a special amount of unpleasure at paying their doctor is connected with the most intimate impulses, which are very far from having been elucidated. Women patients have usually forgotten their purse and so cannot pay at the time of consultation; they then regularly forget to send the fee after they reach home, and thus arrange things so that one has treated them for nothing - 'for the sake of their beaux yeux'. They pay one, as it were, by the sight of their countenance.

Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 19011 published a work¹ in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

[1901b, 1238]

[1906c, 1889]
The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

[1913j, 2804]

[1916-1917, 3136]

[1924f, 4109]
Thus we have attributed three qualities to psychical processes: they are either conscious, preconscious or unconscious. The division between the three classes of material which possess these qualities is neither absolute nor permanent. What is preconscious becomes conscious, as we have seen, without any assistance from us; what is unconscious can, through our efforts, be made conscious, and in the process we may have a feeling that we are often overcoming very strong resistances. When we attempt to do this with someone else, we should not forget that the conscious filling-in of the gaps in his perceptions - the construction we are presenting him with - does not mean as yet that we have made the unconscious material in question conscious to him. All that is true so far is that the material is present in him in two records, once in the conscious reconstruction he has been given, and besides this in its original unconscious state. Our continued efforts usually succeed eventually in making this unconscious material conscious to him himself, as a result of which the two records are brought to coincide. The amount of effort we have to use, by which we estimate the resistance against the material becoming conscious, varies in magnitude in individual cases. For instance, what comes about in an analytic treatment as a result of our efforts can also occur spontaneously: material which is ordinarily unconscious can transform itself into preconscious material and then becomes conscious - a thing that happens to a large extent in psychotic states. From this we infer that the maintenance of certain internal resistances is a *sine qua non* of normality. A relaxation of resistances such as this, with a consequent pushing forward of unconscious material, takes place regularly in the state of sleep, and thus brings about a necessary precondition for the construction of dreams. Conversely, preconscious material can become temporarily inaccessible and cut off by resistances, as happens when something is temporarily forgotten or escapes the memory; or a preconscious thought can even be temporarily put back into the unconscious state, as seems to be a precondition in the case of jokes. We shall see that a similar transformation back of preconscious material or processes into the unconscious state plays a great part in the causation of neurotic disorders.

[1940a [1938], 4970]
Among the various factors, therefore, which contribute to a failure in recollection or a loss of memory, the part played by repression must not be overlooked; and it can be demonstrated not only in neurotics but (in a manner that is qualitatively the same) in normal people as well. It may be asserted quite generally that the ease (and ultimately the faithfulness, too) with which a given impression is awakened in the memory depends not only on the psychical constitution of the individual, the strength of the impression when it was fresh, the interest directed towards it at the time, the psychical constellation at the present time, the interest that is now devoted to its awakening, the connections into which the impression has been drawn, and so on - not only on such things but also on the favourable or unfavourable attitude of a particular psychical factor which refuses to reproduce anything that might liberate unpleasure, or that might subsequently lead to the liberation of unpleasure. Thus the function of memory, which we like to regard as an archive open to anyone who is curious, is in this way subjected to restriction by a trend of the will, just as is any part of our activity directed to the external world. Half the secret of hysterical amnesia is uncovered when we say that hysterical people do not know what they do not want to know; and psycho-analytic treatment, which endeavours to fill up such gaps of memory in the course of its work, leads us to the discovery that the bringing back of those lost memories is opposed by a certain resistance which has to be counterbalanced by work proportionate to its magnitude. In the case of psychical processes which are on the whole normal, it cannot, of course, be claimed that the influence of this one-sided factor in the revival of memories in any way regularly overcomes all the other factors that must be taken into account.¹

¹ On the purposes of forgetting in general see my short paper on the psychical mechanism of forgetting (Freud, 1898b). [Added 1909:] Later included as the first chapter in my Psychopathology of Everyday Life (Freud, 1901b)

In the 1898 volume of the Monatschrift für Psychiatrie und Neurologie I published under the title 'The Psychical Mechanism of Forgetfulness' a short paper the substance of which I shall recapitulate here and take as the starting-point for more extensive discussions. In it I applied psychological analysis to the frequent circumstance of proper names being temporarily forgotten, by exploring a highly suggestive example drawn from my self-observation; and I reached the conclusion that this particular instance (admittedly commonplace and without much practical significance), in which a psychical function - the memory - refuses to operate, admits of an explanation much more far-reaching than that which the phenomenon is ordinarily made to yield.

¹ On the purposes of forgetting in general see my short paper on the psychical mechanism of forgetting (Freud, 1898b). [Added 1909:] Later included as the first chapter in my Psychopathology of Everyday Life (Freud, 1901b)

Cyclamens, I reflected, were my wife's favourite flowers and I reproached myself for so rarely remembering to bring her flowers, which was what she liked. - The subject of 'bringing flowers' recalled an anecdote which I had recently repeated to a circle of friends and which I had used as evidence in favour of my theory that forgetting is very often determined by an unconscious purpose and that it always enables one to deduce the secret intentions of the person who forgets. A young woman was accustomed to receiving a bouquet of flowers from her husband on her birthday. One year this token of his affection failed to appear, and she burst into tears. Her husband came in and had no idea why she was crying till she told him that to-day was her birthday. He clasped his hand to his head and exclaimed: 'I'm so sorry, but I'd quite forgotten. I'll go out at once and fetch your flowers.' But she was not to be consoled; for she recognized that her husband's forgetfulness was a proof that she no longer had the same place in his thoughts as she had formerly. - This lady, Frau L., had met my wife two days before I had the dream, had told her that she was feeling quite well and enquired after me. Some years ago she had come to me for treatment.

[1900a, 567]

[1900a, 953]
Perhaps it is not superfluous to remark that the conditions which psychologists assume to be necessary for reproducing and for forgetting, and which they look for in certain relations and dispositions, are not inconsistent with the above explanation. All we have done is, in certain cases, to add a motive to the factors that have been recognized all along as being able to bring about the forgetting of a name; and, in addition, we have elucidated the mechanism of false recollection (paramnesia). These dispositions are indispensable to our case as well, in order to make it possible for the repressed element to get hold of the missing name by association and draw it with itself into repression. In the case of another name with more favourable conditions for reproduction this perhaps would not happen. It is probable indeed that a suppressed element always strives to assert itself elsewhere, but is successful in this only when suitable conditions meet it half way. At other times the suppression succeeds without any functional disturbance, or, as we can justly say, without any symptom.
[1901b, 1105]

So much for the dissimilarity and the inner affinity between these two typical specimens of the forgetting of words. We have got to know a second mechanism of forgetting - the disturbance of a thought by an internal contradiction which arises from the repressed. Of the two processes this is, I think, the easier to understand; and we shall repeatedly come across it again in the course of this discussion.
[1901b, 1111]

We are perhaps not ready yet to appreciate all the aspects of this pretty example. The following is a simpler specimen, though here it was not a name but a foreign word that was forgotten, from a motive arising out of the situation. (We can already see that we are dealing with the same processes, whether they apply to proper names, first names, foreign words or sets of words.) Here it was a case of a young man forgetting the English word for ‘Gold’ - which is identical with the German word - so as to find an opportunity for carrying out an action he desired.
[1901b, 1129]

I shall accordingly cite some striking examples of forgetting: most of which I observed in myself. I distinguish the forgetting of impressions and experiences - i.e., of knowledge - from the forgetting of intentions - i.e., from omission to do things. I can state in advance the invariable result of the entire series of observations: in every case the forgetting turned out to be based on a motive of unpleasure.
[1901b, 1220]
Finding fault with one's wife, a friendship which has turned into its opposite, a doctor's error in
diagnosis, a rebuff by some one with similar interests, borrowing someone else's ideas - it can
hardly be accidental that a collection of instances of forgetting, gathered at random, should
require me to enter into such distressing subjects in explaining them. On the contrary, I suspect
that everyone who is willing to enquire into the motives behind his lapses of memory will be able
to record a similar sample list of objectionable subjects. The tendency to forget what is
disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless
developed with different degrees of strength in different people. It is probable that many
instances of disowning which we encounter in our medical work are to be traced to forgetting.¹ It
is true that our view of such forgetting limits the distinction between the two forms of behaviour
to purely psychological factors and allows us to see in both modes of reaction the expression of
the same motive. Of all the numerous examples of the disavowal of unpleasant memories which
I have observed on the part of relatives of patients, one remains in my recollection as especially
singular. A mother was giving me information about the childhood of her neurotic son, now in
his puberty, in the course of which she said that, like his brothers and sisters, he had been a
bed-wetter till late on - a fact which is certainly of some significance in the case history of a
neurotic patient. A few weeks later, when she was wanting to find out about the progress of the
treatment, I had occasion to draw her attention to the signs of a constitutional disposition to
illness on the young man's part, and in doing so I referred to the bed-wetting which she had
brought out in the anamnesis. To my astonishment she contested this fact in regard both to him
and to the other children, and asked me how I could know it. Finally I told her that she herself
had informed me a short time before. She must therefore have forgotten it.²

¹ [Footnote added 1907:] If we ask someone whether he suffered from a luetic infection ten or fifteen
years ago, we are too apt to overlook the fact that, from a psychical point of view, he will have regarded
this illness quite differently from, let us say, an acute attack of rheumatism. - In the anamneses which
parents give about their daughters' neurotic illnesses, it is hardly possible to distinguish with certainty
between what has been forgotten and what is being concealed, since everything standing in the way of a
girl's future marriage is systematically set aside, i.e. repressed, by the parents. - [Added 1910:] A man who
had recently lost his dearly-loved wife from an affection of the lungs reported the following instance to me
in which misleading answers given to the doctor's enquiries could only be ascribed to forgetting of this
kind. 'As my poor wife's pleuritis had still not improved after many weeks, Dr. P. was called into
consultation. In taking the anamnesis he asked the usual questions, including whether there were any
cases of lung illness in my wife's family. My wife said there were none and I could not recall any either. As
Dr. P. was leaving, the conversation turned, as though accidentally, to the subject of excursions and my
wife said: "Yes, it's a long journey, too, to Langersdorf, where my poor brother's buried." This brother died
about fifteen years ago after suffering for years from tuberculosis. My wife was very fond of him and often
spoken to me about him. In fact it now occurred to me that at that time her pleuritis was diagnosed she
was very worried and remarked gloomily: "My brother died of a lung complaint too." But now, the memory
was so strongly repressed that even after her remark about the excursion to Langersdorf she was not led
to correct the information she had given about illnesses in her family. I myself became aware of the lapse
of memory at the very moment she spoke of Langersdorf.' - [Added 1912:] A completely analogous
experience is related by Jones in the work to which I have referred several times already. A physician,
whose wife suffered from an abdominal complaint the diagnosis of which was uncertain, remarked by way
of comforting her: 'It is fortunate at any rate that there has been no tuberculosis in your family.' 'Have you
forgotten', answered his wife in the greatest astonishment, 'that my mother died of tuberculosis and that
my sister recovered from it only after having been given up by the doctors?'

² [1901b, 1228]
There are thus abundant signs to be found in healthy, non-neurotic people that the recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance.¹ But the full significance of this fact can be estimated only when the psychology of neurotic people is investigated. We are forced to regard as one of the main pillars of the mechanism supporting hysterical symptoms an elementary endeavour of this kind to fend off ideas that can arouse feelings of unpleasure - an endeavour which can only be compared with the flight-reflex in the presence of painful stimuli. The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect in every case, that in the interplay of psychical forces it may not come up against factors which, for other purposes, aim at the opposite effect and bring it about in spite of the defensive trend. It may be surmised that the architectonic principle of the mental apparatus lies in a stratification - a building up of superimposed agencies; and it is quite possible that this defensive endeavour belongs to a lower psychical agency and is inhibited by higher agencies. At all events, if we can trace back processes such as those found in our examples of forgetting to this defensive trend, that fact speaks in favour of its existence and power.¹(As we have seen, a number of things are forgotten on their own account; where this is not possible, the defensive trend shifts its target and causes something else related to the target at least to be forgotten, something less important which has come into associative connection with the thing that is really objectionable.

¹ [Footnote added 1910:] A. Pick (1905) has recently brought together a number of quotations from authors who appreciate the influence of affective factors on the memory and who - more or less clearly - recognize the contribution towards forgetting made by the endeavour to fend off unpleasure. But none of us has been able to portray the phenomenon and its psychological basis so exhaustively and at the same time so impressively as Nietzsche in one of his aphorisms (Jenseits von Gut und Böse, IV, 68): "'I did this", says my Memory. "I cannot have done this", says my Pride and remains inexorable. In the end - Memory yields.'

The view developed here, that distressing memories succumb especially easily to motivated forgetting, deserves to find application in many spheres where no attention, or too little, has so far been paid to it. Thus it seems to me that it has still not yet been sufficiently strongly emphasized in assessing testimony in courts of law,¹ where the process of putting a witness on oath is clearly expected to have much too great a purifying influence on the play of his psychical forces. It is universally acknowledged that where the origin of a people's traditions and legendary history are concerned, a motive of this kind, whose aim is to wipe from memory whatever is distressing to national feeling, must be taken into consideration. Closer investigation would perhaps reveal a complete analogy between the ways in which the traditions of a people and the childhood memories of the individual come to be formed. - The great Darwin laid down a 'golden rule' for the scientific worker based on his insight into the part played by unpleasure as a motive for forgetting.²

¹ [1901b, 1229]

² [1901b, 1230]
One is on different ground when it comes to examining forgetting in its proper sense - that is, the forgetting of past experiences. (To distinguish them from forgetting in the stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapter I and II, as 'slipping the memory', and the forgetting of intentions as 'omissions'.) The basic determinants of the normal process of forgetting are unknown.¹ We are also reminded that not everything is forgotten that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, in so far as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

[1901b, 1343]

On the other hand we must assume, or we can convince ourselves by a psychological examination of other people, that the very same impressions that we have forgotten have none the less left the deepest traces on our minds and have had a determining effect upon the whole of our later development. There can, therefore, be no question of any real abolition of the impressions of childhood, but rather of an amnesia similar to that which neurotics exhibit for later events, and of which the essence consists in a simple withholding of these impressions from consciousness, viz., in their repression. But what are the forces which bring about this repression of the impressions of childhood? Whoever could solve this riddle would, I think, have explained hysterical amnesia as well.

[1905d, 1498]
With the young man, things had taken a different turn. Archaeology took hold of him and left him with an interest only in women of marble and bronze. His childhood friendship, instead of being strengthened into a passion, was dissolved, and his memories of it passed into such profound forgetfulness that he did not recognize or notice his early playmate when he met her in society. It is true that when we look further we may doubt whether ‘forgetfulness’ is the correct psychological description of the fate of these memories in our young archaeologist. There is a kind of forgetting which is distinguished by the difficulty with which the memory is awakened even by a powerful external summons, as though some internal resistance were struggling against its revival. A forgetting of this kind has been given the name of ‘repression’ in psychopathology; and the case which our author has put before us seems to be an example of this repression. Now we do not know in general whether the forgetting of an impression is linked with the dissolution of its memory-trace in the mind; but we can assert quite definitely of ‘repression’ that it does not coincide with the dissolution or extinction of the memory. What is repressed cannot, it is true, as a rule make its way into memory without more ado; but it retains a capacity for effective action, and, under the influence of some external event, it may one day bring about psychical consequences which can be regarded as products of a modification of the forgotten memory and as derivatives of it and which remain unintelligible unless we take this view of them. We have already seemed to recognize in Norbert Hanold’s phantasies about Gradiva derivatives of his repressed memories of his childhood friendship with Zoe Bertgang. A return like this of what has been repressed is to be expected with particular regularity when a person’s erotic feelings are attached to the repressed impressions - when his erotic life has been attacked by repression. In such cases the old Latin saying holds true, though it may have been coined first to apply to expulsion by external influences and not to internal conflicts: ‘Naturam expelles furca, tamen usque recurret.’¹ But it does not tell us everything. It only informs us of the fact of the return of the piece of nature that has been repressed; it does not describe the highly remarkable manner of that return, which is accomplished by what seems like a piece of malicious treachery. It is precisely what was chosen as the instrument of repression - like the ‘furca’ of the Latin saying - that becomes the vehicle for the return: in and behind the repressing force, what is repressed proves itself victor in the end. This fact, which has been so little noticed and deserves so much consideration, is illustrated - more impressively than it could be by many examples - in a well known etching by Félicien Rops; and it is illustrated in the typical case of repression in the life of saints and penitents. An ascetic monk has fled, no doubt from the temptations of the world, to the image of the crucified Saviour. And now the cross sinks down like a shadow, and in its place, radiant, there rises instead the image of a voluptuous, naked woman, in the same crucified attitude. Other artists with less psychological insight have, in similar representations of temptation, shown Sin, insolent and triumphant, in some position alongside of the Saviour on the cross. Only Rops has placed Sin in the very place of the Saviour on the cross. He seems to have known that, when what has been repressed returns, it emerges from the repressing force itself. [1907a, 1837]

¹ This was untrue. See his exclamation in front of the lions’ cage on p. 2005. It was probably the beginning of amnesia resulting from repression. [1909b, 2024]
The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913], 2804

The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

[1913], 2807

The forgetting of proper names and foreign names, as well as of foreign words, can similarly be traced back to a counter-intention, which is aimed either directly or indirectly against the name concerned. I have already given you several instances of direct dislike. But indirect causation is particularly frequent in these cases and can usually only be established by careful analyses. For instance, during the present war, which has obliged us to give up so many of our former enjoyments, our power of remembering proper names has suffered greatly as the result of the strangest associations. A short time ago I found that I was unable to reproduce the name of the innocent Moravian town of Bisenz; and analysis showed that what was responsible for this was not any direct hostility to it but its resemblance in sound to the name of the Palazzo Bisenzi in Orvieto which I had repeatedly enjoyed visiting in the past. Here for the first time, in this reason for objecting to remembering a name, we come across a principle which will later on reveal its enormous importance for the causation of neurotic symptoms: the memory's disinclination to remembering anything which is connected with feelings of unpleasure and the reproduction of which would renew the unpleasure. This intention to avoid unpleasure arising from a recollection or from other psychical acts, this psychical flight from unpleasure, may be recognized as the ultimate operative motive not only for the forgetting of names but for many other parapraxes, such as omissions, errors, and so on.

[1916-1917, 3180]
The forgetting of impressions and experiences demonstrates much more clearly and exclusively than the forgetting of names the operation of the purpose of keeping disagreeable things out of memory. The whole field of this kind of forgetting does not, of course, fall within the class of parapraxes, but only such cases as, measured by the standard of our usual experience, seem to us striking and unjustified: for instance, when the forgetting affects impressions that are too fresh or important, or when the missing memory tears a gap in what is otherwise a well remembered chain of events. Why and in what way we are able to forget in general, and among other things experiences which have certainly left the deepest impression upon us, such as the events of our earliest childhood years, - that is quite another problem, in which fending off unpleasurable impulses plays a certain part but is far from being the whole explanation. It is an undoubted fact that disagreeable impressions are easily forgotten. Various psychologists have noticed it and the great Darwin was so much impressed by it that he made it 'a golden rule' to note down with especial care any observations which seemed unfavourable to his theory, since he had convinced himself that precisely they would not remain in his memory.

Thus we have attributed three qualities to psychical processes: they are either conscious, preconscious or unconscious. The division between the three classes of material which possess these qualities is neither absolute nor permanent. What is preconscious becomes conscious, as we have seen, without any assistance from us; what is unconscious can, through our efforts, be made conscious, and in the process we may have a feeling that we are often overcoming very strong resistances. When we attempt to do this with someone else, we should not forget that the conscious filling-in of the gaps in his perceptions - the construction we are presenting him with - does not mean as yet that we have made the unconscious material in question conscious to him. All that is true so far is that the material is present in him in two records, once in the conscious reconstruction he has been given, and besides this in its original unconscious state. Our continued efforts usually succeed eventually in making this unconscious material conscious to him himself, as a result of which the two records are brought to coincide. The amount of effort we have to use, by which we estimate the resistance against the material becoming conscious, varies in magnitude in individual cases. For instance, what comes about in an analytic treatment as a result of our efforts can also occur spontaneously: material which is ordinarily unconscious can transform itself into preconscious material and then becomes conscious - a thing that happens to a large extent in psychotic states. From this we infer that the maintenance of certain internal resistances is a sine qua non of normality. A relaxation of resistances such as this, with a consequent pushing forward of unconscious material, takes place regularly in the state of sleep, and thus brings about a necessary precondition for the construction of dreams.

Conversely, preconscious material can become temporarily inaccessible and cut off by resistances, as happens when something is temporarily forgotten or escapes the memory; or a preconscious thought can even be temporarily put back into the unconscious state, as seems to be a precondition in the case of jokes. We shall see that a similar transformation back of preconscious material or processes into the unconscious state plays a great part in the causation of neurotic disorders.
The chief importance however of the *aliquis* example lies in another of the ways in which it differs from the *Signorelli* specimen. In the latter, the reproducing of a name was disturbed by the after-effect of a train of thought begun just before and then broken off, whose content, however, had no clear connection with the new topic containing the name of Signorelli. Contiguity in time furnished the only relation between the repressed topic and the topic of the forgotten name; but this was enough to enable the two topics to find a connection in an external association.¹ Nothing on the other hand can be seen in the *aliquis* example of an independent repressed topic of this sort, which had engaged conscious thinking directly before and then left its echoes in a disturbance. The disturbance in reproduction occurred in this instance from the very nature of the topic hit upon in the quotation, since opposition unconsciously arose to the wishful idea expressed in it. The circumstances must be construed as follows. The speaker had been deploring the fact that the present generation of his people was deprived of its full rights; a new generation, he prophesied like Dido, would inflict vengeance on the oppressors. He had in this way expressed his wish for descendants. At this moment a contrary thought intruded. 'Have you really so keen a wish for descendants? That is not so. How embarrassed you would be if you were to get news just now that you were to expect descendants from the quarter you know of. No: no descendants - however much we need them for vengeance.' This contradiction then asserts itself by exactly the same means as in the *Signorelli* example - by setting up an external association between one of its ideational elements and an element in the wish that has been repudiated; this time, indeed, it does so in a most arbitrary fashion by making use of a roundabout associative path which has every appearance of artificiality. A second essential in which the present case agrees with the *Signorelli* instance is that the contradiction has its roots in repressed sources and derives from thoughts that would lead to a diversion of attention.

¹[1901b, 1111]

So much for the dissimilarity and the inner affinity between these two typical specimens of the forgetting of words. We have got to know a second mechanism of forgetting - the disturbance of a thought by an internal contradiction which arises from the repressed. Of the two processes this is, I think, the easier to understand; and we shall repeatedly come across it again in the course of this discussion.

[1901b, 1111]

Observations such as those mentioned above, of what happens when a portion of a set of words in a foreign tongue is forgotten, may make us curious to know whether the forgetting of sets of words in our own language demands an essentially different explanation. We are not usually surprised, it is true, if a formula learnt by heart, or a poem, can be reproduced only inaccurately some time later, with alterations and omissions. Since, however, this forgetting does not have a uniform effect on what has been learnt as a whole but seems on the contrary to break off isolated portions of it, it may be worth the trouble to submit to analytic investigation a few instances of such faulty reproduction.

[1901b, 1112]

I have since undertaken numerous other analyses where forgetting or faulty reproduction of a set of words took place, and the consistent result of these investigations has inclined me to assume that the mechanism of forgetting demonstrated above in the instances of 'aliquis' and 'The Bride of Corinth' has an almost universal validity. It is generally a little awkward to give an account of such analyses since, like those just mentioned, they constantly lead to matters which are of an intimate sort and are distressing to the person analysed. I shall therefore not give any further examples. What is common to all these cases, irrespective of the material, is the fact that the forgotten or distorted matter is brought by some associative path into connection with an unconscious thought-content - a thought-content which is the source of the effect manifested in the form of forgetting.

[1901b, 1117]
Errors of memory are distinguished from forgetting accompanied by paramnesia by the single feature that in the former the error (the paramnesia) is not recognized as such but finds credence. The use of the term 'error', however, seems to depend on yet another condition. we have remembered it wrongly. We speak of 'being in error' rather than of 'remembering wrongly' where we wish to emphasize the characteristic of objective reality in the psychical material which we are trying to reproduce - that is to say, where what we are trying to remember is something different from a fact of our own psychical life: something, rather, that is open to confirmation or refutation by the memory of other people. The antithesis to an error of memory in this sense is ignorance.

[1901b, 1292]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]
The phenomenon of forgetfulness, which I should like to describe and then go on to explain in this paper, has doubtless been experienced by everyone in himself or been observed by him in others. It affects in particular the use of proper names - *nomen propria* - and it manifests itself in the following manner. In the middle of carrying on a conversation we find ourselves obliged to confess to the person we are talking to that we cannot hit on a name we wanted to mention at that moment, and we are forced to ask for his - usually ineffectual - help. 'What is his name? I know it so well. It's on the tip of my tongue. Just this minute it's escaped me.' An unmistakable feeling of irritation, similar to that which accompanies motor aphasia, now attends our further efforts to find the name, which we feel we had in our head only a moment before. In appropriate instances two accompanying features deserve our notice. First, an energetic deliberate concentration of the function which we call attention proves powerless, however long it is continued, to find the lost name. Secondly, in place of the name we are looking for, another name promptly appears, which we recognize as incorrect and reject, but which persists in coming back. Or else, instead of a substituted name, we find in our memory a single letter or syllable, which we. We say, for instance: 'It begins with a "B".' If we finally succeed, in one way or another, in discovering what the name is, we find in the great majority of cases that it does not begin with a 'B' and does not in fact contain the letter 'B' at all.

The best procedure for getting hold of the missing name is, as is generally known, 'not to think of it' - that is, to divert from the task that part of the attention over which one has voluntary control. After a while, the missing name 'shoots' into one's mind; one cannot prevent oneself from calling it out aloud - to the great astonishment of one's companion, who has already forgotten the episode and who has in any case only taken very little interest in the speaker's efforts. 'Really,' he is apt to say, 'it makes no difference what the man is called; only go on with your story.' The whole of the time until the matter is cleared up, and even after the intentional diversion, one feels preoccupied to a degree which cannot in fact be explained by the amount of interest possessed by the whole affair.

It is perhaps not without interest for its own sake to be able to see into the history of a psychical event of this kind, which is among the most trivial disturbances that can affect the control of the psychical apparatus and which is compatible with an otherwise untroubled state of psychical health. But the example elucidated here receives an immensely added interest when we learn that it may serve as nothing more nor less than a model for the pathological processes to which the psychical symptoms of the psychoneuroses - hysteria, obsessions and paranoia - owe their origin. In both cases we find the same elements and the same play of forces between those elements. In the same manner as here and by means of similar superficial associations, a repressed train of thought takes possession in neuroses of an innocent recent impression and draws it down with itself into repression. The same mechanism which causes the substitute names 'Botticelli' and 'Boltraffio' to emerge from 'Signorelli' (a substitution by means of intermediate or compromise ideas) also governs the formation of obsessional thoughts and paranoid paramnesias. Again, we have seen that such cases of forgetfulness have the characteristic of liberating continuous unpleasure till the moment the problem is solved - a characteristic which is unintelligible apart from this, and something which was in fact unintelligible to the person I was talking to; but there is a complete analogy to it in the way in which collections of repressed thoughts attach their capacity for producing affect to some symptom whose psychical content seems to our judgement totally unsuited to such a liberation of affect. Finally, the resolution of the whole tension by a communication of the correct name from an external quarter is itself a good example of the efficacy of psycho-analytic therapy, which aims at correcting the repressions and displacements and which removes the symptoms by re-instating the genuine psychical object.
[Footnote added 1909:] Schiller was not born at any Marburg, but at Marbach, as every German schoolboy knows, and as I knew myself. This was one more of those mistakes (see above, p. 681 n.) which slip in as a substitute for an intentional falsification at some other point, and which I have tried to explain in my Psychopathology of Everyday Life.
[1900a, 901]

In the 1898 volume of the Monatschrift für Psychiatrie und Neurologie I published under the title of 'The Psychical Mechanism of Forgetfulness' a short paper the substance of which I shall recapitulate here and take as the starting-point for more extensive discussions. In it I applied psychological analysis to the frequent circumstance of proper names being temporarily forgotten, by exploring a highly suggestive example drawn from my self-observation; and I reached the conclusion that this particular instance (admittedly commonplace and without much practical significance), in which a psychical function - the memory - refuses to operate, admits of an explanation much more far-reaching than that which the phenomenon is ordinarily made to yield.
[1901b, 1101]

If a psychologist were asked to explain why it is that on so many occasions a proper name which we think we know perfectly well fails to enter our heads, he would, unless I am much mistaken, be satisfied with answering that proper names succumb more easily to the process of being forgotten than other kinds of memory-content. He would bring forward the plausible reasons why proper names should thus be singled out for special treatment, but would not suspect that any other conditions played their part in such occurrences.
[1901b, 1101]

My close preoccupation with the phenomenon of names being temporarily forgotten arose out of my observation of certain characteristics which could be recognized sufficiently clearly in individual cases, though not, it is true, in all of them. These are cases in which a name is in fact not only forgotten, but wrongly remembered. In the course of our efforts to recover the name that has dropped out, other ones - substitute names - enter our consciousness; we recognize them at once, indeed, as incorrect, but they keep on returning and force themselves on us with great persistence. The process that should lead to the reproduction of the missing name has been so to speak displaced and has therefore led to an incorrect substitute. My hypothesis is that this displacement is not left to arbitrary psychical choice but follows paths which can be predicted and which conform to laws. In other words, I suspect that the name or names which are substituted are connected in a discoverable way with the missing name: and I hope, if I am successful in demonstrating this connection, to proceed to throw light on the circumstances in which names are forgotten.
[1901b, 1101]

The name that I tried without success to recall in the example I chose for analysis in 1898 was that of the artist who painted the magnificent frescoes of the 'Four Last Things' in Orvieto cathedral. Instead of the name I was looking for - Signorelli - the names of two other painters - Botticelli and Boltraffio - thrust themselves on me, though they were immediately and decisively rejected by my judgement as incorrect. When I learnt the correct name from someone else, I recognized it at once and without hesitation. The investigation into the influences and the associative paths by which the reproducing of the name had been displaced in this way from Signorelli to Botticelli and Boltraffio led to the following results.
[1901b, 1102]
(a) The reason why the name Signorelli was lost is not to be found in anything special about the name itself or in any psychological characteristic of the context into which it was introduced. The name I had forgotten was just as familiar to me as one of the substitute names - Botticelli - and much more familiar than the other substitute name - Boltraffio - about whose owner I could scarcely produce any information other than that he belonged to the Milanese school. Moreover the context in which the name was forgotten seemed to me harmless and did not enlighten me further. I was driving in the company of a stranger from Ragusa in Dalmatia to a place in Herzegovina: our conversation turned to the subject of travel in Italy, and I asked my companion whether he had ever been to Orvieto and looked at the famous frescoes there, painted by . . .

[1901b, 1102]

(b) Light was only thrown on the forgetting of the name when I recalled the topic we had been discussing directly before, and it was revealed as a case in which a topic that has just been raised is disturbed by the preceding topic. Shortly before I put the question to my travelling companion whether he had ever been to Orvieto, we had been talking about the customs of the Turks living in Bosnia and Herzegovina. I had told him what I had heard from a colleague practising among those people - that they are accustomed to show great confidence in their doctor and great resignation to fate. If one has to inform them that nothing can be done for a sick person, their reply is: 'Herr: what is there to be said? If he could be saved, I know you would have saved him.' In these sentences we for the first time meet with the words and names Bosnia, Herzegovina and Herr, which can be inserted into an associative series between Signorelli and Botticelli-Boltraffio.

[1901b, 1103]

(c) I assume that the series of thoughts about the customs of the Turks in Bosnia, etc., acquired the capacity to disturb the next succeeding thought from the fact that I had withdrawn my attention from that series before it was brought to an end. I recall in fact wanting to tell a second anecdote which lay close to the first in my memory. These Turks place a higher value on sexual enjoyment than on anything else, and in the event of sexual disorders they are plunged in a despair which contrasts strangely with their resignation towards the threat of death. One of my colleague's patients once said to him: 'Herr, you must know that if that comes to an end then life is of no value.' I suppressed my account of this characteristic trait, since I did not want to allude to the topic in a conversation with a stranger. But I did more: I also diverted my attention from thoughts which might have arisen in my mind from the topic of 'death and sexuality.' On this occasion I was still under the influence of a piece of news which had reached me a few weeks before while making a brief stay at Trafoi. A patient over whom I had taken a great deal of trouble had put an end to his life on account of an incurable sexual disorder. I know for certain that this melancholy event and everything related to it was not recalled to my conscious memory during my journey to Herzegovina. But the similarity between 'Trafoi' and 'Boltraffio' forces me to assume that this reminiscence, in spite of my attention being deliberately diverted from it, was brought into operation in me at the time.

[1901b, 1103]
(d) It is no longer possible for me to take the forgetting of the name Signorelli as a chance event. I am forced to recognize the influence of a motive in the process. It was a motive which caused me to interrupt myself while recounting what was in my mind (concerning the customs of the Turks, etc.), and it was a motive which further influenced me so that I debarred the thoughts connected with them, the thoughts which had led to the news at Trafoi, from becoming conscious in my mind. I wanted, therefore, to forget something; I had repressed something. What I wanted to forget was not, it is true, the name of the artist at Orvieto but something else - something, however, which contrived to place itself in an associative connection with his name, so that my act of will missed its target and I forgot the one thing against my will, while I wanted to forget the other thing intentionally. The disinclination to remember was aimed against one content; the inability to remember emerged in another. It would obviously be a simpler case if disinclination and inability to remember related to the same content. Moreover the substitute names no longer strike me as so entirely unjustified as they did before the matter was elucidated: by a sort of compromise they remind me just as much of what I wanted to forget as of what I wanted to remember; and they show me that my intention to forget something was neither a complete success nor a complete failure.

[1901b, 1104]

(e) The way in which the missing name and the repressed topic (the topic of death and sexuality, etc., in which the names of Bosnia, Herzegovina and Trafoi appeared) became linked is very striking. The schematic diagram which I have inserted at this point, and which is repeated from the 1898 paper, aims at giving a clear picture of this.

[1901b, 1104]

The name Signorelli has undergone a division into two pieces. One of the pairs of syllables (elli) recurs without alteration in one of the substitute names: while the other, by means of the translation of Signor into Herr, has acquired a numerous and miscellaneous set of relations to the names contained in the repressed topic, but for this reason is not available for reproduction. The substitue for it has been arrived at in a way that suggests that a displacement along the connected names of 'Herzegovina and Bosnia' had taken place, without consideration for the sense or for the acoustic demarcation of the syllables. Thus the names have been treated in this process like the pictograms in a sentence which has had to be converted into a picture-puzzle (or rebus). Of the whole course of events that have in ways like these produced the substitute names instead of the name Signorelli no information has been given to consciousness. At first sight it seems impossible to discover any relation between the topic in which the name Signorelli occurred and the repressed topic which preceded it in time, apart from this recurrence of the same syllables (or rather sequence of letters).

[1901b, 1105]

Perhaps it is not superfluous to remark that the conditions which psychologists assume to be necessary for reproducing and for forgetting, and which they look for in certain relations and dispositions, are not inconsistent with the above explanation. All we have done is, in certain cases, to add a motive to the factors that have been recognized all along as being able to bring about the forgetting of a name; and, in addition, we have elucidated the mechanism of false recollection (paramnesia). These dispositions are indispensable to our case as well, in order to make it possible for the repressed element to get hold of the missing name by association and draw it with itself into repression. In the case of another name with more favourable conditions for reproduction this perhaps would not happen. It is probable indeed that a suppressed element always strives to assert itself elsewhere, but is successful in this only when suitable conditions meet it half way. At other times the suppression succeeds without any functional disturbance, or, as we can justly say, without any symptom.

[1901b, 1105]
The conditions necessary for forgetting a name, when forgetting it is accompanied by paramnesia, may then be summarized as follows: (1) a certain disposition for forgetting the name, (2) a process of suppression carried out shortly before, (3) the possibility of establishing an external association between the name and the element previously suppressed. The difficulty of fulfilling the last condition need probably not be rated very high, since, considering the low standards expected of an association of this kind, one could be established in the great majority of cases. There is, however, the profounder question whether an external association like this can really be a sufficient condition for the repressed element's disturbing the reproduction of the lost name - whether some more intimate connection between the two topics is required. On a superficial consideration one would be inclined to reject the latter demand, and accept as sufficient a temporal contiguity between the two, even if the contents are completely different. On close enquiry, however, one finds more and more frequently that the two elements which are joined by an external association (the repressed element and the new one) possess in addition some connection of content; and such a connection is in fact demonstrable in the Signorelli example.

[1901b, 1105]

The value of the insight that we have gained in analysing the Signorelli example naturally depends on whether we want to pronounce that instance as typical or as an isolated occurrence. I must affirm, that the forgetting of names, accompanied by paramnesia, takes place with uncommon frequency in the way in which we have explained it in the Signorelli case. In almost every instance in which I could observe this phenomenon in myself, I have also been able to explain it in the way described above, i.e. as motivated by repression. I must also draw attention to another consideration which supports the typical nature of our analysis. I think there is no justification for making a theoretical separation between those cases in which the forgetting of names is accompanied by paramnesia and the sort where incorrect substitute names have not presented themselves. These substitute names occur spontaneously in a number of cases; in others, where they have not emerged spontaneously, it is possible to force them to emerge by an effort of attention; and they then show the same relation to the repressed element and the missing name as they would if they had appeared spontaneously. Two factors seem to be decisive in bringing the substitute names to consciousness: first, the effort of attention, and secondly, an inner condition that attaches to the psychical material. We might look for the latter in the greater or lesser facility with which the necessary external association between the two elements establishes itself. A good portion of the cases of name-forgetting without paramnesia can thus be added to the cases in which substitute names are formed - to which the mechanism of the Signorelli example applies. I shall certainly not venture to affirm that all cases of name-forgetting are to be classed in the same group. There is no question that instances of it exist which are much simpler. We shall, I think, have stated the facts of the case with sufficient caution if we affirm: By the side of simple cases where proper names are forgotten there is a type which is motivated by repression.

[1901b, 1106]
Closer scrutiny somewhat diminishes the contrast between the analyses of Signorelli and of aliquis in regard to substitutive memories. In the latter example too it appears that the forgetting was accompanied by a substitutive formation. When subsequently I asked my companion whether in the course of his efforts to recall the missing word no substitute whatever came into his mind, he reported that at first he had felt a temptation to introduce an ab into the line (perhaps the detached portion of a-liquis) - nostris ab ossibus; and he went on to say that the exoriare had thrust itself on him with peculiar clarity and obstinacy, 'evidently,' he added with his characteristic scepticism, 'because it was the first word in the line.' When I asked him to attend all the same to the associations starting from exoriare, he produced exorcism. I can therefore very well believe that the intensification of exoriare when it was reproduced actually had the value of a substitutive formation of this sort. This substitute would have been arrived at from the names of the saints via the association 'exorcism.' These however are refinements to which one need attach no importance. (On the other hand Wilson, 1922, stresses the fact that the intensification of exoriare is of great significance to the understanding of the case, since exorcism would be the best symbolic substitute for repressed thoughts about getting rid of the unwanted child by abortion. I gratefully accept this correction, which does not weaken the validity, of the analysis.) It seems possible, however, that the appearance of any kind of substitute memory is a constant sign - even though perhaps only a characteristic and revealing sign - of tendentious forgetfulness which is motivated by repression. It would seem that substitutive formation occurs even in cases not marked by the appearance of incorrect names as substitutes, and that in these it lies in the intensification of an element that is closely related to the forgotten name. For example, in the Signorelli case, so long as the painter's name remained inaccessible, the visual memory that I had of the series of frescoes and of the self-portrait which is introduced into the corner of one of the pictures was ultra-clear - at any rate much more intense than visual memory-traces normally appear to me. In another case, also described in my 1898 paper, which concerned a visit which I was very reluctant to pay to an address in a strange town, I had forgotten the name of the street beyond all hope of recovery, but my memory of the house number, as if in derision, was ultra-clear, whereas normally I have the greatest difficulty in remembering numbers.

Observations such as those mentioned above, of what happens when a portion of a set of words in a foreign tongue is forgotten, may make us curious to know whether the forgetting of sets of words in our own language demands an essentially different explanation. We are not usually surprised, it is true, if a formula learnt by heart, or a poem, can be reproduced only inaccurately some time later, with alterations and omissions. Since, however, this forgetting does not have a uniform effect on what has been learnt as a whole but seems on the contrary to break off isolated portions of it, it may be worth the trouble to submit to analytic investigation a few instances of such faulty reproduction.

The following example of the forgetting of a set of words which I owe to my friend Sándor Ferenczi of Budapest, differs from the preceding ones in that it concerns a phrase coined by the subject himself and not a sentence taken from a writer. It may also present us with the somewhat unusual case in which the forgetting ranges itself on the side of our good sense, when the latter threatens to succumb to a momentary desire. The parapraxis thus comes to serve a useful function. When we have sobered down once more we appreciate the rightness of this internal current, which had previously only been able to express itself in a failure to function - a forgetting, a psychical impotence.
I have since undertaken numerous other analyses where forgetting or faulty reproduction of a set of words took place, and the consistent result of these investigations has inclined me to assume that the mechanism of forgetting demonstrated above in the instances of 'aliquis' and 'The Bride of Corinth' has an almost universal validity. It is generally a little awkward to give an account of such analyses since, like those just mentioned, they constantly lead to matters which are of an intimate sort and are distressing to the person analysed. I shall therefore not give any further examples. What is common to all these cases, irrespective of the material, is the fact that the forgotten or distorted matter is brought by some associative path into connection with an unconscious thought-content - a thought-content which is the source of the effect manifested in the form of forgetting.

I now return to the forgetting of names. So far we have not exhaustively considered either the case-material or the motives behind it. As this is exactly the kind of parapraxis that I can from time to time observe abundantly in myself, I am at no loss for examples. The mild attacks of migraine from which I still suffer usually announce themselves hours in advance by my forgetting names, and at the height of these attacks, during which I am not forced to abandon my work, it frequently happens that all proper names go out of my head. Now it is precisely cases like mine which could furnish the grounds for an objection on principle to our analytic efforts. Should it not necessarily be concluded from such observations that the cause of forgetfulness, and in particular of the forgetting of names, lies in circulatory and general functional disturbances of the cerebrum, and should we not therefore spare ourselves the search for psychological explanations of these phenomena? Not at all, in my view; that would be to confuse the mechanism of a process, which is of the same kind in all cases, with the factors favouring the process, which are variable and not necessarily essential. Instead of a discussion, however, I shall bring forward an analogy to deal with the objection.

Let us suppose that I have been imprudent enough to go for a walk at night in a deserted quarter of the city, and have been attacked and robbed of my watch and purse. I report the matter at the nearest police station in the following words: 'I was in such and such a street, and there loneliness and darkness took away my watch and purse.' Although I should not have said anything in this statement that was not true, the wording of my report would put me in danger of being thought not quite right in the head. The state of affairs could only be described correctly by saying that favoured by the loneliness of the place and under the shield of darkness unknown malefactors robbed me of my valuables. Now the state of affairs in the forgetting of names need not be any different; favoured by tiredness, circulatory disturbances and intoxication, an unknown psychical force robs me of my access to the proper names belonging to my memory - a force which can in other cases bring about the same failure of memory at a time of perfect health and unimpaired efficiency.

If I analyse the cases of the forgetting of names that I observe in myself, I almost always find that the name which is withheld from me is related to a topic of close personal importance to me, and one capable of evoking in me strong and often distressing affects. In accordance with the convenient and commendable practice of the Zurich school (Bleuler, Jung, Riklin) I can also formulate this fact as follows: The lost name has touched on a 'personal complex' in me. The relation of the name to myself is one that I should not have expected and is usually arrived at through superficial associations (such as verbal ambiguity or similarity in sound); it can be characterized quite generally as an oblique relation. Its nature will best be illustrated by some simple examples.
(3) On another occasion, as I was on the point of booking a ticket at Reichenhall railway station, the name of the next main station would not come into my mind. It was perfectly familiar to me, and I had passed through it very frequently. I had actually to look it up in the time-table. It was 'Rosenheim'. But I then knew at once owing to what association I had lost it. An hour before, I had paid a visit to my sister at her home close to Reichenhall; as my sister's name is Rosa this was also a 'Rosenheim'. The 'family complex' had robbed me of this name.

There came to my consulting-room one day a young man who was the younger brother of a woman patient. I had seen him countless times and used to refer to him by his first name. When I wanted to speak about his visit I found I had forgotten his first name (which was, I knew, not at all an unusual one), and nothing could help me to recover it. I thereupon went out into the street to read the names over the shops, and recognized his name the first time I ran across it. The analysis of the episode showed me that I had drawn a parallel between the visitor and my own brother, a parallel which was trying to come to a head in the repressed question: 'Would my brother in the same circumstances have behaved in a similar way, or would he have done the opposite?' The external link between the thoughts concerned with my own and with the other family was made possible by the chance fact that in both cases the mothers had the same first name of Amalia. Later in retrospect I also understood the substitute names, Daniel and Franz, which had forced themselves on me without making me any wiser. These, like Amalia too, are names from Schiller's Die Räuber which were the subject of a jest made by Daniel Spitzer, the 'Vienna walker'.

(5) Another time I was unable to recall a patient's name; it belonged to associations from my youth. My analysis followed a very devious path before it provided me with the name I was looking for. The patient had expressed a fear of losing his sight; this awoke the memory of a young man who had been blinded by a gunshot; and this in turn was connected with the figure of yet another youth, who had injured himself by shooting. This last person had the same name as the first patient, though he was not related to him. However, I did not find the name until I had become conscious that an anxious expectation was being transferred by me from these two young men who had been injured to a member of my own family.

There thus runs though my thoughts a continuous current of 'personal reference', of which I generally have no inkling, but which betrays itself by such instances of my forgetting names. It is as if I were obliged to compare everything I hear about other people with myself; as if my personal complexes were put on the alert whenever another person is brought to my notice. This cannot possibly be an individual peculiarity of my own: it must rather contain an indication of the way in which we understand 'something other than ourself' in general. I have reasons for supposing that other people are in this respect very similar to me.

(7) The motive for forgetting a name may also be a more refined one; it may consist in what might be called a 'sublimated' grudge against the bearer of it. A Fräulein I. von K. writes from Budapest as follows:

(9) Here is an example of name-forgetting with yet another and a very subtle motivation, which the subject of it has explained himself:
The next example, too, shows how a personal complex which is dominating someone at the time may cause a name to be forgotten in some very remote connection. 

Not only the motives, but also the mechanism governing the forgetting of names, deserve our interest. In a large number of cases a name is forgotten not because the name itself arouses such motives, but because - owing to similarity in sound and to assonance - it touches upon another name against which these motives do operate. If the determinants are relaxed in this way, the occurrence of the phenomenon will obviously be made very much easier, as the following examples show.

This example may recall what might be described as its geographical neighbour, in which the name of the town of Nervi could not be remembered (Example 1). Thus we see how a pair of words that are similar in sound can have the same effect as a single word that has two meanings.

When war broke out with Italy in 1915 I was able to make the observation upon myself that a whole quantity of Italian place-names which at ordinary times were readily available to me had suddenly been withdrawn from my memory. Like so many other Germans I had made it my habit to spend a part of my holidays on Italian soil, and I could not doubt that this large-scale forgetting of names was the expression of an understandable hostility to Italy which had now replaced my former partiality. In addition to this directly motivated forgetting of names, however, an indirect amnesia could also be detected, which it was possible to trace back to the same influence. I showed a tendency to forget non-Italian place-names as well; and on investigating the incidents I found that these names were in some way connected by means of remote similarities of sound with the proscribed enemy names. Thus I tormented myself one day in trying to recall the name of the Moravian town of Bisenz. When it finally came to my mind I at once recognized that this act of forgetting was to be laid to the charge of the Palazzo Bisenzi at Orvieto. The Hotel Belle Arti, where I had stayed on all my visits to Orvieto, is located in this palazzo. The most precious memories had naturally been the most severely damaged by the change in my emotional attitude.

Some examples may also help to remind us of the variety of purposes that can be served by the parapraxis of name-forgetting.

From J. Stärcke (1916) I report another interesting observation that concerns the forgetting and subsequent recovery of a proper name. This case is distinguished by the fact that the forgetting of the name was connected with the misquoting of a set of words from a poem, as in the example of the 'Bride of Corinth'.

In some of these examples all the subtleties of psycho-analytic technique have to be called upon in order to explain the forgetting of a name. Anyone who wishes to learn more about such work may be referred to a paper by Ernest Jones of London (1911a). It has been translated into German.

Ferenczi has observed that forgetting a name may also make its appearance as a hysterical symptom. In this situation it displays a very different mechanism from that of a parapraxis. The nature of this distinction may be seen from what he says:
I could cite further instances of the forgetting of names and explore the matter much more fully if I were not reluctant to anticipate at this first stage almost all the points of view that will come up for discussion under later topics. But I may perhaps allow myself to summarize in a few sentences the conclusions to be drawn from the analyses that have been reported here:

[1901b, 1134]

The mechanism of names being forgotten (or, to be more accurate, the mechanism of names escaping the memory, of being temporarily forgotten) consists in the interference with the intended reproduction of the name by an alien train of thought which is not at the time conscious. Between the name interfered with and the interfering complex either a connection exists from the outset, or else such a connection has established itself, often in ways that appear artificial, via superficial (external) associations.

[1901b, 1134]

Among the interfering complexes those of personal reference (i.e. the personal, family and professional complexes) prove to have the greatest effect.

[1901b, 1134]

A name which has more than one meaning and consequently belongs to more than one group of thoughts (complexes) is frequently interfered with in its connection with one train of thought owing to its participation in another, stronger complex.

[1901b, 1134]

Among the motives for these interferences the purpose of avoiding arousing unpleasure by remembering is conspicuous.

[1901b, 1134]

In general two main types of name-forgetting may be distinguished: those cases where the name itself touches on something unpleasant, and those where it is brought into connection with another name which has that effect. Thus names can have their reproduction interfered with on their own account, or because of their closer or remoter associative relations.

[1901b, 1134]

A survey of these general propositions shows us why the temporary forgetting of names is the most frequently to be observed of all our parapraxes.

[1901b, 1134]

A type of continued forgetting of names occurs also, in which whole chains of names are withdrawn from the memory. If in the attempt to recover a lost name other names closely connected with it are pursued, it frequently happens that these new names, which were to serve as stepping stones to the other one, disappear in just the same way. The forgetting thus jumps from one name to another, as if to prove the existence of an obstacle which cannot easily be surmounted.

[1901b, 1136]

How large a part of our store of memory falls into the category of screen memories, and what role they play in various neurotic thought-processes, are problems whose significance I neither discussed in my earlier paper nor shall enter into here. My only concern is to emphasize the similarity between the forgetting of proper names accompanied by paramnesia, and the formation of screen memories.

[1901b, 1138]
At first sight the differences between the two phenomena are much more striking than any analogies that may be found. The former phenomenon relates to proper names; the latter to whole impressions, things experienced either in reality or in thought. In the former we have a manifest failure of the function of memory; in the latter, an act of memory that strikes us as strange. In the former it is a case of momentary disturbance - for the name that has just been forgotten may have been produced correctly a hundred times before, and from tomorrow may be produced once again; in the latter it is a case of a permanent and constant memory, since the indifferent childhood memories seem to have the power of staying with us through a large part of our life. The problem in these two cases appears to be quite differently focused. In the former it is the forgetting, in the latter the retention which arouses our scientific curiosity. Closer study reveals that in spite of the dissimilarity between the two phenomena in regard to their psychical material and their duration, the points at which they agree far outbalance it. Both have to do with mistakes in remembering: what the memory reproduces is not what it should correctly have reproduced, but something else as a substitute. In the case of the forgetting of names the act of memory occurs, though in the form of substitute names; the case of the formation of screen memories has as its basis a forgetting of other more important impressions. In both instances an intellectual feeling gives us information of interference by some disturbing factor; but it takes two different forms. With the forgetting of names we know that the substitute names are false: with screen memories we are surprised that we possess them at all. If, now, psychological analysis establishes that the substitutive formation has come about in the same way in both cases, by means of displacement along a superficial association, it is precisely the dissimilarities between the two phenomena, in regard to their material, their duration and their focal point, which serve to heighten our expectation that we have discovered something of importance and of general validity. This general principle would assert that when the reproducing function fails or goes astray, the occurrence points, far more frequently than we suspect, to interference by a tendentious factor - that is, by a purpose which favours one memory while striving to work against another.

The ordinary material which we use for talking in our native language appears to be protected against being forgotten; but it succumbs all the more frequently to another disturbance, which is known as a 'slip of the tongue'. The slips of the tongue that we observe in normal people give an impression of being the preliminary stages of the so-called 'paraphasias' that appear under pathological conditions. This is a subject on which I find myself in the exceptional position of being able to acknowledge the value of a previous work. In 1895 Meringer and C. Mayer published a study on 'Slips in Speaking and Reading'. Their lines of approach differ widely from my own. One of the authors, who acts as spokesman in the text, is in fact a philologist, and it was his linguistic interests which led him to attempt to discover the rules that govern the making of slips of the tongue. He hoped to be able to conclude from these rules that there exists 'a certain mental mechanism, in which the sounds of a word, or of a sentence, and the words as well, are mutually linked and connected in a quite peculiar way' (10).¹

[1901b, 1139]

[1901b, 1144]
I hope that readers will not overlook the difference in value between these interpretations, of which no proof is possible, and the examples that I have myself collected and explained by means of an analysis. But if I still secretly cling to my expectation that even apparently simple slips of the tongue could be traced to interference by a half-suppressed idea that lies outside the intended context, I am tempted to do so by an observation of Meringer's which is highly deserving of attention. This author says that it is a curious fact that no one is ready to admit having made a slip of the tongue. There are some very sensible and honest people who are offended if they are told they have made one. I would not venture to put it so generally as does Meringer in saying 'no one'. But the trace of affect which follows the revelation of the slip, and which is clearly in the nature of shame, has a definite significance. It may be compared to the annoyance we feel when we cannot recall a forgotten name, and to our surprise at the tenacity of an apparently indifferent memory; and it invariably indicates that some motive has contributed to the occurrence of the interference.

[1901b, 1174]

(3) This assertion is very neatly confirmed by a self-observation of Storfer's (1914), in which the author exposes with commendable frankness the motives that prompted him to recollect the name of a supposed rival wrongly and then to write it down in a distorted form:

[1901b, 1203]

In a very similar way to the forgetting of names, the forgetting of impressions can be accompanied by faulty recollection; and this, where it finds credence, is described as paramnesia. Paramnesia in pathological cases - in paranoia it actually plays the part of a constituent factor in the formation of the delusion - has brought forth an extensive literature in which I have entirely failed to find any hint whatever as to its motivation. As this is also a subject which belongs to the psychology of the neuroses it is inappropriate to consider it in the present context. Instead, I shall describe a singular paramnesia of my own, in which the motivation provided by unconscious, repressed material and the manner and nature of the connection with this material can be recognized clearly enough.

[1901b, 1230]
When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: ‘That’s all very well; but in my case the forgetting of names happens differently.’ The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? And if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one’s own or of one’s patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 1194 (‘Across Europe in a Tub’) gave me the opportunity of showing how a symptom that is at first insoluble becomes accessible to analysis when the real interest in the repressed thoughts has passed away. As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

¹ [Footnote added 1924:] At this point very interesting problems of an economic nature come in, questions taking into consideration the fact that the psychical processes aim at gaining pleasure and removing unpleasure. There is already an economic problem in how it becomes possible by way of substitutive associations to recapture a name that has been forgotten through motives of unpleasure. An excellent paper by Tausk (1913) gives good examples of how the forgotten name becomes accessible once more if one succeeds in connecting it with a pleasurably-toned association, which can counterbalance the unpleasure to be expected from the reproduction of the name.
One is on different ground when it comes to examining forgetting in its proper sense - that is, the forgetting of past experiences. (To distinguish them from forgetting in the stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapter I and II, as ‘slipping the memory’, and the forgetting of intentions as ‘omissions’. The basic determinants of the normal process of forgetting are unknown.) We are also reminded that not everything is forgotten that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, in so far as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

[1901b, 1343]

In other instances the analysis of a parapraxis is less simple and requires less obvious explanations, on account of the intrusion of a process which we describe as ‘displacement’. One may, for instance, forget the name of someone against whom one has no objection; analysis will show, however, that the name has stirred up the memory of someone else, who has the same or a similar-sounding name and whom one has good reason to dislike. This connection has led to the innocent person’s name being forgotten; the intention to forget has, as it were, been displaced along some line of association.

[1913], 2805

LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a slip of the tongue [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a misreading [Verlesen]), or he may hear wrongly something that has been said to him (a mishearing [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis forgetting [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a name which he nevertheless knows and which he recognizes at once, or he may forget to carry out an intention, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of mislaying [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of losing [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of errors [Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

[1916-1917, 3136]
Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

[1916-1917, 3138]

There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget this time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the Komprounz.' Next day an attempt was made at a correction. The paper apologized and said: 'We should of course have said "the Knorprinz".' People speak in such cases of a 'demon of misprints' or a 'type-setting fiend' - terms which at least go beyond any psycho-physiological theory of misprints.

[1916-1917, 3140]

If anyone forgets a proper name which is familiar to him normally or if, in spite of all his efforts, he finds it difficult to keep it in mind, it is plausible to suppose that he has something against the person who bears the name so that he prefers not to think of him. Consider, for instance, what we learn in the following cases about the psychical situation in which the parapraxis occurred.

[1916-1917, 3161]
We shall have a good deal to say about forgetting names in other connections; for the moment we are principally interested in the psychical situation in which the forgetting occurs.

[1916-1917, 3161]

The forgetting of proper names and foreign names, as well as of foreign words, can similarly be traced back to a counter-intention, which is aimed either directly or indirectly against the name concerned. I have already given you several instances of direct dislike. But indirect causation is particularly frequent in these cases and can usually only be established by careful analyses. For instance, during the present war, which has obliged us to give up so many of our former enjoyments, our power of remembering proper names has suffered greatly as the result of the strangest associations. A short time ago I found that I was unable to reproduce the name of the innocent Moravian town of Bisenz; and analysis showed that what was responsible for this was not any direct hostility to it but its resemblance in sound to the name of the Palazzo Bisenzi in Orvieto which I had repeatedly enjoyed visiting in the past. Here for the first time, in this reason for objecting to remembering a name, we come across a principle which will later on reveal its enormous importance for the causation of neurotic symptoms: the memory's disinclination to remembering anything which is connected with feelings of unpleasure and the reproduction of which would renew the unpleasure. This intention to avoid unpleasure arising from a recollection or from other psychical acts, this psychical flight from unpleasure, may be recognized as the ultimate operative motive not only for the forgetting of names but for many other parapraxes, such as omissions, errors, and so on.

[1916-1917, 3180]

The forgetting of names, however, seems particularly facilitated psycho-physiologically, and for that reason cases occur in which interference by the unpleasure motive cannot be confirmed. If someone has a tendency to forget names, analytic investigation will show that names escape him not only because he does not like them themselves or because they remind him of something disagreeable, but also because in his case the same name belongs to another circle of associations with which he is more intimately related. The name is, as it were, anchored there and is kept from contact with the other associations which have been momentarily activated. If you recall the tricks of mnemotechnics, you will realize with some surprise that the same chains of association which are deliberately laid down in order to prevent names from being forgotten can also lead to our forgetting them. The most striking example of this is afforded by the proper names of persons, which naturally possess quite different psychical importance for different people. Let us, for instance, take a first name such as Theodore. To one of you it will have no special meaning, to another it will be the name of his father or brother or of a friend, or his own name. Analytic experience will then show you that the first of these people is in no danger of forgetting that a particular stranger bears this name, whereas the others will be constantly inclined to withhold from strangers a name which seems to them reserved for intimate connections. If you now bear in mind that this associative inhibition may coincide with the operation of the unpleasure principle and, besides that, with an indirect mechanism, you will be in a position to form an adequate idea of the complications in the causation of the temporary forgetting of a name. An appropriate analysis will however unravel every one of these tangles for you.

[1916-1917, 3180]
Let me show you from another instance that the facts are as we expect. The forgetting of proper names is actually an excellent model of what happens in dream-analysis; the difference is only that events that are shared between two people in dream-analysis are combined in a single person in the parapraxis. If I forget a name temporarily, I nevertheless feel in myself a certainty that I know it - a certainty which in the case of the dreamer we only arrived at by the round-about path of the Bernheim experiment. The name which I have forgotten but which I know is, however, not accessible to me. Experience soon teaches me that thinking about it, with however much effort, is of no help. But in place of the forgotten name I can always call up one or several substitute names. It is only after a substitute name of this kind has occurred to me spontaneously that the conformity of this situation with that of dream-interpretation becomes obvious. Like this substitute name, the dream-element is not the right thing, but only takes the place of something else - of the genuine thing which I do not know and which I am to discover by means of the dream-analysis. The difference is once more only that in the case of forgetting the name, I recognize the substitute unhesitatingly as something ungenuine, whereas we had to acquire this view laboriously in the case of the dream-element. Now in the case of forgetting a name there is also a method by which we can start from the substitute and arrive at the unconscious genuine thing, the forgotten name. If I direct my attention to the substitute names and allow further ideas in response to them to occur to me, I arrive by shorter or longer detours at the forgotten name, and I find when this happens that both the spontaneous substitute name and the ones that I have called up are connected with the forgotten one and were determined by it.

[1916-1917, 3207]

I will describe an analysis of this kind to you. I noticed one day that I could not recall the name of the small country on the Riviera, of which Monte Carlo is the chief town. It was very tiresome, but so it was. I summoned up all that I knew about that country. I thought of Prince Albert of the House of Lusignan, of his marriages, of his devotion to deep-sea researches, and everything else I could bring together, but it was of no avail. So I gave up reflection and allowed substitute names to occur to me instead of the lost one. They came rapidly: Monte Carlo itself, then Piedmont, Albania, Montevideo, Colico. Of this series I was struck first by Albania, which was at once replaced by Montenegro, no doubt because of the contrast between white and black.¹ I then saw that four of these substitute names contained the same syllable 'mon', then suddenly I had the forgotten word and exclaimed aloud: 'Monaco!' So the substitute names had in fact arisen from the forgotten one: the first four came from its first syllable while the last reproduced its syllabic structure and its whole last syllable. Moreover I was able to discover quite easily what it was that had temporarily deprived me of the name. Monaco is also the Italian name for Munich; and it was that town which exerted the inhibitory influence.

[1916-1917, 3208]

But if it is possible in the case of forgetting a name, it must also be possible in interpreting dreams to proceed from the substitute along the chain of associations attached to it and so to obtain access to the genuine thing which is being held back. From the example of the forgotten name we may conclude that the associations to the dream-element will be determined both by the dream-element and also by the unconscious genuine thing behind it. In this way, then, we seem to have produced some justification of our technique.

[1916-1917, 3208]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. 

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book The Psychopathology of Everyday Life (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.
I have asserted above that dreams have no means of expressing the relation of a contradiction, a contrary or a 'no'. I shall now proceed to give a first denial of this assertion. One class of cases which can be comprised under the heading of 'contraries' are, as we have seen, simply represented by identification - cases, that is, in which the idea of an exchange or substitution can be brought into connection with the contrast. I have given a number of instances of this. Another class of contraries in the dream-thoughts, falling into a category which may be described as 'contrariwise' or 'just the reverse', find their way into dreams in the following remarkable fashion, which almost deserves to be described as a joke. The 'just the reverse' is not itself represented in the dream-content, but reveals its presence in the material through the fact that some piece of the dream-content, which has already been constructed and happens (for some other reason) to be adjacent to it, is - as it were by an afterthought - turned round the other way. The process is more easily illustrated than described. In the interesting 'Up and Down' dream (p. 759 ff.) the representation of the climbing in the dream was the reverse of what it was in its prototype in the dream-thoughts - that is, in the introductory scene from Daudet’s Sappho: in the dream the climbing was difficult at first but easier later, while in the Daudet scene it was easy at first but more and more difficult later. Further, the 'up above' and 'down below' in the dreamer's relation to his brother were represented the other way round in the dream. This pointed to the presence of a reversed or contrary relation between two pieces of the material in the dream-thoughts; and we found it in the dreamer's childhood phantasy of being carried by his wet-nurse, which was the reverse of the situation in the novel, where the hero was carrying his mistress. So too in my dream of Goethe's attack on Herr M. (see below, p. 886 ff.) there is a similar 'just the reverse' which has to be put straight before the dream can be successfully interpreted. In the dream Goethe made an attack on a young man, Herr M.; in the real situation contained in the dream-thoughts a man of importance, my friend, had been attacked by an unknown young writer. In the dream I based a calculation on the date of Goethe's death; in reality the calculation had been made from the year of the paralytic patient's birth. The thought which turned out to be the decisive one in the dream-thoughts was a contradiction of the idea that Goethe should be treated as though he were a lunatic. 'Just the reverse', said the dream, 'if you don't understand the book, it's you that are feeble-minded, and not the author.' I think, moreover, that all these dreams of turning things round the other way include a reference to the contemptuous implications of the idea of 'turning one's back on something.' (E.g. the dreamer's turning round in relation to his brother in the Sappho dream.) It is remarkable to observe, moreover, how frequently reversal is employed precisely in dreams arising from repressed homosexual impulses.

[1900a, 796]
There are other slips of the tongue where we may assume that the true disturbing factor is some similarity in sound to obscene words and meanings. Deliberate distortion and deformation of words and expressions, which is so dear to vulgar minds, has the sole purpose of exploiting innocent occasions for hinting at forbidden topics; and this playing with words is so frequent that there would be nothing remarkable in its occurring even when not intended and against one’s wishes. To this category no doubt belong such examples as Eischeissweibchen (for Eiweisscheibchen),¹ Apopos Fritz (for à propos),² Lokuskapitäl (for Lotuskapitäl),³ etc.; and perhaps also the Alabüsterbachse (Alabasterbüchse) of St. Mary Magdalen.⁴ -'Ich fordere Sie auf, auf das Wohl unseres Chefs auf zustossen' can hardly be anything other than an unintentional parody which is a perseveration of an intended one. If I were the Principal who was being honoured at the ceremony to which the speaker contributed this slip, I should probably reflect on the cleverness of the Romans in permitting the soldiers of a general who was enjoying a Triumph openly to express in the form of satirical songs their inner criticisms of the man who was being honoured. - Meringer relates that he himself once said to someone, who by reason of being the eldest member of the company was addressed familiarly by the honorific title of 'Senexl or 'altes Senexl: 'Prost, Senex altesl!' He was himself shocked at this mistake (Meringer and Mayer, 1895, 50). We can perhaps interpret his emotion if we reflect how close 'Altesl' comes to the insulting phrase 'alter Esel'. There are powerful internal punishments for any breach of the respect due to age (that is, reduced to childhood terms, of the respect due to the father).

⁵ Making slips of the tongue was a symptom of a woman patient of mine which persisted until it was traced back to the childhood joke of replacing 'ruinieren [ruin]' by 'urinieren [urinate]'. - [Added 1924:] The temptation to employ the artifice of a slip of the tongue for enabling improper and forbidden words to be freely used forms the basis of Abraham's observations on parapraxes 'with an overcompensating purpose' (Abraham, 1922a). A woman patient was very liable to duplicate the first syllable of proper names by stammering. She changed the name 'Protagoras' to 'Protragoras', shortly after having said 'A-alexander' instead of 'Alexander'. Inquiry revealed that in childhood she had been especially fond of the vulgar joke of repeating the syllables 'a' and 'po' when they occurred at the beginnings of words, a form of amusement which quite commonly leads to stammering in children. ['A-a' and 'Popo' are the German nursery words for 'faeces' and 'buttocks'.] On approaching the name 'Protagoras' she became aware of the risk that she might omit the 'r' in the first syllable and say 'Po-potagoras'. As a protection against this danger she held on firmly to this 'r', and inserted another 'r' in the second syllable. She acted in the same way on other occasions, distorting the words 'Parterre [ground floor]' and 'Kondolenz [condolence]' so as to avoid 'Pater (father)' and 'Kondom [condom]' which were closely linked to them in her associations. Another of Abraham's patients confessed to an inclination to say 'Angora' every time for 'angina' - very probably because of a fear of being tempted to replace 'angina' by 'vagina'. These slips of the tongue owed their existence therefore to the fact that a defensive trend had retained the upper hand instead of the distorting one; and Abraham justly draws attention to the analogy between this process and the formation of symptoms in obsessional neurosis.

The twisting round of a name when it is intentional amounts to an insult; and it might well have the same significance in a whole number of cases where it appears in the form of an unintentional slip of the tongue. The person who, as Mayer reports, said 'Freuder' on one occasion instead of 'Freud' because he had shortly before mentioned Breuer's name (Meringer and Mayer, 1895, 38), and who another time spoke of the 'Freuer-Breudian' method of treatment (ibid., 28), was probably a professional colleague - and one who was not particularly enthusiastic about that method. In the chapter below on slips of the pen I shall report an instance of the distortion of a name which certainly cannot be explained in any other way.¹

¹ [1901b, 1174]
It can in fact be observed that members of the aristocracy in particular are prone to distort the names of the doctors they consult. We may conclude from this that inwardly they despise them, in spite of the courtesy they habitually show them. - I quote here some pertinent observations on the forgetting of names which comes from an account of our subject written in English by Dr Ernest Jones, at that time in Toronto (Jones, 1911b):

Conversely, replacing one name by another, assuming some one else's name, identification by means of a slip over a name, must signify an appreciative feeling which has for some reason to remain in the background for the time being. An experience of this kind from his schooldays is described by Sándor Ferenczi:

"When I was in the first form at the Gymnasium I had, for the first time in my life, to recite a poem in public (i.e. in front of the whole class). I was well prepared and was dismayed at being interrupted at the very start by a burst of laughter. The teacher subsequently told me why I had met with this strange reception. I gave the title of the poem "Aus der Ferne " quite correctly, but instead of attributing it to its real author I gave my own name. The poet's name is Alexander (Sándor) Petöfi. The exchange of names was helped by our having the same first name; but the real cause was undoubtedly the fact that at that time I identified myself in my secret wishes with the celebrated hero-poet. Even consciously my love and admiration for him bordered on idolatry. The whole wretched ambition-complex is of course to be found as well behind this parapraxis."

A similar identification by means of an exchange of names was reported to me by a young doctor. He had timidly and reverently introduced himself to the famous Virchow as 'Dr. Virchow'. The professor turned to him in surprise and asked: 'Ah! is your name Virchow too?' I do not know how the ambitious young man justified the slip of the tongue he had made - whether he relied upon the flattering excuse that he felt himself so small beside the great name that his own could not fail to slip away from him, or whether he had the courage to admit that he hoped one day to become as great a man as Virchow, and to beg the Professor not to treat him so contemptuously on that account. One of these two thoughts - or perhaps both of them simultaneously - may have confused the young man while he was introducing himself.

From motives of an extremely personal nature I must leave it open whether a similar interpretation is applicable to the following case as well. At the International Congress at Amsterdam in 1907 my theory of hysteria was the subject of lively discussion. In a diatribe against me one of my most vigorous opponents repeatedly made slips of the tongue which took the form of putting himself in my place and speaking in my name. For example, he said: 'It is well known that Breuer and I have proved . . . ' where he could only have meant ' . . . Breuer and Freud . . . ' My opponent's name bears not the least resemblance to my own. This example, together with many other cases where a slip of the tongue results in one name replacing another, may serve to remind us that such slips can entirely dispense with the assistance afforded by similarity in sound and can come about with no more support than is provided by hidden factors in the subject-matter.
(2) I had received the proofs of my contribution to the *Jahresbericht für Neurologie und Psychiatrie*, and I had naturally to revise the names of authors with particular care, since they are of various nationalities and therefore usually cause the compositor very great difficulty. I did in fact find some foreign sounding names which were still in need of correction; but strangely enough there was one name which the compositor had corrected by departing from my manuscript. He was perfectly right to do so. What I had in fact written was 'Buckrhard', which the compositor guessed should be 'Burckhard'. I had actually praised the useful treatise which an obstetrician of that name had written on the influence of birth upon the origin of children's palsies, and I was not aware of having anything to hold against him; but he has the same name as a writer in Vienna who had annoyed me by an unintelligent review of my *Interpretation of Dreams*. It is just as if in writing the name Burckhard, meaning the obstetrician, I had had a hostile thought about the other Burckhard, the writer;¹ for distorting names is very often a form of insulting their owners, as I have mentioned above in discussing slips of the tongue.

[1901b, 1202]

(3) This assertion is very neatly confirmed by a self-observation of Storfer's (1914), in which the author exposes with commendable frankness the motives that prompted him to recollect the name of a supposed rival wrongly and then to write it down in a distorted form:

[1901b, 1203]

Since we have already divided jokes into 'verbal' and 'conceptual' jokes according to the material handled by their technique, it devolves on us now to examine the relation between that classification and the new one that we are introducing. The relation between verbal and conceptual jokes on the one hand and abstract and tendentious jokes on the other is not one of mutual influence; they are two wholly independent classifications of joking products. Some people may perhaps have gained an impression that innocent jokes are predominantly verbal jokes, but that the more complex technique of conceptual jokes is mostly employed for definite purposes. But there are innocent jokes that work with play upon words and similarity of sound, and equally innocent ones that employ all the methods of conceptual jokes. And it is just as easy to show that a tendentious joke need be nothing other than a verbal joke as regards its technique. For instance, jokes that 'play about' with proper names often have an insulting and wounding purpose, though, needless to say, they are verbal jokes. But the most innocent of all jokes are once more verbal jokes; for instance, the *Schüttelreime*,¹ which have recently become so popular and in which the multiple use of the same material with a modification entirely peculiar to it constitutes the technique:

[1905c, 1688]

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913], 2804]
We seem now to have grasped the secret of a large number of slips of the tongue. If we bear this discovery in mind, we shall be able to understand other groups as well which have puzzled us hitherto. In cases of distortion of names, for instance, we cannot suppose that it is always a matter of competition between two similar but different names. It is not difficult, however to guess the second intention. The distortion of a name occurs often enough apart from slips of the tongue; it seeks to give the name an offensive sound or to make it sound like something inferior, and it is a familiar practice (or malpractice) designed as an insult, which civilized people soon learn to abandon, but which they are reluctant to abandon. It is still often permitted as a 'joke', though a pretty poor one. As a blatant and ugly example of this way of distorting names, I may mention that in these days the name of the President of the French Republic, Poincaré, has been changed into 'Schweinskarré'.¹ It is therefore plausible to suppose that the same insulting intention is present in these slips of the tongue and is trying to find expression in the distortion of a name. Similar explanations suggest themselves along the same lines for certain instances of slips of the tongue with comic or absurd results. 'I call on you to hiccough [aufzustossen] to the health of our Chief.' Here a ceremonial atmosphere is unexpectedly disturbed by the intrusion of a word which calls up an unsavoury idea, and, on the model of certain insulting and offensive phrases, we can scarcely avoid a suspicion that a purpose was trying to find expression which was in violent contradiction to the ostensibly respectful words. What the slip seems to have been saying was something like: 'Don't you believe it! I don't mean this seriously! I don't care a rap for the fellow!' Just the same thing applies to slips of the tongue which turn innocent words into indecent or obscene ones: thus, 'Apopos' for 'à propos' or 'Eischeissweibschen' for 'Eiweissscheibchen'.²

But if the subject does not himself give us the explanation of the sense of a parapraxis, where are we to find the starting-points for our interpretation - the circumstantial evidence? In various directions. In the first place from analogies with phenomena apart from paraprases: when, for instance, we assert that distorting a name when it occurs as a slip of the tongue has the same insulting sense as a deliberate twisting of a name. Further, from the psychical situation in which the parapraxis occurs, the character of the person who makes the parapraxis, and the impressions which he has received before the parapraxis and to which the parapraxis is perhaps a reaction. What happens as a rule is that the interpretation is carried out according to general principles: to begin with there is only a suspicion, a suggestion for an interpretation, and we then find a confirmation by examining the psychical situation. Sometimes we have to wait for subsequent events as well (which have, as it were, announced themselves by the parapraxis) before our suspicion is confirmed.

¹[1916-1917, 3153]
²[1916-1917, 3160]
The neatest instance of this sort was reported to me by a Herr Lederer, who had experienced it himself. While he was on his honeymoon in Venice he came across a gentleman with whom he was superficially acquainted and whom he had to introduce to his young wife. Since however he had forgotten the stranger's name, he helped himself out the first time by means of an unintelligible mumble. On meeting the gentleman a second time, as he was bound to do in Venice, he drew him aside and asked him to save him from embarrassment by telling him his name, which he had unfortunately forgotten. The stranger's reply gave evidence of an unusual knowledge of human nature. 'I can readily imagine your failing to remember my name. I have the same name as you - Lederer!' - One cannot help having a slightly disagreeable feeling when one comes across one's own name in a stranger. Recently I was very sharply aware of it when a Herr S. Freud presented himself to me in my consulting hour. (However, I must record the assurance of one of my critics that in this respect his feelings are the opposite of mine.) [1901b, 1120]
(19) We are however far from having outlined all the characteristics of this phenomenon. There is a further point I wish to make. The forgetting of names is highly contagious. In a conversation between two people it is often sufficient for one of them merely to mention that he has forgotten such and such a name, and the result will be that it slips the other's mind as well. In cases like these, however, where the forgetting is induced, the forgotten name returns more readily. - This 'collective' forgetting, strictly speaking a phenomenon of group psychology, has not yet been made the subject of psycho-analytic study. In a single instance (but an especially neat one) Reik (1920) has been able to offer a good explanation of this curious phenomenon. [1901b, 1134]
The current vocabulary of our own language, when it is confined to the range of normal usage, seems to be protected against being forgotten. With the vocabulary of a foreign language it is notoriously otherwise. The disposition to forget it extends to all parts of speech, and an early stage in functional disturbance is revealed by the fluctuations in the control we have over our stock of foreign words - according to the general condition of our health and to the degree of our tiredness. In a number of cases this kind of forgetting exhibits the same mechanism disclosed to us by the Signorelli example. In proof of this I shall give only a single analysis, one which is distinguished, however, by some useful characteristics: it concerns the forgetting of a non-substantival word in a Latin quotation. Perhaps I may be allowed to present a full and clear account of this small incident.

I have several reasons for valuing this brief analysis; and my thanks are due to my former travelling-companion who presented me with it. In the first place, this is because I was in this instance allowed to draw on a source that is ordinarily denied to me. For the examples collected here of disturbances of a psychical function in daily life I have to fall back mainly on self-observation. I am anxious to steer clear of the much richer material provided by my neurotic patients, since it might otherwise be objected that the phenomena in question are merely consequences and manifestations of neurosis. My purpose is therefore particularly well served when a person other than myself, not suffering from nervous illness, offers himself as the object of such an investigation. This analysis is significant in a further respect: it throws light on the case of a word being forgotten without a substitute for it appearing in the memory. It thus confirms my earlier assertion that the appearance or non-appearance in the memory of incorrect substitutes cannot be made the basis for any radical distinction.¹

Closer scrutiny somewhat diminishes the contrast between the analyses of Signorelli and of aliquis in regard to substitutive memories. In the latter example too it appears that the forgetting was accompanied by a substitutive formation. When subsequently I asked my companion whether in the course of his efforts to recall the missing word no substitute whatever came into his mind, he reported that at first he had felt a temptation to introduce an ab into the line (perhaps the detached portion of a-liquis) - nostris ab ossibus; and he went on to say that the exoriare had thrust itself on him with peculiar clarity and obstinacy, 'evidently,' he added with his characteristic scepticism, 'because it was the first word in the line.' When I asked him to attend all the same to the associations starting from exoriare, he produced exorcism. I can therefore very well believe that the intensification of exoriare when it was reproduced actually had the value of a substitutive formation of this sort. This substitute would have been arrived at from the names of the saints via the association 'exorcism.' These however are refinements to which one need attach no importance. (On the other hand Wilson, 1922, stresses the fact that the intensification of exoriare is of great significance to the understanding of the case, since exorcism would be the best symbolic substitute for repressed thoughts about getting rid of the unwanted child by abortion. I gratefully accept this correction, which does not weaken the validity, of the analysis.) It seems possible, however, that the appearance of any kind of substitute memory is a constant sign - even though perhaps only a characteristic and revealing sign - of tendentious forgetfulness which is motivated by repression. It would seem that substitutive formation occurs even in cases not marked by the appearance of incorrect names as substitutes, and that in these it lies in the intensification of an element that is closely related to the forgotten name. For example, in the Signorelli case, so long as the painter's name remained inaccessible, the visual memory that I had of the series of frescoes and of the self-portrait which is introduced into the corner of one of the pictures was ultra-clear - at any rate much more intense than visual memory-traces normally appear to me. In another case, also described in my 1898 paper, which concerned a visit which I was very reluctant to pay to an address in a strange town, I had forgotten the name of the street beyond all hope of recovery, but my memory of the house number, as if in derision, was ultra-clear, whereas normally I have the greatest difficulty in remembering numbers.

I have since undertaken numerous other analyses where forgetting or faulty reproduction of a set of words took place, and the consistent result of these investigations has inclined me to assume that the mechanism of forgetting demonstrated above in the instances of 'aliquis' and 'The Bride of Corinth' has an almost universal validity. It is generally a little awkward to give an account of such analyses since, like those just mentioned, they constantly lead to matters which are of an intimate sort and are distressing to the person analysed. I shall therefore not give any further examples. What is common to all these cases, irrespective of the material, is the fact that the forgotten or distorted matter is brought by some associative path into connection with an unconscious thought-content - a thought-content which is the source of the effect manifested in the form of forgetting.

We are perhaps not ready yet to appreciate all the aspects of this pretty example. The following is a simpler specimen, though here it was not a name but a foreign word that was forgotten, from a motive arising out of the situation. (We can already see that we are dealing with the same processes, whether they apply to proper names, first names, foreign words or sets of words.) Here it was a case of a young man forgetting the English word for 'Gold' - which is identical with the German word - so as to find an opportunity for carrying out an action he desired.

(16) Reported by Dr. Hanns Sachs: 'A young man became acquainted in a pension with an English lady, whom he took a liking to. On the first evening of their acquaintance he was having a conversation with her in her native language, which he knew fairly well; and in the course of it he wanted to use the English word for "Gold". In spite of strenuous efforts the word would not come to him. Instead, the French or, the Latin aurum and the Greek chrysos obstinately forced themselves on him as substitutes, so that it needed quite an effort to reject them, though he knew for certain that they were not related at all to the word he was looking for. In the end the only way he could find of making himself understood was by touching a gold ring on the lady's hand; and he was very much abashed on learning from her that the long-lost word for gold was exactly the same as the German one, namely "gold". The great value of this touching, for which the forgetting gave an opportunity, did not lie merely in the unobjectionable satisfaction of the instinct for laying hold or touching - for there are other opportunities for this which are eagerly exploited by lovers. It lay much more in the way in which it assisted in clarifying the prospects of the courtship. The lady's unconscious would divine the erotic aim of the forgetting, hidden by its mask of innocence, especially if her unconscious was sympathetically drawn to the man she was talking with. The manner in which she treated his touching of her and accepted its motivation could in this way become a means - unconscious for both of them, yet full of significance - of reaching an understanding on the chances of the flirtation just begun.'

The ordinary material which we use for talking in our native language appears to be protected against being forgotten; but it succumbs all the more frequently to another disturbance, which is known as a 'slip of the tongue'. The slips of the tongue that we observe in normal people give an impression of being the preliminary stages of the so-called 'paraphasias' that appear under pathological conditions. This is a subject on which I find myself in the exceptional position of being able to acknowledge the value of a previous work. In 1895 Meringer and C. Mayer published a study on 'Slips in Speaking and Reading'. Their lines of approach differ widely from my own. One of the authors, who acts as spokesman in the text, is in fact a philologist, and it was his linguistic interests which led him to attempt to discover the rules that govern the making of slips of the tongue. He hoped to be able to conclude from these rules that there exists 'a certain mental mechanism, in which the sounds of a word, or of a sentence, and the words as well, are mutually linked and connected in a quite peculiar way' (10).¹
One is on different ground when it comes to examining forgetting in its proper sense - that is, the forgetting of past experiences. (To distinguish them from forgetting in the stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapter I and II, as ‘slipping the memory’, and the forgetting of intentions as ‘omissions’.) The basic determinants of the normal process of forgetting are unknown.¹ We are also reminded that not everything is forgotten that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, in so far as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

[1901b, 1343]

The forgetting of proper names and foreign names, as well as of foreign words, can similarly be traced back to a counter-intention, which is aimed either directly or indirectly against the name concerned. I have already given you several instances of direct dislike. But indirect causation is particularly frequent in these cases and can usually only be established by careful analyses. For instance, during the present war, which has obliged us to give up so many of our former enjoyments, our power of remembering proper names has suffered greatly as the result of the strangest associations. A short time ago I found that I was unable to reproduce the name of the innocent Moravian town of Bisenz; and analysis showed that what was responsible for this was not any direct hostility to it but its resemblance in sound to the name of the Palazzo Bisenzi in Orvieto which I had repeatedly enjoyed visiting in the past. Here for the first time, in this reason for objecting to remembering a name, we come across a principle which will later on reveal its enormous importance for the causation of neurotic symptoms: the memory's disinclination to remembering anything which is connected with feelings of unpleasure and the reproduction of which would renew the unpleasure. This intention to avoid unpleasure arising from a recollection or from other psychical acts, this psychical flight from unpleasure, may be recognized as the ultimate operative motive not only for the forgetting of names but for many other parapraxes, such as omissions, errors, and so on.

[1916-1917, 3180]
I shall accordingly cite some striking examples of forgetting: most of which I observed in myself. I distinguish the forgetting of impressions and experiences - i.e., of knowledge - from the forgetting of intentions - i.e., from omission to do things. I can state in advance the invariable result of the entire series of observations: in every case the forgetting turned out to be based on a motive of unpleasure.

[1901b, 1220]

(1) One summer holiday my wife made me greatly annoyed though the cause was innocent enough. We were sitting at table d'hôte opposite a gentleman from Vienna whom I knew and who no doubt remembered me too. However, I had reasons of my own for not renewing the acquaintance. My wife, who had heard no more than his distinguished name, revealed too plainly that she was listening to his conversation with his neighbours, for from time to time she turned to me with questions that took up the thread of their discussion. I became impatient and finally irritated. Some weeks later I was complaining to a relative about this behaviour on my wife's part but was unable to recall a single word of the gentleman's conversation. As I am normally rather apt to harbour grievances and can forget no detail of an incident that has annoyed me, my amnesia in the present case was probably motivated by consideration for my wife. A short time ago I had a similar experience. I wished to have a good laugh with an intimate friend over a remark made by my wife only a few hours before, but was prevented from doing so by the singular fact that I had utterly forgotten what she had said. I had first to ask my wife to remind me what it was. It is easy to understand my forgetfulness here as being analogous to the typical disturbance of judgement to which we are subject where those nearest to us are concerned.

[1901b, 1220]

(2) I had undertaken to get a lady who was a stranger to Vienna a small strong-box for her documents and money. When I offered my services I had in my mind's eye an unusually vivid picture of a shop-window in the Inner Town in which I was sure I had seen boxes of the kind. I could not, it was true, recall the name of the street, but I felt sure that I would find the shop if I walked through the town, since my memory told me I had passed it on countless occasions. To my chagrin I had no success in finding the shop-window with the strong-boxes, though I walked all over the Inner Town in every direction. I decided that the only course left was to look up the firms of safe-manufacturers in a trades directory, so as to be able to identify the shop on a second walk round the town. Such extreme measures, however, did not prove necessary; among the addresses given in the directory was one which I immediately recognized as the one I had forgotten. It was true that I had passed the shop-window innumerable times - every time, in fact, that I had visited the M. family, who have lived for many years in the same building. Our intimate friendship later gave place to a total estrangement; after that, I fell into the habit - the reasons for which I never considered - of also avoiding the neighbourhood and the house. On my walk through the town in search of the shop-window with the strong-boxes I had passed through every street in the district but this one, which I had avoided as if it were forbidden territory. The motive of unpleasure responsible in the present case for my failure to find my way is easy to recognize. The mechanism of forgetting, however, is not so simple here as in the preceding example. My aversion naturally applied not to the safe-manufacturer but to another person, whom I did not want to think about; and from this latter person it was then transferred to this occasion where it produced the forgetting. The case of 'Burckhard' was very similar; my grudge against one person of this name induced me to make a slip in writing the same name when it referred to someone else. The part there played by identity of name in establishing a connection between two essentially different groups of thoughts was able to be replaced in the example of the shop-window by spatial contiguity, inseparable proximity. This latter case was, incidentally, more firmly knit; there was a second connection there, one involving its subject-matter, for money played a part among the reasons for my estrangement from the family living in the building.

[1901b, 1221]
There are thus abundant signs to be found in healthy, non-neurotic people that the recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance. But the full significance of this fact can be estimated only when the psychology of neurotic people is investigated. We are forced to regard as one of the main pillars of the mechanism supporting hysterical symptoms an elementary endeavour of this kind to fend off ideas that can arouse feelings of unpleasure - an endeavour which can only be compared with the flight-reflex in the presence of painful stimuli. The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect in every case, that in the interplay of psychical forces it may not come up against factors which, for other purposes, aim at the opposite effect and bring it about in spite of the defensive trend. It may be surmised that the architectonic principle of the mental apparatus lies in a stratification - a building up of superimposed agencies; and it is quite possible that this defensive endeavour belongs to a lower psychical agency and is inhibited by higher agencies. At all events, if we can trace back processes such as those found in our examples of forgetting to this defensive trend, that fact speaks in favour of its existence and power. (As we have seen, a number of things are forgotten on their own account; where this is not possible, the defensive trend shifts its target and causes something else related to the target at least to be forgotten, something less important which has come into associative connection with the thing that is really objectionable.

In a very similar way to the forgetting of names, the forgetting of impressions can be accompanied by faulty recollection; and this, where it finds credence, is described as paramnesia. Paramnesia in pathological cases - in paranoia it actually plays the part of a constituent factor in the formation of the delusion - has brought forth an extensive literature in which I have entirely failed to find any hint whatever as to its motivation. As this is also a subject which belongs to the psychology of the neuroses it is inappropriate to consider it in the present context. Instead, I shall describe a singular paramnesia of my own, in which the motivation provided by unconscious, repressed material and the manner and nature of the connection with this material can be recognized clearly enough.

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.
The forgetting of impressions and experiences demonstrates much more clearly and exclusively than the forgetting of names the operation of the purpose of keeping disagreeable things out of memory. The whole field of this kind of forgetting does not, of course, fall within the class of parapraxes, but only such cases as, measured by the standard of our usual experience, seem to us striking and unjustified: for instance, when the forgetting affects impressions that are too fresh or important, or when the missing memory tears a gap in what is otherwise a well remembered chain of events. Why and in what way we are able to forget in general, and among other things experiences which have certainly left the deepest impression upon us, such as the events of our earliest childhood years, - that is quite another problem, in which fending off unpleasurable impulses plays a certain part but is far from being the whole explanation. It is an undoubted fact that disagreeable impressions are easily forgotten. Various psychologists have noticed it and the great Darwin was so much impressed by it that he made it 'a golden rule' to note down with especial care any observations which seemed unfavourable to his theory, since he had convinced himself that precisely they would not remain in his memory.

[1916-1917, 3181]
In a very similar way to the forgetting of names, the forgetting of impressions can be accompanied by faulty recollection; and this, where it finds credence, is described as paramnesia. Paramnesia in pathological cases - in paranoia it actually plays the part of a constituent factor in the formation of the delusion - has brought forth an extensive literature in which I have entirely failed to find any hint whatever as to its motivation. As this is also a subject which belongs to the psychology of the neuroses it is inappropriate to consider it in the present context. Instead, I shall describe a singular paramnesia of my own, in which the motivation provided by unconscious, repressed material and the manner and nature of the connection with this material can be recognized clearly enough.

[1901b, 1230]

The phenomenon presented by the patient in cases like this deserves to be called a 'fausse reconnaissance', and is completely analogous to what occurs in certain other cases and has been described as a 'déjà vu'. In these other cases the subject has a spontaneous feeling such as 'I've been in this situation before', or 'I've been through all this already', without ever being in a position to confirm his conviction by discovering an actual recollection of the previous occasion. This latter phenomenon, as is well known, has provoked a large number of attempts at explanation, which can be divided roughly into two groups.¹ One class of explanation looks upon the feeling which constitutes the phenomenon as deserving of credence, and assumes that something really has been remembered - the only question being what. The second and far larger class of explanation includes those which maintain, on the contrary, that what we have to deal with is an illusory memory, and that the problem is to discover how this paramnesic error can have arisen. This latter group comprises many widely different hypotheses. There is, for instance, the ancient view, ascribed to Pythagoras, that the phenomenon of déjà vu is evidence of the subject having had a former life; again, there is the hypothesis based on anatomy (put forward by Wigan in 1860) to the effect that the phenomenon is based on an absence of simultaneity in the functioning of the two cerebral hemispheres; and finally there are the purely psychological theories, supported by the majority of more recent authorities, which regard the déjà vu as an indication of an apperceptive weakness, and assign the responsibility for its occurrence to such causes as fatigue, exhaustion and distraction.

[1914a, 2837]

In 1907, in the second edition of my *Psychopathology of Everyday Life*, I proposed an exactly similar explanation for this form of apparent paramnesia without mentioning Grasset's paper or knowing of its existence. By way of excuse I may remark that I arrived at my conclusion as the result of a psycho-analytic investigation which I was able to make of an example of déjà vu in a female patient; it was extremely clear, although it had taken place some 28 years earlier. I shall not reproduce the little analysis in this place. It showed that the situation in which the déjà vu occurred was really calculated to revive the memory of an earlier experience of the patient's. The patient, who was at that time a twelve year-old child, was visiting a family in which there was a brother who was seriously ill and at the point of death; while her own brother had been in a similarly dangerous condition a few months earlier. But with the earlier of these two similar events there had been associated a phantasy that was incapable of entering consciousness - namely, a wish that her brother should die. Consequently, the analogy between the two cases could no become conscious. And the perception of it was replaced by the phenomenon of 'having been through it all before', the identity being displaced from the really common element on to the locality.

[1914a, 2838]
Between 'slips of the pen' and 'forgetting' may be inserted the case of someone who forgets to append a signature. An unsigned cheque comes to the same thing as a forgotten cheque. For the significance of a forgetting of a similar kind I will cite a passage from a novel, which Dr. Hanns Sachs came upon:
[1901b, 1217]

I shall accordingly cite some striking examples of forgetting: most of which I observed in myself. I distinguish the forgetting of impressions and experiences - i.e., of knowledge - from the forgetting of intentions - i.e., from omission to do things. I can state in advance the invariable result of the entire series of observations: in every case the forgetting turned out to be based on a motive of unpleasure.
[1901b, 1220]

No group of phenomena is better qualified than the forgetting of intentions for demonstrating the thesis that, in itself, lack of attention does not suffice to explain parapraxes. An intention is an impulse to perform an action: an impulse which has already found approval but whose execution is postponed to a suitable occasion. Now it can happen that during the interval thus created a change of such a kind occurs in the motives involved that the intention is not carried out; but in that case it is not forgotten: it is re-examined and cancelled. The forgetting of intentions, to which we are subject every day and in every possible situation, is not a thing that we are in the habit of explaining in terms of such a revision in the balance of motives. In general we leave it unexplained; or we try to find a psychological explanation by supposing that at the time when the intention was due to be carried out the attention necessary for the action was no longer at hand - attention which was, after all, an indispensable precondition for the coming into being of the intention and had therefore been available for the action at that time. Observation of our normal behaviour in regard to intentions leads us to reject this attempt at an explanation as being arbitrary. If I form an intention in the morning which is to be carried out in the evening, I may be reminded of it two or three times in the course of the day. It need not however become conscious at all throughout the day. When the time for its execution draws near, it suddenly springs to my mind and causes me to make the necessary preparations for the proposed action.
If I am going for a walk and take a letter with me which has to be posted, it is certainly not necessary for me, as a normal individual, free from neurosis, to walk all the way with it in my hand and to be continually on the look-out for a letter-box in which to post it; on the contrary I am in the habit of putting it in my pocket, of walking along and letting my thoughts range freely, and I confidently expect that one of the first letter-boxes will catch my attention and cause me to put my hand in my pocket and take out the letter. Normal behaviour after an intention has been formed coincides fully with the experimentally-produced behaviour of people to whom what is described as a 'post-hypnotic suggestion at long range' has been given under hypnosis.¹ This phenomenon is usually described in the following way. The suggested intention slumbers on in the person concerned until the time for its execution approaches. Then it awakes and impels him to perform the action.
[1901b, 1233]
There are two situations in life in which even the layman is aware that forgetting - as far as intentions are concerned - cannot in any way claim to be considered as an elementary phenomenon not further reducible, but entitles him to conclude that there are such things as unavowed motives. What I have in mind are love-relationships and military discipline. A lover who has failed to keep a rendezvous will find it useless to make excuses for himself by telling the lady that unfortunately he completely forgot about it. She will not fail to reply: 'A year ago you wouldn't have forgotten. You evidently don't care for me any longer.' Even if he should seize on the psychological explanation mentioned above and try to excuse his forgetfulness by pleading pressure of business, the only outcome would be that the lady, who will have become as sharp-sighted as a doctor is in psycho-analysis, would reply: 'How curious that business distractions like these never turned up in the past!' The lady is not of course wanting to deny the possibility of forgetting; it is only that she believes, not without reason, that practically the same inference - of there being some reluctance present - can be drawn from unintentional forgetting as from conscious evasion.

Similarly, under conditions of military service, the difference between a failure to carry out orders which is due to forgetting and one which is deliberate is neglected on principle - and justifiably so. A soldier must not forget what military service orders him to do. If he does forget in spite of knowing the order, that is because the motives that drive him to carry out the military order are opposed by other, counter-motives. A one year volunteer who at inspection tries to offer the excuse that he has forgotten to polish his buttons is sure to be punished. But this punishment is trifling in comparison to the one to which he would expose himself if he admitted to himself and his superiors that the motive for his failure to carry out orders was that 'I'm heartily sick of this wretched spit-and-polish'. For the sake of this saving of punishment - for reasons of economy, so to speak - he makes use of forgetting as an excuse, or it comes about as a compromise.

Both the service of women and military service demand that everything connected with them should be immune to forgetting. In this way they suggest the notion that, whereas in unimportant matters forgetting is permissible, in important matters it is a sign that one wishes to treat them as unimportant, i.e. to deny their importance.¹ This view, which takes psychical considerations into account, cannot in fact be rejected here. No one forgets to carry out actions that seem to himself important, without incurring suspicion of being mentally disordered. Our investigation can therefore only extend to the forgetting of intentions of a more or less minor character; we cannot consider any intention as being wholly indifferent, for otherwise it would certainly never have been formed.
As with the functional disturbances described on earlier pages, I have made a collection of the cases of omitting to do something as a result of forgetting which I have observed in myself, and I have endeavoured to explain them. I have invariably found that they could be traced to interference by unknown and unavowed motives - or, as one may say, to a *counter-will*. In a number of these cases I found myself in a position which was similar to being under conditions of service; I was under a constraint, against which I had not entirely given up struggling, so that I made a demonstration against it by forgetting. This accounts for the fact that I am especially prone to forget to send congratulations on occasions such as birthdays, anniversaries, wedding celebrations and promotions. I keep on making new resolutions on the subject and become more and more convinced that I shall not succeed. I am now on the point of giving the effort up and of yielding consciously to the motives that oppose it. While I was in a transitional stage, a friend asked me to send a congratulatory telegram on a certain day on his behalf along with my own, but I warned him that I should forget both; and it was not surprising that the prophecy came true. It is due to painful experiences in the course of my life that I am unable to manifest sympathy on occasions where the expression of sympathy must necessarily be exaggerated, as an expression corresponding to the slight amount of my feeling would not be allowable. Since I have come to recognize that I have often mistaken other people's ostensible sympathy for their real feelings, I have been in revolt against these conventional expressions of sympathy, though on the other hand I recognize their social usefulness. Condolences in the case of death are excepted from this divided treatment: once I have decided to send them I do not fail to do so. Where my emotional activity no longer has anything to do with social duty, its expression is never inhibited by forgetting.

[1901b, 1235]

The conflict between a conventional duty and the unavowed view which we privately take of it similarly provides an explanation for those cases in which we forget to carry out actions that we promised to do as a favour to someone. Here the regular result is that it is only the would-be benefactor who believes that forgetting has the power to act as an excuse; the person who asked the favour gives what is unquestionably the right answer: 'He is not interested in the matter, otherwise he would not have forgotten.' There are some people who are known as being forgetful in general, and who are for that reason excused their lapses in the same kind of way as short-sighted people who fail to greet us in the street.¹ These people forget all their small promises, and they fail to carry out any of the commissions they receive. In this way they show themselves unreliable in little things, and they demand that we should not take these minor offences amiss - that is, that we should not attribute them to their character but refer them to an organic idiosyncracy.² I am not one of these people myself, and have had no opportunity of analysing the actions of a person of this kind, so that, by examining the choice of occasions for forgetting, I might discover its motivation. I cannot however help suspecting on the basis of analogy that in these cases the motive is an unusually large amount of unavowed contempt for other people which exploits the constitutional factor for its own ends.³

[1901b, 1237]

¹ Women, with their subtler understanding of unconscious mental processes, are as a rule more apt to take offence when someone does not recognize them in the street and therefore fails to greet them, than to think of the most obvious explanations - namely that the offender is short-sighted, or was so engrossed in his thoughts that he did not notice them. They conclude that he would have seen them if he had 'set any store by them'.

[1901b, 1237]
In other cases the motives for forgetting are less easy to discover, and when found arouse greater surprise. Thus, for instance, in former years I noticed that, out of a fairly large number of visits to patients, I only forgot those to non-paying patients or to colleagues. My shame at this discovery led me to adopt the habit of making a note beforehand in the morning of the visits I intended to make during the day. I do not know if other doctors have arrived at the same practice by the same road. But in this way we get some idea of what causes the so called neurasthenic patient to jot down, in his notorious 'notes', the various things he wants to tell the doctor. The ostensible reason is that he has no confidence in the reproductive capacity of his memory. That is perfectly correct, but the scene usually proceeds as follows. The patient has recounted his various complaints and enquiries in a very long-winded manner. After he has finished he pauses for a moment, then pulls out the jottings and adds apologetically: 'I've made some notes, as I can't remember things.' As a rule he finds that they contain nothing new. He repeats each point and answers it himself: 'Yes, I've asked about that already.' With the notes he is probably only demonstrating one of his symptoms: the frequency with which his intentions are disturbed through the interference of obscure motives.

I pass on to ailments that afflict the greater number of my healthy acquaintances as well as myself. I confess that - especially in former years - I was very apt to forget to return borrowed books, which I kept for long periods, and that it came about especially easily that I put off paying bills by forgetting them. One morning not long ago I left the tobacconist's where I had made my daily purchase of cigars without having paid for them. It was a most harmless omission, as I am well known there and could therefore expect to be reminded of my debt next day. But my trivial act of negligence, my attempt to contract a debt, was certainly not unconnected with budgetary thoughts which had occupied my mind during the preceding day. Among the majority even of what are called 'respectable' people traces of divided behaviour can easily be observed where money and property are concerned. It may perhaps be generally true that the primitive greed of the suckling, who wants to take possession of every object (in order to put it into his mouth), has only been incompletely overcome by civilization and upbringing.¹

¹ For the sake of preserving the unity of the subject I may perhaps interrupt the general arrangement I have adopted, and, in addition to what I have said above, point out that people's memories show a particular partiality in money matters. Paramnesias of having already paid for something can often be very obstinate, as I know from my own experience. When free play is given to avaricious aims apart from the serious interests of life - for fun, in fact -, as in card-playing, the most honourable men show an inclination to make errors and mistakes in memory and counting, and, without quite knowing how, they even find themselves involved in petty cheating. The psychically refreshing nature of these games is partly due to liberties of this kind. We must admit the truth of the saying that in play we can get to know a person's character - that is, if we are not thinking of his manifest character. - If waiters still make unintentional mistakes in the bill, the same explanation obviously applies to them. - In commercial circles a certain delay can frequently be observed in paying out sums of money (for settling accounts and so on) which in point of fact brings the owner no profit and can only be understood in psychological terms - as an expression of a counter-will against paying out money. - [*The next sentence was added in 1912:*] Brill puts the matter with epigrammatic brevity: 'We are more apt to mislay letters containing bills than cheques.' - The fact that women in particular evince a special amount of displeasure at paying their doctor is connected with the most intimate impulses, which are very far from having been elucidated. Women patients have usually forgotten their purse and so cannot pay at the time of consultation; they then regularly forget to send the fee after they reach home, and thus arrange things so that one has treated them for nothing - 'for the sake of their beaux yeux'. They pay one, as it were, by the sight of their countenance.
Where intentions of some importance are concerned, we have found in general that they are forgotten when obscure motives rise against them. In the case of rather less important intentions we can recognize a second mechanism of forgetting: a counter-will is transferred to the intention from some other topic, after an external association has been formed between the other topic and the content of the intention. Here is an example. I set store by high-quality blotting paper and I decided one day to buy a fresh supply that afternoon in the course of my walk to the Inner Town. But I forgot for four days running, till I asked myself what reason I had for the omission. It was easy to find after I had recalled that though I normally write 'Löschpapier' I usually say 'Fliesspapier'. 'Fliess' is the name of a friend in Berlin who had on the days in question given me occasion for a worrying and anxious thought. I could not rid myself of this thought, but the defensive tendency (cf. above, p. 1230) manifested itself by transferring itself, by means of the verbal similarity, to the indifferent intention which on account of its indifference offered little resistance.

[1901b, 1239]

Direct counter-will and more remote motivation are found together in the following example of dilatoriness. I had written a short pamphlet On Dreams (1901a), summarizing the subject-matter of my Interpretation of Dreams, for the series Grenzfragen des Nerven- und Seelenlebens. Bergmann of Wiesbaden had sent me the proofs, and had asked for them back by return of post, as the book was to be issued before Christmas. I corrected the proofs the same night and placed them on my desk so as to take them with me next morning. In the morning I forgot about them, and only remembered them in the afternoon when I saw the wrapper on my desk. In the same way I forgot the proofs that afternoon, that evening and the following morning, till I pulled myself together and took them to a letter-box on the afternoon of the second day, wondering what could be the reason for my procrastination. It was obvious that I did not want to send them off, but I could not discover why. However, in the course of the same walk I called in at my publisher's in Vienna - the firm that had published my Interpretation of Dreams, I placed an order for something and then said, as if impelled by a sudden thought: 'I suppose you know I've written the dream-book over again?' - 'Oh, you can't mean that!' he said. 'Don't be alarmed', I replied; 'it's only a short essay for the Löwenfeld-Kurella series.' But he was still not satisfied; he was worried that the essay would interfere with the sales of the book. I disagreed with him and finally asked: 'If I'd come to you before, would you have forbidden my publishing it?' - 'No, I certainly wouldn't.' Personally I believe I acted quite within my rights and did nothing contrary to common practice; nevertheless it seems certain that a misgiving similar to that expressed by the publisher was the motive for my delay in sending back the proofs. This misgiving goes back to an earlier occasion, on which a different publisher raised difficulties when it seemed unavoidable for me to introduce unaltered a few pages from an earlier work of mine on children's palsies published by another firm, into my monograph on the same subject in Nothnagel's Handbuch. But in this case, as well, the reproach was not justified; this time, too, I had loyally informed my first publisher (the same one who published The Interpretation of Dreams) of my intention. However, if this chain of memories is followed back still further, it brings to light an even earlier occasion involving a translation from the French, in which I really did infringe the rights of property that apply to publications. I added notes to the text which I translated, without asking the author's permission, and some years later had reason to suspect that the author was displeased with my arbitrary action.

[1901b, 1240]

There is a proverb which reveals the popular knowledge that the forgetting of intentions is not accidental: 'If one forgets to do a thing once, one will forget to do it many times more.'

[1901b, 1241]
Indeed, sometimes we cannot avoid an impression that everything that can be said about forgetting and about parapraxes is already familiar and self-evident to everyone. It is sufficiently surprising that it is nevertheless necessary to present to consciousness things that are so well-known. How often have I heard people say: 'Don't ask me to do that, I'm certain to forget it!' There is surely nothing mystical, then, if this prophecy is subsequently fulfilled. A person who talks in this way senses an intention not to carry out the request, and is merely refusing to admit it to himself.

[1901b, 1241]

Much light is thrown, moreover, on the forgetting of intentions by what may be called 'the forming of spurious intentions'. I once promised a young author that I would write a review of his short work; but because of internal resistances, which I knew about, I put off doing so, till one day I yielded to pressure from him and promised it would be done that same evening. I really had seriously meant to do it then, but I had forgotten that I had set the evening aside for preparing a specialist report that could not be deferred. After this had shown me that my intention had been spurious, I gave up the struggle against my resistances and refused the author's request.

[1901b, 1241]

One is on different ground when it comes to examining forgetting in its proper sense - that is, the forgetting of past experiences. (To distinguish them from forgetting in the stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapter I and II, as 'slipping the memory', and the forgetting of intentions as 'omissions'.) The basic determinants of the normal process of forgetting are unknown.¹ We are also reminded that not everything is forgotten that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, in so far as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

[1901b, 1343]

In the forgetting of intentions another factor comes into the foreground. The conflict, which could only be surmised in the repression of what was distressing to remember, here becomes tangible, and in the analysis of the examples a counter-will can regularly be recognized which opposes the intention without putting an end to it. As in the parapraxes already described, two types of psychical process can be recognized here. Either the counter-will is turned directly against the intention (in cases where the latter's purpose is of some importance), or it is unrelated in its nature to the intention itself and establishes its connection with it by means of an external association (in the case of intentions that are almost indifferent).

[1901b, 1344]
The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913], 2804

LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a slip of the tongue [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a misreading [Verlesen]), or he may hear wrongly something that has been said to him (a mishearing [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis forgetting [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a name which he nevertheless knows and which he recognizes at once, or he may forget to carry out an intention, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of mislaying [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of losing [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of errors [Irrtümer], in which the temporary character is present once more: for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

[1916-1917, 3136]
Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

[1916-1917, 3138]

There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget this time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the Kornprinz.' Next day an attempt was made at a correction. The paper apologized and said: 'We should of course have said "the Knorprinz."' People speak in such cases of a 'demon of misprints' or a 'type-setting fiend' - terms which at least go beyond any psycho-physiological theory of misprints.

[1916-1917, 3140]
The forgetting of intentions can in general be traced to an opposing current of thought, which is unwilling to carry out the intention. But this view is not only held by us psycho-analysts; it is the general opinion, accepted by everyone in their daily lives and only denied when it comes to theory. A patron who gives his protégé the excuse of having forgotten his request fails to justify himself. The protégé immediately thinks: 'It means nothing to him; it's true he promised, but he doesn't really want to do it.' For that reason forgetting is banned in certain circumstances of ordinary life; the distinction between the popular and the psycho-analytic view of these parapraxes seems to have disappeared. Imagine the lady of the house receiving her guest with the words: 'What? have you come to-day? I'd quite forgotten I invited you for to-day.' Or imagine a young man confessing to his fiancée that he had forgotten to keep their last rendez-vous. He will certainly not confess it; he will prefer to invent on the spur of the moment the most improbable obstacles which prevented his appearing at the time and afterwards made it impossible for him to let her know. We all know too that in military affairs the excuse of having forgotten something is of no help and is no protection against punishment, and we must all feel that that is justified. Here all at once everyone is united in thinking that a particular parapraxis has a sense and in knowing what that sense is. Why are they not consistent enough to extend this knowledge to the other parapraxes and to admit them fully? There is of course an answer to this question too.

Since laymen have so little doubt about the sense of this forgetting of intentions, you will be the less surprised to find writers employing this sort of parapraxis in the same sense. Any of you who have seen or read Bernard Shaw's Caesar and Cleopatra will remember that in the last scene Caesar, as he is leaving Egypt, is haunted by the idea that there is something else he had intended to do but has forgotten. In the end it turns out what this was: he had forgotten to say good-bye to Cleopatra. The dramatist is seeking by this little contrivance to ascribe to the great Caesar a superiority which he did not in fact possess and which he never desired. For historical sources will tell you that Caesar made Cleopatra follow him to Rome, that she was living there with her little Caesarion when Caesar was murdered, and that she thereupon fled from the city.

Cases of forgetting an intention are in general so clear that they are not of much use for our purpose of obtaining circumstantial evidence of the sense of a parapraxis from the psychical situation. Let us therefore turn to a particularly ambiguous and obscure kind of parapraxis - to losing and mislaying. You will no doubt find it incredible that we ourselves can play an intentional part in what is so often the painful accident of losing something. But there are plenty of observations like the following one. A young man lost a pencil of his which he had been very fond. The day before, he had received a letter from his brother-in-law which ended with these words: 'I have neither the inclination nor the time at present to encourage you in your frivolity and laziness.' The pencil had actually been given to him by this brother-in-law. Without this coincidence we could not, of course, have asserted that a part was played in the loss by an intention to get rid of the thing. Similar cases are very common. We lose an object if we have quarrelled with the person who gave it to us and do not want to be reminded of him; or if we no longer like the object itself and want to have an excuse for getting another and better one instead. The same intention directed against an object can also play a part, of course, in cases of dropping, breaking or destroying things. Can we regard it as a matter of chance when a schoolchild immediately before his birthday loses, ruins or smashes some of his personal belongings, such as his satchel or his watch?
I have already given you an example of a combination of a forgetting with an error, the case of someone forgetting an appointment and on a second occasion, having firmly decided not to forget this time, turning up at the wrong hour. An exactly similar case was reported to me from his own experience by a friend with literary as well as scientific interests. 'Some years ago', he told me, 'I allowed myself to be elected to the committee of a certain literary society, as I thought that the organization might one day be able to help me to have my play produced; and I took a regular part, though without being much interested, in the meetings which were held every Friday. Then, a few months ago, I was given the promise of a production at the theatre at F.; and since then I have regularly forgotten the meetings of the society. When I read your book on the subject I felt ashamed of my forgetfulness. I reproached myself with the thought that it was shabby behaviour on my part to stay away now that I no longer needed these people, and resolved on no account to forget the next Friday. I kept on reminding myself of this resolution until I carried it into effect and stood at the door of the room where the meetings were held. To my astonishment it was locked; the meeting was over. I had in fact made a mistake over the day; it was now Saturday!'

It is these two factors which we meet with most markedly in the different situations in which parapraxes of forgetting occur. The forgetting of intentions is quite unambiguous; as we have already seen, its interpretation is not disputed even by laymen. The purpose which disturbs the intention is in every instance a counter-intention, an unwillingness; and all that remains for us to learn about it is why it has not expressed itself in some other and less disguised manner. But the presence of this counter-will is unquestionable. Sometimes, too, we succeed in guessing something of the motives which compel this counter-will to conceal itself; acting surreptitiously by means of the parapraxis it always achieves its aim, whereas it would be sure of repudiation if it emerged as an open contradiction. If some important change in the psychical situation takes place between the forming of the intention and its carrying-out, as a result of which there is no longer any question of the intention being carried out, then the forgetting of the intention drops out of the category of parapraxes. It no longer seems strange to have forgotten it, and we realize that it would have been unnecessary to remember it: thereafter it becomes permanently or temporarily extinct. The forgetting of an intention can only be called a parapraxis if we cannot believe that the intention has been interrupted in this latter way.
The instances of forgetting an intention are in general so uniform and so perspicuous that for that very reason they are of no interest for our investigation. Nevertheless there are two points at which we can learn something new from a study of these parapraxes. Forgetting - that is, failure to carry out an intention - points, as we have said, to a counter-will that is hostile to it. This is no doubt true; but our enquiries show that the counter-will can be of two kinds - direct or indirect. What I mean by the latter will best appear from one or two examples. If a patron forgets to put in a word with a third person on behalf of his protégé this may happen because he is not really very much interested in the protégé and therefore has no great desire to speak on his behalf. In any case, that is how the protégé will understand the patron's forgetting. But things may be more complicated. The counter-will in the patron against carrying out the intention may come from another direction and may be aimed at quite a different point. It may have nothing to do with the protégé but may perhaps be directed against the third person to whom the recommendation was to have been made. So you see from this once more the doubts that stand in the way of a practical application of our interpretations. In spite of the correct interpretation of the forgetting, the protégé is in danger of being too distrustful and of doing his patron a grave injustice. Or, supposing someone forgets an appointment which he has promised someone else to keep, the most frequent reason for it will be, no doubt, a direct disinclination to meeting this person. But in such a case analysis might show that the disturbing purpose did not relate to him but was directed against the place at which the meeting was planned to happen and was avoided on account of a distressing memory attaching to it. Or, again, if someone forgets to post a letter, the counter-purpose may be based on the contents of the letter; but it is by no means out of the question that the letter may be harmless in itself and may only be subject to the counter-purpose because something about it recalls another letter which had been written on some earlier occasion and which offered the counter-will a direct point of attack. It can be said, therefore, that here the counter-will was transferred from the earlier letter, which justified it, to the present one, which it had in fact no grounds for concern about. You see, then, that we must practise restraint and foresight in applying our interpretations, justified as they are: things that are psychologically equivalent may in practice have a great variety of meanings.

[1916-1917, 3178]

Phenomena such as these last may seem to you most unusual, and you will perhaps be inclined to suppose that an 'indirect' counter-will already indicates that the process is a pathological one. But I can assure you that it occurs as well within the limits of what is normal and healthy. Moreover you should not misunderstand me. I am far from admitting that our analytic interpretations are untrustworthy. The ambiguities in the forgetting of intentions which I have been mentioning exist only so long as we have not made an analysis of the case and are only making our interpretations on the basis of our general assumptions. If we carry out an analysis upon the person in question, we invariably learn with sufficient certainty whether the counter-will is a direct one or what other origin it may have.

[1916-1917, 3179]
The second point I have in mind is this. If in a large majority of instances we find confirmation of the fact that the forgetting of an intention goes back to a counter-will, we grow bold enough to extend the solution to another set of instances in which the person under analysis does not confirm but denies the counter-will we have inferred. Take as examples of this such extremely common events as forgetting to return books one has been lent or to pay bills or debts. We shall venture to insist to the person concerned that an intention exists in him to keep the books and not to pay the debts, while he will deny this intention but will not be able to produce any other explanation of his behaviour. Thereupon we shall go on to say that he has this intention but knows nothing about it, but that it is enough for us that it reveals its presence by producing the forgetting in him. He may repeat to us that he has in fact forgotten. You will now recognize the situation as one in which we found ourselves once before. If we want to pursue our interpretations of parapraxes, which have so frequently proved justified, to a consistent conclusion, we are forced to the inescapable hypothesis that there are purposes in people which can become operative without their knowing about them. But this brings us into opposition to all the views that dominate both ordinary life and psychology.

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.
Errors of memory are distinguished from forgetting accompanied by paramnesia by the single feature that in the former the error (the paramnesia) is not recognized as such but finds credence. The use of the term 'error', however, seems to depend on yet another condition. we have remembered it wrongly We speak of 'being in error' rather than of 'remembering wrongly' where we wish to emphasize the characteristic of objective reality in the psychical material which we are trying to reproduce - that is to say, where what we are trying to remember is something different from a fact of our own psychical life: something, rather, that is open to confirmation or refutation by the memory of other people. The antithesis to an error of memory in this sense is ignorance.

How is it to be explained that my memory provided me at these points with what was incorrect, while otherwise - as the reader of the book can see for himself - it put at my disposal the most out-of-the-way and unusual material? And how, too, did I pass over these errors while I carefully went through three sets of proofs - as if I had been struck blind?

Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.

It has also occasionally happened that friends and patients, whose dreams I have reported, or have alluded to in the course of my dream-analyses, have drawn my attention to the fact that the details of the events experienced by us together have been inaccurately related by me. These again could be classified as historical errors. After being put right I have examined the various cases and here too I have convinced myself that my memory of the facts was incorrect only where I had purposely distorted or concealed something in the analysis. Here once again we find an unobserved error taking the place of an intentional concealment or repression.

These errors that derive from repression are to be sharply distinguished from others which are based on genuine ignorance. Thus, for example, it was ignorance which made me think during an excursion to the Wachau that I had come to the home of Fischhof, the revolutionary leader. The two places merely have the same name: Fischhof's Emmersdorf is in Carinthia. I, however, knew no better.
Here is another instructive error that put me to shame, an example of what might be called temporary ignorance. One day a patient reminded me to give him the two books on Venice that I had promised him, as he needed them in preparing for a journey at Easter. 'I have them ready,' I replied, and went to the library to fetch them. The truth, however, was that I had forgotten to look them out, for I did not entirely approve of my patient’s journey, which I saw as an unnecessary interruption of the treatment and a material loss to the physician. I therefore took a hasty look round the library for two books I had had my eye on. One was ‘Venice, City of Art’; but besides this I thought I must own a historical work in a similar series. Quite right, there it was: ‘The Medici’. I took it and brought it to my waiting patient, only ashamedly to acknowledge the error. In reality I of course knew that the Medici have nothing to do with Venice, but for a short time it did not strike me as in any way incorrect. I now had to be fair; as I had so frequently confronted my patient with his own symptomatic acts I could only vindicate my authority in his eyes by being honest and showing him the motives (which I had kept secret) for my disapproval of his journey.

Of all parapraxes errors seem to have the least rigid mechanism. That is to say, the occurrence of an error is a quite general indication that the mental activity in question has had to struggle with a disturbing influence of some sort or other; but the particular form that the error takes is not determined by the quality of the concealed disturbing idea. We may add here retrospectively that the same thing can be assumed to be true of many simple cases of slips of the tongue and pen. Every time we make a slip in talking or writing we may infer that there has been a disturbance due to mental processes lying outside our intention; but it must be admitted that slips of the tongue and of the pen often obey the laws of resemblance, of indolence or of the tendency to haste, without the disturbing element succeeding in imposing any part of its own character on the resulting mistake in speech or writing. It is the compliance of the linguistic material which alone makes the determining of the mistakes possible, and at the same time sets the limits up to which the determining can go.

To avoid confining myself entirely to my own errors, I shall report a few examples that might indeed have been included just as well among slips of the tongue and bungled actions; this is, however, a matter of indifference, since all these forms of parapraxis are equivalent to one another.

The frequent cases in which a mother confuses the names of her daughters, sons or sons-in-law are just as easy to interpret.
(4) Mislaying something is really the same as forgetting where it has been put. Like most people who are occupied with writing and books I know my way about on my writing-table and can lay my hands straight away on what I want. What appears to other people as disorder is for me order with a history behind it. Why, then, did I recently mislay a book-catalogue, which had been sent to me, so that it was impossible to find it? I had in fact intended to order a book, Über die Sprache, which was advertised in it, since it was by an author whose witty and lively style I like and whose insight in psychology and knowledge of the history of civilization I have learnt to value. I believe that this is precisely why I mislaid the catalogue. For it is my habit to lend books by this author to my acquaintances for their enlightenment, and a few days previously one of them had remarked as he returned a copy: 'His style reminds me very much of your own, and his way of thinking, too, is the same as yours.' The speaker did not know what he was touching on by that remark. Years before, when I was younger and in greater need of outside contacts, an elder colleague to whom I had praised the writings of a well-known medical author had made almost the same comment: 'It's just your style and your manner.' Prompted by this remark I had written a letter to the author seeking closer relations with him, but had been put in my place by a chilly answer. Perhaps still earlier discouraging experiences as well lie concealed behind this one, for I never found the mislaid catalogue and was in fact deterred by this omen from ordering the advertised book, although the disappearance of the catalogue formed no real hindrance since I could remember the names of both book and author.

[1901b, 1223]

(5) Another case of mislaying merits our interest on account of the conditions under which the mislaid object was rediscovered. A youngish man told me the following story: 'Some years ago there were misunderstandings between me and my wife. I found her too cold, and although I willingly recognized her excellent qualities we lived together without any tender feelings. One day, returning from a walk, she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of 'attention', promised to read the book and put it on one side. After that I could never find it again. Months passed by, in which time I occasionally remembered the lost book and made vain attempts to find it. About six months later my dear mother, who was not living with us, fell ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife an opportunity of showing the best side of herself. One evening I returned home full of enthusiasm and gratitude for what my wife had accomplished. I walked up to my desk, and without any definite intention but with a kind of somnambulistic certainty opened one of the drawers. On the very top I found the long lost book I had mislaid.'

[1901b, 1224]

(6) A case of mislaying which shares the last characteristic of the above example - namely, the remarkable sureness shown in finding the object again once the motive for its being mislaid had expired - is reported by Stärcke (1916):

[1901b, 1224]

(7) The following example of 'mislaying' is of a type that has become familiar to every psychoanalyst. I may remark that the patient responsible for it found the solution himself:

[1901b, 1225]
A patient, whose psycho-analytic treatment was interrupted by the summer holidays at a time when he was in a state of resistance and felt unwell, put his bunch of keys in its usual place - or so he thought - when he undressed for the night. Then he remembered that there were a few more things that he needed for his journey next day - the last day of treatment and the date on which his fee was due - and he went to get them out of the writing-desk, in which he had also put his money. But the keys had disappeared. He began to make a systematic but increasingly agitated search of his small flat - with no success. Since he recognized the "mislaying" of the keys as a symptomatic act - that is, as something he had done intentionally - he woke his servant in order to continue the search with the aid of an "unprejudiced" person. After another hour he gave it up and was afraid he had lost the keys. Next morning he ordered new keys from the makers of the desk, and they were hastily made for him. Two friends, who had come home with him in the same cab, thought they remembered hearing something fall with a clink on the ground as he stepped out of the cab. He was convinced that his keys had fallen from his pocket. That evening the servant triumphantly presented him with the keys. They had been found lying between a thick book and a thin pamphlet (a work by one of my pupils) which he wanted to take away to read on his holiday. They were so cleverly placed that no one would have suspected they were there. He found himself afterwards unable to replace them so that they were equally invisible. The unconscious dexterity with which an object is mislaid on account of hidden but powerful motives is very reminiscent of "somnambulistic certainty". The motive, as one would expect, was ill-temper at the treatment being interrupted and secret rage at having to pay a high fee when he was feeling so unwell.

(9) An innocent case, in which the motivation was admitted, is reported by Dora Müller (1915):

If a survey is made of cases of mislaying, it in fact becomes hard to believe that anything is ever mislaid except as a result of an unconscious intention.

(2) The next example combines a symptomatic act with a case of mislaying. It reached me in a somewhat roundabout way, but comes from a reliable source.
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him. [1906c, 1889]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on. [1913], 2805]
LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a *slip of the tongue* [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a *misreading* [Verlesen]), or he may hear wrongly something that has been said to him (a *mishearing* [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis *forgetting* [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a *name* which he nevertheless knows and which he recognizes at once, or he may forget to carry out an *intention*, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of *mislaying* [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of *losing* [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of *errors* [Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

It is to these phenomena, then, that I now propose to draw your attention. But you will protest with some annoyance: 'There are so many vast problems in the wide universe, as well as within the narrower confines of our minds, so many marvels in the field of mental disorders, which require and deserve to have light thrown upon them, that it does really seem gratuitous to waste labour and interest on such trivialities. If you could make us understand why a person with sound eyes and ears can see and hear in broad daylight things that are not there, why another person suddenly thinks he is being persecuted by the people of whom he has hitherto been most fond, or puts forward the cleverest arguments in support of delusional beliefs which any child could see were nonsensical, then we should have some opinion of psycho-analysis. But if it can do no more than ask us to consider why a speaker at a banquet uses one word instead of another or why a housewife has mislaid her keys, and similar futilities, then we shall know how to put our time and interest to better uses.'

[1916-1917, 3136, 3137]
Cases of forgetting an intention are in general so clear that they are not of much use for our purpose of obtaining circumstantial evidence of the sense of a parapraxis from the psychical situation. Let us therefore turn to a particularly ambiguous and obscure kind of parapraxis - to losing and mislaying. You will no doubt find it incredible that we ourselves can play an intentional part in what is so often the painful accident of losing something. But there are plenty of observations like the following one. A young man lost a pencil of his of which he had been very fond. The day before, he had received a letter from his brother-in-law which ended with these words: 'I have neither the inclination nor the time at present to encourage you in your frivolity and laziiness.' The pencil had actually been given to him by this brother-in-law. Without this coincidence we could not, of course, have asserted that a part was played in the loss by an intention to get rid of the thing.¹ Similar cases are very common. We lose an object if we have quarrelled with the person who gave it to us and do not want to be reminded of him; or if we no longer like the object itself and want to have an excuse for getting another and better one instead. The same intention directed against an object can also play a part, of course, in cases of dropping, breaking or destroying things. Can we regard it as a matter of chance when a schoolchild immediately before his birthday loses, ruins or smashes some of his personal belongings, such as his satchel or his watch?

[1916-1917, 3162]

Nor will anyone who has sufficiently often experienced the torment of not being able to find something that he himself has put away feel inclined to believe that there is a purpose in mislaying things. Yet instances are far from rare in which the circumstances attendant on the mislaying point to an intention to get rid of the object temporarily or permanently.

[1916-1917, 3162]

Here is the best example, perhaps, of such an occasion. A youngish man told me the following story: 'Some years ago there were misunderstandings between me and my wife. I found her too cold, and although I willingly recognized her excellent qualities we lived together without any tender feelings. One day, returning from a walk, she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of "attention", promised to read the book and put it on one side. After that I could never find it again. Months passed by, in which I occasionally remembered the lost book and made vain attempts to find it. About six months later my dear mother, who was not living with us, fell ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife an opportunity of showing the best side of herself. One evening I returned home full of enthusiasm and gratitude for what my wife had accomplished. I walked up to my desk, and without any definite intention but with a kind of somnambulistic certainty opened one of the drawers. On the very top I found the long-lost book I had mislaid. With the extinction of the motive the mislaying of the object ceased as well.

[1916-1917, 3163]

In another case a bungled action is combined with an instance of mislaying. A lady travelled to Rome with her brother-in-law, who was a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her - how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent of; and it was at this point, that the meaning of her 'absent-mindedness' dawned on the lady: she wanted to keep the object for herself.²

[1916-1917, 3164]
Losing and mislaying are of particular interest to us owing to the many meanings they may have - owing, that is, to the multiplicity of the purposes which can be served by these parapraxes. All cases have in common the fact that there was a wish to lose something; they differ in the basis and aim of that wish. We lose a thing when it is worn out, when we intend to replace it by a better one, when we no longer like it, when it originates from someone with whom we are no longer on good terms or when we acquired it in circumstances we no longer want to recall. Dropping, damaging or breaking the object can serve the same purpose. In the sphere of social life experience is said to have shown that unwanted and illegitimate children are far more frail than those legitimately conceived. The crude technique of baby-farmers is not necessary for bringing about this result; a certain amount of neglect in looking after the children should be quite sufficient. The preserving of things may be subject to the same influences as that of children.

[1916-1917, 3181]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

[1924f, 4109]
It is consoling to reflect that there is an unsuspected extension of the human habit of 'losing things' - namely, symptomatic acts, and that this habit is consequently welcome, at least to a secret intention of the loser's. It is often only an expression of the low estimation in which the lost object is held, or of a secret antipathy towards it or towards the person that it came from; or else the inclination to lose the object has been transferred to it from other more important objects by a symbolic association of thoughts. Losing objects of value serves to express a variety of impulses; it may either be acting as a symbolic representation of a repressed thought - that is, it may be repeating a warning that one would be glad enough to ignore -, or (most commonly of all) it may be offering a sacrifice to the obscure powers of destiny to whom homage is still paid among us to-day.

Here are a few examples to illustrate these remarks about losing things.

An article of some length by Otto Rank (1911) makes use of dream-analysis to expose the sacrificial mood that forms the basis of this act, and to reveal its deeper motives.¹ It is of interest when he writes later that often not only losing objects but also, finding them appears to be determined. In what sense this is to be understood may be gathered from his story, which I include here (Rank, 1915a). It is obvious that in cases of losing, the object is already provided; in cases of finding, it has first to be looked for.

A similar state of affairs, and probably also the same mechanism, is to be seen in what Ferenczi (1915) has called 'supposed' parapraxes. We believe there is something - some object - that we have forgotten or mislaid or lost; but we are able to convince ourselves we have done nothing of the kind and that everything is as it should be. For example, a woman patient returns to the doctor's room, giving as a reason that she wants to collect the umbrella she has left behind there; but the doctor sees that she is in fact holding it in her hand. There was therefore an impulse towards this parapraxis, and the impulse was sufficient to serve as a substitute for its actual execution. Except for this difference, the supposed parapraxis is equivalent to the real one. It is, however, what one might call cheaper.

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.
Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.
[1913, 2805]

Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.
[1913, 2805]

LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a slip of the tongue [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a misreading [Verlesen]), or he may hear wrongly something that has been said to him (a mishearing [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis forgetting [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a name which he nevertheless knows and which he recognizes at once, or he may forget to carry out an intention, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of mislaying [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of losing [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of errors [Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.
[1916-1917, 3136]
Cases of forgetting an intention are in general so clear that they are not of much use for our purpose of obtaining circumstantial evidence of the sense of a parapraxis from the psychical situation. Let us therefore turn to a particularly ambiguous and obscure kind of parapraxis - to losing and mislaying. You will no doubt find it incredible that we ourselves can play an intentional part in what is so often the painful accident of losing something. But there are plenty of observations like the following one. A young man lost a pencil of his of which he had been very fond. The day before, he had received a letter from his brother-in-law which ended with these words: 'I have neither the inclination nor the time at present to encourage you in your frivolity and laziness.' The pencil had actually been given to him by this brother-in-law. Without this coincidence we could not, of course, have asserted that a part was played in the loss by an intention to get rid of the thing.¹ Similar cases are very common. We lose an object if we have quarrelled with the person who gave it to us and do not want to be reminded of him; or if we no longer like the object itself and want to have an excuse for getting another and better one instead. The same intention directed against an object can also play a part, of course, in cases of dropping, breaking or destroying things. Can we regard it as a matter of chance when a schoolchild immediately before his birthday loses, ruins or smashes some of his personal belongings, such as his satchel or his watch?

¹[1916-1917, 3162]

Losing and mislaying are of particular interest to us owing to the many meanings they may have - owing, that is, to the multiplicity of the purposes which can be served by these parapraxes. All cases have in common the fact that there was a wish to lose something; they differ in the basis and aim of that wish. We lose a thing when it is worn out, when we intend to replace it by a better one, when we no longer like it, when it originates from someone with whom we are no longer on good terms or when we acquired it in circumstances we no longer want to recall. The crude technique of baby-farmers is not necessary for bringing about this result; a certain amount of neglect in looking after the children should be quite sufficient. The preserving of things may be subject to the same influences as that of children.

¹[1916-1917, 3181]

Things may, however, be condemned to be lost without their value having suffered any diminution - when, that is, there is an intention to sacrifice something to Fate in order to ward off some other dreaded loss. Analysis tells us that it is still quite a common thing among us to exorcize Fate in this way; and thus our losing is often a voluntary sacrifice. In the same way, losing may also serve the purpose of defiance or self-punishment. In short, the more remote reasons for the intention to get rid of a thing by losing it are beyond number.

¹[1916-1917, 3181]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. Except for this difference, the supposed parapraxis is equivalent to the real one. It is, however, what one might call cheaper.

[1901b, 1338]

After Gradiva's disappearance, there was only a distant sound, like the laughing call of a bird flying over the ruined city. The young man, now by himself, picked up a white object that had been left behind by Gradiva: not a sheet of papyrus, but a sketch-book with pencil drawings of various scenes in Pompeii. We should be inclined to regard her having forgotten the book there as a pledge of her return, for it is our belief that no one forgets anything without some secret reason or hidden motive.

[1907a, 1825]

Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

[1916-1917, 3138]
The following examples will show how much meaning may turn out to lie in an apparently unintentional act of carrying something off or taking something away with one.

[1901b, 1279]
If slips in speaking - which is clearly a motor function - can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term 'bungled actions' ['Vergreifen'] to describe all the cases in which a wrong result - i.e. a deviation from what was intended - seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena. It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'. Let us rather try to trace the individual examples back to their particular determinants. For this purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.

(a) In former years I visited patients in their homes more frequently than I do at present; and on numerous occasions when I was at the front door, instead of knocking or ringing the bell, I pulled my own latch key out of my pocket, only to thrust it back again in some confusion. When I consider the patients at whose houses this happened, I am forced to think that the parapraxis - taking out my key instead of ringing the bell - was in the nature of a tribute to the house where I made the mistake. It was equivalent to the thought 'Here I feel I am at home', for it only occurred at places where I had taken a liking to the patient. (Of course I never ring my own door bell.)

Thus the parapraxis was a symbolic representation of a thought which was not after all really intended to be accepted seriously and consciously; for a nerve specialist is in fact well aware that his patients remain attached to him only so long as they expect to be benefited by him, and that he in turn allows himself to feel an excessively warm interest in them only with a view to giving them psychical help.

Numerous self-observations made by other people show that handling a key in this significantly incorrect way is certainly not a peculiarity of mine.

Maeder (1906) describes what is an almost identical repetition of my experiences: 'Il est arrivé à chacun de sortir son trousseau, en arrivant à la porte d’un ami particulièrement cher, de se surprendre pour ainsi dire, en train d’ouvrir avec sa clé comme chez soi. C’est un retard, puisqu’il faut sonner malgré tout, mais c’est une preuve qu’on se sent - ou qu’on voudrait se sentir - comme chez soi, auprès de cet ami.'

(c) For many years a reflex hammer and a tuning fork have been lying side by side on my writing table. One day I left in a hurry at the end of my consulting hour as I wanted to catch a particular suburban train; and in broad daylight I put the tuning fork in my coat pocket instead of the hammer. The weight of the object pulling down my pocket drew my attention to my mistake. Anyone who is not in the habit of giving consideration to such minor occurrences will doubtless explain and excuse the mistake by pointing to the haste of the moment. Nevertheless I preferred to ask myself the question why it actually was that I took the tuning fork instead of the hammer. My haste could just as well have been a motive for picking up the right object so as not to have to waste time in correcting my mistake.
It will be observed that this time it was the voice of self-criticism which was making itself heard in the bungled action. A bungled action is quite specially suitable for use in this way as a self-reproach: the present mistake seeks to represent the mistake that has been committed elsewhere.

(d) Bungled actions can, of course, also serve a whole number of other obscure purposes. Here is a first example. It is very rare for me to break anything. I am not particularly dextrous but a result of the anatomical integrity of my nerve-muscle apparatus is that there are clearly no grounds for my making clumsy movements of this kind, with their unwelcome consequences. I cannot therefore recall any object in my house that I have ever broken. Shortage of space in my study has often forced me to handle a number of pottery and stone antiquities (of which I have a small collection) in the most uncomfortable positions, so that onlookers have expressed anxiety that I should knock something down and break it. That however has never happened. Why then did I once dash the marble cover of my plain inkpot to the ground so that it broke?

The explanation was not hard to find. Some hours before, my sister had been in the room to inspect some new acquisitions. She admired them very much, and then remarked: 'Your writing table looks really attractive now; only the inkstand doesn't match. You must get a nicer one.' I went out with my sister and did not return for some hours. But when I did I carried out, so it seems, the execution of the condemned inkstand. Did I perhaps conclude from my sister's remark that she intended to make me a present of a nicer inkstand on the next festive occasion, and did I smash the unlovely old one so as to force her to carry out the intention she had hinted at? If that is so, my sweeping movement was only apparently clumsy; in reality it was exceedingly adroit and well-directed, and understood how to avoid damaging any of the more precious objects that stood around.

It is in fact my belief that we must accept this judgement for a whole series of seemingly accidental clumsy movements. It is true that they make a show of something violent and sweeping, like a spastic-atactic movement, but they prove to be governed by an intention and achieve their aim with a certainty which cannot in general be credited to our conscious voluntary movements. Moreover they have both features - their violence and their unerring aim - in common with the motor manifestations of the hysterical neurosis, and partly, too, with the motor performances of somnambulism. This fact indicates that both in these cases and in the movements under consideration the same unknown modification of the innervatory process is present.

Another self-observation, reported by Frau Lou Andreas-Salomé, may give a convincing demonstration of how obstinate persistence in an act of 'clumsiness' serves unavowed purposes in a far from clumsy way:

In the last few years, during which I have been collecting such observations, I have had a few more experiences of smashing or breaking objects of some value, but the investigation of these cases has convinced me that they were never the result of chance or of unintentional clumsiness on my part. One morning, for example, when I was passing through a room in my dressing-gown with straw slippers on my feet, I yielded to a sudden impulse and hurled one of my slippers from my foot at the wall, causing a beautiful little marble Venus to fall down from its bracket. As it broke into pieces, I quoted quite unmoved these lines from Busch:
This wild conduct and my calm acceptance of the damage are to be explained in terms of the situation at the time. One of my family was gravely ill, and secretly I had already given up hope of her recovery. That morning I had learned that there had been a great improvement, and I know I had said to myself: 'So she's going to live after all!' My attack of destructive fury served therefore to express a feeling of gratitude to fate and allowed me to perform a 'sacrificial act' - rather as if I had made a vow to sacrifice something or other as a thank-offering if she recovered her health! The choice of the Venus of Medici for this sacrifice was clearly only a gallant act of homage towards the convalescent; but even now it is a mystery to me how I made up my mind so quickly, aimed so accurately and avoided hitting anything else among the objects so close to it.

Another case of breaking something, for which I once again made use of a pen-holder that slipped from my hand, likewise had the significance of a sacrifice; but on this occasion it took the form of a propitiatory sacrifice to avert evil. I had once seen fit to reproach a loyal and deserving friend on no other grounds than the interpretation I placed on certain indications coming from his unconscious. He was offended and wrote me a letter asking me not to treat my friends psycho-analytically. I had to admit he was in the right, and wrote him a reply to pacify him. While I was writing this letter I had in front of me my latest acquisition, a handsome glazed Egyptian figure. I broke it in the way I have described, and then immediately realized that I had caused this mischief in order to avert a greater one. Luckily it was possible to cement both of them together - the friendship as well as the figure - so that the break would not be noticed.

A third breakage was connected with less serious matters; it was only the disguised 'execution' - to borrow an expression from Vischer's *Auch Einer* - of an object which no longer enjoyed my favour. For some time I used to carry a stick with a silver handle. On one occasion the thin metal got damaged, through no fault of mine, and was badly repaired. Soon after the stick came back, I used the handle in a mischievous attempt to catch one of my children by the leg - with the natural result that it broke, and I was thus rid of it.

The equanimity with which we accept the resulting damage in all these cases can no doubt be taken as evidence that there is an unconscious purpose behind the performance of these particular actions.

In investigating the reasons for the occurrence of even so trivial a parapraxis as the breaking of an object, one is liable to come across connections which, besides relating to a person's present situation, lead deep into his prehistory. The following analysis by Jekels (1913) may serve as an example:

(e) Dropping, knocking over and breaking objects are acts which seem to be used very often to express unconscious trains of thought, as analysis can occasionally demonstrate, but as may more frequently be guessed from the superstitious or facetious interpretations popularly connected with them. The interpretations attached to salt being spilt, a wine-glass being knocked over, a dropped knife sticking in the ground, etc., are well known. I shall not discuss till later the question of what claims such superstitious interpretations have to being taken seriously. Here I need only remark that individual clumsy actions do not by any means always have the same meaning, but serve as a method of representing one purpose or another according to circumstances.
Recently we passed through a period in my house during which an unusually large amount of glass and china crockery was broken; I myself was responsible for some of the damage. But the little psychical epidemic could easily be explained: these were the days before my eldest daughter's wedding. On such festive occasions it used to be the custom deliberately to break some utensil and at the same time utter a phrase to bring good luck. This custom may have the significance of a sacrifice and it may have another symbolic meaning as well.

When servants drop fragile articles and so destroy them, our first thought is certainly not of a psychological explanation, yet it is not unlikely that here, too, obscure motives play their part. Nothing is more foreign to uneducated people than an appreciation of art and works of art. Our servants are dominated by a mute hostility towards the manifestations of art, especially when the objects (whose value they do not understand) become a source of work for them. On the other hand people of the same education and origin often show great dexterity and reliability in handling delicate objects in scientific institutions, once they have begun to identify themselves with their chief and to consider themselves an essential part of the staff.

I insert here a communication from a young technician which gives us some insight into the mechanism of a case of material damage:

Similarly, falling, stumbling and slipping need not always be interpreted as purely accidental miscarriages of motor actions. The double meanings that language attaches to these expressions are enough to indicate the kind of phantasies involved, which can be represented by such losses of bodily equilibrium. I can recall a number of fairly mild nervous illnesses in women and girls which set in after a fall not accompanied by any injury, and which were taken to be traumatic hysterias resulting from the shock of the fall. Even at that time I had an impression that these events were differently connected and that the fall was already a product of the neurosis and expressed the same unconscious phantasies with a sexual content, which could be assumed to be the forces operating behind the symptoms. Is not the same thing meant by a proverb which runs: 'When a girl falls she falls on her back'?

We can also count as bungled actions cases of giving a beggar a gold piece instead of a copper or small silver coin. The explanation of such mistakes is easy. They are sacrificial acts designed to appease fate, to avert harm, and so on. If a devoted mother or aunt, directly before going for a walk in the course of which she displays unwilling generosity of this kind, is heard to express concern over a child's health, we can have no more doubts about the meaning of the apparently disagreeable accident. In this way our parapraxes make it possible for us to practise all those pious and superstitious customs that must shun the light of consciousness owing to opposition from our reason, which has now grown sceptical.
There is no sphere in which the view that accidental actions are really intentional will command a more ready belief than that of sexual activity, where the border line between the two possibilities seems really to be a faint one. A good example from my own experience of a few years ago shows how an apparently clumsy movement can be most cunningly used for sexual purposes. In the house of some friends I met a young girl who was staying there as a guest and who aroused a feeling of pleasure in me which I had long thought was extinct. As a result I was in a jovial, talkative and obliging mood. At the time I also endeavoured to discover how this came about; a year before, the same girl had made no impression on me. As the girl's uncle, a very old gentleman, entered the room, we both jumped to our feet to bring him a chair that was standing in the corner. She was nimbler than I was and, I think, nearer to the object; so she took hold of the chair first and carried it in front of her with its back towards her, gripping the sides of the seat with both hands. As I got there later, but still stuck to my intention of carrying the chair, I suddenly found myself standing directly behind her, and throwing my arms round her from behind; and for a moment my hands met in front of her waist. I naturally got out of the situation as rapidly as it had arisen. Nor does it seem to have struck anyone how dextrously I had taken advantage of this clumsy movement.

Occasionally, too, I have had to tell myself that the irritating and clumsy process of dodging someone in the street, when for several seconds one steps first to one side and then to the other, but always to the same side as the other person, till finally one comes to a standstill face to face with him (or her) - this 'getting in someone's way', I have had to tell myself, is once more a repetition of an improper and provocative piece of behaviour from earlier times and, behind a mask of clumsiness, pursues sexual aims. I know from my psycho-analyses of neurotics that what is described as the naïveté of young people and children is frequently only a mask of this sort, employed so that they may be able to say or do something improper without feeling embarrassed.

In attempting to analyse this small mistake I first thought of the phrase 'sich an der Alten vergreifen',¹ which provided a short cut to the solution. I was under the influence of a dream which had been told me by a young man the previous evening and the content of which could only point to sexual intercourse with his own mother.² The strange fact that the legend finds nothing objectionable in Queen Jocasta's age seemed to me to fit in well with the conclusion that in being in love with one's own mother one is never concerned with her as she is in the present but with her youthful mnemonic image carried over from one's childhood. Such incongruities always appear when a phantasy that fluctuates between two periods is made conscious and so becomes definitely attached to one of the two periods. While absorbed in thoughts of this kind I came to my patient, who is over ninety, and I must have been on the way to grasping the universal human application of the Oedipus myth as correlated with the Fate which is revealed in the oracles; for at that point I did violence to or committed a blunder on 'the old woman'. Here again the bungled action was a harmless one; of the two possible errors, using the morphine solution for the eye or the eye lotion for the injection, I had chosen by far the more harmless one. This still leaves the question open of whether we may admit the possibility of an unconscious intention in mistakes that can cause serious harm, in the same way as in the cases which I have discussed.
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. Almost, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture. [1901b, 1266]

The actions described so far, in which we recognized the carrying out of an unconscious intention, made their appearance in the form of disturbances of other intended actions and concealed themselves behind the pretext of clumsiness. The 'chance' actions which are now to be discussed differ from 'bungled' actions merely in the fact that they scorn the support of a conscious intention and are therefore in no need of a pretext. They appear on their own account, and are permitted because they are not suspected of having any aim or intention. We perform them 'without thinking there is anything in them', 'quite accidentally', 'just to have something to do'; and such information, it is expected, will put an end to any enquiry into the significance of the action. In order to be able to enjoy this privileged position, these actions, which no longer put forward the excuse of clumsiness, have to fulfil certain conditions: they must be unobtrusive and their effects must be slight. [1901b, 1269]
The richest supply of such chance or symptomatic acts is in fact to be obtained during the psycho-analytic treatment of neurotics. I cannot resist quoting two examples from this source which show how extensively and in what detail these insignificant occurrences are determined by unconscious thoughts. The borderline between symptomatic acts and bungled actions is so ill-defined that I might equally well have included these examples in the last chapter. [1901b, 1269]

To avoid confining myself entirely to my own errors, I shall report a few examples that might indeed have been included just as well among slips of the tongue and bungled actions; this is, however, a matter of indifference, since all these forms of parapraxis are equivalent to one another. [1901b, 1296]

The Roman who gave up an important undertaking if he saw an ill-omened flight of birds was therefore in a relative sense justified; his behaviour was consistent with his premisses. But if he withdrew from the undertaking because he had stumbled on the threshold of his door (‘un Romain retournerait’) he was also in an absolute sense superior to us unbelievers; he was a better psychologist than we are striving to be. For his stumbling must have revealed to him the existence of a doubt, a counter-current at work within him, whose force might at the moment of execution subtract from the force of his intention. For we are only sure of complete success if all our mental forces are united in striving towards the desired goal. How did Schiller's Tell, who hesitated so long to shoot the apple on his son's head, answer the Governor's question why he had provided himself with a second arrow? [1901b, 1329]

The same conflict governs the phenomena of bungled actions. The impulsion which manifests itself in disturbing the action is often a counter-impulsion, but still more often it is an entirely unrelated one, which merely takes the opportunity of achieving expression by disturbing the action while it is being carried out. The cases where the disturbance results from an internal contradiction are the more significant ones; they also involve the more important actions. [1901b, 1344]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on. [1913j, 2805]
Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

Cases of forgetting an intention are in general so clear that they are not of much use for our purpose of obtaining circumstantial evidence of the sense of a parapraxis from the psychical situation. Let us therefore turn to a particularly ambiguous and obscure kind of parapraxis - to losing and mislaying. You will no doubt find it incredible that we ourselves can play an intentional part in what is so often the painful accident of losing something. But there are plenty of observations like the following one. A young man lost a pencil of his which he had been very fond. The day before, he had received a letter from his brother-in-law which ended with these words: 'I have neither the inclination nor the time at present to encourage you in your frivolity and laziness.' The pencil had actually been given to him by this brother-in-law. Without this coincidence we could not, of course, have asserted that a part was played in the loss by an intention to get rid of the thing. Similar cases are very common. We lose an object if we have quarrelled with the person who gave it to us and do not want to be reminded of him; or if we no longer like the object itself and want to have an excuse for getting another and better one instead. The same intention directed against an object can also play a part, of course, in cases of dropping, breaking or destroying things. Can we regard it as a matter of chance when a schoolchild immediately before his birthday loses, ruins or smashes some of his personal belongings, such as his satchel or his watch?
In another case a bungled action is combined with an instance of mislaying. A lady travelled to Rome with her brother-in-law, who was a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her - how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent of; and it was at this point, that the meaning of her ‘absent-mindedness’ dawned on the lady: she wanted to keep the object for herself.

Losing and mislaying are of particular interest to us owing to the many meanings they may have - owing, that is, to the multiplicity of the purposes which can be served by these parapraxes. All cases have in common the fact that there was a wish to lose something; they differ in the basis and aim of that wish. We lose a thing when it is worn out, when we intend to replace it by a better one, when we no longer like it, when it originates from someone with whom we are no longer on good terms or when we acquired it in circumstances we no longer want to recall. Dropping, damaging or breaking the object can serve the same purpose. In the sphere of social life experience is said to have shown that unwanted and illegitimate children are far more frail than those legitimately conceived. The crude technique of baby-farmers is not necessary for bringing about this result; a certain amount of neglect in looking after the children should be quite sufficient. The preserving of things may be subject to the same influences as that of children.

Bungled actions, like other errors, are often used to fulfil wishes which one ought to deny oneself. Here the intention disguises itself as a lucky accident. For instance, as happened to one of my friends, a man may be due, obviously against his will, to go by train to visit someone near the town where he lives, and then, at a junction where he has to change, may by mistake get into a train that takes him back to where he came from. Or someone on a journey may be anxious to make a stop at an intermediate station but may be forbidden from doing so by other obligations, and he may then overlook or miss some connection so that he is after all obliged to break his journey in the way he wished. Or what happened to one of my patients: I had forbidden him to telephone to the girl he was in love with, and then, when he meant to telephone to me, he asked for the wrong number ‘by mistake’ or ‘while he was thinking of something else’ and suddenly found himself connected to the girl’s number. A good example of an outright blunder, and one of practical importance, is provided by an observation made by an engineer in his account of what preceded a case of material damage:

This may lead you to suspect that it is not always just an innocent chance that turns the hands of your domestic servants into dangerous enemies of your household belongings. And you may also raise the question whether it is always a matter of chance when people injure themselves and risk their own safety. These are notions whose value you may care to test, if occasion arises, by analysing observations of your own.
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. Almost, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

Stärcke (1916) has given an example of the way in which creative writers do not hesitate to put a bungled action in the place of an intentional action and to make it in this way the source of the gravest consequences:
(12) I will also report as an 'error' an incident with a serious background, which was told me by a witness who was closely involved. A lady spent an evening out of doors with her husband and two strangers. One of these two 'strangers' was an intimate friend of hers; but the others knew nothing of this and were meant to know nothing. The friends accompanied the married couple to the door of their house and while they were waiting for the door to be opened they took their leave of one another. The lady bowed to the stranger, gave him her hand and said a few polite words. Then she took the arm of her secret lover, turned to her husband and began to bid him good-bye in the same way. Her husband entered into the situation, raised his hat and said with exaggerated politeness: 'Good-bye, dear lady!' The horrified wife dropped her lover's arm and before the concierge appeared had time to exclaim: 'Goodness! What a stupid thing to happen!' The husband was one of those married men who want to put an act of infidelity on their wife's part beyond the bounds of possibility. He had repeatedly sworn that in such a case more than one life would be in jeopardy. He therefore had inner impediments of the strongest kind to prevent his noticing the challenge contained in this error.

[1901b, 1299]

Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

[1913j, 2805]
Here then my material leaves me in the lurch, as might be expected, and I have to fall back on conjectures and inferences. It is well known that in the severer cases of psychoneurosis instances of self-injury are occasionally found as symptoms and that in such cases suicide can never be ruled out as a possible outcome of the psychical conflict. I have now learnt and can prove from convincing examples that many apparently accidental injuries that happen to such patients are really instances of self-injury. What happens is that an impulse to self-punishment, which is constantly on the watch and which normally finds expression in self-reproach or contributes to the formation of a symptom, takes ingenious advantage of an external situation that chance happens to offer, or lends assistance to that situation until the desired injurious effect is brought about. Such occurrences are by no means uncommon in cases even of moderate severity, and they betray the part which the unconscious intention plays by a number of special features - e.g. by the striking composure that the patients retain in what is supposed to be an accident.³

³ In the present state of our civilization self-injury which does not have total self-destruction as its aim has no other choice whatever than to hide itself behind something accidental or to manifest itself by imitating the onset of a spontaneous illness. Formerly self-injury was a customary sign of mourning; at other periods it could express trends towards piety and renunciation of the world.

Instead of a number of cases I will give a detailed report of only a single example from my medical experience. A young married woman broke her leg below the knee in a carriage accident, so that she was bed-ridden for weeks; what was striking was the absence of any expressions of pain and the calmness with which she bore her misfortune. This accident introduced a long and severe neurotic illness of which she was finally cured by psycho-analysis. In treating her I learnt of the circumstances surrounding the accident and of certain events that had preceded it. The young woman was staying with her very jealous husband on the estate of a married sister, in company with her numerous other sisters and brothers with their husbands and wives. One evening in this intimate circle she showed off one of her accomplishments: she gave an accurate performance of the can-can, which was received with hearty applause by her relatives but with scanty satisfaction by her husband, who afterwards whispered to her: 'Carrying on like a tart again!' The remark struck home - we will not enquire whether it was only on account of the dancing display. She spent a restless night. Next morning she felt a desire to go for a drive. She selected the horses herself, refusing one pair and asking for another. Her youngest sister wanted her baby and its nurse to go in the carriage with her; my patient vigorously opposed this. During the drive she showed signs of nerves; she warned the coachman that the horses were growing skittish, and when the restless animals were really causing a moment's difficulty she jumped out in a fright and broke her leg, while the others who stayed in the carriage were unharmed. Although after learning these details we can hardly remain in doubt that this accident was really contrived, we cannot fail to admire the skill which forced chance to mete out a punishment that fitted the crime so well. For it had now been made impossible for her to dance the can-can for quite a long time.

As regards self-injuries of my own, there is little that I can report in uneventful times; but in extraordinary circumstances I find that I am not incapable of them. When a member of my family complains to me of having bitten his tongue, pinched a finger, or the like, he does not get the sympathy he hopes for, but instead the question: 'Why did you do that?' I myself once gave my thumb a most painful pinch when a youthful patient told me during the hour of treatment of his intention (not of course to be taken seriously) of marrying my eldest daughter. I knew that at the time she was lying critically ill in a sanatorium.
Anyone who believes in the occurrence of half-intentional self-injury - if I may use a clumsy expression - will be prepared also to assume that in addition to consciously intentional suicide there is such a thing as half-intentional self-destruction (self-destruction with an unconscious intention), capable of making skilful use of a threat to life and of disguising it as a chance mishap. There is no need to think such self-destruction rare. For the trend to self-destruction is present to a certain degree in very many more human beings than those in whom it is carried out; self-injuries are as a rule a compromise between this instinct and the forces that are still working against it, and even where suicide actually results, the inclination to suicide will have been present for a long time before in lesser strength or in the form of an unconscious and suppressed trend.

[1901b, 1260]

Even a conscious intention of committing suicide chooses its time, means and opportunity; and it is quite in keeping with this that an unconscious intention should wait for a precipitating occasion which can take over a part of the causation and, by engaging the subject's defensive forces, can liberate the intention from their pressure.¹ The views I am putting forward here are far from being idle ones. I have learned of more than one apparently chance mishap (on horseback or in a carriage) the details of which justify a suspicion that suicide was unconsciously allowed to come about. For example, an officer, riding in a race with some fellow-officers, fell from his horse and was so severely injured that he died some days later. His behaviour on regaining consciousness was striking in some ways; and his previous behaviour had been even more remarkable. He had been deeply depressed by the death of his beloved mother, had had fits of sobbing in the company of his fellow officers, and to his trusted friends had spoken of being weary of life. He had wanted to leave the service to take part in a war in Africa which had not interested him previously;² formerly a dashing rider, he now avoided riding whenever possible. Finally, before the race, from which he could not withdraw, he expressed gloomy forebodings; with the view that we hold in these matters, it will not remain a surprise to us that these forebodings turned out to be justified. I shall be told that it is not to be wondered at if a person in such a state of nervous depression cannot manage a horse as well as on normal days. I quite agree; but the mechanism of the motor inhibition produced by this state of 'nerves' should, I think, be looked for in the intention of self-destruction that I am insisting on.

[1901b, 1261]

¹ After all, the case is no different from that of a sexual assault upon a woman, where the man's attack cannot be repelled by her full muscular strength because a portion of her unconscious impulses meets the attack with encouragement. It is said, as we know, that a situation of this kind paralyses a woman's strength; all we need do is to add the reasons for this paralysis. To that extent the ingenious judgement delivered by Sancho Panza as governor of his island is psychologically unjust (Don Quixote, Part 2, Chapter 45). A woman dragged a man before the judge alleging he had robbed her of her honour by violence. In compensation Sancho gave her a full purse of money which he took from the accused; but after the woman's departure he gave him permission to pursue her and snatch his purse back again from her. The two returned struggling, the woman priding herself on the fact that the villain had not been able to take the purse from her. Thereupon Sancho declared: 'If you had defended your honour with half the determination with which you have defended this purse, the man could not have robbed you of it.'

[1901b, 1261]

² It is evident that conditions on a field of battle are such as to come to the help of a conscious intention to commit suicide which nevertheless shuns the direct way. Compare the words of the Swedish captain concerning the death of Max Piccolomini in Wallenstein's Tod: 'They say he wanted to die.'

[1901b, 1261]

S. Ferenczi of Budapest has handed over to me for publication the analysis of an ostensibly accidental injury by shooting, which he explains as an unconscious attempt at suicide. I can only declare my agreement with his view of the matter.

[1901b, 1262]
"I often reproach myself by thinking 'You really had your child killed' and I was afraid such a thing couldn't go unpunished. Now that you've assured me there's nothing wrong with my eyes, my mind's quite at rest: I've been sufficiently punished now in any case."

[1901b, 1264]

¹ [Footnote added 1920:] A correspondent writes to me as follows on the subject of 'self-punishment by means of parapraxes': 'If one studies the way people behave in the street one has a chance of seeing how often men who turn round to look back at passing women - not an unusual habit - meet with a minor accident. Sometimes they will sprain an ankle - on a level pavement; sometimes they will bump into a lamp post or hurt themselves in some other way.'

[1901b, 1264]

When the details of the case are considered one will also be likely to feel that Stärcke (1916) is right in regarding an apparently accidental self-injury by burning as a 'sacrificial act':

[1901b, 1265]

¹ [Footnote added 1924:] In a very large number of cases like these of injury or death in accidents the explanation remains a matter of doubt. The outsider will find no occasion to see in the accident anything other than a chance occurrence, while someone who is closely connected with the victim and is familiar with intimate details has reason to suspect the unconscious intention behind the chance occurrence. The following account by a young man whose fiancée was run over in the street gives a good example of the kind of intimate knowledge that I mean and of the type of accessory details in question:

[1901b, 1265]
'Last September I made the acquaintance of a Fräulein Z., aged 34. She was in well-to-do circumstances, and had been engaged before the war, but her fiancé had fallen in action in 1916 while serving as an officer. We came to know and become fond of each other, not at first with any thought of marrying, as the circumstances on both sides, in particular the difference in our ages (I myself was 27), seemed to rule that out. As we lived opposite each other in the same street and met every day, our relationship took an intimate turn in course of time. Thus the idea of marriage came more into view and I finally agreed to it myself. The betrothal was planned for this Easter; Fräulein Z., however, intended first to make a journey to her relatives at M., but this was suddenly prevented by a railway strike that had been called as a result of the Kapp Putsch. The gloomy prospects that the workers' victory and its consequences appeared to hold out for the future had their effect for a brief time on our mood, too, but especially on Fräulein Z., always a person of very changeable moods, since she thought she saw new obstacles in the way of our future. On Saturday, March 20, however, she was in an exceptionally cheerful frame of mind - a state of affairs that took me quite by surprise and carried me along with her, so that we seemed to see everything in the rosiest colours. A few days before, we had talked of going to church together some time, without however having fixed a definite date. At 9. 15 the next morning, Sunday, March 21, she telephoned to ask me to fetch her to church straight away; but I refused, as I could not have got ready in time, and had, besides, work I wanted to finish. Fräulein Z. was noticeably disappointed; she then set out alone, met an acquaintance on the stairs at her house and walked with him for the short distance along the Tauentzienstrasse to the Rankestrasse, in the best of humour and without referring at all to our conversation. The gentleman bade her good-bye with a joking remark. Fräulein Z. had only to cross the Kurfürstendamm where it widened out and one could have a clear view along it; but, close to the pavement, she was run over by a horse-drawn cab. (Contusion of the liver, which led to her death a few hours later.) - We had crossed at that point hundreds of times before; Fräulein Z. was exceedingly careful, and very often prevented me from being rash; on this morning there was almost no traffic whatever, the trams, omnibuses, etc. were on strike. Just about that time there was almost absolute quiet; even if she did not see the cab she must at all events have heard it! Everybody supposed it was an "accident". My first thought was: "That's impossible - but on the other hand there can be no question of its having been intentional." I tried to find a psychological explanation. After some considerable time I thought I had found it in your Psychopathology of Everyday Life. In particular, Fräulein Z. showed at various times a certain leaning in the direction of suicide and even tried to induce me to think the same way - thoughts from which I have often enough dissuaded her; for example, only two days before, after returning from a walk, she began, without any external reason at all, to talk about her death and the provisions for dealing with her estate. (She had not, by the way, done anything about this! - an indication that these remarks definitely did not have any intention behind them.) If I may venture on an opinion, I should regard this calamity not as an accident, nor as an effect of a clouding of consciousness, but as an intentional self-destruction performed with an unconscious purpose, and disguised as a chance mishap. This view of mine is confirmed by remarks which Fräulein Z. made to her relatives, both earlier, before she knew me, and also more recently, as well as by remarks to me up to within the last few days; so that I am tempted to regard the whole thing as an effect of the loss of her former fiancé, whom in her eyes nothing could replace.'

[1901b, 1266]
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. *Almost,* but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

After this she had gone on quite well till the middle of October, when she had had another attack of aphonia which had lasted for six weeks. I was surprised at this news, and, on my asking her whether there had been any exciting cause, she told me that the attack had followed upon a violent fright. She had seen some one run over by a carriage. Finally she came out with the fact that the accident had occurred to no less a person than Herr K. himself. She had come across him in the street one day; they had met in a place where there was a great deal of traffic; he had stopped in front of her as though in bewilderment, and in his abstraction he had allowed himself to be knocked down by a carriage.¹ She had been able to convince herself, however, that he escaped without serious injury. She still felt some slight emotion if she heard any one speak of her father's affair with Frau K., but otherwise she had no further concern with the matter. She was absorbed in her work, and had no thoughts of marrying.

¹[1905e, 1455]
Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject’s own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

[1913], 2805]

This may lead you to suspect that it is not always just an innocent chance that turns the hands of your domestic servants into dangerous enemies of your household belongings. And you may also raise the question whether it is always a matter of chance when people injure themselves and risk their own safety. These are notions whose value you may care to test, if occasion arises, by analysing observations of your own.

[1916-1917, 3183]
We are led into quite another realm of explanation by the analysis of the attempt at suicide, which I must regard as seriously intended, and which, incidentally, considerably improved her position both with her parents and with the lady she loved. She went for a walk with her one day in a part of the town and at an hour at which she was not unlikely to meet her father on his way from his office. So it turned out. Her father passed them in the street and cast a furious look at her and her companion, about whom he had by that time come to know. A few moments later she flung herself into the railway cutting. The explanation she gave of the immediate reasons determining her decision sounded quite plausible. She had confessed to the lady that the man who had given them such an irate glance was her father, and that he had absolutely forbidden their friendship. The lady became incensed at this and ordered the girl to leave her there and there, and never again to wait for her or to address her - the affair must now come to an end. In her despair at having thus lost her loved one for ever, she wanted to put an end to herself. The analysis, however, was able to disclose another and deeper interpretation behind the one she gave, which was confirmed by the evidence of her own dreams. The attempted suicide was, as might have been expected, determined by two other motives besides the one she gave: it was the fulfilment of a punishment (self-punishment), and the fulfilment of a wish. As the latter it meant the attainment of the very wish which, when frustrated, had driven her into homosexuality - namely, the wish to have a child by her father, for now she 'fell' through her father's fault.¹ The fact that at that moment the lady had spoken in just the same terms as her father, and had uttered the same prohibition, forms the connecting link between this deep interpretation and the superficial one of which the girl herself was conscious. From the point of view of self-punishment the girl's action shows us that she had developed in her unconscious strong death-wishes against one or other of her parents - perhaps against her father, out of revenge for impeding her love, but more probably against her mother too, when she was pregnant with the little brother. For analysis has explained the enigma of suicide in the following way: probably no one finds the mental energy required to kill himself unless, in the first place, in doing so he is at the same time killing an object with whom he has identified himself, and, in the second place, is turning against himself a death-wish which had been directed against someone else. Nor need the regular discovery of these unconscious death-wishes in those who have attempted suicide surprise us (any more than it ought to make us think that it confirms our deductions), since the unconscious of all human beings is full enough of such death-wishes, even against those they love.² Since the girl identified herself with her mother, who should have died at the birth of the child denied to herself, this punishment-fulfilment itself was once again a wish-fulfilment. Finally, the discovery that several quite different motives, all of great strength, must have co-operated to make such a deed possible is only in accordance with what we should expect.

[1920a, 3851]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]
(14) How a wish that has been reluctantly suppressed can be satisfied by means of an 'error' is described in a good example of Maeder's (1908). A colleague who had a day free from duties wanted to enjoy it without any interruptions; but he was due to pay a visit in Lucerne to which he did not look forward. After long deliberation he decided to go there all the same. He passed the time on the journey from Zurich to Arth-Goldau in reading the daily papers. At the latter station he changed trains and continued reading. He travelled on till the ticket-inspector informed him that he was in the wrong train - the one travelling back from Goldau to Zurich, though he had a ticket for Lucerne.

[1901b, 1300]

(15) An analogous, though not entirely successful, attempt to help a suppressed wish to find expression by means of the same mechanism of an error is described by Dr. V. Tausk (1917) under the title of 'Travelling in the Wrong Direction':

[1901b, 1300]

(17) From his own personal experience J. Stärcke (1916) tells of a similar device produced by 'forgetfulness' for the purpose of fulfilling an ostensibly renounced wish.

[1901b, 1302]

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913j, 2804]

The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

[1913j, 2807]
LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a *slip of the tongue* [Versprechen]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a *misreading* [Verlesen]), or he may hear wrongly something that has been said to him (a *mishearing* [Verhören]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis *forgetting* [Vergessen] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a *name* which he nevertheless knows and which he recognizes at once, or he may forget to carry out an *intention*, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of *mislaying* [Verlegen], when a person has put something somewhere and cannot find it again or in the precisely analogous case of *losing* [Verlieren]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of *errors* [Irrtümer], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a *meaning*, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1916-1917, 3136]

[1923a, 3917]
It may perhaps be thought that the class of errors whose explanation I have given here is not very numerous or particularly significant. But I leave it open for question whether there is not some ground for extending the same line of approach to our assessment of the far more important *errors of judgement* made by human beings in their lives and in scientific work. Only for the rarest and best adjusted mind does it seem possible to preserve the picture of external reality, as it is perceived, against the distortion to which it is normally subjected in its passage though the psychical individuality of the percipient.

[1901b, 1303]

The category of what is accidental and requires no motivation, in which the normal person includes a part of his own psychical performances and parapraxes, is thus rejected by the paranoid as far as the psychical manifestations of other people are concerned. Everything he observes in other people is full of significance, everything can be interpreted. How does he reach this position? Probably here as in so many similar cases he projects on to the mental life of other people what is unconsciously present in his own. In paranoia many sorts of things force their way through to consciousness whose presence in the unconscious of normal and neurotic people we can demonstrate only through psycho-analysis.² In a certain sense, therefore, the paranoid is justified in this, for he recognizes something that escapes the normal person: he sees more clearly than someone of normal intellectual capacity, but the displacement on to other people of the state of affairs which he recognizes renders his knowledge worthless. I hope I shall not now be expected to justify the various paranoid interpretations. But the partial justification which we concede to paranoia in respect of this view taken by it of chance actions will help us towards a psychological understanding of the sense of conviction that the paranoid attaches to all these interpretations. *There is in fact some truth in them*; those, too, of our errors of judgement which are not to be counted as pathological acquire their sense of conviction in just the same way. This feeling is justified for a certain part of the erroneous train of thought, or for its source of origin; and it is then extended by us to the rest of the context.

[1901b, 1325]
Parody and travesty achieve the degradation of something exalted in another way: by destroying the unity that exists between people's characters as we know them and their speeches and actions, by replacing either the exalted figures or their utterances by inferior ones. They are distinguished from caricature in this, but not in the mechanism of their production of comic pleasure. The same mechanism is also used for unmasking, which only applies where someone has seized dignity and authority by a deception and these have to be taken from him in reality. We have already met with a few examples of the comic effect of unmasking in jokes - for instance, in the story of the aristocratic lady who, at the first onset of her labour-pains, exclaimed 'Ah! mon Dieu!' but whom the doctor would not assist till she cried out 'Aa-ee, aa-ee!'. Having come to know the characteristics of the comic, we can no longer dispute that this anecdote is in fact an example of comic unmasking and has no justifiable claim to be called a joke. It only recalls jokes by its setting and by the technical method of 'representation by something very small' - in this case the patient's cry, which is found sufficient to establish the indication for treatment. It nevertheless remains true that our linguistic sense, if we call on it for a decision, raises no objection to our calling a story like this a joke. We may explain this by reflecting that linguistic usage is not based on the scientific insight into the nature of jokes that we have arrived at in this laborious investigation. Since one of the functions of jokes is to make hidden sources of comic pleasure accessible once more (p. 1698), any device that brings to light something that is not manifestly comic may, by a loose analogy, be termed a joke. This applies preferably, however, to unmasking as well as to other methods of making people comic.¹

There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget this time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the Komprinz.' Next day an attempt was made at a correction. The paper apologized and said: 'We should of course have said "the Knorprinz".'¹ People speak in such cases of a 'demon of misprints' or a 'type-setting fiend' - terms which at least go beyond any psycho-physiological theory of misprints.

[1905c, 1780]

[1916-1917, 3140]
Finding fault with one's wife, a friendship which has turned into its opposite, a doctor's error in diagnosis, a rebuff by some one with similar interests, borrowing someone else's ideas - it can hardly be accidental that a collection of instances of forgetting, gathered at random, should require me to enter into such distressing subjects in explaining them. On the contrary, I suspect that everyone who is willing to enquire into the motives behind his lapses of memory will be able to record a similar sample list of objectionable subjects. The tendency to forget what is disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless developed with different degrees of strength in different people. It is probable that many instances of disowning which we encounter in our medical work are to be traced to forgetting.¹ It is true that our view of such forgetting limits the distinction between the two forms of behaviour to purely psychological factors and allows us to see in both modes of reaction the expression of the same motive. Of all the numerous examples of the disavowal of unpleasant memories which I have observed on the part of relatives of patients, one remains in my recollection as especially singular. A mother was giving me information about the childhood of her neurotic son, now in his puberty, in the course of which she said that, like his brothers and sisters, he had been a bed-wetter till late on - a fact which is certainly of some significance in the case history of a neurotic patient. A few weeks later, when she was wanting to find out about the progress of the treatment, I had occasion to draw her attention to the signs of a constitutional disposition to illness on the young man's part, and in doing so I referred to the bed-wetting which she had brought out in the anamnesis. To my astonishment she contested this fact in regard both to him and to the other children, and asked me how I could know it. Finally I told her that she herself had informed me a short time before. She must therefore have forgotten it.²

¹ [Footnote added 1907:] If we ask someone whether he suffered from a luetic infection ten or fifteen years ago, we are too apt to overlook the fact that, from a psychical point of view, he will have regarded this illness quite differently from, let us say, an acute attack of rheumatism. - In the anamneses which parents give about their daughters' neurotic illnesses, it is hardly possible to distinguish with certainty between what has been forgotten and what is being concealed, since everything standing in the way of a girl's future marriage is systematically set aside, i.e. repressed, by the parents. - [Added 1910:] A man who had recently lost his deary-loved wife from an affection of the lungs reported the following instance to me in which misleading answers given to the doctor's enquiries could only be ascribed to forgetting of this kind. 'As my poor wife's pleuritis had still not improved after many weeks, Dr. P. was called into consultation. In taking the anamnesis he asked the usual questions, including whether there were any cases of lung illness in my wife's family. My wife said there were none and I could not recall any either. As Dr. P. was leaving, the conversation turned, as though accidentally, to the subject of excursions and my wife said: "Yes, it's a long journey, too, to Langersdorf, where my poor brother's buried." This brother died about fifteen years ago after suffering for years from tuberculosis. My wife was very fond of him and often spoken to me about him. In fact it now occurred to me that at the time that her pleuritis was diagnosed she was very worried and remarked gloomily: "My brother died of a lung complaint too." But now, the memory was so strongly repressed that even after her remark about the excursion to Langersdorf she was not led to correct the information she had given about illnesses in her family. I myself became aware of the lapse of memory at the very moment she spoke of Langersdorf.' - [Added 1912:] A completely analogous experience is related by Jones in the work to which I have referred several times already. A physician, whose wife suffered from an abdominal complaint the diagnosis of which was uncertain, remarked by way of comforting her: 'It is fortunate at any rate that there has been no tuberculosis in your family.' 'Have you forgotten', answered his wife in the greatest astonishment, 'that my mother died of tuberculosis and that my sister recovered from it only after having been given up by the doctors?'

² [1901b, 1228]
Two of the last-mentioned examples - my own error which transferred the Medici to Venice, and that of the young man who succeeded in getting a conversation with his fiancée on the telephone in defiance of my prohibition - have not in fact been described entirely accurately. Careful consideration reveals that they are a combination of an act of forgetting and an error. I can illustrate this combination still more clearly from some other examples.

(2) The next example combines a symptomatic act with a case of mislaying. It reached me in a somewhat roundabout way, but comes from a reliable source.

(3) There are some cases in which the parapraxis obstinately repeats itself, at the same time changing the method that it employs:

(4) The vain attempts to carry out an action in opposition to an internal resistance are most impressively depicted in a short communication by Dr. Karl Weiss (1912) of Vienna:

(9) As some of the above instances have already shown, the unconsciously disturbing purpose can also achieve its aim by obstinately repeating the same kind of parapraxis. I borrow an amusing example of this from a small volume, Frank Wedekind und das Theater, which has been published in Munich by the Drei Masken Verlag; but I must leave the responsibility for the anecdote, which is told in Mark Twain's manner, to the author of the book.

I do not mean to assert that cases of combined parapraxes like these can teach us anything new that could not already be observed in the simple cases. And yet this situation, of there being a change in the form taken by the parapraxis while the outcome remains the same, gives a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be struck by the fact that a conscious intention should in these examples fail so completely to prevent the success of the parapraxis. My friend failed in spite of everything to attend the meeting of the society, and the lady found it impossible to part from the medal. The unknown factor that opposed these intentions found another outlet after the first path had been barred to it. For what was required to overcome the unconscious motive was something other than a conscious counter-intention; it called for a piece of psychical work, which could make what was unknown known to consciousness.
There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget this time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the Komprinz.' Next day an attempt was made at a correction. The paper apologized and said: 'We should of course have said "the Knorprinz".'¹ People speak in such cases of a 'demon of misprints' or a 'type-setting fiend' - terms which at least go beyond any psycho-physiological theory of misprints.

[1916-1917, 3140]

Ladies and Gentlemen, I could multiply this collection of examples indefinitely; but I will not do so here. You will in any case find a profusion of case material for the study of parapraxes in my *Psychopathology of Everyday Life* (first published in 1901).¹ All these examples lead to the same result: they make it probable that parapraxes have a sense, and they show you how that sense is discovered or confirmed by the attendant circumstances. I will be briefer to-day, because we have adopted the limited aim of using the study of these phenomena as a help towards a preparation for psycho-analysis. There are only two groups of observations into which I need enter more fully here: accumulated and combined parapraxes and the confirmation of our interpretations by subsequent events.

[1916-1917, 3163]

Accumulated and combined parapraxes are without doubt the finest flower of their kind. If we had only been concerned to prove that parapraxes have a sense we should have confined ourselves to them from the first, for in their case the sense is unmistakable even to the dull-witted and forces itself on the most critical judgement. An accumulation of these phenomena betrays an obstinacy that is scarcely ever a characteristic of chance events but fits in well with something intentional. Finally, the mutual interchangeability between different species of parapraxes demonstrates what it is in parapraxes that is important and characteristic: not their form or the method which they employ but the purpose which they serve and which can be achieved in the most various ways. For this reason I will give you an instance of repeated forgetting. Ernest Jones tells us that once, for reasons unknown to him, he left a letter lying on his desk for several days. At last he decided to send it off, but he had it returned to him by the Dead Letter Office¹ since he had forgotten to address it. After he had addressed it he took it to the post, but this time it had no stamp. And then at last he was obliged to admit his reluctance to sending the letter off at all.

[1916-1917, 3164]
In another case a bungled action is combined with an instance of mislaying. A lady travelled to Rome with her brother-in-law, who was a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her - how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent of; and it was at this point, that the meaning of her 'absent-mindedness' dawned on the lady: she wanted to keep the object for herself.

I have already given you an example of a combination of a forgetting with an error, the case of someone forgetting an appointment and on a second occasion, having firmly decided not to forget this time, turning up at the wrong hour. An exactly similar case was reported to me from his own experience by a friend with literary as well as scientific interests. 'Some years ago', he told me, 'I allowed myself to be elected to the committee of a certain literary society, as I thought that the organization might one day be able to help me to have my play produced; and I took a regular part, though without being much interested, in the meetings which were held every Friday. Then, a few months ago, I was given the promise of a production at the theatre at F.; and since then I have regularly forgotten the meetings of the society. When I read your book on the subject I felt ashamed of my forgetfulness. I reproached myself with the thought that it was shabby behaviour on my part to stay away now that I no longer needed these people, and resolved on no account to forget the next Friday. I kept on reminding myself of this resolution until I carried it into effect and stood at the door of the room where the meetings were held. To my astonishment it was locked; the meeting was over. I had in fact made a mistake over the day; it was now Saturday!'
There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget this time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the Kornprinz.' Next day an attempt was made at a correction. The paper apologized and said: 'We should of course have said "the Knorprinz".' People speak in such cases of a 'demon of misprints' or a 'type-setting fiend' - terms which at least go beyond any psycho-physiological theory of misprints. [1916-1917, 3140]
There came to my consulting-room one day a young man who was the younger brother of a woman patient. I had seen him countless times and used to refer to him by his first name. When I wanted to speak about his visit I found I had forgotten his first name (which was, I knew, not at all an unusual one), and nothing could help me to recover it. I thereupon went out into the street to read the names over the shops, and recognized his name the first time I ran across it. The analysis of the episode showed me that I had drawn a parallel between the visitor and my own brother, a parallel which was trying to come to a head in the repressed question: 'Would my brother in the same circumstances have behaved in a similar way, or would he have done the opposite?' The external link between the thoughts concerned with my own and with the other family was made possible by the chance fact that in both cases the mothers had the same first name of Amalia. Later in retrospect I also understood the substitute names, Daniel and Franz, which had forced themselves on me without making me any wiser. These, like Amalia too, are names from Schiller's *Die Räuber* which were the subject of a jest made by Daniel Spitzer, the 'Vienna walker'.

(10) At this point I shall insert another example of the name of a town being forgotten. It is not perhaps as simple as the ones given above, but it will strike any one who is fairly well versed in investigations of this nature as authentic and valuable. The name of a town in Italy escaped the subject's memory as a consequence of its great similarity in sound to a woman's first name, with which a number of memories charged with affect were connected, which are doubtless not here reported in full. Sándor Ferenczi of Budapest, who observed this case of forgetting in himself, has treated it in the way in which one analyses a dream or a neurotic idea a - procedure which is fully justified.

A type of continued forgetting of names occurs also, in which whole chains of names are withdrawn from the memory. If in the attempt to recover a lost name other names closely connected with it are pursued, it frequently happens that these new names, which were to serve as stepping stones to the other one, disappear in just the same way. The forgetting thus jumps from one name to another, as if to prove the existence of an obstacle which cannot easily be surmounted.
(1) I was sitting in a café, turning over the pages of a copy of the *Leipziger Illustrierte* (which I was holding up at an angle), when I read the following legend under a picture that stretched across the page: 'A Wedding Celebration in the *Odysee*.' It caught my attention; in surprise I took hold of the paper in the proper way and then corrected my error: 'A Wedding Celebration on the *Ostee*.' How did I come to make this absurd mistake in reading? My thoughts at once turned to a book by Ruths (1898), *Experimentaluntersuchungen über Musikphantome* . . . , which had occupied me a good deal recently since it trenches on the psychological problems that I have been concerned with. The author promised that he would shortly be bringing out a book to be called 'Analysis and Principles of Dream Phenomena'. Seeing that I have just published an *Interpretation of Dreams* it is not surprising that I should await this book with the keenest interest. In Ruths' work on music phantoms I found at the beginning of the list of contents an announcement of a detailed inductive proof that the ancient Greek myths and legends have their main source of origin in phantoms of sleep and music, in the phenomena of dreams and also in deliria. Thereupon I at once plunged into the text to find out whether he also realized that the scene in which Odysseus appears before Nausicaä was derived from the common dream of being naked. A friend had drawn my attention to the fine passage in Gottfried Keller's *Der Grüne Heinrich* which explains this episode in the Odyssey as an objective representation of the dreams of a sailor wandering far from home; and I had pointed out the connection with exhibitionist dreams of being naked.¹ I found nothing on the subject in Ruths' book. In this instance it is obvious that my thoughts were occupied with questions of priority. [1901b, 1193]
(2) How did I come to read in a newspaper one day: 'Im Fass across Europe', instead of 'Zu Fuss'? Solving this problem caused me prolonged difficulties. The first associations, it is true, indicated that it must have been the tub of Diogenes that I had in mind; and I had recently been reading about the art of the age of Alexander in a history of art. From there it was easy to recall Alexander's celebrated remark: 'If I were not Alexander I should like to be Diogenes.' I also had some dim recollection of a certain Hermann Zeitung¹ who had set out on his travels packed in a trunk. But the train of associations declined to run on further, and I did not succeed in rediscovering the page in the history of art on which the remark had caught my eye. It was not till months later that the problem, which I had meanwhile set aside, suddenly sprang to my mind once more; and this time it brought its solution with it. I recalled the comment of a newspaper article on the strange means of transport that people were then choosing in order to go to Paris for the International Exhibition; and the passage, I believe, went on with a joking account of how one gentleman intended to get himself rolled in a tub to Paris by another gentleman. Needless to say the only motive of these people would be to draw attention to themselves by such folly. Hermann Zeitung was in fact the name of the man who had provided the first instance of such extraordinary methods of transport. It then struck me that I once treated a patient whose pathological anxiety about reading newspapers was to be explained as a reaction against his pathological ambition to see himself in print and to read of his fame in the newspapers. Alexander of Macedon was undoubtedly one of the most ambitious men that ever lived. He even complained that he would find no Homer to sing of his exploits. But how could I possibly have failed to recall that there is another Alexander who is closer to me, that Alexander is the name of my younger brother? I now immediately found the objectionable thought about this other Alexander that had had to be repressed, and what it was that had given rise to it at the present time. My brother is an authority on matters connected with tariffs and transport, and at a certain date he was due to receive the title of professor for his work in teaching at a commercial college. Several years ago my own name had been suggested at the University for the same promotion, without my having obtained it. At the time, our mother expressed her surprise that her younger son was to become a professor before her elder. This had been the situation when I was unable to solve my mistake in reading. Subsequently my brother too met with difficulties; his prospects of becoming professor sank even lower than my own. But at that point the meaning of the misreading suddenly became clear to me; it was as though the fading of my brother's prospects had removed an obstacle. I had behaved as if I was reading of my brother's appointment in the newspaper and was saying to myself: 'How curious that a person can appear in the newspaper (i.e. can be appointed professor) on account of such stupidities (which is what his profession amounts to)!' Afterwards I had no difficulty in finding the passage about Hellenistic art in the age of Alexander, and to my astonishment convinced myself that in my previous search I had repeatedly read parts of the same page and had each time passed over the relevant sentence as if I was under the dominance of a negative hallucination. However, this sentence did not contain anything at all to enlighten me - anything that would have deserved to be forgotten. I suspect that the symptom consisting of my failure to find the passage in the book was only formed with the purpose of leading me astray. I was intended to search for a continuation of the train of thought in the place where my enquiries encountered an obstacle - that is, in some idea connected with Alexander of Macedon; in this way I was to be more effectively diverted from my brother of the same name. In fact the device was entirely successful; all my efforts were directed towards rediscovering the lost passage in the history of art.

[1901b, 1194]
In this case the ambiguity of the word ‘Beförderung’ forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

[1901b, 1194]

(3) I was requested by the firm of B. and R. to pay a professional visit to one of their staff. On my way there I was possessed by the thought that I must repeatedly have been in the building where their firm had its premises. It was as if I had noticed their plate on a lower storey while I was paying a professional visit on a higher one. I could however recall neither what house it was nor whom I had visited there. Although the whole matter was of no importance or consequence, I nevertheless turned my mind to it and finally discovered in my usual roundabout way, by collecting the thoughts that occurred to me in connection with it, that the premises of the firm of B. and R. were on the floor below the Pension Fischer, where I have frequently visited patients. At the same time I also recalled the building that housed the offices and the pension. It was still a puzzle to me what motive was at work in this forgetting. I found nothing offensive to my memory in the firm itself or in the Pension Fischer or the patients who lived there. Moreover, I suspected that nothing very distressing could be involved; otherwise I would hardly have succeeded in recovering in a roundabout way what I had forgotten, without resorting to external assistance as I had in the previous example. It finally occurred to me that while I was actually on my way to this new patient, a gentleman whom I had difficulty in recognizing had greeted me in the street. I had seen this man some months before in an apparently grave condition and had passed sentence on him with a diagnosis of progressive paralysis; but later I heard he had recovered, so that my judgement must have been wrong. Unless, that is, there had been a remission of the type that is also found in dementia paralytica - in which case my diagnosis would be justified after all! The influence that made me forget where the offices of B. and R. were came from my meeting with this person, and my interest in solving the problem of what I had forgotten was transferred to it from this case of disputed diagnosis. But the associative link (for there was only a slender internal connection - the man who recovered contrary to expectation was also an official in a large firm which used to recommend patients to me) was provided by an identity of names. The physician with whom I had seen the supposed case of paralysis was also called Fischer, like the pension which was in the building and which I had forgotten.

[1901b, 1222]
In attempting to analyse this small mistake I first thought of the phrase 'sich an der Alten
vergreifen',¹ which provided a short cut to the solution. I was under the influence of a dream
which had been told me by a young man the previous evening and the content of which could
only point to sexual intercourse with his own mother.² The strange fact that the legend finds
nothing objectionable in Queen Jocasta's age seemed to me to fit in well with the conclusion
that in being in love with one's own mother one is never concerned with her as she is in the
present but with her youthful mnemonic image carried over from one's childhood. Such
incongruities always appear when a phantasy that fluctuates between two periods is made
conscious and so becomes definitely attached to one of the two periods. While absorbed in
thoughts of this kind I came to my patient, who is over ninety, and I must have been on the way
to grasping the universal human application of the Oedipus myth as correlated with the Fate
which is revealed in the oracles; for at that point I did violence to or committed a blunder on 'the
old woman'. Here again the bungled action was a harmless one; of the two possible errors,
using the morphine solution for the eye or the eye lotion for the injection, I had chosen by far the
more harmless one. This still leaves the question open of whether we may admit the possibility
of an unconscious intention in mistakes that can cause serious harm, in the same way as in the
cases which I have discussed.

[1901b, 1258]

¹ [Footnote added 1924:] In a very large number of cases like these of injury or death in accidents the
explanation remains a matter of doubt. The outsider will find no occasion to see in the accident anything
other than a chance occurrence, while someone who is closely connected with the victim and is familiar
with intimate details has reason to suspect the unconscious intention behind the chance occurrence. The
following account by a young man whose fiancée was run over in the street gives a good example of the
kind of intimate knowledge that I mean and of the type of accessory details in question:
[1901b, 1265]

I do not mean to assert that cases of combined parapraxes like these can teach us anything
new that could not already be observed in the simple cases. And yet this situation, of there
being a change in the form taken by the parapraxis while the outcome remains the same, gives
a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way
the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be
struck by the fact that a conscious intention should in these examples fail so completely to
prevent the success of the parapraxis. My friend failed in spite of everything to attend the
meeting of the society, and the lady found it impossible to part from the medal. The unknown
factor that opposed these intentions found another outlet after the first path had been barred to
it. For what was required to overcome the unconscious motive was something other than a
conscious counter-intention; it called for a piece of psychical work, which could make what was
unknown known to consciousness.
[1901b, 1310]
I asked myself how it was determined. Who else was there called Dora? I should have liked to
dismiss with incredulity the next thought to occur to me - that it was the name of my sister's
nursemaid; but I have so much self-discipline or so much practice in analysing that I held firmly
to the idea and let my thoughts run on from it. At once there came to my mind a trivial incident
from the previous evening which provided the determinant I was looking for. I had seen a letter
on my sister's dining-room table addressed to 'Fräulein Rosa W.'. I asked in surprise who there
was of that name, and was told that the girl I knew as Dora was really called Rosa, but had had
to give up her real name when she took up employment in the house, since my sister could take
the name 'Rosa' as applying to herself as well. 'Poor people,' I remarked in pity, 'they cannot
even keep their own names!' After that, I now recall, I fell silent for a moment and began to think
of a variety of serious matters which drifted into obscurity, but which I was now easily able to
make conscious. When next day I was looking for a name for someone who could not keep her
own, 'Dora' was the only one to occur to me. The complete absence of alternatives was here
based on a solid association connected with the subject-matter that I was dealing with: for it was
a person employed in someone else's house, a governess, who exercised a decisive influence
on my patient's story, and on the course of the treatment as well.

[1901b, 1313]

(E) When I recently had occasion to report some examples of the forgetting of names, with
their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all
very well; but in my case the forgetting of names happens differently.' The matter can obviously
not be dealt with as easily as this; I do not suppose that my colleague had ever before thought
of analysing the forgetting of a name, nor could he say how it happened differently in his case.
But his comment nevertheless touches on a problem which many people will be inclined to put
in the foreground. Does the elucidation given here of parapraxes and chance actions apply
quite generally or only in certain cases? and if the latter, what are the conditions under which it
can be called in to explain phenomena that might also have been brought about in another
way? In answering this question my experiences leave me in the lurch. I can but utter a warning
against supposing that a connection of the kind here demonstrated is only rarely found; for
every time I have made the test on myself or on my patients, a connection has been clearly
shown to exist just as in the examples reported, or there have at least been good grounds for
supposing that it did. It is not surprising if success in finding the hidden meaning of a
symptomatic act is not achieved every time, for the magnitude of the internal resistances
opposing the solution comes into account as a deciding factor. Equally, it is not possible to
interpret every single dream of one's own or of one's patients; to prove that the theory holds
good in general it is enough if one can penetrate a part of the way into the hidden connection. It
often happens that a dream which proves refractory during an attempt to solve it the next day
will allow its secret to be wrested from it a week or a month later, after a real change has come
about in the meantime and has reduced the contending psychical values. The same applies to
the solving of parapraxes and symptomatic acts. The example of misreading on page 1194
('Across Europe in a Tub') gave me the opportunity of showing how a symptom that is at first
insoluble becomes accessible to analysis when the real interest in the repressed thoughts has
passed away.¹ As long as the possibility existed of my brother obtaining the envied title before
me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned
out to be unlikely that he would be preferred to me in this way, the path that led to its solution
was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist
analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an
assumption would need more than negative evidence. Furthermore, the readiness to believe in
a different explanation of parapraxes and symptomatic acts, which is probably to be found in all
healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same
mental forces which produced the secret and which therefore also devote themselves to
preserving it and resist its elucidation.

[1901b, 1339]
At this point very interesting problems of an economic nature come in, questions taking into consideration the fact that the psychical processes aim at gaining pleasure and removing unpleasure. There is already an economic problem in how it becomes possible by way of substitutive associations to recapture a name that has been forgotten through motives of unpleasure. An excellent paper by Tausk (1913) gives good examples of how the forgotten name becomes accessible once more if one succeeds in connecting it with a pleasurably-toned association, which can counterbalance the unpleasure to be expected from the reproduction of the name.

[Footnote added 1924:] Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline.

1. What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

We have now reached the moment for answering the second question - that is, what psychological determinants are responsible for a thought being compelled to seek expression not in its complete form but in a kind of parasitic form, as a modification and disturbance of another thought. The most striking examples of parapraxes make it seem probable that these determinants must be looked for in a relation to admissibility to consciousness: in the question, that is, of the greater or less degree to which they bear the marked character of being 'repressed'. But if we follow this character through the series of examples, it dissolves into ever vaguer indications. The inclination to dismiss something as a waste of time, or the consideration that the thought in question is not properly relevant to the matter in hand, appear, as motives for pushing back a thought (which is then left to find expression by disturbing another thought), to play the same part as does the moral condemnation of an insubordinate emotional impulse or as does derivation from totally unconscious trains of thought. Insight into the general nature of how parapraxes and chance actions are determined cannot be gained along these lines. One single fact of significance emerges from these enquiries. The more innocent the motivation of a parapraxis, and the less objectionable - and therefore the less inadmissible to consciousness - the thought finding expression in it, the easier it is to explain the phenomenon, once one’s attention has been turned to it. The slightest cases of slips of the tongue are noticed immediately, and spontaneously corrected. Where the motivation comes from really repressed impulses, the case has to be elucidated by careful analysis, which may itself at times come up against difficulties or prove unsuccessful.
On some other occasion I will publish a collection of these symptomatic acts as they are to be observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's reticule, which came apart at the top in the usual way, was nothing but a representation of the genitals, and her playing with it, her opening it and putting her finger in it, was an entirely unembarrassed yet unmistakable pantomimic announcement of what she would like to do with them - namely, to masturbate. A very entertaining episode of a similar kind occurred to me a short time ago. In the middle of a session the patient - a lady who was no longer young - brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made some efforts to open it, and then handed it to me so that I might convince myself how hard it was to open. I expressed my suspicion that the box must mean something special, for this was the very first time I had seen it, although its owner had been coming to me for more than a year. To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I go.' She did not calm down until I had pointed out to her with a laugh how well her words were adapted to quite another meaning. The box - *Dose, πύξις* - like the reticule and the jewel-case, was once again only a substitute for the shell of Venus, for the female genitals.

[1905e, 1414]

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

[1913], 2804]
In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1940b [1938], 5069]
I then understood that behind the train of thought in which she brought these open accusa-
tions against her father there lay concealed as usual a self-accusation. I met her half-
way by assuring her that in my view the occurrence of leucorrhoea in young girls pointed
primarily to masturbation, and I considered that all the other causes which were commonly
assigned to that complaint were put in the background by masturbation.¹ I added that she was
now on the way to finding an answer to her own question of why it was that precisely she had
fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that
she could remember any such thing. But a few days later she did something which I could not
help regarding as a further step towards the confession. For on that day she wore at her waist -
a thing she never did on any other occasion before or after - a small reticule of a shape which
had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it -
opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and
then explained to her the nature of a 'symptomatic act'.² I give the name of symptomatic acts to
those acts which people perform, as we say, automatically, unconsciously, without attending to
them, or as if in a moment of distraction. They are actions to which people would like to deny
any significance, and which, if questioned about them, they would explain as being indifferent
and accidental. Closer observation, however, will show that these actions, about which
consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious
thoughts and impulses, and are therefore most valuable and instructive as being manifesta-
tions of the unconscious which have been able to come to the surface. There are two sorts of
conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous
motives to them we recognize their existence; but if no such pretext can be found for conscious
use we usually fail altogether to notice that we have performed them. Dora found no difficulty in
producing a motive: 'Why should I not wear a reticule like this, as it is now the fashion to do?'
But a justification of this kind does not dismiss the possibility of the action in question having an
unconscious origin. Though on the other hand the existence of such an origin and the meaning
attributed to the act cannot be conclusively established. We must content ourselves with
recording the fact that such a meaning fits in quite extraordinarily well with the situation as a
whole and with the programme laid down by the unconscious.

[1905e, 1413]

On some other occasion I will publish a collection of these symptomatic acts as they are to be
observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's
reticule, which came apart at the top in the usual way, was nothing but a representation of the
genitals, and her playing with it, her opening it and putting her finger in it, was an entirely
unembarrassed yet unmistakable pantomimic announcement of what she would like to do with
them - namely, to masturbate. A very entertaining episode of a similar kind occurred to me a
short time ago. In the middle of a session the patient - a lady who was no longer young -
brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made
some efforts to open it, and then handed it to me so that I might convince myself how hard it
was to open. I expressed my suspicion that the box must mean something special, for this was
the very first time I had seen it, although its owner had been coming to me for more than a year.
To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I
go.' She did not calm down until I had pointed out to her with a laugh how well her words were
adapted to quite another meaning. The box - Dose, πυξίς -, like the reticule and the jewel-case,
was once again only a substitute for the shell of Venus, for the female genitals.

[1905e, 1414]
In this case the ambiguity of the word ‘Beförderung’ forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

[1901b, 1194]

Where intentions of some importance are concerned, we have found in general that they are forgotten when obscure motives rise against them. In the case of rather less important intentions we can recognize a second mechanism of forgetting: a counter-will is transferred to the intention from some other topic, after an external association has been formed between the other topic and the content of the intention. Here is an example. I set store by high-quality blotting paper and I decided one day to buy a fresh supply that afternoon in the course of my walk to the Inner Town. But I forgot for four days running, till I asked myself what reason I had for the omission. It was easy to find after I had recalled that though I normally write ‘Löschpapier’ I usually say ‘Fliesspapier’. ‘Fliess’ is the name of a friend in Berlin who had on the days in question given me occasion for a worrying and anxious thought. I could not rid myself of this thought, but the defensive tendency (cf. above, p. 1230) manifested itself by transferring itself, by means of the verbal similarity, to the indifferent intention which on account of its indifference offered little resistance.

[1901b, 1239]

In misreading and slips of the pen there are also plenty of examples in which we can discern a more remote and complicated motivation. ‘Across Europe in a Tub’ is a disturbance in reading which is explained as being due to the influence of a remote thought, foreign in its essence, arising from a repressed impulse of jealousy and ambition, and utilizing the ‘switch-word’ ‘Beförderung’ to form a connection with the indifferent and innocent topic that was being read. In the case of ‘Burckhard’ the name itself forms a ‘switch-word’ of this kind.

[1901b, 1342]

¹ I laid stress on these words because they took me aback. They seemed to have an ambiguous ring about them. Are not certain physical needs referred to in the same words? Now, in a line of associations ambiguous words (or, as we may call them, ‘switch-words’) act like points at a junction. If the points are switched across from the position in which they appear to lie in the dream, then we find ourselves on another set of rails; and along this second track run the thoughts which we are in search of but which still lie concealed behind the dream.

[1905e, 1402]

A consideration of the significance of the leucorrhoea to which Dora admitted promises to give us a still better understanding of her symptoms. She had learnt to call her affection a ‘catarrh’ at the time when her mother had had to visit Franzensbad on account of a similar complaint; and the word ‘catarrh’ acted once again as a ‘switch-word’ and enabled the whole set of thoughts upon her father’s responsibility for her illness to manifest themselves in the symptom of the cough. The cough, which no doubt originated in the first instance from a slight actual catarrh, was, moreover, an imitation of her father (whose lungs were affected), and could serve as an expression of her sympathy and concern for him. But besides this, it proclaimed aloud, as it were, something of which she may then have been still unconscious: ‘I am my father’s daughter. I have a catarrh, just as he has. He has made me ill, just as he has made Mother ill. It is from him that I have got my evil passions, which are punished by illness.’

[1905e, 1418]
¹ This word played the same part with the fourteen-year old girl whose case history I have compressed into a few lines on p. 1365 n. I had established the child in a pension with an intelligent lady, who took charge of her for me. The lady reported that the little girl could not bear her to be in the room while she was going to bed, and that when she was in bed she had a marked cough, of which there was no trace in the daytime. When the girl was questioned about these symptoms, the only thing that occurred to her was that her grandmother coughed in the same way, and that she was said to have a catarrh. It was clear from this that the child herself had a catarrh, and that she did not want to be observed while she performed her evening ablutions. This catarrh which, thanks to its name, had been displaced from the lower to the upper part of her body, exhibited a quite unusual degree of intensity.

[1905e, 1418]

A recollection of this sort was furnished by the episode of the 'drops' - the jewellery ['Schmuck'] that Dora's mother wanted to have. In appearance the connection between this reminiscence and the two groups of thoughts relating to sexual wetness and to being dirtied was purely external and superficial one, of a verbal character. For 'drops' was used ambiguously as a 'switch-word', while 'jewellery' ['Schmuck'] was taken as an equivalent to 'clean', and thus as a rather forced contrary of 'dirtied'.¹ But in reality the most substantial connections can be shown to have existed between the things denoted themselves. The recollection originated from the material connected with Dora's jealousy of her mother, which, though its roots were infantile, had persisted far beyond that period. By means of these two verbal bridges it was possible to transfer on to the single reminiscence of the 'jewel-drops' the whole of the significance attaching to the ideas of her parents' sexual intercourse, and of her mother's gonorrhoea and tormenting passion for cleanliness.

[1905e, 1426]

But why do so many people dream of being able to fly? The answer that psycho-analysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual activity is 'vögeln' ['to bird': 'Vogel' is the German for 'bird']; that the male organ is actually called 'l'uccello' ['the bird'] in Italian - all of these are only small fragments from a whole mass of connected ideas, from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.² This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier they would probably tell a different story. It seems that childhood is not the blissful idyll into which we distort it in retrospect, and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which they are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.

[1910c, 2296]
The conditions necessary for forgetting a name, when forgetting it is accompanied by paramnesia, may then be summarized as follows: (1) a certain disposition for forgetting the name, (2) a process of suppression carried out shortly before, (3) the possibility of establishing an external association between the name and the element previously suppressed. The difficulty of fulfilling the last condition need probably not be rated very high, since, considering the low standards expected of an association of this kind, one could be established in the great majority of cases. There is, however, the profounder question whether an external association like this can really be a sufficient condition for the repressed element's disturbing the reproduction of the lost name - whether some more intimate connection between the two topics is required. On a superficial consideration one would be inclined to reject the latter demand, and accept as sufficient a temporal contiguity between the two, even if the contents are completely different. On close enquiry, however, one finds more and more frequently that the two elements which are joined by an external association (the repressed element and the new one) possess in addition some connection of content; and such a connection is in fact demonstrable in the Signorelli example. [1901b, 1105]

If I analyse the cases of the forgetting of names that I observe in myself, I almost always find that the name which is withheld from me is related to a topic of close personal importance to me, and one capable of evoking in me strong and often distressing affects. In accordance with the convenient and commendable practice of the Zurich school (Bleuler, Jung, Riklin) I can also formulate this fact as follows: The lost name has touched on a 'personal complex' in me. The relation of the name to myself is one that I should not have expected and is usually arrived at through superficial associations (such as verbal ambiguity or similarity in sound); it can be characterized quite generally as an oblique relation. Its nature will best be illustrated by some simple examples. [1901b, 1118]

In the forgetting of intentions another factor comes into the foreground. The conflict, which could only be surmised in the repression of what was distressing to remember, here becomes tangible, and in the analysis of the examples a counter-will can regularly be recognized which opposes the intention without putting an end to it. As in the parapraxes already described, two types of psychical process can be recognized here. Either the counter-will is turned directly against the intention (in cases where the latter's purpose is of some importance), or it is unrelated in its nature to the intention itself and establishes its connection with it by means of an external association (in the case of intentions that are almost indifferent). [1901b, 1344]
Apatient, whose psycho-analytic treatment was interrupted by the summer holidays at a time when he was in a state of resistance and felt unwell, put his bunch of keys in its usual place - or so he thought - when he undressed for the night. Then he remembered that there were a few more things that he needed for his journey next day - the last day of treatment and the date on which his fee was due - and he went to get them out of the writing-desk, in which he had also put his money. But the keys had disappeared. He began to make a systematic but increasingly agitated search of his small flat - with no success. Since he recognized the "mislaying" of the keys as a symptomatic act - that is, as something he had done intentionally - he woke his servant in order to continue the search with the aid of an "unprejudiced" person. After another hour he gave it up and was afraid he had lost the keys. Next morning he ordered new keys from the makers of the desk, and they were hastily made for him. Two friends, who had come home with him in the same cab, thought they remembered hearing something fall with a clink on the ground as he stepped out of the cab. He was convinced that his keys had fallen from his pocket. That evening the servant triumphantly presented him with the keys. They had been found lying between a thick book and a thin pamphlet (a work by one of my pupils) which he wanted to take away to read on his holiday. They were so cleverly placed that no one would have suspected they were there. He found himself afterwards unable to replace them so that they were equally invisible. The unconscious dexterity with which an object is mislaid on account of hidden but powerful motives is very reminiscent of "somnambulistic certainty". The motive, as one would expect, was ill-temper at the treatment being interrupted and secret rage at having to pay a high fee when he was feeling so unwell. 

If slips in speaking - which is clearly a motor function - can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term "bungled actions" ['Vergreifen'] to describe all the cases in which a wrong result - i.e. a deviation from what was intended - seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena. It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'. Let us rather try to trace the individual examples back to their particular determinants. For this purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. \textit{Almost}, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

[1901b, 1266]

The actions described so far, in which we recognized the carrying out of an unconscious intention, made their appearance in the form of disturbances of other intended actions and concealed themselves behind the pretext of clumsiness. The 'chance' actions which are now to be discussed differ from 'bungled' actions merely in the fact that they scorn the support of a conscious intention and are therefore in no need of a pretext. They appear on their own account, and are permitted because they are not suspected of having any aim or intention. We perform them 'without thinking there is anything in them', 'quite accidentally', 'just to have something to do'; and such information, it is expected, will put an end to any enquiry into the significance of the action. In order to be able to enjoy this privileged position, these actions, which no longer put forward the excuse of clumsiness, have to fulfil certain conditions: they must be \textit{unobtrusive} and their effects must be slight.

[1901b, 1269]
I have collected a large number of such chance actions from myself and from others, and after closely examining the different examples I have come to the conclusion that the name of symptomatic acts is a better one for them. They give expression to something which the agent himself does not suspect in them, and which he does not as a rule intend to impart to other people but to keep to himself. Thus, exactly like all the other phenomena which we have so far considered, they play the part of symptoms.

The richest supply of such chance or symptomatic acts is in fact to be obtained during the psycho-analytic treatment of neurotics. I cannot resist quoting two examples from this source which show how extensively and in what detail these insignificant occurrences are determined by unconscious thoughts. The borderline between symptomatic acts and bungled actions is so ill-defined that I might equally well have included these examples in the last chapter.

Further material was however forthcoming. A little time before, a woman who was an intermediary of a very different kind had enquired of a relative of the patient's whether the young lady would perhaps like to make a certain gentleman's acquaintance; and that morning, a few hours before the lady's visit, the suitor's letter of proposal had arrived and had caused much amusement. So when the lady opened the conversation by enquiring after my patient's health, the latter might well have thought: 'You certainly found me the right doctor, but if you could help me to get the right husband' (with the further thought: 'and to get a child') 'I should be more grateful.' This thought, which was kept repressed, formed the starting-point from which the two intermediaries became fused into one, and she handed her visitor the fee which her phantasy was ready to give the other woman. This solution becomes entirely convincing when I add that I had been telling the patient about such chance or symptomatic acts only the evening before. She thereupon took the first opportunity of producing something analogous.

These extremely frequent chance and symptomatic acts might be arranged in three groups, according to whether they occur habitually, regularly under certain conditions, or sporadically. Actions of the first group (such as playing with one's watch-chain, fingering one's beard and so on), which can almost be taken as characteristics of the person concerned, trench upon the multifarious movements known as tics and no doubt deserve to be dealt with in connection with them. In the second group I include playing with a stick or scribbling with a pencil that one happens to be holding, jingling coins in one's pocket, kneading bread-crumbs and other plastic materials, fiddling with one's clothing in all kinds of ways and so forth. During psychical treatment idle play of this sort regularly conceals a sense and meaning which are denied any other form of expression. Generally the person concerned is quite unaware that he is doing anything of the kind or that he has modified his usual play in certain ways; and he fails to see and hear the effects of these actions. He does not, for example, hear the noise made by the jingling of coins, and, if his attention is drawn to it, he behaves as though he were astonished and incredulous. All the things that a person does with his clothing, often without realizing it, are no less important and deserve the doctor's attention. Every change in the clothing usually worn, every small sign of carelessness - such as an unfastened button - every trace of exposure, is intended to express something which the wearer of the clothes does not want to say straight out and which for the most part he is unaware of. The interpretations of these small chance actions, and the evidence for these interpretations, emerge each time with sufficient certainty from the material which accompanies them during the session, from the topic that is under discussion and from the associations that occur when attention is drawn to the apparently chance action. Because of this I shall not proceed to support my assertions with examples accompanied by analyses; but I mention these actions because I believe that they have the same meaning in the case of normal people as they have in my patients.
I cannot refrain from showing by at least one example how close the connection can be between a symbolic action performed through force of habit and the most intimate and important aspects of a healthy person's life:¹
[1901b, 1273]

The symptomatic acts that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything - and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers - made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by pointing to the egg-shell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so very much easier, and without more ado took as the basis of our discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could he reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.
[1901b, 1277]

Anyone who cares to observe his fellow men while they are at table will be able to observe the neatest and most instructive symptomatic acts.
[1901b, 1278]

The following examples will show how much meaning may turn out to lie in an apparently unintentional act of carrying something off or taking something away with one.
[1901b, 1279]

Chance actions and symptomatic acts occurring in matrimonial matters often have the most serious significance and might induce people who disregard the psychology of the unconscious to believe in omens. It is not a happy beginning when a young bride loses her wedding-ring on the honeymoon; but after all it is usually only mislaid and is soon found again. - I know a lady, now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. - I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I felt a cold chill as I heard the story, but I did not dare to draw the inference. The little incident only occurred to my mind some years later when the marriage had come to a most unhappy end.
[1901b, 1280]
The following observation is quoted from one of Alphonse Maeder’s valuable studies, published in French (Maeder, 1906). It might equally well have been included among the examples of forgetting:
[1901b, 1281]

It is consoling to reflect that there is an unsuspected extension of the human habit of ‘losing things’ - namely, symptomatic acts, and that this habit is consequently welcome, at least to a secret intention of the loser’s. It is often only an expression of the low estimation in which the lost object is held, or of a secret antipathy towards it or towards the person that it came from; or else the inclination to lose the object has been transferred to it from other more important objects by a symbolic association of thoughts. Losing objects of value serves to express a variety of impulses; it may either be acting as a symbolic representation of a repressed thought - that is, it may be repeating a warning that one would be glad enough to ignore -, or (most commonly of all) it may be offering a sacrifice to the obscure powers of destiny to whom homage is still paid among us to-day.
[1901b, 1283]

I add here a brief and varied collection of symptomatic acts found in healthy and neurotic people:
[1901b, 1289]

The slightest actions of a habitual nature which are performed with a minimum of attention, such as winding up one’s watch before going to sleep, switching off the light before leaving a room, etc., are subject from time to time to disturbances that unmistakably demonstrate the influence of unconscious complexes upon what would seem to be the most fixed habits. Maeder, writing in the periodical Coenobium, tells of a house-physician who decided to go into town one evening for an important engagement, although he was on duty and was not supposed to leave the hospital. When he returned he was surprised to find the light on in his room. He had forgotten to turn it off when he went out, which was something that he had never failed to do before. But he soon grasped the motive for his forgetfulness. The chief resident medical officer in the hospital would naturally have concluded from the light in the house-physician’s room that he was at home.
[1901b, 1289]

The subtler determinants, too, of the expression of one’s thoughts in speaking or writing deserve careful attention. We believe that in general we are free to choose what words we shall use for clothing our thoughts or what images for disguising them. Closer observation shows that other considerations determine this choice, and that behind the form in which the thought is expressed a glimpse may be had of a deeper meaning - often one that is not intended. The images and turns of phrase to which a person is particularly given are rarely without significance when one is forming a judgement of him; and others often turn out to be allusions to a theme which is being kept in the background at the time, but which has powerfully affected the speaker. In the course of some theoretical discussions I heard someone at a particular time repeatedly using the expression: ‘If something suddenly shoots through one’s head’. I happened to know that he had recently received news that a Russian bullet had passed right through the cap hat his son was wearing on his head.’
[1901b, 1291]

(2) The next example combines a symptomatic act with a case of mislaying. It reached me in a somewhat roundabout way, but comes from a reliable source.
[1901b, 1305]
On the other hand we must not overlook the fact that repressed thoughts and impulses certainly do not achieve expression in symptomatic acts and parapraxes by their own unaided efforts. The technical possibility for such side-slipping on the part of the innervations must be presented independently; this will then be readily exploited by the intention of the repressed to make itself felt consciously. In the case of verbal parapraxes, detailed investigations by philosophers and philologists have endeavoured to determine what are the structural and functional relations that put themselves at the service of such an intention. If we distinguish, among the determinants of parapraxes and symptomatic acts, between the unconscious motive on the one hand and the physiological and psycho-physical relations that come to meet it on the other, it remains an open question whether there are, within the range of normality, yet other factors that can - like the unconscious motive, and in place of it - create parapraxes and symptomatic acts along the lines of these relations. It is not my task to answer this question. [1901b, 1340]

In chance actions or in symptomatic actions the internal conflict becomes less and less important. These motor manifestations, to which consciousness attaches little value, or which it overlooks entirely, thus serve to express a wide variety of unconscious or withheld impulses; for the most part they are symbolic representations of phantasies or wishes. [1901b, 1344]

My expectations were by no means disappointed when this explanation of mine was met by Dora with a most emphatic negative. The 'No' uttered by a patient after a repressed thought has been presented to his conscious perception for the first time does no more than register the existence of a repression and its severity; it acts, as it were, as a gauge of the repression's strength. If this 'No', instead of being regarded as the expression of an impartial judgement (of which, indeed, the patient is incapable), is ignored, and if work is continued, the first evidence soon begins to appear that in such a case 'No' signifies the desired 'Yes'. Dora admitted that she found it impossible to be as angry with Herr K. as he had deserved. She told me that one day she had met Herr K. in the street while she was walking with a cousin of hers who did not know him. The other girl had exclaimed all at once: 'Why, Dora, what's wrong with you? You've gone as white as a sheet!' She herself had felt nothing of this change of colour; but I explained to her that the expression of emotion and the play of features obey the unconscious rather than the conscious, and are a means of betraying the former.¹ Another time Dora came to me in the worst of tempers after having been uniformly cheerful for several days. She could give no explanation of this. She felt so contrary to-day, she said; it was her uncle's birthday, and she could not bring herself to congratulate him, she did not know why. My powers of interpretation were at a low ebb that day; I let her go on talking, and she suddenly recollected that it was Herr K.'s birthday too - a fact which I did not fail to use against her. And it was then no longer hard to explain why the handsome presents she had had on her own birthday a few days before had given her no pleasure. One gift was missing, and that was Herr K.'s, the gift which had plainly once been the most prized of all. [1905e, 1396]
I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a *self*-accusation. I met her halfway by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.¹ I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step towards the confession. For on that day she wore at her waist - a thing she never did on any other occasion before or after - a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it - opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a 'symptomatic act'.² I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: 'Why should I not wear a reticule like this, as it is now the fashion to do?' But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though on the other hand the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

[1905e, 1413]

On some other occasion I will publish a collection of these symptomatic acts as they are to be observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's reticule, which came apart at the top in the usual way, was nothing but a representation of the genitals, and her playing with it, her opening it and putting her finger in it, was an entirely unembarrassed yet unmistakable pantomimic announcement of what she would like to do with them - namely, to masturbate. A very entertaining episode of a similar kind occurred to me a short time ago. In the middle of a session the patient - a lady who was no longer young - brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made some efforts to open it, and then handed it to me so that I might convince myself how hard it was to open. I expressed my suspicion that the box must mean something special, for this was the very first time I had seen it, although its owner had been coming to me for more than a year. To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I go.' She did not calm down until I had pointed out to her with a laugh how well her words were adapted to quite another meaning. The box - *Dose, πυξις* - , like the reticule and the jewel-case, was once again only a substitute for the shell of Venus, for the female genitals.

[1905e, 1414]
There is a great deal of symbolism of this kind in life, but as a rule we pass it by without heeding it. When I set myself the task of bringing to light what human beings keep hidden within them, not by the compelling power of hypnosis, but by observing what they say and what they show, I thought the task was a harder one than it really is. He that has eyes to see and ears to hear may convince himself that no mortal can keep a secret. If his lips are silent, he chatters with his finger-tips; betrayal oozes out of him at every pore. And thus the task of making conscious the most hidden recesses of the mind is one which it is quite possible to accomplish. [1905e, 1414]

It was not until fifteen months after the case was over and this paper composed that I had news of my patient's condition and the effects of my treatment. On a date which is not a matter of complete indifference, on the first of April (times and dates, as we know, were never without significance for her), Dora came to see me again: to finish her story and to ask for help once more. One glance at her face, however, was enough to tell me that she was not in earnest over her request. For four or five weeks after stopping the treatment she had been 'all in a muddle', as she said. A great improvement had then set in; her attacks had become less frequent and her spirits had risen. In the May of that year one of the K.'s two children (it had always been delicate) had died. She took the opportunity of their loss to pay them a visit of condolence, and they received her as though nothing had happened in the last three years. She made it up with them, she took her revenge on them and she brought her own business to a satisfactory conclusion. To the wife she said: 'I know you have an affair with my father'; and the other did not deny it. From the husband she drew an admission of the scene by the lake which he had disputed, and brought the news of her vindication home to her father. Since then she had not resumed her relations with the family. [1905e, 1454]

But whence comes this striking preference for ambiguous speeches in Gradiva? It is no chance event, so it seems to us, but a necessary consequence of the premisses of the story. It is nothing other than a counterpart to the twofold determination of symptoms, in so far as speeches are themselves symptoms and, like them, arise from compromises between the conscious and the unconscious. It is simply that this double origin is more easily noticed in speeches than, for instance, in actions. And when, as is often made possible by the malleable nature of the material of speech, each of the two intentions lying behind the speech can be successfully expressed in the same turn of words, we have before us what we call an 'ambiguity'. [1907a, 1879]
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work¹ in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

[1906c, 1889]

What remains are just such confirmations on Hans's part of analytical conclusions which our interpretations had already established. In an entirely unequivocal symptomatic act, which he disguised slightly from the maid but not at all from his father, he showed how he imagined a birth took place; but if we look into it more closely we can see that he showed something else, that he was hinting at something which was not alluded to again in the analysis. He pushed a small penknife which belonged to his mother in through a round hole in the body of an india-rubber doll, and then let it drop out again by tearing apart the doll's legs. The enlightenment which he received from his parents soon afterwards, to the effect that children do in fact grow inside their mother's body and are pushed out of it like a lump, came too late; it could tell him nothing new. Another symptomatic act, happening as though by accident, involved a confession that he had wished his father dead; for, just at the moment his father was talking of this death-wish, Hans let a horse that he was playing with fall down - knocked it over in fact. Further, he confirmed in so many words the hypothesis that heavily loaded carts represented his mother's pregnancy to him, and the horse's falling down was like having a baby. The most delightful piece of confirmation in this connection - a proof that, in his view, children were 'lumps' - was his inventing the name of 'Lodi' for his favourite child. There was some delay in reporting this fact, for it then appeared that he had been playing with this sausage child of his for a long time past.¹

[1909b, 2111]
The phenomena in question are the small faulty actions performed by both normal and neurotic people, to which as a rule no importance is attached: forgetting things that might be known and sometimes in fact are known (e.g. the occasional difficulty in recalling proper names), slips of the tongue in talking, by which we ourselves are so often affected, analogous slips of the pen and misreadings, bungling the performance of actions, losing objects or breaking them. All of these are things for which as a rule no psychological determinants are sought and which are allowed to pass without criticism as consequences of distraction or inattention or similar causes. Besides these there are the actions and gestures which people carry out without noticing them at all, to say nothing of attributing any psychological importance to them: playing about and fiddling with things, humming tunes, fingering parts of one's own body or one's clothing and so on.¹ These small things, faulty actions and symptomatic or haphazard actions alike, are not so insignificant as people, by a sort of conspiracy of silence, are ready to suppose. They always have a meaning, which can usually be interpreted with ease and certainty from the situation in which they occur. And it turns out that once again they give expression to impulses and intentions which have to be kept back and hidden from one's own consciousness, or that they are actually derived from the same repressed wishful impulses and complexes which we have already come to know as the creators of symptoms and the constructors of dreams. They therefore deserve to be rated as symptoms, and if they are examined they may lead, just as dreams do, to the uncovering of the hidden part of the mind. A man's most intimate secrets are as a rule betrayed by their help. If they occur particularly easily and frequently even in healthy people in whom the repression of unconscious impulses has on the whole been quite successful, they have their triviality and inconspicuousness to thank for it. But they can claim a high theoretical value, since they prove that repression and the formation of substitutes occur even under healthy conditions.
[1910a, 2224]

If these reports of the way in which Leonardo worked are compared with the evidence of the extraordinarily numerous sketches and studies which he left behind him and which exhibit every motif appearing in his paintings in a great variety of forms, we are bound totally to reject the idea that traits of hastiness and unsteadiness acquired the slightest influence over Leonardo's relation to his art. On the contrary, it is possible to observe a quite extraordinary profundity, a wealth of possibilities between which a decision can only be reached with hesitation, demands which can hardly be satisfied, and an inhibition in the actual execution which is not in fact to be explained even by the artist inevitably falling short of his ideal. The slowness which had all along been conspicuous in Leonardo's work is seen to be a symptom of this inhibition and to be the forerunner of his subsequent withdrawal from painting.³ It was this too which determined the fate of the Last Supper - a fate that was not undeserved. Leonardo could not become reconciled to fresco painting, which demands rapid work while the ground is still moist, and this was the reason why he chose oil colours, the drying of which permitted him to protract the completion of the painting to suit his mood and leisure. These pigments however detached themselves from the ground on which they were applied and which separated them from the wall. Added to this, the defects in the wall, and the later fortunes of the building itself, determined what seems to be the inevitable ruin of the picture.⁴
[1910c, 2246]

One must mistrust all prospective patients who want to make a delay before beginning their treatment. Experience show that when the time agreed upon has arrived they fail to put in an appearance, even though the motive for the delay - i.e. their rationalization of their intention - seems to the uninitiated to be above suspicion.
[1913c, 2479]
The patient's first symptoms or chance actions, like his first resistance, may possess a special interest and may betray a complex which governs his neurosis. A clever young philosopher with exquisite aesthetic sensibilities will hasten to put the creases of his trousers straight before lying down for his first hour; he is revealing himself as a former coprophilic of the highest refinement - which was to be expected from the later aesthete. A young girl will at the same juncture hurriedly pull the hem of her skirt over her exposed ankles; in doing this she is giving away the gist of what her analysis will uncover later: her narcissistic pride in her physical beauty and her inclinations to exhibitionism.

[1913c, 2490]

One further group of taboo observances, which have not hitherto been accounted for, deserve mention, since they admit of an explanation which is familiar to psycho-analysts. Among many savage peoples there is a prohibition against keeping sharp weapons or cutting instruments in a house. Frazer (1911b, 238) quotes a German superstition to the effect that a knife should not be left edge upwards, for fear that God and the angels might be injured on it. May we not recognize in this taboo a premonitory warning against possible 'symptomatic acts' in the execution of which a sharp weapon might be employed by unconscious evil impulses?

[1912-1913, 2740]

There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are 'parapraxes' (slips of the tongue or pen, forgetfulness, etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (in so far as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find 'physiological' explanations of them, though these were invariably unsatisfactory. Psycho-analysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus on the one hand psycho-analysis has narrowed the region subject to the physiological point of view and on the other hand has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psycho-analysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

[1913], 2803]
By parapraxes, then, I understand the occurrence in healthy and normal people of such
events as forgetting words and names that are normally familiar to one, forgetting what one
intends to do, making slips of the tongue and pen, misreading, mislaying things and being
unable to find them, losing things, making mistakes against one's better knowledge, and certain
habitual gestures and movements. All of these have on the whole had little attention paid to
them by psychology; they have been classed as instances of 'absent-mindedness' and have
been attributed to fatigue, to distracted attention or to the contributory effects of certain slight
illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement
that these latter factors merely operate as facilitating factors and may be absent. Parapraxes
are full-blown psychical phenomena and always have a meaning and an intention. They serve
definite purposes which, owing to the prevailing psychological situation, cannot be expressed in
any other way. These situations as a rule involve a psychical conflict which prevents the
underlying intention from finding direct expression and diverts it along indirect paths. A person
who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it
may well be familiar to him; but he is usually unaware, without analysis, that that intention is
responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and
quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him
provides its explanation.
[1913], 2804

There are a number of other phenomena which are closely akin to parapraxes but to which
that name is no longer appropriate. We call them chance and symptomatic actions. Like the
others, they have the character of being without a motive, insignificant and unimportant; but
they have in addition, more clearly, that of being unnecessary. They are distinguished from
parapraxes by their lack of another intention with which they are in collision and which is
disturbed by them. On the other hand, they merge insensibly into the gestures and movements
which we regard as expressions of the emotions. These chance actions include all sorts of
manipulations with our clothing, or parts of our body or objects within our reach, performed as
though in play and apparently with no purpose, or, again, the omission of these manipulations;
or, further, tunes that we hum to ourselves. I suggest that all these phenomena have a sense
and can be interpreted in the same way as parapraxes, that they are small indications of more
important mental processes and are fully valid psychical acts. But I do not propose to linger over
this fresh extension of the field of mental phenomena; I shall return to the parapraxes, in
connection with which problems important for psycho-analysis can be worked out with far
greater clarity.
[1916-1917, 3168]
I am to put before you, then, the psycho-analytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting-room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would - 'There's nothing wrong with you' - with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I fine them so-and-so many Kronen for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psycho-analysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting-room and my consulting- and treatment-room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting-room omits to shut the door behind him and almost always he leaves both doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door-handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting-room and consulting-room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient only occurs when he has been alone in the waiting-room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.

The analysis of this small symptomatic action tells you no thing you did not know before: the thesis that it was not a matter of chance but had a motive, a sense and an intention, that it had a place in an assignable mental context and that it provided information, by a small indication, of a more important mental process. But, more than anything else, it tells you that the process thus indicated was unknown to the consciousness of the person who carried out the action, since none of the patients who left the two doors open would have been able to admit- that by this omission he wanted to give evidence of his contempt. Some of them would probably have been aware of a sense of disappointment when they entered the empty waiting room; but the connection between this impression and the symptomatic action which followed certainly remained unknown to their consciousness.
Let us now bring together what this effort at a psycho-analysis, short and impeded as it was, has brought to light for an understanding of this case - assuming, of course, that our enquiries were correctly carried out, which I cannot here submit to your judgement. Firstly, the delusion has ceased to be absurd or unintelligible; it had a sense, it had good motives and it fitted into the context of an emotional experience of the patient's. Secondly, the delusion was necessary, as a reaction to an unconscious mental process which we have inferred from other indications, and it was precisely to this connection that it owed its delusional character and its resistance to every logical and realistic attack. It itself was something desired, a kind of consolation. Thirdly, the fact that the delusion turned out to be precisely a jealous one and not one of another kind was unambiguously determined by the experience that lay behind the illness. You recall of course that, the day before, she had told the scheming maid that the most dreadful thing that could happen to her would be her husband's unfaithfulness. Nor will you have overlooked the two important analogies between this case and the symptomatic action which we analysed - the explanation of its sense or intention and its relation to something unconscious that was involved in the situation.

[1916-1917, 3335]

The jealousy of the second layer, projected jealousy, is derived in both men and women either from their own actual unfaithfulness in real life or from impulses towards it which have succumbed to repression. It is a matter of everyday experience that fidelity, especially that degree of it required in marriage, is only maintained in the face of continual temptations. Anyone who denies these temptations in himself will nevertheless feel their pressure so strongly that he will be glad enough to make use of an unconscious mechanism to alleviate his situation. He can obtain this alleviation - and, indeed, acquittal by his conscience - if he projects his own impulses to faithlessness on to the partner to whom he owes faith. This strong motive can then make use of the perceptual material which betrays unconscious impulses of the same kind in the partner, and the subject can justify himself with the reflection that the other is probably not much better than he is himself.¹

[1922b, 3901]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]

All this sounds convincing and reasonable. Psycho-analysis has once more to meet the reproach that it makes hair-splitting complications in the simplest things and sees mysteries and problems where none exist, and that it does this by laying undue stress on insignificant and irrelevant details, such as occur every where, and making them the basis of the most far-reaching and strangest conclusions. It would be useless for us to point out that this rejection of our interpretation would do away with many striking analogies and break a number of subtle connections which we are able to demonstrate in this case. Our opponents will say that those analogies and connections do not in fact exist, but have been imported into the case by us with quite uncalled-for ingenuity.

[1923d, 4008]

If we are right in regarding our painter's bond with the Devil as a neurotic phantasy, there is no need for any further apology for considering it psycho-analytically. Even small indications have a meaning and importance, and quite specially when they are related to the conditions under which a neurosis originates. To be sure, it is as possible to overvalue as to undervalue them, and it is a matter of judgement how far one should go in exploiting them. But anyone who does not believe in psycho-analysis - or, for the matter of that, even in the Devil - must be left to make what he can of the painter's case, whether he is able to furnish an explanation of his own or whether he sees nothing in it that needs explaining.

[1923d, 4008]
Closer scrutiny somewhat diminishes the contrast between the analyses of Signorelli and of aliquis in regard to substitutive memories. In the latter example too it appears that the forgetting was accompanied by a substitutive formation. When subsequently I asked my companion whether in the course of his efforts to recall the missing word no substitute whatever came into his mind, he reported that at first he had felt a temptation to introduce an ab into the line (perhaps the detached portion of a-liquis) - nostris ab ossibus; and he went on to say that the exoriare had thrust itself on him with peculiar clarity and obstinacy, 'evidently,' he added with his characteristic scepticism, 'because it was the first word in the line.' When I asked him to attend all the same to the associations starting from exoriare, he produced exorcism. I can therefore very well believe that the intensification of exoriare when it was reproduced actually had the value of a substitutive formation of this sort. This substitute would have been arrived at from the names of the saints via the association 'exorcism.' These however are refinements to which one need attach no importance. (On the other hand Wilson, 1922, stresses the fact that the intensification of exoriare is of great significance to the understanding of the case, since exorcism would be the best symbolic substitute for repressed thoughts about getting rid of the unwanted child by abortion. I gratefully accept this correction, which does not weaken the validity, of the analysis.) It seems possible, however, that the appearance of any kind of substitute memory is a constant sign - even though perhaps only a characteristic and revealing sign - of tendentious forgetfulness which is motivated by repression. It would seem that substitutive formation occurs even in cases not marked by the appearance of incorrect names as substitutes, and that in these it lies in the intensification of an element that is closely related to the forgotten name. For example, in the Signorelli case, so long as the painter's name remained inaccessible, the visual memory that I had of the series of frescoes and of the self-portrait which is introduced into the corner of one of the pictures was ultra-clear - at any rate much more intense than visual memory-traces normally appear to me. In another case, also described in my 1898 paper, which concerned a visit which I was very reluctant to pay to an address in a strange town, I had forgotten the name of the street beyond all hope of recovery, but my memory of the house number, as if in derision, was ultra-clear, whereas normally I have the greatest difficulty in remembering numbers.

[1901b, 1110]
(2) I had undertaken to get a lady who was a stranger to Vienna a small strong-box for her documents and money. When I offered my services I had in my mind's eye an unusually vivid picture of a shop-window in the Inner Town in which I was sure I had seen boxes of the kind. I could not, it was true, recall the name of the street, but I felt sure that I would find the shop if I walked through the town, since my memory told me I had passed it on countless occasions. To my chagrin I had no success in finding the shop-window with the strong-boxes, though I walked all over the Inner Town in every direction. I decided that the only course left was to look up the firms of safe-manufacturers in a trades directory, so as to be able to identify the shop on a second walk round the town. Such extreme measures, however, did not prove necessary; among the addresses given in the directory was one which I immediately recognized as the one I had forgotten. It was true that I had passed the shop-window innumerable times - every time, in fact, that I had visited the M. family, who have lived for many years in the same building. Our intimate friendship later gave place to a total estrangement; after that, I fell into the habit - the reasons for which I never considered - of also avoiding the neighbourhood and the house. On my walk through the town in search of the shop-window with the strong-boxes I had passed through every street in the district but this one, which I had avoided as if it were forbidden territory. The motive of unpleasure responsible in the present case for my failure to find my way is easy to recognize. The mechanism of forgetting, however, is not so simple here as in the preceding example. My aversion naturally applied not to the safe-manufacturer but to another person, whom I did not want to think about; and from this latter person it was then transferred to this occasion where it produced the forgetting. The case of 'Burckhard' was very similar; my grudge against one person of this name induced me to make a slip in writing the same name when it referred to someone else. The part there played by identity of name in establishing a connection between two essentially different groups of thoughts was able to be replaced in the example of the shop-window by spatial contiguity, inseparable proximity. This latter case was, incidentally, more firmly knit; there was a second connection there, one involving its subject-matter, for money played a part among the reasons for my estrangement from the family living in the building. [1901b, 1221]
I know that the subject would merit the most exhaustive treatment; but I shall here do no more than give the analysis of a single case of 'déjà vu' where the feeling was characterized by especial intensity and persistence. A lady who is now thirty-seven claimed to have a most distinct memory of having at the age of twelve and a half paid her first visit to some school friends in the country. When she entered the garden, she had an immediate feeling of having been there before. This feeling was repeated when she went into the reception rooms, so that she felt she knew in advance what room would be the next one, what view there would be from it, and so on. But the possibility that this feeling of familiarity could have owed its origin to an earlier visit to the house and garden, perhaps one in her earliest childhood, was absolutely ruled out and was disproved as a result of her questioning her parents. The lady who reported this was not in search of any psychological explanation, but saw the occurrence of this feeling as a prophetic indication of the significance for her emotional life which these same school friends later acquired. However, a consideration of the circumstances in which the phenomenon occurred in her shows us the way to another view of the matter. At the time when she paid the visit she knew that these girls had an only brother, who was seriously ill. During the visit she actually set eyes on him, though he looked very ill and she said to herself that he would die soon. Now, her own only brother had been dangerously ill with diphtheria a few months earlier; during his illness she had spent several weeks away from her parents' house, staying with a relative. She believed that her brother had been with her on this visit to the country; she even thought it had been his first considerable journey after his illness; but her memory was remarkably uncertain on these points while of all the other details, and in particular of the dress she was wearing that day, she had an ultra-clear picture. Anyone who is well-informed will find no difficulty in concluding from these hints that the expectation that her brother would die had at that time played an important part in the girl's thoughts and either had never become conscious or, after the favourable termination of the illness, had succumbed to energetic repression. If things had turned out otherwise, she would have had to wear a different dress - mourning. She found an analogous situation in the home of her friends, whose only brother was in danger of dying soon, as in fact he did shortly after. She ought to have remembered consciously that she herself had lived through this situation a few months before: instead of remembering it - which was prevented by repression - she transferred her feeling of remembering something to her surroundings, the garden and the house, and fell a victim to the 'fausse reconnaissance' of having seen all this exactly the same once before. From the fact that repression occurred we may conclude that her former expectation of her brother’s death had not been far removed from a wishful phantasy. She would then have been the only child. In her later neurosis she suffered most severely from a fear of losing her parents, behind which, as usual, analysis was able to reveal the unconscious wish with the same content.

[1901b, 1336]
I shall conclude this brief paper with a few remarks which open up a wider perspective. I have been struck by the manner in which, in certain analyses, the communication of an obviously apt construction has evoked in the patients a surprising and at first incomprehensible phenomenon. They have had lively recollections called up in them - which they themselves have described as 'ultra-clear' - but what they have recollected has not been the event that was the subject of the construction but details relating to that subject. For instance, they have recollected with abnormal sharpness the faces of the people involved in the construction or the rooms in which something of the sort might have happened, or, a step further away, the furniture in such rooms - on the subject of which the construction had naturally no possibility of any knowledge. This has occurred both in dreams immediately after the construction had been put forward and in waking states resembling phantasies. These recollections have themselves led to nothing further and it has seemed plausible to regard them as the product of a compromise. The 'upward drive' of the repressed, stirred into activity by the putting forward of the construction, has striven to carry the important memory-traces into consciousness; but a resistance has succeeded, not, it is true, in stopping that movement, but in displacing it on to adjacent objects of minor significance.

[1937d, 5057]
I now return to the forgetting of names. So far we have not exhaustively considered either the
case-material or the motives behind it. As this is exactly the kind of parapraxis that I can from
time to time observe abundantly in myself, I am at no loss for examples. The mild attacks of
migraine from which I still suffer usually announce themselves hours in advance by my
forgetting names, and at the height of these attacks, during which I am not forced to abandon
my work, it frequently happens that all proper names go out of my head. Now it is precisely
cases like mine which could furnish the grounds for an objection on principle to our analytic
efforts. Should it not necessarily be concluded from such observations that the cause of
forgetfulness, and in particular of the forgetting of names, lies in circulatory and general
functional disturbances of the cerebrum, and should we not therefore spare ourselves the
search for psychological explanations of these phenomena? Not at all, in my view; that would
be to confuse the mechanism of a process, which is of the same kind in all cases, with the
factors favouring the process, which are variable and not necessarily essential. Instead of a
discussion, however, I shall bring forward an analogy to deal with the objection.

[1901b, 1117]

If I accept these 'remoter psychical influences' (as Wundt calls them) as established, there is
nothing, on the other hand, to prevent me at the same time from allowing that, in situations
where speaking is hurried and attention is to some extent diverted, the conditions governing
slips of the tongue may easily be confined within the limits defined by Meringer and Mayer. For
some of the examples collected by these authors a more complicated explanation nevertheless
seems more plausible. Take, for instance, one of those quoted above:

[1901b, 1172]

Was what happened here simply that the sound 'schwe' forced back the equally valent sound
'bru' by 'anticipating' it? The idea can hardly be dismissed that the sounds making up 'schwe'
were further enabled to obtrude in this manner because of a special relation. That could only be
the association Schwester - Bruder; perhaps also Brust der Schwester, which leads one on to
other groups of thoughts. It is this invisible helper behind the scenes which lends the otherwise
innocent 'schwe' the strength to produce a mistake in speaking.

[1901b, 1172]

Observation of the conditions under which misreadings occur gives rise to a doubt which I
should not like to leave unmentioned, because it can, I think, become the starting-point for a
fruitful investigation. Everyone knows how frequently the reader finds that in reading aloud his
attention wanders from the text and turns to his own thoughts. As a result of this digression on
the part of his attention he is often unable, if interrupted and questioned, to give any account of
what he has read. He has read, as it were, automatically, but almost always correctly. I do not
think that under such conditions mistakes in reading show a noticeable increase. There is in fact
a whole series of functions which we are accustomed to assume will be performed most exactly
when done automatically - that is, with scarcely any conscious attention. From this it seems to
follow that the factor of attention in mistakes in speaking, reading and writing must be
determined in a different way from that described by Wundt (cessation or diminution of
attention). The examples which we have subjected to analysis have not really justified us in
assuming that there was a quantitative lessening of attention; we found something which is
perhaps not quite the same thing: a disturbance of attention by an alien thought which claims
consideration.

[1901b, 1216]
No group of phenomena is better qualified than the forgetting of intentions for demonstrating the thesis that, in itself, lack of attention does not suffice to explain parapraxes. An intention is an impulse to perform an action: an impulse which has already found approval but whose execution is postponed to a suitable occasion. Now it can happen that during the interval thus created a change of such a kind occurs in the motives involved that the intention is not carried out; but in that case it is not forgotten: it is re-examined and cancelled. The forgetting of intentions, to which we are subject every day and in every possible situation, is not a thing that we are in the habit of explaining in terms of such a revision in the balance of motives. In general we leave it unexplained; or we try to find a psychological explanation by supposing that at the time when the intention was due to be carried out the attention necessary for the action was no longer at hand - attention which was, after all, an indispensable precondition for the coming into being of the intention and had therefore been available for the action at that time. Observation of our normal behaviour in regard to intentions leads us to reject this attempt at an explanation as being arbitrary. If I form an intention in the morning which is to be carried out in the evening, I may be reminded of it two or three times in the course of the day. When the time for its execution draws near, it suddenly springs to my mind and causes me to make the necessary preparations for the proposed action. If I am going for a walk and take a letter with me which has to be posted, it is certainly not necessary for me, as a normal individual, free from neurosis, to walk all the way with it in my hand and to be continually on the look-out for a letter-box in which to post it; on the contrary I am in the habit of putting it in my pocket, of walking along and letting my thoughts range freely, and I confidently expect that one of the first letter-boxes will catch my attention and cause me to put my hand in my pocket and take out the letter. Normal behaviour after an intention has been formed coincides fully with the experimentally-produced behaviour of people to whom what is described as a 'post-hypnotic suggestion at long range' has been given under hypnosis.¹ This phenomenon is usually described in the following way. The suggested intention slumbers on in the person concerned until the time for its execution approaches. Then it awakes and impels him to perform the action.

[1901b, 1233]

As I very rarely find myself undertaking medical treatment, I can report only one example from my personal experience of a bungled action of a medical kind. There is a very old lady whom I have been visiting twice a day for some years. On my morning visit my medical services are limited to two actions. I put a few drops of eye-lotion into her eye and give her a morphine injection. Two bottles are always prepared for me: a blue one with the collyrium and a white one with the morphine solution. During the two operations my thoughts are no doubt usually busy with something else; by now I have performed them so often that my attention behaves as if it were at liberty. One morning I noticed that the automaton had worked wrong. I had put the dropper into the white bottle instead of the blue one and had put morphine into the eye instead of collyrium. I was greatly frightened and then reassured myself by reflecting that a few drops of a two per cent solution of morphine could not do any harm even in the conjunctival sac. The feeling of fright must obviously have come from another source.

[1901b, 1257]
A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the ‘Apfe’). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

[1901b, 1342]

As we see, the note refers to the death of Leonardo’s father. The small error in its form consists of the repetition of the time of day ‘a ore 7’ [at 7 o’clock], which is given twice, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a small detail, and anyone who was not a psycho-analyst would attach no importance to it. He might not even notice it, and if his attention was drawn to it he might say that a thing like that can happen to anyone in a moment of distraction or of strong feeling, and that it has no further significance.

[1910c, 2290]

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one’s better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of ‘absent-mindedness’ and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person’s attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

[1913j, 2804]
Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting-point for a fruitful investigation. Everyone knows how frequently the reader finds that in reading aloud his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly. I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are accustomed to assume will be performed most exactly when done automatically - that is, with scarcely any conscious attention. From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a disturbance of attention by an alien thought which claims consideration.

[1901b, 1216]

A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the ‘Apfe’). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

[1901b, 1342]
This does not appear to promise much for our psycho-analytic interest. We might feel tempted to drop the subject. If, however, we examine the observations more closely, what we find does not tally entirely with this attention theory of parapraxes, or at least does not follow from it naturally. We discover that parapraxes of this kind and forgetting of this kind occur in people who are not fatigued or absent-minded or excited, but who are in all respects in their normal state - unless we choose to ascribe ex post facto to the people concerned, purely on account of their parapraxis, an excitement which, however, they themselves do not admit to. Nor can it be simply the case that a function is ensured by an increase in the attention directed upon it and endangered if that attention is reduced. There are a large number of procedures that one carries out purely automatically, with very little attention, but nevertheless performs with complete security. A walker, who scarcely knows where he is going, keeps to the right path for all that, and stops at his destination without having gone astray [vergangen]. Or at all events this is so as a rule. An expert pianist strikes the right keys without thinking. He may, of course, make an occasional mistake; but if automatic playing increased the danger of bungling, that danger would be at its greatest for a virtuoso, whose playing, as a result of prolonged practice, has become entirely automatic. We know, on the contrary, that many procedures are carried out with quite particular certainty if they are not the object of a specially high degree of attention, and that the mishap of a parapraxis is liable to occur precisely if special importance is attached to correct functioning and there has therefore certainly been no distraction of the necessary attention. It could be argued that this is the result of 'excitement', but it is difficult to see why the excitement should not on the contrary increase the attention directed to what is so earnestly intended. If by a slip of the tongue someone says the opposite of what he intends in an important speech or oral communication, it can scarcely be explained by the psycho-physiological or attention theory.
[1916-1917, 3139]
I now return to the forgetting of names. So far we have not exhaustively considered either the case-material or the motives behind it. As this is exactly the kind of parapraxis that I can from time to time observe abundantly in myself, I am at no loss for examples. The mild attacks of migraine from which I still suffer usually announce themselves hours in advance by my forgetting names, and at the height of these attacks, during which I am not forced to abandon my work, it frequently happens that all proper names go out of my head. Now it is precisely cases like mine which could furnish the grounds for an objection on principle to our analytic efforts. Should it not necessarily be concluded from such observations that the cause of forgetfulness, and in particular of the forgetting of names, lies in circulatory and general functional disturbances of the cerebrum, and should we not therefore spare ourselves the search for psychological explanations of these phenomena? Not at all, in my view; that would be to confuse the mechanism of a process, which is of the same kind in all cases, with the factors favouring the process, which are variable and not necessarily essential. Instead of a discussion, however, I shall bring forward an analogy to deal with the objection.

[1901b, 1117]

Let us suppose that I have been imprudent enough to go for a walk at night in a deserted quarter of the city, and have been attacked and robbed of my watch and purse. I report the matter at the nearest police station in the following words: 'I was in such and such a street, and loneliness and darkness took away my watch and purse.' Although I should not have said anything in this statement that was not true, the wording of my report would put me in danger of being thought not quite right in the head. The state of affairs could only be described correctly by saying that favoured by the loneliness of the place and under the shield of darkness unknown malefactors robbed me of my valuables. Now the state of affairs in the forgetting of names need not be any different; favoured by tiredness, circulatory disturbances and intoxication, an unknown psychical force robs me of my access to the proper names belonging to my memory - a force which in other cases bring about the same failure of memory at a time of perfect health and unimpaired efficiency.

[1901b, 1117]
In this case the ambiguity of the word 'Beförderung' forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

(F) Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline. (1) What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

I will begin by bringing together some material for answering the last question. In discussing the examples of slips of the tongue we found it necessary to go beyond the content of what was intended to be said, and were obliged to look for the cause of the speech-disturbance in something outside the intention. What this was was obvious in a number of cases, and was known to the speaker's consciousness. In the examples that seemed simplest and most transparent it was another version of the same thought - one which sounded as if it had an equal right, and which disturbed the expression of the thought without its being possible to explain why the one version had succumbed and the other had won the day. (These are Meringer and Mayer's 'contaminations'.) In a second group of cases the motive for the defeat of one version was a consideration which, however, did not prove strong enough to withhold it completely ('zum Vorschwein gekommen'). The version which was withheld was perfectly conscious too. Only of the third group can it be asserted unreservedly that the disturbing thought differed from the one intended, and only in their case can a distinction which is apparently essential be established. The disturbing thought is either connected with the disturbed thought by thought associations (disturbance as a result of internal contradiction), or it is unrelated to it in its nature and the disturbed word happens to be connected with the disturbing thought - which is often unconscious - by an unexpected external association. In the examples I have given from my psycho-analyses the entire speech is under the influence of thoughts which have become active but have at the same time remained entirely unconscious; either these are betrayed by the disturbance itself ('Klapperschlange' - 'Kleopatra') or they exercise an indirect influence by making it possible for the different parts of the consciously intended speech to disturb each other ('Ase natmen', where 'Hasenauer Street' and reminiscences of a Frenchwoman are in the background). The withheld or unconscious thoughts from which the disturbance in speech derives are of the most varied origin. This survey therefore does not enable us to generalize in any direction.

¹ [1901b, 1194]
In regard to the first question - as to what is the origin of the thoughts and impulses which find expression in parapraxes - we can say that in a number of cases it is easy to show that the disturbing thoughts are derived from suppressed impulses in mental life. In healthy people, egoistic, jealous and hostile feelings and impulsions, on which the pressure of moral education weighs heavily, make frequent use of the pathway provided by parapraxes in order to find some expression for their strength, which undeniably exists but is not recognized by higher mental agencies. Acquiescence in these parapraxes and chance actions is to a large extent equivalent to a compliant tolerance of the immoral. Among these suppressed impulses no small part is played by the various sexual currents. That these particular ones should in fact appear so rarely among the thoughts disclosed by analysis in my examples is an accident of my material. Since the examples I have analysed are to a great extent taken from my own mental life, the selection was partial from the first and aimed at excluding sexual matters. At other times it appears to be from perfectly innocent objections and considerations that the disturbing thoughts arise.

We have now reached the moment for answering the second question - that is, what psychological determinants are responsible for a thought being compelled to seek expression not in its complete form but in a kind of parasitic form, as a modification and disturbance of another thought. The most striking examples of parapraxes make it seem probable that these determinants must be looked for in a relation to admissibility to consciousness: in the question, that is, of the greater or less degree to which they bear the marked character of being 'repressed'. But if we follow this character through the series of examples, it dissolves into ever vaguer indications. The inclination to dismiss something as a waste of time, or the consideration that the thought in question is not properly relevant to the matter in hand, appear, as motives for pushing back a thought (which is then left to find expression by disturbing another thought), to play the same part as does the moral condemnation of an insubordinate emotional impulse or as does derivation from totally unconscious trains of thought. Insight into the general nature of how parapraxes and chance actions are determined cannot be gained along these lines. One single fact of significance emerges from these enquiries. The more innocent the motivation of a parapraxis, and the less objectionable - and therefore the less inadmissible to consciousness - the thought finding expression in it, the easier it is to explain the phenomenon, once one's attention has been turned to it. The slightest cases of slips of the tongue are noticed immediately, and spontaneously corrected. Where the motivation comes from really repressed impulses, the case has to be elucidated by careful analysis, which may itself at times come up against difficulties or prove unsuccessful.

[1901b, 1344]
I have since undertaken numerous other analyses where forgetting or faulty reproduction of a set of words took place, and the consistent result of these investigations has inclined me to assume that the mechanism of forgetting demonstrated above in the instances of ‘aliquis’ and ‘The Bride of Corinth’ has an almost universal validity. It is generally a little awkward to give an account of such analyses since, like those just mentioned, they constantly lead to matters which are of an intimate sort and are distressing to the person analysed. I shall therefore not give any further examples. What is common to all these cases, irrespective of the material, is the fact that the forgotten or distorted matter is brought by some associative path into connection with an unconscious thought-content - a thought-content which is the source of the effect manifested in the form of forgetting.

(3) Since this first example in which an apparently arbitrarily chosen number was explained I have often repeated the same experiment, and with the same result; but the content of the majority of cases is so intimate that they cannot be reported.

In regard to the first question - as to what is the origin of the thoughts and impulses which find expression in parapraxes - we can say that in a number of cases it is easy to show that the disturbing thoughts are derived from suppressed impulses in mental life. In healthy people, egoistic, jealous and hostile feelings and impulses, on which the pressure of moral education weighs heavily, make frequent use of the pathway provided by parapraxes in order to find some expression for their strength, which undeniably exists but is not recognized by higher mental agencies. Acquiescence in these parapraxes and chance actions is to a large extent equivalent to a compliant tolerance of the immoral. Among these suppressed impulses no small part is played by the various sexual currents. That these particular ones should in fact appear so rarely among the thoughts disclosed by analysis in my examples is an accident of my material. Since the examples I have analysed are to a great extent taken from my own mental life, the selection was partial from the first and aimed at excluding sexual matters. At other times it appears to be from perfectly innocent objections and considerations that the disturbing thoughts arise.

For reasons which will be easily understood I cannot communicate very much about these or other case histories. Nor do I propose to go into the obvious analogy between deformities of character resulting from protracted sickness in childhood and the behaviour of whole nations whose past history has been full of suffering. Instead, however, I will take the opportunity of pointing to a figure created by the greatest of poets - a figure in whose character the claim to be an exception is closely bound up with and is motivated by the circumstance of congenital disadvantage.
It is perhaps not without interest for its own sake to be able to see into the history of a psychical event of this kind, which is among the most trivial disturbances that can affect the control of the psychical apparatus and which is compatible with an otherwise untroubled state of psychical health. But the example elucidated here receives an immensely added interest when we learn that it may serve as nothing more nor less than a model for the pathological processes to which the psychical symptoms of the psychoneuroses - hysteria, obsessions and paranoia - owe their origin. In both cases we find the same elements and the same play of forces between those elements. In the same manner as here and by means of similar superficial associations, a repressed train of thought takes possession in neuroses of an innocent recent impression and draws it down with itself into repression. The same mechanism which causes the substitute names 'Botticelli' and 'Boltraffio' to emerge from 'Signorelli' (a substitution by means of intermediate or compromise ideas) also governs the formation of obsessional thoughts and paranoic paramnesias. Again, we have seen that such cases of forgetfulness have the characteristic of liberating continuous unpleasure till the moment the problem is solved - a characteristic which is unintelligible apart from this, and something which was in fact unintelligible to the person I was talking to; but there is a complete analogy to it in the way in which collections of repressed thoughts attach their capacity for producing affect to some symptom whose psychical content seems to our judgement totally unsuited to such a liberation of affect. Finally, the resolution of the whole tension by a communication of the correct name from an external quarter is itself a good example of the efficacy of psycho-analytic therapy, which aims at correcting the repressions and displacements and which removes the symptoms by re-instating the genuine psychical object.

Among the various factors, therefore, which contribute to a failure in recollection or a loss of memory, the part played by repression must not be overlooked; and it can be demonstrated not only in neurotics but (in a manner that is qualitatively the same) in normal people as well. It may be asserted quite generally that the ease (and ultimately the faithfulness, too) with which a given impression is awakened in the memory depends not only on the psychical constitution of the individual, the strength of the impression when it was fresh, the interest directed towards it at the time, the psychical constellation at the present time, the interest that is now devoted to its awakening, the connections into which the impression has been drawn, and so on - not only on such things but also on the favourable or unfavourable attitude of a particular psychical factor which refuses to reproduce anything that might liberate unpleasure, or that might subsequently lead to the liberation of unpleasure. Thus the function of memory, which we like to regard as an archive open to anyone who is curious, is in this way subjected to restriction by a trend of the will, just as is any part of our activity directed to the external world. Half the secret of hysterical amnesia is uncovered when we say that hysterical people do not know what they do not want to know; and psycho-analytic treatment, which endeavours to fill up such gaps of memory in the course of its work, leads us to the discovery that the bringing back of those lost memories is opposed by a certain resistance which has to be counterbalanced by work proportionate to its magnitude. In the case of psychical processes which are on the whole normal, it cannot, of course, be claimed that the influence of this one-sided factor in the revival of memories in any way regularly overcomes all the other factors that must be taken into account.¹

[1898b, 482]
There are thus abundant signs to be found in healthy, non-neurotic people that the recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance.¹ But the full significance of this fact can be estimated only when the psychology of neurotic people is investigated. We are forced to regard as one of the main pillars of the mechanism supporting hysterical symptoms an elementary endeavour of this kind to fend off ideas that can arouse feelings of displeasure - an endeavour which can only be compared with the flight-reflex in the presence of painful stimuli. The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect in every case, that in the interplay of psychical forces it may not come up against factors which, for other purposes, aim at the opposite effect and bring it about in spite of the defensive trend. It may be surmised that the architectonic principle of the mental apparatus lies in a stratification - a building up of superimposed agencies; and it is quite possible that this defensive endeavour belongs to a lower psychical agency and is inhibited by higher agencies. At all events, if we can trace back processes such as those found in our examples of forgetting to this defensive trend, that fact speaks in favour of its existence and power. (As we have seen, a number of things are forgotten on their own account; where this is not possible, the defensive trend shifts its target and causes something else related to the target at least to be forgotten, something less important which has come into associative connection with the thing that is really objectionable.

¹[1901b, 1229]

(g) The effects produced by the parapraxes of normal people are as a rule of the most harmless kind. Precisely for this reason it is an especially interesting question whether mistakes of considerable importance which may be followed by serious consequences - for example, mistakes made by a doctor or a chemist - are in any way open to the approach presented here. [1901b, 1257]

These extremely frequent chance and symptomatic acts might be arranged in three groups, according to whether they occur habitually, regularly under certain conditions, or sporadically. Actions of the first group (such as playing with one's watch-chain, fingering one's beard and so on), which can almost be taken as characteristics of the person concerned, trench upon the multifarious movements known as tics and no doubt deserve to be dealt with in connection with them. In the second group I include playing with a stick or scribbling with a pencil that one happens to be holding, jingling coins in one's pocket, kneading bread-crumbs and other plastic materials, fiddling with one's clothing in all kinds of ways and so forth. During psychical treatment idle play of this sort regularly conceals a sense and meaning which are denied any other form of expression. Generally the person concerned is quite unaware that he is doing anything of the kind or that he has modified his usual play in certain ways; and he fails to see and hear the effects of these actions. He does not, for example, hear the noise made by the jingling of coins, and, if his attention is drawn to it, he behaves as though he were astonished and incredulous. All the things that a person does with his clothing, often without realizing it, are no less important and deserve the doctor's attention. Every change in the clothing usually worn, every small sign of carelessness - such as an unfastened button - every trace of exposure, is intended to express something which the wearer of the clothes does not want to say straight out and which for the most part he is unaware of. The interpretations of these small chance actions, and the evidence for these interpretations, emerge each time with sufficient certainty from the material which accompanies them during the session, from the topic that is under discussion and from the associations that occur when attention is drawn to the apparently chance action. Because of this I shall not proceed to support my assertions with examples accompanied by analyses; but I mention these actions because I believe that they have the same meaning in the case of normal people as they have in my patients. [1901b, 1272]
The symptomatic acts that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything - and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers - made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by pointing to the egg-shell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so very much easier, and without more ado took as the basis of our discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could he reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.

I add here a brief and varied collection of symptomatic acts found in healthy and neurotic people:

On some other occasion I will publish a collection of these symptomatic acts as they are to be observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's reticule, which came apart at the top in the usual way, was nothing but a representation of the genitals, and her playing with it, her opening it and putting her finger in it, was an entirely unembarrassed yet unmistakable pantomimic announcement of what she would like to do with them - namely, to masturbate. A very entertaining episode of a similar kind occurred to me a short time ago. In the middle of a session the patient - a lady who was no longer young - brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made some efforts to open it, and then handed it to me so that I might convince myself how hard it was to open. I expressed my suspicition that the box must mean something special, for this was the very first time I had seen it, although its owner had been coming to me for more than a year. To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I go.' She did not calm down until I had pointed out to her with a laugh how well her words were adapted to quite another meaning. The box - Dose, πυξίς - , like the reticule and the jewel-case, was once again only a substitute for the shell of Venus, for the female genitals.
Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

[1913j, 2805]

The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psycho-analysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is the interpretation of dreams, which brought psycho-analysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning or significance, and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psycho-analysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream. There is no half-way house between these two views of dreams. What argues against the physiological hypothesis is its unfruitfulness, and what may be argued in favour of the psycho-analytic one is the fact that it has translated and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

[1913j, 2806]

Phenomena such as these last may seem to you most unusual, and you will perhaps be inclined to suppose that an 'indirect' counter-will already indicates that the process is a pathological one. But I can assure you that it occurs as well within the limits of what is normal and healthy. Moreover you should not misunderstand me. I am far from admitting that our analytic interpretations are untrustworthy. The ambiguities in the forgetting of intentions which I have been mentioning exist only so long as we have not made an analysis of the case and are only making our interpretations on the basis of our general assumptions. If we carry out an analysis upon the person in question, we invariably learn with sufficient certainty whether the counter-will is a direct one or what other origin it may have.

[1916-1917, 3179]
This, Ladies and Gentlemen, is far from being all that might be said about parapraxes. Much remains that might be examined and discussed. But I am satisfied if our discussion of the subject so far has to some extent shaken your previous views and has made you a little prepared to accept new ones. I am content, for the rest, to leave you faced with an unclarified situation. We cannot establish all our doctrines from a study of parapraxes and we are not obliged to draw our evidence from that material alone. The great value of parapraxes for our purposes lies in their being very common phenomena which, moreover, can easily be observed in oneself, and which can occur without the slightest implication of illness. There is only one of your unanswered questions which I should like to put into words before I end. If, as we have found from many instances, people come so close to an understanding of parapraxes and so often behave as though they grasped their sense, how is it possible that they none the less set down these same phenomena as being in general chance events without sense or meaning, and that they can oppose the psycho-analytic elucidation of them with so much vigour?

[1916-1917, 3183]

Dreams, then, have become a subject of psycho-analytic research: once again ordinary phenomena, with little value set on them, and apparently of no practical use - like parapraxes, with which indeed they have in common the fact of occurring in healthy people. But apart from this the conditions for our work are a good deal less favourable here. Parapraxes had merely been neglected by science, little attention had been paid to them; but at least there was no harm in concerning oneself with them. 'No doubt', people would say, 'there are more important things. But something may possibly come of it.' But to concern oneself with dreams is not merely unpractical and uncalled-for, it is positively disgraceful. It brings with it the odium of being unscientific and rouses the suspicion of a personal inclination to mysticism. Imagine a medical man going in for dreams when there are so many more serious things even in neuropathology and psychiatry - tumours as big as apples compressing the organ of the mind, haemorrhages, chronic inflammation, in all of which the changes in the tissues can be demonstrated under the microscope! No, dreams are much too trivial, and unworthy to be an object of research.

[1916-1917, 3186]

But the dreams of neurotics do not differ in any important respect from those of normal people; it is possible, indeed, that they cannot be distinguished from them at all. It would be absurd to give an account of the dreams of neurotics which could not also apply to the dreams of normal people. We must therefore say that the difference between neurosis and health holds only during the day; it is not prolonged into dream-life. We are obliged to carry over to healthy people a number of hypotheses which arise in connection with neurotics as a result of the link between the latter's dreams and their symptoms. We cannot deny that healthy people as well possess in their mental life what alone makes possible the formation both of dreams and of symptoms, and we must conclude that they too have carried out repressions, that they expend a certain amount of energy in order to maintain them, that their unconscious system conceals repressed impulses which are still cathected with energy, and that a portion of their libido is withdrawn from their ego's disposal. Thus a healthy person, too, is virtually a neurotic; but dreams appear to be the only symptoms which he is capable of forming. It is true that if one subjects his waking life to a closer examination one discovers something that contradicts this appearance - namely that this ostensibly healthy life is interspersed with a great number of trivial and in practice unimportant symptoms.

[1916-1917, 3496]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations. [1923a, 3917]
This makes it clear that people give slips of the tongue and other parapraxes the same interpretation that I advocate in this book, even if they do not endorse theoretically the view I put forward, and even if they are disinclined, so far as it applies to themselves, to renounce the convenience that goes along with tolerating parapraxes. The amusement and derision which such oral slips are certain to evoke at the crucial moment can be taken as evidence against what purports to be the generally accepted convention that a mistake in speaking is a *lapsus linguae* and of no psychological significance. It was no less a person than the German Imperial Chancellor Prince Bülow who protested on these lines in an effort to save the situation, when the wording of his speech in defence of his Emperor (in November, 1907) was given the opposite meaning by a slip of the tongue. 'As for the present, the new epoch of the Emperor Wilhelm II, I can only repeat what I said a year ago, namely that *it would be unfair and unjust to speak of a coterie of responsible advisors round our Emperor*. . . .' (loud cries of 'irresponsible') ' . . . *irresponsible advisors*. Forgive the *lapsus linguae*.' (Laughter.)

I do not mean to assert that cases of combined parapraxes like these can teach us anything new that could not already be observed in the simple cases. And yet this situation, of there being a change in the form taken by the parapraxis while the outcome remains the same, gives a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be struck by the fact that a conscious intention should in these examples fail so completely to prevent the success of the parapraxis. My friend failed in spite of everything to attend the meeting of the society, and the lady found it impossible to part from the medal. The unknown factor that opposed these intentions found another outlet after the first path had been barred to it. For what was required to overcome the unconscious motive was something other than a conscious counter-intention; it called for a piece of psychical work, which could make what was unknown known to consciousness.

The category of what is accidental and requires no motivation, in which the normal person includes a part of his own psychical performances and parapraxes, is thus rejected by the paranoic as far as the psychical manifestations of other people are concerned. Everything he observes in other people is full of significance, everything can be interpreted. How does he reach this position? Probably here as in so many similar cases he projects on to the mental life of other people what is unconsciously present in his own. In paranoia many sorts of things force their way through to consciousness whose presence in the unconscious of normal and neurotic people we can demonstrate only through psycho-analysis.² In a certain sense, therefore, the paranoic is justified in this, for he recognizes something that escapes the normal person: he sees more clearly than someone of normal intellectual capacity, but the displacement on to other people of the state of affairs which he recognizes renders his knowledge worthless. I hope I shall not now be expected to justify the various paranoic interpretations. But the partial justification which we concede to paranoia in respect of this view taken by it of chance actions will help us towards a psychological understanding of the sense of conviction that the paranoic attaches to all these interpretations. *There is in fact some truth in them;* those, too, of our errors of judgement which are not to be counted as pathological acquire their sense of conviction in just the same way. This feeling is justified for a certain part of the erroneous train of thought, or for its source of origin; and it is then extended by us to the rest of the context.

² The emphasis on normal and neurotic people is mine.
When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 1194 ('Across Europe in a Tub') gave me the opportunity of showing how a symptom that is at first insoluble becomes accessible to analysis when the real interest in the repressed thoughts has passed away.¹ As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

¹ [1901b, 1339]

Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that some disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

[1901b, 1340]
In regard to the first question - as to what is the origin of the thoughts and impulses which find expression in parapraxes - we can say that in a number of cases it is easy to show that the disturbing thoughts are derived from suppressed impulses in mental life. In healthy people, egoistic, jealous and hostile feelings and impulsions, on which the pressure of moral education weighs heavily, make frequent use of the pathway provided by parapraxes in order to find some expression for their strength, which undeniably exists but is not recognized by higher mental agencies. Acquiescence in these parapraxes and chance actions is to a large extent equivalent to a compliant tolerance of the immoral. Among these suppressed impulses no small part is played by the various sexual currents. That these particular ones should in fact appear so rarely among the thoughts disclosed by analysis in my examples is an accident of my material. Since the examples I have analysed are to a great extent taken from my own mental life, the selection was partial from the first and aimed at excluding sexual matters. At other times it appears to be from perfectly innocent objections and considerations that the disturbing thoughts arise.

[1901b, 1344]

I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a self-accusation. I met her halfway by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.¹ I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step towards the confession. For on that day she wore at her waist - a thing she never did on any other occasion before or after - a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it - opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a 'symptomatic act'.² I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: ‘Why should I not wear a reticule like this, as it is now the fashion to do?’ But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though on the other hand the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

[1905e, 1413]
Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work in which I demonstrated that a whole number of actions which were held to be unmotivated are on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects. I showed that when someone makes a slip of the tongue it is not chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content - a complex - can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose - habits of playing or fiddling with things, and so on - and revealed them as 'symptomatic actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr. Alfred Adler, was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905). Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

As we see, the note refers to the death of Leonardo's father. The small error in its form consists of the repetition of the time of day 'a ore 7' [at 7 o'clock], which is given twice, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a small detail, and anyone who was not a psycho-analyst would attach no importance to it. He might not even notice it, and if his attention was drawn to it he might say that a thing like that can happen to anyone in a moment of distraction or of strong feeling, and that it has no further significance.

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.
We can now turn, however, to the main question, which we have long postponed, of what sort of intentions these are, which find expression in this unusual fashion as disturbers of other intentions. Well, they are obviously of very different sorts, among which we must look for the common factor. If we examine a number of examples with this in view, they will soon fall into three groups. The first group contains those cases in which the disturbing purpose is known to the speaker and moreover had been noticed by him before he made the slip of the tongue. Thus, in the 'Vorschwein' slip the speaker admitted not only that he had formed the judgement 'Schweinereien' about the events in question, but also that he had had the intention, from which he afterwards drew back, of expressing his judgement in words. A second group is made up of other cases in which the disturbing purpose is equally recognized as his by the speaker, but in which he was unaware that it was active in him just before he made the slip. Thus, he accepts our interpretation of his slip, but nevertheless remains to some extent surprised at it. Instances of this kind of attitude can perhaps be found in other sorts of parapraxes more easily than in slips of the tongue. In a third group the interpretation of the disturbing intention is vigorously rejected by the speaker; he not only denies that it was active in him before he made the slip, but seeks to maintain that it is entirely foreign to him. You will recall the example of the 'hiccough' and the positively rude denial which I brought on myself from the speaker by uncovering his disturbing intention. As you know, we have not yet come to any agreement in our views on these cases. I should pay no attention to the denial put forward by the proposer of the toast and should persist in my interpretation unruffled, while you, I suppose, are still affected by his protest and raise the question of whether we ought not to give up interpreting parapraxes of this kind and regard them as purely physiological acts in the pre-analytic sense. I can well imagine what it is that deters you. My interpretation carries with it the hypothesis that intentions can find expression in a speaker of which he himself knows nothing but which I am able to infer from circumstantial evidence. You are brought up short in the face of such a novel and momentous hypothesis. I can understand that, and I see your point so far as that goes. But one thing is certain. If you want to apply consistently the view of parapraxes which has been confirmed by so many examples, you will have to make up your mind to accept the strange hypothesis I have mentioned. If you cannot do that, you will have once more to abandon the understanding of parapraxes which you have only just achieved.
