Freud found such a substitute - and a completely satisfactory one - in the 'associations' of his patients; that is, in the involuntary thoughts (most frequently regarded as disturbing elements and therefore ordinarily pushed aside) which so often break across the continuity of a consecutive narrative. [1904a, 1557]

I did not abandon it, however, before the observations I made during my use of it afforded me decisive evidence. I found confirmation of the fact that the forgotten memories were not lost. They were in the patient's possession and were ready to emerge in association to what was still known by him; but there was some force that prevented them from becoming conscious and compelled them to remain unconscious. The existence of this force could be assumed with certainty, since one became aware of an effort corresponding to it if, in opposition to it, one tried to introduce the unconscious memories into the patient's consciousness. The force which was maintaining the pathological condition became apparent in the form of resistance on the part of the patient. [1910a, 2212]

It was on this idea of resistance, then, that I based my view of the course of psychical events in hysteria. In order to effect a recovery, it had proved necessary to remove these resistances. Starting out from the mechanism of cure, it now became possible to construct quite definite ideas of the origin of the illness. The same forces which, in the form of resistance, were now offering opposition to the forgotten material's being made conscious, must formerly have brought about the forgetting and must have pushed the pathogenic experiences in question out of consciousness. I gave the name of 'repression' to this hypothetical process, and I considered that it was proved by the undeniable existence of resistance. [1910a, 2212]

It seems to me not unnecessary to keep on reminding students of the far-reaching changes which psycho-analytic technique has undergone since its first beginnings. In its first phase - that of Breuer's catharsis - it consisted in bringing directly into focus the moment at which the symptom was formed, and in persistently endeavouring to reproduce the mental processes involved in that situation, in order to direct their discharge along the path of conscious activity. Remembering and abreacting, with the help of the hypnotic state, were what was at that time aimed at. Next, where hypnosis had been given up, the task became one of discovering from the patient's free associations what he failed to remember. The resistance was to be circumvented by the work of interpretation and by making its results known to the patient. The situations which had given rise to the formation of the symptom and the other situations which lay behind the moment at which the illness broke out retained their place as the focus of interest; but the element of abreaction receded into the background and seemed to be replaced by the expenditure of work which the patient had to make in being obliged to overcome his criticism of his free associations, in accordance with the fundamental rule of psycho-analysis. Finally, there was evolved the consistent technique used to-day, in which the analyst gives up the attempt to bring a particular moment or problem into focus. He contents himself with studying whatever is present for the time being on the surface of the patient's mind, and he employs the art of interpretation mainly for the purpose of recognizing the resistances which appear there, and making them conscious to the patient. From this there results a new sort of division of labour: the doctor uncovers the resistances which are unknown to the patient; when these have been got the better of, the patient often relates the forgotten situations and connections without any difficulty. The aim of these different techniques has, of course, remained the same. Descriptively speaking, it is to fill in gaps in memory; dynamically speaking, it is to overcome resistances due to repression. [1914g, 2498]
The first psycho-analytic examinations and attempts at treatment were made with the help of hypnotism. Afterwards this was abandoned and the work was carried out by the method of 'free association', with the patient remaining in his normal state. This modification had the advantage of enabling the procedure to be applied to a far larger number of cases of hysteria, as well as to other neuroses and also to healthy people. The development of a special technique of interpretation became necessary, however, in order to draw conclusions from the expressed ideas of the person under investigation. These interpretations established with complete certainty the fact that psychical dissociations are maintained entirely by 'internal resistances'. The conclusion seems justified, therefore, that the dissociations have originated owing to internal conflict, which has led to the 'repression' of the underlying impulse. To overcome this conflict and in that way to cure the neurosis, the guiding hand of a doctor trained in psycho-analysis is required.

Free Association. - The effect of the hypnotic condition upon the patient had been so greatly to increase his ability to make associations that he was able straight away to find the path - inaccessible to his conscious reflection - which led from the symptom to the thoughts and memories connected with it. The abandonment of hypnosis seemed to make the situation hopeless, until the writer recalled a remark of Bernheim's to the effect that things that had been experienced in a state of somnambulism were only apparently forgotten and that they could be brought into recollection at any time if the physician insisted forcibly enough that the patient knew them. The writer therefore endeavoured to insist on his unhypnotized patients giving him their associations, so that from the material thus provided he might find the path leading to what had been forgotten or fended off. He noticed later that the insistence was unnecessary and that copious ideas almost always arose in the patient's mind, but that they were held back from being communicated and even from becoming conscious by certain objections put by the patient in his own way. It was to be expected - though this was still unproved and not until later confirmed by wide experience - that everything that occurred to a patient setting out from a particular starting-point must also stand in an internal connection with that starting-point; hence arose the technique of educating the patient to give up the whole of his critical attitude and of making use of the material which was thus brought to light for the purpose of uncovering the connections that were being sought. A strong belief in the strict determination of mental events certainly played a part in the choice of this technique as a substitute for hypnosis.

[1913m, 2546]

[1923a, 3915]
Psycho-analysis as an Interpretive Art. - The new technique altered the picture of the treatment so greatly, brought the physician into such a new relation to the patient and produced so many surprising results that it seemed justifiable to distinguish the procedure from the cathartic method by giving it a new name. The present writer gave this method of treatment, which could now be extended to many other forms of neurotic disorder, the name of psycho-analysis. Now, in the first resort, this psycho-analysis was an art of interpretation and it set itself the task of carrying deeper the first of Breuer's great discoveries - namely, that neurotic symptoms are significant substitutes for other mental acts which have been omitted. It was now a question of regarding the material produced by the patients' associations as though it hinted at a hidden meaning and of discovering that meaning from it. Experience soon showed that the attitude which the analytic physician could most advantageously adopt was to surrender himself to his own unconscious mental activity, in a state of evenly suspended attention, to avoid so far as possible reflection and the construction of conscious expectations, not to try to fix anything that he heard particularly in his memory, and by these means to catch the drift of the patient's unconscious with his own unconscious. It was then found that, except under conditions that were too unfavourable, the patient's associations emerged like allusions, as it were, to one particular theme and that it was only necessary for the physician to go a step further in order to guess the material which was concealed from the patient himself and to be able to communicate it to him. It is true that this work of interpretation was not to be brought under strict rules and left a great deal of play to the physician's tact and skill; but, with impartiality and practice, it was usually possible to obtain trustworthy results - that is to say, results which were confirmed by being repeated in similar cases. At a time when so little was as yet known of the unconscious, the structure of the neuroses and the pathological processes underlying them, it was a matter for satisfaction that a technique of this kind should be available, even if it had no better theoretical basis. Moreover it is still employed in analyses at the present day in the same manner, though with a sense of greater assurance and with a better understanding of its limitations.
[1923a, 3916]

The Aetiological Significance of Sexual Life. - The second novelty which emerged after the hypnotic technique had been replaced by free associations was of a clinical nature. It was discovered in the course of the prolonged search for the traumatic experiences from which hysterical symptoms appeared to be derived. The more carefully the search was pursued the more extensive seemed to be the network of aetiologically significant impressions involved, but the further back, too, did they reach into the patient's puberty or childhood. At the same time they assumed a uniform character and eventually it became inevitable to bow before the evidence and recognize that at the root of the formation of every symptom there were to be found traumatic experiences from early sexual life. Thus a sexual trauma stepped into the place of an ordinary trauma and the latter was seen to owe its aetiological significance to an associative or symbolic connection with the former, which had preceded it. An investigation of cases of common nervousness (falling into the two classes of neurasthenia and anxiety neurosis) which was simultaneously undertaken led to the conclusion that these disorders could be traced to contemporary abuses in the patients' sexual life and could be removed if these were brought to an end. It was thus easy to infer that neuroses in general are an expression of disturbances in sexual life, the so-called actual-neuroses being the consequences (by chemical agency) of contemporary injuries and the psycho-neuroses the consequences (by psychical modification) of bygone injuries to a biological function which had hitherto been gravely neglected by science. None of the theses of psycho-analysis has met with such tenacious scepticism or such embittered resistance as this assertion of the preponderating aetiological significance of sexual life in the neuroses. It should, however, be expressly remarked that, in its development up to the present day, psycho-analysis has found no reason to retreat from this opinion.
[1923a, 3920]
Hypnosis had, however, performed the service of restoring to the patient's memory what he had forgotten. It was necessary to find some other technique to replace it; and the idea occurred to Freud of substituting for it the method of 'free association'. That is to say, he pledged his patients to refrain from any conscious reflection and to abandon themselves, in a state of quiet concentration, to following the ideas which occurred to them spontaneously (involuntarily) - 'to skim off the surface of their consciousness'. They were to communicate these ideas to the physician even if they felt objections to doing so, if, for instance, the thoughts seemed too disagreeable, too senseless, too unimportant or irrelevant. The choice of free association as a means of investigating the forgotten unconscious material seems so strange that a word in justification of it will not be out of place. Freud was led to it by an expectation that the so-called 'free' association would prove in fact to be unfree, since, when all conscious intellectual purposes had been suppressed, the ideas that emerged would be seen to be determined by the unconscious material. This expectation was justified by experience. When the 'fundamental rule of psycho-analysis' which has just been stated was obeyed, the course of free association produced a plentiful store of ideas which could put one on the track of what the patient had forgotten. To be sure, this material did not bring up what had actually been forgotten, but it brought up such plain and numerous hints at it that, with the help of a certain amount of supplementing and interpreting, the doctor was able to guess (to reconstruct) the forgotten material from it. Thus free association together with the art of interpretation performed the same function as had previously been performed by hypnotism.

[1924f, 4105]

The means which I first adopted for overcoming the patient's resistance, by insistence and encouragement, had been indispensable for the purpose of giving me a first general survey of what was to be expected. But in the long run it proved to be too much of a strain on both sides, and further, it seemed open to certain obvious criticisms. It therefore gave place to another method which was in one sense its opposite. Instead of urging the patient to say something upon some particular subject, I now asked him to abandon himself to a process of free association - that is, to say whatever came into his head, while ceasing to give any conscious direction to his thoughts. It was essential, however, that he should bind himself to report literally everything that occurred to his self-perception and not to give way to critical objections which sought to put certain associations on one side on the ground that they were not sufficiently important or that they were irrelevant or that they were altogether meaningless. There was no necessity to repeat explicitly the demand for candour on the patient's part in reporting his thoughts, for it was the precondition of the whole analytic treatment.

[1925d, 4215]
This was at a date before the investigations of Charcot and Pierre Janet into the origin of hysterical symptoms, and Breuer's discovery was thus entirely uninfluenced by them. But he did not pursue the matter any further at the time, and it was not until some ten years later that he took it up again in collaboration with Sigmund Freud. In 1895 they published a book, *Studies on Hysteria*, in which Breuer's discoveries were described and an attempt was made to explain them by the theory of 'catharsis'. According to that hypothesis, hysterical symptoms originate through the energy of a mental process being withheld from conscious influence and being diverted into bodily innervation ('conversion'). A hysterical symptom would thus be a substitute for an omitted mental act and a reminiscence of the occasion which should have given rise to that act. And, on this view, recovery would be a result of the liberation of the affect that had gone astray and of its discharge along a normal path ('abreaction'). Cathartic treatment gave excellent therapeutic results, but it was found that they were not permanent and that they were not independent of the personal relation between the patient and the physician. Freud, who later proceeded with these investigations by himself, made an alteration in their technique, by replacing hypnosis by the method of free association. He invented the term 'psycho-analysis', which in the course of time came to have two meanings: (1) a particular method of treating nervous disorders and (2) the science of unconscious mental processes, which has also been appropriately described as 'depth-psychology'.

[1926f, 4401]

For these new experiments made it a certainty that the patients whom we described as neurotic were in some sense suffering from mental disturbances and ought therefore to be treated by psychological methods. Our interest therefore necessarily turned to psychology. The psychology which ruled at that time in the academic schools of philosophy had very little to offer and nothing at all for our purposes: we had to discover from the start both our methods and the theoretical hypotheses behind them. So I worked in this direction, first in collaboration with Breuer and afterwards independently of him. In the end I made it a part of my technique to require my patients to tell me without criticism whatever occurred to their minds, even if they were ideas which did not seem to make sense or which it was distressing to report.

[1932c, 4807]
¹ [Added in the text in 1919 and transferred to a footnote in 1930:] Dreams which occur in the earliest years of childhood and are retained in the memory for dozens of years, often with complete sensory vividness, are almost always of great importance in enabling us to understand the history of the subject's mental development and of his neurosis. Analysis of such dreams protects the physician from errors and uncertainties which may lead, among other things, to theoretical confusion. [1900a, 956]

Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called *The Interpretation of Dreams*, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique. [1904a, 1558]

In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest. [1925d, 4222]
When they fell in with my instructions they told me their dreams, amongst other things, as though they were of the same kind as their other thoughts. This was a plain hint that I should assign as much importance to these dreams as to other, intelligible, phenomena. They, however, were not intelligible, but strange, confused, absurd: like dreams, in fact - which for that very reason, were condemned by science as random and senseless twitchings of the organ of the mind. If my patients were right - and they seemed only to be repeating the ancient beliefs held by unscientific men for thousands of years - I was faced by the task of 'interpreting dreams' in a way that could stand up against scientific criticism.

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the distortion which the dream-work had carried out upon the rational and intelligible material.

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.
Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called The Interpretation of Dreams, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.

[1904a, 1558]

I am to put before you, then, the psycho-analytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting-room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would - 'There's nothing wrong with you' - with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I fine them so-and-so many Kronen for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psycho-analysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting-room and my consulting- and treatment-room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting-room omits to shut the door behind him and almost always he leaves both doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door-handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting-room and consulting-room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient only occurs when he has been alone in the waiting-room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.

[1916-1917, 3329]
Thus the patient's omission is neither accidentally nor senselessly determined; and indeed it is not unimportant, for, as we shall see, it throws light on the newcomer's attitude to the doctor. The patient is one of the great multitude who have a craving for mundane authority, who wish to be dazzled and intimidated. He may have enquired on the telephone as to the hour at which he could most easily get an appointment; he had formed a picture of a crowd of people seeking for help, like the crowd outside one of Julius Meinl's branches. He now comes into an empty, and moreover extremely modestly furnished, waiting-room, and is shocked. He has to make the doctor pay for the superfluous respect which he had intended to offer him: so - he omits to shut the door between the waiting-room and the consulting-room. What he means to say to the doctor by his conduct is: 'Ah, so there's no one here and no one's likely to come while I'm here.' He would behave equally impolitely and disrespectfully during the consultation if his arrogance were not given a sharp reprimand at the very beginning.

[1916-1917, 3330]

The analysis of this small symptomatic action tells you no thing you did not know before: the thesis that it was not a matter of chance but had a motive, a sense and an intention, that it had a place in an assignable mental context and that it provided information, by a small indication, of a more important mental process. But, more than anything else, it tells you that the process thus indicated was unknown to the consciousness of the person who carried out the action, since none of the patients who left the two doors open would have been able to admit- that by this omission he wanted to give evidence of his contempt. Some of them would probably have been aware of a sense of disappointment when they entered the empty waiting room; but the connection between this impression and the symptomatic action which followed certainly remained unknown to their consciousness.

[1916-1917, 3330]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
Since the manifestations of the psychoneuroses arise from the deferred action of unconscious psychical traces, they are accessible to psychotherapy. But in this case the therapy must pursue paths other than the only one so far followed of suggestion with or without hypnosis. Basing myself on the ‘cathartic’ method introduced by Josef Breuer, I have in recent years almost completely worked out a therapeutic procedure which I propose to describe as ‘psychoanalytic’. I owe a great number of successes to it, and I hope I may be able further to increase its effectiveness considerably. The first accounts of the technique and scope of this method were given in *Studies on Hysteria*, written jointly with Breuer and published in 1895. Since then a good deal, as I think I may say, has been altered for the better. Whereas at that time we modestly declared that we could undertake to only to remove the symptoms of hysteria, not to cure hysteria itself, this distinction has since come to seem to me without substance, so that there is a prospect of a genuine cure of hysteria and obsessions. It is therefore with very lively interest that I have read in the publications of colleagues that ‘in this case the ingenious procedure devised by Breuer and Freud has failed’, or that ‘the method has not performed what it seemed to promise’. This gave me something of the feelings of a man who reads his own obituary in the paper, but who is able to reassure himself by his better knowledge of the facts. For the method is so difficult that it has quite definitely to be learned; and I cannot recall that a single one of my critics has expressed a wish to learn it from me. Nor do I believe that, like me, they have occupied themselves with it intensely enough to have been able to discover it for themselves. The remarks in the *Studies on Hysteria* are totally inadequate to enable a reader to master the technique, nor are they in any way intended to give any such complete instruction. [1897b, 473]

Readers who are familiar with the technique of analysis as it was expounded in the *Studies on Hysteria* will perhaps be surprised that it should not have been possible in three months to find a complete solution at least for those of the symptoms which were taken in hand. This will become intelligible when I explain that since the date of the *Studies* psycho-analytic technique has been completely revolutionized. At that time the work of analysis started out from the symptoms, and aimed at clearing them up one after the other. Since then I have abandoned that technique, because I found it totally inadequate for dealing with the finer structure of a neurosis. I now let the patient himself choose the subject of the day's work, and in that way I start out from whatever surface his unconscious happens to be presenting to his notice at the moment. But on this plan everything that has to do with the clearing-up of a particular symptom emerges piecemeal, woven into various contexts, and distributed over widely separated periods of time. In spite of this apparent disadvantage, the new technique is far superior to the old, and indeed there can be no doubt that it is the only possible one. [1905e, 1355]

PSYCHO-ANALYSIS An important addition to our knowledge of the sexual instinct in certain people who at least approximate to the normal can be obtained from a source which can only be reached in one particular way. There is only one means of obtaining exhaustive information that will not be misleading about the sexual life of the persons known as ‘psychoneurotics’ - sufferers from hysteria, from obsessional neurosis, from what is wrongly described as neurasthenia, and, undoubtedly, from dementia praecox and paranoia was well. They must be subjected to psycho-analytic investigation, which is employed in the therapeutic procedure introduced by Josef Breuer and myself in 1893 and known at that time as ‘catharsis’. [1905d, 1488]
The cathartic method had already renounced suggestion; Freud went a step further and gave up hypnosis as well. At the present time he treats his patients as follows. Without exerting my other kind of influence, he invites them to lie down in a comfortable attitude on a sofa, while he himself sits on a chair behind them outside their field of vision. He does not even ask them to close their eyes, and avoids touching them in any way, as well as any other procedure which might be reminiscent of hypnosis. The session thus proceeds like a conversation between two people equally awake, but one of whom is spared every muscular exertion and every distracting sensory impression which might divert his attention from his own mental activity.

[1904a, 1556]

Freud found such a substitute - and a completely satisfactory one - in the 'associations' of his patients; that is, in the involuntary thoughts (most frequently regarded as disturbing elements and therefore ordinarily pushed aside) which so often break across the continuity of a consecutive narrative.

[1904a, 1557]

In spite of all these limitations, the number of persons suitable for psycho-analytic treatment is extraordinarily large and the extension which has come to our therapeutic powers from this method is, according to Freud, very considerable. Freud requires long periods, six months to three years, for an effective treatment; yet he informs us that up to the present, owing to various circumstances which can easily be guessed, he has for the most part been in a position to try his treatment only on very severe cases: patients have come to him after many years of illness, completely incapacitated for life, and, after being disappointed by all kinds of treatments, have had recourse as a last resort to a method which is novel and has been greeted with many doubts. In cases of less severe illness the duration of the treatment might well be much shorter, and very great advantage in the direction of future prevention might be achieved.

[1904a, 1560]
Psycho-analysis as an Interpretive Art. - The new technique altered the picture of the treatment so greatly, brought the physician into such a new relation to the patient and produced so many surprising results that it seemed justifiable to distinguish the procedure from the cathartic method by giving it a new name. The present writer gave this method of treatment, which could now be extended to many other forms of neurotic disorder, the name of psycho-analysis. Now, in the first resort, this psycho-analysis was an art of interpretation and it set itself the task of carrying deeper the first of Breuer's great discoveries - namely, that neurotic symptoms are significant substitutes for other mental acts which have been omitted. It was now a question of regarding the material produced by the patients' associations as though it hinted at a hidden meaning and of discovering that meaning from it. Experience soon showed that the attitude which the analytic physician could most advantageously adopt was to surrender himself to his own unconscious mental activity, in a state of evenly suspended attention, to avoid so far as possible reflection and the construction of conscious expectations, not to try to fix anything that he heard particularly in his memory, and by these means to catch the drift of the patient's unconscious with his own unconscious. It was then found that, except under conditions that were too unfavourable, the patient's associations emerged like allusions, as it were, to one particular theme and that it was only necessary for the physician to go a step further in order to guess the material which was concealed from the patient himself and to be able to communicate it to him. It is true that this work of interpretation was not to be brought under strict rules and left a great deal of play to the physician's tact and skill; but, with impartiality and practice, it was usually possible to obtain trustworthy results - that is to say, results which were confirmed by being repeated in similar cases. At a time when so little was as yet known of the unconscious, the structure of the neuroses and the pathological processes underlying them, it was a matter for satisfaction that a technique of this kind should be available, even if it had no better theoretical basis. Moreover it is still employed in analyses at the present day in the same manner, though with a sense of greater assurance and with a better understanding of its limitations.

[1923a, 3916]

Soon after the publication of Studies on Hysteria the partnership between Breuer and Freud came to an end. Breuer, who was in reality a consultant in internal medicine, gave up treating nervous patients, and Freud devoted himself to the further perfection of the instrument left over to him by his elder collaborator. The technical novelties which he introduced and the discoveries which he made changed the cathartic method into psycho-analysis. The most momentous step, no doubt, was his determination to do without the assistance of hypnosis in his technical procedure. He did so for two reasons: first, because, in spite of a course of instruction with Bernheim at Nancy, he did not succeed in inducing hypnosis in a sufficient number of cases, and secondly, because he was dissatisfied with the therapeutic results of catharsis based on hypnosis. It is true that these results were striking and appeared after a treatment of short duration, but they turned out not to be permanent and to depend too much on the patient's personal relations with the physician. The abandonment of hypnosis made a breach in the course of development of the procedure up to then, and it meant a fresh start.

[1924f, 4105]
Hypnosis had, however, performed the service of restoring to the patient's memory what he had forgotten. It was necessary to find some other technique to replace it; and the idea occurred to Freud of substituting for it the method of 'free association'. That is to say, he pledged his patients to refrain from any conscious reflection and to abandon themselves, in a state of quiet concentration, to following the ideas which occurred to them spontaneously (involuntarily) - 'to skim off the surface of their consciousness'. They were to communicate these ideas to the physician even if they felt objections to doing so, if, for instance, the thoughts seemed too disagreeable, too senseless, too unimportant or irrelevant. The choice of free association as a means of investigating the forgotten unconscious material seems so strange that a word in justification of it will not be out of place. Freud was led to it by an expectation that the so-called 'free' association would prove in fact to be unfree, since, when all conscious intellectual purposes had been suppressed, the ideas that emerged would be seen to be determined by the unconscious material. This expectation was justified by experience. When the 'fundamental rule of psycho-analysis' which has just been stated was obeyed, the course of free association produced a plentiful store of ideas which could put one on the track of what the patient had forgotten. To be sure, this material did not bring up what had actually been forgotten, but it brought up such plain and numerous hints at it that, with the help of a certain amount of supplementing and interpreting, the doctor was able to guess (to reconstruct) the forgotten material from it. Thus free association together with the art of interpretation performed the same function as had previously been performed by hypnotism.

The theory of repression became the corner-stone of our understanding of the neuroses. A different view had now to be taken of the task of therapy. Its aim was no longer to 'abreact' an affect which had got on to the wrong lines but to uncover repressions and replace them by acts of judgement which might result either in the accepting or in the condemning of what had formerly been repudiated. I showed my recognition of the new situation by no longer calling my method of investigation and treatment catharsis but psycho-analysis.
Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called The Interpretation of Dreams, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.

Psycho-analysis as an Interpretive Art. - The new technique altered the picture of the treatment so greatly, brought the physician into such a new relation to the patient and produced so many surprising results that it seemed justifiable to distinguish the procedure from the cathartic method by giving it a new name. The present writer gave this method of treatment, which could now be extended to many other forms of neurotic disorder, the name of psycho-analysis. Now, in the first resort, this psycho-analysis was an art of interpretation and it set itself the task of carrying deeper the first of Breuer's great discoveries - namely, that neurotic symptoms are significant substitutes for other mental acts which have been omitted. It was now a question of regarding the material produced by the patients' associations as though it hinted at a hidden meaning and of discovering that meaning from it. Experience soon showed that the attitude which the analytic physician could most advantageously adopt was to surrender himself to his own unconscious mental activity, in a state of evenly suspended attention, to avoid so far as possible reflection and the construction of conscious expectations, not to try to fix anything that he heard particularly in his memory, and by these means to catch the drift of the patient's unconscious with his own unconscious. It was then found that, except under conditions that were too unfavourable, the patient's associations emerged like allusions, as it were, to one particular theme and that it was only necessary for the physician to go a step further in order to guess the material which was concealed from the patient himself and to be able to communicate it to him. It is true that this work of interpretation was not to be brought under strict rules and left a great deal of play to the physician's tact and skill; but, with impartiality and practice, it was usually possible to obtain trustworthy results - that is to say, results which were confirmed by being repeated in similar cases. At a time when so little was as yet known of the unconscious, the structure of the neuroses and the pathological processes underlying them, it was a matter for satisfaction that a technique of this kind should be available, even if it had no better theoretical basis. Moreover it is still employed in analyses at the present day in the same manner, though with a sense of greater assurance and with a better understanding of its limitations.
Hypnosis had, however, performed the service of restoring to the patient's memory what he had forgotten. It was necessary to find some other technique to replace it; and the idea occurred to Freud of substituting for it the method of 'free association'. That is to say, he pledged his patients to refrain from any conscious reflection and to abandon themselves, in a state of quiet concentration, to following the ideas which occurred to them spontaneously (involuntarily) - 'to skim off the surface of their consciousness'. They were to communicate these ideas to the physician even if they felt objections to doing so, if, for instance, the thoughts seemed too disagreeable, too senseless, too unimportant or irrelevant. The choice of free association as a means of investigating the forgotten unconscious material seems so strange that a word in justification of it will not be out of place. Freud was led to it by an expectation that the so-called 'free' association would prove in fact to be unfree, since, when all conscious intellectual purposes had been suppressed, the ideas that emerged would be seen to be determined by the unconscious material. This expectation was justified by experience. When the 'fundamental rule of psycho-analysis' which has just been stated was obeyed, the course of free association produced a plentiful store of ideas which could put one on the track of what the patient had forgotten. To be sure, this material did not bring up what had actually been forgotten, but it brought up such plain and numerous hints at it that, with the help of a certain amount of supplementing and interpreting, the doctor was able to guess (to reconstruct) the forgotten material from it. Thus free association together with the art of interpretation performed the same function as had previously been performed by hypnotism.

[1924f, 4105]
Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called The Interpretation of Dreams, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.

When we come to putting this procedure into effect, we are subject to yet another interference. For the patient will often pause and come to a stop, and assert that he can think of nothing to say, and that nothing whatever occurs to his mind. If this were so and if the patient were right, then our procedure would once again have proved ineffective. But closer observation shows that such a stoppage of the flow of ideas never in fact occurs. It appears to happen only because the patient holds back or gets rid of the idea that he has become aware of, under the influence of the resistances which disguise themselves as various critical judgements about the value of the idea that has occurred to him. We can protect ourselves against this by warning him beforehand of this behaviour and requiring him to take no notice of such criticisms. He must, we tell him, entirely renounce any critical selection of this kind and say whatever comes into his head, even if he considers it incorrect or irrelevant or nonsensical, and above all if he finds it disagreeable to let himself think about what has occurred to him. So long as this ordinance is carried out we are certain of obtaining the material which will put us on the track of the repressed complexes.

It is true that it is by no means easy to demonstrate the traces of this satanic view of the father in the mental life of the individual. When a boy draws grotesque faces and caricatures, we may no doubt be able to show that he is jeering at his father in them; and when a person of either sex is afraid of robbers and burglars at night, it is not hard to recognize these as split off portions of the father.¹ The animals, too, which appear in children's animal phobias are most often father-substitutes, as were the totem animals of primaeval times. But that the Devil is a duplicate of the father and can act as a substitute for him has not been shown so clearly elsewhere as in the demonological neurosis of this seventeenth-century painter. That is why, at the beginning of this paper, I foretold that a demonological case history of this kind would yield in the form of pure metal material which, in the neuroses of a later epoch (no longer superstitious but hypochondriacal instead) has to be laboriously extracted by analytic work from the ore of free associations and symptoms.² A deeper penetration into the analysis of our painter's illness will probably bring stronger conviction. It is no unusual thing for a man to acquire a melancholic depression and an inhibition in his work as a result of his father's death. When this happens, we conclude that the man had been attached to his father with an especially strong love, and we remember how often a severe melancholia appears as a neurotic form of mourning.

¹ [1910a, 2219]
² [1923d, 4011]
When one really practises analysis one learns all kinds of things besides. For instance: you would not find it at all such a simple matter to deduce from what the patient tells you the experiences he has forgotten and the instinctual impulses he has repressed. He says something to you which at first means as little to you as it does to him. You will have to make up your mind to look at the material which he delivers to you in obedience to the rule in a quite special way: as though it were ore, perhaps, from which its content of precious metal has to be extracted by a particular process. You will be prepared, too, to work over many tons of ore which may contain but little of the valuable material you are in search of. Here we should have a first reason for the prolonged character of the treatment.
[1926e, 4361]
My knowledge of that procedure was reached in the following manner. I have been engaged for many years (with a therapeutic aim in view) in unravelling certain psychopathological structures - hysterical phobias, obsessional ideas, and so on. I have been doing so, in fact, ever since I learnt from an important communication by Josef Breuer that as regards these structures (which are looked on as pathological symptoms) unravelling these coincides with removing them. (Cf. Breuer and Freud, 1895.) If a pathological idea of this sort can be traced back to the elements in the patient's mental life from which it originated, it simultaneously crumbles away and the patient is freed from it. Considering the impotence of our other therapeutic efforts and the puzzling nature of these disorders, I felt tempted to follow the path marked out by Breuer, in spite of every difficulty, till a complete explanation was reached. I shall have on another occasion to report at length upon the form finally taken by this procedure and the results of my labours. It was in the course of these psycho-analytic studies that I came upon dream-interpretation. My patients were pledged to communicate to me every idea or thought that occurred to them in connection with some particular subject; amongst other things they told me their dreams and so taught me that a dream can be inserted into the psychical chain that has to be traced backwards in the memory from a pathological idea. It was then only a short step to treating the dream itself as a symptom and to applying to dreams the method of interpretation that had been worked out for symptoms.

[1900a, 603]

I reproached Irma for not having accepted my solution. I said: 'If you still get pains, it's your own fault.' I might have said this to her in waking life, and I may actually have done so. It was my view at that time (though I have since recognized it as a wrong one) that my task was fulfilled when I had informed a patient of the hidden meaning of his symptoms: I considered that I was not responsible for whether he accepted the solution or not - though this was what success depended on. I owe it to this mistake, which I have now fortunately corrected, that my life was made easier at a time when, in spite of all my inevitable ignorance, I was expected to produce therapeutic successes. - I noticed, however, that the words which I spoke to Irma in the dream showed that I was specially anxious not to be responsible for the pains which she still had. If they were her fault they could not be mine. Could it be that the purpose of the dream lay in this direction?

[1900a, 609]
If within ten years of the publication of this book (which is very far from being an easy one to read) a second edition is called for, this is not due to the interest taken in it by the professional circles to whom my original preface was addressed. My psychiatric colleagues seem to have taken no trouble to overcome the initial bewilderment created by my new approach to dreams. The professional philosophers have become accustomed to polishing off the problems of dream-life (which they treat as a mere appendix to conscious states) in a few sentences - and usually in the same ones; and they have evidently failed to notice that we have something here from which a number of inferences can be drawn that are bound to transform our psychological theories. The attitude adopted by reviewers in the scientific periodicals could only lead one to suppose that my work was doomed to be sunk into complete silence; while the small group of gallant supporters, who practise medical psycho-analysis under my guidance and who follow my example in interpreting dreams and make use of their interpretations in treating neurotics, would never have exhausted the first edition of the book. Thus it is that I feel indebted to a wider circle of educated and curious-minded readers, whose interest has led me to take up once more after nine years this difficult, but in many respects fundamental, work.

¹ See Bleuler's important work, _Affektivität, Suggestibilität, Paranoia_ and C. G. Jung's _Diagnostische Assoziationsstudien_, both published in Zurich in 1906. - [Added 1912:] To-day, in 1912, I am able to retract what is said above as being no longer true. Since it was written, the 'psycho-analytic movement' started by me has become widely extended, and it is constantly growing.

My investigations into the aetiology and psychical mechanism of neurotic illnesses, which I have pursued since 1893, attracted little notice to begin with among my fellow specialists. At length, however, those investigations have met with recognition from a number of medical research workers and have also drawn attention to the psycho-analytic methods of examination and treatment to which I owe my findings. Dr. Wilhelm Stekel, who was one of the first of the colleagues to whom I was able to impart a knowledge of psycho-analysis, and who has himself become familiar with its technique through many years of practice in it, has now undertaken the task of working over one topic in the clinical aspect of these neuroses on the basis of my views and of presenting medical readers with the experiences he has obtained through the psycho-analytic method. If I am glad to take the responsibility for his work in the sense which I have just indicated, I think it is only right to declare explicitly that my direct influence upon the volume on nervous states of anxiety which lies before us has been a very slight one. The observations and all the detailed opinions and interpretations are the author's own. My share has been limited to proposing the use of the term 'anxiety hysteria'.

No one need be surprised at the subjective character of the contribution I propose to make here to the history of the psycho-analytic movement, nor need anyone wonder at the part I play in it. For psycho-analysis is my creation; for ten years I was the only person who concerned himself with it, and all the dissatisfaction which the new phenomenon aroused in my contemporaries has been poured out in the form of criticisms on my head. Although it is a long time now since I was the only psycho-analyst, I consider myself justified in maintaining that even to-day no one can know better than I do what psycho-analysis is, how it differs from other ways of investigating the life of the mind, and precisely what should be called psycho-analysis and what would better be described by some other name. In thus repudiating what seems to me a cool act of usurpation, I am indirectly informing the readers of this _Jahrbuch_ the events that have led to the changes in its editorship and format.

[1900a, 509]

[1907a, 1851]

[1908f, 1994]

[1914d, 2877]
In 1909, in the lecture-room of an American university, I had my first opportunity of speaking in public about psycho-analysis.¹ The occasion was a momentous one for my work, and moved by this thought I then declared that it was not I who had brought psycho-analysis into existence: the credit for this was due to someone else, to Josef Breuer, whose work had been done at a time when I was still a student engaged in passing my examinations (1880-2). Since I gave those lectures, however, some well-disposed friends have suggested to me a doubt whether my gratitude was not expressed too extravagantly on that occasion. In their view I ought to have done as I had previously been accustomed to do: treated Breuer's 'cathartic procedure' as a preliminary stage of psycho-analysis, and represented psycho-analysis itself as beginning with my discarding the hypnotic technique and introducing free associations. It is of no great importance in any case whether the history of psycho-analysis is reckoned as beginning with the cathartic method or with my modification of it; I refer to this uninteresting point merely because certain opponents of psycho-analysis have a habit of occasionally recollecting that after all the art of psycho-analysis was not invented by me, but by Breuer. This only happens, of course, if their views allow them to find something in it deserving attention; if they set no such limits to their rejection of it, psycho-analysis is always without question my work alone. I have never heard that Breuer's great share in psycho-analysis has earned him a proportionate measure of criticism and abuse. As I have long recognized that to stir up contradiction and arouse bitterness is the inevitable fate of psycho-analysis, I have come to the conclusion that I must be the true originator of all that is particularly characteristic in it. I am happy to be able to add that none of the efforts to minimize my part in creating this much-abused analysis have ever come from Breuer himself or could claim any support from him.

The small circle soon expanded, and in the course of the next few years often changed its composition. On the whole I could tell myself that it was hardly inferior, in wealth and variety of talent, to the staff of any clinical teacher one could think of. It included from the beginning the men who were later to play such a considerable, if not always a welcome, part in the history of the psycho-analytic movement. At that time, however, one could not yet guess at these developments. I had every reason to be satisfied, and I think I did everything possible to impart my own knowledge and experience to the others. There were only two inauspicious circumstances which at last estranged me inwardly from the group. I could not succeed in establishing among its members the friendly relations that ought to obtain between men who are all engaged upon the same difficult work; nor was I able to stifle the disputes about priority for which there were so many opportunities under these conditions of work in common. The difficulties in the way of giving instruction in the practice of psycho-analysis, which are quite particularly great and are responsible for much in the present dissensions, were evident already in this private Vienna Psycho-Analytical Society. I myself did not venture to put forward a still unfinished technique and a theory still in the making with an authority which would probably have enabled the others to avoid some wrong turnings and ultimate disasters. The self-reliance of intellectual workers, their early independence of their teacher, is always gratifying from a psychological point of view; but it is only of advantage to science if those workers fulfil certain personal conditions which are none too common. For psycho-analysis in particular a long and severe discipline and training in self-discipline would have been required. In view of the courage displayed by their devotion to a subject so much frowned upon and so poor in prospects, I was disposed to tolerate much among the members to which I should otherwise have made objection. Besides doctors, the circle included others - men of education who had recognized something important in psycho-analysis: writers, painters and so on. My Interpretation of Dreams and my book on jokes, among others, had shown from the beginning that the theories of psycho-analysis cannot be restricted to the medical field, but are capable of application to a variety of other mental sciences.

¹ [1914d, 2878]
In 1907 the situation changed all at once and contrary to all expectations. It appeared that psycho-analysis had unobtrusively awakened interest and gained friends, and that there were even some scientific workers who were ready to acknowledge it. A communication from Bleuler had informed me before this that my works had been studied and made use of in the Burghölzli. In January 1907, the first member of the Zurich clinic came to Vienna - Dr. Eitingon.¹ Other visits followed, which led to an animated exchange of ideas. Finally, on the invitation of C. G. Jung, at that time still assistant physician at the Burghölzli, a first meeting took place at Salzburg in the spring of 1908, which brought together friends of psycho-analysis from Vienna, Zurich and other places. One of the results of this first Psycho-Analytical Congress was the founding of a periodical called the *Jahrbuch für psychoanalytische und psychopathologische Forschungen*, under the direction of Bleuler and Freud and edited by Jung, which first appeared in 1909. This publication gave expression to an intimate co-operation between Vienna and Zurich. [1914d, 2893]

According to the evidence of a colleague who witnessed developments at the Burghölzli, it appears that psycho-analysis awakened interest there very early. In Jung's work on occult phenomena, published in 1902, there was already an allusion to my book on dream-interpretation. From 1903 or 1904, says my informant, psycho-analysis was in the forefront of interest. After personal relations between Vienna and Zurich had been established, an informal society was also started, in the middle of 1907, in the Burghölzli, where the problems of psycho-analysis were discussed at regular meetings. In the alliance between the Vienna and Zurich schools the Swiss were by no means mere recipients. They had already produced very creditable scientific work, the results of which were of service to psycho-analysis. The association experiments started by the Wundt School had been interpreted by them in a psycho-analytic sense, and had proved applicable in unexpected ways. By this means it had become possible to arrive at rapid experimental confirmation of psycho-analytic observations and to demonstrate directly to students certain connections which an analyst would only have been able to tell them about. The first bridge linking up experimental psychology with psycho-analysis had been built. [1914d, 2894]

I will not omit to point out a divergence which was already at that time noticeable in the direction taken by the work of the two schools. As early as in 1897 I had published the analysis of a case of schizophrenia, which however was of a paranoid character, so that the solution of it could not take away from the impression made by Jung's analyses. But to me the important point had been, not so much the possibility of interpreting the symptoms, as the psychical mechanism of the disease, and above all the agreement of this mechanism with that of hysteria, which had already been discovered. At that time no light had yet been thrown on the differences between the two mechanisms. For I was then already aiming at a libido theory of the neuroses, which was to explain all neurotic and psychotic phenomena as proceeding from abnormal vicissitudes of the libido, that is, as diversions from its normal employment. This point of view was missed by the Swiss investigators. As far as I know, even to-day Bleuler maintains the view that the various forms of dementia praecox have an organic causation; and at the Salzburg Congress in 1908 Jung, whose book on this disease had appeared in 1907, supported the toxic theory of its causation, which takes no account of the libido theory, although it is true that it does not rule it out. Later on (1912) he came to grief on this same point, by making too much of the material which he had previously refused to employ. [1914d, 2895]
In the years following 1907, when the schools of Vienna and Zurich were united, psycho-
analysis made the extraordinary surge forward of which the momentum is felt even to-day; this is
shown both by the spread of psycho-analytic literature and by the constant increase in the
number of doctors who are practising or studying it, as well as by the frequency of the attacks
made on it at Congresses and in learned societies. It has penetrated into the most distant lands
and has everywhere not merely startled psychiatrists but commanded the attention of the
educated public and of scientific workers in other fields. Havelock Ellis, who has followed its
development with sympathy though without ever calling himself an adherent, wrote in 1911 in a
report for the Australasian Medical Congress: 'Freud's psycho-analysis is now championed and
carried out not only in Austria and in Switzerland, but in the United States, in England, in India, in
Canada, and, I doubt not, in Australasia.'¹ A physician from Chile (probably a German) spoke at
the International Congress at Buenos Aires in 1910 in support of the existence of infantile
sexuality and commended highly the effects of psycho-analytic therapy on obsessional
symptoms.² An English neurologist in Central India (Berkeley-Hill) informed me, through a
distinguished colleague who was visiting Europe, that the analyses of Mohammedan Indians
which he had carried out showed that the aetiology of their neuroses was no different from what
we find in our European patients.

The introduction of psycho-analysis into North America was accompanied by very special
marks of honour. In the autumn of 1909, Stanley Hall, the President of Clark University,
Worcester, Massachusetts, invited Jung and myself to take part in the celebration of the twentieth
anniversary of the foundation of the University by giving a number of lectures in German. To our
great surprise, we found the members of that small but highly esteemed University for the study
of education and philosophy so unprejudiced that they were acquainted with all the literature of
psycho-analysis and had given it a place in their lectures to students. In prudish America it was
possible, in academic circles at least, to discuss freely and scientifically everything that in
ordinary life is regarded as objectionable. The five lectures which I improvised in Worcester
appeared in an English translation in the *American Journal of Psychology*, and were shortly
afterwards published in German under the title *Über Psychoanalyse*. Jung read a paper on
diagnostic association experiments and another on conflicts in the mind of the child. We were
rewarded with the honorary degree of Doctor of Laws. During that week of celebrations at
Worcester, psycho-analysis was represented by five men: besides Jung and myself, there were
Ferenczi, who had joined me for the journey, Ernest Jones, then at the University of Toronto
(Canada) and now in London, and A. A. Brill, who was already practising psycho-analysis in New
York.

For the further spread of this movement Brill and Jones deserve the greatest credit: in their
writings they drew their countrymen's attention with unremitting assiduity to the easily observable
fundamental facts of everyday life, of dreams and neurosis. Brill has contributed still further to this
effect by his medical practice and by his translations of my works, and Jones by his instructive
lectures and by his skill in debate at congresses in America.¹ The absence of any deep-rooted
scientific tradition in America and the much less stringent rule of official authority there have been
of decided advantage to the impetus given by Stanley Hall. It was characteristic of that country
that from the beginning professors and superintendents of mental hospitals showed as much
interest in analysis as independent practitioners. But it is clear that precisely for this reason the
ancient centres of culture, where the greatest resistance has been displayed, must be the scene
of the decisive struggle over psycho-analysis.
Among European countries France has hitherto shown itself the least disposed to welcome psycho-analysis, although useful work in French by A. Maeder of Zurich has provided easy access to its theories. The first indications of sympathy came from the provinces: Morichau-Beauchant (Poitiers) was the first Frenchman to adhere publicly to psycho-analysis. Régis and Hesnard (Bordeaux) have recently attempted to disperse the prejudices of their countrymen against the new ideas by an exhaustive presentation, which, however, is not always understanding and takes special exception to symbolism. In Paris itself, a conviction still seems to reign (to which Janet himself gave eloquent expression at the Congress in London in 1913) that everything good in psycho-analysis is a repetition of Janet's views with insignificant modifications, and that everything else in it is bad. At this Congress itself, indeed, Janet had to submit to a number of corrections by Ernest Jones, who was able to point out to him his insufficient knowledge of the subject. Even though we deny his claims, however, we cannot forget the value of his work on the psychology of the neuroses.

[1914d, 2898]

In Italy, after several promising starts, no real interest was forthcoming. To Holland analysis found early access through personal connections: Van Emden, Van Ophuijsen, Van Renterghem (Freud en zijn School) and the two Stärckes are actively occupied with it both in practice and theory.¹ In scientific circles in England interest in analysis has developed very slowly, but there is reason to expect that the sense for the practical and the passionate love of justice in the English will ensure it a brilliant future there.

[1914d, 2899]

In Sweden, P. Bjerre, who succeeded to Wetterstrand's practice, gave up hypnotic suggestion, at least for the time, in favour of analytic treatment. R. Vogt (Christiania) had already shown an appreciation of psycho-analysis in his Psykiatriens grundtraek, published in 1907; so that the first text-book of psychiatry to refer to psycho-analysis was written in Norwegian. In Russia, psycho-analysis has become generally known and has spread widely; almost all my writings, as well as those of other adherents of analysis, have been translated into Russian. But a really penetrating comprehension of analytic theories has not yet been evinced in Russia; so that the contributions of Russian physicians are at present not very notable. The only trained analyst there is M. Wulff who practises in Odessa. It is principally due to L. Jekels that psycho-analysis has been introduced to Polish scientific and literary circles. Hungary, so near geographically to Austria, and so far from it scientifically, has produced only one collaborator, S. Ferenczi, but one that indeed outweighs a whole society.²

[1914d, 2899]

¹ The first official recognition of dream-interpretation and psycho-analysis in Europe was extended to them by the psychiatrist Jelgersma, Rector of the University of Leyden, in his rectorial address on February 9, 1914.

[1914d, 2899]
It is not my intention, of course, to bring this account, written in 1914, 'up to date' [in English in the original]. I will only add a few remarks to indicate how the picture has altered in the interval, which includes the World War. In Germany a gradual infiltration of analytic theories into clinical psychiatry is taking place, though this is not always admitted. The French translations of my works that have been appearing during the last few years have finally aroused a keen interest in psycho-analysis even in France, though for the moment this is more active in literary circles than in scientific ones. In Italy M. Levi Bianchini (of Nocera Superiore) and Edoardo Weiss (of Trieste) have come forward as translators and champions of psycho-analysis (cf. the Biblioteca Psicoanalitica Italiana). A collected edition of my works which is appearing in Madrid (translated by Lopez Ballesteros) is evidence of the lively interest taken in it in Spanish-speaking countries (Prof. H. Delgado in Lima). As regards England, the prophecy which I have made above seems to be in steady course of fulfilment; a special centre for the study of analysis has been formed at Calcutta in British India. In North America it is still true that the depth of understanding of analysis does not keep pace with its popularity. In Russia, since the Revolution, psycho-analytic work has begun afresh at several centres. In Poland the Polska Biblioteka Psychoanalytyczna is now appearing. In Hungary a brilliant analytic school is flourishing under the leadership of Ferenczi. (Cf. the Festschrift issued in honour of his fiftieth birthday.) At the present time the Scandinavian countries are still the least receptive.

As regards the position of psycho-analysis in Germany, it can only be said that it forms the centre-point of scientific discussions and provokes the most emphatic expressions of disagreement both among doctors and laymen; these are not yet at an end, but are constantly flaring up again, sometimes with greater intensity. No official educational bodies there have up to now recognized psycho-analysis. Successful practitioners who employ it are few; only a few institutions, such as Binswanger's in Kreuzlingen (on Swiss soil) and Marcinowski's in Holstein, have opened their doors to it. One of the most prominent representatives of analysis, Karl Abraham, at one time an assistant of Bleuler's, maintains himself in the critical atmosphere of Berlin. One might wonder that this state of things should have continued unaltered for several years if one did not know that the account I have given only represents external appearances. Too much significance should not be attributed to rejection by the official representatives of science and heads of institutions, and by the followers dependent on them. It is natural that its opponents should give loud expression to their views, while its intimidated adherents keep silence. Some of the latter, whose first contributions to analysis raised favourable expectations, have later withdrawn from the movement under the pressure of circumstances. The movement itself advances surely though silently; it is constantly gaining new adherents among psychiatrists and laymen, it brings in a growing stream of new readers for psycho-analytic literature and for that very reason drives its opponents to ever more violent defensive efforts. At least a dozen times in recent years, in reports of the proceedings of certain congresses and scientific bodies or in reviews of certain publications, I have read that now psycho-analysis is dead, defeated and disposed of once and for all. The best answer to all this would be in the terms of Mark Twain's telegram to the newspaper which had falsely published news of his death: 'Report of my death greatly exaggerated.' After each of these obituaries psycho-analysis regularly gained new adherents and co-workers or acquired new channels of publicity. After all, being declared dead was an advance on being buried in silence.

The first example of an application of the analytic mode of thought to the problems of aesthetics was contained in my book on jokes. Everything beyond this is still awaiting workers, who may expect a particularly rich harvest in this field. We are entirely without the co-operation of specialists in all these branches of knowledge, and in order to attract them Hanns Sachs, in 1912, founded the periodical Imago which is edited by him and Rank. A beginning has been made by Hitschmann and von Winterstein in throwing psycho-analytic light on philosophical systems and personalities, and here there is much need both of extended and of deeper investigation.
Two years after the first private Congress of psycho-analysts the second took place, this time at Nuremberg, in March, 1910. In the interval between them, influenced partly by the favourable reception in America, by the increasing hostility in German-speaking countries, and by the unforeseen acquisition of support from Zurich, I had conceived a project which with the help of my friend Ferenczi I carried out at this second Congress. What I had in mind was to organize the psycho-analytic movement, to transfer its centre to Zurich and to give it a chief who would look after its future career. As this scheme has met with much opposition among the adherents of psycho-analysis, I will set out my reasons for it in some detail. I hope that these will justify me, even though it turns out that what I did was in fact not very wise.

I judged that the new movement's association with Vienna was no recommendation but rather a handicap to it. A place in the heart of Europe like Zurich, where an academic teacher had opened the doors of his institution to psycho-analysis, seemed to me much more promising. I also took it that a second handicap lay in my own person, opinion about which was too much confused by the liking or hatred of the different sides: I was either compared to Columbus, Darwin and Kepler, or abused as a general paralytic. I wished, therefore, to withdraw into the background both myself and the city where psycho-analysis first saw the light. Moreover, I was no longer young; I saw that there was a long road ahead, and I felt oppressed by the thought that the duty of being a leader should fall to me so late in life. Yet I felt that there must be someone at the head. I knew only too well the pitfalls that lay in wait for anyone who became engaged in analysis, and hoped that many of them might be avoided if an authority could be set up who would be prepared to instruct and admonish. This position had at first been occupied by myself, owing to my fifteen years' start in experience which nothing could counterbalance. I felt the need of transferring this authority to a younger man, who would then as a matter of course take my place after my death. This man could only be C. G. Jung, since Bleuler was my contemporary in age; in favour of Jung were his exceptional talents, the contributions he had already made to psycho-analysis, his independent position and the impression of assured energy which his personality conveyed. In addition to this, he seemed ready to enter into a friendly relationship with me and for my sake to give up certain racial prejudices which he had previously permitted himself. I had no inkling at that time that in spite of all these advantages the choice was a most unfortunate one, that I had lighted upon a person who was incapable of tolerating the authority of another, but who was still less capable of wielding it himself, and whose energies were relentlessly devoted to the furtherance of his own interests.

I considered it necessary to form an official association because I feared the abuses to which psycho-analysis would be subjected as soon as it became popular. There should be some headquarters whose business it would be to declare: 'All this nonsense is nothing to do with analysis; this is not psycho-analysis.' At the sessions of the local groups (which together would constitute the international association) instruction should be given as to how psycho-analysis was to be conducted and doctors should be trained, whose activities would then receive a kind of guarantee. Moreover, it seemed to me desirable, since official science had pronounced its solemn ban upon psycho-analysis and had declared a boycott against doctors and institutions practising it, that the adherents of psycho-analysis should come together for friendly communication with one another and mutual support.
This and nothing else was what I hoped to achieve by founding the 'International Psycho-Analytical Association'. It was probably more than could be attained. Just as my opponents were to discover that it was not possible to stem the tide of the new movement, so I was to find that it would not proceed in the direction I wished to mark out for it. The proposals made by Ferenczi in Nuremberg were adopted, it is true; Jung was elected President and made Riklin his Secretary; the publication of a bulletin which should link the Central Executive with the local groups was resolved upon. The object of the Association was declared to be 'to foster and further the science of psycho-analysis founded by Freud, both as pure psychology and in its application to medicine and the mental sciences; and to promote mutual support among its members in all endeavours to acquire and to spread psycho-analytic knowledge'. The scheme was strongly opposed only by the Vienna group. Adler, in great excitement, expressed the fear that 'censorship and restrictions on scientific freedom' were intended. Finally the Viennese gave in, after having secured that the seat of the Association should be not Zurich, but the place of residence of the President for the time being, who was to be elected for two years. [1914d, 2908]

At this Congress three local groups were constituted: one in Berlin, under the chairmanship of Abraham; one in Zurich, whose head had become the President of the whole Association; and one in Vienna, the direction of which I made over to Adler. A fourth group, in Budapest, could not be formed until later. Bleuler had not attended the Congress on account of illness, and later he evinced hesitation about joining the Association on general grounds; he let himself be persuaded to do so, it is true, after a personal conversation with me, but resigned again shortly afterwards as a result of disagreements in Zurich. This severed the connection between the Zurich local group and the Burghölzli institution. [1914d, 2908]

One outcome of the Nuremberg Congress was the founding of the Zentralblatt für Psychoanalyse [Central Journal for Psycho-analysis], for which purpose Adler and Stekel joined forces. It was obviously intended originally to represent the Opposition: it was meant to win back for Vienna the hegemony threatened by the election of Jung. But when the two founders of the journal, labouring under the difficulties of finding a publisher, assured me of their peaceful intentions and as a guarantee of their sincerity gave me a right of veto, I accepted the direction of it and worked energetically for the new organ; its first number appeared in September, 1910. [1914d, 2908]

I will now continue the story of the Psycho-Analytical Congresses. The third Congress took place in September, 1911, at Weimar, and was even more successful than the previous ones in its general atmosphere and scientific interest. J. J. Putnam, who was present on this occasion, declared afterwards in America how much pleasure it had given him and expressed his respect for 'the mental attitude' of those who attended it, quoting some words I was said to have used in reference to them: 'They have learnt to tolerate a bit of truth.' (Putnam 1912.) It is a fact that no one who had attended scientific congresses could have failed to carry away a favourable impression of the Psycho-Analytical Association. I myself had conducted the first two Congresses and I had allowed every speaker time for his paper, leaving discussions to take place in private afterwards among the members. Jung, as President, took over the direction at Weimar and reintroduced formal discussions after each paper, which, however, did not give rise to any difficulties as yet. [1914d, 2909]
A very different picture was presented by the fourth Congress, held in Munich two years later, in September, 1913. It is still fresh in the memory of all who were present. It was conducted by Jung in a disagreeable and incorrect manner; the speakers were restricted in time and the discussions overwhelmed the papers. By a malicious stroke of chance it happened that that evil genius, Hoche, had settled in the very building in which the meetings were held. Hoche would have had no difficulty in convincing himself of the nonsense which the analysts made of his description of them as a fanatical sect blindly submissive to their leader. The fatiguing and unedifying proceedings ended in the re-election of Jung to the Presidency of the International Psycho-Analytical Association, which he accepted, although two-fifths of those present refused him their support. We dispersed without any desire to meet again.

At about the time of this Congress the strength of the International Psycho-Analytical Association was as follows. The local groups in Vienna, Berlin and Zurich had been formed at the Congress in Nuremberg as early as 1910. In May, 1911, a group at Munich under the chairmanship of Dr. L. Seif was added. In the same year the first American local group was formed under the chairmanship of A. A. Brill, with the name 'The New York Psychoanalytic Society'. At the Weimar Congress the foundation of a second American group was authorized; it came into existence during the following year under the name of 'The American Psychoanalytic Association'; and included members from Canada and the whole of America; Putnam was elected President and Ernest Jones Secretary. Shortly before the Congress in Munich in 1913, the Budapest local group was formed under the chairmanship of Ferenczi. Soon after this the first English group was formed by Ernest Jones, who had returned to London. The membership of these local groups, of which there were now eight, naturally affords no means of estimating the number of unorganized students and adherents of psycho-analysis.
The development of the periodicals devoted to psycho-analysis also deserves a brief mention. The first of these was a series of monographs entitled Schriften zur angewandten Seelenkunde [‘Papers on Applied Mental Science’] which have appeared irregularly since 1907 and now number fifteen issues. (The publisher was to begin with Heller in Vienna and later F. Deuticke.) They comprise works by Freud (Nos. 1 and 7), Riklin, Jung, Abraham (Nos. 4 and 11), Rank (Nos. 5 and 13), Sadger, Pfister, Max Graf, Jones (Nos. 10 and 14), Storfer and von Hug-Hellmuth.¹ When the journal Imago (which will be referred to shortly) was founded, this form of publication ceased to have quite the same value. After the meeting at Salzburg in 1908, the Jahrbuch für psychoanalytische und psychopathologische Forschungen [Yearbook for Psycho-Analytic and Psychopathological Researches] was founded, which appeared for two years under Jung's editorship and has now re-emerged, under two new editors and with a slight change in its title, as the Jahrbuch der Psychoanalyse [Yearbook of Psycho-Analysis].² It is no longer intended to be, as it has been in recent years, merely repository for the publication of self-contained works. Instead it will endeavour, through the activity of its editors, to fulfil the aim of recording all the work done and all the advances made in the sphere of psycho-analysis.² The Zentralblatt für Psychoanalyse, which, as I have already said, was started by Adler and Stekel after the foundation of the International Psycho-Analytical Association in Nuremberg in 1910, has, during its short existence, had a stormy career. As early as in the tenth number of the first volume an announcement appeared on the front page that, on account of scientific differences of opinion with the director, Dr. Alfred Adler had decided to withdraw voluntarily from the editorship. After this Dr. Stekel remained the only editor (from the summer of 1911). At the Weimar Congress the Zentralblatt was raised to the position of official organ of the International Association and made available to all members in return for an increase in the annual subscription. From the third number of the second volume onwards (winter, 1912) Stekel became solely responsible for its contents. His behaviour, of which it is not easy to publish an account, had compelled me to resign the direction and hurriedly to establish a new organ for psycho-analysis - the Internationale Zeitschrift für ärztliche Psychoanalyse [International Journal for Medical Psycho-Analysis]. The combined efforts of almost all our workers and of Hugo Heller, the new publisher, resulted in the appearance of the first number in January, 1913, whereupon it took the place of the Zentralblatt as official organ of the International Psycho-Analytical Association.

Meanwhile, early in 1912, a new periodical, Imago (published by Heller), designed exclusively for the application of psycho-analysis to the mental sciences, was founded by Dr. Hanns Sachs and Dr. Otto Rank. Imago is now in the middle of its third volume and is read with interest by a continually increasing number of subscribers, some of whom have little connection with medical analysis.¹

Apart from these four periodical publications (Schriften zur angewandten Seelenkunde, Jahrbuch, Zeitschrift and Imago) other German and foreign journals publish works which may claim a place in the literature of psycho-analysis. The Journal of Abnormal Psychology, directed by Morton Prince, usually contains so many good analytic contributions that it must be regarded as the principal representative of analytic literature in America. In the winter of 1913, White and Jelliffe in New York started a new periodical (The Psychoanalytic Revue) which is devoted exclusively to psycho-analysis, no doubt bearing in mind the fact that most medical men in America who are interested in analysis find the German language a difficulty.²
I must now mention two secessions which have taken place among the adherents of psychoanalysis; the first occurred between the founding of the Association in 1910 and the Weimar Congress in 1911; the second took place after this and became manifest at Munich in 1913. The disappointment that they caused me might have been averted if I had paid more attention to the reactions of patients under analytic treatment. I knew very well of course that anyone may take to flight at his first approach to the unwelcome truths of analysis; I had always myself maintained that everyone’s understanding of it is limited by his own repressions (or rather, by the resistances which sustain them) so that he cannot go beyond a particular point in his relation to analysis. But I had not expected that anyone who had reached a certain depth in his understanding of analysis could renounce that understanding and lose it. And yet daily experience with patients had shown that total rejection of analytic knowledge may result whenever a specially strong resistance arises at any depth in the mind; one may have succeeded in laboriously bringing a patient to grasp some parts of analytic knowledge and to handle them like possessions of his own, and yet one may see him, under the domination of the very next resistance, throw all he has learnt to the winds and stand on the defensive as he did in the days when he was a carefree beginner. I had to learn that the very same thing can happen with psycho-analysts as with patients in analysis.

¹ [Footnote added 1924:] The publication of these two periodicals was transferred in 1919 to the Internationaler Psychoanalytischer Verlag [the International Psycho-Analytical Publishing House]. At the present time (1923) they are both in their ninth volume. (Actually, Internationale Zeitschrift is in the eleventh and Imago in the twelfth year of its existence, but, in consequence of events during the war, Volume IV of the Zeitschrift covered more than one year, i.e. the years 1916-18, and Volume V of Imago the years 1917-18.) With the beginning of Volume VI the word ‘ärztliche’ ['medical'] was dropped from the title of the Internationale Zeitschrift.

² [Footnote added 1924:] In 1920 Ernest Jones undertook the founding of The International Journal of Psycho-Analysis, intended for readers in England and America.

It is no easy or enviable task to write the history of these two secessions, partly because I am without any strong personal motive for doing so - I had not expected gratitude nor am I revengeful to any effective degree - and partly because I know that by doing so I shall lay myself open to the invectives of my not too scrupulous opponents and offer the enemies of analysis the spectacle they so heartily desire - of 'the psycho-analysts tearing one another limb from limb'. After exercising so much self-restraint in not coming to blows with opponents outside of analysis, I now see myself compelled to take up arms against its former followers or people who still like to call themselves its followers. I have no choice in the matter, however; only indolence or cowardice could lead one to keep silence, and silence would cause more harm than a frank revelation of the harms that already exist. Anyone who has followed the growth of other scientific movements will know that the same upheavals and dissensions commonly occur in them as well. It may be that elsewhere they are more carefully concealed; but psycho-analysis, which repudiates so many conventional ideals, is more honest in these matters too.
The first task confronting psycho-analysis was to explain the neuroses; it used the two facts of resistance and transference as starting-points, and, taking into consideration the third fact of amnesia, accounted for them with its theories of repression, of the sexual motive forces in neurosis and of the unconscious. Psycho-analysis has never claimed to provide a complete theory of human mentality in general, but only expected that what it offered should be applied to supplement and correct the knowledge acquired by other means. Adler's theory, however, goes far beyond this point; it seeks at one stroke to explain the behaviour and character of human beings as well as their neurotic and psychotic illnesses. It is actually more suited to any other field than that of neurosis, although for reasons connected with the history of its development it still places this in the foreground. For many years I had opportunities of studying Dr. Adler and have never refused to recognize his unusual ability, combined with a particularly speculative disposition. As an instance of the 'persecution' to which he asserts he has been subjected by me, I can point to the fact that after the Association was founded I made over to him the leadership of the Vienna group. It was not until urgent demands were put forward by all the members of the society that I let myself be persuaded to take the chair again at its scientific meetings. When I perceived how little gift Adler had precisely for judging unconscious material, my view changed to an expectation that he would succeed in discovering the connections of psycho-analysis with psychology and with the biological foundations of instinctual processes - an expectation which was in some sense justified by the valuable work he had done on 'organ-inferiority'. And he did in fact effect something of the kind; but his work conveys an impression 'as if' - to speak in his own 'jargon' - it was intended to prove that psycho-analysis was wrong in everything and that it had only attributed so much importance to sexual motive forces because of its credulity in accepting the assertions of neurotics. I may even speak publicly of the personal motive for his work, since he himself announced it in the presence of a small circle of members of the Vienna group: - 'Do you think it gives me such great pleasure to stand in your shadow my whole life long?' To be sure, I see nothing reprehensible in a younger man freely admitting his ambition, which one would in any case guess was among the incentives for his work. But even though a man is dominated by a motive of this kind he should know how to avoid being what the English, with their fine social tact, call 'unfair' - which in German can only be expressed by a much cruder word. How little Adler has succeeded in this is shown by the profusion of petty outbursts of malice which disfigure his writings and by the indications they contain of an uncontrolled craving for priority. At the Vienna Psycho-Analytical Society we once actually heard him claim priority for the conception of the 'unity of the neuroses' and for the 'dynamic view' of them. This came as a great surprise to me, for I had always believed that these two principles were stated by me before I ever made Adler's acquaintance.

[1914d, 2913]

This striving of Adler's for a place in the sun has, however, had one result which is bound to be beneficial to psycho-analysis. When, after irreconcilable scientific disagreements had come to light, I was obliged to bring about Adler's resignation from the editorship of the Zentralblatt, he left the Vienna society as well, and founded a new one, which at first adopted the tasteful name of 'The Society for Free Psycho-Analysis' ['Verein für freie Psychoanalyse']. But outsiders who are unconnected with analysis are evidently as unskilful in appreciating the differences between the views of two psycho-analysts as we Europeans are in detecting the differences between two Chinese faces. 'Free' psycho-analysis remained in the shadow of 'official', 'orthodox' psycho-analysis and was treated merely as an appendage to the latter. Then Adler took a step for which we are thankful; he severed all connection with psycho-analysis, and gave his theory the name of 'Individual Psychology'. There is room enough on God's earth, and anyone who can has a perfect right to potter about on it without being prevented; but it is not a desirable thing for people who have ceased to understand one another and have grown incompatible with one another to remain under the same roof. Adler's 'Individual Psychology' is now one of the many schools of psychology which are adverse to psycho-analysis and its further development is no concern of ours.

[1914d, 2914]
Adler's secession took place before the Weimar Congress in 1911; after that date the Swiss began theirs. The first signs of it, curiously enough, were a few remarks of Riklin's in some popular articles appearing in Swiss publications, so that the general public learned earlier than those most intimately concerned in the subject that psycho-analysis had got the better of some regrettable errors which had previously discredited it. In 1912 Jung boasted, in a letter from America, that his modifications of psycho-analysis had overcome the resistances of many people who had hitherto refused to have anything to do with it. I replied that that was nothing to boast of, and that the more he sacrificed of the hard-won truths of psycho-analysis the more would he see resistances vanishing. This modification which the Swiss were so proud of introducing was again nothing else but a pushing into the background of the sexual factor in psycho-analytic theory. I confess that from the beginning I regarded this 'advance' as too far-reaching an adjustment to the demands of actuality.

[1914d, 2921]

Later History of Psycho-Analysis. - Psycho-analysis was carried approximately thus far by the work of the writer of this article, who for more than ten years was its sole representative. In 1906 the Swiss psychiatrists Bleuler and C. G. Jung began to play a lively part in analysis; in 1907 a first conference of its supporters took place at Salzburg; and the young science soon found itself the centre of interest both among psychiatrists and laymen. Its reception in Germany, with her morbid craving for authority, was not precisely to the credit of German science and moved even so cool a partisan as Bleuler to an energetic protest. Yet no condemnation or dismissal at official congresses served to hold up the internal growth or external expansion of psycho-analysis. In the course of the next ten years it extended far beyond the frontiers of Europe and became especially popular in the United States of America, and this was due in no small degree to the advocacy and collaboration of Putnam (Boston), Ernest Jones (Toronto; later London), Flournoy (Geneva), Ferenczi (Budapest), Abraham (Berlin), and many others besides. The anathema which was imposed upon psycho-analysis led its supporters to combine in an international organization which in the present year (1922) is holding its eighth private Congress in Berlin and now includes local groups in Vienna, Budapest, Berlin, Holland, Zurich, London, New York, Calcutta and Moscow. This development was not interrupted even by the World War. In 1918-19 Dr. Anton von Freund of Budapest founded the Internationaler Psychoanalytischer Verlag, which publishes journals and books concerned with psycho-analysis, and in 1920 Dr. M. Eitingon opened in Berlin the first psycho-analytic clinic for the treatment of neurotics without private means. Translations of the writer's principal works, which are now in preparation, into French, Italian and Spanish, testify to a growing interest in psycho-analysis in the Latin world as well.

[1923a, 3924]
When, during his last years, he came to know psycho-analysis, it seemed to him to promise the fulfilment of his two great wishes. He set himself the task of helping the masses by psycho-analysis and of making use of the therapeutic effects of that medical technique, which had hitherto only been at the service of the rich, in order to mitigate the neurotic suffering of the poor. Since the State took no heed of the neuroses of the common people, since hospital clinics for the most part rejected psycho-analytic therapy without being able to offer any substitute for it, and since the few psycho-analytic physicians, tied by the necessity for maintaining themselves, were unequal to such a gigantic task, Anton von Freund sought, by his private initiative, to open a path for every one towards the fulfilment of this important social duty. During the years of the war he had collected what was then the very considerable sum of one and a half million kronen for humanitarian purposes in the city of Budapest. With the concurrence of Dr Stephan von Bárczy, the then Burgomaster, he assigned this sum for the foundation of a psycho-analytic Institute in Budapest, in which analysis was to be practised, taught and made accessible to the people. It was intended to train a considerable number of physicians in this Institute who would then receive an honorarium from it for the treatment of poor neurotics in an out-patient clinic. The Institute, furthermore, was to be a centre for further scientific research in analysis. Dr. Ferenczi was to be the scientific head of the Institute; von Freund himself was to undertake its organization and finances. The founder handed over a relatively smaller sum to Professor Freud for the foundation of an international psycho-analytic publishing house. But,

None the less, the example which von Freund sought to set has already had its effect. A few weeks after his death, thanks to the energy and liberality of Dr. Max Eitingon, the first psycho-analytical out-patients' clinic has been opened in Berlin. Thus von Freund's work is carried on, though he himself can never be replaced or forgotten.

The editor of this series must feel a special satisfaction in being able to issue as its opening volume this collection of the psycho-analytical writings of Professor James J. Putnam, the distinguished neurologist of Harvard University. Professor Putnam, who died in 1918 at the age of seventy-two, was not only the first American to interest himself in psycho-analysis, but soon became its most decided supporter and its most influential representative in America. In consequence of the established reputation which he had gained through his activities as a teacher, as well as through his important work in the domain of organic nervous disease, and thanks to the universal respect which his personality enjoyed, he was able to do perhaps more than anyone for the spread of psycho-analysis in his own country, and was able to protect it from aspersions which, on the other side of the Atlantic no less than this, would inevitably have been cast upon it. But all such reproaches were bound to be silenced when a man of Putnam's lofty ethical standards and moral rectitude had ranged himself among the supporters of the new science and of the therapeutics based upon it.

The general hostility, however, did not succeed in preventing psycho-analysis from continuous expansion during the next decade in two directions: on the map, for interest in it was constantly cropping up in new countries, and in the field of the mental sciences, for it was constantly finding applications in new branches of knowledge. In 1909 President G. Stanley Hall invited Freud and Jung to give a series of lectures at Clark University in Worcester, Mass., of which he was the head and where they were given a friendly reception. Since then psycho-analysis has remained popular in America, although precisely in that country its name has been coupled with much superficiality and some abuses. As early as in 1911, Havelock Ellis was able to report that analysis was studied and practised, not only in Austria and Switzerland, but also in the United States, in England, India, Canada, and, no doubt, in Australia too.
It was in this period of struggle and of first blossoming, moreover, that the periodicals devoted exclusively to psycho-analysis were inaugurated. These were the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* (1909-1914), directed by Bleuler and Freud and edited by Jung, which ceased publication at the outbreak of the World War, the *Zentralblatt für Psychoanalyse* (1911), edited by Adler and Stekel, which was soon replaced by the *Internationale Zeitschrift für Psychoanalyse* (1913, to-day in its tenth volume); further, since 1912, *Imago*, founded by Rank and Sachs, a periodical for the application of psycho-analysis to the mental sciences. The great interest taken in the subject by Anglo-American doctors was shown in 1913 by the founding of the still active *Psycho-Analytic Revue* by White and Jelliffe. Later, in 1920, *The International Journal of Psycho-Analysis*, intended specially for readers in England, made its appearance under the editorship of Ernest Jones. The Internationaler Psychoanalytischer Verlag and the corresponding English undertaking, The International Psycho-Analytical Press, brought out a continuous series of analytic publications under the name of the Internationale Psychoanalytische Bibliothek (International Psycho-Analytical Library). The literature of psycho-analysis is, of course, not to be found only in these periodicals, which are for the most part supported by psycho-analytic societies; it appears far and wide in a great number of places, in scientific and in literary publications. Among the periodicals of the Latin world which pay special attention to psycho-analysis the *Rivista de Psiquiatria*, edited by H. Delgado in Lima (Peru), may be specially mentioned.

An essential difference between this second decade of psycho-analysis and the first lay in the fact that the present writer was no longer its sole representative. A constantly growing circle of pupils and followers had collected around him, who devoted themselves first to the diffusion of the theories of psycho-analysis and then extended them, supplemented them and carried them deeper. In the course of years, several of these supporters, as was inevitable, seceded, took their own paths, or turned themselves into an opposition which seemed to threaten the continuity of the development of psycho-analysis. Between 1911 and 1913 C. G. Jung in Zurich and Alfred Adler in Vienna produced some stir by their attempts at giving new interpretations to the facts of analysis and their efforts at a diversion from the analytic standpoint. But it soon appeared that these secessions had effected no lasting damage. What temporary success they achieved was easily accounted for by the readiness of the mass of people to have themselves set free from the pressure of the demands of psycho-analysis by whatever path might be opened to them. The great majority of co-workers remained firm and continued their work along the lines indicated to them. We shall come on their names repeatedly in the short account below of the findings of psycho-analysis in the many and various fields of its application.

The forms in which the resistance to psycho-analysis found expression need not now be considered. It is enough to say that the struggle over this innovation is by no means at an end, though it is already possible to see what direction it will take. Its opponents have not succeeded in suppressing the movement. Psycho-analysis, of which twenty years ago I was the only spokesman, has since attracted the support of numerous valuable and active workers, medical and non-medical, who make use of it as a procedure for the treatment of nervous diseases, as a method of psychological research and as an auxiliary instrument for scientific work in the most various departments of intellectual life. In the following pages our interest will be directed only to the motives of the resistance to psycho-analysis, with particular stress upon the composite character of that resistance and upon the differing amount of weight carried by its components.
Ferenczi has repeatedly played a part, too, in the external affairs of psycho-analysis. His appearance at the Second Analytical Congress, at Nuremberg in 1910, will be remembered, where he proposed and helped to bring about the foundation of an International Psycho-Analytical Association as a means of defence against the contempt with which analysis was treated by official Medicine. At the Fifth Analytical Congress, at Budapest, in September, 1918, he was elected President of the Association. He appointed Anton von Freund as Secretary; and there is no doubt that the combined energy of the two men, together with Freund's generous schemes of endowment, would have made Budapest the analytic capital of Europe, had not political catastrophes and personal tragedy put a merciless end to these fair hopes. Freund fell ill and died in January, 1920. In view of Hungary's isolation from contact with the rest of the world, Ferenczi had resigned his position in October, 1919, and had transferred the Presidency of the International Association to Ernest Jones in London. For the duration of the Soviet Republic in Hungary Ferenczi had been allotted the functions of a University teacher, and his lectures had attracted crowded audiences. The Branch Society, which he had founded in 1913,¹ survived every storm and, under his guidance, became a centre of intense and productive work and was distinguished by an accumulation of abilities such as were exhibited in combination by no other Branch Society. Ferenczi, who, as a middle child in a large family, had to struggle with a powerful brother complex, had, under the influence of analysis, become an irreproachable elder brother, a kindly teacher and promoter of young talent.

[1923i, 4163]

My friend Max Eitingon, who created the Berlin Psycho-Analytical Policlinic and has hitherto supported it out of his own resources, has in the following pages made public his reasons for founding it and has also given an account of the Institute's organization and functions. I can only add to what he has written my wish that individuals or societies may be found elsewhere to follow Eitingon's example and bring similar institutions into existence. If psycho-analysis, alongside of its scientific significance, has a value as a therapeutic procedure, if it is capable of giving help to sufferers in their struggle to fulfil the demands of civilization, this help should be accessible as well to the great multitude who are too poor themselves to repay an analyst for his laborious work. This seems to be a social necessity particularly in our times, when the intellectual strata of the population, which are especially prone to neurosis, are sinking irresistibly into poverty. Institutes such as the Berlin Policlinic are also alone in a position to overcome the difficulties which otherwise stand in the way of thorough instruction in psycho-analysis. They make possible the education of a considerable number of trained analysts, whose activity must be regarded as the sole possible protection against injury to patients by ignorant and unqualified persons, whether they are laymen or doctors.

[1923g, 4175]

Dr. Otto Rank has acted as editor of this journal ever since its foundation in 1913, even though it is only since 1920 that he has been named on its title-page as sole editor. During his period of military service in the War, his place was taken by Dr. Hanns Sachs, who was at that time in Vienna. Since the beginning of the current volume Dr. S. Ferenczi has also had a share in the editing.

[1924h, 4182]

At Easter, 1924, Dr. Rank accepted an invitation which took him to New York. On his return home he announced that he had decided to transfer his activity as a teaching and practising analyst to America - at least for a part of the year. Thus it became necessary to place the editorship of the Zeitschrift in other hands. It is not within the rights of the Director to give public expression to his opinion of the level and achievements of this journal. No one who is inclined to appreciate them should overlook or forget how much of its success is due to the tireless devotion and exemplary work of the retiring editor.

[1924h, 4182]
Dr. Rank’s place will now be taken by Dr. S. Radó of Berlin. He will be supported as advisers and collaborators by Dr. M. Eitingon (Berlin) and Dr. S. Ferenczi (Budapest). All communications and contributions for the editor should be addressed to Dr. Sándor Radó, Berlin-Schöneberg, Am Park, 20. The business side of the Zeitschrift will be conducted as before at the offices of the Internationaler Psychoanalytischer Verlag in Vienna (Manager: A. J. Storfer).

[1924h, 4182]

As soon as I realized the inevitable nature of what I had come up against, my sensitiveness greatly diminished. Moreover my isolation gradually came to an end. To begin with, a small circle of pupils gathered round me in Vienna; and then, after 1906, came the news that the psychiatrists at Zurich, E. Bleuler, his assistant C. G. Jung, and others, were taking a lively interest in psycho-analysis. We got into personal touch with one another, and at Easter 1908 the friends of the young science met at Salzburg, agreed upon the regular repetition of similar informal congresses and arranged for the publication of a journal which was edited by Jung and was given the title of Jahrbuch für psychoanalytische und psychopathologische Forschungen. It was brought out under the direction of Bleuler and myself and ceased publication at the beginning of the World War. At the same time that the Swiss psychiatrists joined the movement, interest in psycho-analysis began to be aroused all over Germany as well; it became the subject of a large number of written comments and of lively discussions at scientific congresses. But its reception was nowhere friendly or even benevolently non-committal. After the briefest acquaintance with psycho-analysis German science was united in rejecting it.

[1925d, 4223]

The result of the official anathema against psycho-analysis was that the analysts began to come closer together. At the second Congress, held at Nuremberg in 1910, they formed themselves, on the proposal of Ferenczi, into an 'International Psycho-Analytical Association' divided into a number of local societies but under a common President. The Association survived the Great War and still exists, consisting to-day of branch societies in Austria, Germany, Hungary, Switzerland, Great Britain, Holland, Russia, and India, as well as two in the United States. I arranged that C. G. Jung should be appointed as the first President, which turned out later to have been a most unfortunate step. At the same time a second journal devoted to psycho-analysis was started, the Zentralblatt für Psychoanalyse, edited by Adler and Stekel, and a little later a third, Imago, edited by two non-medical analysts, H. Sachs and O. Rank, and intended to deal with the application of analysis to the mental sciences. Soon afterwards Bleuler published a paper in defence of psycho-analysis. Though it was a relief to find honesty and straightforward logic for once taking part in the dispute, yet I could not feel completely satisfied by Bleuler's essay. He strove too eagerly after an appearance of impartiality; nor is it a matter of chance that it is to him that our science owes the valuable concept of ambivalence. In later papers Bleuler adopted such a critical attitude towards the theoretical structure of analysis and rejected or threw doubts upon such essential parts of it that I could not help asking myself in astonishment what could be left of it for him to admire. Yet not only has he subsequently uttered the strongest pleas in favour of 'depth psychology' but he based his comprehensive study of schizophrenia upon it. Nevertheless Bleuler did not for long remain a member of the International Psycho-Analytical Association; he resigned from it as a result of misunderstandings with Jung, and the Burghölzli was lost to analysis.

[1925d, 4225]
Official disapproval could not hinder the spread of psycho-analysis either in Germany or in other countries. I have elsewhere followed the stages of its growth and given the names of those who were its first representatives. In 1909 G. Stanley Hall invited Jung and me to America to go to Clark University, Worcester, Mass., of which he was President, and to spend a week giving lectures (in German) at the celebration of the twentieth anniversary of that body's foundation. Hall was justly esteemed as a psychologist and educationalist, and had introduced psycho-analysis into his courses several years earlier; there was a touch of the 'king-maker' about him, a pleasure in setting up authorities and in then deposing them. We also met James J. Putnam there, the Harvard neurologist, who in spite of his age was an enthusiastic supporter of psycho-analysis and threw the whole weight of a personality that was universally respected into the defence of the cultural value of analysis and the purity of its aims. He was an estimable man, in whom, as a reaction against a predisposition to obsessional neurosis, an ethical bias predominated; and the only thing in him that was disquieting was his inclination to attach psycho-analysis to a particular philosophical system and to make it the servant of moral aims. Another event of this time which made a lasting impression on me was a meeting with William James the philosopher. I shall never forget one little scene that occurred as we were on a walk together. He stopped suddenly, handed me a bag he was carrying and asked me to walk on, saying that he would catch me up as soon as he had got through an attack of angina pectoris which was just coming on. He died of that disease a year later; and I have always wished that I might be as fearless as he was in the face of approaching death.

If a community is based on agreement upon a few cardinal points, it is obvious that people who have abandoned that common ground will cease to belong to it. Yet the secession of former pupils has often been brought up against me as a sign of my intolerance or has been regarded as evidence of some special fatality that hangs over me. It is a sufficient answer to point out that in contrast to those who have left me, like Jung, Adler, Stekel, and a few besides, there are a great number of men, like Abraham, Ettingon, Ferenczi, Rank, Jones, Brill, Sachs, Pfister, van Emden, Reik, and others, who have worked with me for some fifteen years in loyal collaboration and for the most part in uninterrupted friendship. I have only mentioned the oldest of my pupils, who have already made a distinguished name for themselves in the literature of psycho-analysis; if I have passed over others, that is not to be taken as a slight, and indeed among those who are young and have joined me lately talents are to be found on which great hopes may be set. But I think I can say in my defence that an intolerant man, dominated by an arrogant belief in his own infallibility, would never have been able to maintain his hold upon so large a number of intellectually eminent people, especially if he had at his command as few practical attractions as I had.
The World War, which broke up so many other organizations, could do nothing against our 'International'. The first meeting after the war took place in 1920, at The Hague, on neutral ground. It was moving to see how hospitably the Dutch welcomed the starving and impoverished subjects of the Central European states; and I believe this was the first occasion in a ruined world on which Englishmen and Germans sat at the same table for the friendly discussion of scientific interests. Both in Germany and in the countries of Western Europe the war had actually stimulated interest in psycho-analysis. The observation of war neuroses had at last opened the eyes of the medical profession to the importance of psychogenesis in neurotic disturbances, and some of our psychological conceptions, such as the 'gain from illness' and the 'flight into illness', quickly became popular. The last Congress before the German collapse, which was held at Budapest in 1918, was attended by official representatives of the allied governments of the Central European powers, and they agreed to the establishment of psycho-analytic Centres for the treatment of war neuroses. But this point was never reached. Similarly too the comprehensive plans made by one of our leading members, Dr. Anton von Freund, for establishing in Budapest a centre for analytic study and treatment came to grief as a result of the political upheavals that followed soon afterwards and of the premature death of their irreplaceable author. At a later date some of his ideas were put into execution by Max Eitingon, who in 1920 founded a psycho-analytical clinic in Berlin. During the brief period of Bolshevik rule in Hungary, Ferenczi was still able to carry on a successful course of instruction as the official representative of psycho-analysis at the University of Budapest. After the war our opponents were pleased to announce that events had produced a conclusive argument against the validity of the theses of analysis. The war neuroses, they said, had proved that sexual factors were unnecessary to the aetiology of neurotic disorders. But their triumph was frivolous and premature. For on the one hand no one had been able to carry out a thorough analysis of a case of war neurosis, so that in fact nothing whatever was known for certain as to their motivation and no conclusions could be drawn from this uncertainty; while on the other hand psycho-analysis had long before arrived at the concept of narcissism and of narcissistic neuroses, in which the subject's libido is attached to his own ego instead of to an object. Though on other occasions, therefore, the charge was brought against psycho-analysis of having made an unjustifiable extension of the concept of sexuality, yet, when it became convenient for controversial ends, this crime was forgotten and we were once more held down to the narrowest meaning of the word.

[1925d, 4229]

If the preliminary cathartic period is left on one side, the history of psycho-analysis falls from my point of view into two phases. In the first of these I stood alone and had to do all the work myself: this was from 1895-6 until 1906 or 1907. In the second phase, lasting from then until the present time, the contributions of my pupils and collaborators have been growing more and more in importance, so that to-day, when a grave illness warns me of the approaching end, I can think with a quiet mind of the cessation of my own labours. For that very reason, however, it is impossible for me in this Autobiographical Study to deal as fully with the progress of psycho-analysis during the second phase as I did with its gradual rise during the first phase, which was concerned with my own activity alone. I feel that I should only be justified in mentioning here those new discoveries in which I still played a prominent part, in particular, therefore, those made in the sphere of narcissism, of the theory of the instincts, and of the application of psycho-analysis to the psychoses.

[1925d, 4230]
I must add a few more words on the history of psycho-analysis during the last decade. There can no longer be any doubt that it will continue; it has proved its capacity to survive and to develop both as a branch of knowledge and as a therapeutic method. The number of its supporters (organized into the International Psycho-Analytical Association) has considerably increased. In addition to the older local groups (in Vienna, Berlin, Budapest, London, Holland, Switzerland, and Russia), societies have since been formed in Paris and Calcutta, two in Japan, several in the United States, and quite recently one each in Jerusalem and South Africa and two in Scandinavia. Out of their own funds these local societies support (or are in process of forming) training institutes, in which instruction in the practice of psycho-analysis is given according to a uniform plan, and out-patient clinics in which experienced analysts as well as students give free treatment to patients of limited means. Every other year the members of the International Psycho-Analytical Association hold a Congress at which scientific papers are read and questions of organization decided. The thirteenth of these congresses (which I myself can no longer attend) took place at Lucerne in 1934. From a core of interests that are common to all members of the Association, their work radiates in many different directions. Some lay most stress upon clarifying and deepening our knowledge of psychology, while others are concerned with keeping in contact with medicine and psychiatry. From the practical point of view, some analysts have set themselves the task of bringing about the recognition of psycho-analysis at the universities and its inclusion in the medical curriculum, whereas others are content to remain outside these institutions and will not allow that psycho-analysis is less important in the field of education than in that of medicine. It happens from time to time that an analytic worker may find himself isolated in an attempt to emphasize some single one of the findings or views of psycho-analysis at the expense of all the rest. Nevertheless, the whole impression is a satisfactory one - of serious scientific work carried on at a high level.
[1925d, 4245]

The beginnings of psycho-analysis may be marked by two dates: 1895, which saw the publication of Breuer and Freud's Studies on Hysteria, and 1900, which saw that of Freud's Interpretation of Dreams. At first the new discoveries aroused no interest either in the medical profession or among the general public. In 1907 the Swiss psychiatrists, under the leadership of E. Bleuler and C. G. Jung, began to concern themselves in the subject; and in 1908 there took place at Salzburg a first meeting of adherents from a number of different countries. In 1909 Freud and Jung were invited to America by G. Stanley Hall to deliver a series of lectures on psycho-analysis at Clark University, Worcester, Mass. From that time forward interest grew rapidly in Europe; it expressed itself, however, in a very forcible rejection of the new teachings - a rejection which often showed an unscientific colouring.
[1926f, 4407]

The reasons for this hostility were to be found, from the medical point of view, in the fact that psycho-analysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psycho-analysis. In spite of this widespread opposition, however, the movement in favour of psycho-analysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the Internationale Zeitschrift für Psychoanalyse, Imago (which is concerned with the application of psycho-analysis to non-medical fields of knowledge), and the International Journal of Psycho-Analysis.
[1926f, 4407]
Let us leave the first question aside for a while; the other two can be dealt with more easily. The case of my visit to his pension makes a particularly convincing impression at first sight. I am certain that in my short, joking reference to my visit to his house I mentioned no name. I think it is most unlikely that P. made enquiries at the pension as to the name of the person concerned; I believe rather that the existence of that person remained entirely unknown to him. But the evidential value of this case is totally destroyed by a chance circumstance. The man whom I had visited at the pension was not only called 'Freund'; he was a true friend to us all. He was Dr. Anton von Freund whose donation had made the foundation of our publishing house possible. His early death, together with that of our colleague Karl Abraham a few years later, are the gravest misfortunes which have befallen the growth of psycho-analysis. It is possible, therefore, that I had said to Herr P.: 'I visited a friend in your house' and with this possibility the occult interest of his second association vanishes.

[1933a, 4662]

Since the days when he was led to me by his interest in psycho-analysis, still in its youth, we have shared many things with each other. I invited him to go with me to Worcester, Massachusetts, when in 1909 I was called upon to lecture there during a week of celebrations. In the morning, before the time had come for my lecture to begin, we would walk together in front of the University building and I would ask him to suggest what I should talk about that day. He thereupon gave me a sketch of what, half an hour later, I improvised in my lecture. In this way he had a share in the origin of the Five Lectures. Soon after this, at the Nuremberg Congress of 1910, I arranged that he should propose the organization of analysts into an international association - a scheme which we had thought out together. With slight modifications it was accepted and is in force to this day. For many successive years we spent the autumn holidays together in Italy, and a number of papers that appeared later in the literature under his or my name took their first shape in our talks there. When the outbreak of the World War put an end to our freedom of movement, and paralysed our analytic activity as well, he made use of the interval to begin his analysis with me. This met with a break when he was called up for military service, but he was able to resume it later. The feeling of a secure common bond, which grew up between us from so many shared experiences, was not interrupted when, late in life unfortunately, he was united to the outstanding woman who mourns him to-day as his widow.

[1933c, 4814]

After this summit of achievement, it came about that our friend slowly drifted away from us. On his return from a period of work in America he seemed to withdraw more and more into solitary work, though he had previously taken the liveliest share in all that happened in analytic circles. We learnt that one single problem had monopolized his interest. The need to cure and to help had become paramount in him. He had probably set himself aims which, with our therapeutic means, are altogether out of reach to-day. From unexhausted springs of emotion the conviction was borne in upon him that one could effect far more with one's patients if one gave them enough of the love which they had longed for as children. He wanted to discover how this could be carried out within the framework of the psycho-analytic situation; and so long as he had not succeeded in this, he kept apart, no longer certain, perhaps, of agreement with his friends. Wherever it may have been that the road he had started along would have led him, he could not pursue it to the end. Signs were slowly revealed in him of a grave organic destructive process which had probably overshadowed his life for many years already. Shortly before completing his sixtieth year he succumbed to pernicious anaemia. It is impossible to believe that the history of our science will ever forget him.

[1933c, 4816]
On February 5 of this year Frau Lou Andreas-Salomé died peacefully in her little house at Göttingen, almost 76 years of age. For the last 25 years of her life this remarkable woman was attached to psycho-analysis, to which she contributed valuable writings and which she practised as well. I am not saying too much if I acknowledge that we all felt it as an honour when she joined the ranks of our collaborators and comrades in arms, and at the same time as a fresh guarantee of the truth of the theories of analysis. [1937a, 5076]

It was in Vienna that long ago the most moving episode of her feminine fortunes had been played out. In 1912 she returned to Vienna in order to be initiated into psycho-analysis. My daughter, who was her close friend, once heard her regret that she had not known psycho-analysis in her youth. But, after all, in those days there was no such thing. [1937a, 5076]
My investigations into the aetiology and psychical mechanism of neurotic illnesses, which I have pursued since 1893, attracted little notice to begin with among my fellow specialists. At length, however, those investigations have met with recognition from a number of medical research workers and have also drawn attention to the psycho-analytic methods of examination and treatment to which I owe my findings. Dr. Wilhelm Stekel, who was one of the first of the colleagues to whom I was able to impart a knowledge of psycho-analysis, and who has himself become familiar with its technique through many years of practice in it, has now undertaken the task of working over one topic in the clinical aspect of these neuroses on the basis of my views and of presenting medical readers with the experiences he has obtained through the psycho-analytic method. If I am glad to take the responsibility for his work in the sense which I have just indicated, I think it is only right to declare explicitly that my direct influence upon the volume on nervous states of anxiety which lies before us has been a very slight one. The observations and all the detailed opinions and interpretations are the author's own. My share has been limited to proposing the use of the term 'anxiety hysteria'.
[1908f, 1994]

Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone represented psychoanalysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling-resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became accustomed to that long ago. People simply did not believe me, just as even to-day people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of all arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patient's minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses - arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psycho-analysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electro-therapy, but that does not enable such measures to get the better of neuroses. Time will show whether psycho-analytic treatment can accomplish more.
[1910d, 2311]
No one need be surprised at the subjective character of the contribution I propose to make here
to the history of the psycho-analytic movement, nor need anyone wonder at the part I play in it.
For psycho-analysis is my creation; for ten years I was the only person who concerned himself
with it, and all the dissatisfaction which the new phenomenon aroused in my contemporaries has
been poured out in the form of criticisms on my head. Although it is a long time now since I was
the only psycho-analyst, I consider myself justified in maintaining that even to-day no one can
know better than I do what psycho-analysis is, how it differs from other ways of investigating the
life of the mind, and precisely what should be called psycho-analysis and what would better be
described by some other name. In thus repudiating what seems to me a cool act of usurpation, I
am indirectly informing the readers of this Jahrbuch the events that have led to the changes in its
editorship and format.
[1914d, 2877]

The interpretation of dreams became a solace and a support to me in those arduous first years
of analysis, when I had to master the technique, clinical phenomena and therapy of the neuroses
all at the same time. At that period I was completely isolated and in the network of problems and
accumulation of difficulties I often dreaded losing my bearings and also my confidence. There
were often patients with whom an unaccountably long time elapsed before my hypothesis, that a
neurosis was bound to become intelligible through analysis, proved true; but these patients'
dreams, which might be regarded as analogues of their symptoms, almost always confirmed the
hypothesis.
[1914d, 2889]
I pictured the future as follows: - I should probably succeed in maintaining myself by means of the therapeutic success of the new procedure, but science would ignore me entirely during my lifetime; some decades later, someone else would infallibly come upon the same things - for which the time was not now ripe - would achieve recognition for them and bring me honour as a forerunner whose failure had been inevitable. Meanwhile, like Robinson Crusoe, I settled down as comfortably as possible on my desert island. When I look back to those lonely years, away from the pressures and confusions of to-day, it seems like a glorious heroic age. My 'splendid isolation'¹ was not without its advantages and charms. I did not have to read any publications, nor listen to any ill-informed opponents; I was not subject to influence from any quarter; there was nothing to hustle me. I learnt to restrain speculative tendencies and to follow the unforgotten advice of my master, Charcot: to look at the same things again and again until they themselves begin to speak. My publications, which I was able to place with a little trouble, could always lag far behind my knowledge, and could be postponed as long as I pleased, since there was no doubtful 'priority' to be defended. The Interpretation of Dreams, for instance, was finished in all essentials at the beginning of 1896 but was not written out until the summer of 1899. The analysis of 'Dora' was over at the end of 1899; the case history was written in the next two weeks, but was not published until 1905. Meanwhile my writings were not reviewed in the medical journals, or, if as an exception they were reviewed, they were dismissed with expressions of scornful or pitying superiority. Occasionally a colleague would make some reference to me in one of his publications; it would be very short and not at all flattering - words such as 'eccentric', 'extreme', or 'very peculiar' would be used. It once happened that an assistant at the clinic in Vienna where I gave my University lectures asked me for permission to attend the course. He listened very attentively and said nothing; after the last lecture was over he offered to join me outside. As we walked away, he told me that with his chief's knowledge he had written a book combating my views; he regretted very much, however, that he had not first learnt more about them from my lectures, for in that case he would have written much of it differently. He had indeed enquired at the clinic whether he had not better first read The Interpretation of Dreams, but had been advised against doing so - it was not worth the trouble. He then himself compared the structure of my theory, so far as he now understood it, with that of the Catholic Church as regards its internal solidity. In the interests of the salvation of his soul, I shall assume that this remark implied a certain amount of appreciation. But he concluded by saying that it was too late to alter anything in his book, since it was already in print. Nor did my colleague think it necessary later to make any public avowal of his change of views on the subject of psycho-analysis; but preferred, in his capacity as a regular reviewer for a medical journal, to follow its development with flippant comments.

[1914d, 2890]

It was hardly to be expected, however, that during the years when I alone represented psycho-analysis I should develop any particular respect for the world's opinion or any bias towards intellectual appeasement.

[1914d, 2891]
Later History of Psycho-Analysis. - Psycho-analysis was carried approximately thus far by the work of the writer of this article, who for more than ten years was its sole representative. In 1906 the Swiss psychiatrists Bleuler and C. G. Jung began to play a lively part in analysis; in 1907 a first conference of its supporters took place at Salzburg; and the young science soon found itself the centre of interest both among psychiatrists and laymen. Its reception in Germany, with her morbid craving for authority, was not precisely to the credit of German science and moved even so cool a partisan as Bleuler to an energetic protest. Yet no condemnation or dismissal at official congresses served to hold up the internal growth or external expansion of psycho-analysis. In the course of the next ten years it extended far beyond the frontiers of Europe and became especially popular in the United States of America, and this was due in no small degree to the advocacy and collaboration of Putnam (Boston), Ernest Jones (Toronto; later London), Flournoy (Geneva), Ferenczi (Budapest), Abraham (Berlin), and many others besides. The anathema which was imposed upon psycho-analysis led its supporters to combine in an international organization which in the present year (1922) is holding its eighth private Congress in Berlin and now includes local groups in Vienna, Budapest, Berlin, Holland, Zurich, London, New York, Calcutta and Moscow. This development was not interrupted even by the World War. In 1918-19 Dr. Anton von Freund of Budapest founded the Internationaler Psychoanalytischer Verlag, which publishes journals and books concerned with psycho-analysis, and in 1920 Dr. M. Eitingon opened in Berlin the first psycho-analytic clinic for the treatment of neurotics without private means. Translations of the writer’s principal works, which are now in preparation, into French, Italian and Spanish, testify to a growing interest in psycho-analysis in the Latin world as well.

[1923a, 3924]

The reception given it in the scientific world was, however, no friendly one. For some ten years no one took any notice of Freud's works. About the year 1907 attention was drawn to psycho-analysis by a group of Swiss psychiatrists (Bleuler and Jung, in Zurich), and a storm of indignation, which was not precisely fastidious in its methods and arguments, thereupon broke out, particularly in Germany. In this, psycho-analysis was sharing the fate of many novelties which, after a certain lapse of time, have found general recognition. Nevertheless it lay in its nature that it should inevitably arouse particularly violent opposition. It wounded the prejudices of civilized humanity at some specially sensitive spots. It subjected every individual, as it were, to the analytic reaction, by uncovering what had by universal agreement been repressed into the unconscious; and in this way it forced its contemporaries to behave like patients who, under analytic treatment, above all else bring their resistances to the fore. It must also be admitted that it was no easy thing to become convinced of the correctness of the psycho-analytic theories, nor to obtain instruction in the practice of analysis.

[1924f, 4110]

An essential difference between this second decade of psycho-analysis and the first lay in the fact that the present writer was no longer its sole representative. A constantly growing circle of pupils and followers had collected around him, who devoted themselves first to the diffusion of the theories of psycho-analysis and then extended them, supplemented them and carried them deeper. In the course of years, several of these supporters, as was inevitable, seceded, took their own paths, or turned themselves into an opposition which seemed to threaten the continuity of the development of psycho-analysis. Between 1911 and 1913 C. G. Jung in Zurich and Alfred Adler in Vienna produced some stir by their attempts at giving new interpretations to the facts of analysis and their efforts at a diversion from the analytic standpoint. But it soon appeared that these secessions had effected no lasting damage. What temporary success they achieved was easily accounted for by the readiness of the mass of people to have themselves set free from the pressure of the demands of psycho-analysis by whatever path might be opened to them. The great majority of co-workers remained firm and continued their work along the lines indicated to them. We shall come on their names repeatedly in the short account below of the findings of psycho-analysis in the many and various fields of its application.

[1924f, 4112]
The psycho-analytic view would also have to include in narcissistic disorders all the ailments described in psychiatry as 'functional psychoses'. It could not be doubted that neuroses and psychoses are not separated by a hard and fast line, any more than health and neurosis; and it was plausible to explain the mysterious psychotic phenomena by the discoveries achieved on the neuroses, which had hitherto been equally incomprehensible. The present writer had himself, during the period of his isolation, made a case of paranoid illness partly intelligible by an analytic investigation and had pointed out in this unquestionable psychosis the same contents (complexes) and a similar interplay of forces as in the simple neuroses. Bleuler followed out the indications of what he called 'Freudian mechanisms' in a whole number of psychoses, and Jung won high opinions as an analyst at a single blow when, in 1907, he explained the most eccentric symptoms in the end-stages of dementia praecox from the individual life-histories of the patients. The comprehensive study of schizophrenia by Bleuler (1911) probably demonstrated once and for all the justification of a psycho-analytic angle of approach for the understanding of these psychoses.

In the following pages I bring forward some findings of analytic research which would be of great importance if they could be proved to apply universally. Why do I not postpone publication of them until further experience has given me the necessary proof, if such proof is obtainable? Because the conditions under which I work have undergone a change, with implications which I cannot disguise. Formerly, I was not one of those who are unable to hold back what seems to be a new discovery until it has been either confirmed or corrected. My *Interpretation of Dreams* (1900a) and my 'Fragment of an Analysis of a Case of Hysteria' (1905e) (the case of Dora) were suppressed by me - if not for the nine years enjoined by Horace - at all events for four or five years before I allowed them to be published. But in those days I had unlimited time before me - 'oceans of time' as an amiable author puts it - and material poured in upon me in such quantities that fresh experiences were hardly to be escaped. Moreover, I was the only worker in a new field, so that my reticence involved no danger to myself and no loss to others.

For more than ten years after my separation from Breuer I had no followers. I was completely isolated. In Vienna I was shunned; abroad no notice was taken of me. My *Interpretation of Dreams*, published in 1900, was scarcely reviewed in the technical journals. In my paper 'On the History of the Psycho-Analytic Movement' I mentioned as an instance of the attitude adopted by psychiatric circles in Vienna a conversation with an assistant at the clinic, who had written a book against my theories but had never read my *Interpretation of Dreams*. He had been told at the clinic that it was not worth while. The man in question, who has since become a professor, has gone so far as to repudiate my report of the conversation and to throw doubts in general upon the accuracy of my recollection. I can only say that I stand by every word of the account I then gave.

If the preliminary cathartic period is left on one side, the history of psycho-analysis falls from my point of view into two phases. In the first of these I stood alone and had to do all the work myself: this was from 1895-6 until 1906 or 1907. In the second phase, lasting from then until the present time, the contributions of my pupils and collaborators have been growing more and more in importance, so that to-day, when a grave illness warns me of the approaching end, I can think with a quiet mind of the cessation of my own labours. For that very reason, however, it is impossible for me in this *Autobiographical Study* to deal as fully with the progress of psycho-analysis during the second phase as I did with its gradual rise during the first phase, which was concerned with my own activity alone. I feel that I should only be justified in mentioning here those new discoveries in which I still played a prominent part, in particular, therefore, those made in the sphere of narcissism, of the theory of the instincts, and of the application of psycho-analysis to the psychoses.
I was able to show from a short story by W. Jensen called *Gradiva*, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the ‘dream-work’ are thus also operative in the processes of imaginative writing. My book on *Jokes and their Relation to the Unconscious* was a side-issue directly derived from *The Interpretation of Dreams*. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the ‘dream-work’ - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (*fore-pleasure*).

So it was that I became one of you, took my share in your humanitarian and national interests, gained friends among you and persuaded my own few remaining friends to join our society. There was no question whatever of my convincing you of my new theories; but at a time when no one in Europe listened to me and I still had no disciples even in Vienna, you gave me your kindly attention. You were my first audience.

But you may raise the question of why these people - both the ones who write books and the conversationalists - behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psycho-analysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement - the judgement, namely, that was formed upon the young psycho-analysis by the representatives of official science. I once complained of this in a historical account I wrote, and I shall not do so again - perhaps that once was too often - but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psycho-analysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob. You may not realize clearly, perhaps, how far upwards in our society mob-characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that it was equally senseless to lament and to invoke the help of kindlier spirits, for there were not courts to which such appeals could be made. So I took another road. I made a first application of psycho-analysis by explaining to myself that this behaviour of the crowd was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This procedure was the right one. The interdict which lay upon psycho-analysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psycho-analysis by scientific circles persists to-day in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.
You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninstructive; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

[1933a, 4751]
From the year 1902 onwards, a number of young doctors gathered round me with the express intention of learning, practising and spreading the knowledge of psycho-analysis. The stimulus came from a colleague who had himself experienced the beneficial effects of analytic therapy. Regular meetings took place on certain evenings at my house, discussions were held according to certain rules and the participants endeavoured to find their bearings in this new and strange field of research and to interest others in it. One day a young man who had passed through a technical training college introduced himself with a manuscript which showed very unusual comprehension. We persuaded him to go through the Gymnasium [Secondary School] and the University and to devote himself to the non-medical side of psycho-analysis. The little society acquired in him a zealous and dependable secretary and I gained in Otto Rank a most loyal helper and co-worker.¹

[1914d, 2892]

The small circle soon expanded, and in the course of the next few years often changed its composition. On the whole I could tell myself that it was hardly inferior, in wealth and variety of talent, to the staff of any clinical teacher one could think of. It included from the beginning the men who were later to play such a considerable, if not always a welcome, part in the history of the psycho-analytic movement. At that time, however, one could not yet guess at these developments. I had every reason to be satisfied, and I think I did everything possible to impart my own knowledge and experience to the others. There were only two inauspicious circumstances which at last estranged me inwardly from the group. I could not succeed in establishing among its members the friendly relations that ought to obtain between men who are all engaged upon the same difficult work; nor was I able to stifle the disputes about priority for which there were so many opportunities under these conditions of work in common. The difficulties in the way of giving instruction in the practice of psycho-analysis, which are quite particularly great and are responsible for much in the present dissensions, were evident already in this private Vienna Psycho-Analytical Society. I myself did not venture to put forward a still unfinished technique and a theory still in the making with an authority which would probably have enabled the others to avoid some wrong turnings and ultimate disasters. The self-reliance of intellectual workers, their early independence of their teacher, is always gratifying from a psychological point of view; but it is only of advantage to science if those workers fulfil certain personal conditions which are none too common. For psycho-analysis in particular a long and severe discipline and training in self-discipline would have been required. In view of the courage displayed by their devotion to a subject so much frowned upon and so poor in prospects, I was disposed to tolerate much among the members to which I should otherwise have made objection. Besides doctors, the circle included others - men of education who had recognized something important in psycho-analysis: writers, painters and so on. My *Interpretation of Dreams* and my book on jokes, among others, had shown from the beginning that the theories of psycho-analysis cannot be restricted to the medical field, but are capable of application to a variety of other mental sciences.

[1914d, 2892]
The reception given it in the scientific world was, however, no friendly one. For some ten years no one took any notice of Freud's works. About the year 1907 attention was drawn to psycho-analysis by a group of Swiss psychiatrists (Bleuler and Jung, in Zurich), and a storm of indignation, which was not precisely fastidious in its methods and arguments, thereupon broke out, particularly in Germany. In this, psycho-analysis was sharing the fate of many novelties which, after a certain lapse of time, have found general recognition. Nevertheless it lay in its nature that it should inevitably arouse particularly violent opposition. It wounded the prejudices of civilized humanity at some specially sensitive spots. It subjected every individual, as it were, to the analytic reaction, by uncovering what had by universal agreement been repressed into the unconscious; and in this way it forced its contemporaries to behave like patients who, under analytic treatment, above all else bring their resistances to the fore. It must also be admitted that it was no easy thing to become convinced of the correctness of the psycho-analytic theories, nor to obtain instruction in the practice of analysis.

As soon as I realized the inevitable nature of what I had come up against, my sensitiveness greatly diminished. Moreover my isolation gradually came to an end. To begin with, a small circle of pupils gathered round me in Vienna; and then, after 1906, came the news that the psychiatrists at Zurich, E. Bleuler, his assistant C. G. Jung, and others, were taking a lively interest in psycho-analysis. We got into personal touch with one another, and at Easter 1908 the friends of the young science met at Salzburg, agreed upon the regular repetition of similar informal congresses and arranged for the publication of a journal which was edited by Jung and was given the title of *Jahrbuch für psychoanalytische und psychopathologische Forschungen*. It was brought out under the direction of Bleuler and myself and ceased publication at the beginning of the World War. At the same time that the Swiss psychiatrists joined the movement, interest in psycho-analysis began to be aroused all over Germany as well; it became the subject of a large number of written comments and of lively discussions at scientific congresses. But its reception was nowhere friendly or even benevolently non-committal. After the briefest acquaintance with psycho-analysis German science was united in rejecting it.

If the preliminary cathartic period is left on one side, the history of psycho-analysis falls from my point of view into two phases. In the first of these I stood alone and had to do all the work myself: this was from 1895-6 until 1906 or 1907. In the second phase, lasting from then until the present time, the contributions of my pupils and collaborators have been growing more and more in importance, so that to-day, when a grave illness warns me of the approaching end, I can think with a quiet mind of the cessation of my own labours. For that very reason, however, it is impossible for me in this *Autobiographical Study* to deal as fully with the progress of psycho-analysis during the second phase as I did with its gradual rise during the first phase, which was concerned with my own activity alone. I feel that I should only be justified in mentioning here those new discoveries in which I still played a prominent part, in particular, therefore, those made in the sphere of narcissism, of the theory of the instincts, and of the application of psycho-analysis to the psychoses.

Besides doctors, the circle included others - men of education who had recognized something important in psycho-analysis: writers, painters and so on. My Interpretation of Dreams and my book on jokes, among others, had shown from the beginning that the theories of psycho-analysis cannot be restricted to the medical field, but are capable of application to a variety of other mental sciences.

¹ [1914d, 2892]
I think that by thus unrolling the story of the development of psycho-analysis I have shown what it is, better than by a systematic description of it. I did not at first perceive the peculiar nature of what I had discovered. I unhesitatingly sacrificed my growing popularity as a doctor, and the increase in attendance during my consulting hours, by making a systematic enquiry into the sexual factors involved in the causation of my patients' neuroses; and this brought me a great many new facts which finally confirmed my conviction of the practical importance of the sexual factor. I innocently addressed a meeting of the Vienna Society for Psychiatry and Neurology with Krafft-Ebing in the chair, expecting that the material losses I had willingly undergone would be made up for by the interest and recognition of my colleagues. I treated my discoveries as ordinary contributions to science and hoped they would be received in the same spirit. But the silence which my communications met with, the void which formed itself about me, the hints that were conveyed to me, gradually made me realize that assertions on the part played by sexuality in the aetiology of the neuroses cannot count upon meeting with the same kind of treatment as other communications. I understood that from now onwards I was one of those who have 'disturbed the sleep of the world', as Hebbel says, and that I could not reckon upon objectivity and tolerance. Since, however, my conviction of the general accuracy of my observations and conclusions grew even stronger, and since neither my confidence in my own judgement nor my moral courage were precisely small, the outcome of the situation could not be in doubt. I made up my mind to believe that it had been my fortune to discover some particularly important facts and connections, and I was prepared to accept the fate that sometimes accompanies such discoveries.

[1914d, 2889]

Later History of Psycho-Analysis. - Psycho-analysis was carried approximately thus far by the work of the writer of this article, who for more than ten years was its sole representative. In 1906 the Swiss psychiatrists Bleuler and C. G. Jung began to play a lively part in analysis; in 1907 a first conference of its supporters took place at Salzburg; and the young science soon found itself the centre of interest both among psychiatrists and laymen. Its reception in Germany, with her morbid craving for authority, was not precisely to the credit of German science and moved even so cool a partisan as Bleuler to an energetic protest. Yet no condemnation or dismissal at official congresses served to hold up the internal growth or external expansion of psycho-analysis. In the course of the next ten years it extended far beyond the frontiers of Europe and became especially popular in the United States of America, and this was due in no small degree to the advocacy and collaboration of Putnam (Boston), Ernest Jones (Toronto; later London), Flournoy (Geneva), Ferenczi (Budapest), Abraham (Berlin), and many others besides. The anathema which was imposed upon psycho-analysis led its supporters to combine in an international organization which in the present year (1922) is holding its eighth private Congress in Berlin and now includes local groups in Vienna, Budapest, Berlin, Holland, Zurich, London, New York, Calcutta and Moscow. This development was not interrupted even by the World War. In 1918-19 Dr. Anton von Freund of Budapest founded the Internationaler Psychoanalytischer Verlag, which publishes journals and books concerned with psycho-analysis, and in 1920 Dr. M. Eitingon opened in Berlin the first psycho-analytic clinic for the treatment of neurotics without private means. Translations of the writer's principal works, which are now in preparation, into French, Italian and Spanish, testify to a growing interest in psycho-analysis in the Latin world as well.

[1923a, 3924]
As soon as I realized the inevitable nature of what I had come up against, my sensitiveness greatly diminished. Moreover my isolation gradually came to an end. To begin with, a small circle of pupils gathered round me in Vienna; and then, after 1906, came the news that the psychiatrists at Zurich, E. Bleuler, his assistant C. G. Jung, and others, were taking a lively interest in psycho-analysis. We got into personal touch with one another, and at Easter 1908 the friends of the young science met at Salzburg, agreed upon the regular repetition of similar informal congresses and arranged for the publication of a journal which was edited by Jung and was given the title of *Jahrbuch für psychoanalytische und psychopathologische Forschungen*. It was brought out under the direction of Bleuler and myself and ceased publication at the beginning of the World War. At the same time that the Swiss psychiatrists joined the movement, interest in psycho-analysis began to be aroused all over Germany as well; it became the subject of a large number of written comments and of lively discussions at scientific congresses. But its reception was nowhere friendly or even benevolently non-committal. After the briefest acquaintance with psycho-analysis German science was united in rejecting it.

[1925d, 4223]

Even to-day it is of course impossible for me to foresee the final judgment of posterity upon the value of psycho-analysis for psychiatry, psychology, and the mental sciences in general. But I fancy that, when the history of the phase we have lived through comes to be written, German science will not have cause to be proud of those who represented it. I am not thinking of the fact that they rejected psycho-analysis or of the decisive way in which they did so; both of these things were easily intelligible, they were only to be expected and at any rate they threw no discredit on the character of the opponents of analysis. But for the degree of arrogance which they displayed, for their conscienceless contempt of logic, and for the coarseness and bad taste of their attacks there could be no excuse. It may be said that it is childish of me to give free rein to such feelings as these now, after fifteen years have passed; nor would I do so unless I had something more to add. Years later, during the World War, when a chorus of enemies were bringing against the German nation the charge of barbarism, a charge which sums up all that I have written above, it none the less hurt deeply to feel that my own experience would not allow me to contradict it.

[1925d, 4224]

I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

[1926e, 4350]
But you may raise the question of why these people - both the ones who write books and the conversationalists - behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psycho-analysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement - the judgement, namely, that was formed upon the young psycho-analysis by the representatives of official science. I once complained of this in a historical account I wrote, and I shall not do so again - perhaps that once was too often - but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psycho-analysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob. You may not realize clearly, perhaps, how far upwards in our society mob-characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that it was equally senseless to lament and to invoke the help of kindlier spirits, for there were not courts to which such appeals could be made. So I took another road. I made a first application of psycho-analysis by explaining to myself that this behaviour of the crowd was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This procedure was the right one. The interdict which lay upon psycho-analysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psycho-analysis by scientific circles persists to-day in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.

[1933a, 4739]
Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psycho-analytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psycho-analysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psycho-analysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

[1905d, 1462]

For the present, therefore, no further development of the libido theory is possible, except upon speculative lines. It would, however, be sacrificing all that we have gained hitherto from psycho-analytic observation, if we were to follow the example of C. G. Jung and water down the meaning of the concept of libido itself by equating it with psychical instinctual force in general. The distinguishing of the sexual instinctual impulses from the rest and the consequent restriction of the concept of libido to the former receives strong support from the assumption which I have already discussed that there is a special chemistry of the sexual function.

[1905d, 1532]

An analysis such as this of someone who is practically healthy will, as may be imagined, remain incomplete. Anyone who can appreciate the high value of the self-knowledge and increase in self-control thus acquired will, when it is over, continue the analytic examination of his personality in the form of a self-analysis, and be content to realize that, within himself as well as in the external world, he must always expect to find something new. But anyone who has scorned to take the precaution of being analysed himself will not merely be punished by being incapable of learning more than a certain amount from his patients, he will risk a more serious danger and one which may become a danger to others. He will easily fall into the temptation of projecting outwards some of the peculiarities of his own personality, which he has dimly perceived, into the field of science, as a theory having universal validity; he will bring the psycho-analytic method into discredit, and lead the inexperienced astray.

[1912e, 2471]

Before I wind up these remarks on beginning analytic treatment, I must say a word about a certain ceremonial which concerns the position in which the treatment is carried out. I hold to the plan of getting the patient to lie on a sofa while I sit behind him out of his sight. This arrangement has a historical basis; it is the remnant of the hypnotic method out of which psycho-analysis was evolved. But it deserves to be maintained for many reasons. The first is a personal motive, but one which others may share with me. I cannot put up with being stared at by other people for eight hours a day (or more). Since, while I am listening to the patient, I, too, give myself over to the current of my unconscious thoughts, I do not wish my expressions of face to give the patient material for interpretations or to influence him in what he tells me. The patient usually regards being made to adopt this position as a hardship and rebels against it, especially if the instinct for looking (scopophilia) plays an important part in his neurosis. I insist on this procedure, however, for its purpose and result are to prevent the transference from mingling with the patient's associations imperceptibly, to isolate the transference and to allow it to come forward in due course sharply defined as a resistance. I know that many analysts work in a different way, but I do not know whether this deviation is due more to a craving for doing things differently or to some advantage which they find they gain by it.

[1913c, 2487]
The theory of repression is the corner-stone on which the whole structure of psycho-analysis rests. It is the most essential part of it; and yet it is nothing but a theoretical formulation of a phenomenon which may be observed as often as one pleases if one undertakes an analysis of a neurotic without resorting to hypnosis. In such cases one comes across a resistance which opposes the work of analysis and in order to frustrate it pleads a failure of memory. The use of hypnosis was bound to hide this resistance; the history of psycho-analysis proper, therefore, only begins with the new technique that dispenses with hypnosis. The theoretical consideration of the fact that this resistance coincides with an amnesia leads inevitably to the view of unconscious mental activity which is peculiar to psycho-analysis and which, too, distinguishes it quite clearly from philosophical speculations about the unconscious. It may thus be said that the theory of psycho-analysis is an attempt to account for two striking and unexpected facts of observation which emerge whenever an attempt is made to trace the symptoms of a neurotic back to their sources in his past life: the facts of transference and of resistance. Any line of investigation which recognizes these two facts and takes them as the starting-point of its work has a right to call itself psycho-analysis, even though it arrives at results other than my own. But anyone who takes up other sides of the problem while avoiding these two hypotheses will hardly escape a charge of misappropriation of property by attempted impersonation, if he persists in calling himself a psycho-analyst.

It is no easy or enviable task to write the history of these two secessions, partly because I am without any strong personal motive for doing so - I had not expected gratitude nor am I revengeful to any effective degree - and partly because I know that by doing so I shall lay myself open to the invectives of my not too scrupulous opponents and offer the enemies of analysis the spectacle they so heartily desire - of 'the psycho-analysts tearing one another limb from limb'. After exercising so much self-restraint in not coming to blows with opponents outside of analysis, I now see myself compelled to take up arms against its former followers or people who still like to call themselves its followers. I have no choice in the matter, however; only indolence or cowardice could lead one to keep silence, and silence would cause more harm than a frank revelation of the harms that already exist. Anyone who has followed the growth of other scientific movements will know that the same upheavals and dissensions commonly occur in them as well. It may be that elsewhere they are more carefully concealed; but psycho-analysis, which repudiates so many conventional ideals, is more honest in these matters too.

Another very severe drawback is that I cannot entirely avoid throwing some analytic light on these two opposition movements. Analysis is not suited, however, for polemical use; it presupposes the consent of the person who is being analysed and a situation in which there is a superior and a subordinate. Anyone, therefore, who undertakes an analysis for polemical purposes must expect the person analysed to use analysis against him in turn, so that the discussion will reach a state which entirely excludes the possibility of convincing any impartial third person. I shall therefore restrict to a minimum my use of analytic knowledge, and, with it, of indiscretion and aggressiveness towards my opponents; and I may also point out that I am not basing any scientific criticism on these grounds. I am not concerned with the truth that may be contained in the theories which I am rejecting, nor shall I attempt to refute them. I shall leave that task to other qualified workers in the field of psycho-analysis, and it has, indeed, already been partly accomplished. I wish merely to show that these theories controvert the fundamental principles of analysis (and on what points they controvert them) and that for this reason they should not be known by the name of analysis. So I shall avail myself of analysis only in order to explain how these divergences from it could arise among analysts. When I come to the points at which the divergences occurred, I shall have, it is true, to defend the just rights of psycho-analysis with some remarks of a purely critical nature.
The first task confronting psycho-analysis was to explain the neuroses; it used the two facts of resistance and transference as starting-points, and, taking into consideration the third fact of amnesia, accounted for them with its theories of repression, of the sexual motive forces in neurosis and of the unconscious. Psycho-analysis has never claimed to provide a complete theory of human mentality in general, but only expected that what it offered should be applied to supplement and correct the knowledge acquired by other means. Adler's theory, however, goes far beyond this point; it seeks at one stroke to explain the behaviour and character of human beings as well as their neurotic and psychotic illnesses. It is actually more suited to any other field than that of neurosis, although for reasons connected with the history of its development it still places this in the foreground. For many years I had opportunities of studying Dr. Adler and have never refused to recognize his unusual ability, combined with a particularly speculative disposition. As an instance of the 'persecution' to which he asserts he has been subjected by me, I can point to the fact that after the Association was founded I made over to him the leadership of the Vienna group. It was not until urgent demands were put forward by all the members of the society that I let myself be persuaded to take the chair again at its scientific meetings. When I perceived how little gift Adler had precisely for judging unconscious material, my view changed to an expectation that he would succeed in discovering the connections of psycho-analysis with psychology and with the biological foundations of instinctual processes - an expectation which was in some sense justified by the valuable work he had done on 'organ-inferiority'. And he did in fact effect something of the kind; but his work conveys an impression 'as if' - to speak in his own 'jargon' - it was intended to prove that psycho-analysis was wrong in everything and that it had only attributed so much importance to sexual motive forces because of its credulity in accepting the assertions of neurotics. I may even speak publicly of the personal motive for his work, since he himself announced it in the presence of a small circle of members of the Vienna group: - 'Do you think it gives me such great pleasure to stand in your shadow my whole life long?' To be sure, I see nothing reprehensible in a younger man freely admitting his ambition, which one would in any case guess was among the incentives for his work. But even though a man is dominated by a motive of this kind he should know how to avoid being what the English, with their fine social tact, call 'unfair' - which in German can only be expressed by a much cruder word. How little Adler has succeeded in this is shown by the profusion of petty outbursts of malice which disfigure his writings and by the indications they contain of an uncontrolled craving for priority. At the Vienna Psycho-Analytical Society we once actually heard him claim priority for the conception of the 'unity of the neuroses' and for the 'dynamic view' of them. This came as a great surprise to me, for I had always believed that these two principles were stated by me before I ever made Adler's acquaintance.

[1914d, 2913]

This striving of Adler's for a place in the sun has, however, had one result which is bound to be beneficial to psycho-analysis. When, after irreconcilable scientific disagreements had come to light, I was obliged to bring about Adler's resignation from the editorship of the Zentralblatt, he left the Vienna society as well, and founded a new one, which at first adopted the tasteful name of 'The Society for Free Psycho-Analysis' ['Verein für freie Psychoanalyse']. But outsiders who are unconnected with analysis are evidently as unskilful in appreciating the differences between the views of two psycho-analysts as we Europeans are in detecting the differences between two Chinese faces. 'Free' psycho-analysis remained in the shadow of 'official', 'orthodox' psycho-analysis and was treated merely as an appendage to the latter. Then Adler took a step for which we are thankful; he severed all connection with psycho-analysis, and gave his theory the name of 'Individual Psychology'. There is room enough on God's earth, and anyone who can has a perfect right to potter about on it without being prevented; but it is not a desirable thing for people who have ceased to understand one another and have grown incompatible with one another to remain under the same roof. Adler's 'Individual Psychology' is now one of the many schools of psychology which are adverse to psycho-analysis and its further development is no concern of ours.

[1914d, 2914]
The Adlerian theory was from the very beginning a 'system' - which psycho-analysis was careful to avoid becoming. It is also a remarkably good example of 'secondary revision', such as occurs, for instance, in the process to which dream-material is submitted by the action of waking thought. In Adler's case the place of dream-material is taken by the new material obtained through psycho-analytic studies; this is then viewed purely from the standpoint of the ego, reduced to the categories with which the ego is familiar, translated, twisted and - exactly as happens in dream-formation - is misunderstood. Moreover, the Adlerian theory is characterized less by what it asserts than by what it denies, so that it consists of three sorts of elements of quite dissimilar value: useful contributions to the psychology of the ego, superfluous but admissible translations of the analytic facts into the new 'jargon', and distortions and perversions of these facts when they do not comply with the requirements of the ego.

[1914d, 2915]

The elements of the first sort have never been ignored by psycho-analysis, although they did not deserve any special attention from it; it was more concerned to show that every ego-trend contains libidinal components. The Adlerian theory emphasises the counterpart to this, the egoistic constituent in libidinal instinctual impulses. This would have been an appreciable gain if Adler had not on every occasion used this observation in order to deny the libidinal impulses in favour of their egoistic instinctual components. His theory does what every patient does and what our conscious thought in general does - namely, makes use of a rationalization, as Jones has called it, in order to conceal the unconscious motive. Adler is so consistent in this that he positively considers that the strongest motive force in the sexual act is the man's intention of showing himself master of the woman - of being 'on top'. I do not know if he has expressed these monstrous notions in his writings.

[1914d, 2915]

Psycho-analysis recognized early that every neurotic symptom owes its possibility of existence to a compromise. Every symptom must therefore in some way comply with the demands of the ego which manipulates the repression; it must offer some advantage, it must admit of some useful application, or it would meet with the same fate as the original instinctual impulse itself which has been fended off. The term 'gain from illness' has taken this into account; one is even justified in differentiating the 'primary' gain to the ego, which must be operative at the time of the generation of the symptom, from a 'secondary' part, which supervenes in attachment to other purposes of the ego, if the symptom is to persist. It has also long been known that the withdrawal of this gain from illness, or its disappearance in consequence of some change in real external circumstances, constitutes one of the mechanisms of a cure of the symptom. In the Adlerian doctrine the main emphasis falls on these easily verifiable and clearly intelligible connections, while the fact is altogether overlooked that on countless occasions the ego is merely making a virtue of necessity in submitting, because of its usefulness, to the very disagreeable symptom which is forced upon it - for instance, in accepting anxiety as a means to security. The ego is here playing the ludicrous part of the clown in a circus who by his gestures tries to convince the audience that every change in the circus ring is being carried out under his orders. But only the youngest of the spectators are deceived by him.

[1914d, 2916]
Psycho-analysis is obliged to give its backing to the second constituent of Adler's theory as it would to something of its own. And in fact it is nothing else than psycho-analytic knowledge, which that author extracted from sources open to everyone during ten years of work in common and which he has now labelled as his own by a change in nomenclature. I myself consider 'safeguarding [Sicherung]', for instance, a better term than 'protective measure [Schutzmassregel]' which is the one I employ; but I cannot discover any difference in their meaning. Again, a host of familiar features come to light in Adler's propositions when one restores the earlier 'phantasied' and 'phantasy' in place of 'feigned [fingiert]', 'fictive' and 'fiction'. The identity of these terms would be insisted upon by psycho-analysis even if their author had not taken part in our common work over a period of many years.

[1914d, 2916]

The third part of the Adlerian theory, the twisted interpretations and distortions of the disagreeable facts of analysis, are what definitely separate 'Individual Psychology', as it is now to be called, from psycho-analysis. As we know, the principle of Adler's system is that the individual's aim of self-assertion, his 'will to power', is what, in the form of a 'masculine protest', plays a dominating part in the conduct of life, in character-formation and in neurosis. This 'masculine protest', the Adlerian motive force, is nothing else, however, but repression detached from its psychological mechanism and, moreover, sexualized in addition - which ill accords with the vaunted ejection of sexuality from its place in mental life. The 'masculine protest' undoubtedly exists, but if it is made into the motive force of mental life the observed facts are being treated like a spring-board that is left behind after it has been used to jump off from. Let us consider one of the fundamental situations in which desire is felt in infancy: that of a child observing the sexual act between adults. Analysis shows, in the case of people with whose life-story the physician will later be concerned, that at such moments two impulses take possession of the immature spectator. In boys, one is the impulse to put himself in the place of the active man, and the other, the opposing current, is the impulse to identify himself with the passive woman. Between them these two impulses exhaust the pleasurable possibilities of the situation. The first alone can come under the head of the masculine protest, if that concept is to retain any meaning at all. The second, however, the further course of which Adler disregards or which he knows nothing about, is the one that will become the more important in the subsequent neurosis. Adler has so merged himself in the jealous narrowness of the ego that he takes account only of those instinctual impulses which are agreeable to the ego and are encouraged by it; the situation in neurosis, in which the impulses are opposed to the ego, is precisely the one that lies beyond his horizon.

[1914d, 2917]
In connection with the attempt, which psycho-analysis has made necessary, to correlate the fundamental principle of its theory with the mental life of children, Adler exhibits the most serious departures from actual observation and the most fundamental confusion in his concepts. The biological, social and psychological meanings of 'masculine' and 'feminine' are here hopelessly mixed. It is impossible, and is disproved by observation, that a child, whether male or female, should find the plan of its life on an original depreciation of the female sex and take the wish to be a real man as its 'guiding line'. Children have, to begin with, no idea of the significance of the distinction between the sexes; on the contrary, they start with the assumption that the same genital organ (the male one) is possessed by both sexes; they do not begin their sexual researches with the problem of the distinction between the sexes, while the social underestimation of women is completely foreign to them. There are women in whose neurosis the wish to be a man has played no part. Whatever in the nature of a masculine protest can be shown to exist is easily traceable to a disturbance in primary narcissism due to threats of castration or to the earliest interferences with sexual activities. All disputes about the psychogenesis of the neuroses must eventually be decided in the field of the neuroses of childhood. Careful dissection of a neurosis in early childhood puts an end to all misapprehensions about the aetiology of the neuroses and to all doubts about the part played by the sexual instincts in them. That is why, in his criticism of Jung's paper 'Conflicts in the Mind of the Child', Adler was obliged to resort to the imputation that the facts of the case had been one-sidedly arranged, 'no doubt by the father'.

I will not dwell any longer on the biological aspect of the Adlerian theory nor discuss whether either actual 'organ-inferiority' or the subjective feeling of it - one does not know which - is really capable of serving as the foundation of Adler's system. I will merely remark in passing that if it were so neurosis would appear as a by-product of every kind of physical decrepitude, whereas observation shows that an impressive majority of ugly, misshapen, crippled and miserable people fail to react to their defects by neurosis. Nor will I deal with the interesting assertion according to which inferiority is to be traced back to the feeling of being a child. It shows the disguise under which the factor of infantilism, which is so strongly emphasized by psycho-analysis, re-appears in "Individual Psychology". On the other hand, I must point out how all the psychological acquisitions of psycho-analysis have been thrown to the winds by Adler. In his book Über den nervösen Charakter the unconscious is still mentioned as a psychological peculiarity, without, however, any relation to his system. Later, he has consistently declared that it is a matter of indifference to him whether an idea is conscious or unconscious. Adler has never from the first shown any understanding of repression. In an abstract of a paper read by him at the Vienna Society (February, 1911) he wrote that it must be pointed out that the evidence in a particular case showed that the patient had never repressed his libido, but had been continually 'safeguarding' himself against it. Soon afterwards, in a discussion at the Vienna Society, he said: 'If you ask where repression comes from, you are told, "from civilization"; but if you go on to ask where civilization comes from, you are told "from repression". So you see it is all simply playing with words.' A tithe of the acuteness and ingenuity with which Adler has unmasked the defensive devices of the 'nervous character' would have been enough to show him the way out of this pettifogging argument. What is meant is simply that civilization is based on the repressions effected by former generations, and that each fresh generation is required to maintain this civilization by effecting the same repressions. I once heard of a child who thought people were laughing at him, and began to cry, because when he asked where eggs come from he was told 'from hens', and when he went on to ask where hens come from he was told 'from eggs'. But they were not playing with words; on the contrary, they were telling him the truth.
Everything that Adler has to say about dreams, the shibboleth of psycho-analysis, is equally empty and unmeaning. At first he regarded dreams as a turning away from the feminine to the masculine line - which is simply a translation of the wish-fulfilment theory of dreams into the language of the 'masculine protest'. Later he found that the essence of dreams lies in enabling men to accomplish unconsciously what they are denied consciously. Adler must also be credited with priority in confusing dreams with latent dream-thoughts - a confusion on which the discovery of his 'prospective tendency' rests. Maeder followed his lead in this later. Here the fact is readily overlooked that every interpretation of a dream which is incomprehensible in its manifest form is based on the very method of dream-interpretation whose premises and conclusions are being disputed. In regard to resistance Adler informs us that it serves the purpose of putting into effect the patient's opposition to the physician. This is certainly true; it is as much as to say that it serves the purpose of resistance. Where it comes from, however, or how it happens that its phenomena are at the disposal of the patient is not further enquired into, as being of no interest to the ego. The detailed mechanism of the symptoms and manifestations of diseases, the explanation of the manifold variety of those diseases and their forms of expression, are disregarded in toto; for everything alike is pressed into the service of the masculine protest, self-assertion and the aggrandizement of the personality. the system is complete; to produce it has cost an enormous amount of labour in the recasting of interpretations, while it has not furnished a single new observation. I fancy I have made it clear that it has nothing to do with psycho-analysis.

[1914d, 2920]

The view of life which is reflected in the Adlerian system is founded exclusively on the aggressive instinct; there is no room in it for love. We might feel surprise that such a cheerless Weltanschauung should have met with any attention at all; but we must not forget that human beings, weighed down by the burden of their sexual needs, are ready to accept anything if only the 'overcoming of sexuality' is offered them as a bait.

[1914d, 2921]

Adler's secession took place before the Weimar Congress in 1911; after that date the Swiss began theirs. The first signs of it, curiously enough, were a few remarks of Riklin's in some popular articles appearing in Swiss publications, so that the general public learned earlier than those most intimately concerned in the subject that psycho-analysis had got the better of some regrettable errors which had previously discredited it. In 1912 Jung boasted, in a letter from America, that his modifications of psycho-analysis had overcome the resistances of many people who had hitherto refused to have anything to do with it. I replied that that was nothing to boast of, and that the more he sacrificed of the hard-won truths of psycho-analysis the more would he see resistances vanishing. This modification which the Swiss were so proud of introducing was again nothing else but a pushing into the background of the sexual factor in psycho-analytic theory. I confess that from the beginning I regarded this 'advance' as too far-reaching an adjustment to the demands of actuality.

[1914d, 2921]

These two retrograde movements away from psycho-analysis, which I must now compare with each other, show another point in common: for they both court a favourable opinion by putting forward certain lofty ideas, which view things, as it were, sub specie aeternitatis. With Adler, this part is played by the relativity of all knowledge and the right of the personality to put an artificial construction on the data of knowledge according to individual taste; with Jung, the appeal is made to the historic right of youth to throw off the fetters in which tyrannical age with its hidebound views seeks to bind it. A few words must be devoted to exposing the fallacy of these ideas.

[1914d, 2921]
The relativity of our knowledge is a consideration which may be advanced against every other science just as well as against psycho-analysis. It is derived from familiar reactionary currents of present-day feeling which are hostile to science, and it lays claim to an appearance of superiority to which no one is entitled. None of us can guess what the ultimate judgement of mankind about our theoretical efforts will be. There are instances in which rejection by the first three generations has been corrected by the succeeding one and changed into recognition. After a man has listened carefully to the voice of criticism in himself and has paid some attention to the criticisms of his opponents, there is nothing for him to do but with all his strength to maintain his own convictions which are based of experience. One should be content to conduct one's case honestly, and should not assume the office of judge, which is reserved for the remote future. The stress on arbitrary personal views in scientific matters is bad; it is clearly an attempt to dispute the right of psycho-analysis to be valued as a science - after that value, incidentally, has already been depreciated by what has been said before. Anyone who sets a high value on scientific thought will rather seek every possible means and method of circumscribing the factor of fanciful personal predilections as far as possible wherever it still plays too great a part. Moreover, it is opportune to recall that any zeal in defending ourselves is out of place. These arguments of Adler's are not intended seriously. They are only meant for use against his opponents; they do not touch his own theories. Nor have they prevented his followers from hailing him as the Messiah, for whose appearance expectant humanity has been prepared by a number of forerunners. The Messiah is certainly no relative phenomenon.

[1914d, 2922]

Jung's argument ad captandam benevolentiam¹ rests on the too optimistic assumption that the progress of the human race, of civilization and knowledge, has always pursued an unbroken one; as if there had been no periods of decadence, no reactions and restorations after every revolution, no generations who have taken a backward step and abandoned the gains of their predecessors. His approach to the standpoint of the masses, his abandonment of an innovation which proved unwelcome, make it a priori improbable that Jung's corrected version of psycho-analysis can justly claim to be a youthful act of liberation. After all, it is not the age of the doer that decides this but the character of the deed.

[1914d, 2922]

Of the two movements under discussion Adler's is indubitably the more important; while radically false, it is marked by consistency and coherence. It is, moreover, in spite of everything, founded upon a theory of the instincts. Jung's modification, on the other hand, loosens the connection of the phenomena with instinctual life; and further, as its critics (e.g. Abraham, Ferenczi and Jones) have pointed out, it is so obscure, unintelligible and confused as to make it difficult to take up any position upon it. Wherever one lays hold of anything, one must be prepared to hear that one has misunderstood it, and one cannot see how to arrive at a correct understanding of it. It is put forward in a peculiarly vacillating manner, one moment as 'quite a mild deviation, which does not justify the outcry that has been raised about it' (Jung), and the next moment as a new message of salvation which is to begin a new epoch for psycho-analysis, and, indeed, a new Weltanschauung for everyone.

[1914d, 2923]
When one thinks of the inconsistencies displayed in the various public and private pronouncements made by the Jungian movement, one is bound to ask oneself how much of this is due to lack of clearness and how much to lack of sincerity. It must be admitted, however, that the exponents of the new theory find themselves in a difficult position. They are now disputing things which they themselves formerly upheld, and they are doing so, moreover, not on the ground of fresh observations which might have taught them something further, but in consequence of fresh interpretations which make the things they see look different to them now from what they did before. For this reason they are unwilling to give up their connection with psycho-analysis, as whose representatives they became known to the world, and prefer to give it out that psycho-analysis has changed. At the Munich Congress I found it necessary to clear up this confusion, and I did so by declaring that I did not recognize the innovations of the Swiss as legitimate continuations and further developments of the psycho-analysis that originated with me. Outside critics (like Furtmüller) had already seen how things were, and Abraham is right in saying that Jung is in full retreat from psycho-analysis. I am of course perfectly ready to allow that everyone has a right to think and to write what he pleases; but he has no right to put it forward as something other than what it really is.

Just as Adler's investigation brought something new to psycho-analysis - a contribution to the psychology of the ego - and then expected us to pay too high a price for this gift by throwing over all the fundamental theories of analysis, so in the same way Jung and his followers paved the way for their fight against psycho-analysis by presenting it with a new acquisition. They traced in detail (as Pfister did before them) the way in which the material of sexual ideas belonging to the family-complex and incestuous object-choice is made use of in representing the highest ethical and religious interests of man - that is, they have illuminated an important instance of the sublimation of the erotic instinctual forces and of their transformation into trends which can no longer be called erotic. This was in complete harmony with all the expectations of psycho-analysis, and would have agreed very well with the view that in dreams and neurosis a regressive dissolution of this sublimation, as of all others, becomes visible. But the world would have risen in indignation and protested that ethics and religion were being sexualized. Now I cannot refrain from thinking teleologically for once and concluding that these discoverers were not equal to meeting such a storm of indignation. Perhaps it even began to rage in their own bosoms. The theological prehistory of so many of the Swiss throws no less light on their attitude to psycho-analysis than does Adler's socialist prehistory on the development of his psychology. One is reminded of Mark Twain's famous story of all the things that happened to his watch and of his concluding words: 'And he used to wonder what became of all the unsuccessful tinkers, and gunsmiths, and shoemakers, and blacksmiths; but nobody could ever tell him.'

Suppose - to make use of a simile - that in a particular social group there lives a parvenu, who boasts of being descended from a noble family living in another place. It is pointed out to him, however, that his parents live somewhere in the neighbourhood, and that they are quite humble people. There is only one way of escape from his difficulty and he seize on it. He can no longer repudiate his parents, but he asserts that they themselves are of noble lineage and have merely come down in the world; and he procures a family-tree from some obliging official source. It seems to me that the Swiss have been obliged to behave in much the same way. If ethics and religion were not allowed to be sexualized but had to be something 'higher' from the start, and if nevertheless the ideas contained in them seemed undeniably to be descended from the Oedipus and family-complex, there could be only one way out: it must be that from the very first these complexes themselves do not mean what they seem to be expressing, but bear the higher 'anagogic' meaning (as Silberer calls it) which made it possible for them to be employed in the abstract trains of thought of ethics and religious mysticism.
I am quite prepared to be told again that I have misunderstood the substance and purpose of the Neo-Zurich theory; but I must protest in advance against any contradictions to my view of it that may be found in the publications of that school being laid at my door instead of theirs. I can find no other way of making the whole range of Jung's innovations intelligible to myself and of grasping all their implications. All the changes that Jung has proposed to make in psycho-analysis flow from his intention to eliminate what is objectionable in the family-complexes, so as not to find it again in religion and ethics. For sexual libido an abstract concept has been substituted, of which one may safely say that it remains mystifying and incomprehensible to wise men and fools alike. The Oedipus complex has a merely 'symbolic' meaning: the mother in it means the unattainable, which must be renounced in the interests of civilization; the father who is killed in the Oedipus myth is the 'inner' father, from whom one must set oneself free in order to become independent. Other parts of the material of sexual ideas will no doubt be subjected to similar re-interpretations in the course of time. In the place of a conflict between ego-dystonic erotic trends and the self-preservative ones a conflict appears between the 'life-task' and 'psychical inertia'; the neurotic's sense of guilt corresponds to his self-reproach for not properly fulfilling his 'life-task'. In this way a new religio-ethical system has been created, which, just like the Adlerian system, was bound to re-interpret, distort or jettison the factual findings of analysis. The truth is that these people have picked out a few cultural overtones from the symphony of life and have once more failed to hear the mighty and primordial melody of the instincts.

In order to preserve this system intact it was necessary to turn entirely away from observation and from the technique of psycho-analysis. Occasionally enthusiasm for the cause even permitted a disregard of scientific logic - as when Jung finds that the Oedipus complex is not 'specific' enough for the aetiology of the neuroses, and proceeds to attribute this specific quality to inertia, the most universal characteristic of all matter, animate and inanimate! It is to be noted, by the way, that the 'Oedipus complex' represents only a topic with which the individual's mental forces have to deal, and is not itself a force, like 'psychical inertia'. The study of individual people had shown (and always will show) that the sexual complexes in their original sense are alive in them. On that account the investigation of individuals was pushed into the background and replaced by conclusions based on evidence derived from anthropological research. The greatest risk of coming up against the original, undisguised meaning of these re-interpreted complexes was to be met with in the early childhood of every individual; consequently in therapy the injunction was laid down that this past history should be dwelt on as little as possible and the main emphasis put on reverting to the current conflict, in which, moreover, the essential thing was on no account to be what was accidental and personal, but what was general - in fact, the non-fulfilment of the life-task. As we know, however, a neurotic's current conflict becomes comprehensible and admits of solution only when it is traced back to his prehistory, when one goes back along the path that his libido took when he fell ill.
The form taken by the Neo-Zurich therapy under these influences can be conveyed in the words of a patient who experienced it himself: 'This time not a trace of attention was given to the past or to the transference. Wherever I thought I recognized the latter it was pronounced to be a pure libidinal symbol. The moral instruction was very fine and I followed it faithfully, but I did not advance a step. It was even more annoying for me than for him, but how could I help it? . . . Instead of freeing me by analysis, every day brought fresh tremendous demands on me, which had to be fulfilled if the neurosis was to be conquered - for instance, inward concentration by means of introversion, religious meditation, resuming life with my wife in loving devotion, etc. It was almost beyond one's strength; it was aiming at a radical transformation of one's whole inner nature. I left the analysis as a poor sinner with intense feelings of contrition and the best resolutions, but at the same time in utter discouragement. Any clergyman would have advised what he recommended, but where was I to find the strength?' The patient, it is true, reported that he had heard that analysis of the past and of the transference must be gone through first; but he had been told that he had already had enough of it. Since this first kind of analysis had not helped him more, the conclusion seems to me justified that the patient had not had enough of it. Certainly the subsequent treatment, which no longer had any claim to be called psycho-analysis, did not improve matters. It is remarkable that the members of the Zurich school should have made the long journey round by way of Vienna in order to wind up at the nearby city of Berne, where Dubois cures neuroses by ethical encouragement in a more considerate manner.¹

[1914d, 2926]

The total incompatibility of this new movement with psycho-analysis shows itself too, of course, in Jung's treatment of repression, which is hardly mentioned nowadays in his writings, in his misunderstanding of dreams, which, like Adler, in complete disregard of dream-psychology, he confuses with the latent dream-thoughts, and in his loss of all understanding of the unconscious - in short, in all the points which I should regard as the essence of psycho-analysis. When Jung tells us that the incest-complex is merely 'symbolic', that after all it has no 'real' existence, that after all a savage feels no desire towards an old hag but prefers a young and pretty woman, we are tempted to conclude that 'symbolic' and 'without real existence' simply mean something which, in virtue of its manifestations and pathogenic effects, is described by psycho-analysis as 'existing unconsciously' - a description that disposes of the apparent contradiction.

[1914d, 2926]

It is not difficult to find a factual refutation of Jung's misconceptions of psycho-analysis and deviations from it. Every analysis conducted in a proper manner, and in particular every analysis of a child, strengthens the convictions upon which the theory of psycho-analysis is founded, and rebuts the re-interpretations made by both Jung's and Adler's systems. In the days before his illumination, Jung himself carried out and published an analysis of this kind of a child; it remains to be seen whether he will undertake a new interpretation of its results with the help of a different 'one-sided arrangement of the facts', to use the expression employed by Adler in this connection.

[1914d, 2927]
The view that the sexual representation of 'higher' thoughts in dreams and neurosis is nothing but an archaic mode of expression is of course irreconcilable with the fact that in neurosis these sexual complexes prove to be the bearers of the quantities of libido which have been withdrawn from utilization in real life. If it was merely a question of a sexual 'jargon', the economy of the libido could not have been altered in any way by it. Jung admits this himself in his *Darstellung der psychoanalytischen Theorie* and formulates the task of therapy as the detaching of libidinal cathexes from these complexes. This can never be achieved, however, by directing the patient away from them and urging him to sublimate, but only by exhaustive examination of them and by making them fully and completely conscious. The first piece of reality which the patient must deal with is his illness. Efforts to spare him that task point to the physician's incapacity to help him to overcome his resistances, or else to the physician's dread of the results of the work. [1914d, 2927]

It may be said lastly that by his 'modification' of psycho-analysis Jung has given us a counterpart to the famous Lichtenberg knife. He has changed the hilt, and he has put a new blade into it; yet because the same name is engraved on it we are expected to regard the instrument as the original one. [1914d, 2928]

I think I have made clear, on the contrary, that the new teaching which aims at replacing psycho-analysis signifies an abandonment of analysis and a secession from it. Some people may be inclined to fear that this secession is bound to have more momentous consequences for analysis than would another, owing to its having been started by men who have played so great a part in the movement and have done so much to advance it. I do not share this apprehension. [1914d, 2928]

Men are strong so long as they represent a strong idea; they become powerless when they oppose it. Psycho-analysis will survive this loss and gain new adherents in place of these. In conclusion, I can only express a wish that fortune may grant an agreeable upward journey to all those who have found their stay in the underworld of psycho-analysis too uncomfortable for their taste. The rest of us, I hope, will be permitted without hindrance to carry through to their conclusion our labours in the depths. [1914d, 2928]
I take the opportunity here of warning you against taking sides in a quite unnecessary dispute. In scientific matters people are very fond of selecting one portion of the truth, putting it in the place of the whole and of then disputing the rest, which is no less true, in favour of this one portion. In just this way a number of schools of opinion have already split off from the psycho-analytic movement, some of which recognize the egoistic instincts while disavowing the sexual ones, and others attribute importance to the influence of the real tasks of life while overlooking the individual's past - and others besides. Now here we have a similar occasion for pointing a contrast and starting a controversy. Are neuroses exogenous or endogenous illnesses? Are they the inevitable result of a particular constitution or the product of certain detrimental (traumatic) experiences in life? More particularly, are they brought about by fixation of the libido (and the other features of the sexual constitution) or by the pressure of frustration? This dilemma seems to me no more sensible on the whole than another that I might put to you: does a baby come about through being begotten by its father or conceived by its mother? Both determinants are equally indispensable, as you will justly reply. In the matter of the causation of the neuroses the relation, if not precisely the same, is very similar. As regards their causation, instances of neurotic illness fall into a series within which the two factors - sexual constitution and experience, or, if you prefer it, fixation of the libido and frustration - are represented in such a manner that if there is more of the one there is less of the other. At one end of the series are the extreme cases of which you could say with conviction: these people, in consequence of the singular development of their libido, would have fallen ill in any case, whatever they had experienced and however carefully their lives had been sheltered. At the other end there are the cases, as to which, on the contrary, you would have had to judge that they would certainly have escaped falling ill if their lives had not brought them into this or that situation. In the cases lying within the series a greater or lesser amount of predisposition in the sexual constitution is combined with a lesser or greater amount of detrimental experience in their lives. Their sexual constitution would not have led them into a neurosis if they had not had these experiences, and these experiences would not have had a traumatic effect on them if their libido had been otherwise disposed. In this series I can perhaps allow a certain preponderance in significance to the predisposing factors; but even that admission depends on how far you choose to extend the frontiers of neurotic illness.

[1916-1917, 3409]

The libido's retreat to phantasy is an intermediate stage on the path to the formation of symptoms and it seem to call for a special name. C. G. Jung coined the very appropriate one of 'introversion', but then most inexpediently gave it another meaning as well. We will continue to take it that introversion denotes the turning away of the libido from the possibilities of real satisfaction and the hypercathexis of phantasies which have hitherto been tolerated as innocent. An introvert is not yet a neurotic, but he is in an unstable situation: he is sure to develop symptoms at the next shift of forces, unless he finds some other outlets for his dammed-up libido. The unreal character of neurotic satisfaction and the neglect of the distinction between phantasy and reality are on the other hand already determined by the fact of lingering at the stage of introversion.

[1916-1917, 3429]

Anyone whom these warnings do not deter from taking the ego's counterfeits as sterling coin will have an easy time of it and will avoid all the resistances which oppose the psycho-analytic emphasis upon the unconscious, sexuality and the passivity of the ego. He will be able to declare like Alfred Adler that the 'neurotic character' is the cause of neuroses instead of their consequence; but neither will he be in a position to explain a single detail of symptom-formation or a single dream.

[1916-1917, 3433]
On the other hand we cannot overlook the fact that not all children are anxious to the same
degree, and that precisely children who exhibit a special timidity towards objects and in
situations of every kind turn out later to be neurotic. Thus the neurotic disposition betrays itself
also by an outspoken tendency to realistic anxiety; apprehensiveness appears to be the primary
thing and we reach the conclusion that the reason why children and, later, growing youths and
girls are afraid of the height of their libido is because in fact they are afraid of everything. The
genesis of anxiety from libido would in this way be denied; and if one examined into the
determinants of realistic anxiety, consistency would lead one to the view that consciousness of
one's own weakness and helplessness - inferiority according to Adler's terminology, - if it can be
prolonged from childhood into adult life, is the final basis of neuroses.
[1916-1917, 3453]

This sounds so simple and seductive that it has a claim on our attention. It is true that it would
involve a displacement of the riddle of the neurotic state. The continued existence of the sense
of inferiority - and thus, of what determine anxiety and the formation of symptoms - seems so
well assured that what calls for an explanation is rather how, as an exception, what we know as
health can come about. But what is revealed by a careful examination of apprehensiveness in
children? At the very beginning, what children are afraid of is strange people; situations only
become important because they include people, and impersonal things do not come into
account at all until later. But a child is not afraid of these strangers because he attributes evil
intentions to them and compares his weakness with their strength, and accordingly assesses
them as dangers to his existence, safety and freedom from pain. A child who is mistrustful in
this way and terrified of the aggressive instinct which dominates the world is a theoretical
construction that has quite miscarried. A child is frightened of a strange face because he is
adjusted to the sight of a familiar and beloved figure - ultimately of his mother. It is his
disappointment and longing that are transformed into anxiety - his libido, in fact, which has
become unemployable, which cannot at that time be held in suspense and is discharged as
anxiety. And it can scarcely be a matter of chance, either, that in this situation which is the
prototype of the anxiety of children there is a repetition of the determinant of the first state of
anxiety during the act of birth - namely, separation from the mother.
[1916-1917, 3453]

It is obvious, too, that we shall profit very little if, following Jung's example, we insist upon the
original unity of all the instincts and give the name of 'libido' to the energy manifested in all of
them. Since no device whatever will make it possible to eliminate the sexual function from
mental life, we shall in that case find ourselves obliged to speak of sexual and asexual libido.
But the name of libido is properly reserved for the instinctual forces of sexual life, as has
hitherto been our practice.
[1916-1917, 3459]

But I shall resist the temptation of going further here or of discussing other situations which
can be understood or pictured if we adopt the hypothesis that the object-libido may withdraw
into the ego - for I am obliged to meet two objections which, as I know, are now attracting your
attention. In the first place you want to call me to account because in talking of sleep, illness
and similar situations I invariably try to separate libido from interest, sexual from ego-instincts,
where observations can be fully satisfied by the hypothesis of a single and uniform energy
which, being freely mobile, cathects now the object and now the ego, in obedience to one or the
other instinct. And in the second place you want to know how I can venture to treat the
detaching of the libido from the object as the source of a pathological state, when a
transposition of this kind of object-libido into ego-libido (or, more generally, into ego-energy) is
among the normal processes of mental dynamics which are repeated daily and every night.
[1916-1917, 3465]
This case history was written down shortly after the termination of the treatment, in the winter of 1914-15. At that time I was still freshly under the impression of the twisted re-interpretations which C. G. Jung and Alfred Adler were endeavouring to give to the findings of psycho-analysis. This paper is therefore connected with my essay 'On the History of the Psycho-Analytic Movement' which was published in the *Jahrbuch der Psychoanalyse* in 1914. It supplements the polemic contained in that essay, which is in its essence of a personal character, by an objective estimation of the analytic material. It was originally intended for the next volume of the *Jahrbuch*, the appearance of which was, however, postponed indefinitely owing to the obstacles raised by the Great War. I therefore decided to add it to the present collection of papers which was being issued by a new publisher. Meanwhile I had been obliged to deal in *my Introductory Lectures on Psycho-Analysis* (which I delivered in 1916 and 1917) with many points which should have been raised for the first time in this paper. No alterations of any importance have been made in the text of the first draft; additions are indicated by means of square brackets. 

Human sexual conduct, as well as everything else, has been subordinated by Alfred Adler to motive forces of this kind, which spring from the will to power, from the individual's self-assertive instinct. Without ever denying the importance of these motives of power and prerogative, I have never been convinced that they play the dominating and exclusive part that has been ascribed to them. If I had not pursued my patient's analysis to the end, I should have been obliged, on account of my observation of this case, to correct my preconceived opinion in a direction favourable to Adler. The conclusion of the analysis unexpectedly brought up new material which, on the contrary, showed that these motives of power (in this case the intention to debase) had determined the object-choice only in the sense of serving as a contributory cause and as a rationalization, whereas the true underlying determination enabled me to maintain my former convictions.¹

The whale and the polar bear, it has been said, cannot wage war on each other, for since each is confined to his own element they cannot meet. It is just as impossible for me to argue with workers in the field of psychology or of the neuroses who do not recognize the postulates of psycho-analysis and who look on its results as artefacts. But during the last few years there has grown up another kind of opposition as well, among people who, in their own opinion at all events, take their stand upon the ground of analysis, who do not dispute its technique or results, but who merely think themselves justified in drawing other conclusions from the same material and in submitting it to other interpretations.

As a rule, however, theoretical controversy is unfruitful. No sooner has one begun to depart from the material on which one ought to be relying, than one runs the risk of becoming intoxicated with one's own assertions and, in the end, of supporting opinions which any observation would have contradicted. For this reason it seems to me to be incomparably more useful to combat dissentient interpretations by testing them upon particular cases and problems.

The two other doubts are based on a low estimate of the importance of early infantile impressions and an unwillingness to ascribe such enduring effects to them. The supporters of this view look for the causes of neuroses almost exclusively in the grave conflicts of later life; they assume that the importance of childhood is only held up before our eyes in analysis on account of the inclination of neurotics for expressing their present interests in reminiscences and symbols from the remote past. Such an estimate of the importance of the infantile factor would involve the disappearance of much that has formed part of the most intimate characteristics of analysis, though also, no doubt, of much that raises resistance to it and alienates the confidence of the outsider.
The view, then, that we are putting up for discussion is as follows. It maintains that scenes from early infancy, such as are brought up by an exhaustive analysis of neuroses (as, for instance, in the present case), are not reproductions of real occurrences, to which it is possible to ascribe an influence over the course of the patient's later life and over the formation of his symptoms. It considers them rather as products of the imagination, which find their instigation in mature life, which are intended to serve as some kind of symbolic representation of real wishes and interests, and which owe their origin to a regressive tendency, to a turning-away from the tasks of the present. If that is so, we can of course spare ourselves the necessity of attributing such a surprising amount to the mental life and intellectual capacity of children of the tenderest age.

I may here venture to point out that the antagonistic views which are to be found in the psycho-analytic literature of to-day are usually arrived at on the principle of *pars pro toto*. From a highly composite combination one part of the operative factors is singled out and proclaimed as the truth; and in its favour the other part, together with the whole combination, is then contradicted. If we look a little closer, to see which group of factors it is that has been given the preference, we shall find that it is the one that contains material already known from other sources or what can be most easily related to that material. Thus, Jung picks out actuality and regression, and Adler, egoistic motives. What is left over, however, and rejected as false, is precisely what is new in psycho-analysis and peculiar to it. This is the easiest method of repelling the revolutionary and inconvenient advances of psycho-analysis.

It is worth while remarking that none of the factors which are adduced by the opposing view in order to explain these scenes from infancy had to wait for recognition until Jung brought them forward as novelties. The notion of a current conflict, of a turning away from reality, of a substitutive satisfaction obtained in phantasy, of a regression to material from the past - all of this (employed, moreover, in the same context, though perhaps with a slightly different terminology) had for years formed an integral part of my own theory. It was not the whole of it, however. It was only one part of the causes leading to the formation of neuroses - that part which, starting from reality, operates in a regressive direction. Side by side with this I left room for another influence which, starting from the impressions of childhood, operates in a forward direction, which points a path for the libido that is shrinking away from life, and which makes it possible to understand the otherwise inexplicable regression to childhood. Thus on my view the two factors co-operate in the formation of symptoms. But an earlier co-operation seems to me to be of equal importance. I am of opinion that the influence of childhood makes itself felt already in the situation at the beginning of the formation of a neurosis, since it plays a decisive part in determining whether and at what point the individual shall fail to master the real problems of life.

What is in dispute, therefore, is the significance of the infantile factor. The problem is to find a case which can establish that significance beyond any doubt. Such, however, is the case which is being dealt with so exhaustively in these pages and which is distinguished by the characteristic that the neurosis in later life was preceded by a neurosis in early childhood. It is for that very reason, indeed, that I have chosen it to report upon. Should any one feel inclined to reject it because the animal phobia strikes him as not sufficiently serious to be recognized as an independent neurosis, I may mention that the phobia was succeeded without any interval by an obsessional ceremonial, and by obsessional acts and thoughts, which will be discussed in the following sections of this paper.
The occurrence of a neurotic disorder in the fourth and fifth years of childhood proves, first and foremost, that infantile experiences are by themselves in a position to produce a neurosis, without there being any need for the addition of a flight from some task which has to be faced in real life. It may be objected that even a child is constantly being confronted with tasks which it would perhaps be glad to evade. That is so; but the life of a child under school age is easily observable, and we can examine it to see whether any 'tasks' are to be found in it capable of determining the causation of a neurosis. But we discover nothing but instinctual impulses which the child cannot satisfy and which it is not old enough to master, and the sources from which these impulses arise.

[1918b, 3541]

All that we find in the prehistory of neuroses is that a child catches hold of this phylogenetic experience where his own experience fails him. He fills in the gaps in individual truth with prehistoric truth; he replaces occurrences in his own life by occurrences in the life of his ancestors. I fully agree with Jung ¹ in recognizing the existence of this phylogenetic heritage; but I regard it as a methodological error to seize on a phylogenetic explanation before the ontogenetic possibilities have been exhausted. I cannot see any reason for obstinately disputing the importance of infantile prehistory while at the same time freely acknowledging the importance of ancestral prehistory. Nor can I overlook the fact that phylogenetic motives and productions themselves stand in need of elucidation, and that in quite a number of instances this is afforded by factors in the childhood of the individual. And, finally, I cannot feel surprised that what was originally produced by certain circumstances in prehistoric times and was then transmitted in the shape of a predisposition to its re-acquirement should, since the same circumstances persist, emerge once more as a concrete event in the experience of the individual.

[1918b, 3577]

But what can have been the meaning of the fact that this veil, which was now symbolic but had once been real, was torn at the moment at which he evacuated his bowels after an enema, and that under this condition his illness left him? The context enables us to reply. If this birth-veil was torn, then he saw the world and was re-born. The stool was the child, as which he was born a second time, to a happier life. Here, then, we have the phantasy of re-birth, to which Jung has recently drawn attention and to which he has assigned such a dominating position in the imaginative life of neurotics.

[1918b, 3579]

¹ I admit that this is the most delicate question in the whole domain of psycho-analysis. I did not require the contributions of Adler or Jung to induce me to consider the matter with a critical eye, and to bear in mind the possibility that what analysis puts forward as being forgotten experiences of childhood (and of an improbably early childhood) may on the contrary be based upon phantasies created on occasions occurring late in life. According to this view, wherever we seemed in analyses to see traces of the after-effects of an infantile impression of the kind in question, we should rather have to assume that we were faced by the manifestation of some constitutional factor or of some disposition that had been phylogenetically maintained. On the contrary, no doubt has troubled me more; no other uncertainty has been more decisive in holding me back from publishing my conclusions. I was the first - a point to which none of my opponents have referred - to recognize both the part played by phantasies in symptom-formation and also the 'retrospective phantasying' of late impressions into childhood and their sexualization after the event. (See my Interpretation of Dreams (1900a), First Edition, p. 559, and 'Notes upon a Case of Obsessional Neurosis', (1909d).) If, in spite of this, I have held to the more difficult and more improbable view, it has been as a result of arguments such as are forced upon the investigator by the case described in these pages or by any other infantile neurosis - arguments which I once again lay before my readers for their decision.

[1918b, 3581]
One might be tempted at this point to introduce a slight alteration into psycho-analytic theory. It would seem palpably obvious that the repression and the formation of the neurosis must have originated out of the conflict between masculine and feminine tendencies, that is out of bisexuality. This view of the situation, however, is incomplete. Of the two conflicting sexual impulses one was ego-syntonic, while the other offended the boy's narcissistic interest; it was on that account that the latter underwent repression. So that in this case, too, it was the ego that put the repression into operation, for the benefit of one of the sexual tendencies. In other cases there is no such conflict between masculinity and femininity; there is only a single sexual tendency present, which seeks for acceptance, but offends against certain forces of the ego and is consequently repelled. Indeed, conflicts between sexuality and the moral ego trends are far more common than such as take place within the sphere of sexuality; but a moral conflict of this kind is lacking in our present case. To insist that bisexuality is the motive force leading to repression is to take too narrow a view; whereas if we assert the same of the conflict between the ego and the sexual tendencies (that is, the libido) we shall have covered all possible cases.

The theory of the 'masculine protest', as it has been developed by Adler, is faced by the difficulty that repression by no means always takes the side of masculinity against femininity; there are quite large classes of cases in which it is masculinity that has to submit to repression by the ego.

The opposition which he at first offered to religion had three different points of origin. To begin with, there was, in general, his characteristic (which we have seen exemplified already) of fending off all novelties. Any position of the libido which he had once taken up was obstinately defended by him from fear of what he would lose by giving it up and from distrust of the probability of a complete substitute being afforded by the new position that was in view. This is an important and fundamental psychological peculiarity, which I described in my Three Essays on the Theory of Sexuality (1905d) as a susceptibility to 'fixation'. Under the name of psychological 'inertia' Jung has attempted to erect it into the principal cause of all the failures of neurotics. I think he is wrong in this; for this factor has a far more general application and plays an important part in the lives of the non-neurotic as well. Great mobility or sluggishness of libidinal cathexes (as well as of other kinds of energetic cathexes) are special characteristics which attach to many normal people and by no means to all neurotics, and which have hitherto not been brought into relation with other qualities. They are, as it were, like prime numbers, not further divisible. We only know one thing about them, and that is that mobility of the mental cathexes is a quality which shows striking diminution with the advance of age. This has given us one of the indications of the limits within which psycho-analytic treatment is effective. There are some people, however, who retain this mental plasticity far beyond the usual age-limit, and others who lose it very prematurely. If the latter are neurotics, we make the unwelcome discovery that it is impossible to undo developments in them which, in apparently similar circumstances, have been easily dealt with in other people. So that in considering the conversion of psychical energy no less than of physical, we must make use of the concept of an entropy, which opposes the undoing of what has already occurred. 

[1918b, 3586]

[1918b, 3591]
I do not think I have exhausted the range of desirable activity on the part of the physician in saying that a condition of privation is to be kept up during the treatment. Activity in another direction during analytic treatment has already, as you will remember, been a point at issue between us and the Swiss school. We refused most emphatically to turn a patient who puts himself into our hands in search of help into our private property, to decide his fate for him, to force our own ideals upon him, and with the pride of a Creator to form him in our own image and see that it is good. I still adhere to this refusal, and I think that this is the proper place for the medical discretion which we have had to ignore in other connections. I have learnt by experience, too, that such a far-reaching activity towards patients is not in the least necessary for therapeutic purposes. For I have been able to help people with whom I had nothing in common - neither race, education, social position nor outlook upon life in general - without affecting their individuality. At the time of the controversy I have just spoken of, I had the impression, to be sure, that the objections of our spokesmen - I think it was Ernest Jones who took the chief part - were too harsh and uncompromising. We cannot avoid taking some patients for treatment who are so helpless and incapable of ordinary life that for them one has to combine analytic with educative influence; and even with the majority, occasions now and then arise in which the physician is bound to take up the position of teacher and mentor. But it must always be done with great caution, and the patient should be educated to liberate and fulfil his own nature, not to resemble ourselves.
[1919a, 3633]

The second theory is of more recent origin. It is in agreement with the first one in so far as it too represents the struggle between the two sexes as being the decisive cause of repression. In other respects it comes into conflict with the former theory; moreover, it looks for support to sociological rather than biological sources. According to this theory of the 'masculine protest', formulated by Alfred Adler, every individual makes efforts not to remain on the inferior 'feminine line' and struggles towards the 'masculine line', from which satisfaction can alone be derived. Adler makes the masculine protest responsible for the whole formation both of character and of neuroses. Unfortunately he makes so little distinction between the two processes, which certainly have to be kept separate, and sets altogether so little store in general by the fact of repression, that to attempt to apply the doctrine of the masculine protest to repression brings with it the risk of misunderstanding. In my opinion such an attempt could only lead us to infer that the masculine protest, the desire to break away from the feminine line, was in every case the motive force of repression. The repressing agency, therefore, would always be a masculine instinctual impulse, and the repressed would be a feminine one. But symptoms would also be the result of a feminine impulse, for we cannot discard the characteristic feature of symptoms - that they are substitutes for the repressed, substitutes that have made their way out in spite of repression.
[1919e, 3660]
The theory of the masculine protest seems to maintain its ground very much better on being tested in regard to the beating-phantasies. In the case of both boys and girls the beating phantasy corresponds with a feminine attitude - one, that is, in which the individual is lingering on the ‘feminine line’ - and both sexes hasten to get free from this attitude by repressing the phantasy. Nevertheless, it seems to be only with the girl that the masculine protest is attended with complete success, and in that instance, indeed, an ideal example is to be found of the operation of the masculine protest. With the boy the result is not entirely satisfactory; the feminine line is not given up, and the boy is certainly not ‘on top’ in his conscious masochistic phantasy. It would therefore agree with the expectations derived from the theory if we were to recognize that this phantasy was a symptom which had come into existence through the failure of the masculine protest. It is a disturbing fact, to be sure, that the girl’s phantasy, which owes its origin to the forces of repression, also has the value and meaning of a symptom. In this instance, where the masculine protest has completely achieved its object, surely the determining condition for the formation of a symptom must be absent.

Before we are led by this difficulty to a suspicion that the whole conception of the masculine protest is inadequate to meet the problem of neuroses and perversions, and that its application to them is unfruitful, we will for a moment leave the passive beating-phantasies and turn our attention to other instinctual manifestations of infantile sexual life - manifestations which have equally undergone repression. No one can doubt that there are also wishes and phantasies which keep to the masculine line from their very nature, and which are the expression of masculine instinctual impulses - sadistic tendencies, for instance, or a boy’s lustful feelings towards his mother arising out of the normal Oedipus complex. It is no less certain that these impulses, too, are overtaken by repression. If the masculine protest is to be taken as having satisfactorily explained the repression of passive phantasies (which later become masochistic), then it becomes for that very reason totally inapplicable to the opposite case of active phantasies. That is to say, the doctrine of the masculine protest is altogether incompatible with the fact of repression. Unless we are prepared to throw away all that has been acquired in psychology since Breuer's first cathartic treatment and through its agency, we cannot expect that the principle of the masculine protest will acquire any significance in the elucidation of the neuroses and perversions.

[1919e, 3661]
The next step was taken when psycho-analysis felt its way closer towards the psychological
ego, which it had first come to know only as a repressive, censoring agency, capable of erecting
protective structures and reactive formations. Critical and far-seeing minds had, it is true, long
since objected to the concept of libido being restricted to the energy of the sexual instincts
directed towards an object. But they failed to explain how they had arrived at their better
knowledge or to derive from it anything of which analysis could make use. Advancing more
cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the
object and directed on to the ego (the process of introversion); and, by studying the libidinal
development of children in its earliest phases, came to the conclusion that the ego is the true
and original reservoir of libido, and that it is only from that reservoir that libido is extended on to
objects. The ego now found its position among sexual objects and was at once given the
foremost place among them. Libido which was in this way lodged in the ego was described as
'narcissistic'.¹ This narcissistic libido was of course also a manifestation of the force of the
sexual instinct in the analytical sense of those words, and it had necessarily to be identified with
the 'self-preservative instincts' whose existence had been recognized from the first. Thus the
original opposition between the ego-in instincts and the sexual instincts proved to be inadequate.
A portion of the ego-in instincts was seen to be libidinal; sexual instincts - probably alongside
others - operated in the ego. Nevertheless we are justified in saying that the old formula which
lays it down that psychoneuroses are based on a conflict between ego-in instincts and sexual
instincts contains nothing that we need reject to-day. It is merely that the distinction between the
two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now
be characterized differently - namely as being topographical. And in particular it is still true that
the transference neuroses, the essential subject of psycho-analytic study, are the result of a
conflict between the ego and the libidinal cathexis of objects.
[1920g, 3753]

But it is all the more necessary for us to lay stress upon the libidinal character of the self-
preservative instincts now that we are venturing upon the further step of recognizing the sexual
instinct as Eros, the preserver of all things, and of deriving the narcissistic libido of the ego from
the stores of libido by means of which the cells of the soma are attached to one another. But we
now find ourselves suddenly faced by another question. If the self-preservative instincts too are
of a libidinal nature, are there perhaps no other instincts whatever but the libidinal ones? At all
events there are none other visible. But in that case we shall after all be driven to agree with the
critics who suspected from the first that psycho-analysis explains everything by sexuality, or
with innovators like Jung who, making a hasty judgement, have used the word 'libido' to mean
instinctual force in general. Must not this be so?
[1920g, 3753]
It was not our intention at all events to produce such a result. Our argument had as its point of departure a sharp distinction between ego-instincts, which we equated with death instincts, and sexual instincts, which we equated with life instincts. (We were prepared at one stage to include the so-called self-preservative instincts of the ego among the death instincts; but we subsequently corrected ourselves on this point and withdrew it.) Our views have from the very first been dualistic, and to-day they are even more definitely dualistic than before - now that we describe the opposition as being, not between ego-instincts and sexual instincts but between life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us otherwise. We suspect that instincts other than those of self-preservation operate in the ego, and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-instincts which are still strange to us. Even before we had any clear understanding of narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components attached to them. But these are very uncertain possibilities, to which our opponents will pay very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to point to any instincts other than the libidinal ones. That, however, is no reason for our falling in with the conclusion that no others in fact exist.

[1920g, 3754]

We are not destined, so it seems, to devote ourselves quietly to the extension of our science. Scarcely have we triumphantly repulsed two attacks - one of which sought to deny once more what we had brought to light and only offered us in exchange the theme of disavowal, while the other tried to persuade us that we had mistaken the nature of what we had found and might with advantage take something else in its place - scarcely, then, do we feel ourselves safe from these enemies, when another peril has arisen. And this time it is something tremendous, something elemental, which threatens not us alone but our enemies, perhaps, still more.

[1941d [1921], 3863]

Later History of Psycho-Analysis. - Psycho-analysis was carried approximately thus far by the work of the writer of this article, who for more than ten years was its sole representative. In 1906 the Swiss psychiatrists Bleuler and C. G. Jung began to play a lively part in analysis; in 1907 a first conference of its supporters took place at Salzburg; and the young science soon found itself the centre of interest both among psychiatrists and laymen. Its reception in Germany, with her morbid craving for authority, was not precisely to the credit of German science and moved even so cool a partisan as Bleuler to an energetic protest. Yet no condemnation or dismissal at official congresses served to hold up the internal growth or external expansion of psycho-analysis. In the course of the next ten years it extended far beyond the frontiers of Europe and became especially popular in the United States of America, and this was due in no small degree to the advocacy and collaboration of Putnam (Boston), Ernest Jones (Toronto; later London), Flournoy (Geneva), Ferenczi (Budapest), Abraham (Berlin), and many others besides. The anathema which was imposed upon psycho-analysis led its supporters to combine in an international organization which in the present year (1922) is holding its eighth private Congress in Berlin and now includes local groups in Vienna, Budapest, Berlin, Holland, Zurich, London, New York, Calcutta and Moscow. This development was not interrupted even by the World War. In 1918-19 Dr. Anton von Freund of Budapest founded the Internationaler Psychoanalytischer Verlag, which publishes journals and books concerned with psycho-analysis, and in 1920 Dr. M. Eitingon opened in Berlin the first psycho-analytic clinic for the treatment of neurotics without private means. Translations of the writer's principal works, which are now in preparation, into French, Italian and Spanish, testify to a growing interest in psycho-analysis in the Latin world as well.

[1923a, 3924]
Between 1911 and 1913 two movements of divergence from psycho-analysis took place, evidently with the object of mitigating its repellent features. One of these (sponsored by C. G. Jung), in an endeavour to conform to ethical standards, divested the Oedipus complex of its real significance by giving it only a symbolic value, and in practice neglected the uncovering of the forgotten and, as we may call it, 'prehistoric' period of childhood. The other (originated by Alfred Adler in Vienna) reproduced many factors from psycho-analysis under other names - repression, for instance, appeared in a sexualized version as the 'masculine protest'. But in other respects it turned away from the unconscious and the sexual instincts, and endeavoured to trace back the development of character and of the neuroses to the 'will to power', which by means of overcompensation strives to check the dangers arising from 'organ inferiority'. Neither of these movements, with their systematic structures, had any permanent influence on psycho-analysis. In the case of Adler's theories it soon became clear that they had very little in common with psycho-analysis, which they were designed to replace.

[1923a, 3924]

**Criticisms and Misunderstandings of Psycho-Analysis.** - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1923a, 3928]

**Primal Libido.** - C. G. Jung attempted to resolve this obscurity along speculative lines by assuming that there was only a single primal libido which could be either sexualized or desexualized and which therefore coincided in its essence with mental energy in general. This innovation was methodologically disputable, caused a great deal of confusion, reduced the term 'libido' to the level of a superfluous synonym and was still in practice confronted with the necessity for distinguishing between sexual and asexual libido. The difference between the sexual instincts and instincts with other aims was not to be got rid of by means of a new definition.

[1923a, 3932]
Apparent Approach to Jung's Views. - It thus seemed on the face of it as though the slow process of psycho-analytic research was following in the steps of Jung's speculation about a primal libido, especially because the transformation of object-libido into narcissism necessarily carried along with it a certain degree of desexualization, or abandonment of the specifically sexual aims. Nevertheless, it has to be borne in mind that the fact that the self-preservative instincts of the ego are recognized as libidinal does not necessarily prove that there are no other instincts operating in the ego.

[1923a, 3933]

In these pages things are touched on which have not yet been the subject of psycho-analytic consideration, and it has not been possible to avoid trenching upon some theories which have been put forward by non-analysts or by former analysts on their retreat from analysis. I have elsewhere always been ready to acknowledge what I owe to other workers; but in this instance I feel burdened by no such debt of gratitude. If psycho-analysis has not hitherto shown its appreciation of certain things, this has never been because it overlooked their achievement or sought to deny their importance, but because it followed a particular path, which had not yet led so far. And finally, when it has reached them, things have a different look to it from what they have to others.

[1923b, 3946]

This revolt against castration or a feminine attitude has been torn out of its organic context by Alfred Adler. He has linked it superficially or falsely with the longing for power, and has postulated it as an independent 'masculine protest'. Since a neurosis can only arise from a conflict between two trends, it is as justifiable to see the cause of 'every' neurosis in the masculine protest as it is to see it in the feminine attitude against which the protest is being made. It is quite true that this masculine protest plays a regular part in the formation of character - in some types of people a very large part - and that we meet it in the analysis of neurotic men as a vigorous resistance. Psycho-analysis has attached due importance to the masculine protest in connection with the castration complex, without being able to accept its omnipotence or its omnipresence in neuroses. The most marked case of a masculine protest with all its manifest reactions and character-traitsthat I have met with in analysis was that of a patient who came to me for treatment on account of an obsessional neurosis in whose symptoms the unresolved conflict between a masculine and a feminine attitude (fear of castration and desire for castration) found clear expression. In addition, the patient had developed masochistic phantasies which were wholly derived from a wish to accept castration; and he had even gone beyond these phantasies to real satisfaction in perverse situations. The whole of his state rested - like Adler's theory itself - on the repression and denial of early infantile fixations of love.

[1923d, 4016]
An essential difference between this second decade of psycho-analysis and the first lay in the fact that the present writer was no longer its sole representative. A constantly growing circle of pupils and followers had collected around him, who devoted themselves first to the diffusion of the theories of psycho-analysis and then extended them, supplemented them and carried them deeper. In the course of years, several of these supporters, as was inevitable, seceded, took their own paths, or turned themselves into an opposition which seemed to threaten the continuity of the development of psycho-analysis. Between 1911 and 1913 C. G. Jung in Zurich and Alfred Adler in Vienna produced some stir by their attempts at giving new interpretations to the facts of analysis and their efforts at a diversion from the analytic standpoint. But it soon appeared that these secessions had effected no lasting damage. What temporary success they achieved was easily accounted for by the readiness of the mass of people to have themselves set free from the pressure of the demands of psycho-analysis by whatever path might be opened to them. The great majority of co-workers remained firm and continued their work along the lines indicated to them. We shall come on their names repeatedly in the short account below of the findings of psycho-analysis in the many and various fields of its application.

[1924f, 4112]

¹ In my first critical account of the 'History of the Psycho-Analytic Movement' (1914d), I recognized that this fact represents the core of truth contained in Adler's theory. That theory has no hesitation in explaining the whole world by this single point ('organ inferiority', the 'masculine protest', 'breaking away from the feminine line') and prides itself upon having in this way robbed sexuality of its importance and put the desire for power in its place! Thus the only organ which could claim to be called 'inferior' without any ambiguity would be the clitoris. On the other hand, one hears of analysts who boast that, though they have worked for dozens of years, they have never found a sign of the existence of a castration complex. We must bow our heads in recognition of the greatness of this achievement, even though it is only a negative one, a piece of virtuosity in the art of overlooking and mistaking. The two theories form an interesting pair of opposites: in the latter not a trace of a castration complex, in the former nothing else than its consequences.

[1925j, 4151]
The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of component instincts. These are dependent upon erotogenic zones in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly auto-erotic. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the oral components, an anal-sadistic stage follows, and it is only after the third stage has at last been reached that the primacy of the genitals is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of libido to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, fixations of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as regression), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the choice of neurosis, that is, the form in which the subsequent illness makes its appearance.

[1925d, 4211]

The result of the official anathema against psycho-analysis was that the analysts began to come closer together. At the second Congress, held at Nuremberg in 1910, they formed themselves, on the proposal of Ferenczi, into an 'International Psycho-Analytical Association' divided into a number of local societies but under a common President. The Association survived the Great War and still exists, consisting to-day of branch societies in Austria, Germany, Hungary, Switzerland, Great Britain, Holland, Russia, and India, as well as two in the United States. I arranged that C. G. Jung should be appointed as the first President, which turned out later to have been a most unfortunate step. At the same time a second journal devoted to psycho-analysis was started, the Zentralblatt für Psychoanalyse, edited by Adler and Stekel, and a little later a third, Imago, edited by two non-medical analysts, H. Sachs and O. Rank, and intended to deal with the application of analysis to the mental sciences. Soon afterwards Bleuler published a paper in defence of psycho-analysis. Though it was a relief to find honesty and straightforward logic for once taking part in the dispute, yet I could not feel completely satisfied by Bleuler's essay. He strove too eagerly after an appearance of impartiality; nor is it a matter of chance that it is to him that our science owes the valuable concept of ambivalence. In later papers Bleuler adopted such a critical attitude towards the theoretical structure of analysis and rejected or threw doubts upon such essential parts of it that I could not help asking myself in astonishment what could be left of it for him to admire. Yet not only has he subsequently uttered the strongest pleas in favour of 'depth psychology' but he based his comprehensive study of schizophrenia upon it. Nevertheless Bleuler did not for long remain a member of the International Psycho-Analytical Association; he resigned from it as a result of misunderstandings with Jung, and the Burghölzli was lost to analysis.

[1925d, 4225]
In Europe during the years 1911-13 two secessionist movements from psycho-analysis took place, led by men who had previously played a considerable part in the young science, Alfred Adler and C. G. Jung. Both movements seemed most threatening and quickly obtained a large following. But their strength lay, not in their own content, but in the temptation which they offered of being freed from what were felt as the repellent findings of psycho-analysis even though its actual material was no longer rejected. Jung attempted to give to the facts of analysis a fresh interpretation of an abstract, impersonal and non-historical character, and thus hoped to escape the need for recognizing the importance of infantile sexuality and of the Oedipus complex as well as the necessity for any analysis of childhood. Adler seemed to depart still further from psycho-analysis; he entirely repudiated the importance of sexuality, traced back the formation both of character and of the neuroses solely to men's desire for power and to their need to compensate for their constitutional inferiorities, and threw all the psychological discoveries of psycho-analysis to the winds. But what he had rejected forced its way back into his closed system under other names; his 'masculine protest' is nothing else than repression unjustifiably sexualized. The criticism with which the two heretics were met was a mild one; I only insisted that both Adler and Jung should cease to describe their theories as 'psycho-analysis'. After a lapse of ten years it can be asserted that both of these attempts against psycho-analysis have blown over without doing any harm.
[1925d, 4227]

If a community is based on agreement upon a few cardinal points, it is obvious that people who have abandoned that common ground will cease to belong to it. Yet the secession of former pupils has often been brought up against me as a sign of my intolerance or has been regarded as evidence of some special fatality that hangs over me. It is a sufficient answer to point out that in contrast to those who have left me, like Jung, Adler, Stekel, and a few besides, there are a great number of men, like Abraham, Eitingon, Ferenczi, Rank, Jones, Brill, Sachs, Pfister, van Emden, Reik, and others, who have worked with me for some fifteen years in loyal collaboration and for the most part in uninterrupted friendship. I have only mentioned the oldest of my pupils, who have already made a distinguished name for themselves in the literature of psycho-analysis; if I have passed over others, that is not to be taken as a slight, and indeed among those who are young and have joined me lately talents are to be found on which great hopes may be set. But I think I can say in my defence that an intolerant man, dominated by an arrogant belief in his own infallibility, would never have been able to maintain his hold upon so large a number of intellectually eminent people, especially if he had at his command as few practical attractions as I had.
[1925d, 4228]

I must begin by adding that increasing experience showed more and more plainly that the Oedipus complex was the nucleus of the neurosis. It was at once the climax of infantile sexual life and the point of junction from which all of its later developments proceeded. But if so, it was no longer possible to expect analysis to discover a factor that was specific in the aetiology of the neuroses. It must be true, as Jung expressed it so well in the early days when he was still an analyst, that neuroses have no peculiar content which belongs exclusively to them but that neurotics break down at the same difficulties that are successfully overcome by normal people. This discovery was very far from being a disappointment. It was in complete harmony with another one: that the depth-psychology revealed by psycho-analysis was in fact the psychology of the normal mind. Our path had been like that of chemistry: the great qualitative differences between substances were traced back to quantitative variations in the proportions in which the same elements were combined.
[1925d, 4230]
I must add a few more words on the history of psycho-analysis during the last decade. There can no longer be any doubt that it will continue; it has proved its capacity to survive and to develop both as a branch of knowledge and as a therapeutic method. The number of its supporters (organized into the International Psycho-Analytical Association) has considerably increased. In addition to the older local groups (in Vienna, Berlin, Budapest, London, Holland, Switzerland, and Russia), societies have since been formed in Paris and Calcutta, two in Japan, several in the United States, and quite recently one each in Jerusalem and South Africa and two in Scandinavia. Out of their own funds these local societies support (or are in process of forming) training institutes, in which instruction in the practice of psycho-analysis is given according to a uniform plan, and out-patient clinics in which experienced analysts as well as students give free treatment to patients of limited means. Every other year the members of the International Psycho-Analytical Association hold a Congress at which scientific papers are read and questions of organization decided. The thirteenth of these congresses (which I myself can no longer attend) took place at Lucerne in 1934. From a core of interests that are common to all members of the Association, their work radiates in many different directions. Some lay most stress upon clarifying and deepening our knowledge of psychology, while others are concerned with keeping in contact with medicine and psychiatry. From the practical point of view, some analysts have set themselves the task of bringing about the recognition of psycho-analysis at the universities and its inclusion in the medical curriculum, whereas others are content to remain outside these institutions and will not allow that psycho-analysis is less important in the field of education than in that of medicine. It happens from time to time that an analytic worker may find himself isolated in an attempt to emphasize some single one of the findings or views of psycho-analysis at the expense of all the rest. Nevertheless, the whole impression is a satisfactory one - of serious scientific work carried on at a high level.

[1925d, 4245]

All we can do is to examine the occasions on which infants in arms or somewhat older children show readiness to produce anxiety. In his book on the trauma of birth, Rank (1924) has made a determined attempt to establish a relationship between the earliest phobias of children and the impressions made on them by the event of birth. But I do not think he has been successful. His theory is open to two objections. In the first place, he assumes that the infant has received certain sensory impressions, in particular of a visual kind, at the time of birth, the renewal of which can recall to its memory the trauma of birth and thus evoke a reaction of anxiety. This assumption is quite unfounded and extremely improbable. It is not credible that a child should retain any but tactile and general sensations relating to the process of birth. If, later on, children show fear of small animals that disappear into holes or emerge from them, this reaction, according to Rank, is due to their perceiving an analogy. But it is an analogy of which they cannot be aware. In the second place, in considering these later anxiety-situations Rank dwells, as suits him best, now on the child's recollection of its happy intra-uterine existence, now on its recollection of the traumatic disturbance which interrupted that existence which leaves the door wide open for arbitrary interpretation. There are, moreover, certain examples of childhood anxiety which directly traverse his theory. When, for instance, a child is left alone in the dark one would expect it, according to his view, to welcome the re-establishment of the intra-uterine situation; yet it is precisely on such occasions that the child reacts with anxiety. And if this is explained by saying that the child is being reminded of the interruption which the event of birth made in its intra-uterine happiness, it becomes impossible to shut one's eyes any longer to the far-fetched character of such explanations.

[1926d, 4291]
I am driven to the conclusion that the earliest phobias of infancy cannot be directly traced back to impressions of the act of birth and that so far they have not been explained. A certain preparedness for anxiety is undoubtedly present in the infant in arms. But this preparedness for anxiety, instead of being at its maximum immediately after birth and then slowly decreasing, does not emerge till later, as mental development proceeds, and lasts over a certain period of childhood. If these early phobias persist beyond that period one is inclined to suspect the presence of a neurotic disturbance, although it is not at all clear what their relation is to the undoubted neuroses that appear later on in childhood.

But a moment's reflection takes us beyond this question of loss of object. The reason why the infant in arms wants to perceive the presence of its mother is only because it already knows by experience that she satisfies all its needs without delay. The situation, then, which it regards as a 'danger' and against which it wants to be safeguarded is that of non-satisfaction, of a growing tension due to need, against which it is helpless. I think that if we adopt this view all the facts fall into place. The situation of non-satisfaction in which the amounts of stimulation rise to an unpleasurable height without its being possible for them to be mastered psychically or discharged must for the infant be analogous to the experience of being born - must be a repetition of the situation of danger. What both situations have in common is the economic disturbance caused by an accumulation of amounts of stimulation which require to be disposed of. It is this factor, then, which is the real essence of the 'danger'. In both cases the reaction of anxiety sets in. (This reaction is still an expedient one in the infant in arms, for the discharge, being directed into the respiratory and vocal muscular apparatus, now calls its mother to it, just as it activated the lungs of the new-born baby to get rid of the internal stimuli.) It is unnecessary to suppose that the child carries anything more with it from the time of its birth than this way of indicating the presence of danger.

In these two aspects, as an automatic phenomenon and as a rescuing signal, anxiety is seen to be a product of the infant's mental helplessness which is a natural counterpart of its biological helplessness. The striking coincidence by which the anxiety of the new-born baby and the anxiety of the infant in arms are both conditioned by separation from the mother does not need to be explained on psychological lines. It can be accounted for simply enough biologically; for, just as the mother originally satisfied all the needs of the foetus through the apparatus of her own body, so now, after its birth, she continues to do so, though partly by other means. There is much more continuity between intra-uterine life and earliest infancy than the impressive caesura of the act of birth would have us believe. What happens is that the child's biological situation as a foetus is replaced for it by a psychical object-relation to its mother. But we must not forget that during its intra-uterine life the mother was not an object for the foetus, and that at that time there were no objects at all. It is obvious that in this scheme of things there is no place for the abreaction of the birth trauma. We cannot find that anxiety has any function other than that of being a signal for the avoidance of a danger situation.
Anxiety is the reaction to danger. One cannot, after all, help suspecting that the reason why the affect of anxiety occupies a unique position in the economy of the mind has something to do with the essential nature of danger. Yet dangers are the common lot of humanity; they are the same for everyone. What we need and cannot lay our finger on is some factor which will explain why some people are able to subject the affect of anxiety, in spite of its peculiar quality, to the normal workings of the mind, or which decides who is doomed to come to grief over that task. Two attempts to find a factor of this kind have been made; and it is natural that such efforts should meet with a sympathetic reception, since they promise help to meet a tormenting need. The two attempts in question are mutually complementary; they approach the problem at opposite ends. The first was made by Alfred Adler more than ten years ago. His contention, reduced to its essence, was that the people who came to grief over the task set them by danger were those who were too greatly impeded by some organic inferiority. If it were true that *simpex sigillum veri*, we should welcome such a solution as a deliverance. But on the contrary, our critical studies of the last ten years have effectively demonstrated the total inadequacy of such an explanation - an explanation, moreover, which sets aside the whole wealth of material that has been discovered by psycho-analysis.

[1926d, 4304]

The second attempt was made by Otto Rank in 1923 in his book, *The Trauma of Birth*. It would be unjust to put his attempt on the same level as Adler's except in this single point which concerns us here, for it remains on psycho-analytic ground and pursues a psycho-analytic line of thought, so that it may be accepted as a legitimate endeavour to solve the problems of analysis. In this matter of the relation of the individual to danger Rank moves away from the question of organic defect in the individual and concentrates on the variable degree of intensity of the danger. The process of birth is the first situation of danger, and the economic upheaval which it produces becomes the prototype of the reaction of anxiety. We have already traced the line of development which connects this first danger-situation and determinant of anxiety with all the later ones, and we have seen that they all retain a common quality in so far as they signify in a certain sense a separation from the mother - at first only in a biological sense, next as a direct loss of object and later as a loss of object incurred indirectly. The discovery of this extensive concatenation is an undoubted merit of Rank's construction. Now the trauma of birth overtakes each individual with a different degree of intensity, and the violence of his anxiety-reaction varies with the strength of the trauma; and it is the initial amount of anxiety generated in him which, according to Rank, decides whether he will ever learn to control it - whether he will become neurotic or normal.

[1926d, 4304]
It is not our business to criticize Rank’s hypothesis in detail here. We have only to consider whether it helps to solve our particular problem. His formula - that those people become neurotic in whom the trauma of birth was so strong that they have never been able completely to abreact it - is highly disputable from a theoretical point of view. We do not rightly know what is meant by abreacting the trauma. Taken literally, it implies that the more frequently and the more intensely a neurotic person reproduces the affect of anxiety the more closely will he approach to mental health - an untenable conclusion. It was because it did not tally with the facts that I gave up the theory of abreaction which had played such a large part in the cathartic method. To lay so much stress, too, on the variability in the strength of the birth trauma is to leave no room for the legitimate claims of hereditary constitution as an aetiological factor. For this variability is an organic factor which operates in an accidental fashion in relation to the constitution and is itself dependent on many influences which might be called accidental - as, for instance, on timely assistance in child-birth. Rank’s theory completely ignores constitutional factors as well as phylogenetic ones. If, however, we were to try to find a place for the constitutional factor by qualifying his statement with the proviso, let us say, that what is really important is the extent to which the individual reacts to the variable intensity of the trauma of birth, we should be depriving his theory of its significance and should be relegating the new factor introduced by him to a position of minor importance: the factor which decided whether a neurosis should supervene or not would lie in a different, and once more in an unknown, field.

Moreover, the fact that while man shares the process of birth with the other mammals he alone has the privilege over them of possessing a special disposition to neurosis is hardly favourable to Rank’s theory. But the main objection to it is that it floats in the air instead of being based upon ascertained observations. No body of evidence has been collected to show that difficult and protracted birth does in fact coincide with the development of a neurosis, or even that children so born exhibit the phenomena of early infantile apprehensiveness more strongly and over a longer period than other children. It might be rejoined that induced labour and births that are easy for the mother may possibly involve a severe trauma for the child. But we can still point out that births which lead to asphyxia would be bound to give clear evidence of the results which are supposed to follow. It should be one of the advantages of Rank’s aetiological theory that it postulates a factor whose existence can be verified by observation. And so long as no such attempt at verification has been made it is impossible to assess the theory’s value.

On the other hand I cannot identify myself with the view that Rank’s theory contradicts the aetiological importance of the sexual instincts as hitherto recognized by psycho-analysis. For his theory only has reference to the individual’s relation to the danger-situation, so that it leaves it perfectly open to us to assume that if a person has not been able to master his first dangers he is bound to come to grief as well in later situations involving sexual danger and thus be driven into a neurosis.
I do not believe, therefore, that Rank’s attempt has solved the problem of the causation of neurosis; nor do I believe that we can say as yet how much it may nevertheless have contributed to such a solution. If an investigation into the effects of difficult birth on the disposition to neurosis should yield negative results, we shall rate the value of his contribution low. It is to be feared that our need to find a single, tangible ‘ultimate cause’ of neurotic illness will remain unsatisfied. The ideal solution, which medical men no doubt still yearn for, would be to discover some bacillus which could be isolated and bred in a pure culture and which, when injected into anyone, would invariably produce the same illness; or, to put it rather less extravagantly, to demonstrate the existence of certain chemical substances the administration of which would bring about or cure particular neuroses. But the probability of a solution of this kind seems slight.

[1926d, 4306]

Rank’s contention - which was originally my own -, that the affect of anxiety is a consequence of the event of birth and a repetition of the situation then experienced, obliged me to review the problem of anxiety once more. But I could make no headway with his idea that birth is a trauma, states of anxiety a reaction of discharge to it and all subsequent affects of anxiety an attempt to 'abreact' it more and more completely. I was obliged to go back from the anxiety reaction to the situation of danger that lay behind it. The introduction of this element opened up new aspects of the question. Birth was seen to be the prototype of all later situations of danger which overtook the individual under the new conditions arising from a changed mode of life and a growing mental development. On the other hand its own significance was reduced to this prototypic relationship to danger. The anxiety felt at birth became the prototype of an affective state which had to undergo the same vicissitudes as the other affects. Either the state of anxiety reproduced itself automatically in situations analogous to the original situation and was thus an inexpedient form of reaction instead of an expedient one as it had been in the first situation of danger; or the ego acquired power over this affect, reproduced it on its own initiative, and employed it as a warning of danger and as a means of setting the pleasure-unpleasure mechanism in motion. We thus gave the biological aspect of the anxiety affect its due importance by recognizing anxiety as the general reaction to situations of danger; while we endorsed the part played by the ego as the seat of anxiety by allocating to it the function of producing the anxiety affect according to its needs. Thus we attributed two modes of origin to anxiety in later life. One was involuntary, automatic and always justified on economic grounds, and arose whenever a danger situation analogous to birth had established itself. The other was produced by the ego as soon as a situation of this kind merely threatened to occur, in order to call for its avoidance. In the second case the ego subjects itself to anxiety as a sort of inoculation, submitting to a slight attack of the illness in order to escape its full strength. It vividly imagines the danger situation, as it were, with the unmistakable purpose of restricting that distressing experience to a mere indication, a signal. We have already seen in detail how the various situations of danger arise one after the other, retaining at the same time a genetic connection.

[1926d, 4315]
I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

[1926e, 4350]

'I shall venture, for once in a way, to take sides on that point. It strikes me as extremely bold to assert that sexuality is not a natural, primitive need of living organisms, but an expression of something else. One need only take the example of animals.'

[1926e, 4351]

That makes no difference. There is no mixture, however absurd, that society will not willingly swallow down if it is advertised as an antidote to the dreaded predominance of sexuality.

[1926e, 4351]

Very well. I can now proceed with my exposition. Sexual life is not simply something spicy; it is also a serious scientific problem. There was much that was novel to be learnt about it, many strange things to be explained. I told you just now that analysis has to go back into the early years of the patient's childhood, because the decisive repressions have taken place then, while his ego was feeble. But surely in childhood there is no sexual life? surely it only starts at puberty? On the contrary. We have to learn that sexual instinctual impulses accompany life from birth onwards, and that it is precisely in order to fend off those instincts that the infantile ego institutes repressions. A remarkable coincidence, is it not? that small children should already be struggling against the power of sexuality, just as the speaker in the learned society was to do later, and later still my followers who have set up their own theories. How does that come about? The most general explanation would be that our civilization is built up entirely at the expense of sexuality; but there is much more to be said on the subject.

[1926e, 4352]
Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I do know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?

During the years 1911-13 two former adherents, Alfred Adler, of Vienna, and C. G. Jung, of Zurich, seceded from the psycho-analytic movement and founded schools of thought of their own, which, in view of the general hostility to psycho-analysis, could be certain of a favourable reception, but which remained scientifically sterile. In 1921 Dr. M. Eitingon founded in Berlin the first public psycho-analytic clinic and training-school, and this was soon followed by a second in Vienna.
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primateval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

¹[1930a, 4509]

An investigation of fetishism is strongly recommended to any one who still doubts the existence of the castration complex or who can still believe that fright at the sight of the female genital has some other ground - for instance, that it is derived from a supposed recollection of the trauma of birth.

[1927e, 4537]
I am sure you have heard a great deal of the sense of inferiority which is supposed particularly to characterize neurotics. It especially haunts the pages of what are known as belles lettres. An author who uses the term 'inferiority complex' thinks that by so doing he has fulfilled all the demands of psycho-analysis and has raised his composition to a higher psychological plane. In fact 'inferiority complex' is a technical term that is scarcely used in psycho-analysis. For us it does not bear the meaning of anything simple, let alone elementary. To trace it back to the self-perception of possible organic defects, as the school of what are known as 'Individual Psychologists' likes to do, seems to us a short-sighted error. The sense of inferiority has strong erotic roots. A child feels inferior if he notices that he is not loved, and so does an adult. The only bodily organ which is really regarded as inferior is the atrophied penis, a girl's clitoris. But the major part of the sense of inferiority derives from the ego's relation to its super-ego; like the sense of guilt it is an expression of the tension between them. Altogether, it is hard to separate the sense of inferiority and the sense of guilt. It would perhaps be right to regard the former as the erotic complement to the moral sense of inferiority. Little attention has been given in psycho-analysis to the question of the delimitation of the two concepts.

Otto Rank, to whom psycho-analysis is indebted for many excellent contributions, also has the merit of having expressly emphasized the significance of the act of birth and of separation from the mother. Nevertheless we have all found it impossible to accept the extreme inferences which he has drawn from this factor as bearing on the theory of the neuroses and even on analytic therapy. The core of his theory - that the experience of anxiety at birth is the model of all later situations of danger - he found already there. If we dwell on these situations of danger for a moment, we can say that in fact a particular determinant of anxiety (that is, situation of danger) is allotted to every age of development as being appropriate to it. The danger of psychical helplessness fits the stage of the ego's early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic phase; and finally fear of the super-ego, which assumes a special position, fits the period of latency. In the course of development the old determinants of anxiety should be dropped, since the situations of danger corresponding to them have lost their importance owing to the strengthening of the ego. But this only occurs most incompletely. Many people are unable to surmount the fear of loss of love; they never become sufficiently independent of other people's love and in this respect carry on their behaviour as infants. Fear of the super-ego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations, and only in the rarest cases can an individual become independent of human society. A few of the old situations of danger, too, succeed in surviving into later periods by making contemporary modifications in their determinants of anxiety. Thus, for instance, the danger of castration persists under the mark of syphilidophobia. It is true that as an adult one knows that castration is no longer customary as a punishment for the indulgence of sexual desires, but on the other hand one has learnt that instinctual liberty of that kind is threatened by serious diseases. There is no doubt that the people we describe as neurotics remain infantile in their attitude to danger and have not surmounted obsolete determinants of anxiety. We may take this as a factual contribution to the characterization of neurotics; it is not so easy to say why it should be so.
There is a common saying that we should learn from our enemies. I confess I have never succeeded in doing so; but I thought all the same that it might be instructive for you if I undertook a review of all the reproaches and objections which the opponents of psycho-analysis have raised against it, and if I went on to point out the injustices and offences against logic which could so easily be revealed in them. But 'on second thoughts' I told myself that it would not be at all interesting but would become tedious and distressing and would be precisely what I have been so carefully avoiding all these years. So you must forgive me if I pursue this path no further and if I spare you the judgements of our so-called scientific opponents. After all it is nearly always a question of people whose one qualification is the impartiality which they have preserved by keeping at a distance from the experiences of psycho-analysis. But I know there are other cases in which you will not let me off so lightly. 'Nevertheless', you will tell me, 'there are such a number of people to whom your last remark does not apply. They have not evaded analytic experience, they have analysed patients and have perhaps been analysed themselves; for a time they have even been your collaborators. Yet they have arrived at other views and theories on the basis of which they have seceded from you and founded independent schools of psycho-analysis. You ought to throw some light for us on the possibility and significance of these secessionist movements which have been so frequent in the history of analysis.'

[1933a, 4741]

Well, I will try to do so; but only in brief, since they contribute less to an understanding of analysis than you might expect. I feel sure you will be thinking in the first place of Adler's 'Individual Psychology', which, in America for instance, is regarded as a line of thought collateral with our psycho-analysis and on a par with it and which is regularly mentioned alongside of it. Actually, Individual Psychology has very little to do with psycho-analysis but, as a result of certain historical circumstances, leads a kind of parasitic existence at its expense. The determinants which we have attributed to this group of opponents apply to the founders of Individual Psychology only to a limited extent. Its very name is inappropriate and seems to have been the product of embarrassment. We cannot allow the legitimate use of the term as an antithesis to 'group psychology' to be interfered with; moreover, our own activity is concerned for the most part and primarily with the psychology of human individuals. I shall not enter to-day upon an objective criticism of Adler's Individual Psychology; there is no place for it in the plan of these introductory lectures. Besides, I have already attempted it once, and feel no temptation to change anything in what I said then. I will, however, illustrate the impression his views produce by a small episode dating from the years before analysis.

[1933a, 4742]
For, whether a man is a homosexual or a necrophilic, a hysterical suffering from anxiety, an obsessive neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psycho-analysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in *Wallenstein*:

[1933a, 4743]

Criticism from specialist circles, which is so relentless against psycho-analysis, has in general handled Individual Psychology with kid gloves. It is true that in America one of the most highly respected psychiatrists published a paper against Adler under the title 'Enough', in which he gave energetic expression to his boredom at the 'compulsion to repeat' of Individual Psychology. If others have treated it far more amiably, no doubt their antagonism to analysis has had much to do with it.

[1933a, 4744]
I need not say much about other schools which have branched off from our psycho-analysis. The fact that they have done so cannot be used either for or against the validity of psycho-analytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'. When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways - especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst attaches little value to the influence of the patient's personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premises. It is an almost universal characteristic of these 'secessionist movements' that each of them takes hold of one fragment out of the wealth of themes in psycho-analysis and makes itself independent on the basis of this seizure - selecting the instinct for mastery, for instance, or ethical conflict, or the mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous to-day in the history of psycho-analysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psycho-analysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psycho-analysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down - the odium of infantile sexuality, perhaps, or the absurdity of symbolism - and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.
[1933a, 4744]

After this summit of achievement, it came about that our friend slowly drifted away from us. On his return from a period of work in America he seemed to withdraw more and more into solitary work, though he had previously taken the liveliest share in all that happened in analytic circles. We learnt that one single problem had monopolized his interest. The need to cure and to help had become paramount in him. He had probably set himself aims which, with our therapeutic means, are altogether out of reach to-day. From unexhausted springs of emotion the conviction was borne in upon him that one could effect far more with one's patients if one gave them enough of the love which they had longed for as children. He wanted to discover how this could be carried out within the framework of the psycho-analytic situation; and so long as he had not succeeded in this, he kept apart, no longer certain, perhaps, of agreement with his friends. Wherever it may have been that the road he had started along would have led him, he could not pursue it to the end. Signs were slowly revealed in him of a grave organic destructive process which had probably overshadowed his life for many years already. Shortly before completing his sixtieth year he succumbed to pernicious anaemia. It is impossible to believe that the history of our science will ever forget him.
[1933c, 4816]
In 1909 Otto Rank, who was at that time still under my influence, published, following a suggestion of mine, a book bearing the title *Der Mythus von der Geburt des Helden*.¹ It deals with the fact that 'almost all the prominent civilized nations... began at an early stage to glorify their heroes, legendary kings and princes, founders of religions, dynasties, empires or cities, in brief their national heroes, in a number of poetic tales and legends. The history of the birth and of the early life of these personalities came to be especially invested with phantastic features, which, indifferent peoples, even though widely separated by space and entirely independent of each other, present a baffling similarity and in part, indeed, a literal conformity. Many investigators have been impressed with this fact, which has long been recognized.' If, following Rank, we construct (by a technique a little like Galton's) an 'average legend' that brings into prominence the essential features of all these stories, we arrive at the following picture: [1939a, 4841]

A particularly energetic attempt in this direction was made by Otto Rank, following upon his book, *The Trauma of Birth* (1924). He supposed that the true source of neurosis was the act of birth, since this involves the possibility of a child's 'primal fixation' to his mother not being surmounted but persisting as a 'primal repression'. Rank hoped that if this primal trauma were dealt with by a subsequent analysis the whole neurosis would be got rid of. Thus this one small piece of analytic work would save the necessity for all the rest. And a few months should be enough to accomplish this. It cannot be disputed that Rank's argument was bold and ingenious; but it did not stand the test of critical examination. Moreover, it was a child of its time, conceived under the stress of the contrast between the post-war misery of Europe and the 'prosperity' of America, and designed to adapt the tempo of analytic therapy to the haste of American life. We have not heard much about what the implementation of Rank's plan has done for cases of sickness. Probably not more than if the fire-brigade, called to deal with a house that had been set on fire by an overturned oil-lamp, contented themselves with removing the lamp from the room in which the blaze had started. No doubt a considerable shortening of the brigade's activities would be effected by this means. The theory and practice of Rank's experiment are now things of the past - no less than American 'prosperity' itself. [1937c, 5014]
This brings me to two problems which arise directly out of analytic practice, as I hope to show by the following examples. A certain man, who had himself practised analysis with great success, came to the conclusion that his relations both to men and women - to the men who were his competitors and to the woman whom he loved - were nevertheless not free from neurotic impediments; and he therefore made himself the subject of an analysis by someone else whom he regarded as superior to himself. This critical illumination of his own self had a completely successful result. He married the woman he loved and turned into a friend and teacher of his supposed rivals. Many years passed in this way, during which his relations with his former analyst also remained unclouded. But then, for no assignable external reason, trouble arose. The man who had been analysed became antagonistic to the analyst and reproached him for having failed to give him a complete analysis. The analyst, he said, ought to have known and to have taken into account the fact that a transference-relation can never be purely positive; he should have given his attention to the possibilities of a negative transference. The analyst defended himself by saying that, at the time of the analysis, there was no sign of a negative transference. But even if he had failed to observe some very faint signs of it - which was not altogether ruled out, considering the limited horizon of analysis in those early days - it was still doubtful, he thought, whether he would have had the power to activate a topic (or, as we say, a 'complex') by merely pointing it out, so long as it was not currently active in the patient himself at the time. To activate it would certainly have required some unfriendly piece of behaviour in reality on the analyst's part. Furthermore, he added, not every good relation between an analyst and his subject during and after analysis was to be regarded as a transference; there were also friendly relations which were based on reality and which proved to be viable.

No doubt it is desirable to shorten the duration of analytic treatment, but we can only achieve our therapeutic purpose by increasing the power of analysis to come to the assistance of the ego. Hypnotic influence seemed to be an excellent instrument for our purposes; but the reasons for our having to abandon it are well known. No substitute for hypnosis has yet been found. From this point of view we can understand how such a master of analysis as Ferenczi came to devote the last years of his life to therapeutic experiments, which, unhappily, proved to be vain.

The two corresponding themes are in the female, an envy for the penis - a positive striving to possess a male genital - and, in the male, a struggle against his passive or feminine attitude to another male. What is common to the two themes was singled out at an early date by psychoanalytic nomenclature as an attitude towards the castration complex. Subsequently Alfred Adler brought the term 'masculine protest' into current use. It fits the case of males perfectly; but I think that, from the start, 'repudiation of femininity' would have been the correct description of this remarkable feature in the psychical life of human beings.

¹ We must not be misled by the term 'masculine protest' into supposing that what the man is repudiating is his passive attitude - what might be called the social aspect of femininity. Such a view is contradicted by an observation that is easily verifiable - namely that such men often display a masochistic attitude - a state that amounts to bondage - towards women. What they reject is not passivity in general, but passivity towards a male. In other words, the 'masculine protest' is in fact nothing else than castration anxiety.
It has justly been said that the Oedipus complex is the nuclear complex of the neuroses, and constitutes the essential part of their content. It represents the peak of infantile sexuality, which, through its after-effects, exercises a decisive influence on the sexuality of adults. Every new arrival on this planet is faced by the task of mastering the Oedipus complex; anyone who fails to do so falls a victim to neurosis. With the progress of psycho-analytic studies the importance of the Oedipus complex has become more and more clearly evident; its recognition has become the shibboleth that distinguishes the adherents of psycho-analysis from its opponents.

[1905d, 1539]

But in psycho-analytic relations things often happen differently from what the psychology of consciousness might lead us to expect. Experience does not speak in favour of an affective technique of this kind. Nor is it hard to see that it involves a departure from psycho-analytic principles and verges upon treatment by suggestion. It may induce the patient to bring forward sooner and with less difficulty things he already knows but would otherwise have kept back for a time through conventional resistances. But this technique achieves nothing towards the uncovering of what is unconscious to the patient. It makes him even more incapable of overcoming his deeper resistances, and in severer cases it invariably fails by encouraging the patient to be insatiable: he would like to reverse the situation, and finds the analysis of the doctor more interesting than his own. The resolution of the transference, too - one of the main tasks of the treatment - is made more difficult by an intimate attitude on the doctor's part, so that any gain there may be at the beginning is more than outweighed at the end. I have no hesitation, therefore, in condemning this kind of technique as incorrect. The doctor should be opaque to his patients and, like a mirror, should show them nothing but what is shown to him. In practice, it is true, there is nothing to be said against a psychotherapist combining a certain amount of analysis with some suggestive influence in order to achieve a perceptible result in a shorter time - as is necessary, for instance, in institutions. But one has a right to insist that he himself should be in no doubt about what he is doing and should know that his method is not that of true psycho-analysis.

[1912e, 2472]

It is now time for us to take a survey of the play of forces which is set in motion by the treatment. The primary motive force in the therapy is the patient's suffering and the wish to be cured that arises from it. The strength of this motive force is subtracted from by various factors - which are not discovered till the analysis is in progress - above all, by what we have called the 'secondary gain from illness'; but it must be maintained till the end of the treatment. Every improvement effects a diminution of it. By itself, however, this motive force is not sufficient to get rid of the illness. Two things are lacking in it for this: it does not know what paths to follow to reach this end; and it does not possess the necessary quota of energy with which to oppose the resistances. The analytic treatment helps to remedy both these deficiencies. It supplies the amounts of energy that are needed for overcoming the resistances by making mobile the energies which lie ready for the transference; and, by giving the patient information at the right time, it shows him the paths along which he should direct those energies. Often enough the transference is able to remove the symptoms of the disease by itself, but only for a while - only for as long as it itself lasts. In this case the treatment is a treatment by suggestion, and not a psycho-analysis at all. It only deserves the latter name if the intensity of the transference has been utilized for the overcoming of resistances. Only then has being ill become impossible, even when the transference has once more been dissolved, which is its destined end.

[1913c, 2494]
Not every analysis of psychological phenomena deserves the name of psycho-analysis. The latter implies more than the mere analysis of composite phenomena into simpler ones. It consists in tracing back one psychical structure to another which preceded it in time and out of which it developed. Medical psycho-analytic procedure was not able to eliminate a symptom until it had traced that symptom's origin and development. Thus from the very first psycho-analysis was directed towards tracing developmental processes. It began by discovering the genesis of neurotic symptoms, and was led, as time went on, to turn its attention to other psychical structures and to construct a genetic psychology which would apply to them too.

The theory of repression is the corner-stone on which the whole structure of psycho-analysis rests. It is the most essential part of it; and yet it is nothing but a theoretical formulation of a phenomenon which may be observed as often as one pleases if one undertakes an analysis of a neurotic without resorting to hypnosis. In such cases one comes across a resistance which opposes the work of analysis and in order to frustrate it pleads a failure of memory. The use of hypnosis was bound to hide this resistance; the history of psycho-analysis proper, therefore, only begins with the new technique that dispenses with hypnosis. The theoretical consideration of the fact that this resistance coincides with an amnesia leads inevitably to the view of unconscious mental activity which is peculiar to psycho-analysis and which, too, distinguishes it quite clearly from philosophical speculations about the unconscious. It may thus be said that the theory of psycho-analysis is an attempt to account for two striking and unexpected facts of observation which emerge whenever an attempt is made to trace the symptoms of a neurotic back to their sources in his past life: the facts of transference and of resistance. Any line of investigation which recognizes these two facts and takes them as the starting-point of its work has a right to call itself psycho-analysis, even though it arrives at results other than my own. But anyone who takes up other sides of the problem while avoiding these two hypotheses will hardly escape a charge of misappropriation of property by attempted impersonation, if he persists in calling himself a psycho-analyst.

Everything that Adler has to say about dreams, the shibboleth of psycho-analysis, is equally empty and unmeaning. At first he regarded dreams as a turning away from the feminine to the masculine line - which is simply a translation of the wish-fulfilment theory of dreams into the language of the 'masculine protest'. Later he found that the essence of dreams lies in enabling men to accomplish unconsciously what they are denied consciously. Adler must also be credited with priority in confusing dreams with latent dream-thoughts - a confusion on which the discovery of his 'prospective tendency' rests. Maeder followed his lead in this later. Here the fact is readily overlooked that every interpretation of a dream which is incomprehensible in its manifest form is based on the very method of dream-interpretation whose premisses and conclusions are being disputed. In regard to resistance Adler informs us that it serves the purpose of putting into effect the patient's opposition to the physician. This is certainly true; it is as much as to say that it serves the purpose of resistance. Where it comes from, however, or how it happens that its phenomena are at the disposal of the patient is not further enquired into, as being of no interest to the ego. The detailed mechanism of the symptoms and manifestations of diseases, the explanation of the manifold variety of those diseases and their forms of expression, are disregarded in toto; for everything alike is pressed into the service of the masculine protest, self-assertion and the aggrandizement of the personality. The system is complete; to produce it has cost an enormous amount of labour in the recasting of interpretations, while it has not furnished a single new observation. I fancy I have made it clear that it has nothing to do with psycho-analysis.
When one thinks of the inconsistencies displayed in the various public and private pronouncements made by the Jungian movement, one is bound to ask oneself how much of this is due to lack of clearness and how much to lack of sincerity. It must be admitted, however, that the exponents of the new theory find themselves in a difficult position. They are now disputing things which they themselves formerly upheld, and they are doing so, moreover, not on the ground of fresh observations which might have taught them something further, but in consequence of fresh interpretations which make the things they see look different to them now from what they did before. For this reason they are unwilling to give up their connection with psycho-analysis, as whose representatives they became known to the world, and prefer to give it out that psycho-analysis has changed. At the Munich Congress I found it necessary to clear up this confusion, and I did so by declaring that I did not recognize the innovations of the Swiss as legitimate continuations and further developments of the psycho-analysis that originated with me. Outside critics (like Furtmüller) had already seen how things were, and Abraham is right in saying that Jung is in full retreat from psycho-analysis. I am of course perfectly ready to allow that everyone has a right to think and to write what he pleases; but he has no right to put it forward as something other than what it really is.

The form taken by the Neo-Zurich therapy under these influences can be conveyed in the words of a patient who experienced it himself: 'This time not a trace of attention was given to the past or to the transference. Wherever I thought I recognized the latter it was pronounced to be a pure libidinal symbol. The moral instruction was very fine and I followed it faithfully, but I did not advance a step. It was even more annoying for me than for him, but how could I help it? . . . Instead of freeing me by analysis, every day brought fresh tremendous demands on me, which had to be fulfilled if the neurosis was to be conquered - for instance, inward concentration by means of introversion, religious meditation, resuming life with my wife in loving devotion, etc. It was almost beyond one's strength; it was aiming at a radical transformation of one's whole inner nature. I left the analysis as a poor sinner with intense feelings of contrition and the best resolutions, but at the same time in utter discouragement. Any clergyman would have advised what he recommended, but where was I to find the strength?' The patient, it is true, reported that he had heard that analysis of the past and of the transference must be gone through first; but he had been told that he had already had enough of it. Since this first kind of analysis had not helped him more, the conclusion seems to me justified that the patient had not had enough of it. Certainly the subsequent treatment, which no longer had any claim to be called psycho-analysis, did not improve matters. It is remarkable that the members of the Zurich school should have made the long journey round by way of Vienna in order to wind up at the nearby city of Berne, where Dubois cures neuroses by ethical encouragement in a more considerate manner.¹

It may be said lastly that by his 'modification' of psycho-analysis Jung has given us a counterpart to the famous Lichtenberg knife. He has changed the hilt, and he has put a new blade into it; yet because the same name is engraved on it we are expected to regard the instrument as the original one.

I think I have made clear, on the contrary, that the new teaching which aims at replacing psycho-analysis signifies an abandonment of analysis and a secession from it. Some people may be inclined to fear that this secession is bound to have more momentous consequences for analysis than would another, owing to its having been started by men who have played so great a part in the movement and have done so much to advance it. I do not share this apprehension.
Strictly considered - and why should this question not be considered with all possible strictness? - analytic work deserves to be recognized as genuine psycho-analysis only when it has succeeded in removing the amnesia which conceals from the adult his knowledge of his childhood from its beginning (that is, from about the second to the fifth year). This cannot be said among analysts too emphatically or repeated too often. The motives for disregarding this reminder are, indeed, intelligible. It would be desirable to obtain practical results in a shorter period and with less trouble. But at the present time theoretical knowledge is still far more important to all of us than therapeutic success, and anyone who neglects childhood analysis is bound to fall into the most disastrous errors. The emphasis which is laid here upon the importance of the earliest experiences does not imply any underestimation of the influence of later ones. But the later impressions of life speak loudly enough through the mouth of the patient, while it is the physician who has to raise his voice on behalf of the claims of childhood.

[1919e, 3646]

*The Corner-Stones of Psycho-Analytic Theory.* - The assumption that there are unconscious mental processes, the recognition of the theory of resistance and repression, the appreciation of the importance of sexuality and of the Oedipus complex - these constitute the principal subject-matter of psycho-analysis and the foundations of its theory. No one who cannot accept them all should count himself a psycho-analyst.

[1923a, 3924]

The general hostility, however, did not succeed in preventing psycho-analysis from continuous expansion during the next decade in two directions: on the map, for interest in it was constantly cropping up in new countries, and in the field of the mental sciences, for it was constantly finding applications in new branches of knowledge. In 1909 President G. Stanley Hall invited Freud and Jung to give a series of lectures at Clark University in Worcester, Mass., of which he was the head and where they were given a friendly reception. Since then psycho-analysis has remained popular in America, although precisely in that country its name has been coupled with much superficiality and some abuses. As early as in 1911, Havelock Ellis was able to report that analysis was studied and practised, not only in Austria and Switzerland, but also in the United States, in England, India, Canada, and, no doubt, in Australia too.

[1924f, 4111]
Everything now depends on that. And the whole skill in handling the ‘transference’ is devoted to bringing it about. As you see, the requirements of analytic technique reach their maximum at this point. Here the gravest mistakes can be made or the greatest successes be registered. It would be folly to attempt to evade the difficulties by suppressing or neglecting the transference; whatever else had been done in the treatment, it would not deserve the name of an analysis. To send the patient away as soon as the inconveniences of his transference neurosis make their appearance would be no more sensible, and would moreover be cowardly. It would be as though one had conjured up spirits and run away from them as soon as they appeared. Sometimes, it is true, nothing else is possible. There are cases in which one cannot master the unleashed transference and the analysis has to be broken of; but one must at least have struggled with the evil spirits to the best of one’s strength. To yield to the demands of the transference, to fulfil the patient’s wishes for affectionate and sensual satisfaction, is not only justly forbidden by moral considerations but is also completely ineffective as a technical method for attaining the purpose of the analysis. A neurotic cannot be cured by being enabled to reproduce uncorrected an unconscious stereotype plate that is ready to hand in him. If one engages in compromises with him by offering him partial satisfactions in exchange for his further collaboration in the analysis, one must beware of falling into the ridiculous situation of the cleric who was supposed to convert a sick insurance agent. The sick man remained unconverted but the cleric took his leave insured. The only possible way out of the transference situation is to trace it back to the patient’s past, as he really experienced it or as he pictured it through the wish-fulfilling activity of his imagination. And this demands from the analyst much skill, patience, calm and self-abnegation.

There are other things too that favour his appearing as an analytic quack. If he tried to undertake eye-operations without sufficient preparation, the failure of his cataract extractions and iridectomies and the absence of patients would soon bring his hazardous enterprise to an end. The practice of analysis is comparatively safe for him. The public is spoilt by the average successful outcome of eye-operations and expects cure from the surgeon. But if a ‘nerve-specialist’ fails to restore his patients no one is surprised. People have not been spoilt by successes in the therapy of the neuroses; the nerve-specialist has at least ‘taken a lot of trouble with them’. Indeed, there is not much that can be done; nature must help, or time. With women there is first menstruation, then marriage, and later on the menopause. Finally death is a real help. Moreover, what the medical analyst has done with his neurotic patient is so inconspicuous that no reproach can attach to it. He has made use of no instruments or medicines; he has merely conversed with him and tried to talk him into or out of something. Surely that can do no harm, especially if he avoids touching on distressing or agitating subjects. The medical analyst, who has avoided any strict teaching, will, no doubt, not have omitted an attempt to improve analysis, to pull out its poison fangs and make it pleasant for the patient. And it will be wise for him to stop there; for if he really ventures to call up resistances and then does not know how to meet them, he may in true earnest make himself unpopular.

Honesty compels me to admit that the activity of an untrained analyst does less harm to his patients than that of an unskilled surgeon. The possible damage is limited to the patient having been led into useless expenditure and having his chances of recovery removed or diminished. Furthermore, the reputation of analytic therapy has been lowered. All this is most undesirable, but it bears no comparison with the dangers that threaten from the knife of a surgical quack. In my judgement, severe or permanent aggravations of a pathological condition are not to be feared even with an unskilled use of analysis. The unwelcome reactions cease after a while. Compared with the traumas of life which have provoked the illness, a little mishandling by the doctor is of no account. It is simply that the unsuitable attempt at a cure has done the patient no good.
Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.

[1933a, 4622]

I am sure you have heard a great deal of the sense of inferiority which is supposed particularly to characterize neurotics. It especially haunts the pages of what are known as *belles lettres*. An author who uses the term 'inferiority complex' thinks that by so doing he has fulfilled all the demands of psycho-analysis and has raised his composition to a higher psychological plane. In fact 'inferiority complex' is a technical term that is scarcely used in psycho-analysis. For us it does not bear the meaning of anything simple, let alone elementary. To trace it back to the self-perception of possible organic defects, as the school of what are known as 'Individual Psychologists' likes to do, seems to us a short-sighted error. The sense of inferiority has strong erotic roots. A child feels inferior if he notices that he is not loved, and so does an adult. The only bodily organ which is really regarded as inferior is the atrophied penis, a girl's clitoris. But the major part of the sense of inferiority derives from the ego's relation to its super-ego; like the sense of guilt it is an expression of the tension between them. Altogether, it is hard to separate the sense of inferiority and the sense of guilt. It would perhaps be right to regard the former as the erotic complement to the moral sense of inferiority. Little attention has been given in psycho-analysis to the question of the delimitation of the two concepts.

[1933a, 4674]
But you must not expect to hear the glad tidings that the struggle about analysis is over and has ended in its recognition as a science and its admission as a subject for instruction at universities. There is no question of that. The struggle continues, though in more polite forms. What is also new is that a sort of buffer-layer has formed in scientific society between analysis and its opponents. This consists of people who allow the validity of some portions of analysis and admit as much, subject to the most entertaining qualifications, but who on the other hand reject other portions of it, a fact which they cannot proclaim too loudly. It is not easy to divine what determines their choice in this. It seems to depend on personal sympathies. One person will take objection to sexuality, another to the unconscious; what seems particularly unpopular is the fact of symbolism. Though the structure of psycho-analysis is unfinished, it nevertheless presents, even to-day, a unity from which elements cannot be broken off at the caprice of whoever comes along; but these eclectics seem to disregard this. I have never had the impression that these half- or quarter-adherents based their rejection on an examination of the facts. Some distinguished men, too, are included in this category. They, to be sure, are excused by the fact that their time and their interest belong to other things - to those things, namely, in mastering which they have achieved so much. But in that case would they not do better to suspend their judgement instead of taking sides so decisively? With one of these great men I once succeeded in effecting a rapid conversion. He was a world-famous critic, who had followed the spiritual currents of the time with benevolent understanding and prophetic penetration. I only came to know him when he was past his eightieth year; but he was still enchanting in his talk. You will easily guess whom I mean. Nor was it I who introduced the subject of psycho-analysis. It was he who did so, by comparing himself with me in the most modest fashion. ‘I am only a literary man,’ he said, ‘but you are a natural scientist and discoverer. However, there is one thing I must say to you: I have never had sexual feelings towards my mother.’ ‘But there is no need at all for you to have known them,’ was my reply; ‘to grown-up people those are unconscious feelings.’ ‘Oh! so that’s what you think!’ he said with relief, and pressed my hand. We went on talking together on the best of terms for another few hours. I heard later that in the few remaining years of his life he often spoke of analysis in a friendly way and was pleased at being able to use a word that was new to him - ‘repression’. [1933a, 4740]
For, whether a man is a homosexual or a necrophilic, a hysterical suffering from anxiety, an obsession neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psychoanalysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in *Wallenstein*:

[1933a, 4743]
I need not say much about other schools which have branched off from our psycho-analysis. The fact that they have done so cannot be used either for or against the validity of psycho-analytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'. When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways - especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst attaches little value to the influence of the patient's personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premises. It is an almost universal characteristic of these 'secessionist movements' that each of them takes hold of one fragment out of the wealth of themes in psycho-analysis and makes itself independent on the basis of this seizure - selecting the instinct for mastery, for instance, or ethical conflict, or the mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous to-day in the history of psycho-analysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psycho-analysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psycho-analysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down - the odium of infantile sexuality, perhaps, or the absurdity of symbolism - and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.

[1933a, 4744]
You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninstructive; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

[1933a, 4751]
Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman’s belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.

¹ This therefore makes it nonsensical to say that one is practising psycho-analysis if one excludes from examination and consideration precisely these earliest periods - as happens in some quarters.

[1933a, 4752]

[1939a, 4899]
Accordingly, I can now describe to you the form taken by a child's sexual life before the establishment of the primacy of the genitals, preparations for which are made in the first period of infancy preceding the latency period and which is permanently organized from puberty onwards. A kind of loose organization which may be called 'pregenital' exists during this early period. During this phase what stand in the forefront are not the genital component instincts but the sadistic and anal ones. The contrast between 'masculine' and 'feminine' plays no part here as yet. Its place is taken by the contrast between 'active' and 'passive', which may be described as a precursor of the sexual polarity and which later on is soldered to that polarity. What appears to us as masculine in the activities of this phase, when we look at it from the point of view of the genital phase, turns out to be an expression of an instinct for mastery which easily passes over into cruelty. Trends with a passive aim are attached to the erotogenic zone of the anal orifice, which is very important at this period. The instincts for looking and for gaining knowledge are powerfully at work; the genitals actually play a part in sexual life only as organs for the excretion of urine. The component instincts of this phase are not without objects, but those objects do not necessarily converge into a single object. The sadistic-anal organization is the immediate forerunner of the phase of genital primacy. Detailed study shows how much of it is retained in the later definitive shape of things and shows too the way in which its component instincts are compelled to take their place in the new genital organization. Behind the sadistic-anal phase of libidinal development we get a glimpse of a still earlier and more primitive stage of organization, in which the erotogenic zone of the mouth plays the chief part. As you will guess, the sexual activity of sensual sucking belongs to it. We must admire the understanding of the Ancient Egyptians who, in their art, represented children, including the God Horus, with a finger in their mouth. Only recently Abraham has given examples of the traces which this primitive oral phase leaves behind it in later sexual life.

[1916-1917, 3395]

We began at an early date to extend psycho-analytic observations to these other illnesses. Already in 1908 Karl Abraham, after an exchange of thoughts with me, pronounced the main characteristic of dementia praecox (which was reckoned among the psychoses) to be that in it the libidinal cathexis of objects was lacking. But the question then arose of what happened to the libido of dementia praecox patients which was turned away from objects. Abraham did not hesitate to give the answer: it is turned back on to the ego and this reflexive turning-back is the source of the megalomania in dementia praecox. Megalomania is in every way comparable to the familiar sexual overvaluation of the object in erotic life. In this way for the first time we learnt to understand a trait in a psychotic illness by relating it to normal erotic life.

[1916-1917, 3461]

I may tell you at once that these first explanations of Abraham's have been accepted in psycho-analysis and have become the basis of our attitude to the psychoses. We thus slowly became familiar with the notion that the libido, which we find attached to objects and which is the expression of an effort to obtain satisfaction in connection with those objects, can also leave the objects and set the subject's own ego in their place; and this notion was gradually built up more and more consistently. The name for this way of allocating the libido - 'narcissism' - was borrowed by us from a perversion described by Paul Näcke in which an adult treats his own body with all the caresses that are usually devoted to an outside sexual object.

[1916-1917, 3461]
The war neuroses, in so far as they are distinguished from the ordinary neuroses of peace-time by special characteristics, are to be regarded as traumatic neuroses whose occurrence has been made possible or has been promoted by a conflict in the ego. Abraham's paper affords good evidence for this conflict, which has also been recognized by the English and American writers quoted by Jones. The conflict is between the soldier's old peaceful ego and his new warlike one, and it becomes acute as soon as the peace-ego realizes what danger it runs of losing its life owing to the rashness of its newly formed, parasitic double. It would be equally true to say that the old ego is protecting itself from a mortal danger by taking flight into a traumatic neurosis or to say that it is defending itself against the new ego which it sees is threatening its life. Thus the precondition of the war neuroses, the soil that nourishes them, would seem to be a national army; there would be no possibility of their arising in an army of professional soldiers or mercenaries.

In this way psychiatry became the first field to which psycho-analysis was applied and it has remained so ever since. The same research workers who have done most to deepen analytic knowledge of the neuroses, such as Karl Abraham in Berlin and Sándor Ferenczi in Budapest (to name only the most prominent), have also played a leading part in throwing analytic light on the psychoses. The conviction of the unity and intimate connection of all the disorders that present themselves as neurotic and psychotic phenomena is becoming more and more firmly established despite all the efforts of the psychiatrists. People are beginning to understand - best of all, perhaps, in America - that the psycho-analytic study of the neuroses is the only preparation for an understanding of the psychoses, and that psycho-analysis is destined to make possible a scientific psychiatry of the future which will not need to content itself with describing curious clinical pictures and unintelligible sequences of events and with tracing the influence of gross anatomical and toxic traumas upon a mental apparatus which is inaccessible to our knowledge.

In the valuable and comprehensive studies on the masculinity and castration complexes in women by Abraham (1921), Horney (1923) and Helene Deutsch (1925) there is much that touches closely on what I have written but nothing that coincides with it completely, so that here again I feel justified in publishing this paper.
The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the psychoses is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoid modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in dments by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psycho-analysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.
[1925d, 4235]
It will not have escaped my readers that in what I have said I have assumed as axiomatic something that is still violently disputed in the discussion. I have assumed, that is to say, that psycho-analysis is not a specialized branch of medicine. I cannot see how it is possible to dispute this. Psycho-analysis is a part of psychology; not of medical psychology in the old sense, not of the psychology of morbid processes, but simply of psychology. It is certainly not the whole of psychology, but its sub-structure and perhaps even its entire foundation. The possibility of its application to medical purposes must not lead us astray. Electricity and radiology also have their medical application, but the science to which they both belong is none the less physics. Nor can their situation be affected by historical arguments. The whole theory of electricity had its origin in an observation of a nerve-muscle preparation; yet no one would dream to-day of regarding it as a part of physiology. It is argued that psycho-analysis was after all discovered by a physician in the course of his efforts to assist his patients. But that is clearly neither here nor there. Moreover, the historical argument is double-edged. We might pursue the story and recall the unfriendliness and indeed the animosity with which the medical profession treated analysis from the very first. That would seem to imply that it can have no claims over analysis to-day. And though I do not accept that implication, I still feel some doubts as to whether the present wooing of psycho-analysis by the doctors is based, from the point of view of the libido theory, upon the first or upon the second of Abraham's sub-stages - whether they wish to take possession of their object for the purpose of destroying or of preserving it.

We bury with him - integer vitae scerisque purus - one of the firmest hopes of our science, young as it is and still so bitterly assailed, and a part of its future that is now, perhaps, unrealizable. Among all those who followed me along the dark paths of psycho-analytic research, he won so pre-eminent a place that only one other name could be set beside his. It is likely that the boundless trust of his colleagues and pupils would have called him to the leadership; and he would without doubt have been a model leader in the pursuit of truth, led astray neither by the praise or blame of the many nor by the seductive illusion of his own phantasies.

Abraham's (1921) description of the manifestations of the castration complex in the female is still unsurpassed; but one would be glad if it had included the factor of the girl's original exclusive attachment to her mother. I am in agreement with the principal points in Jeanne Lampl-de Groot's¹ (1927) important paper. In this the complete identity of the pre-Oedipus phase in boys and girls is recognized, and the girl's sexual (phallic) activity towards her mother is affirmed and substantiated by observations. The turning-away from the mother is traced to the influence of the girl's recognition of castration, which obliges her to give up her sexual object, and often masturbation along with it. The whole development is summed up in the formula that the girl goes through a phase of the 'negative' Oedipus complex before she can enter the positive one. A point on which I find the writer's account inadequate is that it represents the turning-away from the mother as being merely a change of object and does not discuss the fact that it is accompanied by the plainest manifestations of hostility. To this hostility full justice is done in Helene Deutsch's latest paper, on feminine masochism and its relation to frigidity (1930), in which she also recognizes the girl's phallic activity and the intensity of her attachment to her mother. Helene Deutsch states further that the girl's turning towards her father takes place viâ her passive trends (which have already been awakened in relation to her mother). In her earlier book (1925) the author had not yet set herself free from the endeavour to apply the Oedipus pattern to the pre-Oedipus phase, and she therefore interpreted the little girl's phallic activity as an identification with her father.
We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how this particular symbol had come to have that particular meaning. In such cases confirmations from elsewhere - from philology, folklore, mythology or ritual - were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak. We have said that in a woman's dreams this stands for a man. I hope it will impress you when you hear that Theodor Reik (1920) gives us this information: 'During the extremely ancient bridal ceremonial of the Bedouins, the bridgroom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!" (Quoted from Robert Eisler). We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922) a spider in dreams is a symbol of the mother, but of the phallic mother, of whom we are afraid; so that the fear of spiders expresses dread of mother-incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same motif of fright at castration. The other symbol I want to talk to you about is that of the bridge, which has been explained by Ferenczi (1921 and 1922). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. In so far as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore.

[1933a, 4637]

So far all this is trite repetition. And you must not suppose that the many things I have not mentioned this time no longer hold good. This repetition was necessary so that I might use it as the starting-point for a report on the advances in our knowledge. We can boast of having learnt much that is new, particularly about the early organizations of the libido, and of having obtained a clearer grasp of the significance of what is old; and I will give you at least a few examples to demonstrate this. Abraham showed in 1924 that two stages can be distinguished in the sadistic-anal phase. The earlier of these is dominated by the destructive trends of destroying and losing, the later one by trends friendly towards objects - those of keeping and possessing. It is in the middle of this phase, therefore, that consideration for the object makes its first appearance as a precursor of a later erotic cathexis. We are equally justified in making a similar subdivision in the first, oral phase. In the first sub-stage what is in question is only oral incorporation, there is no ambivalence at all in the relation to the object - the mother's breast. The second stage, characterized by the emergence of the biting activity, may be described as the 'oral-sadistic' one; it exhibits for the first time the phenomena of ambivalence, which become so much clearer afterwards, in the following sadistic-anal phase. The value of these new distinctions is to be seen especially if we look for the dispositional points in the development of the libido in the case of particular neuroses, such as obsessional neurosis or melancholia. You must here recall to mind what we have learnt about the connection between fixation of the libido, disposition and regression.

[1933a, 4704]
We have been able to study transformations of instinct and similar processes particularly in anal erotism, the excitations arising from the sources of the erotogenic anal zone, and we were surprised at the multiplicity of uses to which these instinctual impulses are put. It may not be easy, perhaps, to get free from the contempt into which this particular zone has fallen in the course of evolution. Let us therefore allow ourselves to be reminded by Abraham that embryologically the anus corresponds to the primitive mouth, which has migrated down to the end of the bowel. We have learnt, then, that after a person's own faeces, his excrement, has lost its value for him, this instinctual interest derived from the anal source passes over on to objects that can be presented as gifts. And this is rightly so, for faeces were the first gift that an infant could make, something he could part with out of love for whoever was looking after him. After this, corresponding exactly to analogous changes of meaning that occur in linguistic development, this ancient interest in faeces is transformed into the high valuation of gold and money but also makes a contribution to the affective cathexis of baby and penis. It is a universal conviction among children, who long retain the cloaca theory, that babies are born from the bowel like a piece of faeces: defaecation is the model of the act of birth. But the penis too has its fore-runner in the column of faeces which fills and stimulates the mucous membrane of the bowel. When a child, unwillingly enough, comes to realize that there are human creatures who do not possess a penis, that organ appears to him as something detachable from the body and becomes unmistakably analogous to the excrement, which was the first piece of bodily material that had to be renounced. A great part of anal erotism is thus carried over into a cathexis of the penis. But the interest in that part of the body has, in addition to its anal-erotic root, an oral one which is perhaps more powerful still: for when sucking has come to an end, the penis also becomes heir of the mother’s nipple.

What I have been telling you here may be described as the prehistory of women. It is a product of the very last few years and may have been of interest to you as an example of detailed analytic work. Since its subject is woman, I will venture on this occasion to mention by name a few of the women who have made valuable contributions to this investigation. Dr. Ruth Mack Brunswick was the first to describe a case of neurosis which went back to a fixation in the pre-Oedipus stage and had never reached the Oedipus situation at all. The case took the form of jealous paranoia and proved accessible to therapy. Dr. Jeanne Lampl-de Groot has established the incredible phallic activity of girls towards their mother by some assured observations, and Dr. Helene Deutsch has shown that the erotic actions of homosexual women reproduce the relations between mother and baby.
The treatment described in this paper was broken off on December 31st, 1899. My account of it was written during the two weeks immediately following, but was not published until 1905. It is not to be expected that after more than twenty years of uninterrupted work I should see nothing to alter in my view of such a case and in my presentment of it; but it would obviously be absurd to bring the case history 'up to date' by means of emendations and additions. In all essentials, therefore, I have left it as it was, and in the text I have merely corrected a few oversights and inaccuracies to which my excellent English translators, Mr. and Mrs. James Strachey, have directed my attention. Such critical remarks as I have thought it permissible to add I have incorporated in these additional notes: so that the reader will be justified in assuming that I still hold to the opinions expressed in the text unless he finds them contradicted in the footnotes. The problem of medical discretion which I have discussed in this preface does not touch the remaining case histories contained in this volume; for three of them were published with the express assent of the patients (or rather, as regards little Hans, with that of his father), while in the fourth case (that of Schreber) the subject of the analysis was not actually a person but a book produced by him. In Dora's case the secret was kept until this year. I had long been out of touch with her, but a short while ago I heard that she had recently fallen ill again from other causes, and had confided to her physician that she had been analysed by me when she was a girl. This disclosure made it easy for my well-informed colleague to recognize her as the Dora of 1899. No fair judge of analytic therapy will make it a reproach that the three months' treatment she received at that time effected no more than the relief of her current conflict and was unable to give her protection against subsequent illnesses.

For the further spread of this movement Brill and Jones deserve the greatest credit: in their writings they drew their countrymen's attention with unremitting assiduity to the easily observable fundamental facts of everyday life, of dreams and neurosis. Brill has contributed still further to this effect by his medical practice and by his translations of my works, and Jones by his instructive lectures and by his skill in debate at congresses in America.¹ The absence of any deep-rooted scientific tradition in America and the much less stringent rule of official authority there have been of decided advantage to the impetus given by Stanley Hall. It was characteristic of that country that from the beginning professors and superintendents of mental hospitals showed as much interest in analysis as independent practitioners. But it is clear that precisely for this reason the ancient centres of culture, where the greatest resistance has been displayed, must be the scene of the decisive struggle over psycho-analysis.

¹ (Footnote added 1923:) It is not my intention, of course, to bring this account, written in 1914, 'up to date' [in English in the original]. I will only add a few remarks to indicate how the picture has altered in the interval, which includes the World War. In Germany a gradual infiltration of analytic theories into clinical psychiatry is taking place, though this is not always admitted. The French translations of my works that have been appearing during the last few years have finally aroused a keen interest in psycho-analysis even in France, though for the moment this is more active in literary circles than in scientific ones. In Italy M. Levi Bianchini (of Nocera Superiore) and Edoardo Weiss (of Trieste) have come forward as translators and champions of psycho-analysis (cf. the Biblioteca Psicoanalitica Italiana). A collected edition of my works which is appearing in Madrid (translated by Lopez Ballesteros) is evidence of the lively interest taken in it in Spanish-speaking countries (Prof. H. Delgado in Lima). As regards England, the prophecy which I have made above seems to be in steady course of fulfilment; a special centre for the study of analysis has been formed at Calcutta in British India. In North America it is still true that the depth of understanding of analysis does not keep pace with its popularity. In Russia, since the Revolution, psycho-analytic work has begun afresh at several centres. In Poland the Polska Biblioteka Psychoanalytyczna is now appearing. In Hungary a brilliant analytic school is flourishing under the leadership of Ferenczi. (Cf. the Festschrift issued in honour of his fiftieth birthday.) At the present time the Scandinavian countries are still the least receptive.

² (Footnote added 1923:)
Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psycho-analysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psycho-analysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial. A reader who suspends his judgement and allows psycho-analysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.

Later History of Psycho-Analysis. - Psycho-analysis was carried approximately thus far by the work of the writer of this article, who for more than ten years was its sole representative. In 1906 the Swiss psychiatrists Bleuler and C. G. Jung began to play a lively part in analysis; in 1907 a first conference of its supporters took place at Salzburg; and the young science soon found itself the centre of interest both among psychiatrists and laymen. Its reception in Germany, with her morbid craving for authority, was not precisely to the credit of German science and moved even so cool a partisan as Bleuler to an energetic protest. Yet no condemnation or dismissal at official congresses served to hold up the internal growth or external expansion of psycho-analysis. In the course of the next ten years it extended far beyond the frontiers of Europe and became especially popular in the United States of America, and this was due in no small degree to the advocacy and collaboration of Putnam (Boston), Ernest Jones (Toronto; later London), Flournoy (Geneva), Ferenczi (Budapest), Abraham (Berlin), and many others besides. The anathema which was imposed upon psycho-analysis led its supporters to combine in an international organization which in the present year (1922) is holding its eighth private Congress in Berlin and now includes local groups in Vienna, Budapest, Berlin, Holland, Zurich, London, New York, Calcutta and Moscow. This development was not interrupted even by the World War. In 1918-19 Dr. Anton von Freund of Budapest founded the Internationaler Psychoanalytischer Verlag, which publishes journals and books concerned with psycho-analysis, and in 1920 Dr. M. Eitingon opened in Berlin the first psycho-analytic clinic for the treatment of neurotics without private means. Translations of the writer's principal works, which are now in preparation, into French, Italian and Spanish, testify to a growing interest in psycho-analysis in the Latin world as well.
When I published the paper I have mentioned, I was under no illusion as to its power to carry conviction. In the first place, I was aware that the account I had given was only a brief and incomplete one and even in places hard to understand - just enough, perhaps, to arouse the reader's expectations. Then, too, I had scarcely brought forward any examples and given no figures. Nor had I touched on the technique of collecting anamneses or done anything to prevent misunderstandings. I had not given consideration to any but the most obvious objections; and, as regards the theory itself, I had laid stress only on its main proposition and not on its qualifications. Accordingly, each reader was in fact at liberty to form his own opinion as to the binding force of the whole hypothesis. I could, moreover, reckon upon another difficulty in the way of its acceptance. I know very well that in putting forward my 'sexual aetiology' of the neuroses, I have brought up nothing new, and that undercurrents in medical literature taking these facts into account have never been absent. I know, too, that official academic medicine has in fact also been aware of them. But it has acted as if it knew nothing about the matter. It has made no use of its knowledge and has drawn no inferences from it. Such behaviour must have a deep-seated cause, originating perhaps in a kind of reluctance to look squarely at sexual matters in a reaction against older attempts at an explanation, which are regarded as obsolete. At all events, one had to be prepared to meet with resistance in venturing upon an attempt to make something credible to other people which they could without any trouble have discovered for themselves.

[1895f, 353]

"But where there are grounds for regarding the neurosis as an acquired one, careful enquiry directed to that end reveals that a set of noxae and influences from sexual life..." Löwenfeld quotes this passage and adds the following gloss: 'From this it appears that Freud always regards a neurosis as "acquired" whenever incidental causes are to be found for it.'

[1895f, 362]

I am quite sure that this theory will call up a storm of contradictions from contemporary physicians. But this is not the place in which to present the documents and the experiences which have forced me to my convictions, nor to explain the true meaning of the rather vague expression 'disorders of the economics of the nervous system'. This will be done, most fully, I hope, in a work on the subject which I have in preparation. In the present paper I limit myself to reporting my findings.

[1896a, 374]

I will without delay add some factual details and some commentary to the result I have announced, in order to combat the scepticism with which I expect to meet. I have been able to carry out a complete psycho-analysis in thirteen cases of hysteria, three of that number being true combinations of hysteria and obsessional neurosis. (I do not speak of hysteria with obsessions.) In none of these cases was an event of the kind defined above missing. It was represented either by a brutal assault committed by an adult or by a seduction less rapid and less repulsive, but reaching the same conclusion. In seven out of the thirteen cases the intercourse was between children on both sides - sexual relations between a little girl and a boy a little older (most often her brother) who had himself been the victim of an earlier seduction. These relations sometimes continued for years, until the little guilty parties reached puberty; the boy would repeat the same practices with the little girl over and over again and without alteration - practices to which he himself had been subjected by some female servant or governess and which on account of their origin were often of a disgusting sort. In a few cases there was a combination of an assault and relations between children or a repetition of a brutal abuse.

[1896a, 376]
From previous experience I can foresee that it is precisely against this assertion or against its universal validity that your contradiction, Gentlemen, will be directed. Perhaps it would be better to say, your inclination to contradict; for none of you, no doubt, have as yet any investigations at your disposal which, based upon the same procedure, might have yielded a different result. As regards the controversial matter itself, I will only remark that the singling out of the sexual factor in the aetiology of hysteria springs at least from no preconceived opinion of my part. The two investigators as whose pupil I began my studies of hysteria, Charcot and Breuer, were far from having any such presupposition; in fact they had a personal disinclination to it which I originally shared. Only the most laborious and detailed investigations have converted me, and that slowly enough, to the view I hold to-day. If you submit my assertion that the aetiology of hysteria lies in sexual life to the strictest examination, you will find that it is supported by the fact that in some eighteen cases of hysteria I have been able to discover this connection in every single symptom, and, where the circumstances allowed, to confirm it by therapeutic success. No doubt you may raise the objection that the nineteenth or the twentieth analysis will perhaps show that hysterical symptoms are derived from other sources as well, and thus reduce the universal validity of the sexual aetiology to one of eighty percent. By all means let us wait and see; but, since these eighteen cases are at the same time all the cases on which I have been able to carry out the work of analysis and since they were not picked out by anyone for my convenience, you will find it understandable that I do not share such an expectation but am prepared to let my belief run ahead of the evidential force of the observations I have so far made. Besides, I am influenced by another motive as well, which for the moment is of merely subjective value. In the sole attempt to explain the physiological and psychical mechanism of hysteria which I have been able to make in order to correlate my observations, I have come to regard the participation of sexual motive forces as an indispensable premiss.

I therefore put forward the thesis that at the bottom of every case of hysteria there are one or more occurrences of premature sexual experience, occurrences which belong to the earliest years of childhood but which can be reproduced through the work of psycho-analysis in spite of the intervening decades. I believe that this is an important finding, the discovery of a caput Nili in neuropathology; but I hardly know what to take as a starting-point for a continuation of my discussion of this subject. Shall I put before you the actual material I have obtained from my analyses? Or shall I rather try first to meet the mass of objections and doubts which, as I am surely correct in supposing, have now taken possession of your attention? I shall choose the latter course; perhaps we shall then be able to go over the facts more calmly.

(a) No one who is altogether opposed to a psychological view of hysteria, who is unwilling to give up the hope that some day it will be possible to trace back its symptoms to 'finer anatomical changes' and who has rejected the view that the material foundations of hysterical changes are bound to be of the same kind as those of our normal mental processes - no one who adopts this attitude will, of course, put any faith in the results of our analyses; however, the difference in principle between his premisses and ours absolves us from the obligation of convincing him on individual points.
But other people, too, although they may be less averse to psychological theories of hysteria, will be tempted, when considering our analytic findings, to ask what degree of certainty the application of psycho-analysis offers. Is it not very possible either that the physician forces such scenes upon his docile patients, alleging that they are memories, or else that the patients tell the physician things which they have deliberately invented or have imagined and that he accepts those things as true? Well, my answer to this is that the general doubt about the reliability of the psycho-analytic method can be appraised and removed only when a complete presentation of its technique and results is available. Doubts about the genuineness of the infantile sexual scenes can, however, be deprived of their force here and now by more than one argument. In the first place, the behaviour of patients while they are reproducing these infantile experiences is in every respect incompatible with the assumption that the scenes are anything else than a reality which is being felt with distress and reproduced with the greatest reluctance. Before they come for analysis the patients know nothing about these scenes. They are indignant as a rule if we warn them that such scenes are going to emerge. Only the strongest compulsion of the treatment can induce them to embark on a reproduction of them. While they are recalling these infantile experiences to consciousness, they suffer under the most violent sensations, of which they are ashamed and which they try to conceal; and, even after they have gone through them once more in such a convincing manner, they still attempt to withhold belief from them, by emphasizing the fact that, unlike what happens in the case of other forgotten material, they have no feeling of remembering the scenes.¹

[1896c, 418]

I have now come to the end of what I have to say to-day. Prepared as I am to meet with contradiction and disbelief, I should like to say one thing more in support of my position. Whatever you may think about the conclusions I have come to, I must ask you not to regard them as the fruit of idle speculation. They are based on a laborious individual examination of patients which has in most cases taken up a hundred or more hours of work. What is even more important to me than the value you put on my results is the attention you give to the procedure I have employed. This procedure is new and difficult to handle, but it is nevertheless irreplaceable for scientific and therapeutic purposes. You will realize, I am sure, that one cannot properly deny the findings which follow from this modification of Breuer's procedure so long as one puts it aside and uses only the customary method of questioning patients. To do so would be like trying to refute the findings of histological technique by relying upon macroscopic examination. The new method of research gives wide access to a new element in the psychical field of events, namely, to processes of thought which have remained unconscious - which, to use Breuer's expression, are 'inadmissible to consciousness'. Thus it inspires us with the hope of a new and better understanding of all functional psychical disturbances. I cannot believe that psychiatry will long hold back from making use of this new pathway to knowledge.

[1896c, 433]

I am aware that efforts will be made, by the use of arguments with an ethical colouring, to prevent the physician from pursuing the matter further. Anyone who wants to make certain whether or not his patients' neuroses are really connected with their sexual life cannot avoid asking them about their sexual life and insisting upon receiving a true account of it. But in this, it is asserted, lies the danger both for the individual and society. A doctor, I hear it being said, has no right to intrude upon his patients' sexual secrets and grossly injure their modesty (especially with women patients) by an interrogation of this sort. His clumsy hand can only ruin family happiness, offend the innocence of young people and encroach upon the authority of parents; and where adults are concerned he will come to share uncomfortable knowledge and destroy his own relations to his patients. It is therefore his ethical duty, the conclusion is, to keep away from the whole business of sex.

[1897b, 455]
To this one may well reply that it is the expression of a prudery which is unworthy of a physician and which inadequately conceals its weakness behind bad arguments. If factors arising out of sexual life must really be acknowledged to be causes of illness, then, for that very reason, investigation and discussion of them automatically falls within the sphere of a physician's duty. The injury to modesty of which he is guilty in this is no different and no worse, one would imagine, than when he insists on examining a woman's genital organs in order to cure a local affection - a demand on which he is pledged to insist by his medical training itself. Even now one often hears elderly women who have spent their youth in the provinces tell of how at one time they were reduced to a state of exhaustion by excessive genital haemorrhages, because they could not make up their minds to allow a doctor to see their nakedness. The educative influence which has been exercised on the public by the medical world has, in the course of one generation, so altered things that an objection of this sort is an extremely rare occurrence among the young women of to-day. If it were to occur, it would be condemned as unreasonable prudery, as modesty in the wrong place. Are we living in Turkey, a husband would ask, where all that a sick woman may show to the physician is her arm through a hole in the wall?

[1897b, 456]

Since the manifestations of the psychoneuroses arise from the deferred action of unconscious psychical traces, they are accessible to psychotherapy. But in this case the therapy must pursue paths other than the only one so far followed of suggestion with or without hypnosis. Basing myself on the 'cathartic' method introduced by Josef Breuer, I have in recent years almost completely worked out a therapeutic procedure which I propose to describe as 'psychoanalytic'. I owe a great number of successes to it, and I hope I may be able further to increase its effectiveness considerably. The first accounts of the technique and scope of this method were given in Studies on Hysteria, written jointly with Breuer and published in 1895. Since then a good deal, as I think I may say, has been altered for the better. Whereas at that time we modestly declared that we could undertake to only to remove the symptoms of hysteria, not to cure hysteria itself, this distinction has since come to seem to me without substance, so that there is a prospect of a genuine cure of hysteria and obsessions. It is therefore with very lively interest that I have read in the publications of colleagues that 'in this case the ingenious procedure devised by Breuer and Freud has failed', or that 'the method has not performed what it seemed to promise'. This gave me something of the feelings of a man who reads his own obituary in the paper, but who is able to reassure himself by his better knowledge of the facts. For the method is so difficult that it has quite definitely to be learned; and I cannot recall that a single one of my critics has expressed a wish to learn it from me. Nor do I believe that, like me, they have occupied themselves with it intensely enough to have been able to discover it for themselves. The remarks in the Studies on Hysteria are totally inadequate to enable a reader to master the technique, nor are they in any way intended to give any such complete instruction.

[1897b, 473]
If within ten years of the publication of this book (which is very far from being an easy one to read) a second edition is called for, this is not due to the interest taken in it by the professional circles to whom my original preface was addressed. My psychiatric colleagues seem to have taken no trouble to overcome the initial bewilderment created by my new approach to dreams. The professional philosophers have become accustomed to polishing off the problems of dream-life (which they treat as a mere appendix to conscious states) in a few sentences - and usually in the same ones; and they have evidently failed to notice that we have something here from which a number of inferences can be drawn that are bound to transform our psychological theories. The attitude adopted by reviewers in the scientific periodicals could only lead one to suppose that my work was doomed to be sunk into complete silence; while the small group of gallant supporters, who practise medical psycho-analysis under my guidance and who follow my example in interpreting dreams and make use of their interpretations in treating neurotics, would never have exhausted the first edition of the book. Thus it is that I feel indebted to a wider circle of educated and curious-minded readers, whose interest has led me to take up once more after nine years this difficult, but in many respects fundamental, work.

I am glad to say that I have found little to change in it. Here and there I have inserted some new material, added some fresh points of detail derived from my increased experience, and at some few points recast my statements. But the essence of what I have written about dreams and their interpretation, as well as about the psychological theorems to be deduced from them - all this remains unaltered: subjectively at all events, it has stood the test of time. Anyone who is acquainted with my other writings (on the aetiology and mechanism of the psycho-neuroses) will know that I have never put forward inconclusive opinions as though they were established facts, and that I have always sought to modify my statements so that they may keep in step with my advancing knowledge. In the sphere of dream-life I have been able to leave my original assertions unchanged. During the long years in which I have been working at the problems of the neuroses I have often been in doubt and some times been shaken in my convictions. At such times it has always been the Interpretation of Dreams that has given me back my certainty. It is thus a sure instinct which has led my many scientific opponents to refuse to follow me more especially in my researches upon dreams.

Nine years elapsed between the first and second editions of this book, but after scarcely more than a single year a third edition has become necessary. This new turn of events may please me: but just as formerly I was unwilling to regard the neglect of my book by readers as evidence of its worthlessness, so I cannot claim that the interest which is now being taken in it is a proof of its excellence.
‘One objection which is frequently brought forward by opponents of psycho-analysis, and which has lately been voiced by Havelock Ellis (1911, 168), argues that though dream-symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psycho-analytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream-distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.

[1900a, 833]

This same dream in its opening passage contained some sentences which could hardly be refused the name of an argument. This argument was not even absurd; it might just as well have occurred in waking thought: I was amused in the dream at the communication from the town council since, in the first place, I was not yet in the world in 1851 and, in the second place, my father, to whom it might have related, was already dead. Both of these statements were not only correct in themselves but agreed precisely with the real arguments that I should bring up if I were actually to receive a communication of that kind. My earlier analysis of the dream showed that it grew out of deeply embittered and derisive dream-thoughts. If we may also assume that there were strong reasons present for the activity of the censorship, we shall understand that the dream-work had every motive for producing a perfectly valid reftutation of an absurd suggestion on the model contained in the dream-thoughts. The analysis showed, however, that the dream-work did not have a free hand in framing this parallel but was obliged, for that purpose, to use material from the dream-thoughts. It was just as though there were an algebraic equation containing (in addition to numerals) plus and minus signs, indices and radical signs, and as though someone were to copy out the equation without understanding it, taking over both the operational symbols and the numerals into his copy but mixing them all up together. The two arguments could be traced back to the following material. It was distressing to me to think that some of the premises which underlay my psychological explanations of the psychoneuroses were bound to excite scepticism and laughter when they were first met with. For instance, I had been driven to assume that impressions from the second year of life, and sometimes even from the first, left a lasting trace on the emotional life of those who were later to fall ill, and that these impressions - though distorted and exaggerated in many ways by the memory - might constitute the first and deepest foundation for hysterical symptoms. Patients, to whom I explained this at some appropriate moment, used to parody this newly gained knowledge by declaring that they were ready to look for recollections dating from a time at which they were not yet alive. My discovery of the unexpected part played by their father in the earliest sexual impulses of female patients might well be expected to meet with a similar reception (see the discussion on p. 736 f.). Nevertheless, it was my well-grounded conviction that both of these hypotheses were true. By way of confirmation I called to mind some instances in which the death of the father occurred while the child was at a very early age and in which later events, otherwise inexplicable, proved that the child had nevertheless retained unconsciously recollections of the figure which had disappeared so early in his life. I was aware that these two assertions of mine rested on the drawing of conclusions whose validity would be disputed. It was therefore an achievement of wish-fulfilment when the material of precisely those conclusions which I was afraid would be contested was employed by the dream-work for drawing conclusions which it was impossible to contest.

[1900a, 897]
On the other hand, I cannot confirm the opinion, first stated by Silberer, that all dreams (or many dreams, or certain classes of dreams) require two different interpretations, which are even stated to bear a fixed relation to each other. One of these interpretations, which Silberer calls the 'psycho-analytic' one, is said to give the dream some meaning or other, usually of an infantile-sexual kind; the other and more important interpretation, to which he gives the name of 'anagogic', is said to reveal the more serious thoughts, often of profound import, which the dream-work has taken as its material. Silberer has not given evidence in support of this opinion by reporting a series of dreams analysed in the two directions. And I must object that the alleged fact is non-existent. In spite of what he says, the majority of dreams require no 'over-interpretation' and, more particularly, are insusceptible to an anagogic interpretation. As in the case of many other theories put forward in recent years, it is impossible to overlook the fact that Silberer's views are influenced to some extent by a purpose which seeks to disguise the fundamental circumstances in which dreams are formed and to divert interest from their instinctual roots. In a certain number of cases I have been able to confirm Silberer's statements. Analysis showed that in such cases the dream-work found itself faced with the problem of transforming into a dream a series of highly abstract thoughts from waking life which were incapable of being given any direct representation. It endeavoured to solve the problem by getting hold of another group of intellectual material, somewhat loosely related (often in a manner which might be described as 'allegorical') to the abstract thoughts, and at the same time capable of being represented with fewer difficulties. The abstract interpretation of a dream that has arisen in this way is given by the dreamer without any difficulty; the correct interpretation of the material that has been interpolated must be looked for by the technical methods which are now familiar to us.

[1900a, 958]

No doubt it was awkward that I was obliged to publish the results of my enquiries without there being any possibility of other workers in the field testing and checking them, particularly as those results were of a surprising and by no means gratifying character. But it will be scarcely less awkward now that I am beginning to bring forward some of the material upon which my conclusions were based and make it accessible to the judgement of the world. I shall not escape blame by this means. Only, whereas before I was accused of giving no information about my patients, now I shall be accused of giving information about my patients which ought not to be given. I can only hope that in both cases the critics will be the same, and that they will merely have shifted the pretext for their reproaches; if so I can resign in advance any possibility of ever removing their objections.

[1905e, 1350]
Even if I ignore the ill-will of narrow-minded critics such as these, the presentation of my case histories remains a problem which is hard for me to solve. The difficulties are partly of a technical kind, but are partly due to the nature of the circumstances themselves. If it is true that the causes of hysterical disorders are to be found in the intimacies of the patients' psycho-sexual life, and that hysterical symptoms are the expression of their most secret and repressed wishes, then the complete elucidation of a case of hysteria is bound to involve the revelation of those intimacies and the betrayal of those secrets. It is certain that the patients would never have spoken if it had occurred to them that their admissions might possibly be put to scientific uses; and it is equally certain that to ask them themselves for leave to publish their case would be quite unavailing. In such circumstances persons of delicacy, as well as those who were merely timid, would give first place to the duty of medical discretion and would declare with regret that the matter was one upon which they could offer science no enlightenment. But in my opinion the physician has taken upon himself duties not only towards the individual patient but towards science as well; and his duties towards science mean ultimately nothing else than his duties towards the many other patients who are suffering or will some day suffer from the same disorder. Thus it becomes the physician's duty to publish what he believes he knows of the causes and structure of hysteria, and it becomes a disgraceful piece of cowardice on his part to neglect doing so, as long as he can avoid causing direct personal injury to the single patient concerned. I think I have taken every precaution to prevent my patient from suffering any such injury. I have picked out a person the scenes of whose life were laid not in Vienna but in a remote provincial town, and whose personal circumstances must therefore be practically unknown in Vienna. I have from the very beginning kept the fact of her being under my treatment such a careful secret that only one other physician - and one in whose discretion I have complete confidence - can be aware that the girl was a patient of mine. I have waited for four whole years since the end of the treatment and have postponed publication till hearing that a change has taken place in the patient's life of such a character as allows me to suppose that her own interest in the occurrences and psychological events which are to be related here may now have grown faint. Needless to say, I have allowed no name to stand which could put a non-medical reader upon the scent; and the publication of the case in a purely scientific, and technical periodical should, further, afford a guarantee against unauthorized readers of this sort. I naturally cannot prevent the patient herself from being pained if her own case history should accidentally fall into her hands. But she will learn nothing from it that she does not already know; and she may ask herself who besides her could discover from it that she is the subject of this paper.

[1905e, 1351]
I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (The Interpretation of Dreams) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance. [1905e, 1353]

But instead of this I formulated a generalization according to which the meaning of dreams is limited to a single form, to the representation of wishes, and by so doing I aroused a universal inclination to dissent. I must, however, observe that I did not consider it either my right or my duty to simplify a psychological process so as to make it more acceptable to my readers, when my researches had shown me that it presented a complication which could not be reduced to uniformity until the inquiry had been carried into another field. It is therefore of special importance to me to show that apparent exceptions such as this dream of Dora's, which has shown itself in the first instance to be the continuation into sleep of an intention formed during the day - nevertheless lend fresh support to the rule which is in dispute. [1905e, 1405]
Dora had listened to me without any of her usual contradictions. She seemed to be moved; she said good-bye to me very warmly, with the heartiest wishes for the New Year, and - came no more. Her father, who called on me two or three times afterwards, assured me that she would come back again, and said it was easy to see that she was eager for the treatment to continue. But it must be confessed that Dora's father was never entirely straightforward. He had given his support to the treatment so long as he could hope that I should 'talk' Dora out of her belief that there was something more than a friendship between him and Frau K. His interest faded when he observed that it was not my intention to bring about that result. I knew Dora would not come back again. Her breaking off so unexpectedly, just when my hopes of a successful termination of the treatment were at their highest, and her thus bringing those hopes to nothing - this was an unmistakable act of vengeance on her part. Her purpose of self-injury also profited by this action. No one who, like me, conjures up the most evil of those half-tamed demons that inhabit the human breast, and seeks to wrestle with them, can expect to come through the struggle unscathed. Might I perhaps have kept the girl under my treatment if I myself had acted a part, if I had exaggerated the importance to me of her staying on, and had shown a warm personal interest in her - a course which, even after allowing for my position as her physician, would have been tantamount to providing her with a substitute for the affection she longed for? I do not know. Since in every case a portion of the factors that are encountered under the form of resistance remains unknown, I have always avoided acting a part, and have contented myself with practising the humbler arts of psychology. In spite of every theoretical interest and of every endeavour to be of assistance as a physician, I keep the fact in mind that there must be some limits set to the extent to which psychological influence may be used, and I respect as one of these limits the patient's own will and understanding.

[1905e, 1444]

I was further anxious to show that sexuality does not simply intervene, like a *deus ex machina*, on one single occasion, at some point in the working of the processes which characterize hysteria, but that it provides the motive power for every single symptom, and for every single manifestation of a symptom. The symptoms of the disease are nothing else than the patient's sexual activity. A single case can never be capable of proving a theorem so general as this one; but I can only repeat over and over again - for I never find it otherwise - that sexuality is the key to the problem of the psychoneuroses and of the neuroses in general. No one who disdains the key will ever be able to unlock the door. I still await news of the investigations which are to make it possible to contradict this theorem or to limit its scope. What I have hitherto heard against it have been expressions of personal dislike or disbelief. To these it is enough to reply in the words of Charcot: 'Ça n'empêche pas d'exister.'

[1905e, 1448]

Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psycho-analytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psycho-analysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psycho-analysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

[1905d, 1462]
Nevertheless I cannot bring myself to accept the idea that this part of psycho-analytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation of this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psycho-analysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.

[1905d, 1462]

In spite of all these limitations, the number of persons suitable for psycho-analytic treatment is extraordinarily large and the extension which has come to our therapeutic powers from this method is, according to Freud, very considerable. Freud requires long periods, six months to three years, for an effective treatment; yet he informs us that up to the present, owing to various circumstances which can easily be guessed, he has for the most part been in a position to try his treatment only on very severe cases: patients have come to him after many years of illness, completely incapacitated for life, and, after being disappointed by all kinds of treatments, have had recourse as a last resort to a method which is novel and has been greeted with many doubts. In cases of less severe illness the duration of the treatment might well be much shorter, and very great advantage in the direction of future prevention might be achieved.

[1904a, 1560]

I cannot say the same of the therapeutic procedure which was introduced to our colleagues at the same time as our theory; it is still struggling for recognition. There may be special reasons for this. At that time the technique of the method was as yet undeveloped; it was impossible for me to give medical readers of the book the directions necessary to enable them to carry through the treatment completely. But causes of a general nature have certainly also played a part. To many physicians, even to-day, psychotherapy seems to be a product of modern mysticism and, compared with our physico-chemical remedies which are applied on the basis of physiological knowledge, appears positively unscientific and unworthy of the attention of a serious investigator. Allow me, therefore, to defend the cause of psychotherapy before you, and to point out to you what may be described as unjust or mistaken in this condemnation of it.

[1905a, 1563]
A theory which is novel, which lacks simplicity and which runs counter to our habits of thought, can scarcely gain in clarity from a concise presentation. All I can aim at in these remarks, therefore, is to draw attention to the fuller treatment of the unconscious in my *Interpretation of Dreams* and to the writings of Lipps, which seem to me of the highest importance. I am aware that anyone who is under the spell of a good academic philosophical education, or who takes his opinions at long range from some so-called system of philosophy, will be opposed to the assumption of an ‘unconscious psychical’ in the sense in which Lipps and I use the term, and will prefer to prove its impossibility on the basis of a definition of the psychical. But definitions are a matter of convention and can be altered. I have often found that people who dispute the unconscious as being something absurd and impossible have not formed their impressions from the sources from which I at least was brought to the necessity of recognizing it. These opponents of the unconscious had never witnessed the effect of a post-hypnotic suggestion, and when I have told them examples from my analyses with non-hypnotized neurotics they have been filled with the greatest astonishment. They had never realized the idea that the unconscious is something which we really do not know, but which we are obliged by compelling inferences to supply; they had understood it as being something capable of becoming conscious but which was not being thought of at the moment, which did not occupy ‘the focal point of attention’. Nor had they ever tried to convince themselves of the existence in their own minds of unconscious thoughts like these by analysing one of their own dreams; and when I attempted to do so with them they could only greet their own associations with surprise and confusion. I have also formed an impression that fundamental emotional resistances stand in the way of accepting the ‘unconscious’, and that these are based on the fact that no one wants to get to know his unconscious and that the most convenient plan is to deny its possibility altogether.

[1905c, 1747]

And now for the final question, whose answer we have already evaded more than once. Our views on repression, on the genesis of delusions and allied disorders, on the formation and solution of dreams, on the part played by erotic life, and on the method by which such disorders are cured, are far from being the common property of science, let alone the assured possession of educated people. If the insight which has enabled the author to construct his ‘phantasy’ in such a way that we have been able to dissect it like a real case history is in the nature of knowledge, we should be curious to learn what were the sources of that knowledge. One of our circle - the one who, as I said at the beginning, was interested in the dreams in *Gradiva* and their possible interpretation - approached the author with the direct question whether he knew anything of such scientific theories as these. The author replied, as was to be expected, in the negative, and, indeed, somewhat brusquely. His imagination, he said, had inspired *Gradiva*, and he had enjoyed it; if there was anyone whom it did not please, let him simply leave it alone. He had no suspicion of how greatly it had in fact pleased his readers.

[1907a, 1882]
That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.

I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is 'degenerate', from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psycho-analytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations - that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution an especially strong sexual instinct and a tendency to precocity and to a premature expression of that instinct, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis's example, we shall have thought it worth while to collect the childhood memories of healthy adults as well.

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.
You may have formed an impression that the technique through whose armoury I have just conducted you is particularly difficult. In my opinion that technique is entirely in conformity with the material with which it has to deal. But this much at least is clear: it is not a self-evident one and it must be learnt just as the techniques of histology or surgery must be learnt. You will perhaps be surprised to hear that in Europe we have heard a large number of judgements on psycho-analysis from people who know nothing of this technique and do not employ it; and who go on to demand with apparent scorn that we shall prove to them the correctness of our findings. Among these adversaries there are no doubt some to whom a scientific mode of thought is not as a rule alien, who, for instance, would not reject the results of a microscopic examination because it could not be confirmed on the anatomical preparation with the naked eye, but who would first form a judgement on the matter themselves with the help of a microscope. But, where psycho-analysis is concerned, the prospects of recognition are in truth less favourable. Psycho-analysis is seeking to bring to conscious recognition the things in mental life which are repressed; and everyone who forms a judgement on it is himself a human being, who possesses similar repressions and may perhaps be maintaining them with difficulty. They are therefore bound to call up the same resistance in him as in our patients; and that resistance finds it easy to disguise itself is an intellectual rejection and to bring up arguments like those which we ward off in our patients by means of the fundamental rule of psycho-analysis. We often become aware in our opponents, just as we do in our patients, that their power of judgement is very noticeably influenced affectively in the sense of being diminished. The arrogance of consciousness (in rejecting dreams with such contempt, for instance) is one of the most powerful of the devices with which we are provided as a universal protection against the incursion of unconscious complexes. That is why it is so hard to convince people of the reality of the unconscious and to teach them to recognize something new which is in contradiction to their conscious knowledge.

[1910a, 2226]

A conviction of the correctness of this thesis was not precisely made easier by the behaviour of patients. Instead of willingly presenting us with information about their sexual life, they try to conceal it by every means in their power. People are in general not candid over sexual matters. They do not show their sexuality freely, but to conceal it they wear a heavy overcoat woven of a tissue of lies, as though the weather were bad in the world of sexuality. Nor are they mistaken. It is a fact that sun and wind are not favourable to sexual activity in this civilized world of ours; none of us can reveal his erotism freely to others. But when your patients discover that they can feel quite easy about it while they are under your treatment, they discard this veil of lies, and only then are you in a position to form a judgement on this debatable question. Unluckily even doctors are not preferred above other human creatures in their personal relation to questions of sexual life, and many of them are under the spell of the combination of prudery and prurience which governs the attitude of most ‘civilized people’ in matters of sexuality.

[1910a, 2227]
Ladies and Gentlemen, from the intellectual point of view we must, I think, take into account two special obstacles to recognizing psycho-analytic trains of thought. In the first place, people are unaccustomed to reckoning with a strict and universal application of determinism to mental life; and in the second place, they are ignorant of the peculiarities which distinguish unconscious mental processes from the conscious ones that are familiar to us. One of the most widespread resistances to psycho-analytic work, in the sick and healthy alike, can be traced to the second of these two factors. People are afraid of doing harm by psycho-analysis; they are afraid of bringing the repressed sexual instincts into the patient's consciousness, as though that involved a danger of their overwhelming his higher ethical trends and of their robbing him of his cultural acquisitions. People notice that the patient has sore spots in his mind, but shrink from touching them for fear of increasing his sufferings. We can accept this analogy. It is no doubt kinder not to touch diseased spots if it can do nothing else but cause pain. But, as we know, a surgeon does not refrain from examining and handling a focus of disease, if he is intending to take active measures which he believes will lead to a permanent cure. No one thinks of blaming him for the inevitable suffering caused by the examination or for the reactions to the operation, if only it gains its end and the patient achieves a lasting recovery as a result of the temporary worsening of his state. The case is similar with psycho-analysis. It may make the same claims as surgery: the increase in suffering which it causes the patient during treatment is incomparably less than what a surgeon causes, and is quite negligible in proportion to the severity of the underlying ailment. On the other hand, the final outcome that is so much dreaded - the destruction of the patient's cultural character by the instincts which have been set free from repression - is totally impossible. For alarm on this score takes no account of what our experiences have taught us with certainty - namely that the mental and somatic power of a wishful impulse, when once its repression has failed, is far stronger if it is unconscious than if it is conscious; so that to make it conscious can only be to weaken it. An unconscious wish cannot be influenced and it is independent of any contrary tendencies, whereas a conscious one is inhibited by whatever else is conscious and opposed to it. Thus the work of psycho-analysis puts itself at the orders of precisely the highest and most valuable cultural trends, as a better substitute for the unsuccessful repression.

[1910a, 2237]

GENTLEMEN, - Since the objects for which we are assembled here to-day are mainly practical, I shall choose a practical theme for my introductory address and appeal to your medical, not to your scientific, interest. I can imagine your probable views on the results of our therapy, and I assume that most of you have already passed through the two stages which all beginners go through, the stage of enthusiasm at the unexpected increase in our therapeutic achievements, and the stage of depression at the magnitude of the difficulties which stand in the way of our efforts. At whatever point in this development, however, each of you may happen to be, my intention to-day is to show you that we have by no means come to the end of our resources for combating the neuroses, and that we may expect a substantial improvement in our therapeutic prospects before long.

[1910d, 2307]
Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone represented psycho-analysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling-resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became accustomed to that long ago. People simply did not believe me, just as even to-day people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of all arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patient's minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses - arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psycho-analysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electro-therapy, but that does not enable such measures to get the better of neuroses. Time will show whether psycho-analytic treatment can accomplish more.

[1910d, 2311]

Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psycho-analysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

[1910d, 2311]
In place of a single sick person let us put society - suffering as a whole from neuroses, though composed of sick and healthy members; and in place of individual acceptance in the one case let us put general recognition in the other. A little reflection will then show you that this substitution cannot in any way alter the outcome. The success which the treatment can have with the individual must occur equally with the community. Sick people will not be able to let their various neuroses become known - their anxious over-tenderness which is meant to conceal their hatred, their agoraphobia which tells of disappointed ambition, their obsessive actions which represent self-reproaches for evil intentions and precautions against them - if all their relatives and every stranger from whom they wish to conceal their mental processes know the general meaning of such symptoms, and if they themselves know that in the manifestations of their illness they are producing nothing that other people cannot instantly interpret. The effect, however, will not be limited to the concealment of the symptoms which, incidentally, it is often impossible to carry out; for this necessity for concealment destroys the use of being ill. Disclosure of the secret will have attacked, at its most sensitive point, the 'aetiological equation' from which neuroses arise - it will have made the gain from the illness illusory; and consequently the final outcome of the changed situation brought about by the physician's indiscretion can only be that the production of the illness will be brought to a stop.

Neither I myself nor my friends and co-workers find it agreeable to claim a monopoly in this way in the use of a medical technique. But in face of the dangers to patients and to the cause of psycho-analysis which are inherent in the practice that is to be foreseen of a 'wild' psycho-analysis, we have had no other choice. In the spring of 1910 we founded an International Psycho-Analytical Association, to which its members declare their adherence by the publication of their names, in order to be able to repudiate responsibility for what is done by those who do not belong to us and yet call their medical procedure 'psycho-analysis'. For as a matter of fact 'wild' analysts of this kind do more harm to the cause of psycho-analysis than to individual patients. I have often found that a clumsy procedure like this, even if at first it produced an exacerbation of the patient's condition, led to a recovery in the end. Not always but still often. When he has abused the physician enough and feels far enough away from his influence, his symptoms give way, or he decides to take some step which leads along the path to recovery. The final improvement then comes about 'of itself', or is ascribed to some totally indifferent treatment by some other doctor to whom the patient has later turned. In the case of the lady whose complaint against her physician we have heard, I should say that, despite everything, the 'wild' psycho-analyst did more for her than some highly respected authority who might have told her she was suffering from a 'vasomotor neurosis'. He forced her attention to the real cause of her trouble, or in that direction, and in spite of all her opposition this intervention of his cannot be without some favourable results. But he has done himself harm and helped to intensify the prejudices which patients feel, owing to their natural affective resistances, against the methods of psycho-analysis. And this can be avoided.

[1910d, 2312]

[1910k, 2380]
(e) I cannot advise my colleagues too urgently to model themselves during psycho-analytic treatment on the surgeon, who puts aside all his feelings, even his human sympathy, and concentrates his mental forces on the simple aim of performing the operation as skilfully as possible. Under present-day conditions the feeling that is most dangerous to a psycho-analyst is the therapeutic ambition to achieve by this novel and much disputed method something that will produce a convincing effect upon other people. This will not only put him into a state of mind which is unfavourable for his work, but will make him helpless against certain resistances of the patient, whose recovery, as we know, primarily depends on the interplay of forces in him. The justification for requiring this emotional coldness in the analyst is that it creates the most advantageous conditions for both parties: for the doctor a desirable protection for his own emotional life and for the patient the largest amount of help that we can give him to-day. A surgeon of earlier times took as his motto the words: 'Je le pansai, Dieu le guérit.'¹ The analyst should be content with something similar.

Both lay public and doctors - still ready to confuse psycho-analysis with treatment by suggestion - are inclined to attribute great importance to the expectations which the patient brings to the new treatment. They often believe in the case of one patient that he will not give much trouble, because he has great confidence in psycho-analysis and is fully convinced of its truth and efficacy; whereas in the case of another, they think that he will undoubtedly prove more difficult, because he has a sceptical outlook and will not believe anything until he has experienced its successful results on his own person. Actually, however, this attitude on the part of the patient has very little importance. His initial trust or distrust is almost negligible compared with the internal resistances which hold the neurosis firmly in place. It is true that the patient's happy trustfulness makes our earliest relationship with him a very pleasant one; we are grateful to him for that, but we warn him that his favourable prepossession will be shattered by the first difficulty that arises in the analysis. To the sceptic we say that the analysis requires no faith, that he may be as critical and suspicious as he pleases and that we do not regard his attitude as the effect of his judgement at all, for he is not in a position to form a reliable judgement on these matters; his distrust is only a symptom like his other symptoms and it will not be an interference, provided he conscientiously carries out what the rule of the treatment requires of him.

The analytic psychotherapist thus has a threefold battle to wage - in his own mind against the forces which seek to drag him down from the analytic level; outside the analysis, against opponents who dispute the importance he attaches to the sexual instinctual forces and hinder him from making use of them in his scientific technique; and inside the analysis, against his patients, who at first behave like opponents but later on reveal the overvaluation of sexual life which dominates them, and who try to make him captive to their socially untamed passion.
The lay public, about whose attitude to psycho-analysis I spoke at the outset, will doubtless seize upon this discussion of transference-love as another opportunity for directing the attention of the world to the serious danger of this therapeutic method. The psycho-analyst knows that he is working with highly explosive forces and that he needs to proceed with as much caution and conscientiousness as a chemist. But when have chemists ever been forbidden, because of the danger, from handling explosive substances, which are indispensable, on account of their effects? It is remarkable that psycho-analysis has to win for itself afresh all the liberties which have long since been accorded to other medical activities. I am certainly not in favour of giving up the harmless methods of treatment. For many cases they are sufficient, and, when all is said, human society has no more use for the *furor sanandi*¹ than for any other fanaticism. But to believe that the psychoneuroses are to be conquered by operating with harmless little remedies is grossly to under-estimate those disorders both as to their origin and their practical importance. No; in medical practice there will always be room for the 'ferrum' and the 'ignis' side by side with the 'medicina'; and in the same way we shall never be able to do without a strictly regular, undiluted psycho-analysis which is not afraid to handle the most dangerous mental impulses and to obtain mastery over them for the benefit of the patient.

[1915a, 2520]

There is often a tendency in medical and especially in psychiatric circles to contradict the theories of psycho-analysis without any real study or practical application of them. This is due not only to the striking novelty of these theories and the contrast they present to the views hitherto held by psychiatrists, but also to the fact that the premisses and technique of psycho-analysis are much more nearly related to the field of psychology than to that of medicine. It cannot be disputed, however, that purely medical and non-psychological teachings have hitherto done very little towards an understanding of mental life. The progress of psycho-analysis is further retarded by the dread felt by the average observer of seeing himself in his own mirror. Men of science tend to meet emotional resistances with arguments, and thus satisfy themselves to their own satisfaction! Whoever wishes not to ignore a truth will do well to distrust his antipathies, and, if he wishes to submit the theory of psycho-analysis to a critical examination, let him first analyse himself.

[1913m, 2548]

It has been our purpose on this occasion to show the direction into which the study of the problem of masturbation has been forced by the emergence of the psycho-analytic method of approach. How far we have succeeded in that purpose will appear from our readers' applause, or perhaps still more clearly from their disapproval.

[1912f, 2567]

It is far from being a simple matter to survey or describe the consequences involved in this way of treating the 'distressing trace of the Earth', of which the sexual and excretory functions may be considered the nucleus. It will be enough to mention a single one of these consequences, the one with which we are most concerned here: the fact that science is prohibited from dealing with these proscribed aspects of human life, so that anyone who studies such things is regarded as scarcely less 'improper' than someone who actually does improper things.

[1913k, 2640]
An attempt is made in this volume to deduce the original meaning of totemism from the vestiges remaining of it in childhood from the hints of it which emerge in the course of the growth of our own children. The close connection between totems and taboos carries us a step further along the path towards the hypothesis presented in these pages; and if in the end that hypothesis bears a highly improbable appearance, that need be no argument against the possibility of its approximating more or less closely to the reality which it is so hard to reconstruct.

[1912-1913, 2648]

There has been little opportunity in the preceding pages for showing how new light can be thrown upon the facts of social psychology by the adoption of a psycho-analytic method of approach: for the horror of incest displayed by savages has long been recognized as such and stands in need of no further interpretation. All that I have been able to add to our understanding of it is to emphasize the fact that it is essentially an infantile feature and that it reveals a striking agreement with the mental life of neurotic patients. Psycho-analysis has taught us that a boy's earliest choice of objects for his love is incestuous and that those objects are forbidden ones -his mother and his sister. We have learnt, too, the manner in which, as he grows up, he liberates himself from this incestuous attraction. A neurotic, on the other hand, invariably exhibits some degree of psychical infantilism. He has either failed to get free from the psychosexual conditions that prevailed in his childhood or he has returned to them - two possibilities which may be summed up as developmental inhibition and regression. Thus incestuous fixations of libido continue to play (or begin once more to play) the principal part in his unconscious mental life. We have arrived at the point of regarding a child's relation to his parents, dominated as it is by incestuous longings, as the nuclear complex of neurosis. This revelation of the importance of incest in neurosis is naturally received with universal scepticism by adults and normal people. Similar expressions of disbelief, for instance, inevitably greet the writings of Otto Rank, which have brought more and more evidence to show the extent to which the interest of creative writers centres round the theme of incest and how the same theme, in countless variations and distortions, provides the subject-matter of poetry. We are driven to believe that this rejection is principally a product of the distaste which human beings feel for their early incestuous wishes, now over taken by repression. It is therefore of no small importance that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defence must be enforced.

[1912-1913, 2665]

² Since I am used to being misunderstood, I think it worth while to insist explicitly that the derivations which I have proposed in these pages do not in the least overlook the complexity of the phenomena under review. All that they claim is to have added a new factor to the sources, known or still unknown, of religion, morality and society - a factor based on a consideration of the implications of psycho-analysis. I must leave to others the task of synthesizing the explanation into a unity. It does, however, follow from the nature of the new contribution that it could not play any other than a central part in such a synthesis, even though powerful emotional resistance might have to be overcome before its great importance was recognized.

[1912-1913, 2796]

This medical significance of psycho-analysis would not, however, justify me in bringing it to the notice of a circle of savants concerned in the synthesis of the sciences. And such a plan must seem particularly premature so long as a large number of psychiatrists and neurologists are opposed to the new therapeutic method and reject both its postulates and its findings. If, nevertheless, I regard the experiment as a legitimate one, it is because psycho-analysis can also claim to be of interest to others than psychiatrists, since it touches upon various other spheres of knowledge and reveals unexpected relations between them and the pathology of mental life.

[1913, 2802]
The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psycho-analysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is the interpretation of dreams, which brought psycho-analysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning or significance, and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psycho-analysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream. There is no half-way house between these two views of dreams. What argues against the physiological hypothesis is its unfruitfulness, and what may be argued in favour of the psycho-analytic one is the fact that it has translated and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

It has not been the fate of psycho-analysis to be greeted (like other young sciences) with the sympathetic encouragement of those who are interested in the advance of knowledge. For a long time it was disregarded, and when at last it could no longer be neglected it became, for emotional reasons, the object of the most violent attacks from people who had not taken the trouble to become acquainted with it. It owed this unfriendly reception to a single circumstance: for at an early stage of its researches psycho-analysis was driven to the conclusion that nervous illnesses are an expression of a disturbance of the sexual function and it was thus led to devote its attention to an investigation of that function - one which had been far too long neglected. But anyone who respects the rule that scientific judgement should not be influenced by emotional attitudes will assign a high degree of biological interest to psycho-analysis on account of these very investigations and will regard the resistances to it as actual evidence in favour of the correctness of its assertions.

Later I became a physician - or a psychologist, rather - and was able to create a new psychological discipline, something that is known as 'psycho-analysis', which is followed to-day with excited interest, and is greeted with praise and blame, by physicians and enquirers in neighbouring, and in distant, foreign lands - but least of all, of course, in our own country.

No one need be surprised at the subjective character of the contribution I propose to make here to the history of the psycho-analytic movement, nor need anyone wonder at the part I play in it. For psycho-analysis is my creation; for ten years I was the only person who concerned himself with it, and all the dissatisfaction which the new phenomenon aroused in my contemporaries has been poured out in the form of criticisms on my head. Although it is a long time now since I was the only psycho-analyst, I consider myself justified in maintaining that even to-day no one can know better than I do what psycho-analysis is, how it differs from other ways of investigating the life of the mind, and precisely what should be called psycho-analysis and what would better be described by some other name. In thus repudiating what seems to me a cool act of usurpation, I am indirectly informing the readers of this Jahrbuch the events that have led to the changes in its editorship and format.
In 1909, in the lecture-room of an American university, I had my first opportunity of speaking in public about psycho-analysis.¹ The occasion was a momentous one for my work, and moved by this thought I then declared that it was not I who had brought psycho-analysis into existence: the credit for this was due to someone else, to Josef Breuer, whose work had been done at a time when I was still a student engaged in passing my examinations (1880-2). Since I gave those lectures, however, some well-disposed friends have suggested to me a doubt whether my gratitude was not expressed too extravagantly on that occasion. In their view I ought to have done as I had previously been accustomed to do: treated Breuer's 'cathartic procedure' as a preliminary stage of psycho-analysis, and represented psycho-analysis itself as beginning with my discarding the hypnotic technique and introducing free associations. It is of no great importance in any case whether the history of psycho-analysis is reckoned as beginning with the cathartic method or with my modification of it; I refer to this uninteresting point merely because certain opponents of psycho-analysis have a habit of occasionally recollecting that after all the art of psycho-analysis was not invented by me, but by Breuer. This only happens, of course, if their views allow them to find something in it deserving attention; if they set no such limits to their rejection of it, psycho-analysis is always without question my work alone. I have never heard that Breuer's great share in psycho-analysis has earned him a proportionate measure of criticism and abuse. As I have long recognized that to stir up contradiction and arouse bitterness is the inevitable fate of psycho-analysis, I have come to the conclusion that I must be the true originator of all that is particularly characteristic in it. I am happy to be able to add that none of the efforts to minimize my part in creating this much-abused analysis have ever come from Breuer himself or could claim any support from him.

[1914d, 2878]

I am quite sure, however, that this opposition between our views had nothing to do with the breach in our relations which followed shortly after. This had deeper causes, but it came about in such a way that at first I did not understand it; it was only later that I learnt from many clear indications how to interpret it. It will be remembered that Breuer said of his famous first patient that the element of sexuality was astonishingly undeveloped in her and had contributed nothing to the very rich clinical picture of the case. I have always wondered why the critics did not more often cite this assertion of Breuer's as an argument against my contention of a sexual aetiology in the neuroses, and even to-day I do not know whether I ought to regard the omission as evidence of tact or of carelessness on their part. Anyone who reads the history of Breuer's case now in the light of the knowledge gained in the last twenty years will at once perceive the symbolism in it - the snakes, the stiffening, the paralysis of the arm - and, on taking into account the situation at the bedside of the young woman's sick father, will easily guess the real interpretation of her symptoms; his opinion of the part played by sexuality in her mental life will therefore be very different from that of her doctor. In his treatment of her case, Breuer was able to make use of a very intense suggestive rapport with the patient, which may serve us as a complete prototype of what we call 'transference' to-day. Now I have strong reasons for suspecting that after all her symptoms had been relieved Breuer must have discovered from further indications the sexual motivation of this transference, but that the universal nature of this unexpected phenomenon escaped him, with the result that, as though confronted by an 'untoward event',¹ he broke off all further investigation. He never said this to me in so many words, but he told me enough at different times to justify this reconstruction of what happened. When I later began more and more resolutely to put forward the significance of sexuality in the aetiology of neuroses, he was the first to show the reaction of distaste and repudiation which was later to become so familiar to me, but which at that time I had not yet learnt to recognize as my inevitable fate.

[1914d, 2881]
There was some consolation for the bad reception accorded to my contention of a sexual aetiology in the neuroses even by my more intimate circle of friends - for a vacuum rapidly formed itself about my person - in the thought that I was taking up the fight for a new and original idea. But, one day, certain memories gathered in my mind which disturbed this pleasing notion, but which gave me in exchange a valuable insight into the processes of human creative activity and the nature of human knowledge. The idea for which I was being made responsible had by no means originated with me. It had been imparted to me by three people whose opinion had commanded my deepest respect - by Breuer himself, by Charcot, and by Chrobak, the gynaecologist at the University, perhaps the most eminent of all our Vienna physicians. These three men had all communicated to me a piece of knowledge which, strictly speaking, they themselves did not possess. Two of them later denied having done so when I reminded them of the fact; the third (the great Charcot) would probably have done the same if it had been granted me to see him again. But these three identical opinions, which I had heard without understanding, had lain dormant in my mind for years, until one day they awoke in the form of an apparently original discovery.

[1914d, 2882]

I think that by thus unrolling the story of the development of psycho-analysis I have shown what it is, better than by a systematic description of it. I did not at first perceive the peculiar nature of what I had discovered. I unhesitatingly sacrificed my growing popularity as a doctor, and the increase in attendance during my consulting hours, by making a systematic enquiry into the sexual factors involved in the causation of my patients' neuroses; and this brought me a great many new facts which finally confirmed my conviction of the practical importance of the sexual factor. I innocently addressed a meeting of the Vienna Society for Psychiatry and Neurology with Krafft-Ebing in the chair, expecting that the material losses I had willingly undergone would be made up for by the interest and recognition of my colleagues. I treated my discoveries as ordinary contributions to science and hoped they would be received in the same spirit. But the silence which my communications met with, the void which formed itself about me, the hints that were conveyed to me, gradually made me realize that assertions on the part played by sexuality in the aetiology of the neuroses cannot count upon meeting with the same kind of treatment as other communications. I understood that from now onwards I was one of those who have 'disturbed the sleep of the world', as Hebbel says, and that I could not reckon upon objectivity and tolerance. Since, however, my conviction of the general accuracy of my observations and conclusions grew even stronger, and since neither my confidence in my own judgement nor my moral courage were precisely small, the outcome of the situation could not be in doubt. I made up my mind to believe that it had been my fortune to discover some particularly important facts and connections, and I was prepared to accept the fate that sometimes accompanies such discoveries.

[1914d, 2889]
I pictured the future as follows: - I should probably succeed in maintaining myself by means of the therapeutic success of the new procedure, but science would ignore me entirely during my lifetime; some decades later, someone else would infallibly come upon the same things - for which the time was not now ripe - would achieve recognition for them and bring me honour as a forerunner whose failure had been inevitable. Meanwhile, like Robinson Crusoe, I settled down as comfortably as possible on my desert island. When I look back to those lonely years, away from the pressures and confusions of to-day, it seems like a glorious heroic age. My 'splendid isolation' was not without its advantages and charms. I did not have to read any publications, nor listen to any ill-informed opponents; I was not subject to influence from any quarter; there was nothing to hustle me. I learnt to restrain speculative tendencies and to follow the unforgotten advice of my master, Charcot: to look at the same things again and again until they themselves begin to speak. My publications, which I was able to place with a little trouble, could always lag far behind my knowledge, and could be postponed as long as I pleased, since there was no doubtful 'priority' to be defended. The Interpretation of Dreams, for instance, was finished in all essentials at the beginning of 1896 but was not written out until the summer of 1899. The analysis of 'Dora' was over at the end of 1899; the case history was written in the next two weeks, but was not published until 1905. Meanwhile my writings were not reviewed in the medical journals, or, if as an exception they were reviewed, they were dismissed with expressions of scornful or pitying superiority. Occasionally a colleague would make some reference to me in one of his publications; it would be very short and not at all flattering - words such as 'eccentric', 'extreme', or 'very peculiar' would be used. It once happened that an assistant at the clinic in Vienna where I gave my University lectures asked me for permission to attend the course. He listened very attentively and said nothing; after the last lecture was over he offered to join me outside. As we walked away, he told me that with his chief's knowledge he had written a book combating my views; he regretted very much, however, that he had not first learnt more about them from my lectures, for in that case he would have written much of it differently. He had indeed enquired at the clinic whether he had not better first read The Interpretation of Dreams, but had been advised against doing so - it was not worth the trouble. He then himself compared the structure of my theory, so far as he now understood it, with that of the Catholic Church as regards its internal solidity. In the interests of the salvation of his soul, I shall assume that this remark implied a certain amount of appreciation. But he concluded by saying that it was too late to alter anything in his book, since it was already in print. Nor did my colleague think it necessary later to make any public avowal of his change of views on the subject of psycho-analysis; but preferred, in his capacity as a regular reviewer for a medical journal, to follow its development with flippant comments.

[1914d, 2890]
Whatever personal sensitiveness I possessed became blunted during those years, to my advantage. I was saved from becoming embittered, however, by a circumstance which is not always present to help lonely discoverers. Such people are as a rule tormented by the need to account for the lack of sympathy or the aversion of their contemporaries, and feel this attitude as a distressing contradiction of the security of their own sense of conviction. There was no need for me to feel so; for psycho-analytic theory enabled me to understand this attitude in my contemporaries and to see it as a necessary consequence of fundamental analytic premisses. If it was true that the set of facts I had discovered were kept from the knowledge of patients themselves by internal resistances of an affective kind, then these resistances would be bound to appear in healthy people too, as soon as some external source confronted them with what was repressed. It was not surprising that they should be able to justify this rejection of my ideas on intellectual grounds though it was actually affective in origin. The same thing happened equally often with patients; the arguments they advanced were the same and were not precisely brilliant. In Falstaff's words, reasons are 'as plenty as blackberries'. The only difference was that with patients one was in a position to bring pressure to bear on them so as to induce them to get insight into their resistances and overcome them, whereas one had to do without this advantage in dealing with people who were ostensibly healthy. How to compel these healthy people to examine the matter in a cool and scientifically objective spirit was an unsolved problem which was best left to time to clear up. In the history of science one can clearly see that often the very proposition which has at first called out nothing but contradiction has later come to be accepted, although no new proofs in support of it have been brought forward.

[1914d, 2891]

I have repeatedly acknowledged with gratitude the great services rendered by the Zurich School of Psychiatry in the spread of psycho-analysis, particularly by Bleuler and Jung, and I have no hesitation in doing so again, even in the greatly altered circumstances of the present. True, it was not the support of the Zurich School which first directed the attention of the scientific world to psycho-analysis at that time. What had happened was that the latency period had expired and everywhere psycho-analysis was becoming the object of ever-increasing interest. But in all other places this accession of interest at first produced nothing but a very emphatic repudiation, mostly a quite passionate one; whereas in Zurich, on the contrary, agreement on general lines was the dominant note. Moreover, nowhere else did such a compact little group of adherents exist, or could a public clinic be placed at the service of psycho-analytic researches, or was there a clinical teacher who included psycho-analytic theories as an integral part of his psychiatric course. The Zurich group thus became the nucleus of the small band who were fighting for the recognition of analysis. The only opportunity of learning the new art and working at it in practice lay there. Most of my followers and co-workers at the present time came to me by way of Zurich, even those who were geographically much nearer to Vienna than to Switzerland. In relation to Western Europe, which contains the great centres of our culture, the position of Vienna is an outlying one; and its prestige has for many years been affected by strong prejudices. Representatives of all the most important nations congregate in Switzerland, where intellectual activity is so lively; a focus of infection there was bound to be of great importance for the spread of the 'psychical epidemic', as Hoche of Freiburg has called it.

[1914d, 2893]
For the further spread of this movement Brill and Jones deserve the greatest credit: in their writings they drew their countrymen's attention with unremitting assiduity to the easily observable fundamental facts of everyday life, of dreams and neurosis. Brill has contributed still further to this effect by his medical practice and by his translations of my works, and Jones by his instructive lectures and by his skill in debate at congresses in America.¹ The absence of any deep-rooted scientific tradition in America and the much less stringent rule of official authority there have been of decided advantage to the impetus given by Stanley Hall. It was characteristic of that country that from the beginning professors and superintendents of mental hospitals showed as much interest in analysis as independent practitioners. But it is clear that precisely for this reason the ancient centres of culture, where the greatest resistance has been displayed, must be the scene of the decisive struggle over psycho-analysis.

[1914d, 2898]

As regards the position of psycho-analysis in Germany, it can only be said that it forms the centre-point of scientific discussions and provokes the most emphatic expressions of disagreement both among doctors and laymen; these are not yet at an end, but are constantly flaring up again, sometimes with greater intensity. No official educational bodies there have up to now recognized psycho-analysis. Successful practitioners who employ it are few; only a few institutions, such as Binswanger's in Kreuzlingen (on Swiss soil) and Marcinowski's in Holstein, have opened their doors to it. One of the most prominent representatives of analysis, Karl Abraham, at one time an assistant of Bleuler's, maintains himself in the critical atmosphere of Berlin. One might wonder that this state of things should have continued unaltered for several years if one did not know that the account I have given only represents external appearances. Too much significance should not be attributed to rejection by the official representatives of science and heads of institutions, and by the followers dependent on them. It is natural that its opponents should give loud expression to their views, while its intimidated adherents keep silence. Some of the latter, whose first contributions to analysis raised favourable expectations, have later withdrawn from the movement under the pressure of circumstances. The movement itself advances surely though silently; it is constantly gaining new adherents among psychiatrists and laymen, it brings in a growing stream of new readers for psycho-analytic literature and for that very reason drives its opponents to ever more violent defensive efforts. At least a dozen times in recent years, in reports of the proceedings of certain congresses and scientific bodies or in reviews of certain publications, I have read that now psycho-analysis is dead, defeated and disposed of once and for all. The best answer to all this would be in the terms of Mark Twain's telegram to the newspaper which had falsely published news of his death: 'Report of my death greatly exaggerated.' After each of these obituaries psycho-analysis regularly gained new adherents and co-workers or acquired new channels of publicity. After all, being declared dead was an advance on being buried in silence.

[1914d, 2900]
Another path led from the investigation of dreams to the analysis of works of imagination and ultimately to the analysis of their creators - writers and artists themselves. At an early stage it was discovered that dreams invented by writers will often yield to analysis in the same way as genuine ones. (Cf. 'Gradiva'.) The conception of unconscious mental activity made it possible to form a preliminary idea of the nature of imaginative creative writing; and the realization, gained in the study of neurotics, of the part played by the instinctual impulses enabled us to perceive the sources of artistic production and confronted us with two problems: how the artist reacts to this instigation and what means he employs to disguise his reactions.¹ Most analysts with general interests have contributed something to the solution of these problems, which are the most fascinating among the applications of psycho-analysis. Naturally, opposition was not lacking in this direction either on the part of people who knew nothing of analysis; it took the same form as it did in the original field of psycho-analytic research - the same misconceptions and vehement rejections. It was only to be expected from the beginning that, whatever the regions into which psycho-analysis might penetrate, it would inevitably experience the same struggles with those already in possession of the field. These attempted invasions, however, have not yet stirred up the attention in some quarters which awaits them in the future. Among the strictly scientific applications of analysis to literature, Rank's exhaustive work on the theme of incest easily takes the first place. Its subject is bound to arouse the greatest unpopularity. Up to the present, little work based on psycho-analysis has been done in the sciences of language and history. I myself ventured the first approach to the problems of the psychology of religion by drawing a parallel between religious ritual and the ceremonials of neurotics (1907b). Dr. Pfister, a pastor in Zurich, has traced back the origin of religious fanaticism to perverse eroticism in his book on the piety of Count von Zinzendorf, as well as in other contributions. In the latest works of the Zurich school, however, we find analysis permeated with religious ideas rather than the opposite outcome that had been in view.

[1914d, 2902]

With this incomplete outline I have attempted to give some idea of the still incalculable wealth of connections which have come to light between medical psycho-analysis and other fields of science. There is material here for a generation of investigators to work at, and I do not doubt that the work will be carried out as soon as the resistances against psycho-analysis are overcome on its original ground.¹

[1914d, 2904]

To write the story of these resistances would, I think, be both fruitless and inopportune at the present time. The story is not very creditable to the scientific men of our day. But I must add at once that it has never occurred to me to pour contempt upon the opponents of psycho-analysis merely because they were opponents - apart from the few unworthy individuals, the adventurers and profiteers, who are always to be found on both sides in time of war. I knew very well how to account for the behaviour of these opponents and, moreover, I had learnt that psycho-analysis brings out the worst in everyone. But I made up my mind not to answer my opponents and, so far as my influence went, to restrain others from polemics. Under the peculiar conditions of the controversy over psycho-analysis it seemed to me very doubtful whether either public or written discussion would avail anything; it was certain which way the majority at congresses and meetings would go, and my faith in the reasonableness and good behaviour of the gentlemen who opposed me was not at any time great. Experience shows that only very few people are capable of remaining polite, to say nothing of objective, in a scientific dispute, and the impression made on me by scientific squabbles has always been odious. Perhaps this attitude on my part has been misunderstood; perhaps I have been thought so good-natured or so easily intimidated that no further notice need be taken of me. This was a mistake; I can be as abusive and enraged as anyone; but I have not the art of expressing the underlying emotions in a form suitable for publication and I therefore prefer to abstain completely.

[1914d, 2904]
Perhaps in some respects it would have been better if I had given free rein to my own passions and to those of others round me. We have all heard of the interesting attempt to explain psycho-analysis as a product of the Vienna milieu. As recently as in 1913 Janet was not ashamed to use this argument, although he himself is no doubt proud of being a Parisian, and Paris can scarcely claim to be a city of stricter morals than Vienna. The suggestion is that psycho-analysis, and in particular its assertion that the neuroses are traceable to disturbances in sexual life, could only have originated in a town like Vienna - in an atmosphere of sensuality and immorality foreign to other cities - and that it is simply a reflection, a projection into theory, as it were, of these peculiar Viennese conditions. Now I am certainly no local patriot; but this theory about psycho-analysis always seems to me quite exceptionally senseless - so senseless, in fact, that I have sometimes been inclined to suppose that the reproach of being a citizen of Vienna is only a euphemistic substitute for another reproach which no one would care to put forward openly. If the premisses on which the argument rests were the opposite of what they are, then it might be worth giving it a hearing. If there were a town in which the inhabitants imposed exceptional restrictions on themselves as regards sexual satisfaction, and if at the same time they exhibited a marked tendency to severe neurotic disorders, that town might certainly give rise in an observer’s mind to the idea that the two circumstances had some connection with each other, and might suggest that one was contingent on the other. But neither of these assumptions is true of Vienna. The Viennese are no more abstinent and no more neurotic than the inhabitants of any other capital city. There is rather less embarrassment - less prudery - in regard to sexual relationships than in the cities of the West and North which are so proud of their chastity. These peculiar characteristics of Vienna would be more likely to mislead the observer on the causation of neurosis than to enlighten him on it.

[1914d, 2905]

Vienna has done everything possible, however, to deny her share in the origin of psycho-analysis. In no other place is the hostile indifference of the learned and educated section of the population so evident to the analyst as in Vienna.

[1914d, 2905]

It may be that my policy of avoiding wide publicity is to some extent responsible for this. If I had encouraged or allowed the medical societies of Vienna to occupy themselves with psycho-analysis in stormy debates which would have discharged all the passions and brought into the open all the reproaches and invectives that were on its opponents’ tongues or in their hearts - then, perhaps, the ban on psycho-analysis would have been overcome by now and it would no longer be a stranger in its native city. As it is, the poet may be right when he makes his Wallenstein say:

[1914d, 2905]
The task to which I was not equal - that of demonstrating to the opponents of psycho-analysis suaviter in modo their injustice and arbitrariness - was undertaken and carried out most creditably by Bleuler in a paper written in 1910, 'Freud's Psycho-Analysis: A Defence and Some Critical Remarks'. It would seem so natural for me to praise this work (which offers criticisms in both directions) that I will hasten to say what I take exception to in it. It seems to me still to display partiality, to be too lenient to the faults of the opponents of psycho-analysis and too severe on the shortcomings of its adherents. This trait in it may possibly explain why the opinion of a psychiatrist of such high repute, such undoubted ability and independence, failed to carry more weight with his colleagues. The author of Affectivity (1906) ought not to be surprised if the influence of a work is determined not by the strength of its arguments but by its affective tone. Another part of its influence - its influence on the followers of psycho-analysis - was destroyed later by Bleuler himself, when in 1913 he showed the reverse side of his attitude to psycho-analysis in his 'Criticism of the Freudian Theory'. In that paper he subtracts so much from the structure of psycho-analytic theory that our opponents may well be glad of the help given them by this champion of psycho-analysis. These adverse judgements of Bleuler's, however, are not based on new arguments or better observations. They rely simply on the state of his own knowledge, the inadequacy of which he no longer himself admits, as he did in his earlier works. It seemed therefore that an almost irreparable loss threatened psycho-analysis here. But in his last publication, 'Criticisms of my Schizophrenia' (1914), Bleuler rallies his forces in the face of the attacks made on him for having introduced psycho-analysis into his book on schizophrenia, and makes what he himself calls a 'presumptuous claim'. 'But now I will make a presumptuous claim: I consider that up to the present the various schools of psychology have contributed extremely little towards explaining the nature of psychogenic symptoms and diseases, but that depth-psychology offers something towards a psychology which still awaits creation and which physicians are in need of in order to understand their patients and to cure them rationally; and I even believe that in my Schizophrenia I have taken a very short step towards that understanding. The first two assertions are certainly correct; the last may be an error.' [1914d, 2906]

I considered it necessary to form an official association because I feared the abuses to which psycho-analysis would be subjected as soon as it became popular. There should be some headquarters whose business it would be to declare: 'All this nonsense is nothing to do with analysis; this is not psycho-analysis.' At the sessions of the local groups (which together would constitute the international association) instruction should be given as to how psycho-analysis was to be conducted and doctors should be trained, whose activities would then receive a kind of guarantee. Moreover, it seemed to me desirable, since official science had pronounced its solemn ban upon psycho-analysis and had declared a boycott against doctors and institutions practising it, that the adherents of psycho-analysis should come together for friendly communication with one another and mutual support. [1914d, 2907]
I must now mention two secessions which have taken place among the adherents of psycho-analysis; the first occurred between the founding of the Association in 1910 and the Weimar Congress in 1911; the second took place after this and became manifest at Munich in 1913. The disappointment that they caused me might have been averted if I had paid more attention to the reactions of patients under analytic treatment. I knew very well of course that anyone may take to flight at his first approach to the unwelcome truths of analysis; I had always myself maintained that everyone's understanding of it is limited by his own repressions (or rather, by the resistances which sustain them) so that he cannot go beyond a particular point in his relation to analysis. But I had not expected that anyone who had reached a certain depth in his understanding of analysis could renounce that understanding and lose it. And yet daily experience with patients had shown that total rejection of analytic knowledge may result whenever a specially strong resistance arises at any depth in the mind; one may have succeeded in laboriously bringing a patient to grasp some parts of analytic knowledge and to handle them like possessions of his own, and yet one may see him, under the domination of the very next resistance, throw all he has learnt to the winds and stand on the defensive as he did in the days when he was a carefree beginner. I had to learn that the very same thing can happen with psycho-analysts as with patients in analysis.

[1914d, 2911]

The view of life which is reflected in the Adlerian system is founded exclusively on the aggressive instinct; there is no room in it for love. We might feel surprise that such a cheerless Weltanschauung should have met with any attention at all; but we must not forget that human beings, weighed down by the burden of their sexual needs, are ready to accept anything if only the 'overcoming of sexuality' is offered them as a bait.

[1914d, 2921]

Adler's secession took place before the Weimar Congress in 1911; after that date the Swiss began theirs. The first signs of it, curiously enough, were a few remarks of Riklin's in some popular articles appearing in Swiss publications, so that the general public learned earlier than those most intimately concerned in the subject that psycho-analysis had got the better of some regrettable errors which had previously discredited it. In 1912 Jung boasted, in a letter from America, that his modifications of psycho-analysis had overcome the resistances of many people who had hitherto refused to have anything to do with it. I replied that that was nothing to boast of, and that the more he sacrificed of the hard-won truths of psycho-analysis the more he would see resistances vanishing. This modification which the Swiss were so proud of introducing was again nothing else but a pushing into the background of the sexual factor in psycho-analytic theory. I confess that from the beginning I regarded this 'advance' as too far-reaching an adjustment to the demands of actuality.

[1914d, 2921]

The layman feels an extraordinary horror at the possibility of such feelings, and takes this aversion as a legitimate ground for disbelief in the assertions of psycho-analysis. Mistakenly, I think. No depreciation of feelings of love is intended, and there is in fact none. It is indeed foreign to our intelligence as well as to our feelings thus to couple love and hate; but Nature, by making use of this pair of opposites, contrives to keep love ever vigilant and fresh, so as to guard it against the hate which lurks behind it. It might be said that we owe the fairest flowerings of our love to the reaction against the hostile impulse which we sense within us.

[1915b, 3091]

I venture, under the impact of the war, to remind you of two theses which have been put forward by psycho-analysis and which have undoubtedly contributed to its unpopularity.
But this demand for immortality is a product of our wishes too unmistakable to lay claim to reality: what is painful may none the less be true. I could not see my way to dispute the transience of all things, nor could I insist upon an exception in favour of what is beautiful and perfect. But I did dispute the pessimistic poet's view that the transience of what is beautiful involves any loss in its worth.

[1916a, 3095]

Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psycho-analysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psycho-analysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial. A reader who suspends his judgement and allows psycho-analysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.

[1916-1917, 3127]

Do not be annoyed, then, if I begin by treating you in the same way as these neurotic patients. I seriously advise you not to join my audience a second time. To support this advice, I will explain to you how incomplete any instruction in psycho-analysis must necessarily be and what difficulties stand in the way of your forming a judgement of your own upon it. I will show you how the whole trend of your previous education and all your habits of thought are inevitably bound to make you into opponents of psycho-analysis, and how much you would have to overcome in yourselves in order to get the better of this instinctive opposition. I cannot, of course, foretell how much understanding of psycho-analysis you will obtain from the information I give you, but I can promise you this: that by listening to it you will not have learnt how to set about a psycho-analytic investigation or how to carry a treatment through. If, however, there should actually turn out to be one of you who did not feel satisfied by a fleeting acquaintance with psycho-analysis but was inclined to enter into a permanent relationship to it, I should not merely dissuade him from doing so but actively warn him against it. As things stand at present, such a choice of profession would ruin any chance he might have of success at a University, and, if he started in life as a practising physician, he would find himself in a society which did not understand his efforts, which regarded him with distrust and hostility, and unleashed upon him all the evil spirits lurking within it. And the phenomena accompanying the war that is now raging in Europe will perhaps give you some notion of what legions of these evil spirits there may be.

[1916-1917, 3130]

I shall not hold you, your education or your attitude of mind responsible for the next difficulty. Two of the hypotheses of psycho-analysis are an insult to the entire world and have earned its dislike. One of them offends against an intellectual prejudice, the other against an aesthetic and moral one. We must not be too contemptuous of these prejudices; they are powerful things, precipitates of human developments that were useful and indeed essential. They are kept in existence by emotional forces and the struggle against them is hard.

[1916-1917, 3134]
In my experience antipathy to this outcome of psycho-analytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization has been created under the pressure of the exigencies of life at the cost of satisfaction of the instincts; and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of instinctual satisfaction for the benefit of the whole community. Among the instinctual forces which are put to this use the sexual impulses play an important part; in this process they are sublimated - that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement is unstable; the sexual instincts are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual instincts may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual instincts were to be liberated and returned to their original aims. For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual instincts or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psycho-analytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psycho-analysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them.

[1916-1917, 3135]

It will shortly become clear whether a further study of dreams may not bring us up against yet another factor that contributes to the distortion of dreams. But I should not like to leave the subject of dream-symbolism without once more touching on the problem of how it can meet with such violent resistance in educated people when the wide diffusion of symbolism in myths, religion, art and language is so unquestionable. May it not be that what is responsible is once again its connection with sexuality?

[1916-1917, 3261]

It cannot be said that the world has shown much gratitude to psycho-analytic research for its revelation of the Oedipus complex. On the contrary, the discovery has provoked the most violent opposition among adults; and those who had neglected to take part in the repudiation of this proscribed and tabooed emotional relationship made up for their fault later by depriving the complex of its value through twisted re-interpretations. It is my unaltered conviction that there is nothing in this to be disavowed or glossed over. We must reconcile ourselves to the fact which was recognized by the Greek legend itself as an inevitable fate. It is once again an interesting fact that the Oedipus complex, which has been rejected from real life, has been left to imaginative writing, has been placed freely, as it were, at its disposal. Otto Rank has shown in a careful study how the Oedipus complex has provided dramatic authors with a wealth of themes in endless modifications, softenings and disguises - in distortions, that is to say, of the kind which we are already familiar with as the work of a censorship. We may therefore also ascribe this Oedipus complex to dreamers who have been fortunate enough to escape conflicts with their parents in later life. And, intimately linked with it, we find what we call the 'castration complex', the reaction to the threats against the child aimed at putting a stop to his early sexual activities and attributed to his father.

[1916-1917, 3296]
It is truly refreshing to see how swiftly and unerringly a person can arrive at a judgement on some delicate problem of depth-psychoLOGY after his first impression of it. The interpretations seem to him far-fetched and forced and he does not like them; so they are false and all this business of interpretation is worthless. Not even a fleeting thought is given to the other possibility - that there are good reasons why these interpretations are bound to have this appearance; after which the further question would follow of what these good reasons are. [1916-1917, 3319]

But in thus emphasizing the unconscious in mental life we have conjured up the most evil spirits of criticism against psycho-analysis. Do not be surprised at this, and do not suppose that the resistance to us rests only on the understandable difficulty of the unconscious or the relative inaccessibility of the experiences which provide evidence of it. Its source, I think, lies deeper. In the course of centuries the naïve self-love of men has had to submit to two major blows at the hands of science. The first was when they learnt that our earth was not the centre of the universe but only a tiny fragment of a cosmic system of scarcely imaginable vastness. This is associated in our mind: with the name of Copernicus, though something similar had already been asserted by Alexandrian science. The second blow fell when biological research destroyed man's supposedly privileged place in creation and proved his descent from the animal kingdom and his ineradicable animal nature. This revaluation has been accomplished in our own days by Darwin, Wallace and their predecessors, though not without the most violent contemporary opposition. But human megalomania will have suffered its third and most wounding blow from the psychological research of the present time which seeks to prove to the ego that it is not even master in its own house, but must content itself with scanty information of what is going on unconsciously in its mind. We psycho-analysts were not the first and not the only ones to utter this call to introspection; but it seems to be our fate to give it its most forcible expression and to support it with empirical material which affects every individual. Hence arises the general revolt against our science, the disregard of all considerations of academic civility and the releasing of the opposition from every restraint of impartial logic. And beyond all this we have yet to disturb the peace of this world in still another way, as you will shortly hear. [1916-1917, 3361]

It now appears as an intellectual resistance, it fights by means of arguments and exploits all the difficulties and improbabilities which normal but uninstructed thinking finds in the theories of analysis. It is now our fate to hear from this single voice all the criticisms and objections which assail our ears in a chorus in the scientific literature of the subject. And for this reason none of the shouts that reach us from outside sound unfamiliar. It is a regular storm in a tea-cup. But the patient is willing to be argued with; he is anxious to get us to instruct him, teach him, contradict him, introduce him to the literature, so that he can find further instruction. He is quite ready to become an adherent of psycho-analysis - on condition that analysis spares him personally. But we recognize this curiosity as a resistance, as a diversion from our particular tasks, and we repel it. In the case of an obsessional neurotic we have to expect special tactics of resistance. He will often allow the analysis to proceed on its way uninhibited, so that it is able to shed an ever-increasing light upon the riddle of his illness. We begin to wonder in the end, however, why this enlightenment is accompanied by no practical advance, no diminution of the symptoms. We are then able to realize that resistance has withdrawn on to the doubt belonging to the obsessional neurosis and from that position is successfully defying us. It is as though the patient were saying: 'Yes, that's all very nice and interesting, and I'll be very glad to go on with it further. It would change my illness a lot if it were true. But I don't in the least believe that it is true; and, so long as I don't believe it, it makes no difference to my illness.' Things can proceed like this for a long time, till finally one comes up against this uncommitted attitude itself, and the decisive struggle then breaks out. [1916-1917, 3364]
It is not the case that the perversions alone would have obliged us to make the change in the concept of sexuality which has brought such violent contradictions down on us. The study of infantile sexuality had even more to do with it and it was the concurrence of the two which was decisive for us. But the manifestations of infantile sexuality, however unmistakable they may be in later childhood, seem to melt into indefiniteness towards their beginnings. Anyone who chooses to disregard the history of their development and their analytic context will deny that they are of a sexual character and will attribute some undifferentiated character to them instead. You must not forget that at the moment we are not in possession of any generally recognized criterion of the sexual nature of a process, apart, once again, from a connection with the reproductive function which we must reject as being too narrow-minded. The biological criteria, such as the periodicities of twenty-three and twenty-eight days postulated by Wilhelm Fliess, are still highly debatable; the chemical characteristics of the sexual process, which we may suspect, are still awaiting discovery. On the other hand, the sexual perversions of adults are something tangible and unambiguous. As is already shown by the name by which they are universally known, they are unquestionably sexual. Whether they are described as indications of degeneracy or in any other way, no one has yet had the courage to class them as anything but phenomena of sexual life. On their account alone we are justified in asserting that sexuality and reproduction do not coincide, for it is obvious that all of them disavow the aim of reproduction.

[1916-1917, 3389]

Thus forearmed we can proceed to the consideration of a suggestion which we shall certainly not be spared. 'Why', we shall be asked, 'are you so obstinate in describing as being already sexuality what on your own evidence are indefinable manifestations in childhood out of which sexual life will later develop? Why should you not be content instead with giving them a physiological description and simply say that in an infant at the breast we already observe activities, such as sensual sucking or holding back the excreta, which show us that he is striving for "organ-pleasure"? In that way you would have avoided the hypothesis, so repugnant to every feeling, of the smallest babies having a sexual life.' - Indeed, Gentlemen, I have no objection at all to organ-pleasure. I know that even the supreme pleasure of sexual union is only an organ-pleasure attached to the activity of the genitals. But can you tell me when this originally indifferent organ-pleasure acquires the sexual character which it undoubtedly possesses in the later phases of development? Do we know any more about 'organ-pleasure' than about sexuality? You will reply that it gains its sexual character precisely when the genitals begin to play their part; 'sexual' coincides with 'genital'. You will even reject the objection raised by the perversions by pointing out to me that in the majority of perversions a genital orgasm is after all aimed at, even if it is arrived at by a method other than the union of the genitals. You are certainly taking up a much stronger position in determining the characteristics of what is sexual if you knock out of it the relation to reproduction which is made untenable by the perversions and put genital activity in its place. But, if so, we are no longer far apart: it is only a question of the genital organs versus the other organs. What are you going to do, however, about the numerous experiences which show you that the genitals can be represented as regards their yield of pleasure by other organs, as in the case of kissing or of the perverse practices of voluptuaries or of the symptoms of hysteria? In that neurosis it is quite usual for signs of stimulation, sensations and innervations, and even the processes of erection, which belong properly to the genitals, to be displaced on to other, remote regions of the body - as, for instance, by transposition upwards, to the head and face. Being thus convinced that you have nothing to catch hold of for your characterization of what is sexual, you will no doubt have to make up your minds to follow my example and extend the description of being 'sexual' to the activities of early childhood, too, which strive for organ-pleasure.

[1916-1917, 3392]
The processes of finding an object are fairly complex and no comprehensive account has hitherto been given of them. For our purposes it may be specially pointed out that when, in the years of childhood before puberty, the process has in some respects reached a conclusion, the object that has been found turns out to be almost identical with the first object of the oral pleasure-instinct, which was reached by attachment. Though it is not actually the mother's breast, at least it is the mother. We call the mother the first love-object. For we speak of love when we bring the mental side of the sexual trends into the foreground and want to force back the underlying physical or 'sensual' instinctual demands or to forget them for a moment. At the time at which the child's mother becomes his love-object the psychical work of repression has already begun in him, which is withdrawing from his knowledge awareness of a part of his sexual aims. To his choice of his mother as a love-object everything becomes attached which, under the name of the 'Oedipus complex', has attained so much importance in the psycho-analytic explanation of the neuroses and has played no less a part, perhaps, in the resistance to psycho-analysis.
[1916-1917, 3397]

Over and over again, Gentlemen, when psycho-analysis has claimed that some mental event is the product of the sexual instincts, it has been angrily pointed out to it by way of defence that human beings do not consist only of sexuality, that there are instincts and interests in mental life other than sexual ones, that it ought not to derive 'everything' from sexuality, and so on. Well, it is most gratifying for once in a way to find ourselves in agreement with our opponents. Psycho-analysis has never forgotten that there are instinctual forces as well which are not sexual. It was based on a sharp distinction between the sexual instincts and the ego-instincts, and, in spite of all objections, it has maintained not that the neuroses are derived from sexuality but that their origin is due to a conflict between the ego and sexuality. Nor has it any conceivable reason for disputing the existence or significance of the ego-instincts while it pursues the part played by the sexual instincts in illness and in ordinary life. It has simply been its fate to begin by concerning itself with the sexual instincts because the transference neuroses made them the most easily accessible to examination and because it was incumbent on it to study what other people had neglected.
[1916-1917, 3412]

Anyone whom these warnings do not deter from taking the ego's counterfeits as sterling coin will have an easy time of it and will avoid all the resistances which oppose the psycho-analytic emphasis upon the unconscious, sexuality and the passivity of the ego. He will be able to declare like Alfred Adler that the 'neurotic character' is the cause of neuroses instead of their consequence; but neither will he be in a position to explain a single detail of symptom-formation or a single dream.
[1916-1917, 3433]
But I still owe you further enlightenment, Gentlemen, on my reasons for not starting my account of the theory of the neuroses with the common neurotic state. You may perhaps suppose that it was because in that case I should have had greater difficulty in proving the sexual causation of the neuroses. But you would be wrong there. In the case of the transference neuroses one must work one's way through the interpretation of symptoms before one can arrive at that discovery. In the common forms of what are known as the 'actual neuroses' the aetiological significance of sexual life is a crude fact that springs to the observer's eyes. I came upon it more than twenty years ago when one day I asked myself the question of why in the examination of neurotics their sexual activities were so regularly excluded from consideration. At that time I sacrificed my popularity with my patients for the sake of these enquiries; but after only a brief effort I was able to declare that 'if the \textit{vita sexualis} is normal, there can be no neurosis' - and by this I meant no 'actual neurosis'. No doubt this statement passes too lightly over people's individual differences; it suffers, too, from the indefiniteness inseparable from the judgement of what is 'normal'. But as a rough guide it retains its value to this day. I had by then reached the point of establishing specific relations between particular forms of neurosis and particular sexual noxae; and I have no doubt that I could repeat the same observations to-day if similar pathological material were still at my disposal. I found often enough that a man who indulged in a certain kind of incomplete sexual satisfaction (for instance, manual masturbation) had fallen ill of a particular form of 'actual neurosis', and that this neurosis promptly gave place to another if he replaced this sexual \textit{régime} by another equally far from being irreproachable. I was then in a position to infer the change in a patient's sexual mode of life from an alteration in his condition. I also learnt then to stand obstinately by my suspicions till I had overcome the patients' disingenuousness and compelled them to confirm my views. It is true that thereafter they preferred to go to other doctors who did not make such keen enquiries about their sexual life.

[1916-1917, 3438]

Let us hope that the doctor is modest enough to attribute his patient's high opinion of him to the hopes he can rouse in him and to the widening of his intellectual horizon by the surprising and liberating enlightenment that the treatment brings with it. Under these conditions the analysis makes fine progress too. The patient understands what is interpreted to him and becomes engrossed in the tasks set him by the treatment; the material of memories and associations floods in upon him in plenty, the certainty and appositeness of his interpretations are a surprise to the doctor, and the latter can only take note with satisfaction that here is a patient who readily accepts all the psychological novelties which are apt to provoke the most bitter contradiction among healthy people in the outside world. Moreover the cordial relations that prevail during the work of analysis are accompanied by an objective improvement, which is recognized on all sides, in the patient's illness.

[1916-1917, 3482]
We shall soon have reached the end. You are perhaps disappointed that on the topic of the psycho-analytic method of therapy I have only spoken to you about theory and not about the conditions which determine whether a treatment is to be undertaken or about the results it produces. I shall discuss neither: the former because it is not my intention to give you practical instructions on how to carry out a psycho-analysis, and the latter because several reasons deter me from it. At the beginning of our talks, I emphasized the fact that under favourable conditions we achieve successes which are second to none of the finest in the field of internal medicine; and I can now add something further - namely that they could not have been achieved by any other procedure. If I were to say more than this I should be suspected of trying to drown the loudly raised voices of depreciation by self-advertisement. The threat has repeatedly been made against psycho-analysts by our medical 'colleagues' - even at public congresses - that a collection of the failures and damaging results of analysis would be published which would open the suffering public's eyes to the worthlessness of this method of treatment. But, apart from the malicious, denunciatory character of such a measure, it would not even be calculated to make it possible to form a correct judgement of the therapeutic effectiveness of analysis. Analytic therapy, as you know, is in its youth; it has taken a long time to establish its technique, and that could only be done in the course of working and under the influence of increasing experience. In consequence of the difficulties in giving instruction, the doctor who is a beginner in psycho-analysis is thrown back to a greater extent than other specialists on his own capacity for further development, and the results of his first years will never make it possible to judge the efficacy of analytic therapy.

This presents a gloomy prospect for the effectiveness of psycho-analysis as a therapy - does it not? - even though we are able to explain the great majority of our failures by attributing them to interfering external factors. Friends of analysis have advised us to meet the threatened publication of our failures with statistics of our successes drawn up by ourselves. I did not agree to this. I pointed out that statistics are worthless if the items assembled in them are too heterogeneous; and the cases of neurotic illness which we had taken into treatment were in fact incomparable in a great variety of respects. Moreover, the period of time that could be covered was too short to make it possible to judge the durability of the cures. And it was altogether impossible to report on many of the cases: they concerned people who had kept both their illness and its treatment secret, and their recovery had equally to be kept secret. But the strongest reason for holding back lay in the realization that in matters of therapy people behave highly irrationally, so that one has no prospect of accomplishing anything with them by rational means. A therapeutic novelty is either received with delirious enthusiasm - as, for instance, when Koch introduced his first tuberculin against tuberculosis to the public - or it is treated with abysmal distrust - like Jenner's vaccination, which was in fact a blessing and which even to-day has its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, all the members of her family and a high medical authority, too, who was called in for consultation - were convinced that the fresh attack could only be the result of my attempted analysis. Nothing can be done against prejudices. You can see it again to-day in the prejudices which each group of nations at war has developed against the other. The most sensible thing to do is to wait, and to leave such prejudices to the eroding effects of time. One day the same people begin to think about the same things in quite a different way from before; why they did not think so earlier remains a dark mystery.

[1916-1917, 3497]

[1916-1917, 3500]
It is possible that the prejudice against analytic treatment is already diminishing. The constant spread of analytic teachings, the increasing number of doctors practising analysis in a number of countries seems to vouch for this. When I was a young doctor, I found myself in a similar storm of indignation on the doctors' part against treatment by hypnotic suggestion, which is now held up in contrast to analysis by people of 'moderate' views. Hypnotism, however, has not fulfilled its original promise as a therapeutic agent. We psycho-analysts may claim to be its legitimate heirs and we do not forget how much encouragement and theoretical clarification we owe to it. The damaging results attributed to psycho-analysis are restricted essentially to passing manifestations of increased conflict if an analysis is clumsily carried out or if it is broken off in the middle. You have heard an account of what we do with our patients and can form your own judgement as to whether our efforts are calculated to lead to any lasting damage. Abuse of analysis is possible in various directions; in particular, the transference is a dangerous instrument in the hands of an unconscientious doctor. But no medical instrument or procedure is guaranteed against abuse; if a knife does not cut, it cannot be used for healing either.

In any case it may be maintained that analysis of children's neuroses can claim to possess a specially high theoretical interest. They afford us, roughly speaking, as much help towards a proper understanding of the neuroses of adults as do children's dreams in respect to the dreams of adults. Not, indeed, that they are more perspicuous or poorer in elements; in fact, the difficulty of feeling one's way into the mental life of a child makes them set the physician a particularly difficult task. But nevertheless, so many of the later deposits are wanting in them that the essence of the neurosis springs to the eyes with unmistakable distinctness. In the present phase of the battle which is raging round psycho-analysis the resistance to its findings has, as we know, taken on a new form. People were content formerly to dispute the reality of the facts which are asserted by analysis; and for this purpose the best technique seemed to be to avoid examining them. That procedure appears to be slowly exhausting itself; and people are now adopting another plan of recognizing the facts, but of eliminating, by means of twisted interpretations, the consequences that follow from them, so that the critics can still ward off the objectionable novelties as efficiently as ever. The study of children's neuroses exposes the complete inadequacy of these shallow or high-handed attempts at re-interpretation. It shows the predominant part that is played in the formation of neuroses by those libidinal motive forces which are so eagerly disavowed, and reveals the absence of any aspirations towards remote cultural aims, of which the child still knows nothing, and which cannot therefore be of any significance for him.

The whale and the polar bear, it has been said, cannot wage war on each other, for since each is confined to his own element they cannot meet. It is just as impossible for me to argue with workers in the field of psychology or of the neuroses who do not recognize the postulates of psycho-analysis and who look on its results as artefacts. But during the last few years there has grown up another kind of opposition as well, among people who, in their own opinion at all events, take their stand upon the ground of analysis, who do not dispute its technique or results, but who merely think themselves justified in drawing other conclusions from the same material and in submitting it to other interpretations.

The last question is purely one of fact. Anyone who will take the trouble of pursuing an analysis into these depths by means of the prescribed technique will convince himself that it is decidedly possible. Anyone who neglects this, and breaks off the analysis in some higher stratum, has waived his right of forming a judgement on the matter. But the interpretation of what is arrived at in depth-analysis is not decided by this.
The two other doubts are based on a low estimate of the importance of early infantile impressions and an unwillingness to ascribe such enduring effects to them. The supporters of this view look for the causes of neuroses almost exclusively in the grave conflicts of later life; they assume that the importance of childhood is only held up before our eyes in analysis on account of the inclination of neurotics for expressing their present interests in reminiscences and symbols from the remote past. Such an estimate of the importance of the infantile factor would involve the disappearance of much that has formed part of the most intimate characteristics of analysis, though also, no doubt, of much that raises resistance to it and alienates the confidence of the outsider.

[1918b, 3536]

I will say at once that it is not an intellectual difficulty I am thinking of, not anything that makes psycho-analysis hard for the hearer or reader to understand, but an affective one - something that alienates the feelings of those who come into contact with it, so that they become less inclined to believe in it or take an interest in it. As will be observed, the two kinds of difficulty amount to the same thing in the end. Where sympathy is lacking, understanding will not come very easily.

[1917a, 3608]

My present readers, I take it, have not so far had anything to do with the subject and I shall be obliged, therefore, to go back some distance. Out of a great number of individual observations and impressions something in the nature of a theory has at last shaped itself in psycho-analysis, and this is known by the name of the 'libido theory'. As is well known, psycho-analysis is concerned with the elucidation and removal of what are called nervous disorders. A starting-point had to be found from which to approach this problem, and it was decided to look for it in the instinctual life of the mind. Hypotheses about the instincts in man came to form the basis, therefore, of our conception of nervous disease.

[1917a, 3608]

The psycho-analytic method of treatment is then able to subject this process of repression to revision and to bring about a better solution of the conflict - one that is compatible with health. Unintelligent opposition accuses us of one-sidedness in our estimate of the sexual instincts. 'Human beings have other interests besides sexual ones,' they say. We have not forgotten or denied this for a moment. Our one-sidedness is like that of the chemist, who traces all compounds back to the force of chemical attraction. He is not on that account denying the force of gravity; he leaves that to the physicist to deal with.

[1917a, 3609]

It is thus that psycho-analysis has sought to educate the ego. But these two discoveries - that the life of our sexual instincts cannot be wholly tamed, and that mental processes are in themselves unconscious and only reach the ego and come under its control through incomplete and untrustworthy perceptions - these two discoveries amount to a statement that the ego is not master in its own house. Together they represent the third blow to man's self-love, what I may call the psychological one. No wonder, then, that the ego does not look favourably upon psycho-analysis and obstinately refuses to believe in it.

[1917a, 3614]
Probably very few people can have realized the momentous significance for science and life of the recognition of unconscious mental processes. It was not psycho-analysis, however, let us hasten to add, which first took this step. There are famous philosophers who may be cited as forerunners - above all the great thinker Schopenhauer, whose unconscious 'Will' is equivalent to the mental instincts of psycho-analysis. It was this same thinker, moreover, who in words of unforgettable impressiveness admonished mankind of the importance, still so greatly underestimated by it, of its sexual craving. Psycho-analysis has this advantage only, that it has not affirmed these two propositions which are so distressing to narcissism - the psychical importance of sexuality and the unconsciousness of mental life - on an abstract basis, but has demonstrated them in matters that touch every individual personally and force him to take up some attitude towards these problems. It is just for this reason, however, that it brings on itself the aversion and resistances which still hold back in awe before the great name of the philosopher.

[1917a, 3615]

And now in conclusion I will cast a glance at a situation which belongs to the future - one that will seem fantastic to many of you, but which I think, nevertheless, deserves that we should be prepared for it in our minds. You know that our therapeutic activities are not very far-reaching. There are only a handful of us, and even by working very hard each one can devote himself in a year to only a small number of patients. Compared to the vast amount of neurotic misery which there is in the world, and perhaps need not be, the quantity we can do away with is almost negligible. Besides this, the necessities of our existence limit our work to the well-to-do classes, who are accustomed to choose their own physicians and whose choice is diverted away from psycho-analysis by all kinds of prejudices. At present we can do nothing for the wider social strata, who suffer extremely seriously from neuroses.

[1919a, 3635]

There is, however, no need to consider that these approaches to psycho-analysis imply any reconciliation or any appeasement of opposition. Suppose someone has hitherto rejected the whole of a complex of interdependent propositions, but now suddenly finds himself in a position to convince himself of the truth of one portion of the whole. It might be thought that he will begin to hesitate about his opposition in general and permit himself some degree of deferent expectation that the other portion, about which he has had no personal experience and can consequently form no judgement of his own, may also turn out to be true. This other portion of psycho-analytic theory, with which the study of the war neuroses did not come into contact, is to the effect that the motive forces which are expressed in the formation of symptoms are sexual and that neuroses arise from a conflict between the ego and the sexual instincts which it repudiates. ('Sexuality' in this context is to be understood in the extended sense in which it is used in psycho-analysis and is not to be confused with the narrower concept of 'genitality'.) Now it is quite true, as Ernest Jones remarks in his contribution to this volume, that this portion of the theory has not yet been proved to apply to the war neuroses. The work that might prove it has not yet been taken in hand. It may be that the war neuroses are altogether unsuitable material for the purpose. But the opponents of psycho-analysis, whose dislike of sexuality is evidently stronger than their logic, have been in a hurry to proclaim that the investigation of the war neuroses has finally disproved this portion of psycho-analytic theory. They have been guilty here of a slight confusion. If the investigation of the war neuroses (and a very superficial one at that) has not shown that the sexual theory of the neuroses is correct, that is something very different from its showing that that theory is incorrect. With the help of an impartial attitude and a little good will, it should not be hard to find the way to a further clarification of the subject.

[1919d, 3666]
The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their pleasant experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primal experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power. [1920g, 3738]

But it is all the more necessary for us to lay stress upon the libidinal character of the self-preservative instincts now that we are venturing upon the further step of recognizing the sexual instinct as Eros, the preserver of all things, and of deriving the narcissistic libido of the ego from the stores of libido by means of which the cells of the soma are attached to one another. But we now find ourselves suddenly faced by another question. If the self-preservative instincts too are of a libidinal nature, are there perhaps no other instincts whatever but the libidinal ones? At all events there are none other visible. But in that case we shall after all be driven to agree with the critics who suspected from the first that psycho-analysis explains everything by sexuality, or with innovators like Jung who, making a hasty judgement, have used the word 'libido' to mean instinctual force in general. Must not this be so? [1920g, 3753]
We are of opinion, then, that language has carried out an entirely justifiable piece of unification in creating the word 'love' with its numerous uses, and that we cannot do better than take it as the basis of our scientific discussions and expositions as well. By coming to this decision, psycho-analysis has let loose a storm of indignation, as though it had been guilty of an act of outrageous innovation. Yet it has done nothing original in taking love in this 'wider' sense. In its origin, function, and relation to sexual love, the 'Eros' of the philosopher Plato coincides exactly with the love-force, the libido of psycho-analysis, as has been shown in detail by Nachansohn (1915) and Pfister (1921); and when the apostle Paul, in his famous epistle to the Corinthians, praises love above all else, he certainly understands it in the same 'wider' sense.¹ But this only shows that men do not always take their great thinkers seriously, even when they profess most to admire them.

Psycho-analysis, then, gives these love instincts the name of sexual instincts, *a potiori* and by reason of their origin. The majority of 'educated' people have regarded this nomenclature as an insult, and have taken their revenge by retorting upon psycho-analysis with the reproach of 'pan-sexualism'. Anyone who considers sex as something mortifying and humiliating to human nature is at liberty to make use of the more genteel expressions 'Eros' and 'erotic'. I might have done so myself from the first and thus have spared myself much opposition. But I did not want to, for I like to avoid concessions to faint-heartedness. One can never tell where that road may lead one; one gives way first in words, and then little by little in substance too. I cannot see any merit in being ashamed of sex; the Greek word 'Eros', which is to soften the affront, is in the end nothing more than a translation of our German word *Liebe*; and finally, he who knows how to wait need make no concessions.

It does not follow as a matter of course that an intensified interest in occultism must involve a danger to psycho-analysis. We should, on the contrary, be prepared to find reciprocal sympathy between them. They have both experienced the same contemptuous and arrogant treatment by official science. To this day psycho-analysis is regarded as savouring of mysticism, and its unconscious is looked upon as one of the things between heaven and earth which philosophy refuses to dream of. The numerous suggestions made to us by occultists that we should co-operate with them show that they would like to treat us as half belonging to them and that they count on our support against the pressure of exact authority. Nor, on the other hand, has psycho-analysis any interest in going out of its way to defend that authority, for it itself stands in opposition to everything that is conventionally restricted, well-established and generally accepted. Not for the first time would it be offering its help to the obscure but indestructible surmises of the common people against the obscurantism of educated opinion. Alliance and co-operation between analysts and occultists might thus appear both plausible and promising.
The Aetiological Significance of Sexual Life. - The second novelty which emerged after the hypnotic technique had been replaced by free associations was of a clinical nature. It was discovered in the course of the prolonged search for the traumatic experiences from which hysterical symptoms appeared to be derived. The more carefully the search was pursued the more extensive seemed to be the network of aetiologically significant impressions involved, but the further back, too, did they reach into the patient's puberty or childhood. At the same time they assumed a uniform character and eventually it became inevitable to bow before the evidence and recognize that at the root of the formation of every symptom there were to be found traumatic experiences from early sexual life. Thus a sexual trauma stepped into the place of an ordinary trauma and the latter was seen to owe its aetiological significance to an associative or symbolic connection with the former, which had preceded it. An investigation of cases of common nervousness (falling into the two classes of neurasthenia and anxiety neurosis) which was simultaneously undertaken led to the conclusion that these disorders could be traced to contemporary abuses in the patients' sexual life and could be removed if these were brought to an end. It was thus easy to infer that neuroses in general are an expression of disturbances in sexual life, the so-called actual-neuroses being the consequences (by chemical agency) of contemporary injuries and the psycho-neuroses the consequences (by psychical modification) of bygone injuries to a biological function which had hitherto been gravely neglected by science. None of the theses of psycho-analysis has met with such tenacious scepticism or such embittered resistance as this assertion of the preponderating aetiological significance of sexual life in the neuroses. It should, however, be expressly remarked that, in its development up to the present day, psycho-analysis has found no reason to retreat from this opinion.

Later History of Psycho-Analysis. - Psycho-analysis was carried approximately thus far by the work of the writer of this article, who for more than ten years was its sole representative. In 1906 the Swiss psychiatrists Bleuler and C. G. Jung began to play a lively part in analysis; in 1907 a first conference of its supporters took place at Salzburg; and the young science soon found itself the centre of interest both among psychiatrists and laymen. Its reception in Germany, with her morbid craving for authority, was not precisely to the credit of German science and moved even so cool a partisan as Bleuler to an energetic protest. Yet no condemnation or dismissal at official congresses served to hold up the internal growth or external expansion of psycho-analysis. In the course of the next ten years it extended far beyond the frontiers of Europe and became especially popular in the United States of America, and this was due in no small degree to the advocacy and collaboration of Putnam (Boston), Ernest Jones (Toronto; later London), Flournoy (Geneva), Ferenczi (Budapest), Abraham (Berlin), and many others besides. The anathema which was imposed upon psycho-analysis led its supporters to combine in an international organization which in the present year (1922) is holding its eighth private Congress in Berlin and now includes local groups in Vienna, Budapest, Berlin, Holland, Zurich, London, New York, Calcutta and Moscow. This development was not interrupted even by the World War. In 1918-19 Dr. Anton von Freund of Budapest founded the Internationaler Psychoanalytischer Verlag, which publishes journals and books concerned with psycho-analysis, and in 1920 Dr. M. Eitingon opened in Berlin the first psycho-analytic clinic for the treatment of neurotics without private means. Translations of the writer's principal works, which are now in preparation, into French, Italian and Spanish, testify to a growing interest in psycho-analysis in the Latin world as well.
Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1923a, 3928]

A recent book by Havelock Ellis (so justly admired for his researches into sexual science, and an eminent critic of psycho-analysis), which bears the title of The Philosophy of Conflict (1919), includes an essay on 'Psycho-Analysis in Relation to Sex.' The aim of this essay is to show that the writings of the creator of analysis should be judged not as a piece of scientific work but as an artistic production. We cannot but regard this view as a fresh turn taken by resistance and as a repudiation of analysis, even though it is disguised in a friendly, indeed in too flattering a manner. We are inclined to meet it with a most decided contradiction.

[1920b, 3935]
When, during his last years, he came to know psycho-analysis, it seemed to him to promise the fulfilment of his two great wishes. He set himself the task of helping the masses by psycho-analysis and of making use of the therapeutic effects of that medical technique, which had hitherto only been at the service of the rich, in order to mitigate the neurotic suffering of the poor. Since the State took no heed of the neuroses of the common people, since hospital clinics for the most part rejected psycho-analytic therapy without being able to offer any substitute for it, and since the few psycho-analytic physicians, tied by the necessity for maintaining themselves, were unequal to such a gigantic task, Anton von Freund sought, by his private initiative, to open a path for every one towards the fulfilment of this important social duty. During the years of the war he had collected what was then the very considerable sum of one and a half million kronen for humanitarian purposes in the city of Budapest. With the concurrence of Dr Stephan von Bárczy, the then Burgomaster, he assigned this sum for the foundation of a psycho-analytic Institute in Budapest, in which analysis was to be practised, taught and made accessible to the people. It was intended to train a considerable number of physicians in this Institute who would then receive an honorarium from it for the treatment of poor neurotics in an out-patient clinic. The Institute, furthermore, was to be a centre for further scientific research in analysis. Dr. Ferenczi was to be the scientific head of the Institute; von Freund himself was to undertake its organization and finances. The founder handed over a relatively smaller sum to Professor Freud for the foundation of an international psycho-analytic publishing house. But, 

The editor of this series must feel a special satisfaction in being able to issue as its opening volume this collection of the psycho-analytical writings of Professor James J. Putnam, the distinguished neurologist of Harvard University. Professor Putnam, who died in 1918 at the age of seventy-two, was not only the first American to interest himself in psycho-analysis, but soon became its most decided supporter and its most influential representative in America. In consequence of the established reputation which he had gained through his activities as a teacher, as well as through his important work in the domain of organic nervous disease, and thanks to the universal respect which his personality enjoyed, he was able to do perhaps more than anyone for the spread of psycho-analysis in his own country, and was able to protect it from aspersions which, on the other side of the Atlantic no less than this, would inevitably have been cast upon it. But all such reproaches were bound to be silenced when a man of Putnam's lofty ethical standards and moral rectitude had ranged himself among the supporters of the new science and of the therapeutics based upon it. 

Among the observations made by psycho-analysis of the mental life of children there is scarcely one which sounds so repugnant and unbelievable to a normal adult as that of a boy's feminine attitude to his father and the phantasy of pregnancy that arises from it. It is only since Senatspräsident Daniel Paul Schreber, a judge presiding over a division of the Appeal Court of Saxony, published the history of his psychotic illness and his extensive recovery from it,¹ that we can discuss the subject without trepidation or apology. We learn from this invaluable book that, somewhere about the age of fifty, the Senatspräsident became firmly convinced that God - who, incidentally, exhibited distinct traits of his father, the worthy physician, Dr. Schreber - had decided to emasculate him, to use him as a woman, and to beget from him 'a new race of men born from the spirit of Schreber'. (His own marriage was childless.) In his revolt against this intention of God's, which seemed to him highly unjust and 'contrary to the Order of Things', he fell ill with symptoms of paranoia, which, however, underwent a process of involution in the course of years, leaving only a small residue behind. The gifted author of his own case history could not have guessed that in it he had uncovered a typical pathogenic factor.
The cathartic method was the immediate precursor of psycho-analysis; and, in spite of every extension of experience and of every modification of theory, is still contained within it as its nucleus. But it was no more than a new medical procedure for influencing certain nervous diseases, and nothing suggested that it might become a subject for the most general interest and for the most violent contradiction.

[1924f, 4104]

In the form which it thus assumed, the psycho-analytic theory of the neuroses already contained a number of things which ran counter to accepted opinions and inclinations and which were calculated to provoke astonishment, repugnance and scepticism in outsiders: for instance, the attitude of psycho-analysis to the problem of the unconscious, its recognition of an infantile sexuality and the stress it laid on the sexual factor in mental life generally. But more was to follow.

[1924f, 4108]

The reception given it in the scientific world was, however, no friendly one. For some ten years no one took any notice of Freud's works. About the year 1907 attention was drawn to psycho-analysis by a group of Swiss psychiatrists (Bleuler and Jung, in Zurich), and a storm of indignation, which was not precisely fastidious in its methods and arguments, thereupon broke out, particularly in Germany. In this, psycho-analysis was sharing the fate of many novelties which, after a certain lapse of time, have found general recognition. Nevertheless it lay in its nature that it should inevitably arouse particularly violent opposition. It wounded the prejudices of civilized humanity at some specially sensitive spots. It subjected every individual, as it were, to the analytic reaction, by uncovering what had by universal agreement been repressed into the unconscious; and in this way it forced its contemporaries to behave like patients who, under analytic treatment, above all else bring their resistances to the fore. It must also be admitted that it was no easy thing to become convinced of the correctness of the psycho-analytic theories, nor to obtain instruction in the practice of analysis.

[1924f, 4110]

The general hostility, however, did not succeed in preventing psycho-analysis from continuous expansion during the next decade in two directions: on the map, for interest in it was constantly cropping up in new countries, and in the field of the mental sciences, for it was constantly finding applications in new branches of knowledge. In 1909 President G. Stanley Hall invited Freud and Jung to give a series of lectures at Clark University in Worcester, Mass., of which he was the head and where they were given a friendly reception. Since then psycho-analysis has remained popular in America, although precisely in that country its name has been coupled with much superficiality and some abuses. As early as in 1911, Havelock Ellis was able to report that analysis was studied and practised, not only in Austria and Switzerland, but also in the United States, in England, India, Canada, and, no doubt, in Australia too.

[1924f, 4111]
An essential difference between this second decade of psycho-analysis and the first lay in the fact that the present writer was no longer its sole representative. A constantly growing circle of pupils and followers had collected around him, who devoted themselves first to the diffusion of the theories of psycho-analysis and then extended them, supplemented them and carried them deeper. In the course of years, several of these supporters, as was inevitable, seceded, took their own paths, or turned themselves into an opposition which seemed to threaten the continuity of the development of psycho-analysis. Between 1911 and 1913 C. G. Jung in Zurich and Alfred Adler in Vienna produced some stir by their attempts at giving new interpretations to the facts of analysis and their efforts at a diversion from the analytic standpoint. But it soon appeared that these secessions had effected no lasting damage. What temporary success they achieved was easily accounted for by the readiness of the mass of people to have themselves set free from the pressure of the demands of psycho-analysis by whatever path might be opened to them. The great majority of co-workers remained firm and continued their work along the lines indicated to them. We shall come on their names repeatedly in the short account below of the findings of psycho-analysis in the many and various fields of its application.

[1924f, 4112]

The noisy rejection of psycho-analysis by the medical world could not deter its supporters from developing it, to begin with, along its original lines into a specialized pathology and treatment of the neuroses - a task which has not been completely accomplished even to-day. Its undeniable therapeutic success, which far exceeded any that had previously been achieved, constantly spurred them on to fresh efforts; while the difficulties which came to light as the material was examined more deeply led to profound alterations in the technique of analysis and to important corrections in its theoretical hypotheses and postulates.

[1924f, 4112]

Among the hypothetical concepts which enable the doctor to deal with the analytic material, the first to be mentioned is that of 'libido'. Libido means in psycho-analysis in the first instance the force (thought of as quantitatively variable and measurable) of the sexual instincts directed towards an object - 'sexual' in the extended sense required by analytic theory. Further study showed that it was necessary to set alongside this 'object-libido' a 'narcissistic' or 'ego-libido', directed to the subject's own ego; and the interaction of these two forces has enabled us to account for a great number of normal and abnormal processes in mental life. A rough distinction was soon made between what are known as the 'transference neuroses' and the narcissistic disorders. The former (hysteria and obsessional neurosis) are the objects proper of psycho-analytic treatment, while the others, the narcissistic neuroses, though they can, it is true, be examined by the help of analysis, offer fundamental difficulties to therapeutic influence. It is true that the libido theory of psycho-analysis is by no means complete and that its relation to a general theory of the instincts is not yet clear, for psycho-analysis is a young science, quite unfinished and in a stage of rapid development. Here, however, it should be emphatically pointed out how erroneous the charge of pan-sexualism is which is so often levelled at psycho-analysis. It seeks to show that psycho-analytic theory knows of no mental motive forces other than purely sexual ones and in doing so exploits popular prejudices by using the word 'sexual' not in its analytic but in its vulgar sense.

[1924f, 4113]
To take an instance from another field. It is impossible to escape the impression of the perfect correspondence which can be discovered between the obsessive actions of certain obsessional patients and the religious observances of believers all over the world. Some cases of obsessional neurosis actually behave like a caricature of a private religion, so that it is tempting to liken the official religions to an obsessional neurosis that has been mitigated by becoming universalized. This comparison, which is no doubt highly objectionable to all believers, has nevertheless proved most fruitful psychologically. For psycho-analysis soon discovered in the case of obsessional neurosis what the forces are that struggle with one another in it till their conflicts find a remarkable expression in the ceremonial of obsessive actions. Nothing similar was suspected in the case of religious ceremonial until, by tracing back religious feeling to the relation with the father as its deepest root, it became possible to point to an analogous dynamic situation in that case too. This instance, moreover, may warn the reader that even in its application to non-medical fields psycho-analysis cannot avoid wounding cherished prejudices, touching upon deeply-rooted sensibilities and thus provoking enmities which have an essentially emotional basis. [1924f, 4116]

A particularly bad reception was accorded to psycho-analysis, which the present writer began to develop nearly thirty years ago from the discoveries of Josef Breuer (of Vienna) on the origin of neurotic symptoms. It cannot be disputed that it possessed the quality of novelty, even though it made use of plenty of material which was well known from other sources (quite apart from Breuer's discoveries), such as the lessons from the teachings of Charcot, the great neuropathologist, and impressions derived from the sphere of hypnotic phenomena. Its original significance was purely therapeutic: it aimed at creating a new and efficient method for treating neurotic illnesses. But connections which could not be foreseen in the beginning caused psycho-analysis to reach out far beyond its original aim. It ended by claiming to have set our whole view of mental life upon a new basis and therefore to be of importance for every field of knowledge that is founded on psychology. After a decade of complete neglect it suddenly became a subject of general interest - and set loose a storm of indignant opposition. [1925e, 4122]

The forms in which the resistance to psycho-analysis found expression need not now be considered. It is enough to say that the struggle over this innovation is by no means at an end, though it is already possible to see what direction it will take. Its opponents have not succeeded in suppressing the movement. Psycho-analysis, of which twenty years ago I was the only spokesman, has since attracted the support of numerous valuable and active workers, medical and non-medical, who make use of it as a procedure for the treatment of nervous diseases, as a method of psychological research and as an auxiliary instrument for scientific work in the most various departments of intellectual life. In the following pages our interest will be directed only to the motives of the resistance to psycho-analysis, with particular stress upon the composite character of that resistance and upon the differing amount of weight carried by its components. [1925e, 4122]
Psycho-analysis took hold of this new realization and began to consider the problem of the nature of the psychical processes which led to these unusual consequences. But the direction taken by this enquiry was not to the liking of the contemporary generation of physicians. They had been brought up to respect only anatomical, physical and chemical factors. They were not prepared for taking psychical ones into account and therefore met them with indifference or antipathy. They obviously had doubts whether psychical events allowed of any exact scientific treatment whatever. As an excessive reaction against an earlier phase during which medicine had been dominated by what was known as the 'philosophy of Nature', they regarded such abstractions as those with which psychology is obliged to work as nebulous, fantastic and mystical; while they simply refused to believe in remarkable phenomena which might have been the starting-point of research. The symptoms of hysterical neuroses were looked upon as shamming and the phenomena of hypnotism as a hoax. Even the psychiatrists, upon whose attention the most unusual and astonishing mental phenomena were constantly being forced, showed no inclination to examine their details or enquire into their connections. They were content to classify the variegated array of symptoms and trace them back, so far as they could manage, to somatic, anatomical or chemical aetiological disturbances. During this materialistic or, rather, mechanistic period, medicine made tremendous advances, but it also showed a short-sighted misunderstanding of the most important and most difficult among the problems of life.

[1925e, 4123]

It is easy to understand why doctors, with an attitude of this kind towards the mind, should have had no liking for psycho-analysis and should have demurred to its demand for learning many things afresh and for seeing many things in a different light. But as a compensation it might be supposed that the new theory would be all the more likely to meet with applause from philosophers. For philosophers were accustomed to putting abstract concepts (or, as unkind tongues would say, hazy words) in the forefront of their explanations of the universe, and it would be impossible that they should object to the extension of the sphere of psychology for which psycho-analysis had paved the way. But here another obstacle arose. The philosophers' idea of what is mental was not that of psycho-analysis. The overwhelming majority of philosophers regard as mental only the phenomena of consciousness. For them the world of consciousness coincides with the sphere of what is mental. Everything else that may take place in the 'mind' - an entity so hard to grasp - is relegated by them to the organic determinants of mental processes or to processes parallel to mental ones. Or, more strictly speaking, the mind has no contents other than the phenomena of consciousness, and consequently psychology, the science of the mind, has no other subject-matter. And on this point the layman's view is the same.

[1925e, 4124]

So it comes about that psycho-analysis derives nothing but disadvantages from its middle position between medicine and philosophy. Doctors regard it as a speculative system and refuse to believe that, like every other natural science, it is based on a patient and tireless elaboration of facts from the world of perception; philosophers, measuring it by the standard of their own artificially constructed systems, find that it starts from impossible premises and reproach it because its most general concepts (which are only now in process of evolution) lack clarity and precision.

[1925e, 4125]
This state of affairs is enough to account for the reluctant and hesitant reception of analysis in scientific quarters. But it does not explain the outbursts of indignation, derision and scorn which, in disregard of every standard of logic and good taste, have characterized the controversial methods of its opponents. A reaction of such a kind suggests that resistances other than purely intellectual ones were stirred up and that powerful emotional forces were aroused. And there are indeed plenty of things to be found in the theory of psycho-analysis calculated to produce such an effect as this upon the passions of men of every kind and not of scientists alone. Above all there is the very important place in the mental life of human beings which psycho-analysis assigns to what are known as the sexual instincts. Psycho-analytic theory maintained that the symptoms of neuroses are distorted substitutive satisfactions of sexual instinctual forces, the direct satisfaction of which has been frustrated by internal resistances. Later on, when analysis had extended beyond its original field of work and began to be applied to normal mental life, it sought to show that these same sexual components, which could be diverted from their immediate aims and directed to other things, made the most important contributions to the cultural achievements of the individual and of society. These views were not entirely new. The incomparable significance of sexual life had been proclaimed by the philosopher Schopenhauer in an intensely impressive passage. Moreover, what psycho-analysis called sexuality was by no means identical with the impulsion towards a union of the two sexes or towards producing a pleasurable sensation in the genitals; it had far more resemblance to the all-inclusive and all-preserving Eros of Plato's *Symposium*.

But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.

Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization rests upon two pillars, of which one is the control of natural forces and the other the restriction of our instincts. The ruler's throne rests upon fettered slaves. Among the instinctual components which are thus brought into service, the sexual instincts, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this - and will not allow the topic to be mentioned.
But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

PSYCHO-ANALYSIS has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

Thus the strongest resistances to psycho-analysis were not of an intellectual kind but arose from emotional sources. This explained their passionate character as well as their poverty in logic. The situation obeyed a simple formula: men in the mass behaved to psycho-analysis in precisely the same way as individual neurotics under treatment for their disorders. It is possible, however, by patient work to convince these latter individuals that everything happened as we maintained it did: we had not invented it ourselves but had arrived at it from a study of other neurotics covering a period of twenty or thirty years. The position was at once alarming and consoling: alarming because it was no small thing to have the whole human race as one's patient, and consoling because after all everything was taking place as the hypotheses of psycho-analysis declared that it was bound to.

If we cast our eyes once again over the various resistances to psycho-analysis that have been enumerated, it is evident that only a minority of them are of the kind which habitually arise against most scientific innovations of any considerable importance. The majority of them are due to the fact that powerful human feelings are hurt by the subject-matter of the theory. Darwin's theory of descent met with the same fate, since it tore down the barrier that had been arrogantly set up between men and beasts. I drew attention to this analogy in an earlier paper,¹ in which I showed how the psycho-analytic view of the relation of the conscious ego to an overpowering unconscious was a severe blow to human self-love. I described this as the psychological blow to men's narcissism, and compared it with the biological blow delivered by the theory of descent and the earlier cosmological blow aimed at it by the discovery of Copernicus.

¹[1925e, 4129]
Purely external difficulties have also contributed to strengthen the resistance to psycho-analysis. It is not easy to arrive at an independent judgement upon matters to do with analysis without having experienced it oneself or practised it on someone else. Nor can one do the latter without having acquired a specific and decidedly delicate technique, while until recently there was no easily accessible means of learning psycho-analysis and its technique. This position has now been improved by the foundation (in 1920) of the Berlin Psycho-Analytic Clinic and Training Institute, and soon afterwards (in 1922) of an exactly similar institute in Vienna. [1925e, 4130]

Finally, with all reserve, the question may be raised whether the personality of the present writer as a Jew who has never sought to disguise the fact that he is a Jew may not have had a share in provoking the antipathy of his environment to psycho-analysis. An argument of this kind is not often uttered aloud. But we have unfortunately grown so suspicious that we cannot avoid thinking that this factor may not have been quite without its effect. Nor is it perhaps entirely a matter of chance that the first advocate of psycho-analysis was a Jew. To profess belief in this new theory called for a certain degree of readiness to accept a situation of solitary opposition - a situation with which no one is more familiar than a Jew. [1925e, 4130]

Finally, the remarks which the author makes in conclusion on the technique of psycho-analysis are quite excellent. They are entirely correct and, in spite of their conciseness, leave aside nothing essential. They are convincing evidence of the author's subtle understanding. The reader should not, of course, conclude that knowledge of these rules of technique alone will make him capable of undertaking an analysis. [1922e, 4174]

As I write these lines, a number of papers and newspaper articles have reached me from France, which give evidence of a violent objection to the acceptance of psycho-analysis, and which often make the most inaccurate assertions in regard to my relations with the French school. I read, for instance, that I made use of my visit to Paris to familiarize myself with the theories of Pierre Janet and then made off with my booty. I should therefore like to say explicitly that during the whole of my visit to the Salpêtrière Janet's name was never so much as mentioned. [1925d, 4191]

During the years that followed the publication of the Studies, having reached these conclusions upon the part played by sexuality in the aetiology of the neuroses, I read some papers on the subject before various medical societies, but was only met with incredulity and contradiction. Breuer did what he could for some time longer to throw the great weight of his personal influence into the scales in my favour, but he effected nothing and it was easy to see that he too shrank from recognizing the sexual aetiology of the neuroses. He might have crushed me or at least disconcerted me by pointing to his own first patient, in whose case sexual factors had ostensibly played no part whatever. But he never did so, and I could not understand why this was, until I came to interpret the case correctly and to reconstruct, from some remarks which he had made, the conclusion of his treatment of it. After the work of catharsis had seemed to be completed, the girl had suddenly developed a condition of 'transference love'; he had not connected this with her illness, and had therefore retired in dismay. It was obviously painful to him to be reminded of this apparent contretemps. His attitude towards me oscillated for some time between appreciation and sharp criticism; then accidental difficulties arose, as they never fail to do in a strained situation, and we parted. [1925d, 4203]
I have already mentioned that my investigation of the precipitating and underlying causes of the neuroses led me more and more frequently to conflicts between the subject's sexual impulses and his resistances to sexuality. In my search for the pathogenic situations in which the repressions of sexuality had set in and in which the symptoms, as substitutes for what was repressed, had had their origin, I was carried further and further back into the patient's life and ended by reaching the first years of his childhood. What poets and students of human nature had always asserted turned out to be true: the impressions of that early period of life, though they were for the most part buried in amnesia, left ineradicable traces upon the individual's growth and in particular laid down the disposition to any nervous disorder that was to follow. But since these experiences of childhood were always concerned with sexual excitations and the reaction against them, I found myself faced by the fact of infantile sexuality - once again a novelty and a contradiction of one of the strongest of human prejudices. Childhood was looked upon as 'innocent' and free from the lusts of sex, and the fight with the demon of 'sensuality' was not thought to begin until the troubled age of puberty. Such occasional sexual activities as it had been impossible to overlook in children were put down as signs of degeneracy or premature depravity or as a curious freak of nature. Few of the findings of psycho-analysis have met with such universal contradiction or have aroused such an outburst of indignation as the assertion that the sexual function starts at the beginning of life and reveals its presence by important signs even in childhood. And yet no other finding of analysis can be demonstrated so easily and so completely. [1925d, 4209]

For more than ten years after my separation from Breuer I had no followers. I was completely isolated. In Vienna I was shunned; abroad no notice was taken of me. My Interpretation of Dreams, published in 1900, was scarcely reviewed in the technical journals. In my paper 'On the History of the Psycho-Analytic Movement' I mentioned as an instance of the attitude adopted by psychiatric circles in Vienna a conversation with an assistant at the clinic, who had written a book against my theories but had never read my Interpretation of Dreams. He had been told at the clinic that it was not worth while. The man in question, who has since become a professor, has gone so far as to repudiate my report of the conversation and to throw doubts in general upon the accuracy of my recollection. I can only say that I stand by every word of the account I then gave. [1925d, 4223]

As soon as I realized the inevitable nature of what I had come up against, my sensitiveness greatly diminished. Moreover my isolation gradually came to an end. To begin with, a small circle of pupils gathered round me in Vienna; and then, after 1906, came the news that the psychiatrists at Zurich, E. Bleuler, his assistant C. G. Jung, and others, were taking a lively interest in psycho-analysis. We got into personal touch with one another, and at Easter 1908 the friends of the young science met at Salzburg, agreed upon the regular repetition of similar informal congresses and arranged for the publication of a journal which was edited by Jung and was given the title of Jahrbuch für psychoanalytische und psychopathologische Forschungen. It was brought out under the direction of Breuler and myself and ceased publication at the beginning of the World War. At the same time that the Swiss psychiatrists joined the movement, interest in psycho-analysis began to be aroused all over Germany as well; it became the subject of a large number of written comments and of lively discussions at scientific congresses. But its reception was nowhere friendly or even benevolently non-committal. After the briefest acquaintance with psycho-analysis German science was united in rejecting it. [1925d, 4223]
Even to-day it is of course impossible for me to foresee the final judgment of posterity upon the value of psycho-analysis for psychiatry, psychology, and the mental sciences in general. But I fancy that, when the history of the phase we have lived through comes to be written, German science will not have cause to be proud of those who represented it. I am not thinking of the fact that they rejected psycho-analysis or of the decisive way in which they did so; both of these things were easily intelligible, they were only to be expected and at any rate they threw no discredit on the character of the opponents of analysis. But for the degree of arrogance which they displayed, for their conscienceless contempt of logic, and for the coarseness and bad taste of their attacks there could be no excuse. It may be said that it is childish of me to give free rein to such feelings as these now, after fifteen years have passed; nor would I do so unless I had something more to add. Years later, during the World War, when a chorus of enemies were bringing against the German nation the charge of barbarism, a charge which sums up all that I have written above, it none the less hurt deeply to feel that my own experience would not allow me to contradict it.

[1925d, 4224]

One of my opponents boasted of silencing his patients as soon as they began to talk of anything sexual and evidently thought that this technique gave him a right to judge the part played by sexuality in the aetiology of the neuroses. Apart from emotional resistances, which were so easily explicable by the psycho-analytic theory that it was impossible to be misled by them, it seemed to me that the main obstacle to agreement lay in the fact that my opponents regarded psycho-analysis as a product of my speculative imagination and were unwilling to believe in the long, patient and unbiased work which had gone to its making. Since in their opinion analysis had nothing to do with observation or experience, they believed that they themselves were justified in rejecting it without experience. Others again, who did not feel so strongly convinced of this, repeated in their resistance the classical manoeuvre of not looking through the microscope so as to avoid seeing what they had denied. It is remarkable, indeed, how incorrectly most people act when they are obliged to form a judgement of their own on some new subject. For years I have been told by 'benevolent' critics - and I hear the same thing even to-day - that psycho-analysis is right up to such-and-such a point but that there it begins to exaggerate and to generalize without justification. And I know that, though nothing is more difficult than to decide where such a point lies, these critics had been completely ignorant of the whole subject only a few weeks or days earlier.

[1925d, 4224]
The result of the official anathema against psycho-analysis was that the analysts began to come closer together. At the second Congress, held at Nuremberg in 1910, they formed themselves, on the proposal of Ferenczi, into an 'International Psycho-Analytical Association' divided into a number of local societies but under a common President. The Association survived the Great War and still exists, consisting to-day of branch societies in Austria, Germany, Hungary, Switzerland, Great Britain, Holland, Russia, and India, as well as two in the United States. I arranged that C. G. Jung should be appointed as the first President, which turned out later to have been a most unfortunate step. At the same time a second journal devoted to psycho-analysis was started, the Zentralblatt für Psychoanalyse, edited by Adler and Stekel, and a little later a third, Imago, edited by two non-medical analysts, H. Sachs and O. Rank, and intended to deal with the application of analysis to the mental sciences. Soon afterwards Bleuler published a paper in defence of psycho-analysis. Though it was a relief to find honesty and straightforward logic for once taking part in the dispute, yet I could not feel completely satisfied by Bleuler's essay. He strove too eagerly after an appearance of impartiality; nor is it a matter of chance that it is to him that our science owes the valuable concept of ambivalence. In later papers Bleuler adopted such a critical attitude towards the theoretical structure of analysis and rejected or threw doubts upon such essential parts of it that I could not help asking myself in astonishment what could be left of it for him to admire. Yet not only has he subsequently uttered the strongest pleas in favour of 'depth psychology' but he based his comprehensive study of schizophrenia upon it. Nevertheless Bleuler did not for long remain a member of the International Psycho-Analytical Association; he resigned from it as a result of misunderstandings with Jung, and the Burghölzli was lost to analysis.

Official disapproval could not hinder the spread of psycho-analysis either in Germany or in other countries. I have elsewhere followed the stages of its growth and given the names of those who were its first representatives. In 1909 G. Stanley Hall invited Jung and me to America to go to Clark University, Worcester, Mass., of which he was President, and to spend a week giving lectures (in German) at the celebration of the twentieth anniversary of that body's foundation. Hall was justly esteemed as a psychologist and educationalist, and had introduced psycho-analysis into his courses several years earlier; there was a touch of the 'king-maker' about him, a pleasure in setting up authorities and in then deposing them. We also met James J. Putnam there, the Harvard neurologist, who in spite of his age was an enthusiastic supporter of psycho-analysis and threw the whole weight of a personality that was universally respected into the defence of the cultural value of analysis and the purity of its aims. He was an estimable man, in whom, as a reaction against a predisposition to obsessional neurosis, an ethical bias predominated; and the only thing in him that was disquieting was his inclination to attach psycho-analysis to a particular philosophical system and to make it the servant of moral aims. Another event of this time which made a lasting impression on me was a meeting with William James the philosopher. I shall never forget one little scene that occurred as we were on a walk together. He stopped suddenly, handed me a bag he was carrying and asked me to walk on, saying that he would catch me up as soon as he had got through an attack of angina pectoris which was just coming on. He died of that disease a year later; and I have always wished that I might be as fearless as he was in the face of approaching death.
At that time I was only fifty-three. I felt young and healthy, and my short visit to the new world encouraged my self-respect in every way. In Europe I felt as though I were despised; but over there I found myself received by the foremost men as an equal. As I stepped on to the platform at Worcester to deliver my *Five Lectures on Psycho-Analysis* it seemed like the realization of some incredible day-dream: psycho-analysis was no longer a product of delusion, it had become a valuable part of reality. It has not lost ground in America since our visit; it is extremely popular among the lay public and is recognized by a number of official psychiatrists as an important element in medical training. Unfortunately, however, it has suffered a great deal from being watered down. Moreover, many abuses which have no relation to it find a cover under its name, and there are few opportunities for any thorough training in technique or theory. In America, too, it has come in conflict with Behaviourism, a theory which is naïve enough to boast that it has put the whole problem of psychology completely out of court.

[1925d, 4227]

In Europe during the years 1911-13 two secessionist movements from psycho-analysis took place, led by men who had previously played a considerable part in the young science, Alfred Adler and C. G. Jung. Both movements seemed most threatening and quickly obtained a large following. But their strength lay, not in their own content, but in the temptation which they offered of being freed from what were felt as the repellent findings of psycho-analysis even though its actual material was no longer rejected. Jung attempted to give to the facts of analysis a fresh interpretation of an abstract, impersonal and non-historical character, and thus hoped to escape the need for recognizing the importance of infantile sexuality and of the Oedipus complex as well as the necessity for any analysis of childhood. Adler seemed to depart still further from psycho-analysis; he entirely repudiated the importance of sexuality, traced back the formation both of character and of the neuroses solely to men's desire for power and to their need to compensate for their constitutional inferiorities, and threw all the psychological discoveries of psycho-analysis to the winds. But what he had rejected forced its way back into his closed system under other names; his 'masculine protest' is nothing else than repression unjustifiably sexualized. The criticism with which the two heretics were met was a mild one; I only insisted that both Adler and Jung should cease to describe their theories as 'psycho-analysis'. After a lapse of ten years it can be asserted that both of these attempts against psycho-analysis have blown over without doing any harm.

[1925d, 4227]
The World War, which broke up so many other organizations, could do nothing against our 'International'. The first meeting after the war took place in 1920, at The Hague, on neutral ground. It was moving to see how hospitably the Dutch welcomed the starving and impoverished subjects of the Central European states; and I believe this was the first occasion in a ruined world on which Englishmen and Germans sat at the same table for the friendly discussion of scientific interests. Both in Germany and in the countries of Western Europe the war had actually stimulated interest in psycho-analysis. The observation of war neuroses had at last opened the eyes of the medical profession to the importance of psychogenesis in neurotic disturbances, and some of our psychological conceptions, such as the 'gain from illness' and the 'flight into illness', quickly became popular. The last Congress before the German collapse, which was held at Budapest in 1918, was attended by official representatives of the allied governments of the Central European powers, and they agreed to the establishment of psycho-analytic Centres for the treatment of war neuroses. But this point was never reached. Similarly too the comprehensive plans made by one of our leading members, Dr. Anton von Freund, for establishing in Budapest a centre for analytic study and treatment came to grief as a result of the political upheavals that followed soon afterwards and of the premature death of their irreplaceable author. At a later date some of his ideas were put into execution by Max Eitingon, who in 1920 founded a psycho-analytical clinic in Berlin. During the brief period of Bolshevik rule in Hungary, Ferenczi was still able to carry on a successful course of instruction as the official representative of psycho-analysis at the University of Budapest. After the war our opponents were pleased to announce that events had produced a conclusive argument against the validity of the theses of analysis. The war neuroses, they said, had proved that sexual factors were unnecessary to the aetiology of neurotic disorders. But their triumph was frivolous and premature. For on the one hand no one had been able to carry out a thorough analysis of a case of war neurosis, so that in fact nothing whatever was known for certain as to their motivation and no conclusions could be drawn from this uncertainty; while on the other hand psycho-analysis had long before arrived at the concept of narcissism and of narcissistic neuroses, in which the subject's libido is attached to his own ego instead of to an object. Though on other occasions, therefore, the charge was brought against psycho-analysis of having made an unjustifiable extension of the concept of sexuality, yet, when it became convenient for controversial ends, this crime was forgotten and we were once more held down to the narrowest meaning of the word.

[1925d, 4229]
It remains to be seen whether this construction will turn out to be serviceable. Although it arose from a desire to fix some of the most important theoretical ideas of psycho-analysis, it goes far beyond psycho-analysis. I have repeatedly heard it said contemptuously that it is impossible to take a science seriously whose most general concepts are as lacking in precision as those of libido and of instinct in psycho-analysis. But this reproach rests on a complete misconception of the facts. Clear basic concepts and sharply drawn definitions are only possible in the mental sciences in so far as the latter seek to fit a region of facts into the frame of a logical system. In the natural sciences, of which psychology is one, such clear-cut general concepts are superfluous and indeed impossible. Zoology and Botany did not start from correct and adequate definitions of an animal and a plant; to this very day biology has been unable to give any certain meaning to the concept of life. Physics itself, indeed, would never have made any advance if it had had to wait until its concepts of matter, force, gravitation, and so on, had reached the desirable degree of clarity and precision. The basic ideas or most general concepts in any of the disciplines of science are always left indeterminate at first and are only explained to begin with by reference to the realm of phenomena from which they were derived; it is only by means of a progressive analysis of the material of observation that they can be made clear and can find a significant and consistent meaning. I have always felt it as a gross injustice that people have refused to treat psycho-analysis like any other science. This refusal found an expression in the raising of the most obstinate objections. Psycho-analysis was constantly reproached for its incompleteness and insufficiencies; though it is plain that a science based upon observation has no alternative but to work out its findings piecemeal and to solve its problems step by step. Again, when I endeavoured to obtain for the sexual function the recognition which had so long been withheld from it, psycho-analytic theory was branded as 'pan-sexualism'. And when I laid stress on the hitherto neglected importance of the part played by the accidental impressions of early youth, I was told that psycho-analysis was denying constitutional and hereditary factors - a thing which I had never dreamt of doing. It was a case of contradiction at any price and by any methods.
The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the psychoses is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoid modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in dementias by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psycho-analysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.

I now watch from a distance the symptomatic reactions that are accompanying the introduction of psycho-analysis into the France which was for so long refractory. It seems like a reproduction of something I have lived through before, and yet it has peculiarities of its own. Objections of incredible simplicity are raised, such as that French sensitiveness is offended by the pedantry and crudity of psycho-analytic terminology. (One cannot help being reminded of Lessing's immortal Chevalier Riccaut de la Marliéri.) Another comment has a more serious ring (a Professor of Psychology at the Sorbonne did not think it beneath him): the whole mode of thought of psycho-analysis, so he declared, is inconsistent with the génie latin. Here the Anglo-Saxon allies of France, who count as supporters of analysis, are explicitly thrown over. Anyone hearing the remark would suppose that psycho-analysis had been the favourite child of the génie teutonique and had been clasped to its heart from the moment of birth.
I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.

[1925d, 4242]

The title of this small work is not immediately intelligible. I will therefore explain it. 'Layman' = 'Non-doctor'; and the question is whether non-doctors as well as doctors are to be allowed to practise analysis. This question has its limitations both in time and place. In time, because up to now no one has been concerned as to who practises analysis. Indeed, people have been much too little concerned about it - the one thing they were agreed on was a wish that no one should practise it. Various reasons were given for this, but they were based on the same underlying distaste. Thus the demand that only doctors should analyse corresponds to a new and apparently more friendly attitude to analysis - if, that is, it can escape the suspicion of being after all only a slightly modified derivative of the earlier attitude. It is conceded that in some circumstances an analytic treatment shall be undertaken; but, if so, only doctors are to undertake it. The reason for this restriction then becomes a matter for enquiry.

[1926e, 4327]

I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

[1926e, 4350]

I confess, moreover, that the dislike that you yourself have betrayed of assigning to the factor of sexuality so great a part in the causation of neurosis - I confess that this scarcely seems to me consistent with your task as an Impartial Person. Are you not afraid that this antipathy may interfere with your passing a just judgement?

[1926e, 4351]
Because that someone else would not have thought any differently from you. But if he had been prepared from the first to recognize the importance of sexual life, everyone would have exclaimed: 'Why, that is no Impartial Person, he is one of your supporters!' No, I am far from abandoning the expectation of being able to influence your opinions. I must admit, however, that from my point of view this situation is different from the one we dealt with earlier. As regards our psychological discussions it is a matter of indifference to me whether you believe me or not, provided only that you get an impression that what we are concerned with are purely psychological problems. But here, as regards the question of sexuality, I should nevertheless be glad if you were accessible to the realization that your strongest motive for contradiction is precisely the ingrained hostility which you share with so many other people.

Very well. I can now proceed with my exposition. Sexual life is not simply something spicy; it is also a serious scientific problem. There was much that was novel to be learnt about it, many strange things to be explained. I told you just now that analysis has to go back into the early years of the patient's childhood, because the decisive repressions have taken place then, while his ego was feeble. But surely in childhood there is no sexual life? surely it only starts at puberty? On the contrary. We have to learn that sexual instinctual impulses accompany life from birth onwards, and that it is precisely in order to fend off those instincts that the infantile ego institutes repressions. A remarkable coincidence, is it not? that small children should already be struggling against the power of sexuality, just as the speaker in the learned society was to do later, and later still my followers who have set up their own theories. How does that come about? The most general explanation would be that our civilization is built up entirely at the expense of sexuality; but there is much more to be said on the subject.

The discovery of infantile sexuality is one of those of which we have reason to feel ashamed. A few paediatricians have, it seems, always known about it, and a few children's nurses. Clever men, who call themselves child psychologists, have thereupon spoken in tones of reproach of a 'desecration of the innocence of childhood'. Once again, sentiment instead of argument! Events of that kind are of daily occurrence in political bodies. A member of the Opposition rises and denounces some piece of maladministration in the Civil Service, in the Army, in the Judiciary and so on. Upon this another member, preferably one of the Government, declares that such statements are an affront to the sense of honour of the body politic, of the army, of the dynasty, or even of the nation. So they are as good as untrue. Feelings such as these can tolerate no affronts.

I am surprised that you are still silent. That can scarcely mean consent. - In asserting that a child's first choice of an object is, to use the technical term, an incestuous one, analysis no doubt once more hurt the most sacred feelings of humanity, and might well be prepared for a corresponding amount of disbelief, contradiction and attack. And these it has received in abundance. Nothing has damaged it more in the good opinion of its contemporaries than its hypothesis of the Oedipus complex as a structure universally bound to human destiny. The Greek myth, incidentally, must have had the same meaning; but the majority of men to-day, learned and unlearned alike, prefer to believe that Nature has laid down an innate abhorrence in us as a guard against the possibility of incest.
It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances.

There are at the moment two Institutes at which instruction in psycho-analysis is given. The first has been founded in Berlin by Dr. Max Eitingon, who is a member of the Society there. The second is maintained by the Vienna Psycho-Analytical Society at its own expense and at considerable sacrifice. The part played by the authorities is at present limited to the many difficulties which they put in the way of the young undertaking. A third training Institute is at this moment being opened in London by the Society there, under the direction of Dr. Ernest Jones. At these Institutes the candidates themselves are taken into analysis, receive theoretical instruction by lectures on all the subjects that are important for them, and enjoy the supervision of older and more experienced analysts when they are allowed to make their first trials with comparatively slight cases. A period of some two years is calculated for this training. Even after this period, of course, the candidate is only a beginner and not yet a master. What is still needed must be acquired by practice and by an exchange of ideas in the psycho-analytical societies in which young and old members meet together. Preparation for analytic activity is by no means so easy and simple. The work is hard, the responsibility great. But anyone who has passed through such a course of instruction, who has been analysed himself, who has mastered what can be taught to-day of the psychology of the unconscious, who is at home in the science of sexual life, who has learnt the delicate technique of psycho-analysis, the art of interpretation, of fighting resistances and of handling the transference - anyone who has accomplished all this is no longer a layman in the field of psycho-analysis. He is capable of undertaking the treatment of neurotic disorders, and will be able in time to achieve in that field whatever can be required from this form of therapy.

A doctor who does what you have promised on his behalf will be welcome to all of us. Four-fifths of those whom I recognize as my pupils are in any case doctors. But allow me to point out to you how the relations of doctors to analysis have really developed and how they will probably continue to develop. Doctors have no historical claim to the sole possession of analysis. On the contrary, until recently they have met it with everything possible that could damage it, from the shallowest ridicule to the gravest calumny. You will justly reply that that belongs to the past and need not affect the future. I agree, but I fear the future will be different from what you have foretold.

The comparison which you brought up to pacify me, between specialization in analysis and in other branches of medicine, is thus not applicable. For surgery, ophthalmology, and so on, the medical school itself offers an opportunity for further education. The analytic training institutes are few in number, young in years, and without authority. The medical schools have not recognized them and take no notice of them. The young doctor, who has had to take so much on trust from his teachers that he has had little occasion for educating his judgement, will gladly seize an occasion for playing the part of a critic for once in a field in which there is as yet no recognized authority.
I have not got so far as that yet; and I cannot tell whether I shall get there at all. I should like to discuss another question with you, and first of all to touch on one special point. It is said that the authorities, at the instigation of the medical profession, want to forbid the practice of analysis by laymen altogether. Such a prohibition would also affect the non-medical members of the Psycho-Analytical Society, who have enjoyed an excellent training and have perfected themselves greatly by practice. If the prohibition were enacted, we should find ourselves in a position in which a number of people are prevented from carrying out an activity which one can safely feel convinced they can perform very well, while the same activity is opened to other people for whom there is no question of a similar guarantee. That is not precisely the sort of result to which legislation should lead. However, this special problem is neither very important nor difficult to solve. Only a handful of people are concerned, who cannot be seriously damaged. They will probably emigrate to Germany where no legislation will prevent them from finding recognition for their proficiency. If it is desired to spare them this and to mitigate the law's severity, that can easily be done on the basis of some well-known precedents. Under the Austrian Monarchy it repeatedly happened that permission was given to notorious quacks, _ad personam_, to carry out medical activities in certain fields, because people were convinced of their real ability. Those concerned were for the most part peasant healers, and their recommendation seems regularly to have been made by one of the Archduchesses who were once so numerous; but it ought to be possible for it also to be done in the case of town-dwellers and on the basis of a different and merely expert guarantee. Such a prohibition would have more important effects on the Vienna analytic training institute, which would thenceforward be unable to accept any candidates for training from non-medical circles. Thus once again in our country a line of intellectual activity would be suppressed which is allowed to develop freely elsewhere. I am the last person to claim any competence in judging laws and regulations. But this much I can see: that to lay emphasis on our quackery law does not lead in the direction of the approach to conditions in Germany which is so much aimed at to-day, and that the application of that law to the case of psycho-analysis has something of an anachronism about it, since at the time of its enactment there was as yet no such thing as analysis and the peculiar nature of neurotic illnesses was not yet recognized.

It is unjust and inexpedient to try to compel a person who wants to set someone else free from the torment of a phobia or an obsession to take the roundabout road of the medical curriculum. Nor will such an endeavour have any success, unless it results in suppressing analysis entirely. Imagine a landscape in which two paths lead to a hilltop with a view - one short and straight, the other long, winding and circuitous. You try to stop up the short path by a prohibitory notice, perhaps because it passes by some flower-beds that you want to protect. The only chance you have of your prohibition being respected is if the short path is steep and difficult while the longer one leads gently up. If, however, that is not so, and the roundabout path is on the contrary the harder, you may imagine the use of your prohibition and the fate of your flower-beds! I fear you will succeed in compelling the laymen to study medicine just as little as I shall be able to induce doctors to learn analysis. For you know human nature as well as I do.

I cannot foresee the way out of these difficulties, nor is it my business to point it out. I see only two things, first that analysis is an embarrassment to you and that the best thing would be for it not to exist - though neurotics, no doubt, are an embarrassment too; and secondly, that the interests of everyone concerned would for the time being be met if the doctors could make up their minds to tolerate a class of therapists which would relieve them of the tedium of treating the enormously common psychogenic neuroses while remaining in constant touch with them to the benefit of the patients.
Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.

It will not have escaped my readers that in what I have said I have assumed as axiomatic something that is still violently disputed in the discussion. I have assumed, that is to say, that psycho-analysis is not a specialized branch of medicine. I cannot see how it is possible to dispute this. Psycho-analysis is a part of psychology; not of medical psychology in the old sense, not of the psychology of morbid processes, but simply of psychology. It is certainly not the whole of psychology, but its sub-structure and perhaps even its entire foundation. The possibility of its application to medical purposes must not lead us astray. Electricity and radiology also have their medical application, but the science to which they both belong is none the less physics. Nor can their situation be affected by historical arguments. The whole theory of electricity had its origin in an observation of a nerve-muscle preparation; yet no one would dream to-day of regarding it as a part of physiology. It is argued that psycho-analysis was after all discovered by a physician in the course of his efforts to assist his patients. But that is clearly neither here nor there. Moreover, the historical argument is double-edged. We might pursue the story and recall the unfriendliness and indeed the animosity with which the medical profession treated analysis from the very first. That would seem to imply that it can have no claims over analysis to-day. And though I do not accept that implication, I still feel some doubts as to whether the present wooing of psycho-analysis by the doctors is based, from the point of view of the libido theory, upon the first or upon the second of Abraham's sub-stages - whether they wish to take possession of their object for the purpose of destroying or of preserving it.

The beginnings of psycho-analysis may be marked by two dates: 1895, which saw the publication of Breuer and Freud's Studies on Hysteria, and 1900, which saw that of Freud's Interpretation of Dreams. At first the new discoveries aroused no interest either in the medical profession or among the general public. In 1907 the Swiss psychiatrists, under the leadership of E. Bleuler and C. G. Jung, began to concern themselves in the subject; and in 1908 there took place at Salzburg a first meeting of adherents from a number of different countries. In 1909 Freud and Jung were invited to America by G. Stanley Hall to deliver a series of lectures on psycho-analysis at Clark University, Worcester, Mass. From that time forward interest grew rapidly in Europe; it expressed itself, however, in a very forcible rejection of the new teachings - a rejection which often showed an unscientific colouring.
The reasons for this hostility were to be found, from the medical point of view, in the fact that psycho-analysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psycho-analysis. In spite of this widespread opposition, however, the movement in favour of psycho-analysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psycho-analysis to non-medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

During the years 1911-13 two former adherents, Alfred Adler, of Vienna, and C. G. Jung, of Zurich, seceded from the psycho-analytic movement and founded schools of thought of their own, which, in view of the general hostility to psycho-analysis, could be certain of a favourable reception, but which remained scientifically sterile. In 1921 Dr. M. Eitingon founded in Berlin the first public psycho-analytic clinic and training-school, and this was soon followed by a second in Vienna.

It happened that in the years from 1895 onwards I was subjected to two powerful impressions which combined to produce the same effect on me. On the one hand, I had gained my first insight into the depths of the life of the human instincts; I had seen some things that were sobering and even, at first, frightening. On the other hand, the announcement of my unpleasing discoveries had as its result the severance of the greater part of my human contacts; I felt as though I were despised and universally shunned. In my loneliness I was seized with a longing to find a circle of picked men of high character who would receive me in a friendly spirit in spite of my temerity. Your society was pointed out to me as the place where such men were to be found.

We bury with him - *integer vitae scerisque purus* - one of the firmest hopes of our science, young as it is and still so bitterly assailed, and a part of its future that is now, perhaps, unrealizable. Among all those who followed me along the dark paths of psycho-analytic research, he won so pre-eminent a place that only one other name could be set beside his. It is likely that the boundless trust of his colleagues and pupils would have called him to the leadership; and he would without doubt have been a model leader in the pursuit of truth, led astray neither by the praise or blame of the many nor by the seductive illusion of his own phantasies.

<607>
The one person this publication may injure is myself. I shall have to listen to the most disagreeable reproaches for my shallowness, narrow-mindedness and lack of idealism or understanding for the highest interests of mankind. But on the one hand, such remonstrances are not new to me; and on the other, if a man has already learnt in his youth to rise superior to the disapproval of his contemporaries, what can it matter to him in his old age when he is certain soon to be beyond the reach of all favour or disfavour? In former times it was different. Then utterances such as mine brought with them a sure curtailment of one's earthly existence and an effective speeding-up of the opportunity for gaining a personal experience of the after-life. But, I repeat, those times are past and to-day writings such as this bring no more danger to their author than to their readers. The most that can happen is that the translation and distribution of his book will be forbidden in one country or another - and precisely, of course, in a country that is convinced of the high standard of its culture. But if one puts in any plea at all for the renunciation of wishes and for acquiescence in Fate, one must be able to tolerate this kind of injury too.

[1927c, 4445]

The further question occurred to me whether the publication of this work might not after all do harm. Not to a person, however, but to a cause - the cause of psycho-analysis. For it cannot be denied that psycho-analysis is my creation, and it has met with plenty of mistrust and ill-will. If I now come forward with such displeasing pronouncements, people will be only too ready to make a displacement from my person to psycho-analysis. 'Now we see,' they will say, 'where psycho-analysis leads to. The mask has fallen; it leads to a denial of God and of a moral ideal, as we always suspected. To keep us from this discovery we have been deluded into thinking that psycho-analysis has no Weltanschauung and never can construct one.'

[1927c, 4445]

I am sorry, though I cannot alter the facts, if this exposition of the attitudes of hatred and love towards the father and their transformations under the influence of the threat of castration seems to readers unfamiliar with psycho-analysis unsavoury and incredible. I should myself expect that it is precisely the castration complex that would be bound to arouse the most general repudiation. But I can only insist that psycho-analytic experience has put these matters in particular beyond the reach of doubt and has taught us to recognize in them the key to every neurosis. This key, then, we must apply to our author's so-called epilepsy. So alien to our consciousness are the things by which our unconscious mental life is governed!

[1928b, 4560]

Unfortunately I shall not be able to attend the ceremony in Frankfurt; I am too frail for such an undertaking. The company there will lose nothing by that: my daughter Anna is certainly pleasanter to look at and to listen to than I am. We propose that she shall read out a few sentences of mine which deal with Goethe's connections with psycho-analysis and defend the analysts themselves against the reproach of having offended against the respect due to the great man by the analytic attempts they have made on him. I hope it will be acceptable if I thus adapt the theme that has been proposed to me - my 'inner relations as a man and a scientist to Goethe' - or else that you will be kind enough to let me know.

[1930, 4577]

I think that Goethe would not have rejected psycho-analysis in an unfriendly spirit, as so many of our contemporaries have done. He himself approached it at a number of points, recognized much through his own insight that we have since been able to confirm, and some views, which have brought criticism and mockery down upon us, were expounded by him as self-evident. Thus he was familiar with the incomparable strength of the first affective ties of human creatures. He celebrated them in the Dedication to his Faust poem, in words which we could repeat for each of our analyses:

[1930, 4579]
Thus he does not deny that these perennial first inclinations take figures from one's own family circle as their object.
[1930, 4579]

I am prepared for the reproach that we analysts have forfeited the right to place ourselves under the patronage of Goethe because we have offended against the respect due to him by trying to apply analysis to him himself: we have degraded the great man to the position of an object of analytic investigation. But I would dispute at once that any degradation is intended or implied by this.
[1930, 4580]

It is therefore of special interest to us, in the particular instance of the theory of dreams, on the one hand to follow the vicissitudes through which psycho-analysis has passed during this interval, and on the other hand to learn what advances it has made in being understood and appreciated by the contemporary world. I may tell you at once that you will be disappointed in both these directions.
[1933a, 4621]

Let us look through the volumes of the Internationale Zeitschrift für (ärztliche) Psychoanalyse, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my Interpretation of Dreams, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.
[1933a, 4622]
In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients' dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne's thread is the umbilical cord.

[1933a, 4638]

A whole number of occultist assertions have the same sort of effect on us as the jam hypothesis; so that we consider ourselves justified in rejecting them at sight, without further investigation. But all the same, the position is not so simple. A comparison like the one I have chosen proves nothing, or proves as little as comparisons in general. It remains doubtful whether it fits the case, and it is clear that its choice was already determined by our attitude of contemptuous rejection. Prejudices are sometimes expedient and justified; but sometimes they are erroneous and detrimental, and one can never tell when they are the one and when the other. The history of science itself abounds in instances which are a warning against premature condemnation. For a long time it was regarded as a senseless hypothesis to suppose that the stones, which we now call meteorites, could have reached the earth from outer space or that the rocks forming mountains, in which the remains of shells are imbedded, could have once formed the bed of the sea. Incidentally, much the same thing happened to our psycho-analysis when it brought forward its inference of there being an unconscious. Thus we analysts have special reason to be careful in using intellectual considerations for rejecting new hypotheses and must admit that they do not relieve us from feelings of antipathy, doubt and uncertainty.

[1933a, 4645]
LADIES AND GENTLEMEN, - Perhaps you will allow me for once, as a relief from the dry tone of these lectures, to talk to you about some things which have very little theoretical significance but which concern you closely in so far as you are friendly disposed to psycho-analysis. Let us imagine, for instance, that in your leisure hours you take up a German, English or American novel, in which you expect to find an account of contemporary people and society. After a few pages you come upon a first comment on psycho-analysis and soon afterwards upon others, even though the context does not seem to call for them. You must not imagine that it is a question of applying depth-psychology to a better understanding of the characters in the book or of their actions - though, incidentally, there are other and more serious works in which an attempt of that kind is in fact made. No, these are for the most part facetious remarks intended by the author to display his wide reading and intellectual superiority. Nor will you always form an impression that he really knows what he is talking about. Again, you may go as a recreation to a social gathering - and this need not necessarily happen in Vienna. After a short time the conversation turns upon psycho-analysis and you will hear the greatest variety of people passing their judgement on it, mostly in voices of unwavering certainty. It is quite usual for the judgement to be contemptuous or often slanderous or at least, once again, facetious. If you are so imprudent as to betray the fact that you know something about the subject, they fall upon you with one accord, ask for information and explanations and soon convince you that all these severe judgements had been arrived at without any basis of knowledge, that scarcely any of these critics had ever opened an analytic book or, if they had, had gone beyond the first resistance aroused by their contact with this new material.

[1933a, 4738]

You may perhaps expect an introduction to psycho-analysis to give you instructions, too, on what arguments you should use to correct these obvious errors about analysis, what books you should recommend to give more accurate information, or even what examples you should bring up in the discussion from your reading or experience in order to alter the company's attitude. I must beg you to do none of this. It would be useless. The best plan would be for you to conceal your superior knowledge altogether. If that is no longer possible, limit yourself to saying that, so far as you can make out, psycho-analysis is a special branch of knowledge, very hard to understand and to form an opinion on, which is concerned with very serious things, so that a few jokes will not bring one to close quarters with it - and that it would be better to find some other plaything for social entertainment. Nor, of course, will you join in attempts at interpretation, if unwary people repeat their dreams; and you will resist the temptation to curry favour for analysis by retailing reports of its cures.

[1933a, 4739]
But you may raise the question of why these people - both the ones who write books and the conversationalists - behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psycho-analysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement - the judgement, namely, that was formed upon the young psycho-analysis by the representatives of official science. I once complained of this in a historical account I wrote, and I shall not do so again - perhaps that once was too often - but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psycho-analysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob. You may not realize clearly, perhaps, how far upwards in our society mob-characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that it was equally senseless to lament and to invoke the help of kindlier spirits, for there were not courts to which such appeals could be made. So I took another road. I made a first application of psycho-analysis by explaining to myself that this behaviour of the crowd was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This procedure was the right one. The interdict which lay upon psycho-analysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psycho-analysis by scientific circles persists to-day in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.

[1933a, 4739]
But you must not expect to hear the glad tidings that the struggle about analysis is over and has ended in its recognition as a science and its admission as a subject for instruction at universities. There is no question of that. The struggle continues, though in more polite forms. What is also new is that a sort of buffer-layer has formed in scientific society between analysis and its opponents. This consists of people who allow the validity of some portions of analysis and admit as much, subject to the most entertaining qualifications, but who on the other hand reject other portions of it, a fact which they cannot proclaim too loudly. It is not easy to divine what determines their choice in this. It seems to depend on personal sympathies. One person will take objection to sexuality, another to the unconscious; what seems particularly unpopular is the fact of symbolism. Though the structure of psycho-analysis is unfinished, it nevertheless presents, even to-day, a unity from which elements cannot be broken off at the caprice of whoever comes along; but these eclectics seem to disregard this. I have never had the impression that these half- or quarter-adherents based their rejection on an examination of the facts. Some distinguished men, too, are included in this category. They, to be sure, are excused by the fact that their time and their interest belong to other things - to those things, namely, in mastering which they have achieved so much. But in that case would they not do better to suspend their judgement instead of taking sides so decisively? With one of these great men I once succeeded in effecting a rapid conversion. He was a world-famous critic, who had followed the spiritual currents of the time with benevolent understanding and prophetic penetration. I only came to know him when he was past his eightieth year; but he was still enchanting in his talk. You will easily guess whom I mean. Nor was it I who introduced the subject of psycho-analysis. It was he who did so, by comparing himself with me in the most modest fashion. 'I am only a literary man,' he said, 'but you are a natural scientist and discoverer. However, there is one thing I must say to you: I have never had sexual feelings towards my mother.' 'But there is no need at all for you to have known them,' was my reply; 'to grown-up people those are unconscious feelings.' 'Oh! so that's what you think!' he said with relief, and pressed my hand. We went on talking together on the best of terms for another few hours. I heard later that in the few remaining years of his life he often spoke of analysis in a friendly way and was pleased at being able to use a word that was new to him - 'repression'.

There is a common saying that we should learn from our enemies. I confess I have never succeeded in doing so; but I thought all the same that it might be instructive for you if I undertook a review of all the reproaches and objections which the opponents of psycho-analysis have raised against it, and if I went on to point out the injustices and offences against logic which could so easily be revealed in them. But 'on second thoughts' I told myself that it would not be at all interesting but would become tedious and distressing and would be precisely what I have been so carefully avoiding all these years. So you must forgive me if I pursue this path no further and if I spare you the judgements of our so-called scientific opponents. After all it is nearly always a question of people whose one qualification is the impartiality which they have preserved by keeping at a distance from the experiences of psycho-analysis. But I know there are other cases in which you will not let me off so lightly. 'Nevertheless', you will tell me, 'there are such a number of people to whom your last remark does not apply. They have not evaded analytic experience, they have analysed patients and have perhaps been analysed themselves; for a time they have even been your collaborators. Yet they have arrived at other views and theories on the basis of which they have seceded from you and founded independent schools of psycho-analysis. You ought to throw some light for us on the possibility and significance of these secessionist movements which have been so frequent in the history of analysis.'
For, whether a man is a homosexual or a necrophilic, a hysterical suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psycho-analysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in Wallenstein:

Criticism from specialist circles, which is so relentless against psycho-analysis, has in general handled Individual Psychology with kid gloves. It is true that in America one of the most highly respected psychiatrists published a paper against Adler under the title 'Enough', in which he gave energetic expression to his boredom at the 'compulsion to repeat' of Individual Psychology. If others have treated it far more amiably, no doubt their antagonism to analysis has had much to do with it.
I need not say much about other schools which have branched off from our psycho-analysis. The fact that they have done so cannot be used either for or against the validity of psycho-analytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'. When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways - especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst attaches little value to the influence of the patient's personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premisses. It is an almost universal characteristic of these 'secessionist movements' that each of them takes hold of one fragment out of the wealth of themes in psycho-analysis and makes itself independent on the basis of this seizure - selecting the instinct for mastery, for instance, or ethical conflict, or the mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous to-day in the history of psycho-analysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psycho-analysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psycho-analysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down - the odium of infantile sexuality, perhaps, or the absurdity of symbolism - and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.

[1933a, 4744]

What further claims do you make in the name of tolerance? That when someone has uttered an opinion which we regard as completely false we should say to him: 'Thank you very much for having given voice to this contradiction. You are guarding us against the danger of complacency and are giving us an opportunity of showing the Americans that we are really as "broad-minded" as they always wish. To be sure, we do not believe a word of what you are saying, but that makes no difference. Probably you are just as right as we are. After all, who can possibly know who is right? In spite of our antagonism, pray allow us to represent your point of view in our publications. We hope that you will be kind enough in exchange to find a place for our views which you deny.' In the future, when the misuse of Einstein's relativity has been entirely achieved, this will obviously become the regular custom in scientific affairs. For the moment, it is true, we have not gone quite so far. We restrict ourselves, in the old fashion, to putting forward only our own convictions, we expose ourselves to the risk of error because it cannot be guarded against, and we reject what is in contradiction to us. We have made plentiful use in psycho-analysis of the right to change our opinions if we think we have found something better.

[1933a, 4745]
One of the first applications of psycho-analysis was to teach us to understand the opposition offered to us by our contemporaries because we practised psycho-analysis. Other applications, of an objective nature, may claim a more general interest. Our first purpose, of course, was to understand the disorders of the human mind, because a remarkable experience had shown that here understanding and cure almost coincide, that a traversable road leads from the one to the other. And for a long time it was our only purpose. Then, however, we perceived the close relations, the internal identity indeed, between pathological processes and what are known as normal ones. Psycho-analysis became a depth-psychology; and, since nothing that men make or do is understandable without the co-operation of psychology, the applications of psycho-analysis to numerous fields of knowledge, in particular to those of the mental sciences, came about of their own accord, pushed their way to the front and called for ventilation. These tasks unluckily came up against obstacles which, rooted as they were in the circumstances, have not yet been overcome even to-day. An application of this kind presupposes specialized knowledge which an analyst does not possess, while those who possess it, the specialists, know nothing of analysis and perhaps want to know nothing. The result has been that analysts, as amateurs with an equipment of greater or less adequacy, often hastily scraped together, have made excursions into such fields of knowledge as mythology, the history of civilization, ethnology, the science of religion and so on. They were no better treated by the experts resident in those fields than are trespassers in general: their methods and their findings, in so far as they attracted attention, were in the first instance rejected. But these conditions are constantly improving, and in every region there is a growing number of people who study psycho-analysis in order to make use of it in their special subject, and in order, as colonists, to replace the pioneers. Here we may expect a rich harvest of new discoveries. Applications of analysis are always confirmations of it as well. There, too, where scientific work is further removed from practical activity, the inevitable differences of opinion will no doubt take a less embittered form.

[1933a, 4745]

We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no super-ego, the method of free association does not carry far with him, transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis - and even the analysis itself - is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child-analysis. It has automatically happened that child-analysis has become the domain of women analysts, and no doubt this will remain true.

[1933a, 4748]
The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice.

[1933a, 4749]
Parallel with the efforts of analysts to influence education, other investigations are being made into the origin and prevention of delinquency and crime. Here again I am only opening the door for you and showing you the rooms that lie beyond it, without leading you inside. I am certain that if you remain loyal to your interest in psycho-analysis you will be able to learn much that is new and valuable on these subjects. I must not, however, leave the topic of education without referring to one particular aspect of it. It has been said - and no doubt justly - that every education has a partisan aim, that it endeavours to bring the child into line with the established order of society, without considering how valuable or how stable that order may be in itself. If one is convinced of the defects in our present social arrangements, education with a psycho-analytic alignment cannot justifiably be put at their service as well: it must be given another and higher aim, liberated from the prevailing demands of society. In my opinion, however, this argument is out of place here. Such a demand goes beyond the legitimate function of analysis. In the same way, it is not the business of a doctor who is called in to treat a case of pneumonia to concern himself with whether the patient is an honest man or a suicide or a criminal, whether he deserves to remain alive or whether one ought to wish him to. This other aim which it is desired to give to education will also be a partisan one, and it is not the affair of an analyst to decide between the parties. I am leaving entirely on one side the fact that psycho-analysis would be refused any influence on education if it admitted to intentions inconsistent with the established social order. Psycho-analytic education will be taking an uninvited responsibility on itself if it proposes to mould its pupils into rebels. It will have played its part if it sends them away as healthy and efficient as possible. It itself contains enough revolutionary factors to ensure that no one educated by it will in later life take the side of reaction and suppression. It is even my opinion that revolutionary children are not desirable from any point of view.

[1933a, 4750]
You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: ‘That's all very nice and clever; but show me a case that you have cured by analysis.’ This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninstructive; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

[1933a, 4751]
Overwhelmed by meeting with such wisdom, I began to read all his works - his books on Voltaire, on Religion, on War, on the Universal Provision of Subsistence, etc. - till there was built up clearly before my eyes a picture of this simple-minded, great man, who was a thinker and a critic and at the same time a kindly humanitarian and reformer. I reflected much over the rights of the individual which he advocated and to which I should gladly have added my support had I not been restrained by the thought that neither the processes of Nature nor the aims of human society quite justified such claims. A special feeling of sympathy drew me to him, since he too had clearly had painful experience of the bitterness of the life of a Jew and of the hollowness of the ideals of present-day civilization. Yet I never saw him in the flesh. He knew of me through common acquaintances, and I once had occasion to answer a letter from him in which he asked for some piece of information. But I never sought him out. My innovations in psychology had estranged me from my contemporaries, and especially from the older among them: often enough when I approached some man whom I had honoured from a distance, I found myself repelled, as it were, by his lack of understanding for what had become my whole life to me. And after all Josef Popper had been a physicist: he had been a friend of Ernst Mach. I was anxious that the happy impression of our agreement upon the problem of dream-distortion should not be spoilt. So it came about that I put off calling upon him till it was too late and I could now only salute his bust in the gardens in front of our Rathaus.

[1932c, 4811]

After reading your letter I felt a wave of the deepest sympathy, but it was soon halted by two reflections - an internal difficulty and an external obstacle. A sentence from your own preface offers me an apt expression of the former: ‘No doubt, however, there are people who have so poor an opinion of the civilized humanity of to-day that they deny the existence of a world conscience.’ I believe I am one of those people. For instance, I could not subscribe to the assertion that the treatment of convicted prisoners is a disgrace to our civilization. On the contrary, a voice would tell me, it is in perfect harmony with our civilization, a necessary expression of the brutality and lack of understanding which dominate the civilized humanity of the present time. And if by some miracle people suddenly became convinced that the reform of the penal system is the first and most urgent task before our civilization, what else would emerge than that capitalist society has not now the means for meeting the expenditure which that reform would demand? The second, the external, difficulty is brought to light in the passages in your letter in which you exalt me into a recognized intellectual leader and cultural innovator and attribute to me the privilege of having the ear of the civilized world. I only wish, my dear Sir, that it were so: I should not in that case refuse your request. But it seems to me that I am persona ingrata, if not ingratissima, with the German people - and moreover with the learned and the unlearned alike. I hope most positively that you will not think that I feel seriously aggrieved by these signs of disapproval. It is tens of years since I have been so foolish; measured by your example, moreover, it would be too ridiculous. I only mention these trivialities to confirm the fact that I am no desirable advocate for a book which seeks to kindle its readers’ sympathies on behalf of a good cause. Let me add that your book is a moving one, noble, wise and good.

[1931f, 4832]
I do not only think but I know that I shall let myself be deterred by this second obstacle, by the external danger, from publishing the last portion of my study on Moses. I have made yet another attempt to get the difficulty out of the way, by telling myself that my fears are based on an over-estimation of my own personal importance: that it will probably be a matter of complete indifference to the authorities what I choose to write about Moses and the origin of monotheist religions. But I feel uncertain in my judgement of this. It seems to me much more possible that malice and sensationalism will counter-balance any lack of recognition of me in the contemporary world's judgement. So I shall not give this work to the public. But that need not prevent my writing it. Especially as I have written it down already once, two years ago, so that I have only to revise it and attach it to the two essays that have preceded it. It may then be preserved in concealment till some day the time arrives when it may venture without danger into the light, or till someone who has reached the same conclusions and opinions can be told: 'there was someone in darker times who thought the same as you!'

[1939a, 4883]

It is no doubt true that the impact of the threat of castration upon a boy's budding sexual life does not always have these dreaded consequences. It will depend once again on quantitative relations how much damage is done and how much avoided. The whole occurrence, which may probably be regarded as the central experience of the years of childhood, the greatest problem of early life and the strongest source of later inadequacy, is so completely forgotten that its reconstruction during the work of analysis is met in adults by the most decided disbelief. Indeed, aversion to it is so great that people try to silence any mention of the proscribed subject and the most obvious reminders of it are overlooked by a strange intellectual blindness. One may hear it objected, for instance, that the legend of King Oedipus has in fact no connection with the construction made by analysis: the cases are quite different, since Oedipus did not know that it was his father that he killed and his mother that he married. What is overlooked in this is that a distortion of this kind is inevitable if an attempt is made at a poetic handling of the material, and that there is no introduction of extraneous material but only a skilful employment of the factors presented by the theme. The ignorance of Oedipus is a legitimate representation of the unconscious state into which, for adults, the whole experience has fallen; and the coercive power of the oracle, which makes or should make the hero innocent, is a recognition of the inevitability of the fate which has condemned every son to live through the Oedipus complex. Again it was pointed out from psycho-analytic quarters how easily the riddle of another dramatic hero, Shakespeare's procrastinator, Hamlet, can be solved by reference to the Oedipus complex, since the prince came to grief over the task of punishing someone else for what coincided with the substance of his own Oedipus wish - whereupon the general lack of understanding on the part of the literary world showed how ready is the mass of mankind to hold fast to its infantile repressions.

[1940a [1938], 4999]

In what follows I shall not rely exclusively upon either of the two methods of presentation: I shall make use now of one and now of the other. I am under no delusion about the difficulty of my task. Psycho-analysis has little prospect of becoming liked or popular. It is not merely that much of what it has to say offends people's feelings. Almost as much difficulty is created by the fact that our science involves a number of hypotheses - it is hard to say whether they should be regarded as postulates or as products of our researches - which are bound to seem very strange to ordinary modes of thought and which fundamentally contradict current views. But there is no help for it. We must begin our brief study with two of these hazardous hypotheses.

[1940b [1938], 5067]
Anyone whom these warnings do not deter from taking the ego's counterfeits as sterling coin will have an easy time of it and will avoid all the resistances which oppose the psycho-analytic emphasis upon the unconscious, sexuality and the passivity of the ego. He will be able to declare like Alfred Adler that the 'neurotic character' is the cause of neuroses instead of their consequence; but neither will he be in a position to explain a single detail of symptom-formation or of a single dream.

[1916-1917, 3433]

In any case it may be maintained that analysis of children's neuroses can claim to possess a specially high theoretical interest. They afford us, roughly speaking, as much help towards a proper understanding of the neuroses of adults as do children's dreams in respect to the dreams of adults. Not, indeed, that they are more perspicuous or poorer in elements; in fact, the difficulty of feeling one's way into the mental life of a child makes them set the physician a particularly difficult task. But nevertheless, so many of the later deposits are wanting in them that the essence of the neurosis springs to the eyes with unmistakable distinctness. In the present phase of the battle which is raging round psycho-analysis the resistance to its findings has, as we know, taken on a new form. People were content formerly to dispute the reality of the facts which are asserted by analysis; and for this purpose the best technique seemed to be to avoid examining them. That procedure appears to be slowly exhausting itself; and people are now adopting another plan of recognizing the facts, but of eliminating, by means of twisted interpretations, the consequences that follow from them, so that the critics can still ward off the objectionable novelties as efficiently as ever. The study of children's neuroses exposes the complete inadequacy of these shallow or high-handed attempts at re-interpretation. It shows the predominant part that is played in the formation of neuroses by those libidinal motive forces which are so eagerly disavowed, and reveals the absence of any aspirations towards remote cultural aims, of which the child still knows nothing, and which cannot therefore be of any significance for him.

[1918b, 3505]

There is, however, no need to consider that these approaches to psycho-analysis imply any reconciliation or any appeasement of opposition. Suppose someone has hitherto rejected the whole of a complex of interdependent propositions, but now suddenly finds himself in a position to convince himself of the truth of one portion of the whole. It might be thought that he will begin to hesitate about his opposition in general and permit himself some degree of deferent expectation that the other portion, about which he has had no personal experience and can consequently form no judgement of his own, may also turn out to be true. This other portion of psycho-analytic theory, with which the study of the war neuroses did not come into contact, is to the effect that the motive forces which are expressed in the formation of symptoms are sexual and that neuroses arise from a conflict between the ego and the sexual instincts which it repudiates. ('Sexuality' in this context is to be understood in the extended sense in which it is used in psycho-analysis and is not to be confused with the narrower concept of 'genitality'.) Now it is quite true, as Ernest Jones remarks in his contribution to this volume, that this portion of the theory has not yet been proved to apply to the war neuroses. The work that might prove it has not yet been taken in hand. It may be that the war neuroses are altogether unsuitable material for the purpose. But the opponents of psycho-analysis, whose dislike of sexuality is evidently stronger than their logic, have been in a hurry to proclaim that the investigation of the war neuroses has finally disproved this portion of psycho-analytic theory. They have been guilty here of a slight confusion. If the investigation of the war neuroses (and a very superficial one at that) has not shown that the sexual theory of the neuroses is correct, that is something very different from its showing that that theory is incorrect. With the help of an impartial attitude and a little good will, it should not be hard to find the way to a further clarification of the subject.

[1919d, 3666]
The Aetiological Significance of Sexual Life. - The second novelty which emerged after the hypnotic technique had been replaced by free associations was of a clinical nature. It was discovered in the course of the prolonged search for the traumatic experiences from which hysterical symptoms appeared to be derived. The more carefully the search was pursued the more extensive seemed to be the network of aetologically significant impressions involved, but the further back, too, did they reach into the patient's puberty or childhood. At the same time they assumed a uniform character and eventually it became inevitable to bow before the evidence and recognize that at the root of the formation of every symptom there were to be found traumatic experiences from early sexual life. Thus a sexual trauma stepped into the place of an ordinary trauma and the latter was seen to owe its aetiological significance to an associative or symbolic connection with the former, which had preceded it. An investigation of cases of common nervousness (falling into the two classes of neurasthenia and anxiety neurosis) which was simultaneously undertaken led to the conclusion that these disorders could be traced to contemporary abuses in the patients' sexual life and could be removed if these were brought to an end. It was thus easy to infer that neuroses in general are an expression of disturbances in sexual life, the so-called actual-neuroses being the consequences (by chemical agency) of contemporary injuries and the psycho-neuroses the consequences (by psychical modification) of bygone injuries to a biological function which had hitherto been gravely neglected by science. None of the theses of psycho-analysis has met with such tenacious scepticism or such embittered resistance as this assertion of the preponderating aetiological significance of sexual life in the neuroses. It should, however, be expressly remarked that, in its development up to the present day, psycho-analysis has found no reason to retreat from this opinion.

[Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1923a, 3920]
The World War, which broke up so many other organizations, could do nothing against our 'International'. The first meeting after the war took place in 1920, at The Hague, on neutral ground. It was moving to see how hospitably the Dutch welcomed the starving and impoverished subjects of the Central European states; and I believe this was the first occasion in a ruined world on which Englishmen and Germans sat at the same table for the friendly discussion of scientific interests. Both in Germany and in the countries of Western Europe the war had actually stimulated interest in psycho-analysis. The observation of war neuroses had at last opened the eyes of the medical profession to the importance of psychogenesis in neurotic disturbances, and some of our psychological conceptions, such as the 'gain from illness' and the 'flight into illness', quickly became popular. The last Congress before the German collapse, which was held at Budapest in 1918, was attended by official representatives of the allied governments of the Central European powers, and they agreed to the establishment of psycho-analytic Centres for the treatment of war neuroses. But this point was never reached. Similarly too the comprehensive plans made by one of our leading members, Dr. Anton von Freund, for establishing in Budapest a centre for analytic study and treatment came to grief as a result of the political upheavals that followed soon afterwards and of the premature death of their irreplaceable author. At a later date some of his ideas were put into execution by Max Eitingon, who in 1920 founded a psycho-analytical clinic in Berlin. During the brief period of Bolshevik rule in Hungary, Ferenczi was still able to carry on a successful course of instruction as the official representative of psycho-analysis at the University of Budapest. After the war our opponents were pleased to announce that events had produced a conclusive argument against the validity of the theses of analysis. The war neuroses, they said, had proved that sexual factors were unnecessary to the aetiology of neurotic disorders. But their triumph was frivolous and premature. For on the one hand no one had been able to carry out a thorough analysis of a case of war neurosis, so that in fact nothing whatever was known for certain as to their motivation and no conclusions could be drawn from this uncertainty; while on the other hand psycho-analysis had long before arrived at the concept of narcissism and of narcissistic neuroses, in which the subject's libido is attached to his own ego instead of to an object. Though on other occasions, therefore, the charge was brought against psycho-analysis of having made an unjustifiable extension of the concept of sexuality, yet, when it became convenient for controversial ends, this crime was forgotten and we were once more held down to the narrowest meaning of the word.

[1925d, 4229]
The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the psychoses is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoic modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in dementias by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psycho-analysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.
[1925d, 4235]
If anxiety is a reaction of the ego to danger, we shall be tempted to regard the traumatic neuroses, which so often follow upon a narrow escape from death, as a direct result of a fear of death (or fear for life) and to dismiss from our minds the question of castration and the dependent relationships of the ego. Most of those who observed the traumatic neuroses that occurred during the last war took this line, and triumphantly announced that proof was now forthcoming that a threat to the instinct of self-preservation could by itself produce a neurosis without any admixture of sexual factors and without requiring any of the complicated hypotheses of psycho-analysis. It is in fact greatly to be regretted that not a single analysis of a traumatic neurosis of any value is extant. And it is to be regretted, not because such an analysis would contradict the aetiological importance of sexuality - for any such contradiction has long since been disposed of by the introduction of the concept of narcissism, which brings the libidinal cathexis of the ego into line with the cathexes of objects and emphasizes the libidinal character of the instinct of self-preservation - but because, in the absence of any analyses of this kind, we have lost a most precious opportunity of drawing decisive conclusions about the relations between anxiety and the formation of symptoms. In view of all that we know about the structure of the comparatively simple neuroses of everyday life, it would seem highly improbable that a neurosis could come into being merely because of the objective presence of danger, without any participation of the deeper levels of the mental apparatus. But the unconscious seems to contain nothing that could give any content to our concept of the annihilation of life. Castration can be pictured on the basis of the daily experience of the faeces being separated from the body or on the basis of losing the mother's breast at weaning. But nothing resembling death can ever have been experienced; or if it has, as in fainting, it has left no observable traces behind. I am therefore inclined to adhere to the view that the fear of death should be regarded as analogous to the fear of castration and that the situation to which the ego is reacting is one of being abandoned by the protecting super-ego - the powers of destiny - so that it has no longer any safeguard against all the dangers that surround it. In addition, it must be remembered that in the experiences which lead to a traumatic neurosis the protective shield against external stimuli is broken through and excessive amounts of excitation impinge upon the mental apparatus; so that we have here a second possibility - that anxiety is not only being signalled as an affect but is also being freshly created out of the economic conditions of the situation.

[1926d, 4286]

I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

[1926e, 4350]
I confess, moreover, that the dislike that you yourself have betrayed of assigning to the factor of sexuality so great a part in the causation of neurosis - I confess that this scarcely seems to me consistent with your task as an Impartial Person. Are you not afraid that this antipathy may interfere with your passing a just judgement?

[1926e, 4351]

Because that someone else would not have thought any differently from you. But if he had been prepared from the first to recognize the importance of sexual life, everyone would have exclaimed: 'Why, that is no Impartial Person, he is one of your supporters!' No, I am far from abandoning the expectation of being able to influence your opinions. I must admit, however, that from my point of view this situation is different from the one we dealt with earlier. As regards our psychological discussions it is a matter of indifference to me whether you believe me or not, provided only that you get an impression that what we are concerned with are purely psychological problems. But here, as regards the question of sexuality, I should nevertheless be glad if you were accessible to the realization that your strongest motive for contradiction is precisely the ingrained hostility which you share with so many other people.

[1926e, 4351]

The reasons for this hostility were to be found, from the medical point of view, in the fact that psycho-analysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psycho-analysis. In spite of this widespread opposition, however, the movement in favour of psycho-analysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psycho-analysis to non-medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

[1926f, 4407]
But you must not expect to hear the glad tidings that the struggle about analysis is over and has ended in its recognition as a science and its admission as a subject for instruction at universities. There is no question of that. The struggle continues, though in more polite forms. What is also new is that a sort of buffer-layer has formed in scientific society between analysis and its opponents. This consists of people who allow the validity of some portions of analysis and admit as much, subject to the most entertaining qualifications, but who on the other hand reject other portions of it, a fact which they cannot proclaim too loudly. It is not easy to divine what determines their choice in this. It seems to depend on personal sympathies. One person will take objection to sexuality, another to the unconscious; what seems particularly unpopular is the fact of symbolism. Though the structure of psycho-analysis is unfinished, it nevertheless presents, even to-day, a unity from which elements cannot be broken off at the caprice of whoever comes along; but these eclectics seem to disregard this. I have never had the impression that these half- or quarter-adherents based their rejection on an examination of the facts. Some distinguished men, too, are included in this category. They, to be sure, are excused by the fact that their time and their interest belong to other things - to those things, namely, in mastering which they have achieved so much. But in that case would they not do better to suspend their judgement instead of taking sides so decisively? With one of these great men I once succeeded in effecting a rapid conversion. He was a world-famous critic, who had followed the spiritual currents of the time with benevolent understanding and prophetic penetration. I only came to know him when he was past his eightieth year; but he was still enchanting in his talk. You will easily guess whom I mean. Nor was it I who introduced the subject of psycho-analysis. It was he who did so, by comparing himself with me in the most modest fashion. 'I am only a literary man,' he said, 'but you are a natural scientist and discoverer. However, there is one thing I must say to you: I have never had sexual feelings towards my mother.' 'But there is no need at all for you to have known them,' was my reply; 'to grown-up people those are unconscious feelings.' 'Oh! so that's what you think!' he said with relief, and pressed my hand. We went on talking together on the best of terms for another few hours. I heard later that in the few remaining years of his life he often spoke of analysis in a friendly way and was pleased at being able to use a word that was new to him - 'repression'.
[1933a, 4740]
For, whether a man is a homosexual or a necrophilic, a hysteric suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top' to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologist': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psychoanalysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid of a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in Wallenstein: [1933a, 4743]
The first of these unpopular assertions made by psycho-analysis declares that mental processes are in themselves unconscious and that of all mental life it is only certain individual acts and portions that are conscious. You know that on the contrary we are in the habit of identifying what is psychical with what is conscious. We look upon consciousness as nothing more nor less than the defining characteristic of the psychical, and psychology as the study of the contents of consciousness. Indeed it seems to us so much a matter of course to equate them in this way that any contradiction of the idea strikes us as obvious nonsense. Yet psycho-analysis cannot avoid raising this contradiction; it cannot accept the identity of the conscious and the mental. It defines what is mental as processes such as feeling, thinking and willing, and it is obliged to maintain that there is unconscious thinking and unapprehended willing. In saying this it has from the start frivolously forfeited the sympathy of every friend of sober scientific thought, and laid itself open to the suspicion of being a fantastic esoteric doctrine eager to make mysteries and fish in troubled waters. But you, Ladies and Gentlemen, naturally cannot understand as yet what right I have to describe as a prejudice a statement of so abstract a nature as 'what is mental is conscious'. Nor can you guess what development can have led to a denial of the unconscious - should such a thing exist - and what advantage there may have been in that denial. The question whether we are to make the psychical coincide with the conscious or make it extend further sounds like an empty dispute about words; yet I can assure you that the hypothesis of there being unconscious mental processes paves the way to a decisive new orientation in the world and in science.

[1916-1917, 3134]

Anyone whom these warnings do not deter from taking the ego's counterfeits as sterling coin will have an easy time of it and will avoid all the resistances which oppose the psycho-analytic emphasis upon the unconscious, sexuality and the passivity of the ego. He will be able to declare like Alfred Adler that the 'neurotic character' is the cause of neuroses instead of their consequence; but neither will he be in a position to explain a single detail of symptom-formation or a single dream.

[1916-1917, 3433]

It is thus that psycho-analysis has sought to educate the ego. But these two discoveries - that the life of our sexual instincts cannot be wholly tamed, and that mental processes are in themselves unconscious and only reach the ego and come under its control through incomplete and untrustworthy perceptions - these two discoveries amount to a statement that the ego is not master in its own house. Together they represent the third blow to man's self-love, what I may call the psychological one. No wonder, then, that the ego does not look favourably upon psycho-analysis and obstinately refuses to believe in it.

[1917a, 3614]

Probably very few people can have realized the momentous significance for science and life of the recognition of unconscious mental processes. It was not psycho-analysis, however, let us hasten to add, which first took this step. There are famous philosophers who may be cited as forerunners - above all the great thinker Schopenhauer, whose unconscious 'Will' is equivalent to the mental instincts of psycho-analysis. It was this same thinker, moreover, who in words of unforgettable impressiveness admonished mankind of the importance, still so greatly underestimated by it, of its sexual craving. Psycho-analysis has this advantage only, that it has not affirmed these two propositions which are so distressing to narcissism - the psychical importance of sexuality and the unconsciousness of mental life - on an abstract basis, but has demonstrated them in matters that touch every individual personally and force him to take up some attitude towards these problems. It is just for this reason, however, that it brings on itself the aversion and resistances which still hold back in awe before the great name of the philosopher.

[1917a, 3615]
If I could suppose that everyone interested in psychology would read this book, I should also
be prepared to find that at this point some of my readers would already stop short and would go
no further; for here we have the first shibboleth of psycho-analysis. To most people who have
been educated in philosophy the idea of anything psychical which is not also conscious is so
inconceivable that it seems to them absurd and refutable simply by logic. I believe this is only
because they have never studied the relevant phenomena of hypnosis and dreams, which -
quite apart from pathological manifestations - necessitate this view. Their psychology of
consciousness is incapable of solving the problems of dreams and hypnosis.
[1923b, 3947]

Thus we obtain our concept of the unconscious from the theory of repression. The repressed
is the prototype of the unconscious for us. We see, however, that we have two kinds of
unconscious - the one which is latent but capable of becoming conscious, and the one which is
repressed and which is not, in itself and without more ado, capable of becoming conscious. This
piece of insight into psychical dynamics cannot fail to affect terminology and description. The
latent, which is unconscious only descriptively, not in the dynamic sense, we call preconscious;
we restrict the term unconscious to the dynamically unconscious repressed; so that now we
have three terms, conscious (Cs.), preconscious (Pcs.), and unconscious (Ucs.), whose sense
is no longer purely descriptive. The Pcs. is presumably a great deal closer to the Cs. than is the
Ucs., and since we have called the Ucs. psychical we shall with even less hesitation call the
latent Pcs. psychical. But why do we not rather, instead of this, remain in agreement with the
philosophers and, in a consistent way, distinguish the Pcs. as well as the Ucs. from the
conscious psychical? The philosophers would then propose that the Pcs. and the Ucs. should
be described as two species or stages of the 'psychoid', and harmony would be established. But
endless difficulties in exposition would follow; and the one important fact, that these two kinds of
'psychoid' coincide in almost every other respect with what is admittedly psychical, would be
forced into the background in the interests of a prejudice dating from a period in which these
psychoids, or the most important part of them, were still unknown.
[1923b, 3949]

¹ This may be compared so far with my 'Note on the Unconscious in Psycho-Analysis' (1912g). A new
turn taken by criticisms of the unconscious deserves consideration at this point. Some investigators, who
do not refuse to recognize the facts of psycho-analysis but who are unwilling to accept the unconscious,
find a way out of the difficulty in the fact, which no one contests, that in consciousness (regarded as a
phenomenon) it is possible to distinguish a great variety of gradations in intensity or clarity. Just as there
are processes which are very vividly, glaringly, and tangibly conscious, so we also experience others
which are only faintly, hardly even noticeably conscious; those that are most faintly conscious are, it is
argued, the ones to which psycho-analysis wishes to apply the unsuitable name 'unconscious'. These too,
however (the argument proceeds), are conscious or 'in consciousness', and can be made fully and
intensely conscious if sufficient attention is paid to them.
[1923b, 3950]
In so far as it is possible to influence by arguments the decision of a question of this kind which depends either on convention or on emotional factors, we may make the following comments. The reference to gradations of clarity in consciousness is in no way conclusive and has no more evidential value than such analogous statements as: 'There are so very many gradations in illumination - from the most glaring and dazzling light to the dimmest glimmer - therefore there is no such thing as darkness at all'; or, 'There are varying degrees of vitality, therefore there is no such thing as death.' Such statements may in a certain way have a meaning, but for practical purposes they are worthless. This will be seen if one tries to draw particular conclusions from them, such as, 'there is therefore no need to strike a light', or, 'therefore all organisms are immortal'. Further, to include 'what is unnoticeable' under the concept of 'what is conscious' is simply to play havoc with the one and only piece of direct and certain knowledge that we have about the mind. And after all, a consciousness of which one knows nothing seems to me a good deal more absurd than something mental that is unconscious. Finally, this attempt to equate what is unnoticed with what is unconscious is obviously made without taking into account the dynamic conditions involved, which were the decisive factors in forming the psycho-analytic view. For it ignores two facts: first, that it is exceedingly difficult and requires very great effort to concentrate enough attention on something unnoticed of this kind; and secondly, that when this has been achieved the thought which was previously unnoticed is not recognized by consciousness, but often seems entirely alien and opposed to it and is promptly disavowed by it. Thus, seeking refuge from the unconscious in what is scarcely noticed or unnoticed is after all only a derivative of the preconceived belief which regards the identity of the psychical and the conscious as settled once and for all.

[1923b, 3950]

In the form which it thus assumed, the psycho-analytic theory of the neuroses already contained a number of things which ran counter to accepted opinions and inclinations and which were calculated to provoke astonishment, repugnance and scepticism in outsiders: for instance, the attitude of psycho-analysis to the problem of the unconscious, its recognition of an infantile sexuality and the stress it laid on the sexual factor in mental life generally. But more was to follow.

[1924f, 4108]

The reasons for this hostility were to be found, from the medical point of view, in the fact that psycho-analysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psycho-analysis. In spite of this widespread opposition, however, the movement in favour of psycho-analysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psycho-analysis to non-medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

[1926f, 4407]
But you must not expect to hear the glad tidings that the struggle about analysis is over and has ended in its recognition as a science and its admission as a subject for instruction at universities. There is no question of that. The struggle continues, though in more polite forms. What is also new is that a sort of buffer-layer has formed in scientific society between analysis and its opponents. This consists of people who allow the validity of some portions of analysis and admit as much, subject to the most entertaining qualifications, but who on the other hand reject other portions of it, a fact which they cannot proclaim too loudly. It is not easy to divine what determines their choice in this. It seems to depend on personal sympathies. One person will take objection to sexuality, another to the unconscious; what seems particularly unpopular is the fact of symbolism. Though the structure of psycho-analysis is unfinished, it nevertheless presents, even to-day, a unity from which elements cannot be broken off at the caprice of whoever comes along; but these eclectics seem to disregard this. I have never had the impression that these half- or quarter-adherents based their rejection on an examination of the facts. Some distinguished men, too, are included in this category. They, to be sure, are excused by the fact that their time and their interest belong to other things - to those things, namely, in mastering which they have achieved so much. But in that case would they not do better to suspend their judgement instead of taking sides so decisively? With one of these great men I once succeeded in effecting a rapid conversion. He was a world-famous critic, who had followed the spiritual currents of the time with benevolent understanding and prophetic penetration. I only came to know him when he was past his eightieth year; but he was still enchanting in his talk. You will easily guess whom I mean. Nor was it I who introduced the subject of psycho-analysis. It was he who did so, by comparing himself with me in the most modest fashion. ‘I am only a literary man,’ he said, ‘but you are a natural scientist and discoverer. However, there is one thing I must say to you: I have never had sexual feelings towards my mother.’ ‘But there is no need at all for you to have known them,’ was my reply; ‘to grown-up people those are unconscious feelings.’ ‘Oh! so that’s what you think!’ he said with relief, and pressed my hand. We went on talking together on the best of terms for another few hours. I heard later that in the few remaining years of his life he often spoke of analysis in a friendly way and was pleased at being able to use a word that was new to him - ‘repression’. [1933a, 4740]
For, whether a man is a homosexual or a necrophilic, a hysterical suffering from anxiety, an obsessionnal neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in Wallenstein:

[1933a, 4743]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself. [1930a, 4510]

[1933a, 4707]
I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

If we recognize the case we are discussing as an expression of the destructive or aggressive instinct, the question at once arises whether this view should not be extended to other instances of conflict, and, indeed, whether all that we know about psychical conflict should not be revised from this new angle. After all, we assume that in the course of man's development from a primitive state to a civilized one his aggressiveness undergoes a very considerable degree of internalization or turning inwards; if so, his internal conflicts would certainly be the proper equivalent for the external struggles which have then ceased. I am well aware that the dualistic theory according to which an instinct of death or of destruction or aggression claims equal rights as a partner with Eros as manifested in the libido, has found little sympathy and has not really been accepted even among psycho-analysts. This made me all the more pleased when not long ago I came upon this theory of mine in the writings of one of the great thinkers of ancient Greece. I am very ready to give up the prestige of originality for the sake of such a confirmation, especially as I can never be certain, in view of the wide extent of my reading in early years, whether what I took for a new creation might not be an effect of cryptomnesia.
I am aware that efforts will be made, by the use of arguments with an ethical colouring, to prevent the physician from pursuing the matter further. Anyone who wants to make certain whether or not his patients' neuroses are really connected with their sexual life cannot avoid asking them about their sexual life and insisting upon receiving a true account of it. But in this, it is asserted, lies the danger both for the individual and society. A doctor, I hear it being said, has no right to intrude upon his patients' sexual secrets and grossly injure their modesty (especially with women patients) by an interrogation of this sort. His clumsy hand can only ruin family happiness, offend the innocence of young people and encroach upon the authority of parents; and where adults are concerned he will come to share uncomfortable knowledge and destroy his own relations to his patients. It is therefore his ethical duty, the conclusion is, to keep away from the whole business of sex.

[1897b, 455]

Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psychoanalysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

[1910d, 2311]

Are we, then, to abandon our efforts to explain the hidden meaning of neurosis as being in the last resort dangerous to the individual and harmful to the workings of society? Are we to give up drawing the practical conclusion from a piece of scientific insight? No; I think that in spite of this our duty lies in the other direction. The gain from illness provided by the neuroses is nevertheless on the whole and in the end detrimental to individuals as well as to society. The unhappiness that our work of enlightenment may cause will after all only affect some individuals. The change-over to a more realistic and creditable attitude on the part of society will not be bought too dearly by these sacrifices. But above all, all the energies which are to-day consumed in the production of neurotic symptoms serving the purposes of a world of phantasy isolated from reality, will, even if they cannot at once be put to uses in life, help to strengthen the clamour for the changes in our civilization through which alone we can look for the well-being of future generations.

[1910d, 2314]
Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfill that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.
Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

[1925e, 4128]
When I published the paper I have mentioned, I was under no illusion as to its power to carry conviction. In the first place, I was aware that the account I had given was only a brief and incomplete one and even in places hard to understand - just enough, perhaps, to arouse the reader's expectations. Then, too, I had scarcely brought forward any examples and given no figures. Nor had I touched on the technique of collecting anamneses or done anything to prevent misunderstandings. I had not given consideration to any but the most obvious objections; and, as regards the theory itself, I had laid stress only on its main proposition and not on its qualifications. Accordingly, each reader was in fact at liberty to form his own opinion as to the binding force of the whole hypothesis. I could, moreover, reckon upon another difficulty in the way of its acceptance. I know very well that in putting forward my 'sexual aetiology' of the neuroses, I have brought up nothing new, and that undercurrents in medical literature taking these facts into account have never been absent. I know, too, that official academic medicine has in fact also been aware of them. But it has acted as if it knew nothing about the matter. It has made no use of its knowledge and has drawn no inferences from it. Such behaviour must have a deep-seated cause, originating perhaps in a kind of reluctance to look squarely at sexual matters or in a reaction against older attempts at an explanation, which are regarded as obsolete. At all events, one had to be prepared to meet with resistance in venturing upon an attempt to make something credible to other people which they could without any trouble have discovered for themselves.

From previous experience I can foresee that it is precisely against this assertion or against its universal validity that your contradiction, Gentlemen, will be directed. Perhaps it would be better to say, your inclination to contradict; for none of you, no doubt, have as yet any investigations at your disposal which, based upon the same procedure, might have yielded a different result. As regards the controversial matter itself, I will only remark that the singling out of the sexual factor in the aetiology of hysteria springs at least from no preconceived opinion of my part. The two investigators as whose pupil I began my studies of hysteria, Charcot and Breuer, were far from having any such presupposition; in fact they had a personal disinclination to it which I originally shared. Only the most laborious and detailed investigations have converted me, and that slowly enough, to the view I hold today. If you submit my assertion that the aetiology of hysteria lies in sexual life to the strictest examination, you will find that it is supported by the fact that in some eighteen cases of hysteria I have been able to discover this connection in every single symptom, and, where the circumstances allowed, to confirm it by therapeutic success. No doubt you may raise the objection that the nineteenth or the twentieth analysis will perhaps show that hysterical symptoms are derived from other sources as well, and thus reduce the universal validity of the sexual aetiology to one of eighty percent. By all means let us wait and see; but, since these eighteen cases are at the same time all the cases on which I have been able to carry out the work of analysis and since they were not picked out by anyone for my convenience, you will find it understandable that I do not share such an expectation but am prepared to let my belief run ahead of the evidential force of the observations I have so far made. Besides, I am influenced by another motive as well, which for the moment is of merely subjective value. In the sole attempt to explain the physiological and psychical mechanism of hysteria which I have been able to make in order to correlate my observations, I have come to regard the participation of sexual motive forces as an indispensable premiss.
But other people, too, although they may be less averse to psychological theories of hysteria, will be tempted, when considering our analytic findings, to ask what degree of certainty the application of psycho-analysis offers. Is it not very possible either that the physician forces such scenes upon his docile patients, alleging that they are memories, or else that the patients tell the physician things which they have deliberately invented or have imagined and that he accepts those things as true? Well, my answer to this is that the general doubt about the reliability of the psycho- analytic method can be appraised and removed only when a complete presentation of its technique and results is available. Doubts about the genuineness of the infantile sexual scenes can, however, be deprived of their force here and now by more than one argument. In the first place, the behaviour of patients while they are reproducing these infantile experiences is in every respect incompatible with the assumption that the scenes are anything else than a reality which is being felt with distress and reproduced with the greatest reluctance. Before they come for analysis the patients know nothing about these scenes. They are indignant as a rule if we warn them that such scenes are going to emerge. Only the strongest compulsion of the treatment can induce them to embark on a reproduction of them. While they are recalling these infantile experiences to consciousness, they suffer under the most violent sensations, of which they are ashamed and which they try to conceal; and, even after they have gone through them once more in such a convincing manner, they still attempt to withhold belief from them, by emphasizing the fact that, unlike what happens in the case of other forgotten material, they have no feeling of remembering the scenes.¹

[1896c, 418]

Thus my assumption that after an existence of nearly twenty years this book had accomplished its task has not been confirmed. On the contrary, I might say that it has a new task to perform. If its earlier function was to offer some information on the nature of dreams, now it has the no less important duty of dealing with the obstinate misunderstandings to which that information is subject.
[1900a, 513]

Thus my assumption that after an existence of nearly twenty years this book had accomplished its task has not been confirmed. On the contrary, I might say that it has a new task to perform. If its earlier function was to offer some information on the nature of dreams, now it has the no less important duty of dealing with the obstinate misunderstandings to which that information is subject.
[1900a, 513]
In the course of my psycho-analyses of neurotics I must already have analysed over a thousand dreams; but I do not propose to make use of this material in my present introduction to the technique and theory of dream-interpretation. Apart from the fact that such a course would be open to the objection that these are the dreams of neuropaths, from which no valid inferences could be made as to the dreams of normal people, there is quite another reason which forces this decision upon me. The subject to which these dreams of my patients lead up is always, of course, the case history which underlies their neurosis. Each dream would therefore necessitate a lengthy introduction and an investigation of the nature and aetiological determinants of the psychoneuroses. But these questions are in themselves novelties and highly bewildering and would distract attention from the problem of dreams. On the contrary, it is my intention to make use of my present elucidation of dreams as a preliminary step towards solving the more difficult problems of the psychology of the neuroses. If, however, I forego my principal material, the dreams of my neurotic patients, I must not be too particular about what is left to me. All that remains are such dreams as have been reported to me from time to time by normal persons of my acquaintance, and such others as have been quoted as instances in the literature dealing with dream-life. Unluckily, however, none of these dreams are accompanied by the analysis without which I cannot discover a dream's meaning. My procedure is not so convenient as the popular decoding method which translates any given piece of a dream's content by a fixed key. I, on the contrary, am prepared to find that the same piece of content may conceal a different meaning when it occurs in various people or in various contexts. Thus it comes about that I am led to my own dreams, which offer a copious and convenient material, derived from an approximately normal person and relating to multifarious occasions of daily life. No doubt I shall be met by doubts of the trustworthiness of 'self-analyses' of this kind; and I shall be told that they leave the door open to arbitrary conclusions. In my judgement the situation is in fact more favourable in the case of self-observation than in that of other people; at all events we may make the experiment and see how far self-analysis takes us with the interpretation of dreams. But I have other difficulties to overcome, which lie within myself. There is some natural hesitation about revealing so many intimate facts about one's mental life; nor can there be any guarantee against misinterpretation by strangers. But it must be possible to overcome such hesitations. 'Tout psychologue, écrit Delboeuf, 'est obligé de faire l'aveu même de ses faiblesses s'il croit par là jeter du jour sur quelque problème obscur.'¹ And it is safe to assume that my readers too will very soon find their initial interest in the indiscretions which I am bound to make replaced by an absorbing immersion in the psychological problems upon which they throw light.²

[1900a, 606]

If this sentence is taken in the sense in which it was intended, it merely shows the unconscientious manner in which critics are accustomed to perform their functions, and the readiness with which opponents overlook the clearest statements if they do not give scope to their aggressive inclinations. For only a few pages earlier I had mentioned the variety of the wishes whose fulfilments are to be found in children's dreams (wishes to take part in an excursion or a sail on a lake, or to make up for a missed meal, and so on); and in other passages I had discussed dreams of hunger, dreams stimulated by thirst or by excretory needs, and dreams of mere convenience. Even Rank himself made no absolute assertion. The words he used were 'also as a rule erotic wishes', and what he said can be amply confirmed in the dreams of most adults.

[1900a, 653]
The more one is concerned with the solution of dreams, the more one is driven to recognize that the majority of the dreams of adults deal with sexual material and give expression to erotic wishes. A judgement on this point can be formed only by those who really analyse dreams, that is to say, who make their way through their manifest content to the latent dream-thoughts, and never by those who are satisfied with making a note of the manifest content alone (like Näcke, for instance, in his writings on sexual dreams). Let me say at once that this fact is not in the least surprising but is in complete harmony with the principles of my explanation of dreams. No other instinct has been subjected since childhood to so much suppression as the sexual instinct with its numerous components (cf. my *Three Essays on the Theory of Sexuality*, 1905d); from no other instinct are so many and such powerful unconscious wishes left over, ready to produce dreams in a state of sleep. In interpreting dreams we should never forget the significance of sexual complexes, though we should also, of course, avoid the exaggeration of attributing exclusive importance to them.

[1900a, 853]

We can assert of many dreams, if they are carefully interpreted, that they are bisexual, since they unquestionably admit of an 'over-interpretation' in which the dreamer's homosexual impulses are realized - impulses, that is, which are contrary to his normal sexual activities. To maintain, however, as do Stekel (1911) and Adler (1910, etc.), that *all* dreams are to be interpreted bisexual appears to me to be a generalization which is equally undemonstrable and unplausible and which I am not prepared to support. In particular, I cannot dismiss the obvious fact that there are numerous dreams which satisfy needs other than those which are erotic in the widest sense of the word: dreams of hunger and thirst, dreams of convenience, etc. So, too, such statements as that 'the spectre of death is to be found behind every dream' (Stekel), or that 'every dream shows an advance from the feminine to the masculine line' (Adler), appear to me to go far beyond anything that can be legitimately maintained in dream-interpretation.

[1900a, 853]

The assertion that all dreams require a sexual interpretation, against which critics rage so incessantly, occurs nowhere in my *Interpretation of Dreams*. It is not to be found in any of the numerous editions of this book and is in obvious contradiction to other views expressed in it.

[1900a, 854]
There is, however, another point to which I attach importance; and I must confess that it is solely on its account that I have embarked here upon all these discussions of the two psychical systems and their modes of activity and of repression. It is not now a question of whether I have formed an approximately correct opinion of the psychological factors with which we are concerned, or whether, which is quite possible in such difficult matters, my picture of them is distorted and incomplete. However many changes may be made in our reading of the psychical censorship and of the rational and abnormal revisions made of the dream-content, it remains true that processes of this sort are at work in the formation of dreams and that they show the closest analogy in their essentials to the processes observable in the formation of hysterical symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance of psychical equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made that no conclusions as to the dreams of normal people can be drawn from my dreams or those of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may argue back from the phenomena to their motive forces, we must recognize that the psychical mechanism employed by neuroses is not created by the impact of a pathological disturbance upon the mind but is present already in the normal structure of the mental apparatus. The two psychical systems, the censorship upon the passage from one of them to the other, the inhibition and overlaying of one activity by the other, the relations of both of them to consciousness - or whatever more correct interpretations of the observed facts may take their place - all of these form part of the normal structure of our mental instrument, and dreams show us one of the paths leading to an understanding of its structure. If we restrict ourselves to the minimum of new knowledge which has been established with certainty, we can still say this of dreams: they have proved that what is suppressed continues to exist in normal people as well as abnormal, and remains capable of psychical functioning. Dreams themselves are among the manifestations of this suppressed material; this is so theoretically in every case, and it can be observed empirically in a great number of cases at least, and precisely in cases which exhibit most clearly the striking peculiarities of dream-life. In waking life the suppressed material in the mind is prevented from finding expression and is cut off from internal perception owing to the fact that the contradictions present in it are eliminated - one side being disposed of in favour of the other; but during the night, under the sway of an impetus towards the construction of compromises, this suppressed material finds methods and means of forcing its way into consciousness.

I have several reasons for valuing this brief analysis; and my thanks are due to my former travelling-companion who presented me with it. In the first place, this is because I was in this instance allowed to draw on a source that is ordinarily denied to me. For the examples collected here of disturbances of a psychical function in daily life I have to fall back mainly on self-observation. I am anxious to steer clear of the much richer material provided by my neurotic patients, since it might otherwise be objected that the phenomena in question are merely consequences and manifestations of neurosis. My purpose is therefore particularly well served when a person other than myself, not suffering from nervous illness, offers himself as the object of such an investigation. This analysis is significant in a further respect: it throws light on the case of a word being forgotten without a substitute for it appearing in the memory. It thus confirms my earlier assertion that the appearance or non-appearance in the memory of incorrect substitutes cannot be made the basis for any radical distinction.¹
Some of my medical colleagues have looked upon my theory of hysteria as a purely psychological one, and have for that reason pronounced it *ipso facto* incapable of solving a pathological problem. They may perhaps discover from this paper that their objection was based upon their having unjustifiably transferred what is a characteristic of the technique on to the theory itself. It is the therapeutic technique alone that is purely psychological; the theory does not by any means fail to point out that neuroses have an organic basis - though it is true that it does not look for that basis in any pathological anatomical changes, and provisionally substitutes the conception of organic functions for the chemical changes which we should expect to find but which we are at present unable to apprehend. No one, probably, will be inclined to deny the sexual function the character of an organic factor, and it is the sexual function that I look upon as the foundation of hysteria and of the psychoneuroses in general. No theory of sexual life will, I suspect, be able to avoid assuming the existence of some definite sexual substances having an excitant action. Indeed, of all the clinical pictures which we meet with in clinical medicine, it is the phenomena of intoxication and abstinence in connection with the use of certain chronic poisons that most closely resemble the genuine psychoneuroses.

But, once again, in the present paper I have not gone fully into all that might be said to-day about 'somatic compliance', about the infantile germs of perversion, about the erotogenic zones, and about our predisposition towards bisexuality; I have merely drawn attention to the points at which the analysis comes into contact with these organic bases of the symptoms. More than this could not be done with a single case. And I had the same reasons that I have already mentioned for wishing to avoid a cursory discussion of these factors. There is a rich opportunity here for further works, based upon the study of a large number of analyses.

Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psycho-analytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psycho-analysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psycho-analysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

At the end of the chapter in which I was concerned with discovering the technique of jokes, I remarked (p. 1686 f.) that the processes of condensation, with or without the formation of substitutes, of representation by nonsense and by the opposite, of indirect representation, and so on, which, as we found, play a part in producing jokes, show a very far-reaching agreement with the processes of the ‘dream-work’. I further promised on the one hand that we would study these similarities more closely and on the other hand that we would examine the common element in jokes and dreams which seems to be thus suggested. It would be much easier for me to carry out this comparison if I could assume that one of the two objects of comparison - the ‘dream-work’ - was already familiar to my readers. But it will probably be wiser not to make that assumption. I have an impression that my *Interpretation of Dreams*, published in 1900, provoked more ‘bewilderment’ than ‘enlightenment’ among my fellow-specialists; and I know that wider circles of readers have been content to reduce the contents of the book to a catch-word (‘wish-fulfilment’) which can be easily remembered and conveniently misused.
Perhaps, too, in most people's eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

[1907a, 1843]

That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.

[1908c, 1966]
I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is 'degenerate', from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psycho-analytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations - that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution an especially strong sexual instinct and a tendency to precocity and to a premature expression of that instinct, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis's example, we shall have thought it worth while to collect the childhood memories of healthy adults as well.

[1908c, 1967]

My impression is that the picture of a child's sexual life presented in this observation of little Hans agrees very well with the account I gave of it (basing my views upon psycho-analytic examinations of adults) in my Three Essays. But before going into the details of this agreement I must deal with two objections which will be raised against my making use of the present analysis for this purpose. The first objection is to the effect that Hans was not a normal child, but (as events - the illness itself, in fact - showed) had a predisposition to neurosis, and was a young 'degenerate'; it would be illegitimate, therefore, to apply to other, normal children conclusions which might perhaps be true of him. I shall postpone consideration of this objection, since it only limits the value of the observation, and does not completely nullify it. According to the second and more uncompromising objection, an analysis of a child conducted by his father, who went to work instilled with my theoretical views and infected with my prejudices, must be entirely devoid of any objective worth. A child, it will be said, is necessarily highly suggestible, and in regard to no one, perhaps, more than to his own father; he will allow anything to be forced upon him, out of gratitude to his father for taking so much notice of him; none of his assertions can have any evidential value, and everything he produces in the way of associations, phantasies, and dreams will naturally take the direction into which they are being urged by every possible means. Once more, in short, the whole thing is simply 'suggestion' - the only difference being that in the case of a child it can be unmasked much more easily than in that of an adult.

[1909b, 2087]
And yet, even during the analysis, the small patient gave evidence of enough independence to acquit him upon the charge of 'suggestion'. Like all other children, he applied his childish sexual theories to the material before him without having received any encouragement to do so. These theories are extremely remote from the adult mind. Indeed, in this instance I actually omitted to warn Hans's father that the boy would be bound to approach the subject of childbirth by way of the excretory complex. This negligence on my part, though it led to an obscure phase in the analysis, was nevertheless the means of producing a good piece of evidence of the genuineness and independence of Hans's mental processes. He suddenly became occupied with 'lumf', without his father, who is supposed to have been practising suggestion upon him, having the least idea how he had arrived at that subject or what was going to come of it. Nor can his father be saddled with any responsibility for the production of the two plumber phantasies, which arose out of Hans's early acquired 'castration complex'. And I must here confess that, out of theoretical interest, I entirely concealed from Hans's father my expectation that there would turn out to be some such connection, so as not to interfere with the value of a piece of evidence such as does not often come within one's grasp.

[1909b, 2090]

If I went more deeply into the details of the analysis I could produce plenty more evidence of Hans's independence of 'suggestion'; but I shall break off the discussion of this preliminary objection at this point. I am aware that even with this analysis I shall not succeed in convincing any one who will not let himself be convinced, and I shall proceed with my discussion of the case for the benefit of those readers who are already convinced of the objective reality of unconscious pathogenic material. And I do this with the agreeable assurance that the number of such readers is steadily increasing.

[1909b, 2090]

Psycho-analysis is unjustly reproached, Gentlemen, for leading to purely psychological theories of pathological problems. The emphasis which it lays on the pathogenic role of sexuality, which, after all, is certainly not an exclusively psychical factor should alone protect it from this reproach. Psycho-analysts never forget that the mental is based on the organic, although their work can only carry them as far as this basis and no beyond it. Thus psycho-analysis is ready to admit, and indeed to postulate, that not all disturbances of vision need be psychogenic, like those that are evoked by the repression of erotic scopophilia. If an organ which serves the two sorts of instinct increases its erotogenic role, it is in general to be expected that this will not occur without the excitability and innervation of the organ undergoing changes which will manifest themselves as disturbances of its function in the service of the ego. Indeed, if we find that an organ normally serving the purpose of sense-perception begins to behave like an actual genital when its erotogenic role is increased, we shall not regard it as improbable that toxic changes are also occurring in it. For lack of a better name we must retain the old unsuitable term of 'neurotic' disturbances for both classes of functional disturbances - those of physiological as well as those of toxic origin - which follow from an increase in the erotogenic factor. Generally speaking, the neurotic disturbances of vision stand in the same relation to the psychogenic ones as the 'actual neuroses' do to the psychoneuroses: psychogenic visual disturbances can no doubt hardly ever appear without neurotic ones, but the latter can appear without the former. These neurotic symptoms are unfortunately little appreciated and understood even today; for they are not directly accessible to psycho-analysis, and other methods of research have left the standpoint of sexuality out of account.

[1910i, 2370]
Yet another line of thought extending into organic research branches off from psycho-analysis. We may ask ourselves whether the suppression of sexual component instincts which is brought about by environmental influences is sufficient in itself to call up functional disturbances in organs, or whether special constitutional conditions must be present in order that the organs may be led to an exaggeration of their erotogenic role and consequently provoke repression of the instincts. We should have to see in those conditions the constitutional part of the disposition to fall ill of psychogenic and neurotic disorders. This is the factor to which, as applied to hysteria, I gave the provisional name of 'somatic compliance'.

[1910i, 2371]

There would be nothing more to discuss or worry about in this behaviour of transference, if it were not that two points remain unexplained about it which are of particular interest to psycho-analysis. Firstly, we do not understand why transference is so much more intense with neurotic subjects in analysis than it is with other such people who are not being analysed; and secondly, it remains a puzzle why in analysis transference emerges as the most powerful resistance to the treatment, whereas outside analysis it must be regarded as the vehicle of cure and the condition of success. For our experience has shown us - and the fact can be confirmed as often as we please - that if a patient's free associations fail¹ the stoppage can invariably be removed by an assurance that he is being dominated at the moment by an association which is concerned with the doctor himself or with something connected with him. As soon as this explanation is given, the stoppage is removed, or the situation is changed from one in which the associations fail into one in which they are being kept back. At first sight it appears to be an immense disadvantage in psycho-analysis as a method that what is elsewhere the strongest factor towards success is changed in it into the most powerful medium of resistance. If, however, we examine the situation more closely, we can at least clear away the first of our two problems. It is not a fact that transference emerges with greater intensity and lack of restraint during psycho-analysis than outside it. In institutions in which nerve patients are treated non-analytically, we can observe transference occurring with the greatest intensity and in the most unworthy forms, extending to nothing less than mental bondage, and moreover showing the plainest erotic colouring. Gabriele Reuter, with her sharp powers of observation, described this at a time when there was no such thing as psycho-analysis, in a remarkable book which betrays in every respect the clearest insight into the nature and genesis of neuroses.² These characteristics of transference are therefore to be attributed not to psycho-analysis but to neurosis itself.

[1912b, 2458]

Psycho-analysis points to psychology for the solution of a good half of the problems of psychiatry. It would nevertheless be a serious mistake to suppose that analysis favours or aims at a purely psychological view of mental disorders. It cannot overlook the fact that the other half of the problems of psychiatry are concerned with the influence of organic factors (whether mechanical, toxic or infective) on the mental apparatus. Even in the case of the mildest of these disorders, the neuroses, it makes no claim that their origin is purely psychogenic but traces their aetiology to the influence upon mental life of an unquestionably organic factor to which I shall refer later.

[1913j, 2812]
We have found it necessary to hold aloof from biological considerations during our psychoanalytic work and to refrain from using them for heuristic purposes, so that we may not be misled in our impartial judgement of the psycho-analytic facts before us. But after we have completed our psycho-analytic work we shall have to find a point of contact with biology; and we may rightly feel glad if that contact is already assured at one important point or another. The contrast between the ego instincts and the sexual instinct, to which we have been obliged to trace back the origin of the neuroses, is carried into the sphere of biology in the contrast between the instincts which serve the preservation of the individual and those which serve the survival of the species. In biology we come upon the more comprehensive conception of an immortal germ-plasm to which the different transitory individuals are attached like organs that develop successively. It is only this conception which enables us rightly to understand the part played by the sexual instinctual forces in physiology and psychology.

[1913j, 2818]

In spite of all our efforts to prevent biological terminology and considerations from dominating psycho-analytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'instinct' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' - that is, qualities determined not by the instincts themselves but by their aims. The regular association of these 'active' and 'passive' instincts in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psycho-analysis.

[1913j, 2818]

I shall be satisfied if these few remarks have drawn attention to the many respects in which psycho-analysis acts as an intermediary between biology and psychology.

[1913j, 2818]

In the beginning, my statements about infantile sexuality were founded almost exclusively on the findings of analysis in adults which led back into the past. I had no opportunity of direct observations on children. It was therefore a very great triumph when it became possible years later to confirm almost all my inferences by direct observation and the analysis of very young children - a triumph that lost some of its magnitude as one gradually realized that the nature of the discovery was such that one should really be ashamed of having had to make it. The further one carried these observations on children, the more self-evident the facts became; but the more astonishing, too, did it become that one had taken so much trouble to overlook them.

[1914d, 2887]
In the total absence of any theory of the instincts which would help us to find our bearings, we may be permitted, or rather, it is incumbent upon us, to start off by working out some hypothesis to its logical conclusion, until it either breaks down or is confirmed. There are various points in favour of the hypothesis of there having been from the first a separation between sexual instincts and others, ego-instincts, besides the serviceability of such a hypothesis in the analysis of the transference neuroses. I admit that this latter consideration alone would not be unambiguous, for it might be a question of an indifferent psychical energy which only becomes libido through the act of cathecting an object. But, in the first place, the distinction made in this concept corresponds to the common, popular distinction between hunger and love. In the second place, there are biological considerations in its favour. The individual does actually carry on a twofold existence: one to serve his own purposes and the other as a link in a chain, which he serves against his will, or at least involuntarily. The individual himself regards sexuality as one of his own ends; whereas from another point of view he is an appendage to his germ plasm, at whose disposal he puts his energies in return for a bonus of pleasure. He is the mortal vehicle of a (possibly) immortal substance - like the inheritor of an entailed property, who is only the temporary holder of an estate which survives him. The separation of the sexual instincts from the ego-instincts would simply reflect this twofold function of the individual. Thirdly, we must recollect that all our provisional ideas in psychology will presumably some day be based on an organic substructure. This makes it probable that it is special substances and chemical processes which perform the operations of sexuality and provide for the extension of individual life into that of the species. We are taking this probability into account in replacing the special chemical substances by special psychical forces.

I try in general to keep psychology clear from everything that is different in nature from it, even biological lines of thought. For that very reason I should like at this point expressly to admit that the hypothesis of separate ego-instincts and sexual instincts (that is to say, the libido theory) rests scarcely at all upon a psychological basis, but derives its principal support from biology. But I shall be consistent enough to drop this hypothesis if psycho-analytic work should itself produce some other, more serviceable hypothesis about the instincts. So far, this has not happened. It may turn out that, most basically and on the longest view, sexual energy - libido - is only the product of a differentiation in the energy at work generally in the mind. But such an assertion has no relevance. It relates to matters which are so remote from the problems of our observation, and of which we have so little cognizance, that it is as idle to dispute it as to affirm it; this primal identity may well have as little to do with our analytic interests as the primal kinship of all the races of mankind has to do with the proof of kinship required in order to establish a legal right of inheritance. All these speculations take us nowhere. Since we cannot wait for another science to present us with the final conclusions on the theory of the instincts, it is far more to the purpose that we should try to see what light may be thrown upon this basic problem of biology by a synthesis of the psychological phenomena. Let us face the possibility of error; but do not let us be deterred from pursuing the logical implications of the hypothesis we first adopted of an antithesis between ego-instincts and sexual instincts (a hypothesis to which we were forcibly led by analysis of the transference neuroses), and from seeing whether it turns out to be without contradictions and fruitful, and whether it can be applied to other disorders as well, such as schizophrenia.
I feel sure that you have heard some time or other that it is asserted by psycho-analysis that
every dream has a sexual meaning. Well, you yourselves are in a position to form a judgement
of the incorrectness of this reproach. You have become acquainted with wishful dreams dealing
with the satisfaction of the most obvious needs - hunger and thirst and the longing for freedom -
with dreams of convenience and of impatience, and also with purely covetous and egoistic
dreams. But at the same time you should bear in mind, as one of the results of psycho-analytic
research, that greatly distorted dreams give expression mainly (though, again, not exclusively)
to sexual wishes.
[1916-1917, 3283]

Over and over again, Gentlemen, when psycho-analysis has claimed that some mental event
is the product of the sexual instincts, it has been angrily pointed out to it by way of defence that
human beings do not consist only of sexuality, that there are instincts and interests in mental life
other than sexual ones, that it ought not to derive ‘everything’ from sexuality, and so on. Well, it
is most gratifying for once in a way to find ourselves in agreement with our opponents. Psycho-
analysis has never forgotten that there are instinctual forces as well which are not sexual. It was
based on a sharp distinction between the sexual instincts and the ego-instincts, and, in spite of
all objections, it has maintained not that the neuroses are derived from sexuality but that their
origin is due to a conflict between the ego and sexuality. Nor has it any conceivable reason for
disputing the existence or significance of the ego-instincts while it pursues the part played by
the sexual instincts in illness and in ordinary life. It has simply been its fate to begin by
concerning itself with the sexual instincts because the transference neuroses made them the
most easily accessible to examination and because it was incumbent on it to study what other
people had neglected.
[1916-1917, 3412]

Now, however, I must draw your attention to the decisive difference between the symptoms of
the ‘actual’ neuroses and those of the psychoneuroses, the first group of which, the
transference neuroses, have occupied us so much hitherto. In both cases the symptoms
originate from the libido, and are thus abnormal employments of it, substitutive satisfactions. But
the symptoms of the ‘actual’ neuroses - intracranial pressure, sensations of pain, a state of
irritation in an organ, weakening or inhibition of a function - have no ‘sense’, no psychical
meaning. They are not only manifested predominantly in the body (as are hysterical symptoms,
for instance, as well), but they are also themselves entirely somatic processes, in the generating
of which all the complicated mental mechanisms we have come to know are absent. Thus they
really are what psychoneurotic symptoms were so long believed to be. But if so, how can they
correspond to employments of the libido, which we have recognized as a force operating in the
mind? Well, Gentlemen, that is a very simple matter. Let me remind you of one of the very first
objections that were brought up against psycho-analysis. It was said then that it was occupied in
finding a purely psychological theory of neurotic phenomena and this was quite hopeless, since
psychological theories could never explain an illness. People had chosen to forget that the
sexual function is not a purely psychical thing any more than it is a purely somatic one. It
influences bodily and mental life alike. If in the symptoms of the psychoneuroses we have
become acquainted with manifestations of disturbances in the psychical operation of the sexual
function, we shall not be surprised to find in the ‘actual’ neuroses the direct somatic
consequences of sexual disturbances.
[1916-1917, 3439]
Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as 'real frustration' - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clutching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by 'living a full life' sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]

But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]
But here I will pause, and let you have a word; for I see an objection boiling up in you so fiercely that it would make you incapable of listening if it were not put into words: 'Ah! so you've admitted it at last! You work with the help of suggestion, just like the hypnotists! That is what we've thought for a long time. But, if so, why the roundabout road by way of memories of the past, discovering the unconscious, interpreting and translating back distortions - this immense expenditure of labour, time and money - when the one effective thing is after all only suggestion? Why do you not make direct suggestion against the symptoms, as the others do - the honest hypnotists? Moreover, if you try to excuse yourself for your long detour on the ground that you have made a number of important psychological discoveries which are hidden by direct suggestion - what about the certainty of these discoveries now? Are not they a result of suggestion too, of unintentional suggestion? Is it not possible that you are forcing on the patient what you want and what seems to you correct, in this field as well?'

LADIES AND GENTLEMEN, - You know what we are going to talk about to-day. You asked me why we do not make use of direct suggestion in psycho-analytic therapy, when we admit that our influence rests essentially on transference - that is, on suggestion; and you added a doubt whether, in view of this predominance of suggestion, we are still able to claim that our psychological discoveries are objective. I promised I would give you a detailed reply.
But you will now tell me that, no matter whether we call the motive force of our analysis transference or suggestion, there is a risk that the influencing of our patient may make the objective certainty of our findings doubtful. What is advantageous to our therapy is damaging to our researches. This is the objection that is most often raised against psycho-analysis, and it must be admitted that, though it is groundless, it cannot be rejected as unreasonable. If it were justified, psycho-analysis would be nothing more than a particularly well-disguised and particularly effective form of suggestive treatment and we should have to attach little weight to all that it tells us about what influences our lives, the dynamics of the mind or the unconscious. That is what our opponents believe; and in especial they think that we have "talked" the patients into everything relating to the importance of sexual experiences - or even into those experiences themselves - after such notions have grown up in our own depraved imagination. These accusations are contradicted more easily by an appeal to experience than by the help of theory. Anyone who has himself carried out psycho-analyses will have been able to convince himself on countless occasions that it is impossible to make suggestions to a patient in that way. The doctor has no difficulty, of course, in making him a supporter of some particular theory and in thus making him share some possible error of his own. In this respect the patient is behaving like anyone else - like a pupil - but this only affects his intelligence, not his illness. After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor's conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct. We endeavour by a careful technique to avoid the occurrence of premature successes due to suggestion; but no harm is done even if they do occur, for we are not satisfied by a first success. We do not regard an analysis as at an end until all the obscurities of the case are cleared up, the gaps in the patient's memory filled in, the precipitating causes of the repressions discovered. We look upon successes that set in too soon as obstacles rather than as a help to the work of analysis; and we put an end to such successes by constantly resolving the transference on which they are based. It is this last characteristic which is the fundamental distinction between analytic and purely suggestive therapy, and which frees the results of analysis from the suspicion of being successes due to suggestion. In every other kind of suggestive treatment the transference is carefully preserved and left untouched; in analysis it is itself subjected to treatment and is dissected in all the shapes in which it appears. At the end of an analytic treatment the transference must itself be cleared away; and if success is then obtained or continues, it rests, not on suggestion, but on the achievement by its means of an overcoming of internal resistances, on the internal change that has been brought about in the patient.

[1916-1917, 3493]

The acceptance of suggestions on individual points is no doubt discouraged by the fact that during the treatment we are struggling unceasingly against resistances which are able to transform themselves into negative (hostile) transferences. Nor must we fail to point out that a large number of the individual findings of analysis, which might otherwise be suspected to being products of suggestion, are confirmed from another and irreproachable source. Our guarantors in this case are the sufferers from dementia praecox and paranoia, who are of course far above any suspicion of being influenced by suggestion. The translations of symbols and the phantasies, which these patients produce for us and which in them have forced their way through into consciousness, coincide faithfully with the results of our investigations into the unconscious of transference neurotics and thus confirm the objective correctness of our interpretations, on which doubt is so often thrown. You will not, I think, be going astray if you trust analysis on these points.

[1916-1917, 3493]
Instead of reporting a number of cases, I will tell you the story of a single one, in which, from considerations of medical discretion, I was condemned to play a long-suffering part. I undertook the analytic treatment - it was many years ago - of a girl who had for some time been unable, owing to anxiety, to go out in the street or to stay at home by herself. The patient slowly brought out an admission that her imagination had been seized by chance observations of the affectionate relations between her mother and a well-to-do friend of the family. But she was so clumsy - or so subtle - that she gave her mother a hint of what was being talked about in the analytic sessions. She brought this about by changing her behaviour towards her mother, by insisting on being protected by no one but her mother from her anxiety at being alone and by barring the door to her in her anxiety if she tried to leave the house. Her mother had herself been very neurotic in the past, but had been cured years before in a hydropathic establishment. Or rather, she had there made the acquaintance of the man with whom she was able to enter into a relation that was in every way satisfying to her. The girl's passionate demands took her aback, and she suddenly understood the meaning of her daughter's anxiety: the girl had made herself ill in order to keep her mother prisoner and to rob her of the freedom of movement that her relations with her lover required. The mother quickly made up her mind and brought the obnoxious treatment to an end. The girl was taken to a sanatorium for nervous diseases and was demonstrated for many years as 'a poor victim of psycho-analysis'. All this time, too, I was pursued by the calumny of responsibility for the unhappy end of the treatment. I kept silence, for I thought I was bound by the duty of medical discretion. Long afterwards I learnt from one of my colleagues, who visited the sanatorium and had seen the agoraphobic girl there, that the liaison between her mother and the well-to-do friend of the family was common knowledge in the city and that it was probably connived at by the husband and father. Thus it was to this 'secret' that the treatment had been sacrificed.

This presents a gloomy prospect for the effectiveness of psycho-analysis as a therapy - does it not? - even though we are able to explain the great majority of our failures by attributing them to interfering external factors. Friends of analysis have advised us to meet the threatened publication of our failures with statistics of our successes drawn up by ourselves. I did not agree to this. I pointed out that statistics are worthless if the items assembled in them are too heterogeneous; and the cases of neurotic illness which we had taken into treatment were in fact incomparable in a great variety of respects. Moreover, the period of time that could be covered was too short to make it possible to judge the durability of the cures. And it was altogether impossible to report on many of the cases: they concerned people who had kept both their illness and its treatment secret, and their recovery had equally to be kept secret. But the strongest reason for holding back lay in the realization that in matters of therapy people behave highly irrationally, so that one has no prospect of accomplishing anything with them by rational means. A therapeutic novelty is either received with delirious enthusiasm - as, for instance, when Koch introduced his first tuberculin against tuberculosis to the public - or it is treated with abysmal distrust - like Jenner's vaccination, which was in fact a blessing and which even to-day has its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, the members of her family and a high medical authority, too, who was called in for consultation - were convinced that the fresh attack could only be the result of my attempted analysis. Nothing can be done against prejudices. You can see it again to-day in the prejudices which each group of nations at war has developed against the other. The most sensible thing to do is to wait, and to leave such prejudices to the eroding effects of time. One day the same people begin to think about the same things in quite a different way from before; why they did not think so earlier remains a dark mystery.

[1916-1917, 3499]
Let it be clearly understood that this last attempt at an explanation on the part of those who take the view opposed to mine results in the scenes from infancy being disposed of far more fundamentally than was announced to begin with. What was argued at first was that they were not realities but phantasies. But what is argued now is evidently that they are phantasies not of the patient but of the analyst himself, who forces them upon the person under analysis on account of some complexes of his own. An analyst, indeed, who hears this reproach, will comfort himself by recalling how gradually the construction of this phantasy which he is supposed to have originated came about, and, when all is said and done, how independently of the physician's incentive many points in its development proceeded; how, after a certain phase of the treatment, everything seemed to converge upon it, and how later, in the synthesis, the most various and remarkable results radiated out from it; how not only the large problems but the smallest peculiarities in the history of the case were cleared up by this single assumption. And he will disclaim the possession of the amount of ingenuity necessary for the concoction of an occurrence which can fulfil all these demands. But even this plea will be without an effect on an adversary who has not experienced the analysis himself. On the one side there will be a charge of subtle self-deception, and on the other of obtuseness of judgement; it will be impossible to arrive at a decision.

[1918b, 3539]

In the present case the content of the primal scene is a picture of sexual intercourse between the boy's parents in a posture especially favourable for certain observations. Now it would be no evidence whatever of the reality of such a scene if we were to find it in a patient whose symptoms (the effects of the scene, that is) had appeared at some time or other in the later part of his life. A person such as this might have acquired the impressions, the ideas, and the knowledge on a great number of different occasions in the course of the long interval; he might then have transformed them into an imaginary picture, have projected them back into his childhood, and have attached them to his parents. If, however, the effects of a scene of this sort appear in the child's fourth or fifth year, then he must have witnessed the scene at an age even earlier than that. But in that case we are still faced with all the disconcerting consequences which have arisen from the analysis of this infantile neurosis. The only way out would be to assume that the patient not only unconsciously imagined the primal scene, but also concocted the alteration in his character, his fear of the wolf, and his religious obsession; but such an expedient would be contradicted by his otherwise sober nature and by the direct tradition in his family. It must therefore be left at this (I can see no other possibility): either the analysis based on the neurosis in his childhood is all a piece of nonsense from start to finish, or everything took place just as I have described it above.

[1918b, 3542]

At an earlier stage in the discussion we were brought up against an ambiguity in regard to the patient's predilection for female nates and for sexual intercourse in the posture in which they are especially prominent. It seemed necessary to trace this predilection back to the intercourse which he had observed between his parents, while at the same time a preference of this kind is a general characteristic of archaic constitutions which are predisposed to an obsessional neurosis. But the contradiction is easily resolved if we regard it as a case of overdetermination. The person who was the subject of his observation of this posture during intercourse was, after all, his father in the flesh, and it may also have been from him that he had inherited this constitutional predilection. Neither his father's subsequent illness nor his family history contradicts this; as has been mentioned already, a brother of his father's died in a condition which must be regarded as the outcome of a severe obsessional disorder.

[1918b, 3542]
This memory recurred occasionally during the analysis, and called for an explanation; but for a long time none was to be found. Nevertheless it was to be assumed as a matter of course that a detail like this had not kept its place in his recollection on its own account, but that it was a screen-memory, representing something of more importance with which it was in some way connected. One day he told me that in his language a butterfly was called 'babushka', 'granny'. He added that in general butterflies had seemed to him like women and girls, and beetles and caterpillars like boys. So there could be little doubt that in this anxiety scene a recollection of some female person had been aroused. I will not hide the fact that at that time I put forward the possibility that the yellow stripes on the butterfly had reminded him of similar stripes on a piece of clothing worn by some woman. I only mention this as an illustration to show how inadequate the physician's constructive efforts usually are for clearing up questions that arise, and how unjust it is to attribute the results of analysis to the physician's imagination and suggestion. [1918b, 3571]

I must here turn for a moment to the history of the treatment. When once the Grusha scene had been assimilated - the first experience that he could really remember, and one which he had remembered without any conjectures or intervention on my part - the problem of the treatment had every appearance of having been solved. From that time forward there were no more resistances; all that remained to be done was to collect and to co-ordinate. The old trauma theory of the neuroses, which was after all built up upon impressions gained from psycho-analytic practice, had suddenly come to the front once more. Out of critical interest I made one more attempt to force upon the patient another view of his story, which might commend itself to sober common sense. It was true that there could be no doubt about the scene with Grusha, but, I suggested, in itself that scene meant nothing; it had been emphasized ex post facto by a regression from the circumstances of his object choice, which, as a result of his intention to debase, had been diverted from his sister on to servant girls. On the other hand, his observation of intercourse, I argued, was a phantasy of his later years; its historical nucleus may perhaps have been an observation or an experience by the patient of the administration of an innocent enema. Some of my readers will possibly be inclined to think that with such hypotheses as these I was for the first time beginning to approach an understanding of the case; but the patient looked at me uncomprehendingly and a little contemptuously when I put this view before him, and he never reacted to it again. I have already stated my own arguments against any such rationalization at their proper point in the discussion. [1918b, 3576]

On these issues I can venture upon no decision. I must confess, however, that I regard it as greatly to the credit of psycho-analysis that it should even have reached the stage of raising such questions as these. Nevertheless, I cannot deny that the scene with Grusha, the part it played in the analysis, and the effects that followed from it in the patient's life can be most naturally and completely explained if we consider that the primal scene, which may in other cases be a phantasy, was a reality in the present one. After all, there is nothing impossible about it; and the hypothesis of its reality is entirely compatible with the inciting action of the observations upon animals which are indicated by the sheep-dogs in the dream-picture. [1918b, 3577]
¹ The Grusha scene was, as I have said, a spontaneous product of the patient's memory, and no construction or stimulation by the physician played any part in evoking it. The gaps in it were filled up by the analysis in a fashion which must be regarded as unexceptionable, if any value at all is attached to the analytic method of work. The only possible rationalistic explanation of the phobia would be the following. There is nothing extraordinary, it might be said, in a child that was inclined to be nervous having had an anxiety attack in connection with a yellow-striped butterfly, probably as a result of some inherited tendency to anxiety. (See Stanley Hall, 'A Synthetic Genetic Study of Fear', 1914.) In ignorance of the true causation of his fear, this explanation would proceed, the patient looked about for something in his childhood to which he could connect it; he made use of the chance similarity of names and the recurrence of the stripes as a ground for the construction of an imaginary adventure with the nursery-maid whom he still remembered. When, however, we observe that the trivial details of this event (which, according to this view, was in itself an innocent one) - the scrubbing, the pail and the broom - had enough power over the patient's later life to determine his object-choice permanently and compulsively, then the butterfly phobia seems to have acquired an inexplicable importance. The state of things on this hypothesis is thus seen to be at least as remarkable as on mine, and any advantage that might be claimed for a rationalistic reading of the scene has melted away. The Grusha scene is of particular value to us, since in relation to it we can prepare our judgement upon the less certain primal scene.

Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1918b, 3588]

[1923a, 3928]
Psycho-analysis has been reproached time after time with ignoring the higher, moral, supra-personal side of human nature. The reproach is doubly unjust, both historically and methodologically. For, in the first place, we have from the very beginning attributed the function of instigating repression to the moral and aesthetic trends in the ego, and secondly, there has been a general refusal to recognize that psycho-analytic research could not, like a philosophical system, produce a complete and ready-made theoretical structure, but had to find its way step by step along the path towards understanding the intricacies of the mind by making an analytic dissection of both normal and abnormal phenomena. So long as we had to concern ourselves with the study of what is repressed in mental life, there was no need for us to share in any agitated apprehensions as to the whereabouts of the higher side of man. But now that we have embarked upon the analysis of the ego we can give an answer to all those whose moral sense has been shocked and who have complained that there must surely be a higher nature in man: 'Very true,' we can say, 'and here we have that higher nature, in this ego ideal or super-ego, the representative of our relation to our parents. When we were little children we knew these higher natures, we admired them and feared them; and later we took them into ourselves.'

All this sounds convincing and reasonable. Psycho-analysis has once more to meet the reproach that it makes hair-splitting complications in the simplest things and sees mysteries and problems where none exist, and that it does this by laying undue stress on insignificant and irrelevant details, such as occur everywhere, and making them the basis of the most far-reaching and strangest conclusions. It would be useless for us to point out that this rejection of our interpretation would do away with many striking analogies and break a number of subtle connections which we are able to demonstrate in this case. Our opponents will say that those analogies and connections do not in fact exist, but have been imported into the case by us with quite uncalled-for ingenuity.

But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.
But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

Dr. de Saussure has not only conscientiously studied my writings, but in addition he has made the sacrifice of coming to me to undergo an analysis lasting several months. This has put him in a position to form his own judgement on the majority of those questions in psycho-analysis which are still undecided, and to avoid the many distortions and errors which one is accustomed to finding in French as well as in German expositions of psycho-analysis. Nor has he failed to contradict certain false or negligent statements which commentators pass on from one to another: such as, for instance, that all dreams have a sexual meaning or that, according to me, the only motive force in our mental life is that of sexual libido.

We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfiliements of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹
It remains to be seen whether this construction will turn out to be serviceable. Although it arose from a desire to fix some of the most important theoretical ideas of psycho-analysis, it goes far beyond psycho-analysis. I have repeatedly heard it said contemptuously that it is impossible to take a science seriously whose most general concepts are as lacking in precision as those of libido and of instinct in psycho-analysis. But this reproach rests on a complete misconception of the facts. Clear basic concepts and sharply drawn definitions are only possible in the mental sciences in so far as the latter seek to fit a region of facts into the frame of a logical system. In the natural sciences, of which psychology is one, such clear-cut general concepts are superfluous and indeed impossible. Zoology and Botany did not start from correct and adequate definitions of an animal and a plant; to this very day biology has been unable to give any certain meaning to the concept of life. Physics itself, indeed, would never have made any advance if it had had to wait until its concepts of matter, force, gravitation, and so on, had reached the desirable degree of clarity and precision. The basic ideas or most general concepts in any of the disciplines of science are always left indeterminate at first and are only explained to begin with by reference to the realm of phenomena from which they were derived; it is only by means of a progressive analysis of the material of observation that they can be made clear and can find a significant and consistent meaning. I have always felt it as a gross injustice that people have refused to treat psycho-analysis like any other science. This refusal found an expression in the raising of the most obstinate objections. Psycho-analysis was constantly reproached for its incompleteness and insufficiencies; though it is plain that a science based upon observation has no alternative but to work out its findings piecemeal and to solve its problems step by step. Again, when I endeavoured to obtain for the sexual function the recognition which had so long been withheld from it, psycho-analytic theory was branded as 'pan-sexualism'. And when I laid stress on the hitherto neglected importance of the part played by the accidental impressions of early youth, I was told that psycho-analysis was denying constitutional and hereditary factors - a thing which I had never dreamt of doing. It was a case of contradiction at any price and by any methods.

[1925d, 4233]

'And you claim that you have discovered this "common foundation" of mental life, which has been overlooked by every psychologist, from observations on sick people?'

[1926e, 4335]

The source of our findings does not seem it me to deprive them of their value. Embryology, to take an example, would not deserve to be trusted if it could not give a plain explanation of the origin of innate malformations. I have told you of people whose thoughts go their own way, so that they are obliged to worry over problems to which they are perfectly indifferent. Do you think that academic psychology could ever make the smallest contribution towards explaining an abnormality such as that? And, after all, we all of us have the experience at night-time of our thoughts going their own way and creating things which we do not understand, which puzzle us, and which are suspiciously reminiscent of pathological products. Our dreams, I mean. The common people have always firmly believed that dreams have a sense and a value - that they mean something. Academic psychology has never been able to inform us what this meaning is. It could make nothing of dreams. If it attempted to produce explanations, they were non-psychological - such as tracing them to sensory stimuli, or to an unequal depth of sleep in different portions of the brain, and so on. But it is fair to say that a psychology which cannot explain dreams is also useless for an understanding of normal mental life, that it has no claim to be called a science.

[1926e, 4335]
"You are becoming aggressive; so you have evidently got on to a sensitive spot. I have heard, it is true, that in analysis great value is attached to dreams, that they are interpreted, and that memories of real events are looked for behind them, and so on. But I have heard as well that the interpretation of dreams is left to the caprice of analysts, and that they themselves have never ceased disputing over the way of interpreting dreams and the justification for drawing conclusions from them. If that is so, you ought not to underline so heavily the advantage that analysis has won over academic psychology."

[1926e, 4336]

There is really a great deal of truth in what you say. It is true that the interpretation of dreams has come to have unequaled importance both for the theory and the practice of analysis. If I seem to be aggressive, that is only a way of defending myself. And when I think of all the mischief some analysts have done with the interpretation of dreams I might lose heart and echo the pessimistic pronouncement of our great satirist Nestroy when he says that every step forward is only half as big as it looks at first. But have you ever found that men do anything but confuse and distort what they get hold of? By the help of a little foresight and self-discipline most of the dangers of dream-interpretation can be avoided with certainty. But you will agree that I shall never come to my exposition if we let ourselves be led aside like this.

[1926e, 4336]

But whether the interests which are stimulated by the study of the sexual life of neurotics create an atmosphere favourable to the encouragement of lasciviousness - that is a question which I venture to leave to your own judgement.

[1926e, 4359]

"'Interpret!' A nasty word! I dislike the sound of it; it robs me of all certainty. If everything depends on my interpretation who can guarantee that I interpret right? So after all everything is left to my caprice."

[1926e, 4361]

Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

[1926e, 4362]
Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.

[1933a, 4622]

An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.

[1940a [1938], 4975]
It has always seemed to me to be greatly to the credit of a certain well-known man of science that he treated psycho-analysis fairly at a time when most other people felt themselves under no such obligation. On one occasion, nevertheless, he gave expression to an opinion upon analytic technique which was at once derogatory and unjust. He said that in giving interpretations to a patient we treat him upon the famous principle of 'Heads I win, tails you lose'.¹ That is to say, if the patient agrees with us, then the interpretation is right; but if he contradicts us, that is only a sign of his resistance, which again shows that we are right. In this way we are always in the right against the poor helpless wretch whom we are analysing, no matter how he may respond to what we put forward. Now, since it is in fact true that a 'No' from one of our patients is not as a rule enough to make us abandon an interpretation as incorrect, a revelation such as this of the nature of our technique has been most welcome to the opponents of analysis. It is therefore worth while to give a detailed account of how we are accustomed to arrive at an assessment of the 'Yes' or 'No' of our patients during analytic treatment - of their expression of agreement or of denial. The practising analyst will naturally learn nothing in the course of this apologia that he does not know already.

[1937d, 5049]
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

Moreover, I can assure you that you are misinformed if you suppose that advice and guidance in the affairs of life play an integral part in analytic influence. On the contrary, so far as possible we avoid the role of a mentor such as this and there is nothing we would rather bring about than the patient should make his decisions for himself. With this purpose, too, we require him to postpone for the term of his treatment any vital decisions on choice of a profession, business undertakings, marriage or divorce, and only to put them in practice when the treatment is finished. You must admit that all this is different from what you pictured. Only in the case of some very youthful or quite helpless or unstable individuals are we unable to put the desired limitation of our role into effect. With them we have to combine the functions of a doctor and an educator; but when this is so we are quite conscious of our responsibility and behave with the necessary caution.

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.
Thus you cannot explain the therapeutic effect of psycho-analysis by its permitting a full sexual life. Look around, then, for something else. I fancy that, while I was rejecting this suggestion of yours, one remark of mine put you on the right track. What we make use of must no doubt be the replacing of what is unconscious by what is conscious, the translation of what is unconscious into what is conscious. Yes, that is it. By carrying what is unconscious on into what is conscious, we lift the repressions, we remove the preconditions for the formation of symptoms, we transform the pathogenic conflict to a normal one for which it must be possible somehow to find a solution. All that we bring about in a patient is this single psychical change: the length to which it is carried is the measure of the help we provide. Where no repressions (or analogous psychical processes) can be undone, our therapy has nothing to expect.

[1916-1917, 3477]

What you are throwing up at me in this is uncommonly interesting and must be answered. But I cannot do so to-day: we have not the time. Till our next meeting, then. I will answer you, you will see. But to-day I must finish what I have begun. I promised to make you understand by the help of the fact of transference why our therapeutic efforts have no success with the narcissistic neuroses.

[1916-1917, 3489]

LADIES AND GENTLEMEN, - You know what we are going to talk about to-day. You asked me why we do not make use of direct suggestion in psycho-analytic therapy, when we admit that our influence rests essentially on transference - that is, on suggestion; and you added a doubt whether, in view of this predominance of suggestion, we are still able to claim that our psychological discoveries are objective. I promised I would give you a detailed reply.

[1916-1917, 3490]
But you will now tell me that, no matter whether we call the motive force of our analysis transference or suggestion, there is a risk that the influencing of our patient may make the objective certainty of our findings doubtful. What is advantageous to our therapy is damaging to our researches. This is the objection that is most often raised against psycho-analysis, and it must be admitted that, though it is groundless, it cannot be rejected as unreasonable. If it were justified, psycho-analysis would be nothing more than a particularly well-disguised and particularly effective form of suggestive treatment and we should have to attach little weight to all that it tells us about what influences our lives, the dynamics of the mind or the unconscious. That is what our opponents believe; and in especial they think that we have "talked" the patients into everything relating to the importance of sexual experiences - or even into those experiences themselves - after such notions have grown up in our own depraved imagination. These accusations are contradicted more easily by an appeal to experience than by the help of theory. Anyone who has himself carried out psycho-analyses will have been able to convince himself on countless occasions that it is impossible to make suggestions to a patient in that way. The doctor has no difficulty, of course, in making him a supporter of some particular theory and in thus making him share some possible error of his own. In this respect the patient is behaving like anyone else - like a pupil - but this only affects his intelligence, not his illness. After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor's conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct. We endeavour by a careful technique to avoid the occurrence of premature successes due to suggestion; but no harm is done even if they do occur, for we are not satisfied by a first success. We do not regard an analysis as at an end until all the obscurities of the case are cleared up, the gaps in the patient's memory filled in, the precipitating causes of the repressions discovered. We look upon successes that set in too soon as obstacles rather than as a help to the work of analysis; and we put an end to such successes by constantly resolving the transference on which they are based. It is this last characteristic which is the fundamental distinction between analytic and purely suggestive therapy, and which frees the results of analysis from the suspicion of being successes due to suggestion. In every other kind of suggestive treatment the transference is carefully preserved and left untouched; in analysis it is itself subjected to treatment and is dissected in all the shapes in which it appears. At the end of an analytic treatment the transference must itself be cleared away; and if success is then obtained or continues, it rests, not on suggestion, but on the achievement by its means of an overcoming of internal resistances, on the internal change that has been brought about in the patient.

[1916-1917, 3493]

The acceptance of suggestions on individual points is no doubt discouraged by the fact that during the treatment we are struggling unceasingly against resistances which are able to transform themselves into negative (hostile) transferences. Nor must we fail to point out that a large number of the individual findings of analysis, which might otherwise be suspected to being products of suggestion, are confirmed from another and irreproachable source. Our guarantors in this case are the sufferers from dementia praecox and paranoia, who are of course far above any suspicion of being influenced by suggestion. The translations of symbols and the phantasies, which these patients produce for us and which in them have forced their way through into consciousness, coincide faithfully with the results of our investigations into the unconscious of transference neurotics and thus confirm the objective correctness of our interpretations, on which doubt is so often thrown. You will not, I think, be going astray if you trust analysis on these points.

[1916-1917, 3493]
We shall soon have reached the end. You are perhaps disappointed that on the topic of the psycho-analytic method of therapy I have only spoken to you about theory and not about the conditions which determine whether a treatment is to be undertaken or about the results it produces. I shall discuss neither: the former because it is not my intention to give you practical instructions on how to carry out a psycho-analysis, and the latter because several reasons deter me from it. At the beginning of our talks, I emphasized the fact that under favourable conditions we achieve successes which are second to none of the finest in the field of internal medicine; and I can now add something further - namely that they could not have been achieved by any other procedure. If I were to say more than this I should be suspected of trying to drown the loudly raised voices of depreciation by self-advertisement. The threat has repeatedly been made against psycho-analysts by our medical 'colleagues' - even at public congresses - that a collection of the failures and damaging results of analysis would be published which would open the suffering public's eyes to the worthlessness of this method of treatment. But, apart from the malicious, denunciatory character of such a measure, it would not even be calculated to make it possible to form a correct judgement of the therapeutic effectiveness of analysis. Analytic therapy, as you know, is in its youth; it has taken a long time to establish its technique, and that could only be done in the course of working and under the influence of increasing experience. In consequence of the difficulties in giving instruction, the doctor who is a beginner in psycho-analysis is thrown back to a greater extent than other specialists on his own capacity for further development, and the results of his first years will never make it possible to judge the efficacy of analytic therapy.

[1916-1917, 3497]
Many attempts at treatment miscarried during the early period of analysis because they were undertaken in cases which were altogether unsuited to the procedure and which we should exclude to-day on the basis of our present view of the indications for treatment. But these indications, too, could only be arrived at by experiment. In those days we did not know *a priori* that paranoia and dementia praecox in strongly marked forms are inaccessible, and we had a right to make trial of the method on all kinds of disorders. But most of the failures of those early years were due not to the doctor's fault or an unsuitable choice of patients but to unfavourable external conditions. Here we have only dealt with internal resistances, those of the patient, which are inevitable and can be overcome. The external resistances which arise from the patient's circumstances, from his environment, are of small theoretical interest but of the greatest practical importance. Psycho-analytic treatment may be compared with a surgical operation and may similarly claim to be carried out under arrangements that will be the most favourable for its success. You know the precautionary measures adopted by a surgeon: a suitable room, good lighting, assistants, exclusion of the patient's relatives, and so on. Ask yourselves now how many of these operations would turn out successfully if they had to take place in the presence of all the members of the patient's family, who would stick their noses into the field of the operation and exclaim aloud at every incision. In psycho-analytic treatments the intervention of relatives is a positive danger and a danger one does not know how to meet. One is armed against the patient's internal resistances which one knows are inevitable, but how can one ward off these external resistances? No kind of explanations make any impression on the patient's relatives; they cannot be induced to keep at a distance from the whole business, and one cannot make common cause with them because of the risk of losing the confidence of the patient, who - quite rightly moreover - expects the person in whom he has put his trust to take his side. No one who has any experience of the rifts which so often divide a family will, if he is an analyst, be surprised to find that the patient's closest relatives sometimes betray less interest in his recovering than in his remaining as he is. When, as so often, the neurosis is related to conflicts between members of a family, the healthy party will not hesitate long in choosing between his own interest and the sick party's recovery. It is not to be wondered at, indeed, if a husband looks with disfavour on a treatment in which, as he may rightly suspect, the whole catalogue of his sins will be brought to light. Nor do we wonder at it; but we cannot in that case blame ourselves if our efforts remain unsuccessful and the treatment is broken off prematurely because the husband's resistance is added to that of his sick wife. We had in fact undertaken something which in the prevailing circumstances was unrealizable.

[1916-1917, 3498]
Instead of reporting a number of cases, I will tell you the story of a single one, in which, from considerations of medical discretion, I was condemned to play a long-suffering part. I undertook the analytic treatment - it was many years ago - of a girl who had for some time been unable, owing to anxiety, to go out in the street or to stay at home by herself. The patient slowly brought out an admission that her imagination had been seized by chance observations of the affectionate relations between her mother and a well-to-do friend of the family. But she was so clumsy - or so subtle - that she gave her mother a hint of what was being talked about in the analytic sessions. She brought this about by changing her behaviour towards her mother, by insisting on being protected by no one but her mother from her anxiety at being alone and by barring the door to her in her anxiety if she tried to leave the house. Her mother had herself been very neurotic in the past, but had been cured years before in a hydropathic establishment. Or rather, she had there made the acquaintance of the man with whom she was able to enter into a relation that was in every way satisfying to her. The girl's passionate demands took her aback, and she suddenly understood the meaning of her daughter's anxiety: the girl had made herself ill in order to keep her mother prisoner and to rob her of the freedom of movement that her relations with her lover required. The mother quickly made up her mind and brought the obnoxious treatment to an end. The girl was taken to a sanatorium for nervous diseases and was demonstrated for many years as 'a poor victim of psycho-analysis'. All this time, too, I was pursued by the calumny of responsibility for the unhappy end of the treatment. I kept silence, for I thought I was bound by the duty of medical discretion. Long afterwards I learnt from one of my colleagues, who visited the sanatorium and had seen the agoraphobic girl there, that the liaison between her mother and the well-to-do friend of the family was common knowledge in the city and that it was probably connived at by the husband and father. Thus it was to this 'secret' that the treatment had been sacrificed.

This presents a gloomy prospect for the effectiveness of psycho-analysis as a therapy - does it not? - even though we are able to explain the great majority of our failures by attributing them to interfering external factors. Friends of analysis have advised us to meet the threatened publication of our failures with statistics of our successes drawn up by ourselves. I did not agree to this. I pointed out that statistics are worthless if the items assembled in them are too heterogeneous; and the cases of neurotic illness which we had taken into treatment were in fact incomparable in a great variety of respects. Moreover, the period of time that could be covered was too short to make it possible to judge the durability of the cures. And it was altogether impossible to report on many of the cases: they concerned people who had kept both their illness and its treatment secret, and their recovery had equally to be kept secret. But the strongest reason for holding back lay in the realization that in matters of therapy people behave highly irrationally, so that one has no prospect of accomplishing anything with them by rational means. A therapeutic novelty is either received with delirious enthusiasm - as, for instance, when Koch introduced his first tuberculin against tuberculosis to the public - or it is treated with abysmal distrust - like Jenner's vaccination, which was in fact a blessing and which even to-day has its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, all the members of her family and a high medical authority, too, who was called in for consultation - were convinced that the fresh attack could only be the result of my attempted analysis. Nothing can be done against prejudices. You can see it again to-day in the prejudices which each group of nations at war has developed against the other. The most sensible thing to do is to wait, and to leave such prejudices to the eroding effects of time. One day the same people begin to think about the same things in quite a different way from before; why they did not think so earlier remains a dark mystery.

[1916-1917, 3499]
The last question is purely one of fact. Anyone who will take the trouble of pursuing an analysis into these depths by means of the prescribed technique will convince himself that it is decidedly possible. Anyone who neglects this, and breaks off the analysis in some higher stratum, has waived his right of forming a judgement on the matter. But the interpretation of what is arrived at in depth-analysis is not decided by this.

[1918b, 3536]

The two other doubts are based on a low estimate of the importance of early infantile impressions and an unwillingness to ascribe such enduring effects to them. The supporters of this view look for the causes of neuroses almost exclusively in the grave conflicts of later life; they assume that the importance of childhood is only held up before our eyes in analysis on account of the inclination of neurotics for expressing their present interests in reminiscences and symbols from the remote past. Such an estimate of the importance of the infantile factor would involve the disappearance of much that has formed part of the most intimate characteristics of analysis, though also, no doubt, of much that raises resistance to it and alienates the confidence of the outsider.

[1918b, 3536]

The psycho-analytic method of treatment is then able to subject this process of repression to revision and to bring about a better solution of the conflict - one that is compatible with health. Unintelligent opposition accuses us of one-sidedness in our estimate of the sexual instincts. 'Human beings have other interests besides sexual ones,' they say. We have not forgotten or denied this for a moment. Our one-sidedness is like that of the chemist, who traces all compounds back to the force of chemical attraction. He is not on that account denying the force of gravity; he leaves that to the physicist to deal with.

[1917a, 3609]

Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1923a, 3928]
Psycho-analysis has been reproached time after time with ignoring the higher, moral, supra-personal side of human nature. The reproach is doubly unjust, both historically and methodologically. For, in the first place, we have from the very beginning attributed the function of instigating repression to the moral and aesthetic trends in the ego, and secondly, there has been a general refusal to recognize that psycho-analytic research could not, like a philosophical system, produce a complete and ready-made theoretical structure, but had to find its way step by step along the path towards understanding the intricacies of the mind by making an analytic dissection of both normal and abnormal phenomena. So long as we had to concern ourselves with the study of what is repressed in mental life, there was no need for us to share in any agitated apprehensions as to the whereabouts of the higher side of man. But now that we have embarked upon the analysis of the ego we can give an answer to all those whose moral sense has been shocked and who have complained that there must surely be a higher nature in man: 'Very true,' we can say, 'and here we have that higher nature, in this ego ideal or super-ego, the representative of our relation to our parents. When we were little children we knew these higher natures, we admired them and feared them; and later we took them into ourselves.'

But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.
But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

Dr. de Saussure has not only conscientiously studied my writings, but in addition he has made the sacrifice of coming to me to undergo an analysis lasting several months. This has put him in a position to form his own judgement on the majority of those questions in psycho-analysis which are still undecided, and to avoid the many distortions and errors which one is accustomed to finding in French as well as in German expositions of psycho-analysis. Nor has he failed to contradict certain false or negligent statements which commentators pass on from one to another: such as, for instance, that all dreams have a sexual meaning or that, according to me, the only motive force in our mental life is that of sexual libido.

We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfils of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

¹ [1925d, 4221]
It remains to be seen whether this construction will turn out to be serviceable. Although it arose from a desire to fix some of the most important theoretical ideas of psycho-analysis, it goes far beyond psycho-analysis. I have repeatedly heard it said contemptuously that it is impossible to take a science seriously whose most general concepts are as lacking in precision as those of libido and of instinct in psycho-analysis. But this reproach rests on a complete misconception of the facts. Clear basic concepts and sharply drawn definitions are only possible in the mental sciences in so far as the latter seek to fit a region of facts into the frame of a logical system. In the natural sciences, of which psychology is one, such clear-cut general concepts are superfluous and indeed impossible. Zoology and Botany did not start from correct and adequate definitions of an animal and a plant; to this very day biology has been unable to give any certain meaning to the concept of life. Physics itself, indeed, would never have made any advance if it had had to wait until its concepts of matter, force, gravitation, and so on, had reached the desirable degree of clarity and precision. The basic ideas or most general concepts in any of the disciplines of science are always left indeterminate at first and are only explained to begin with by reference to the realm of phenomena from which they were derived; it is only by means of a progressive analysis of the material of observation that they can be made clear and can find a significant and consistent meaning. I have always felt it as a gross injustice that people have refused to treat psycho-analysis like any other science. This refusal found an expression in the raising of the most obstinate objections. Psycho-analysis was constantly reproached for its incompleteness and insufficiencies; though it is plain that a science based upon observation has no alternative but to work out its findings piecemeal and to solve its problems step by step. Again, when I endeavoured to obtain for the sexual function the recognition which had so long been withheld from it, psycho-analytic theory was branded as 'pan-sexualism'. And when I laid stress on the hitherto neglected importance of the part played by the accidental impressions of early youth, I was told that psycho-analysis was denying constitutional and hereditary factors - a thing which I had never dreamt of doing. It was a case of contradiction at any price and by any methods.

[1925d, 4233]
If anxiety is a reaction of the ego to danger, we shall be tempted to regard the traumatic neuroses, which so often follow upon a narrow escape from death, as a direct result of a fear of death (or fear for life) and to dismiss from our minds the question of castration and the dependent relationships of the ego. Most of those who observed the traumatic neuroses that occurred during the last war took this line, and triumphantly announced that proof was now forthcoming that a threat to the instinct of self-preservation could by itself produce a neurosis without any admixture of sexual factors and without requiring any of the complicated hypotheses of psycho-analysis. It is in fact greatly to be regretted that not a single analysis of a traumatic neurosis of any value is extant. And it is to be regretted, not because such an analysis would contradict the aetiological importance of sexuality - for any such contradiction has long since been disposed of by the introduction of the concept of narcissism, which brings the libidinal cathexis of the ego into line with the cathexes of objects and emphasizes the libidinal character of the instinct of self-preservation - but because, in the absence of any analyses of this kind, we have lost a most precious opportunity of drawing decisive conclusions about the relations between anxiety and the formation of symptoms. In view of all that we know about the structure of the comparatively simple neuroses of everyday life, it would seem highly improbable that a neurosis could come into being merely because of the objective presence of danger, without any participation of the deeper levels of the mental apparatus. But the unconscious seems to contain nothing that could give any content to our concept of the annihilation of life. Castration can be pictured on the basis of the daily experience of the faeces being separated from the body or on the basis of losing the mother's breast at weaning. But nothing resembling death can ever have been experienced; or if it has, as in fainting, it has left no observable traces behind. I am therefore inclined to adhere to the view that the fear of death should be regarded as analogous to the fear of castration and that the situation to which the ego is reacting is one of being abandoned by the protecting super-ego - the powers of destiny - so that it has no longer any safeguard against all the dangers that surround it. In addition, it must be remembered that in the experiences which lead to a traumatic neurosis the protective shield against external stimuli is broken through and excessive amounts of excitation impinge upon the mental apparatus; so that we have here a second possibility - that anxiety is not only being signalled as an affect but is also being freshly created out of the economic conditions of the situation.  

[1926d, 4286]

'And you claim that you have discovered this "common foundation" of mental life, which has been overlooked by every psychologist, from observations on sick people?'

[1926e, 4335]

The source of our findings does not seem it me to deprive them of their value. Embryology, to take an example, would not deserve to be trusted if it could not give a plain explanation of the origin of innate malformations. I have told you of people whose thoughts go their own way, so that they are obliged to worry over problems to which they are perfectly indifferent. Do you think that academic psychology could ever make the smallest contribution towards explaining an abnormality such as that? And, after all, we all of us have the experience at night-time of our thoughts going their own way and creating things which we do not understand, which puzzle us, and which are suspiciously reminiscent of pathological products. Our dreams, I mean. The common people have always firmly believed that dreams have a sense and a value - that they mean something. Academic psychology has never been able to inform us what this meaning is. It could make nothing of dreams. If it attempted to produce explanations, they were non-psychological - such as tracing them to sensory stimuli, or to an unequal depth of sleep in different portions of the brain, and so on. But it is fair to say that a psychology which cannot explain dreams is also useless for an understanding of normal mental life, that it has no claim to be called a science.

[1926e, 4335]
There is really a great deal of truth in what you say. It is true that the interpretation of dreams has come to have unequalled importance both for the theory and the practice of analysis. If I seem to be aggressive, that is only a way of defending myself. And when I think of all the mischief some analysts have done with the interpretation of dreams I might lose heart and echo the pessimistic pronouncement of our great satirist Nestroy when he says that every step forward is only half as big as it looks at first. But have you ever found that men do anything but confuse and distort what they get hold of? By the help of a little foresight and self-discipline most of the dangers of dream-interpretation can be avoided with certainty. But you will agree that I shall never come to my exposition if we let ourselves be led aside like this.

"Interpret!" A nasty word! I dislike the sound of it; it robs me of all certainty. If everything depends on my interpretation who can guarantee that I interpret right? So after all everything is left to my caprice.'

Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.
Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.

[1933a, 4622]
The procedure is laborious and time-consuming for the physician. It presupposes great interest in psychological happenings, but personal concern for the patients as well. I cannot imagine bringing myself to delve into the psychical mechanism of a hysteria in anyone who struck me as low-minded and repellent, and who, on closer acquaintance, would not be capable of arousing human sympathy; whereas I can keep the treatment of a tabetic or rheumatic patient apart from personal approval of this kind. The demands made on the patient are not less. The procedure is not applicable at all below a certain level of intelligence, and it is made very much more difficult by any trace of feebleness of mind. The complete consent and complete attention of the patients are needed, but above all their confidence, since the analysis invariably leads to the disclosure of the most intimate and secret psychical events. A good number of the patients who would be suitable for this form of treatment abandon the doctor as soon as the suspicion begins to dawn on them of the direction in which the investigation is leading. For patients such as these the doctor has remained a stranger. With others, who have decided to put themselves in his hands and place their confidence in him - a step which in other such situations is only taken voluntarily and never at the doctor's request - with these other patients, I say, it is almost inevitable that their personal relation to him will force itself, for a time at least, unduly into the foreground. It seems, indeed, as though an influence of this kind on the part of the doctor is a sine qua non to a solution of the problem. I do not think any essential difference is made in this respect whether hypnosis can be used or whether it has to be bypassed and replaced by something else. But reason demands that we should emphasize the fact that these drawbacks, though they are inseparable from our procedure, cannot be laid at its door. On the contrary, it is quite clear that they are based on the predetermining conditions of the neuroses that are to be cured and that they must attach to any medical activity which involves intense preoccupation with the patient and leads to a psychical change in him. I have not been able to attribute any deleterious effects or danger to the employment of hypnosis, though I made copious use of it in some of my cases. Where I caused damage, the reasons lay elsewhere and deeper. If I survey my therapeutic efforts during the last few years since the communications made by my honoured teacher and friend Josef Breuer showed me the use of the cathartic method, I believe that in spite of everything, I have done much more, and more frequent, good than harm and have accomplished some things which no other therapeutic procedure could have achieved. It has on the whole, as the 'Preliminary Communication' put it, brought 'considerable therapeutic advantages'.

[1895d, 235]

I am aware that efforts will be made, by the use of arguments with an ethical colouring, to prevent the physician from pursuing the matter further. Anyone who wants to make certain whether or not his patients' neuroses are really connected with their sexual life cannot avoid asking them about their sexual life and insisting upon receiving a true account of it. But in this, it is asserted, lies the danger both for the individual and society. A doctor, I hear it being said, has no right to intrude upon his patients' sexual secrets and grossly injure their modesty (especially with women patients) by an interrogation of this sort. His clumsy hand can only ruin family happiness, offend the innocence of young people and encroach upon the authority of parents; and where adults are concerned he will come to share uncomfortable knowledge and destroy his own relations to his patients. It is therefore his ethical duty, the conclusion is, to keep away from the whole business of sex.

[1897b, 455]
No one can undertake the treatment of a case of hysteria until he is convinced of the impossibility of avoiding the mention of sexual subjects, or unless he is prepared to allow himself to be convinced by experience. The right attitude is: *pour faire une omelette il faut casser des œufs.* The patients themselves are easy to convince; and there are only too many opportunities of doing so in the course of the treatment. There is no necessity for feeling any compunction at discussing the facts of normal or abnormal sexual life with them. With the exercise of a little caution all that is done is to translate into conscious ideas what was already known in the unconscious; and, after all, the whole effectiveness of the treatment is based upon our knowledge that the affect attached to an unconscious idea operates more strongly and, since it cannot be inhibited, more injuriously than the affect attached to a conscious one. There is never any danger of corrupting an inexperienced girl. For where there is no knowledge of sexual processes even in the unconscious, no hysterical symptom will arise; and where hysteria is found there can no longer be any question of 'innocence of mind' in the sense in which parents and educators use the phrase. With children of ten, of twelve, or of fourteen, with boys and girls alike, I have satisfied myself that the truth of this statement can invariably be relied upon.

Some people may feel inclined to look upon it as a serious objection to a method which is in any case troublesome enough that it itself should multiply the labours of the physician by creating a new species of pathological mental products. They may even be tempted to infer from the existence of transferences that the patient will be injured by analytic treatment. Both these suppositions would be mistaken. The physician's labours are not multiplied by transference; it need make no difference to him whether he has to overcome any particular impulse of the patient's in connection with himself or with some one else. Nor does the treatment force upon the patient, in the shape of transference, any new task which he would not other wise have performed. It is true that neuroses may be cured in institutions from which psycho-analytic treatment is excluded, that hysteria may be said to be cured not by the method but by the physician, and that there is usually a sort of blind dependence and a permanent bond between a patient and the physician who has removed his symptoms by hypnotic suggestion; but the scientific explanation of all these facts is to be found in the existence of 'transferences' such as are regularly directed by patients on to their physicians. Psycho-analytic treatment does not create transferences, it merely brings them to light, like so many other hidden psychical factors. The only difference is this - that spontaneously a patient will only call up affectionate and friendly transferences to help towards his recovery; if they cannot be called up, he feels the physician is 'antipathetic' to him, and breaks away from him as fast as possible and without having been influenced by him. In psycho-analysis, on the other hand, since the play of motives is different, all the patient's tendencies, including hostile ones, are aroused; they are then turned to account for the purposes of the analysis by being made conscious, and in this way the transference is constantly being destroyed. Transference, which seems ordained to be the greatest obstacle to psycho-analysis, becomes its most powerful ally, if its presence can be detected each time and explained to the patient.
(e) You will no doubt wish to enquire about the possibility of doing harm by undertaking a psycho-analysis. In reply to this I may say that if you are willing to judge impartially, if you will consider this procedure in the same spirit of critical fairness that you show to our other therapeutic methods, you will have to agree with me that no injury to the patient is to be feared when the treatment is conducted with comprehension. Anyone who is accustomed, like the lay public, to blame the treatment for whatever happens during an illness will doubtless judge differently. It is not so very long since the same prejudice was directed against our hydropathic establishments. Many patients who were advised to go into an establishment of that kind hesitated because they had known someone who had entered the place as a nervous invalid and had become insane there. As you may guess, these were cases of early general paralysis that could still in their first stage be sent to a hydropathic establishment; once there, they had run their inevitable course until manifest mental disorder supervened: but the public blamed the water for this disastrous change. When it is a matter of new kinds of therapeutic treatment even physicians are not always free from such errors of judgement. I recall once making an attempt at psychotherapy with a woman who had passed the greater part of her life in a state alternating between mania and melancholia. I took on the case at the close of a period of melancholia and for two weeks things seemed to go smoothly; in the third week we were already at the beginning of the next attack of mania. This was undoubtedly a spontaneous transformation of the clinical picture, since in two weeks analytic psychotherapy cannot accomplish anything. And yet the eminent physician (now deceased) who saw the case with me could not refrain from the remark that psychotherapy was probably to blame for this 'relapse'. I am quite convinced that in other circumstances he would have shown a more critical judgement.

(f) Finally, Gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psycho-analytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this: This therapy, then, is based on the recognition that unconscious ideas - or better, the unconsciousness of certain mental processes - are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious idée fixe. Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of 'unconscious mental processes'. If, however, you will look at the matter from our point of view, you will understand that the transformation of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious will-power governs only conscious mental processes, and every mental compulsion is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses.

[1905a, 1570]
It not at all infrequently happens that it is only after doing a certain amount of psycho-analytic work with a patient that an analyst can succeed in learning the actual content of a phobia, the precise form of words of an obsessional impulse, and so on. Repression has not only descended upon the unconscious complexes, but it is continually attacking their derivatives as well, and even prevents the patient from becoming aware of the products of the disease itself. The analyst thus finds himself in the position, curious for a doctor, of coming to the help of a disease, and of procuring it its due of attention. But only those who entirely misunderstand the nature of psycho-analysis will lay stress upon this phase of the work and suppose that on its account harm is likely to be done by analysis. The fact is that you must catch your thief before you can hang him, and that it requires some expenditure of labour to get securely hold of the pathological structures - at the destruction of which the treatment is aimed.

In other cases of this kind there would be a great deal more to be said upon the structure, the development, and the diffusion of the neurosis. But the history of little Hans's attack was very short; almost as soon as it had begun, its place was taken by the history of its treatment. And although during the treatment the phobia appeared to develop further and to extend over new objects and to lay down new conditions, his father, since he was himself treating the case, naturally had sufficient penetration to see that it was merely a question of the emergence of material that was already in existence, and not of fresh productions for which the treatment might be held responsible. In the treatment of other cases it would not always be possible to count upon so much penetration.

But I must now enquire what harm was done to Hans by dragging to light in him complexes such as are not only repressed by children but dreaded by their parents. Did the little boy proceed to take some serious action as regards what he wanted from his mother? or did his evil intentions against his father give place to evil deeds? Such misgivings will no doubt have occurred to many doctors, who misunderstand the nature of psycho-analysis and think that wicked instincts are strengthened by being made conscious. Wise men like these are being no more than consistent when they implore us for heaven's sake not to meddle with the evil things that lurk behind a neurosis. In so doing they forget, it is true, that they are physicians, and their words bear a fatal resemblance to Dogberry's, when he advised the Watch to avoid all contact with any thieves they might happen to meet: 'for such kind of men, the less you meddle or make with them, why, the more is for your honesty.'¹

On the contrary, the only results of the analysis were that Hans recovered, that he ceased to be afraid of horses, and that he got on to rather familiar terms with his father, as the latter reported with some amusement. But whatever his father may have lost in the boy's respect he won back in his confidence: 'I thought', said Hans, 'you knew everything, as you knew that about the horse.' For analysis does not undo the effects of repression. The instincts which were formerly suppressed remain suppressed; but the same effect is produced in a different way. Analysis replaces the process of repression, which is an automatic and excessive one, by a temperate and purposeful control on the part of the highest agencies of the mind. In a word, analysis replaces repression by condemnation. This seems to bring us the long-looked-for evidence that consciousness has a biological function, and that with its entrance upon the scene an important advantage is secured.²
¹ At this point I cannot keep back an astonished question. Where do my opponents obtain their knowledge, which they produce with so much confidence, on the question whether the repressed sexual instincts play a part, and if so what part, in the aetiology of the neuroses, if they shut their patients' mouths as soon as they begin to talk about their complexes or their derivatives? For the only alternative source of knowledge remaining open to them are my own writings and those of my adherents.

[1909b, 2121]

A few months ago - in the spring of 1922 - a young man introduced himself to me and informed me that he was the 'little Hans' whose infantile neurosis had been the subject of the paper which I published in 1909. I was very glad to see him again, for about two years after the end of his analysis I had lost sight of him and had heard nothing of him for more than ten years. The publication of this first analysis of a child had caused a great stir and even greater indignation, and a most evil future had been foretold for the poor little boy, because he had been 'robbed of his innocence' at such a tender age and had been made the victim of a psycho-analysis.

[1909b, 2124]

Ladies and Gentlemen, from the intellectual point of view we must, I think, take into account two special obstacles to recognizing psycho-analytic trains of thought. In the first place, people are unaccustomed to reckoning with a strict and universal application of determinism to mental life; and in the second place, they are ignorant of the peculiarities which distinguish unconscious mental processes from the conscious ones that are familiar to us. One of the most widespread resistances to psycho-analytic work, in the sick and healthy alike, can be traced to the second of these two factors. People are afraid of doing harm by psycho-analysis; they are afraid of bringing the repressed sexual instincts into the patient's consciousness, as though that involved a danger of their overwhelming his higher ethical trends and of their robbing him of his cultural acquisitions. People notice that the patient has sore spots in his mind, but shrink from touching them for fear of increasing his sufferings. We can accept this analogy. It is no doubt kinder not to touch diseased spots if it can do nothing else but cause pain. But, as we know, a surgeon does not refrain from examining and handling a focus of disease, if he is intending to take active measures which he believes will lead to a permanent cure. No one thinks of blaming him for the inevitable suffering caused by the examination or for the reactions to the operation, if only it gains its end and the patient achieves a lasting recovery as a result of the temporary worsening of his state. The case is similar with psycho-analysis. It may make the same claims as surgery: the increase in suffering which it causes the patient during treatment is incomparably less than what a surgeon causes, and is quite negligible in proportion to the severity of the underlying ailment. On the other hand, the final outcome that is so much dreaded - the destruction of the patient's cultural character by the instincts which have been set free from repression - is totally impossible. For alarm on this score takes no account of what our experiences have taught us with certainty - namely that the mental and somatic power of a wishful impulse, when once its repression has failed, is far stronger if it is unconscious than if it is conscious; so that to make it conscious can only be to weaken it. An unconscious wish cannot be influenced and it is independent of any contrary tendencies, whereas a conscious one is inhibited by whatever else is conscious and opposed to it. Thus the work of psycho-analysis puts itself at the orders of precisely the highest and most valuable cultural trends, as a better substitute for the unsuccessful repression.

[1910a, 2237]
Are we, then, to abandon our efforts to explain the hidden meaning of neurosis as being in the last resort dangerous to the individual and harmful to the workings of society? Are we to give up drawing the practical conclusion from a piece of scientific insight? No; I think that in spite of this our duty lies in the other direction. The gain from illness provided by the neuroses is nevertheless on the whole and in the end detrimental to individuals as well as to society. The unhappiness that our work of enlightenment may cause will after all only affect some individuals. The change-over to a more realistic and creditable attitude on the part of society will not be bought too dearly by these sacrifices. But above all, all the energies which are to-day consumed in the production of neurotic symptoms serving the purposes of a world of phantasy isolated from reality, will, even if they cannot at once be put to uses in life, help to strengthen the clamour for the changes in our civilization through which alone we can look for the well-being of future generations.

Neither I myself nor my friends and co-workers find it agreeable to claim a monopoly in this way in the use of a medical technique. But in face of the dangers to patients and to the cause of psycho-analysis which are inherent in the practice that is to be foreseen of a 'wild' psycho-analysis, we have had no other choice. In the spring of 1910 we founded an International Psycho-Analytical Association, to which its members declare their adherence by the publication of their names, in order to be able to repudiate responsibility for what is done by those who do not belong to us and yet call their medical procedure 'psycho-analysis'. For as a matter of fact 'wild' analysts of this kind do more harm to the cause of psycho-analysis than to individual patients. I have often found that a clumsy procedure like this, even if at first it produced an exacerbation of the patient's condition, led to a recovery in the end. Not always but still often. When he has abused the physician enough and feels far enough away from his influence, his symptoms give way, or he decides to take some step which leads along the path to recovery. The final improvement then comes about 'of itself', or is ascribed to some totally indifferent treatment by some other doctor to whom the patient has later turned. In the case of the lady whose complaint against her physician we have heard, I should say that, despite everything, the 'wild' psycho-analyst did more for her than some highly respected authority who might have told her she was suffering from a 'vasomotor neurosis'. He forced her attention to the real cause of her trouble, or in that direction, and in spite of all her opposition this intervention of his cannot be without some favourable results. But he has done himself harm and helped to intensify the prejudices which patients feel, owing to their natural affective resistances, against the methods of psycho-analysis. And this can be avoided.
We shall soon have reached the end. You are perhaps disappointed that on the topic of the psycho-analytic method of therapy I have only spoken to you about theory and not about the conditions which determine whether a treatment is to be undertaken or about the results it produces. I shall discuss neither: the former because it is not my intention to give you practical instructions on how to carry out a psycho-analysis, and the latter because several reasons deter me from it. At the beginning of our talks, I emphasized the fact that under favourable conditions we achieve successes which are second to none of the finest in the field of internal medicine; and I can now add something further - namely that they could not have been achieved by any other procedure. If I were to say more than this I should be suspected of trying to drown the loudly raised voices of depreciation by self-advertisement. The threat has repeatedly been made against psycho-analysts by our medical 'colleagues' - even at public congresses - that a collection of the failures and damaging results of analysis would be published which would open the suffering public's eyes to the worthlessness of this method of treatment. But, apart from the malicious, denunciatory character of such a measure, it would not even be calculated to make it possible to form a correct judgement of the therapeutic effectiveness of analysis. Analytic therapy, as you know, is in its youth; it has taken a long time to establish its technique, and that could only be done in the course of working and under the influence of increasing experience. In consequence of the difficulties in giving instruction, the doctor who is a beginner in psycho-analysis is thrown back to a greater extent than other specialists on his own capacity for further development, and the results of his first years will never make it possible to judge the efficacy of analytic therapy.

[1916-1917, 3497]
Many attempts at treatment miscarried during the early period of analysis because they were undertaken in cases which were altogether unsuited to the procedure and which we should exclude to-day on the basis of our present view of the indications for treatment. But these indications, too, could only be arrived at by experiment. In those days we did not know a priori that paranoia and dementia praecox in strongly marked forms are inaccessible, and we had a right to make trial of the method on all kinds of disorders. But most of the failures of those early years were due not to the doctor's fault or an unsuitable choice of patients but to unfavourable external conditions. Here we have only dealt with internal resistances, those of the patient, which are inevitable and can be overcome. The external resistances which arise from the patient's circumstances, from his environment, are of small theoretical interest but of the greatest practical importance. Psycho-analytic treatment may be compared with a surgical operation and may similarly claim to be carried out under arrangements that will be the most favourable for its success. You know the precautionary measures adopted by a surgeon: a suitable room, good lighting, assistants, exclusion of the patient's relatives, and so on. Ask yourselves now how many of these operations would turn out successfully if they had to take place in the presence of all the members of the patient's family, who would stick their noses into the field of the operation and exclaim aloud at every incision. In psycho-analytic treatments the intervention of relatives is a positive danger and a danger one does not know how to meet. One is armed against the patient's internal resistances which one knows are inevitable, but how can one ward off these external resistances? No kind of explanations make any impression on the patient's relatives; they cannot be induced to keep at a distance from the whole business, and one cannot make common cause with them because of the risk of losing the confidence of the patient, who - quite rightly moreover - expects the person in whom he has put his trust to take his side. No one who has any experience of the rifts which so often divide a family will, if he is an analyst, be surprised to find that the patient's closest relatives sometimes betray less interest in his recovering than in his remaining as he is. When, as so often, the neurosis is related to conflicts between members of a family, the healthy party will not hesitate long in choosing between his own interest and the sick party's recovery. It is not to be wondered at, indeed, if a husband looks with disfavour on a treatment in which, as he may rightly suspect, the whole catalogue of his sins will be brought to light. Nor do we wonder at it; but we cannot in that case blame ourselves if our efforts remain unsuccessful and the treatment is broken off prematurely because the husband's resistance is added to that of his sick wife. We had in fact undertaken something which in the prevailing circumstances was unrealizable.

[1916-1917, 3498]
Instead of reporting a number of cases, I will tell you the story of a single one, in which, from considerations of medical discretion, I was condemned to play a long-suffering part. I undertook the analytic treatment - it was many years ago - of a girl who had for some time been unable, owing to anxiety, to go out in the street or to stay at home by herself. The patient slowly brought out an admission that her imagination had been seized by chance observations of the affectionate relations between her mother and a well-to-do friend of the family. But she was so clumsy - or so subtle - that she gave her mother a hint of what was being talked about in the analytic sessions. She brought this about by changing her behaviour towards her mother, by insisting on being protected by no one but her mother from her anxiety at being alone and by barring the door to her in her anxiety if she tried to leave the house. Her mother had herself been very neurotic in the past, but had been cured years before in a hydropathic establishment. Or rather, she had there made the acquaintance of the man with whom she was able to enter into a relation that was in every way satisfying to her. The girl's passionate demands took her aback, and she suddenly understood the meaning of her daughter's anxiety: the girl had made herself ill in order to keep her mother prisoner and to rob her of the freedom of movement that her relations with her lover required. The mother quickly made up her mind and brought the obnoxious treatment to an end. The girl was taken to a sanatorium for nervous diseases and was demonstrated for many years as 'a poor victim of psycho-analysis'. All this time, too, I was pursued by the calumny of responsibility for the unhappy end of the treatment. I kept silence, for I thought I was bound by the duty of medical discretion. Long afterwards I learnt from one of my colleagues, who visited the sanatorium and had seen the agoraphobic girl there, that the liaison between her mother and the well-to-do friend of the family was common knowledge in the city and that it was probably connived at by the husband and father. Thus it was to this 'secret' that the treatment had been sacrificed.

This presents a gloomy prospect for the effectiveness of psycho-analysis as a therapy - does it not? - even though we are able to explain the great majority of our failures by attributing them to interfering external factors. Friends of analysis have advised us to meet the threatened publication of our failures with statistics of our successes drawn up by ourselves. I did not agree to this. I pointed out that statistics are worthless if the items assembled in them are too heterogeneous; and the cases of neurotic illness which we had taken into treatment were in fact incomparable in a great variety of respects. Moreover, the period of time that could be covered was too short to make it possible to judge the durability of the cures. And it was altogether impossible to report on many of the cases: they concerned people who had kept both their illness and its treatment secret, and their recovery had equally to be kept secret. But the strongest reason for holding back lay in the realization that in matters of therapy people behave highly irrationally, so that one has no prospect of accomplishing anything with them by rational means. A therapeutic novelty is either received with delirious enthusiasm - as, for instance, when Koch introduced his first tuberculin against tuberculosis to the public - or it is treated with abysmal distrust - like Jenner's vaccination, which was in fact a blessing and which even to-day has its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, all the members of her family and a high medical authority, too, who was called in for consultation - were convinced that the fresh attack could only be the result of my attempted analysis. Nothing can be done against prejudices. You can see it again to-day in the prejudices which each group of nations at war has developed against the other. The most sensible thing to do is to wait, and to leave such prejudices to the eroding effects of time. One day the same people begin to think about the same things in quite a different way from before; why they did not think so earlier remains a dark mystery.

[1916-1917, 3500]
Let it be clearly understood that this last attempt at an explanation on the part of those who take the view opposed to mine results in the scenes from infancy being disposed of far more fundamentally than was announced to begin with. What was argued at first was that they were not realities but phantasies. But what is argued now is evidently that they are phantasies not of the patient but of the analyst himself, who forces them upon the person under analysis on account of some complexes of his own. An analyst, indeed, who hears this reproach, will comfort himself by recalling how gradually the construction of this phantasy which he is supposed to have originated came about, and, when all is said and done, how independently of the physician's incentive many points in its development proceeded; how, after a certain phase of the treatment, everything seemed to converge upon it, and how later, in the synthesis, the most various and remarkable results radiated out from it; how not only the large problems but the smallest peculiarities in the history of the case were cleared up by this single assumption. And he will disclaim the possession of the amount of ingenuity necessary for the concoction of an occurrence which can fulfil all these demands. But even this plea will be without an effect on an adversary who has not experienced the analysis himself. On the one side there will be a charge of subtle self-deception, and on the other of obtuseness of judgement; it will be impossible to arrive at a decision.

[1918b, 3539]

In the present case the content of the primal scene is a picture of sexual intercourse between the boy's parents in a posture especially favourable for certain observations. Now it would be no evidence whatever of the reality of such a scene if we were to find it in a patient whose symptoms (the effects of the scene, that is) had appeared at some time or other in the later part of his life. A person such as this might have acquired the impressions, the ideas, and the knowledge on a great number of different occasions in the course of the long interval; he might then have transformed them into an imaginary picture, have projected them back into his childhood, and have attached them to his parents. If, however, the effects of a scene of this sort appear in the child's fourth or fifth year, then he must have witnessed the scene at an age even earlier than that. But in that case we are still faced with all the disconcerting consequences which have arisen from the analysis of this infantile neurosis. The only way out would be to assume that the patient not only unconsciously imagined the primal scene, but also concocted the alteration in his character, his fear of the wolf, and his religious obsession; but such an expedient would be contradicted by his otherwise sober nature and by the direct tradition in his family. It must therefore be left at this (I can see no other possibility): either the analysis based on the neurosis in his childhood is all a piece of nonsense from start to finish, or everything took place just as I have described it above.

[1918b, 3542]

At an earlier stage in the discussion we were brought up against an ambiguity in regard to the patient's predilection for female nates and for sexual intercourse in the posture in which they are especially prominent. It seemed necessary to trace this predilection back to the intercourse which he had observed between his parents, while at the same time a preference of this kind is a general characteristic of archaic constitutions which are predisposed to an obsessional neurosis. But the contradiction is easily resolved if we regard it as a case of overdetermination. The person who was the subject of his observation of this posture during intercourse was, after all, his father in the flesh, and it may also have been from him that he had inherited this constitutional predilection. Neither his father's subsequent illness nor his family history contradicts this; as has been mentioned already, a brother of his father's died in a condition which must be regarded as the outcome of a severe obsessional disorder.

[1918b, 3542]
This memory recurred occasionally during the analysis, and called for an explanation; but for a long time none was to be found. Nevertheless it was to be assumed as a matter of course that a detail like this had not kept its place in his recollection on its own account, but that it was a screen-memory, representing something of more importance with which it was in some way connected. One day he told me that in his language a butterfly was called 'babushka', 'granny'. He added that in general butterflies had seemed to him like women and girls, and beetles and caterpillars like boys. So there could be little doubt that in this anxiety scene a recollection of some female person had been aroused. I will not hide the fact that at that time I put forward the possibility that the yellow stripes on the butterfly had reminded him of similar stripes on a piece of clothing worn by some woman. I only mention this as an illustration to show how inadequate the physician's constructive efforts usually are for clearing up questions that arise, and how unjust it is to attribute the results of analysis to the physician's imagination and suggestion. [1918b, 3571]

Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psycho-analytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative. [1923a, 3927]
Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

"Interpret!" A nasty word! I dislike the sound of it; it robs me of all certainty. If everything depends on my interpretation who can guarantee that I interpret right? So after all everything is left to my caprice.'

Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.
'But would not the best plan be not to give these difficult people any treatment at all, but to leave them to themselves! I cannot think it is worth while to expend such great efforts over each of them as you lead me to suppose that you make.'

[1926e, 4364]

I cannot approve of your suggestion. It is undoubtedly a more proper line to accept the complications of life rather than struggle against them. It may be true that not every neurotic whom we treat is worth the expenditure of an analysis; but there are some very valuable individuals among them as well. We must set ourselves the goal of bringing it about that as few human beings as possible enter civilized life with such a defective mental equipment. And for that purpose we must collect much experience and learn to understand many things. Every analysis can be instructive and bring us a yield of new understanding quite apart from the personal value of the individual patient.

[1926e, 4364]

We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no super-ego, the method of free association does not carry far with him, transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis - and even the analysis itself - is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child-analysis. It has automatically happened that child-analysis has become the domain of women analysts, and no doubt this will remain true.

[1933a, 4748]
You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninstructive; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

[1933a, 4751]
However much our therapeutic ambition may be tempted to undertake such tasks, experience flatly rejects the notion. If an instinctual conflict is not a currently active one, is not manifesting itself, we cannot influence it even by analysis. The warning that we should let sleeping dogs lie, which we have so often heard in connection with our efforts to explore the psychical underworld, is peculiarly inapposite when applied to the conditions of mental life. For if the instincts are causing disturbances, it is a proof that the dogs are not sleeping; and if they seem really to be sleeping, it is not in our power to awaken them. This last statement, however, does not seem to be quite accurate and calls for a more detailed discussion. Let us consider what means we have at our disposal for turning an instinctual conflict which is at the moment latent into one which is currently active. Obviously there are only two things that we can do. We can bring about situations in which the conflict does become currently active, or we can content ourselves with discussing it in the analysis and pointing out the possibility of its arising. The first of these two alternatives can be carried out in two ways: in reality, or in the transference - in either case by exposing the patient to a certain amount of real suffering through frustration and the damming up of libido. Now it is true that we already make use of a technique of this kind in our ordinary analytic procedure. What would otherwise be the meaning of the rule that analysis must be carried out 'in a state of frustration'? But this is a technique which we use in treating a conflict which is already currently active. We seek to bring this conflict to a head, to develop it to its highest pitch, in order to increase the instinctual force available for its solution. Analytic experience has taught us that the better is always the enemy of the good and that in every phase of the patient's recovery we have to fight against his inertia, which is ready to be content with an incomplete solution.

[1937c, 5027]

It cannot be disputed that analysts in their own personalities have not invariably come up to the standard of psychical normality to which they wish to educate their patients. Opponents of analysis often point to this fact with scorn and use it as an argument to show the uselessness of analytic exertions. We might reject this criticism as making unjustifiable demands. Analysts are people who have learned to practise a particular art; alongside of this, they may be allowed to be human beings like anyone else. After all, nobody maintains that a physician is incapable of treating internal diseases if his own internal organs are not sound; on the contrary, it may be argued that there are certain advantages in a man who is himself threatened with tuberculosis specializing in the treatment of persons suffering from that disease. But the cases are not on all fours. So long as he is capable of practising at all, a doctor suffering from disease of the lungs or heart is not handicapped either in diagnosing or treating internal complaints; whereas the special conditions of analytic work do actually cause the analyst's own defects to interfere with his making a correct assessment of the state of things in his patient and reacting to them in a useful way. It is therefore reasonable to expect of an analyst, as a part of his qualifications, a considerable degree of mental normality and correctness. In addition, he must possess some kind of superiority, so that in certain analytic situations he can act as a model for his patient and in others as a teacher. And finally we must not forget that the analytic relationship is based on a love of truth - that is, on a recognition of reality - and that it precludes any kind of sham or deceit.

[1937c, 5041]
It has always seemed to me to be greatly to the credit of a certain well-known man of science that he treated psycho-analysis fairly at a time when most other people felt themselves under no such obligation. On one occasion, nevertheless, he gave expression to an opinion upon analytic technique which was at once derogatory and unjust. He said that in giving interpretations to a patient we treat him upon the famous principle of 'Heads I win, tails you lose'.¹ That is to say, if the patient agrees with us, then the interpretation is right; but if he contradicts us, that is only a sign of his resistance, which again shows that we are right. In this way we are always in the right against the poor helpless wretch whom we are analysing, no matter how he may respond to what we put forward. Now, since it is in fact true that a 'No' from one of our patients is not as a rule enough to make us abandon an interpretation as incorrect, a revelation such as this of the nature of our technique has been most welcome to the opponents of analysis. It is therefore worth while to give a detailed account of how we are accustomed to arrive at an assessment of the 'Yes' or 'No' of our patients during analytic treatment - of their expression of agreement or of denial. The practising analyst will naturally learn nothing in the course of this apologia that he does not know already.

[1937d, 5049]
I have been engaged for years in researches into the aetiology of the major neuroses (functional nervous states analogous to hysteria) and it is the result of those studies that I propose to describe to you in the following pages. To avoid any possible misunderstanding I shall begin by making two remarks on the nosography of the neuroses and on the aetiology of the neuroses in general.

[1896a, 371]

I am quite sure that this theory will call up a storm of contradictions from contemporary physicians. But this is not the place in which to present the documents and the experiences which have forced me to my convictions, nor to explain the true meaning of the rather vague expression 'disorders of the economics of the nervous system'. This will be done, most fully, I hope, in a work on the subject which I have in preparation. In the present paper I limit myself to reporting my findings.

[1896a, 374]

I have now come to the end of what I have to say to-day. Prepared as I am to meet with contradiction and disbelief, I should like to say one thing more in support of my position. Whatever you may think about the conclusions I have come to, I must ask you not to regard them as the fruit of idle speculation. They are based on a laborious individual examination of patients which has in most cases taken up a hundred or more hours of work. What is even more important to me than the value you put on my results is the attention you give to the procedure I have employed. This procedure is new and difficult to handle, but it is nevertheless irreplaceable for scientific and therapeutic purposes. You will realize, I am sure, that one cannot properly deny the findings which follow from this modification of Breuer's procedure so long as one puts it aside and uses only the customary method of questioning patients. To do so would be like trying to refute the findings of histological technique by relying upon macroscopic examination. The new method of research gives wide access to a new element in the psychical field of events, namely, to processes of thought which have remained unconscious - which, to use Breuer's expression, are 'inadmissible to consciousness'. Thus it inspires us with the hope of a new and better understanding of all functional psychical disturbances. I cannot believe that psychiatry will long hold back from making use of this new pathway to knowledge.

[1896c, 433]

My knowledge of that procedure was reached in the following manner. I have been engaged for many years (with a therapeutic aim in view) in unravelling certain psychopathological structures - hysterical phobias, obsessional ideas, and so on. I have been doing so, in fact, ever since I learnt from an important communication by Josef Breuer that as regards these structures (which are looked on as pathological symptoms) unravelling these coincides with removing them. (Cf. Breuer and Freud, 1895.) If a pathological idea of this sort can be traced back to the elements in the patient's mental life from which it originated, it simultaneously crumbles away and the patient is freed from it. Considering the impotence of our other therapeutic efforts and the puzzling nature of these disorders, I felt tempted to follow the path marked out by Breuer, in spite of every difficulty, till a complete explanation was reached. I shall have on another occasion to report at length upon the form finally taken by this procedure and the results of my labours. It was in the course of these psycho-analytic studies that I came upon dream-interpretation. My patients were pledged to communicate to me every idea or thought that occurred to them in connection with some particular subject; amongst other things they told me their dreams and so taught me that a dream can be inserted into the psychical chain that has to be traced backwards in the memory from a pathological idea. It was then only a short step to treating the dream itself as a symptom and to applying to dreams the method of interpretation that had been worked out for symptoms.

[1900a, 603]
A number of the results of the analysis have been omitted, because at the time when work was broken off they had either not been established with sufficient certainty or they required further study before any general statement could be made about them. At other points, where it seemed to be permissible, I have indicated the direction along which some particular solution would probably have been found to lie. I have in this paper left entirely out of account the technique, which does not at all follow as a matter of course, but by whose means alone the pure metal of valuable unconscious thoughts can be extracted from the raw material of the patient's associations. This brings with it the disadvantage of the reader being given no opportunity of testing the correctness of my procedure in the course of this exposition of the case. I found it quite impracticable, however, to deal simultaneously with the technique of analysis and with the internal structure of a case of hysteria: I could scarcely have accomplished such a task, and if I had, the result would have been almost unreadable. The technique of analysis demands an entirely separate exposition, which would have to be illustrated by numerous examples chosen from a very great variety of cases and which would not have to take the results obtained in each particular case into account. Nor have I attempted in this paper to substantiate the psychological postulates which will be seen to underlie my descriptions of mental phenomena. A cursory attempt to do so would have effected nothing; an exhaustive one would have been a volume in itself. I can only assure the reader that I approached the study of the phenomena revealed by observation of the psychoneuroses without being pledged to any particular psychological system, and that I then proceeded to adjust my views until they seemed adapted for giving an account of the collection of facts which had been observed. I take no pride in having avoided speculation; the material for my hypotheses was collected by the most extensive and laborious series of observations. The decidedness of my attitude on the subject of the unconscious is perhaps specially likely to cause offence, for I handle unconscious ideas, unconscious trains of thought, and unconscious impulses as though they were no less valid and unimpeachable psychological data than conscious ones. But of this I am certain - that any one who sets out to investigate the same region of phenomena and employs the same method will find himself compelled to take up the same position, however much philosophers may expostulate. [1905e, 1446]

The fact that this book is based upon the psycho-analytic observations which led to its composition is shown, however, not only in the choice of the topics dealt with, but also in their arrangement. Throughout the entire work the various factors are placed in a particular order of precedence: preference is given to the accidental factors while disposition is left in the background, and more weight is attached to ontogenesis than to phylogenesis. For it is the accidental factors that play the principal part in analysis: they are almost entirely subject to its influence. The dispositional ones only come to light after them, as something stirred into activity by experience: adequate consideration of them would lead far beyond the sphere of psycho-analysis. [1905d, 1460]
Nevertheless I cannot bring myself to accept the idea that this part of psycho-analytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation of this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psycho-analysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.

Permit me now to correct a few mistakes that have been made in regard to this cathartic or analytic method of psychotherapy, and to give a few explanations on the subject.

My theory of the aetiological importance of the sexual factor in the neuroses can best be appreciated, in my opinion, by following the history of its development. For I have no desire whatever to deny that it has gone through a process of evolution and been modified in the course of it. My professional colleagues may find a guarantee in this admission that the theory is nothing other than the product of continuous and ever deeper-going experience. What is born of speculation, on the contrary, may easily spring into existence complete and there after remain unchangeable.

I think it is worth emphasizing the fact that, whatever modifications my views on the aetiology of the psychoneuroses have passed through, there are two positions which I have never repudiated or abandoned - the importance of sexuality and of infantilism. Apart from this, accidental influences have been replaced by constitutional factors and 'defence' in the purely psychological sense has been replaced by organic 'sexual repression'. The question may, however, be raised of where convincing evidence is to be found in favour of the alleged aetiological importance of sexual factors in the psychoneuroses, in view of the fact that the onset of these illnesses may be observed in response to the most commonplace emotions or even to somatic precipitating causes, and since I have had to abandon a specific aetiology depending on the particular form of the childhood experiences concerned. To such a question I would reply that the psycho-analytic examination of neurotics is the source from which this disputed conviction of mine is derived. If we make use of that irreplaceable method of research, we discover that the patient's symptoms constitute his sexual activity (whether wholly or in part), which arises from the sources of the normal or perverse component instincts of sexuality. Not only is a large part of the symptomatology of hysteria derived directly from expressions of sexual excitement, not only do a number of erotogenic zones attain the significance of genitals during neuroses owing to an intensification of infantile characteristics, but the most complicated symptoms are themselves revealed as representing, by means of 'conversion', phantasies which have a sexual situation as their subject-matter. Anyone who knows how to interpret the language of hysteria will recognize that the neurosis is concerned only with the patient's repressed sexuality. The sexual function must, however, be understood in its true extent, as it is laid down by disposition in infancy. Wherever some commonplace emotion must be included among the determinants of the onset of the illness, analysis invariably shows that it is the sexual component of the traumatic experience - a component that is never lacking which has produced the pathogenic result.
It is quite possible that the author's disavowal does not stop at this. He may perhaps altogether deny any knowledge of the rules which we have shown that he has followed, and he may repudiate all the purposes we have recognized in his work. I do not regard this as improbable; but if it is so, there are only two possible explanations. It may be that we have produced a complete caricature of an interpretation by introducing into an innocent work of art purposes of which its creator had no notion, and by so doing have shown once more how easy it is to find what one is looking for and what is occupying one's own mind - a possibility of which the strangest examples are to be found in the history of literature. Let every reader now make up his mind whether he is able to accept this explanation. We ourselves, of course, hold to the other view, the remaining alternative. Our opinion is that the author need have known nothing of these rules and purposes, so that he could disavow them in good faith, but that nevertheless we have not discovered anything in his work that is not already in it. We probably draw from the same source and work upon the same object, each of us by another method. And the agreement of our results seems to guarantee that we have both worked correctly. Our procedure consists in the conscious observation of abnormal mental processes in other people so as to be able to elicit and announce their laws. The author no doubt proceeds differently. He directs his attention to the unconscious in his own mind, he listens to its possible developments and lends them artistic expression instead of suppressing them by conscious criticism. Thus he experiences from himself what we learn from others - the laws which the activities of this unconscious must obey. But he need not state these laws, nor even be clearly aware of them; as a result of the tolerance of his intelligence, they are incorporated within his creations. We discover these laws by analysing his writings just as we find them from cases of real illness; but the conclusion seems inescapable that either both of us, the writer and the doctor, have misunderstood the unconscious in the same way, or we have both understood it correctly. This conclusion is of great value to us, and it is on its account that it has been worth while to investigate by the methods of medical psycho-analysis the way in which the formation and the cure of the delusions as well as the dreams are represented in Jensen's *Gradiva*.

[1907a, 1883]

The material on which the following synthesis is based is derived from several sources. Firstly, from the direct observation of what children say and do; secondly, from what adult neurotics consciously remember from their childhood and relate during psycho-analytic treatment; and thirdly, from the inferences and constructions, and from the unconscious memories translated into conscious material, which result from the psycho-analysis of neurotics.

[1908c, 1966]

It is seldom that we are in the fortunate position of being able, as in the present instance, to establish the facts upon which these tales of the individual's prehistoric past are based, by recourse to the unimpeachable testimony of a grown-up person. Even so, the statement made by our patient's mother leaves the way open to various possibilities. That she did not proclaim the sexual character of the offence for which the child was punished may have been due to the activity of her own censorship; for with all parents it is precisely this sexual element in their children's past that their own censorship is most anxious to eliminate. But it is just as possible that the child was reproved by his nurse or by his mother herself for some commonplace piece of naughtiness of a non-sexual nature, and that his reaction was so violent that he was castigated by his father. In phantasies of this kind nurses and servants are regularly replaced by the superior figure of the mother. A deeper interpretation of the patient's dreams in relation to this episode revealed the clearest traces of the presence in his mind of an imaginative production of a positively epic character. In this his sexual desires for his mother and sister and his sister's premature death were linked up with the young hero's chastisement at his father's hand. It was impossible to unravel this tissue of phantasy thread by thread; the therapeutic success of the treatment was precisely what stood in the way of this. The patient recovered, and his ordinary life began to assert its claims: there were many tasks before him, which he had already neglected far too long, and which were incompatible with a continuation of the treatment. I am not to be blamed, therefore, for this gap in the analysis. The scientific results of psycho-analysis are at present only a by-product of its therapeutic aims, and for that reason it is often just in those cases where treatment fails that most discoveries are made.

[1909d, 2162]
I shall not in the present paper attempt any discussion of the psychological significance of obsessional thinking. Such a discussion would be of extraordinary value in its results, and would do more to clarify our ideas upon the nature of the conscious and the unconscious than any study of hysteria or the phenomena of hypnosis. It would be a most desirable thing if the philosophers and psychologists who develop brilliant theoretical views on the unconscious upon a basis of hearsay knowledge or from their own conventional definitions would first submit to the convincing impressions which may be gained from a first-hand study of the phenomena of obsessional thinking. We might almost go to the length of requiring it of them, if the task were not so far more laborious than the methods of work to which they are accustomed. I will only add here that in obsessional neuroses the unconscious mental processes occasionally break through into consciousness in their pure and undistorted form, that such incursions may take place at every possible stage of the unconscious process of thought, and that at the moment of the incursion the obsessional ideas can, for the most part, be recognized as formations of very long standing. This accounts for the striking circumstance that, when the analyst tries, with the patient's help, to discover the date of the first occurrence of an obsessional idea, the patient is obliged to place it further and further back as the analysis proceeds, and is constantly finding fresh 'first' occasions for the appearance of the obsession.

[1909d, 2178]

This last part of my account will not, I fear, strike you as particularly clear. But you should bear in mind that we are dealing with novel and difficult considerations, and it may well be that it is not possible to make them much clearer - which shows that we still have a long way to go in our knowledge of the subject. Moreover, Breuer's theory of 'hypnoid states' turned out to be impeding and unnecessary, and it has been dropped by psycho-analysis to-day. Later on, you will at least have a hint of the influences and processes that were to be discovered behind the screen of hypnoid states erected by Breuer. You will have rightly formed the opinion, too, that Breuer's investigation has only succeeded in offering you a very incomplete theory and an unsatisfying explanation of the phenomena observed. But complete theories do not fall ready-made from the sky and you would have even better grounds for suspicion if anyone presented you with a flawless and complete theory at the very beginning of his observations. Such a theory could only be a child of his speculation and could not be the fruit of an unprejudiced examination of the facts.

[1910a, 2209]

When, later on, I set about continuing on my own account the investigations that had been begun by Breuer, I soon arrived at another view of the origin of hysterical dissociation (the splitting of consciousness). A divergence of this kind, which was to be decisive for everything that followed, was inevitable, since I did not start out, like Janet, from laboratory experiments, but with therapeutic aims in mind.

[1910a, 2211]
I was driven forward above all by practical necessity. The cathartic procedure, as carried out by Breuer, presupposed putting the patient into a state of deep hypnosis; for it was only in a state of hypnosis that he attained a knowledge of the pathogenic connections which escaped him in his normal state. But I soon came to dislike hypnosis, for it was a temperamental and, one might almost say, a mystical ally. When I found that, in spite of all my efforts, I could not succeed in bringing more than a fraction of my patients into a hypnotic state, I determined to give up hypnosis and to make the cathartic procedure independent of it. Since I was not able at will to alter the mental state of the majority of my patients, I set about working with them in their normal state. At first, I must confess, this seemed a senseless and hopeless undertaking. I was set the task of learning from the patient something that I did not know and that he did not know himself. How could one hope to elicit it? But there came to my help a recollection of a most remarkable and instructive experiment which I had witnessed when I was with Bernheim at Nancy. Bernheim showed us that people whom he had put into a state of hypnotic somnambulism, and who had had all kinds of experiences while they were in that state, only appeared to have lost the memory of what they had experienced during somnambulism; it was possible to revive these memories in their normal state. It is true that, when he questioned them about their somnambulistic experiences, they began by maintaining that they knew nothing about them; but if he refused to give way, and insisted, and assured them that they did know about them, the forgotten experiences always reappeared.

[1910a, 2211]

You will now see in what it is that the difference lies between our view and Janet's. We do not derive the psychical splitting from an innate incapacity for synthesis on the part of the mental apparatus; we explain it dynamically, from the conflict of opposing mental forces and recognize it as the outcome of an active struggling on the part of the two psychical groupings against each other. But our view gives rise to a large number of fresh problems. Situations of mental conflict are, of course, exceedingly common; efforts by the ego to ward off painful memories are quite regularly to be observed without their producing the result of a mental split. The reflection cannot be escaped that further determinants must be present if the conflict is to lead to dissociation. I will also readily grant you that the hypothesis of repression leaves us not at the end but at the beginning of a psychological theory. We can only go forward step by step however, and complete knowledge must await the results of further and deeper researches.

[1910a, 2214]

Psycho-analysis is a remarkable combination, for it comprises not only a method of research into the neuroses but also a method of treatment based on the aetiology thus discovered. I may begin by saying that psycho-analysis is not a child of speculation, but the outcome of experience; and for that reason, like every new product of science, is unfinished. It is open to anyone to convince himself by his own investigations of the correctness of the theses embodied in it, and to help in the further development of the study.

[1913m, 2545]

If anyone sought to place the theory of repression and resistance among the premises instead of the findings of psycho-analysis, I should oppose him most emphatically. Such premises of a general psychological and biological nature do exist, and it would be useful to consider them on some other occasion; but the theory of repression is a product of psychoanalytic work, a theoretical inference legitimately drawn from innumerable observations.

[1914d, 2885]
It is not difficult to find a factual refutation of Jung's misconceptions of psycho-analysis and deviations from it. Every analysis conducted in a proper manner, and in particular every analysis of a child, strengthens the convictions upon which the theory of psycho-analysis is founded, and rebuts the re-interpretations made by both Jung's and Adler's systems. In the days before his illumination, Jung himself carried out and published an analysis of this kind of a child; it remains to be seen whether he will undertake a new interpretation of its results with the help of a different 'one-sided arrangement of the facts', to use the expression employed by Adler in this connection.

[1914d, 2927]

To be asked to give a definite answer to the second question must occasion perceptible uneasiness in every psycho-analyst. One dislikes the thought of abandoning observation for barren theoretical controversy, but nevertheless one must not shirk an attempt at clarification. It is true that notions such as that of an ego-libido, an energy of the ego-instincts, and so on, are neither particularly easy to grasp, nor sufficiently rich in content; a speculative theory of the relations in question would begin by seeking to obtain a sharply defined concept as its basis. But I am of opinion that that is just the difference between a speculative theory and a science erected on empirical interpretation. The latter will not envy speculation its privilege of having a smooth, logically unassailable foundation, but will gladly content itself with nebulous, scarcely imaginable basic concepts, which it hopes to apprehend more clearly in the course of its development, or which it is even prepared to replace by others. For these ideas are not the foundation of science, upon which everything rests: that foundation is observation alone. They are not the bottom but the top of the whole structure, and they can be replaced and discarded without damaging it. The same thing is happening in our day in the science of physics, the basic notions of which as regards matter, centres of force, attraction, etc., are scarcely less debatable than the corresponding notions in psycho-analysis.

[1914c, 2934]

Study of the derivatives of the Ucs. will completely disappoint our expectations of a schematically clear-cut distinction between the two psychical systems. This will no doubt give rise to dissatisfaction with our results and will probably be used to cast doubts on the value of the way in which we have divided up the psychical processes. Our answer is, however, that we have no other aim but that of translating into theory the results of observation, and we deny that there is any obligation on us to achieve at our first attempt a well-rounded theory which will commend itself by its simplicity. We shall defend the complications of our theory so long as we find that they meet the results of observation, and we shall not abandon our expectations of being led in the end by those very complications to the discovery of a state of affairs which, while simple in itself, can account for all the complications of reality.

[1915e, 3013]
On the other hand, you should not for a moment suppose that what I put before you as the psycho-analytic view is a speculative system. It is on the contrary empirical - either a direct expression of observations or the outcome of a process of working them over. Whether this working-over has been carried out in an adequate and justifiable manner will appear in the course of the further advance of the science, and indeed I may assert without boasting, after a lapse of nearly twenty-five years, and having reached a fairly advanced age, that these observations are the result of particularly hard, concentrated and deep-going work. I have often had an impression that our opponents were unwilling to take any account of this origin of our theses, as though they thought what was in question were merely subjectively determined notions to which someone else might oppose others of his own choice. This behaviour of our opponents is not entirely intelligible to me. It may perhaps be due to the fact that, as a doctor, one usually makes so little contact with neurotic patients and pays so little attention to what they say that one cannot imagine the possibility that anything valuable could be derived from their communications - the possibility, that is, of carrying out any thorough observations upon them. I take this opportunity of assuring you that in the course of these lectures I shall indulge in very little controversy, especially with individuals. I have never been able to convince myself of the truth of the maxim that strife is the father of all things. I believe it is derived from the Greek sophists and is at fault, like them, through overvaluing dialectics. It seems to me, on the contrary, that what is known as scientific controversy is on the whole quite unproductive, apart from the fact that it is almost always conducted on highly personal lines. Up to a few years ago I was able to boast that I had only once engaged in a regular scientific dispute - with one single worker (Löwenfeld of Munich). It ended in our becoming friends and we have remained so to this day. But I did not repeat the experiment for a long time, as I did not feel sure that the outcome would be the same.

[1916-1917, 3327]

The difficulty in understanding now lies else here. The anxiety which signifies a flight of the ego from its libido is after all supposed to be derived from that libido itself. This is obscure and it reminds us not to forget that after all a person's libido is fundamentally something of his and cannot be contrasted with him as something external. It is the topographical dynamics of the generation of anxiety which are still obscure to us - the question of what mental energies are produced in what process and from what mental systems they derive. This is once more a question which I cannot promise to answer: but there are two other tracks which we must not fail to follow and in doing so we shall once more be making use of direct observation and analytic enquiry as a help to our speculations. We will turn to the genesis of anxiety in children and to the source of the neurotic anxiety which is attached to phobias.

[1916-1917, 3452]
We shall soon have reached the end. You are perhaps disappointed that on the topic of the psycho-analytic method of therapy I have only spoken to you about theory and not about the conditions which determine whether a treatment is to be undertaken or about the results it produces. I shall discuss neither: the former because it is not my intention to give you practical instructions on how to carry out a psycho-analysis, and the latter because several reasons deter me from it. At the beginning of our talks, I emphasized the fact that under favourable conditions we achieve successes which are second to none of the finest in the field of internal medicine; and I can now add something further - namely that they could not have been achieved by any other procedure. If I were to say more than this I should be suspected of trying to drown the loudly raised voices of depreciation by self-advertisement. The threat has repeatedly been made against psycho-analysts by our medical 'colleagues' - even at public congresses - that a collection of the failures and damaging results of analysis would be published which would open the suffering public's eyes to the worthlessness of this method of treatment. But, apart from the malicious, denunciatory character of such a measure, it would not even be calculated to make it possible to form a correct judgement of the therapeutic effectiveness of analysis. Analytic therapy, as you know, is in its youth; it has taken a long time to establish its technique, and that could only be done in the course of working and under the influence of increasing experience. In consequence of the difficulties in giving instruction, the doctor who is a beginner in psycho-analysis is thrown back to a greater extent than other specialists on his own capacity for further development, and the results of his first years will never make it possible to judge the efficacy of analytic therapy.

[1916-1917, 3497]

It is obvious that a case such as that which is described in these pages might be made an excuse for dragging into the discussion every one of the findings and problems of psycho-analysis. But this would be an endless and unjustifiable labour. It must be recognized that everything cannot be learnt from a single case and that everything cannot be decided by it; we must content ourselves with exploiting whatever it may happen to show most clearly. There are in any case narrow limits to what a psycho-analysis is called upon to explain. For, while it is its business to explain the striking symptoms by revealing their genesis, it is not its business to explain but merely to describe the psychical mechanisms and instinctual processes to which one is led by that means. In order to derive fresh generalizations from what has thus been established with regard to the mechanisms and instincts, it would be essential to have at one's disposal numerous cases as thoroughly and deeply analysed as the present one. But they are not easily to be had, and each one of them requires years of labour. So that advances in these spheres of knowledge must necessarily be slow. There is no doubt a great temptation to content oneself with 'scratching' the mental surface of a number of people and of replacing what is left undone by speculation - the latter being put under the patronage of some school or other of philosophy. Practical requirements may also be adduced in favour of this procedure; but no substitute can satisfy the requirements of science.

[1918b, 3583]
The theory of psycho-analysis (a theory based on observation) holds firmly to the view that the motive forces of repression must not be sexualized. Man's archaic heritage forms the nucleus of the unconscious mind; and whatever part of that heritage has to be left behind in the advance to later phases of development, because it is unserviceable or incompatible with what is new and harmful to it, falls a victim to the process of repression. This selection is made more successfully with one group of instincts than with the other. In virtue of special circumstances which have often been pointed out already, the latter group, that of the sexual instincts, are able to defeat the intentions of repression, and to enforce their representation by substitutive formations of a disturbing kind. For this reason infantile sexuality, which is held under repression, acts as the chief motive force in the formation of symptoms; and the essential part of its content, the Oedipus complex, is the nuclear complex of neuroses. I hope that in this paper I have raised an expectation that the sexual aberrations of childhood, as well as those of mature life, are ramifications of the same complex.

Psycho-analysis was born out of medical necessity. It sprang from the need for bringing help to neurotic patients, who had found no relief through rest-cures, through the arts of hydropathy or through electricity. A most remarkable observation made by Josef Breuer had excited a hope that the more one understood of the hitherto unexplored origin of their symptoms the more extensive would be the help one could afford them. Thus it came about that psycho-analysis, being originally a purely medical technique, was from the first directed towards research, towards the discovery of causal chains at once far-reaching and recondite.

Psycho-analysis an Empirical Science. - Psycho-analysis is not, like philosophies, a system starting out from a few sharply defined basic concepts, seeking to grasp the whole universe with the help of these and, once it is completed, having no room for fresh discoveries or better understanding. On the contrary, it keeps close to the facts in its field of study, seeks to solve the immediate problems of observation, gropes its way forward by the help of experience, is always incomplete and always ready to correct or modify its theories. There is no incongruity (any more than in the case of physics or chemistry) if its most general concepts lack clarity and if its postulates are provisional; it leaves their more precise definition to the results of future work.

Psycho-analysis has been reproached time after time with ignoring the higher, moral, supra-personal side of human nature. The reproach is doubly unjust, both historically and methodologically. For, in the first place, we have from the very beginning attributed the function of instigating repression to the moral and aesthetic trends in the ego, and secondly, there has been a general refusal to recognize that psycho-analytic research could not, like a philosophical system, produce a complete and ready-made theoretical structure, but had to find its way step by step along the path towards understanding the intricacies of the mind by making an analytic dissection of both normal and abnormal phenomena. So long as we had to concern ourselves with the study of what is repressed in mental life, there was no need for us to share in any agitated apprehensions as to the whereabouts of the higher side of man. But now that we have embarked upon the analysis of the ego we can give an answer to all those whose moral sense has been shocked and who have complained that there must surely be a higher nature in man: 'Very true,' we can say, 'and here we have that higher nature, in this ego ideal or super-ego, the representative of our relation to our parents. When we were little children we knew these higher natures, we admired them and feared them; and later we took them into ourselves.'
The difficulty of the work of research in psycho-analysis is clearly shown by the fact of its being possible, in spite of whole decades of unremitting observation, to overlook features that are of general occurrence and situations that are characteristic, until at last they confront one in an unmistakable form. The remarks that follow are intended to make good a neglect of this sort in the field of infantile sexual development.

So it comes about that psycho-analysis derives nothing but disadvantages from its middle position between medicine and philosophy. Doctors regard it as a speculative system and refuse to believe that, like every other natural science, it is based on a patient and tireless elaboration of facts from the world of perception; philosophers, measuring it by the standard of their own artificially constructed systems, find that it starts from impossible premisses and reproach it because its most general concepts (which are only now in process of evolution) lack clarity and precision.

One of my opponents boasted of silencing his patients as soon as they began to talk of anything sexual and evidently thought that this technique gave him a right to judge the part played by sexuality in the aetiology of the neuroses. Apart from emotional resistances, which were so easily explicable by the psycho-analytic theory that it was impossible to be misled by them, it seemed to me that the main obstacle to agreement lay in the fact that my opponents regarded psycho-analysis as a product of my speculative imagination and were unwilling to believe in the long, patient and unbiased work which had gone to its making. Since in their opinion analysis had nothing to do with observation or experience, they believed that they themselves were justified in rejecting it without experience. Others again, who did not feel so strongly convinced of this, repeated in their resistance the classical manoeuvre of not looking through the microscope so as to avoid seeing what they had denied. It is remarkable, indeed, how incorrectly most people act when they are obliged to form a judgement of their own on some new subject. For years I have been told by 'benevolent' critics - and I hear the same thing even to-day - that psycho-analysis is right up to such-and-such a point but that there it begins to exaggerate and to generalize without justification. And I know that, though nothing is more difficult than to decide where such a point lies, these critics had been completely ignorant of the whole subject only a few weeks or days earlier.
It remains to be seen whether this construction will turn out to be serviceable. Although it arose from a desire to fix some of the most important theoretical ideas of psycho-analysis, it goes far beyond psycho-analysis. I have repeatedly heard it said contemptuously that it is impossible to take a science seriously whose most general concepts are as lacking in precision as those of libido and of instinct in psycho-analysis. But this reproach rests on a complete misconception of the facts. Clear basic concepts and sharply drawn definitions are only possible in the mental sciences in so far as the latter seek to fit a region of facts into the frame of a logical system. In the natural sciences, of which psychology is one, such clear-cut general concepts are superfluous and indeed impossible. Zoology and Botany did not start from correct and adequate definitions of an animal and a plant; to this very day biology has been unable to give any certain meaning to the concept of life. Physics itself, indeed, would never have made any advance if it had had to wait until its concepts of matter, force, gravitation, and so on, had reached the desirable degree of clarity and precision. The basic ideas or most general concepts in any of the disciplines of science are always left indeterminate at first and are only explained to begin with by reference to the realm of phenomena from which they were derived; it is only by means of a progressive analysis of the material of observation that they can be made clear and can find a significant and consistent meaning. I have always felt it as a gross injustice that people have refused to treat psycho-analysis like any other science. This refusal found an expression in the raising of the most obstinate objections. Psycho-analysis was constantly reproached for its incompleteness and insufficiencies; though it is plain that a science based upon observation has no alternative but to work out its findings piecemeal and to solve its problems step by step. Again, when I endeavoured to obtain for the sexual function the recognition which had so long been withheld from it, psycho-analytic theory was branded as 'pan-sexualism'. And when I laid stress on the hitherto neglected importance of the part played by the accidental impressions of early youth, I was told that psycho-analysis was denying constitutional and hereditary factors - a thing which I had never dreamt of doing. It was a case of contradiction at any price and by any methods.

[1925d, 4233]

I should not like to create an impression that during this last period of my work I have turned my back upon patient observation and have abandoned myself entirely to speculation. I have on the contrary always remained in the closest touch with the analytic material and have never ceased working at detailed points of clinical or technical importance. Even when I have moved away from observation, I have carefully avoided any contact with philosophy proper. This avoidance has been greatly facilitated by constitutional incapacity. I was always open to the ideas of G. T. Fechner and have followed that thinker upon many important points. The large extent to which psycho-analysis coincides with the philosophy of Schopenhauer - not only did he assert the dominance of the emotions and the supreme importance of sexuality but he was even aware of the mechanism of repression - is not to be traced to my acquaintance with his teaching. I read Schopenhauer very late in my life. Nietzsche, another philosopher whose guesses and intuitions often agree in the most astonishing way with the laborious findings of psycho-analysis, was for a long time avoided by me on that very account; I was less concerned with the question of priority than with keeping my mind unembarrassed.

[1925d, 4234]
If I am to say anything intelligible to you, I shall no doubt have to tell you something of a psychological theory which is not known or not appreciated outside analytic circles. It will be easy to deduce from this theory what we want from our patients and how we obtain it. I shall expound it to you dogmatically, as though it were a complete theoretical structure. But do not suppose that it came into being as such a structure, like a philosophical system. We have developed it very slowly, we have wrestled over every small detail of it, we have unceasingly modified it, keeping a continuous contact with observation, till it has finally taken a shape in which it seems to suffice for our purposes. Only a few years ago I should have had to clothe this theory in other terms. Nor, of course, can I guarantee to you that the form in which it is expressed to-day will remain the final one. Science, as you know, is not a revelation; long after its beginnings it still lacks the attributes of definiteness, immutability and infallibility for which human thought so deeply longs. But such as it is, it is all that we can have. If you will further bear in mind that our science is very young, scarcely as old as the century, and that it is concerned with what is perhaps the most difficult material that can be the subject of human research, you will easily be able to adopt the correct attitude towards my exposition. But interrupt me whenever you feel inclined, if you cannot follow me or if you want further explanations.

Oh, by no means. It is based on direct observation. What happened was this. We had begun by inferring the content of sexual childhood from the analysis of adults - that is to say, some twenty to forty years later. Afterwards, we undertook analyses on children themselves, and it was no small triumph when we were thus able to confirm in them everything that we had been able to divine, in spite of the amount to which it had been overlaid and distorted in the interval.

At this point two observations may be in place. It must not be supposed that these very general ideas are presuppositions upon which the work of psycho-analysis depends. On the contrary, they are its latest conclusions and are 'open to revision'. Psycho-analysis is founded securely upon the observation of the facts of mental life; and for that very reason its theoretical superstructure is still incomplete and subject to constant alteration. Secondly, there is no reason for surprise that psycho-analysis, which was originally no more than an attempt at explaining pathological mental phenomena, should have developed into a psychology of normal mental life. The justification for this arose with the discovery that the dreams and mistakes of normal men have the same mechanism as neurotic symptoms.

I propose further, Ladies and Gentlemen, to say a few words to you about psycho-analysis as a form of therapy. I discussed the theoretical side of this question fifteen years ago and I cannot formulate it in any other manner to-day; I have now to tell you of our experience during this interval. As you know, psycho-analysis originated as a method of treatment; it has far outgrown this, but it has not abandoned its home-ground and it is still linked to its contact with patients for increasing its depth and for its further development. The accumulated impressions from which we derive our theories could be arrived at in no other way. The failures we meet with as therapists are constantly setting us new tasks and the demands of real life are an effective guard against an overgrowth of the speculation which we cannot after all do without in our work. I have already discussed long ago the means used by psycho-analysis in helping patients, when it does help them, and the method by which it does so; to-day I shall enquire how much it achieves.

[1926e, 1926f, 1933a, 4334, 4356, 4404]
The teachings of psycho-analysis are based on an incalculable number of observations and experiences, and only someone who has repeated those observations on himself and on others is in a position to arrive at a judgement of his own upon it.

[1940a [1938], 4956]

All of the general discoveries and hypotheses which I brought forward in the first chapter were, of course, arrived at by laborious and patient detailed work of the kind of which I have given an example in the previous chapter. We may now feel tempted to make a survey of the increases in knowledge that we have achieved by work such as this and to consider what paths we have opened for further advances. In this connection we may be struck by the fact that we have so often been obliged to venture beyond the frontiers of the science of psychology. The phenomena with which we were dealing do not belong to psychology alone; they have an organic and biological side as well, and accordingly in the course of our efforts at building up psycho-analysis we have also made some important biological discoveries and have not been able to avoid framing new biological hypotheses.

[1940a [1938], 5002]
Since the manifestations of the psychoneuroses arise from the deferred action of unconscious psychical traces, they are accessible to psychotherapy. But in this case the therapy must pursue paths other than the only one so far followed of suggestion with or without hypnosis. Basing myself on the 'cathartic' method introduced by Josef Breuer, I have in recent years almost completely worked out a therapeutic procedure which I propose to describe as 'psychoanalytic'. I owe a great number of successes to it, and I hope I may be able further to increase its effectiveness considerably. The first accounts of the technique and scope of this method were given in *Studies on Hysteria*, written jointly with Breuer and published in 1895. Since then a good deal, as I think I may say, has been altered for the better. Whereas at that time we modestly declared that we could undertake to only to remove the symptoms of hysteria, not to cure hysteria itself, this distinction has since come to seem to me without substance, so that there is a prospect of a genuine cure of hysteria and obsessions. It is therefore with very lively interest that I have read in the publications of colleagues that 'in this case the ingenious procedure devised by Breuer and Freud has failed', or that 'the method has not performed what it seemed to promise'. This gave me something of the feelings of a man who reads his own obituary in the paper, but who is able to reassure himself by his better knowledge of the facts. For the method is so difficult that it has quite definitely to be learned; and I cannot recall that a single one of my critics has expressed a wish to learn it from me. Nor do I believe that, like me, they have occupied themselves with it intensely enough to have been able to discover it for themselves. The remarks in the *Studies on Hysteria* are totally inadequate to enable a reader to master the technique, nor are they in any way intended to give any such complete instruction.

One day I discovered to my great astonishment that the view of dreams which came nearest to the truth was not the medical but the popular one, half-involved though it still was in superstition. For I had been led to fresh conclusions on the subject of dreams by applying to them a new method of psychological investigation which had done excellent service in the solution of phobias, obsessions and delusions, etc. Since then, under the name of 'psychoanalysis', it has found acceptance by a whole school of research workers. The numerous analogies that exist between dream-life and a great variety of conditions of psychical illness in waking life have indeed been correctly observed by many medical investigators. There seemed, therefore, good ground for hoping that a method of investigation which had given satisfactory results in the case of psychopathic structures would also be of use in throwing light upon dreams. Phobias and obsessions are as alien to normal consciousness as dreams are to waking consciousness; their origin is as unknown to consciousness as that of dreams. In the case of these psychopathic structures practical considerations led to an investigation of their origin and mode of development; for experience had shown that the discovery of the trains of thought which, concealed from consciousness, connect the pathological ideas with the remaining contents of the mind is equivalent to a resolution of the symptoms and has as its consequence the mastering of ideas which till then could not be inhibited. Thus psychotherapy was the starting-point of the procedure of which I made use for the explanation of dreams.

In the second place we have found that some of the perversions which we have examined are only made intelligible if we assume the convergence of several motive forces. If such perversions admit of analysis, that is, if they can be taken to pieces, then they must be of a composite nature. This gives us a hint that perhaps the sexual instinct itself may be no simple thing, but put together from components which have come apart again in the perversions. If this is so, the clinical observation of these abnormalities will have drawn our attention to amalgamations which have been lost to view in the uniform behaviour of normal people.

[1897b, 473]

[1901a, 1053]

[1905d, 1487]
The particular psychotherapeutic procedure which Freud practises and describes as 'psychoanalysis' is an outgrowth of what was known as the 'cathartic' method and was discussed by him in collaboration with Josef Breuer in their Studies on Hysteria (1895). This cathartic therapy was a discovery of Breuer's, and was first used by him some ten years earlier in the successful treatment of a hysterical woman patient, in the course of which he obtained an insight into the pathogenesis of her symptoms. As the result of a personal suggestion from Breuer, Freud revived this procedure and tested it on a considerable number of patients.

[1904a, 1555]

There are many ways and means of practising psychotherapy. All that lead to recovery are good. Our usual word of comfort, which we dispense so liberally to our patients - 'You'll soon be all right again' -, corresponds to one of these psychotherapeutic methods; but now that we have deeper insight into the neuroses, we are no longer obliged to confine ourselves to the word of comfort. We have developed the technique of hypnotic suggestion, and psychotherapy by mental distraction, by exercise, and by eliciting suitable affects. I despise none of these methods and would use them all in appropriate circumstances. If I have actually come to confine myself to one form of treatment, to the method which Breuer called cathartic, but which I myself prefer to call 'analytic', it is because I have allowed myself to be influenced by purely subjective motives. Because of the part I have played in founding this therapy, I feel a personal obligation to devote myself to closer investigation of it and to the development of its technique. And I may say that the analytic method of psychotherapy is the one that penetrates most deeply and carries farthest, the one by means of which the most extensive transformations can be effected in patients. Putting aside for a moment the therapeutic point of view, I may also say of it that it is the most interesting method, the only one which informs us at all about the origin and inter-relation of morbid phenomena. Owing to the insight which we gain into mental illness by this method, it alone should be capable of leading us beyond its own limits and of pointing out the way to other forms of therapeutic influence.

[1905a, 1565]

Permit me now to correct a few mistakes that have been made in regard to this cathartic or analytic method of psychotherapy, and to give a few explanations on the subject.

[1905a, 1566]

The procedure which the author makes his Zoe adopt for curing her childhood friend's delusion shows a far-reaching similarity - no, a complete agreement in its essence - with a therapeutic method which was introduced into medical practice in 1895 by Dr. Josef Breuer and myself, and to the perfecting of which I have since then devoted myself. This method of treatment, to which Breuer first gave the name of 'cathartic' but which I prefer to describe as 'analytic', consists, as applied to patients suffering from disorders analogous to Hanold's delusion, in bringing to their consciousness, to some extent forcibly, the unconscious whose repression led to their falling ill - exactly as Gradiva did with the repressed memories of their childhood relations. Gradiva, it is true, could carry out this task more easily than a doctor: in several respects she was in what may be described as an ideal position for it. The doctor, who has no pre-existing knowledge of his patient and possesses no conscious memory of what is unconsciously at work in him, must call a complicated technique to his help in order to make up for this disadvantage. He must learn how to infer with great certainty from the conscious associations and communications of the patient what is repressed in him, how to discover his unconscious as it betrays itself behind his conscious words and acts. He then brings about something like what Norbert Hanold grasped at the end of the story when he translated back the name 'Gradiva' into 'Bertgang'. The disorder vanishes while being traced back to its origin; analysis, too, brings simultaneous cure.

[1907a, 1881]
The field I have in mind is indeed very different from yours. I am referring to the therapy employed for certain 'nervous diseases' - what are known as the psychoneuroses - of which hysteria and obsessional ideas may be taken as samples. The method is called 'psycho-analysis'; it was evolved by me from the 'cathartic' method of therapy first practised by Josef Breuer in Vienna.¹ To combat your surprise, I must draw an analogy between the criminal and the hysteric. In both we are concerned with a secret, with something hidden. But in order not to be paradoxical I must at once point out the difference. In the case of the criminal it is a secret which he knows and hides from you, whereas in the case of the hysteric it is a secret which he himself does not know either, which is hidden even from himself. How is this possible? Now we know, through laborious research, that all these illnesses are the result of the patient's having succeeded in repressing certain ideas and memories that are strongly cathected with affect, together with the wishes that arise from them, in such a way that they play no part in his thinking - do not enter into his consciousness - and thus remain unknown to him. But from this repressed psychical material (these 'complexes') are generated the somatic and psychical symptoms which plague the patient in just the same way as a guilty conscience does. In this one respect, therefore, the difference between the criminal and the hysteric is fundamental.

[1906c, 1892]

The work by which we bring the repressed mental material into the patient's consciousness has been called by us psycho-analysis. Why 'analysis' - which means breaking up or separating out, and suggests an analogy with the work carried out by chemists on substances which they find in nature and bring into their laboratories? Because in an important respect there really is an analogy between the two. The patient's symptoms and pathological manifestations, like all his mental activities, are of a highly composite kind; the elements of this compound are at bottom motives, instinctual impulses. But the patient knows nothing of these elementary motives or not nearly enough. We teach him to understand the way in which these highly complicated mental formations are compounded; we trace the symptoms back to the instinctual impulses which motivate them; we point out to the patient these instinctual motives, which are present in his symptoms and of which he has hitherto been unaware, - just as a chemist isolates the fundamental substance, the chemical 'element', out of the salt in which it had been combined with other elements and in which it was unrecognizable. In the same way, as regards those of the patient's mental manifestations that were not considered pathological, we show him that he was only to a certain extent conscious of their motivation - that other instinctual impulses of which he had remained in ignorance had co-operated in producing them.

[1919a, 3629]

Again, we have thrown light on the sexual impulsions in man by separating them into their component elements; and when we interpret a dream we proceed by ignoring the dream as a whole and starting associations from its single elements.

[1919a, 3629]

This well-founded comparison of medical psycho-analytic activity with a chemical procedure might suggest a new direction for our therapy. We have analysed the patient - that is, separated his mental processes into their elementary constituents and demonstrated these instinctual elements in him singly and in isolation; what could be more natural than to expect that we should also help him to make a new and a better combination of them? You know that this demand has actually been put forward. We have been told that after an analysis of a sick mind a synthesis of it must follow. And, close upon this, concern has been expressed that the patient might be given too much analysis and too little synthesis; and there has then followed a move to put all the weight on this synthesis as the main factor in the psychotherapeutic effect, to see in it a kind of restoration of something that had been destroyed - destroyed, as it were, by vivisection.

[1919a, 3629]
Psycho-analysis as an Interpretive Art. - The new technique altered the picture of the treatment so greatly, brought the physician into such a new relation to the patient and produced so many surprising results that it seemed justifiable to distinguish the procedure from the cathartic method by giving it a new name. The present writer gave this method of treatment, which could now be extended to many other forms of neurotic disorder, the name of psycho-analysis. Now, in the first resort, this psycho-analysis was an art of interpretation and it set itself the task of carrying deeper the first of Breuer's great discoveries - namely, that neurotic symptoms are significant substitutes for other mental acts which have been omitted. It was now a question of regarding the material produced by the patients' associations as though it hinted at a hidden meaning and of discovering that meaning from it. Experience soon showed that the attitude which the analytic physician could most advantageously adopt was to surrender himself to his own unconscious mental activity, in a state of evenly suspended attention, to avoid so far as possible reflection and the construction of conscious expectations, not to try to fix anything that he heard particularly in his memory, and by these means to catch the drift of the patient's unconscious with his own unconscious. It was then found that, except under conditions that were too unfavourable, the patient's associations emerged like allusions, as it were, to one particular theme and that it was only necessary for the physician to go a step further in order to guess the material which was concealed from the patient himself and to be able to communicate it to him. It is true that this work of interpretation was not to be brought under strict rules and left a great deal of play to the physician's tact and skill; but, with impartiality and practice, it was usually possible to obtain trustworthy results - that is to say, results which were confirmed by being repeated in similar cases. At a time when so little was as yet known of the unconscious, the structure of the neuroses and the pathological processes underlying them, it was a matter for satisfaction that a technique of this kind should be available, even if it had no better theoretical basis. Moreover it is still employed in analyses at the present day in the same manner, though with a sense of greater assurance and with a better understanding of its limitations. [1923a, 3916]

The theory of repression became the corner-stone of our understanding of the neuroses. A different view had now to be taken of the task of therapy. Its aim was no longer to 'abreact' an affect which had got on to the wrong lines but to uncover repressions and replace them by acts of judgement which might result either in the accepting or in the condemning of what had formerly been repudiated. I showed my recognition of the new situation by no longer calling my method of investigation and treatment catharsis but psycho-analysis. [1925d, 4207]
This was at a date before the investigations of Charcot and Pierre Janet into the origin of hysterical symptoms, and Breuer's discovery was thus entirely uninfluenced by them. But he did not pursue the matter any further at the time, and it was not until some ten years later that he took it up again in collaboration with Sigmund Freud. In 1895 they published a book, *Studies on Hysteria*, in which Breuer's discoveries were described and an attempt was made to explain them by the theory of 'catharsis'. According to that hypothesis, hysterical symptoms originate through the energy of a mental process being withheld from conscious influence and being diverted into bodily innervation ('conversion'). A hysterical symptom would thus be a substitute for an omitted mental act and a reminiscence of the occasion which should have given rise to that act. And, on this view, recovery would be a result of the liberation of the affect that had gone astray and of its discharge along a normal path ('abreaction'). Cathartic treatment gave excellent therapeutic results, but it was found that they were not permanent and that they were not independent of the personal relation between the patient and the physician. Freud, who later proceeded with these investigations by himself, made an alteration in their technique, by replacing hypnosis by the method of free association. He invented the term 'psycho-analysis', which in the course of time came to have two meanings: (1) a particular method of treating nervous disorders and (2) the science of unconscious mental processes, which has also been appropriately described as 'depth-psychology'.

Goethe always rated Eros high, never tried to belittle its power, followed its primitive and even wanton expressions with no less attentiveness than its highly sublimated ones and has, as it seems to me, expounded its essential unity throughout all its manifestations no less decisively than Plato did in the remote past. Indeed, it is perhaps more than a chance coincidence when in *Die Wahlverwandtschaften* he applies to love an idea taken from the sphere of chemistry - a connection to which the name of psycho-analysis itself bears witness. [1926f, 4401]

[1930, 4580]
No one who is familiar with the course of development of human knowledge will be surprised to learn that I have in the meantime gone beyond some of the opinions which are expressed here, and have seen my way to modifying others. Nevertheless, I have been able to retain the greater part of them unaltered and in fact have no need to withdraw anything as wholly erroneous or completely worthless.

I am glad to say that I have found little to change in it. Here and there I have inserted some new material, added some fresh points of detail derived from my increased experience, and at some few points recast my statements. But the essence of what I have written about dreams and their interpretation, as well as about the psychological theorems to be deduced from them - all this remains unaltered: subjectively at all events, it has stood the test of time. Anyone who is acquainted with my other writings (on the aetiology and mechanism of the psycho-neuroses) will know that I have never put forward inconclusive opinions as though they were established facts, and that I have always sought to modify my statements so that they may keep in step with my advancing knowledge. In the sphere of dream-life I have been able to leave my original assertions unchanged. During the long years in which I have been working at the problems of the neuroses I have often been in doubt and some times been shaken in my convictions. At such times it has always been the *Interpretation of Dreams* that has given me back my certainty. It is thus a sure instinct which has led my many scientific opponents to refuse to follow me more especially in my researches upon dreams.

Continued concern with the problems treated there - for which my medical practice as a psychotherapist has given me abundant opportunity - has not brought me up against anything that might have called for alterations or improvements in my lines of thought; I can therefore wait quietly till my readers’ understanding catches up with me or till judicious criticism has shown me the fundamental errors in my view. For the purpose of making the comparison with jokes, I will now repeat, briefly and concisely, the most essential information about dreams and the dream-work.

The essence of the theories about the ‘actual neuroses’ which I have put forward in the past and am defending to-day lies in my assertion, based on experiment, that their symptoms, unlike psychoneurotic ones, cannot be analysed. That is to say, the constipation, headaches and fatigue of the so-called neurasthenic do not admit of being traced back historically or symbolically to operative experiences and cannot be understood as substitutes for sexual satisfaction or as compromises between opposing instinctual impulses, as is the case with psycho-neurotic symptoms (even though the latter may perhaps have the same appearance). I do not believe it will be possible to upset this assertion by the help of psycho-analysis. On the other hand I will grant to-day what I was unable to believe formerly - that an analytic treatment can have an indirect curative effect on ‘actual’ symptoms. It can do so either by enabling the current noxae to be better tolerated, or by enabling the sick person to escape from the current noxae by making a change in his sexual régime. These would be desirable prospects from the point of view of our therapeutic interest.
I must confess that I still do not quite understand why the stand I took against any such temptation in my Interpretation of Dreams has given rise to misgivings in the minds of so many psycho-analysts, among them some well-known ones. It seems to me that the differentiation between dreams of wishing, admission, warning, adaptation, and so on, has not much more sense than the differentiation, which is accepted perforce, of medical specialists into gynaecologists, paediatricians, and dentists. Let me recapitulate here as briefly as possible what I have said on this question in my Interpretation of Dreams.¹

Now you will no doubt conclude that a rejection such as this of all written discussion argues a high degree of inaccessibility to objections, of obstinacy, or, to use the polite colloquial scientific term, of pig-headedness. I should like to say in reply that when once, after such hard work, one has arrived at a conviction, one has at the same time acquired a certain right to retain that conviction with some tenacity. I may also urge that in the course of my work I have modified my views on a few important points, changed them and replaced them by fresh ones - and in each case, of course, I have made this publicly known. And the outcome of this frankness? Some people have taken no notice whatever of myself - corrections and continue to this day to criticize me for hypotheses which have long ceased to have the same meaning for me. Others reproach me precisely for these changes and regard me as untrustworthy on their account. Of course! a person who has occasionally changed his opinions is deserving of no belief at all, since he has made it all too likely that his latest assertions may also be mistaken; but a person who has unflinchingly maintained what he once asserted, or who cannot be quickly enough persuaded to give it up, must naturally be pig-headed or stubborn! What can one do, in the face of these contradictory objections by the critics, but remain as one is and behave in accordance with one's own judgement? I am resolved to do that, and I shall not be deterred from modifying or withdrawing any of my theories, as my advancing experience may require. In regard to fundamental discoveries I have hitherto found nothing to alter, and I hope this will remain true in the future.

Readers of my Three Essays on the Theory of Sexuality (1905d) will be aware that I have never undertaken any thorough remodelling of that work in its later editions, but have retained the original arrangement and have kept abreast of the advances made in our knowledge by means of interpolations and alterations in the text. In doing this, it may often have happened that what was old and what was more recent did not admit of being merged into an entirely uncontradictory whole. Originally, as we know, the accent was on a portrayal of the fundamental difference between the sexual life of children and of adults; later, the pregensal organizations of the libido made their way into the foreground, and also the remarkable and momentous fact of the diphasic onset of sexual development. Finally, our interest was engaged by the sexual researches of children; and from this we were able to recognize the far-reaching approximation of the final outcome of sexuality in childhood (in about the fifth year) to the definitive form taken by it in the adult. This is the point at which I left things in the last (1922) edition of my Three Essays.

¹[1913a, 2590]

[1916-1917, 3328]

[1923e, 4058]
Breuer’s patient, Anna O., seems to contradict my opinion and to be an example of a pure hysterical disorder. This case, however, which has been so fruitful for our knowledge of hysteria, was not considered at all by its observer from the point of view of a sexual neurosis, and is now quite useless for this purpose. When I began to analyse the second patient, Frau Emmy von N., the expectation of a sexual neurosis being the basis of hysteria was fairly remote from my mind. I had come fresh from the school of Charcot, and I regarded the linking of hysteria with the topic of sexuality as a sort of insult - just as the women patients themselves do. When I go through my notes on this case to-day there seems to me no doubt at all that it must be looked on as a case of severe anxiety neurosis accompanied by anxious expectation and phobias - an anxiety neurosis which originated from sexual abstinence and had become combined with hysteria. Case 3, that of Miss Lucy R., can perhaps best be described as a marginal case of pure hysteria. It was a short hysteria which ran an episodic course and had an unmistakable sexual aetiology, such as would correspond to an anxiety neurosis. The patient was an over-mature girl with a need to be loved, whose affections had been too hastily aroused through a misunderstanding. The anxiety neurosis, however, did not become visible, or it escaped me. Case 4, Katharina, was nothing less than a model of what I have described as ‘virginal anxiety’. It was a combination of anxiety neurosis and hysteria. The former created the symptoms, while the latter repeated them and operated with them. Incidentally, it was a case typical of a large number of neuroses in young people that are described as ‘hysteria’. Case 5, that of Fräulein Elisabeth von R., was once again not investigated as a sexual neurosis. I was only able to express, without confirming it, a suspicion that a spinal neurasthenia may have been its basis.

[1895d, 230]
Nevertheless I cannot bring myself to accept the idea that this part of psycho-analytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation of this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psycho-analysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.

I think it is worth emphasizing the fact that, whatever modifications my views on the aetiology of the psychoneuroses have passed through, there are two positions which I have never repudiated or abandoned - the importance of sexuality and of infantilism. Apart from this, accidental influences have been replaced by constitutional factors and 'defence' in the purely psychological sense has been replaced by organic 'sexual repression'. The question may, however, be raised of where convincing evidence is to be found in favour of the alleged aetiological importance of sexual factors in the psychoneuroses, in view of the fact that the onset of these illnesses may be observed in response to the most commonplace emotions or even to somatic precipitating causes, and since I have had to abandon a specific aetiology depending on the particular form of the childhood experiences concerned. To such a question I would reply that the psycho-analytic examination of neurotics is the source from which this disputed conviction of mine is derived. If we make use of that irreplaceable method of research, we discover that the patient's symptoms constitute his sexual activity (whether wholly or in part), which arises from the sources of the normal or perverse component instincts of sexuality. Not only is a large part of the symptomatology of hysteria derived directly from expressions of sexual excitement, not only do a number of erotogenic zones attain the significance of genitals during neuroses owing to an intensification of infantile characteristics, but the most complicated symptoms are themselves revealed as representing, by means of 'conversion', phantasies which have a sexual situation as their subject-matter. Anyone who knows how to interpret the language of hysteria will recognize that the neurosis is concerned only with the patient's repressed sexuality. The sexual function must, however, be understood in its true extent, as it is laid down by disposition in infancy. Wherever some commonplace emotion must be included among the determinants of the onset of the illness, analysis invariably shows that it is the sexual component of the traumatic experience - a component that is never lacking which has produced the pathogenic result.
The Aetiological Significance of Sexual Life. - The second novelty which emerged after the hypnotic technique had been replaced by free associations was of a clinical nature. It was discovered in the course of the prolonged search for the traumatic experiences from which hysterical symptoms appeared to be derived. The more carefully the search was pursued the more extensive seemed to be the network of aetiologically significant impressions involved, but the further back, too, did they reach into the patient's puberty or childhood. At the same time they assumed a uniform character and eventually it became inevitable to bow before the evidence and recognize that at the root of the formation of every symptom there were to be found traumatic experiences from early sexual life. Thus a sexual trauma stepped into the place of an ordinary trauma and the latter was seen to owe its aetiological significance to an associative or symbolic connection with the former, which had preceded it. An investigation of cases of common nervousness (falling into the two classes of neurasthenia and anxiety neurosis) which was simultaneously undertaken led to the conclusion that these disorders could be traced to contemporary abuses in the patients' sexual life and could be removed if these were brought to an end. It was thus easy to infer that neuroses in general are an expression of disturbances in sexual life, the so-called actual-neuroses being the consequences (by chemical agency) of contemporary injuries and the psycho-neuroses the consequences (by psychical modification) of bygone injuries to a biological function which had hitherto been gravely neglected by science. None of the theses of psycho-analysis has met with such tenacious scepticism or such embittered resistance as this assertion of the preponderating aetiological significance of sexual life in the neuroses. It should, however, be expressly remarked that, in its development up to the present day, psycho-analysis has found no reason to retreat from this opinion.

[1923a, 3920]

Under the influence of my surprising discovery, I now took a momentous step. I went beyond the domain of hysteria and began to investigate the sexual life of the so-called neurasthenics who used to visit me in numbers during my consultation hours. This experiment cost me, it is true, my popularity as a doctor, but it brought me convictions which to-day, almost thirty years later, have lost none of their force. There was a great deal of equivocation and mystery-making to be overcome, but, once that had been done, it turned out that in all of these patients grave abuses of the sexual function were present. Considering how extremely widespread are these abuses on the one hand and neurasthenia on the other, a frequent coincidence between the two would not have proved much; but there was more in it than that one bald fact. Closer observation suggested to me that it was possible to pick out from the confused jumble of clinical pictures covered by the name of neurasthenia two fundamentally different types, which might appear in any degree of mixture but which were nevertheless to be observed in their pure forms. In the one type the central phenomenon was the anxiety attack with its equivalents, rudimentary forms and chronic substitutive symptoms; I consequently gave it the name of anxiety neurosis, and limited the term neurasthenia to the other type. Now it was easy to establish the fact that each of these types had a different abnormality of sexual life as its corresponding aetiological factor: in the former, coitus interruptus, unconsummated excitation and sexual abstinence, and in the latter, excessive masturbation and too numerous nocturnal emissions. In a few specially instructive cases, which had shown a surprising alteration in the clinical picture from one type to the other, it could be proved that there had been a corresponding change in the underlying sexual régime. If it was possible to put an end to the abuse and allow its place to be taken by normal sexual activity, a striking improvement in the condition was the reward.

[1925d, 4202]
No one who is familiar with the course of development of human knowledge will be surprised to learn that I have in the meantime gone beyond some of the opinions which are expressed here, and have seen my way to modifying others. Nevertheless, I have been able to retain the greater part of them unaltered and in fact have no need to withdraw anything as wholly erroneous or completely worthless.
[1906b, 272]

I am glad to say that I have found little to change in it. Here and there I have inserted some new material, added some fresh points of detail derived from my increased experience, and at some few points recast my statements. But the essence of what I have written about dreams and their interpretation, as well as about the psychological theorems to be deduced from them - all this remains unaltered: subjectively at all events, it has stood the test of time. Anyone who is acquainted with my other writings (on the aetiology and mechanism of the psycho-neuroses) will know that I have never put forward inconclusive opinions as though they were established facts, and that I have always sought to modify my statements so that they may keep in step with my advancing knowledge. In the sphere of dream-life I have been able to leave my original assertions unchanged. During the long years in which I have been working at the problems of the neuroses I have often been in doubt and some times been shaken in my convictions. At such times it has always been the Interpretation of Dreams that has given me back my certainty. It is thus a sure instinct which has led my many scientific opponents to refuse to follow me more especially in my researches upon dreams.
[1900a, 509]

It will be seen on closer consideration that what the psychological discussion in the preceding sections invites us to assume is not the existence of two systems near the motor end of the apparatus but the existence of two kinds of processes of excitation or modes of its discharge. It is all one to us, for we must always be prepared to drop our conceptual scaffolding if we feel that we are in a position to replace it by something that approximates more closely to the unknown reality. So let us try to correct some conceptions which might be misleading so long as we looked upon the two systems in the most literal and crudest sense as two localities in the mental apparatus - conceptions which have left their traces in the expressions 'to repress' and 'to force a way through.' Thus, we may speak of an unconscious thought seeking to convey itself into the preconscious so as to be able then to force its way through into consciousness. What we have in mind here is not the forming of a second thought situated in a new place, like a transcription which continues to exist alongside the original; and the notion of forcing a way through into consciousness must be kept carefully free from any idea of a change of locality. Again, we may speak of a preconscious thought being repressed or driven out and then taken over by the unconscious. These images, derived from a set of ideas relating to a struggle for a piece of ground, may tempt us to suppose that it is literally true that a mental grouping in one locality has been brought to an end and replaced by a fresh one in another locality. Let us replace these metaphors by something that seems to correspond better to the real state of affairs, and let us say instead that some particular mental grouping has had a cathexis of energy attached to it or withdrawn from it, so that the structure in question has come under the sway of a particular agency or been withdrawn from it. What we are doing here is once again to replace a topographical way of representing things by a dynamic one. What we regard as mobile is not the psychical structure itself but its innervation.¹
[1900a, 1036]
My theory of the aetiological importance of the sexual factor in the neuroses can best be appreciated, in my opinion, by following the history of its development. For I have no desire whatever to deny that it has gone through a process of evolution and been modified in the course of it. My professional colleagues may find a guarantee in this admission that the theory is nothing other than the product of continuous and ever deeper-going experience. What is born of speculation, on the contrary, may easily spring into existence complete and there after remain unchangeable.

[1906a, 1575]

Though even to-day I do not consider these assertions incorrect, it is not to be wondered at that, in the course of ten years of continuous effort at reaching an understanding of these phenomena, I have made a considerable step forward from the views I then held, and now believe that I am in a position, on the basis of deeper experience, to correct the insufficiencies, the displacements and the misunderstandings under which my theory then laboured. At that time my material was still scanty, and it happened by chance to include a disproportionately large number of cases in which sexual seduction by an adult or by older children played the chief part in the history of the patient's childhood. I thus over-estimated the frequency of such events (though in other respects they were not open to doubt). Moreover, I was at that period unable to distinguish with certainty between falsifications made by hysterics in their memories of childhood and traces of real events. Since then I have learned to explain a number of phantasies of seduction as attempts at fending off memories of the subject's own sexual activity (infantile masturbation). When this point had been clarified, the 'traumatic' element in the sexual experiences of childhood lost its importance and what was left was the realization that infantile sexual activity (whether spontaneous or provoked) prescribes the direction that will be taken by later sexual life after maturity. The same clarification (which corrected the most important of my early mistakes) also made it necessary to modify my view of the mechanism of hysterical symptoms. They were now no longer to be regarded as direct derivatives of the repressed memories of childhood experiences; but between the symptoms and the childish impressions there were inserted the patient's phantasies (or imaginary memories), mostly produced during the years of puberty, which on the one side were built up out of and over the childhood memories and on the other side were transformed directly into the symptoms. It was only after the introduction of this element of hysterical phantasies that the texture of the neurosis and its relation to the patient's life became intelligible; a surprising analogy came to light, too, between these unconscious phantasies of hysterics and the imaginary creations of paranoics which become conscious as delusions.

[1906a, 1578]
A third consideration which arises from the views that have been developed in these pages is as follows. Are we to suppose that a general detachment of the libido from the external world would be an effective enough agent to account for the 'end of the world'? Or would not the ego-cathexes which still remained in existence have been sufficient to maintain rapport with the external world? To meet this difficulty we should either have to assume that what we call libidinal cathexis (that is, interest emanating from erotic sources) coincides with interest in general, or we should have to consider the possibility that a very widespread disturbance in the distribution of libido may bring about a corresponding disturbance in the ego-cathexes. But these are problems which we are still quite helpless and incompetent to solve. It would be otherwise if we could start out from some well-grounded theory of instincts; but in fact we have nothing of the kind at our disposal. We regard instinct as being the concept on the frontier-line between the somatic and the mental, and see in it the psychical representative of organic forces. Further, we accept the popular distinction between ego-instincts and a sexual instinct; for such a distinction seems to agree with the biological conception that the individual has a double orientation, aiming on the one hand at self-preservation and on the other at the preservation of the species. But beyond this are only hypotheses, which we have taken up - and are quite ready to drop again - in order to help us to find our bearings in the chaos of the obscurer processes of the mind. What we expect from psycho-analytic investigations of pathological mental processes is precisely that they shall drive us to some conclusions on questions connected with the theory of instincts. These investigations, however, are in their infancy and are only being carried out by isolated workers, so that the hopes we place in them must still remain unfulfilled. We can no more dismiss the possibility that disturbances of the libido may react upon the ego-cathexes than we can overlook the converse possibility - namely, that a secondary or induced disturbance of the libidinal processes may result from abnormal changes in the ego. Indeed, it is probable that processes of this kind constitute the distinctive characteristic of psychoses. How much of all this may apply to paranoia it is impossible at present to say. There is one consideration, however, on which I should like to lay stress. It cannot be asserted that a paranoic, even at the height of the repression, withdraws his interest from the external world completely - as must be considered to occur in certain other kinds of hallucinatory psychosis (such a Meynert's amentia). The paranoic perceives the external world and takes into account any alterations that may happen in it, and the effect it makes upon him stimulates him to invent explanatory theories (such as Schreber's 'cursorily improvised men'). It therefore appears to me far more probable that the paranoic's altered relation to the world is to be explained entirely or in the main by the loss of his libidinal interest.

¹ I take this opportunity of defending myself against the mistaken charge of having denied the importance of innate (constitutional) factors because I have stressed that of infantile impressions. A charge such as this arises from the restricted nature of what men look for in the field of causation: in contrast to what ordinarily holds good in the real world, people prefer to be satisfied with a single causative factor. Psycho-analysis has talked a lot about the accidental factors in aetiology and little about the constitutional ones; but that is only because it was able to contribute something fresh to the former, while, to begin with, it knew no more than was commonly known about the latter. We refuse to posit any contrast in principle between the two sets of aetiological factors; on the contrary, we assume that the two sets regularly act jointly in bringing about the observed result. Δαιμων και Τυχη [Endowment and Chance] determine a man's fate - rarely or never one of these powers alone. The amount of aetiological effectiveness to be attributed to each of them can only be arrived at in every individual case separately. These cases may be arranged in a series according to the varying proportion in which the two factors are present, and this series will no doubt have its extreme cases. We shall estimate the share taken by constitution or experience differently in individual cases according to the stage reached by our knowledge; and we shall retain the right to modify our judgement along with changes in our understanding. Incidentally, one might venture to regard constitution itself as a precipitate from the accidental effects produced on the endlessly long chain of our ancestors.

[1911c, 2440]

[1912b, 2457]
(d) One of the claims of psycho-analysis to distinction is, no doubt, that in its execution research and treatment coincide; nevertheless, after a certain point, the technique required for the one opposes that required for the other. It is not a good thing to work on a case scientifically while treatment is still proceeding - to piece together its structure, to try to foretell its further progress, and to get a picture from time to time of the current state of affairs, as scientific interest would demand. Cases which are devoted from the first to scientific purposes and are treated accordingly suffer in their outcome; while the most successful cases are those in which one proceeds, as it were, without any purpose in view, allows oneself to be taken by surprise by any new turn in them, and always meets them with an open mind, free from any presuppositions. The correct behaviour for an analyst lies in swinging over according to need from the one mental attitude to the other, in avoiding speculation or brooding over cases while they are in analysis, and in submitting the material obtained to a synthetic process of thought only after the analysis is concluded. The distinction between the two attitudes would be meaningless if we already possessed all the knowledge (or at least the essential knowledge) about the psychology of the unconscious and about the structure of the neuroses that we can obtain from psycho-analytic work. At present we are still far from that goal and we ought not to cut ourselves off from the possibility of testing what we have already learnt and of extending our knowledge further.

Psycho-analysis is a remarkable combination, for it comprises not only a method of research into the neuroses but also a method of treatment based on the aetiology thus discovered. I may begin by saying that psycho-analysis is not a child of speculation, but the outcome of experience; and for that reason, like every new product of science, is unfinished. It is open to anyone to convince himself by his own investigations of the correctness of the theses embodied in it, and to help in the further development of the study.

It is never the aim of the discussions in the Vienna Psycho-Analytical Society to remove diversities or to arrive at conclusions. The different speakers, who are held together by taking a similar fundamental view of the same facts, allow themselves to give the sharpest expression to the variety of their individual opinions without any regard to the probability of converting any of their audience who may think otherwise. There may be many points in these discussions which have been misstated and misunderstood, but the final outcome, nevertheless, is that every one has received the clearest impression of views differing from his own and has communicated his own differing views to other people.

GENTLEMEN, - The older members of this group will be able to recall that some years ago we made a previous attempt at a collective discussion of this kind - a 'symposium', as our American colleagues call it - on the subject of masturbation. At that time the opinions expressed showed such important divergences that we did not venture to lay our proceedings before the public. Since then the same group, together with some newcomers, having been uninterrupted in touch with observed facts, and having had a constant interchange of ideas with one another, have so far clarified their views and arrived at common ground that the venture which we previously abandoned now no longer seems so rash. I really have an impression that the points on which we are agreed in connection with masturbation are now firmer and more deep-going than the disagreements - though these undeniably exist. Some of the apparent contradictions are only the result of the many different directions from which you have approached the subject, whereas in fact the opinions in question may quite well find a place alongside one another.
If in the end I am convicted of being in error over the theoretical problem of the 'actual neuroses', I shall be able to console myself with the advance in our knowledge, which must disregard the opinions of an individual. You may then ask why, since I have such a laudable appreciation of the limitations of my own infallibility, I do not at once give in to these new suggestions but prefer to re-enact the familiar comedy of an old man obstinately clinging to his opinions. My reply is that I do not yet see any evidence to induce me to give in. In early days I made a number of alterations in my views and did not conceal them from the public. I was reproached on account of these changes, just as to-day I am reproached for my conservativeness. Not that I should be intimidated by the one reproach or the other. But I know that I have a destiny to fulfil. I cannot escape it and I need not move towards it. I shall await it, and in the meantime I shall behave towards our science as earlier experience has taught me.

Now you will no doubt conclude that a rejection such as this of all written discussion argues a high degree of inaccessibility to objections, of obstinacy, or, to use the polite colloquial scientific term, of pig-headedness. I should like to say in reply that when once, after such hard work, one has arrived at a conviction, one has at the same time acquired a certain right to retain that conviction with some tenacity. I may also urge that in the course of my work I have modified my views on a few important points, changed them and replaced them by fresh ones - and in each case, of course, I have made this publicly known. And the outcome of this frankness? Some people have taken no notice whatever of myself - corrections and continue to this day to criticize me for hypotheses which have long ceased to have the same meaning for me. Others reproach me precisely for these changes and regard me as untrustworthy on their account. Of course! a person who has occasionally changed his opinions is deserving of no belief at all, since he has made it all too likely that his latest assertions may also be mistaken; but a person who has unflinchingly maintained what he once asserted, or who cannot be quickly enough persuaded to give it up, must naturally be pig-headed or stubborn! What can one do, in the face of these contradictory objections by the critics, but remain as one is and behave in accordance with one's own judgement? I am resolved to do that, and I shall not be deterred from modifying or withdrawing any of my theories, as my advancing experience may require. In regard to fundamental discoveries I have hitherto found nothing to alter, and I hope this will remain true in the future.

Of the two kinds of regression of the libido, that to an earlier phase of the sexual organization is by far the more striking. Since this is absent in hysteria, and since our whole view of the neuroses is still far too much under the influence of the study of hysteria, which was chronologically the first, the significance of libidinal regression also became clear to us far later than that of repression. We must be prepared to find that our views will be subjected to still further extensions and revaluations when we are able to take into consideration not only hysteria and obsessional neurosis but also the other, narcissistic neuroses.

I have finished, Ladies and Gentlemen. It is more than a conventional form of words if I admit that I myself am profoundly aware of the many defects in the lectures I have given you. I regret above all that I have so often promised to return later to a topic I have lightly touched on and have then found no opportunity of redeeming my promise. I undertook to give you an account of a subject which is still incomplete and in process of development, and my condensed summary has itself turned out to be an incomplete one. At some points I have set out the material on which to draw a conclusion and have then myself not drawn it. But I could not pretend to make you into experts; I have only tried to stimulate and enlighten you.
GENTLEMEN, - As you know, we have never prided ourselves on the completeness and finality of our knowledge and capacity. We are just as ready now as we were earlier to admit the imperfections of our understanding, to learn new things and to alter our methods in any way that can improve them.
[1919a, 3628]

Twenty five years of intense work have had as their result that the immediate aims of psychoanalytic technique are quite other to-day than they were at the outset. At first the analysing physician could do no more than discover the unconscious material that was concealed from the patient, put it together, and, at the right moment, communicate it to him. Psychoanalysis was then first and foremost an art of interpreting. Since this did not solve the therapeutic problem, a further aim quickly came in view: to oblige the patient to confirm the analyst's construction from his own memory. In that endeavour the chief emphasis lay upon the patient's resistances: the art consisted now in uncovering these as quickly as possible, in pointing them out to the patient and in inducing him by human influence - this was where suggestion operating as 'transference' played its part - to abandon his resistances.
[1920g, 3723]

Here might be the starting-point for fresh investigations. Our consciousness communicates to us feelings from within not only of pleasure and unpleasure but also of a peculiar tension which in its turn can be either pleasurable or unpleasurable. Should the difference between these feelings enable us to distinguish between bound and unbound processes of energy? or is the feeling of tension to be related to the absolute magnitude, or perhaps to the level, of the cathexis, while the pleasure and unpleasure series indicates a change in magnitude of the cathexis within a given unit of time? Another striking fact is that the life instincts have so much more contact with our internal perception - emerging as breakers of the peace and constantly producing tensions whose release is felt as pleasure - while the death instincts seem to do their work unobtrusively. The pleasure principle seems actually to serve the death instincts. It is true that it keeps watch upon stimuli from without, which are regarded as dangers by both kinds of instincts; but it is more especially on guard against increases of stimulation from within, which would make the task of living more difficult. This in turn raises a host of other questions to which we can at present find no answer. We must be patient and await fresh methods and occasions of research. We must be ready, too, to abandon a path that we have followed for a time, if it seems to be leading to no good end. Only believers, who demand that science shall be a substitute for the catechism they have given up, will blame an investigator for developing or even transforming his views. We may take comfort, too, for the slow advances of our scientific knowledge in the words of the poet:
[1920g, 3762]
But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.

Psycho-analysis an Empirical Science. - Psycho-analysis is not, like philosophies, a system starting out from a few sharply defined basic concepts, seeking to grasp the whole universe with the help of these and, once it is completed, having no room for fresh discoveries or better understanding. On the contrary, it keeps close to the facts in its field of study, seeks to solve the immediate problems of observation, gropes its way forward by the help of experience, is always incomplete and always ready to correct or modify its theories. There is no incongruity (any more than in the case of physics or chemistry) if its most general concepts lack clarity and if its postulates are provisional; it leaves their more precise definition to the results of future work.

Libido is a term used in the theory of the instincts for describing the dynamic manifestation of sexuality. It was already used in this sense by Moll (1898) and was introduced into psycho-analysis by the present writer. What follows is limited to a description of the developments which the theory of the instincts has passed through in psycho-analysis - developments which are still proceeding.

The noisy rejection of psycho-analysis by the medical world could not deter its supporters from developing it, to begin with, along its original lines into a specialized pathology and treatment of the neuroses - a task which has not been completely accomplished even to-day. Its undeniable therapeutic success, which far exceeded any that had previously been achieved, constantly spurred them on to fresh efforts; while the difficulties which came to light as the material was examined more deeply led to profound alterations in the technique of analysis and to important corrections in its theoretical hypotheses and postulates.
Among the hypothetical concepts which enable the doctor to deal with the analytic material, the first to be mentioned is that of 'libido'. Libido means in psycho-analysis in the first instance the force (thought of as quantitatively variable and measurable) of the sexual instincts directed towards an object - 'sexual' in the extended sense required by analytic theory. Further study showed that it was necessary to set alongside this 'object-libido' a 'narcissistic' or 'ego-libido', directed to the subject's own ego: and the interaction of these two forces has enabled us to account for a great number of normal and abnormal processes in mental life. A rough distinction was soon made between what are known as the 'transference neuroses' and the narcissistic disorders. The former (hysteria and obsessional neurosis) are the objects proper of psycho-analytic treatment, while the others, the narcissistic neuroses, though they can, it is true, be examined by the help of analysis, offer fundamental difficulties to therapeutic influence. It is true that the libido theory of psycho-analysis is by no means complete and that its relation to a general theory of the instincts is not yet clear, for psycho-analysis is a young science, quite unfinished and in a stage of rapid development. Here, however, it should be emphatically pointed out how erroneous the charge of pan-sexualism is which is so often levelled at psycho-analysis. It seeks to show that psycho-analytic theory knows of no mental motive forces other than purely sexual ones and in doing so exploits popular prejudices by using the word 'sexual' not in its analytic but in its vulgar sense.

So it comes about that psycho-analysis derives nothing but disadvantages from its middle position between medicine and philosophy. Doctors regard it as a speculative system and refuse to believe that, like every other natural science, it is based on a patient and tireless elaboration of facts from the world of perception; philosophers, measuring it by the standard of their own artificially constructed systems, find that it starts from impossible premisses and reproach it because its most general concepts (which are only now in process of evolution) lack clarity and precision.

On the other hand, I am glad to acknowledge that your shrewdness has enabled you to detect some things which are well known to myself. For instance, you are right in inferring that I have often been compelled to make détours when following my own path. You are right, too, in thinking that I have no use for other people's ideas when they are presented to me at an inopportune moment. (Still, as regards the latter point, I think you might have defended me from the accusation that I am repudiating ideas when I am merely unable for the time being to pass judgement on them or to elaborate them.) But I am delighted to find that you do me full justice in the matter of my relations with Adler....

It would be more difficult to explain concisely how it came about that psycho-analysis made a further distinction in the unconscious, and separated it into a preconscious and an unconscious proper. It will be sufficient to say that it appeared a legitimate course to supplement the theories that were a direct expression of experience with hypotheses that were designed to facilitate the handling of the material and related to matters which could not be a subject of immediate observation. The very same procedure is adopted by the older sciences. The subdivision of the unconscious is part of an attempt to picture the apparatus of the mind as being built up of a number of agencies or systems whose relations to one another are expressed in spatial terms, without, however, implying any connection with the actual anatomy of the brain. (I have described this as the topographical method of approach.) Such ideas as these are part of a speculative superstructure of psycho-analysis, any portion of which can be abandoned or changed without loss or regret the moment its inadequacy has been proved. But there is still plenty to be described that lies closer to actual experience.
I must confess that I am not at all partial to the fabrication of *Weltanschauungen*. Such activities may be left to philosophers, who avowedly find it impossible to make their journey through life without a Baedeker of that kind to give them information on every subject. Let us humbly accept the contempt with which they look down on us from the vantage-ground of their superior needs. But since we cannot forgo our narcissistic pride either, we will draw comfort from the reflection that such ‘Handbooks to Life’ soon grow out of date and that it is precisely our short-sighted, narrow and finicky work which obliges them to appear in new editions, and that even the most up-to-date of them are nothing but attempts to find a substitute for the ancient, useful and all-sufficient Church Catechism. We know well enough how little light science has so far been able to throw on the problems that surround us. But however much ado the philosophers may make, they cannot alter the situation. Only patient, persevering research, in which everything is subordinated to the one requirement of certainty, can gradually bring about a change. The benighted traveller may sing aloud in the dark to deny his own fears; but, for all that, he will not see an inch further beyond his nose.

[1926d, 4257]

We showed on an earlier occasion that the resistance that has to be overcome in analysis proceeds from the ego, which cling to its anticathexes. It is hard for the ego to direct its attention to perceptions and ideas which it has up till now made a rule of avoiding, or to acknowledge as belonging to itself impulses that are the complete opposite of those which it knows as its own. Our fight against resistance in analysis is based upon this view of the facts. If the resistance is itself unconscious, as so often happens owing to its connection with the repressed material, we make it conscious. If it is conscious, or when it has become conscious, we bring forward logical arguments against it; we promise the ego rewards and advantages if it will give up its resistance. There can be no doubt or mistake about the existence of this resistance on the part of the ego. But we have to ask ourselves whether it covers the whole state of affairs in analysis. For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions; and we have called the period of strenuous effort which follows after its praiseworthy decision, the phase of ‘working-through’. The dynamic factor which makes a working-through of this kind necessary and comprehensible is not far to seek. It must be that after the ego's resistance has been removed the power of the compulsion to repeat - the attraction exerted by the unconscious prototype upon the repressed instinctual process - has still to be overcome. There is nothing to be said against describing this factor as the resistance of the unconscious. There is no need to be discouraged by these emendations. They are to be welcomed if they add something to our knowledge, and they are no disgrace to us so long as they enrich rather than invalidate our earlier views - by limiting some statement, perhaps, that was too general or by enlarging some idea that was too narrowly formulated.

[1926d, 4312]
If I am to say anything intelligible to you, I shall no doubt have to tell you something of a psychological theory which is not known or not appreciated outside analytic circles. It will be easy to deduce from this theory what we want from our patients and how we obtain it. I shall expound it to you dogmatically, as though it were a complete theoretical structure. But do not suppose that it came into being as such a structure, like a philosophical system. We have developed it very slowly, we have wrestled over every small detail of it, we have unceasingly modified it, keeping a continuous contact with observation, till it has finally taken a shape in which it seems to suffice for our purposes. Only a few years ago I should have had to clothe this theory in other terms. Nor, of course, can I guarantee to you that the form in which it is expressed to-day will remain the final one. Science, as you know, is not a revelation; long after its beginnings it still lacks the attributes of definiteness, immutability and infallibility for which human thought so deeply longs. But such as it is, it is all that we can have. If you will further bear in mind that our science is very young, scarcely as old as the century, and that it is concerned with what is perhaps the most difficult material that can be the subject of human research, you will easily be able to adopt the correct attitude towards my exposition. But interrupt me whenever you feel inclined, if you cannot follow me or if you want further explanations.

[1926e, 4334]

At this point two observations may be in place. It must not be supposed that these very general ideas are presuppositions upon which the work of psycho-analysis depends. On the contrary, they are its latest conclusions and are 'open to revision'. Psycho-analysis is founded securely upon the observation of the facts of mental life; and for that very reason its theoretical superstructure is still incomplete and subject to constant alteration. Secondly, there is no reason for surprise that psycho-analysis, which was originally no more than an attempt at explaining pathological mental phenomena, should have developed into a psychology of normal mental life. The justification for this arose with the discovery that the dreams and mistakes of normal men have the same mechanism as neurotic symptoms.

[1926f, 4404]

In none of my previous writings have I had so strong a feeling as now that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive instinct means an alteration of the psycho-analytic theory of the instincts.

[1930a, 4508]
We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed \textit{inwards} mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]

The new lectures are by no means intended to take the place of the earlier ones. They do not in any sense form an independent entity with an expectation of finding a circle of readers of its own; they are continuations and supplements, which, in relation to the former series, fall into three groups. A first group contains fresh treatments of subjects which were already dealt with fifteen years ago but which, as a result of a deepening of our knowledge and an alteration in our views, call for a different exposition to-day - that is to say, critical revisions. The two other groups contain what are true extensions, for they deal with things which either did not exist in psycho-analysis at the time of the first lectures or which were too little in evidence to justify a special chapter-heading. It is inevitable, but not to be regretted, if some of the new lectures unite the characteristics of more than one of these groups.

[1933a, 4619]
I fear, Ladies and Gentlemen, that you will find this exposition hard to follow, and you will guess that I have not stated it exhaustively. I am sorry to have had to rouse your displeasure. But I can set myself no other aim than to give you an impression of the nature of our findings and of the difficulties involved in working them out. The deeper we penetrate into the study of mental processes the more we recognize their abundance and complexity. A number of simple formulas which to begin with seemed to meet our needs have later turned out to be inadequate. We do not tire of altering and improving them. In my lecture on the theory of dreams I introduced you to a region in which for fifteen years there has scarcely been a new discovery. Here, where we are dealing with anxiety, you see everything in a state of flux and change. These novelties, moreover, have not yet been thoroughly worked through and perhaps this too adds to the difficulties of demonstrating them. But have patience! We shall soon be able to take leave of the subject of anxiety. I cannot promise that it will have been settled to our satisfaction, but it is to be hoped that we shall have made a little bit of progress. And in the meantime we have made all sorts of new discoveries. Now, for instance, our study of anxiety leads us to add a new feature to our description of the ego. We have said that the ego is weak in comparison with the id, that it is its loyal servant, eager to carry out its orders and to fulfil its demands. We have no intention of withdrawing this statement. But on the other hand this same ego is the better organized part of the id, with its face turned towards reality. We must not exaggerate the separation between the two of them too much, and we must not be surprised if the ego on its part can bring its influence to bear on the processes in the id. I believe the ego exercises this influence by putting into action the almost omnipotent pleasure-unpleasure principle by means of the signal of anxiety. On the other hand, it shows its weakness again immediately afterwards, for by the act of repression it renounces a portion of its organization and has to allow the repressed instinctual impulse to remain permanently withdrawn from its influence.

LADIES AND GENTLEMEN, - All the while I am preparing to talk to you I am struggling with an internal difficulty. I feel uncertain, so to speak, of the extent of my licence. It is true that in the course of fifteen years of work psycho-analysis has changed and grown richer; but, in spite of that, an introduction to psycho-analysis might have been left without alteration or supplement. It is constantly in my mind that these lectures are without a raison d'être. For analysts I am saying too little and nothing at all that is new; but for you I am saying too much and saying things which you are not equipped to understand and which are not in your province. I have looked around for excuses and I have tried to justify each separate lecture on different grounds. The first one, on the theory of dreams, was supposed to put you back again at one blow into the analytic atmosphere and to show you how durable our views have turned out to be. I was led on to the second one, which followed the paths from dreams to what is called occultism, by the opportunity of speaking my mind without constraint on a department of work in which prejudiced expectations are fighting to-day against passionate resistances, and I could hope that your judgement, educated to tolerance on the example of psycho-analysis, would not refuse to accompany me on the excursion. The third lecture, on the dissection of the personality, certainly made the hardest demands upon you with its unfamiliar subject-matter; but it was impossible for me to keep this first beginning of an ego-psychology back from you, and if we had possessed it fifteen years ago I should have had to mention it to you then. My last lecture, finally, which you were probably able to follow only by great exertions, brought forward necessary corrections - fresh attempts at solving the most important conundrums; and my introduction would have been leading you astray if I had been silent about them. As you see, when one starts making excuses it turns out in the end that it was all inevitable, all the work of destiny. I submit to it, and I beg you to do the same.

[1933a, 4699]

[1933a, 4715]
What further claims do you make in the name of tolerance? That when someone has uttered an opinion which we regard as completely false we should say to him: 'Thank you very much for having given voice to this contradiction. You are guarding us against the danger of complacency and are giving us an opportunity of showing the Americans that we are really as "broad-minded" as they always wish. To be sure, we do not believe a word of what you are saying, but that makes no difference. Probably you are just as right as we are. After all, who can possibly know who is right? In spite of our antagonism, pray allow us to represent your point of view in our publications. We hope that you will be kind enough in exchange to find a place for our views which you deny.' In the future, when the misuse of Einstein's relativity has been entirely achieved, this will obviously become the regular custom in scientific affairs. For the moment, it is true, we have not gone quite so far. We restrict ourselves, in the old fashion, to putting forward only our own convictions, we expose ourselves to the risk of error because it cannot be guarded against, and we reject what is in contradiction to us. We have made plentiful use in psycho-analysis of the right to change our opinions if we think we have found something better.

[1933a, 4745]

I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions that there is something at work in them - an instinct for hatred and destruction - which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of an instinct of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the instincts which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psycho-analysis?

[1933b, 4798]

Now it would look as though this dispute between psycho-analysis and philosophy is concerned only with a trifling matter of definition - the question whether the name 'psychical' should be applied to one or another sequence of phenomena. In fact, however, this step has become of the highest significance. Whereas the psychology of consciousness never went beyond the broken sequences which were obviously dependent on something else, the other view, which held that the psychical is unconscious in itself, enabled psychology to take its place as a natural science like any other. The processes with which it is concerned are in themselves just as unknowable as those dealt with by other sciences, by chemistry or physics, for example; but it is possible to establish the laws which they obey and to follow their mutual relations and interdependences unbroken over long stretches - in short, to arrive at what is described as an 'understanding' of the field of natural phenomena in question. This cannot be effected without framing fresh hypotheses and creating fresh concepts; but these are not to be despised as evidence of embarrassment on our part but deserve on the contrary to be appreciated as an enrichment of science. They can lay claim to the same value as approximations that belongs to the corresponding intellectual scaffolding found in other natural sciences, and we look forward to their being modified, corrected and more precisely determined as further experience is accumulated and sifted. So too it will be entirely in accordance with our expectations if the basic concepts and principles of the new science (instinct, nervous energy, etc.) remain for a considerable time no less indeterminate than those of the older sciences (force, mass, attraction, etc.).

[1940a [1938], 4968]
I have now come to the end of what I have to say to-day. Prepared as I am to meet with contradiction and disbelief, I should like to say one thing more in support of my position. Whatever you may think about the conclusions I have come to, I must ask you not to regard them as the fruit of idle speculation. They are based on a laborious individual examination of patients which has in most cases taken up a hundred or more hours of work. What is even more important to me than the value you put on my results is the attention you give to the procedure I have employed. This procedure is new and difficult to handle, but it is nevertheless irreplaceable for scientific and therapeutic purposes. You will realize, I am sure, that one cannot properly deny the findings which follow from this modification of Breuer's procedure so long as one puts it aside and uses only the customary method of questioning patients. To do so would be like trying to refute the findings of histological technique by relying upon macroscopic examination. The new method of research gives wide access to a new element in the psychical field of events, namely, to processes of thought which have remained unconscious - which, to use Breuer's expression, are 'inadmissible to consciousness'. Thus it inspires us with the hope of a new and better understanding of all functional psychical disturbances. I cannot believe that psychiatry will long hold back from making use of this new pathway to knowledge.

[1896c, 433]

It would be more dignified as well as more helpful to the patient - who, after all, has to come to terms with his ailments - for the doctor to tell the truth, as he knows it from his daily practice. The psychoneuroses as a genus are by no means mild illnesses. When hysteria sets in, no one can foretell when it will come to an end. We mostly comfort ourselves with the vain prophecy that 'one day it will suddenly disappear'. Recovery often enough turns out to be merely an agreement to mutual toleration between the sick part of the patient and the healthy part; or it is the result of the transformation of a symptom into a phobia. A girl's hysteria, calmed down with difficulty, revives in her as a wife after the short interruption of young married happiness. The only difference is that another person, the husband, is now driven by his own interests to keep silence about her condition. Even if an illness of this kind leads to no manifest incapacity on the patients' part to carry on their life, it nearly always prevents free unfolding of their mental powers. Obsessions recur throughout their lives; and phobias and other restrictions upon the will have hitherto been unamenable to treatment of any kind. All this is kept from the knowledge of the layman. The father of a hysterical girl is consequently horrified if, for instance, he is asked to agree to her being given a year's treatment, when she has perhaps only been ill for a few months. The layman is, as it were, deeply convinced in himself that all these psychoneuroses are unnecessary; so he has no patience with the processes of the illness and no readiness to make sacrifices for its treatment. If, in face of a case of typhus which lasts three weeks, or of a broken leg which takes six months to mend, he adopts a more understanding attitude, and if, as soon as his child shows the first signs of a curvature of the spine, he finds it reasonable that orthopaedic treatment should be carried on over several years, the difference in his behaviour is due to the better knowledge on the part of the physicians who pass on their knowledge honestly to the layman. Honesty on the part of the physician and willing acquiescence on the part of the layman will be established for the neuroses too, as soon as an insight into the nature of those affections becomes common property in the medical world. Radical treatment of these disorders will no doubt always require special training and will be incompatible with other kinds of medical activity. On the other hand, this class of physicians, which will, I believe, be a large one in the future, has the prospect of achieving noteworthy results and of obtaining a satisfying insight into the mental life of mankind.

[1897b, 475]
Even the Interpretation of Dreams has not been left untouched by the advance of scientific knowledge. When I wrote it in 1899, my theory of sexuality was not yet in existence and the analysis of the more complicated forms of psycho-neurosis was only just beginning. It was my hope that dream-interpretation would help to make possible the psychological analysis of the neuroses; since then a deeper understanding of neuroses has reacted in turn upon our view of dreams. The theory of dream-interpretation has itself developed further in a direction on which insufficient stress had been laid in the first edition of this book. My own experience, as well as the works of Wilhelm Stekel and others, have since taught me to form a truer estimate of the extent and importance of symbolism in dreams (or rather in unconscious thinking). Thus in the course of these years much has accumulated which demands attention. I have endeavoured to take these innovations into account by making numerous interpolations in the text and by additional footnotes. If these additions threaten at times to burst the whole framework of the book or if I have not everywhere succeeded in bringing the original text up to the level of our present knowledge, I must ask the reader's indulgence for these deficiencies: they are the results and signs of the present increasingly rapid development of our science. I may even venture to prophesy in what other directions later editions of this book - if any should be needed - will differ from the present one. They will have on the one hand to afford a closer contact with the copious material presented in imaginative writing, in myths, in linguistic usage and in folklore; while on the other hand they will have to deal in greater detail than has here been possible with the relations of dreams to neuroses and mental diseases.

Nor can we leave the subject of regression in dreams without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psycho-neuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the instinctual impulses which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood - a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's assertion that in dreams 'some primaeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psycho-analysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race.

¹ [Footnote added 1907:] These conceptions of the strict determination of apparently arbitrary psychical acts have already borne rich fruit in psychology, and perhaps also in the juridical field. By applying them, Bleuler and Jung have made intelligible the reactions in what is known as the 'association experiment', in which the subject of the test, when he hears a word called out (the stimulus-word), answers it with one that comes to his mind in connection with it (the reaction), the intervening time being measured (the reaction-time). In his Studies in Word Association (1906), Jung has shown what a subtle reagent for psychical states we possess in the association experiment as thus interpreted. Wertheimer and Klein, both pupils of Hans Gross, the Professor of Criminal Law in Prague, have developed out of these experiments a technique for the establishment of the facts in criminal proceedings which is at present being examined by psychologists and jurists.
The four essays that follow were originally published (under a heading which serves as the present book's sub-title) in the first two volumes of *Imago*, a periodical issued under my direction. They represent a first attempt on my part at applying the point of view and the findings of psycho-analysis to some unsolved problems of social psychology [*Völkerpsychologie*]. Thus they offer a methodological contrast on the one hand to Wilhelm Wundt's extensive work, which applies the hypotheses and working methods of non-analytic psychology to the same purposes, and on the other hand to the writings of the Zurich school of psycho-analysis, which endeavour, on the contrary, to solve the problems of individual psychology with the help of material derived from social psychology. (Cf. Jung, 1912 and 1913.) I readily confess that it was from these two sources that I received the first stimulus for my own essays.

I am fully conscious of the deficiencies of these studies. I need not mention those which are necessarily characteristic of pioneering work; but others require a word of explanation. The four essays collected in these pages aim at arousing the interest of a fairly wide circle of educated readers, but they cannot in fact be understood and appreciated except by those few who are no longer strangers to the essential nature of psycho-analysis. They seek to bridge the gap between students of such subjects as social anthropology, philology and folklore on the one hand, and psycho-analysts on the other. Yet they cannot offer to either side what each lacks - to the former an adequate initiation into the new psychological technique or to the latter a sufficient grasp of the material that awaits treatment. They must therefore rest content with attracting the attention of the two parties and with encouraging a belief that occasional co-operation between them could not fail to be of benefit to research.

This medical significance of psycho-analysis would not, however, justify me in bringing it to the notice of a circle of savants concerned in the synthesis of the sciences. And such a plan must seem particularly premature so long as a large number of psychiatrists and neurologists are opposed to the new therapeutic method and reject both its postulates and its findings. If, nevertheless, I regard the experiment as a legitimate one, it is because psycho-analysis can also claim to be of interest to others than psychiatrists, since it touches upon various other spheres of knowledge and reveals unexpected relations between them and the pathology of mental life.

It has not been my aim in my present paper to lay before a scientifically orientated public an account of the compass and content of psycho-analysis or of its hypotheses, problems and findings. My purpose will have been fulfilled if I have made clear the many spheres of knowledge in which psycho-analysis is of interest and the numerous links which it has begun to forge between them.
I do not mean that connoisseurs and lovers of art find no words with which to praise such objects to us. They are eloquent enough, it seems to me. But usually in the presence of a great work of art each says something different from the other; and none of them says anything that solves the problem for the unpretending admirer. In my opinion, what grips us so powerfully can only be the artist's intention, in so far as he has succeeded in expressing it in his work and in getting us to understand it. I realize that this cannot be merely a matter of intellectual comprehension; what he aims at is to awaken in us the same, emotional attitude, the same mental constellation as that which in him produced the impetus to create. But why should the artist's intention not be capable of being communicated and comprehended in words, like any other fact of mental life? Perhaps where great works of art are concerned this would never be possible without the application of psycho-analysis. The product itself after all must admit of such an analysis, if it really is an effective expression of the intentions and emotional activities of the artist. To discover his intention, though, I must first find out the meaning and content of what is represented in his work; I must, in other words, be able to interpret it. It is possible, therefore, that a work of art of this kind needs interpretation, and that until I have accomplished that interpretation I cannot come to know why I have been so powerfully affected. I even venture to hope that the effect of the work will undergo no diminution after we have succeeded in thus analysing it.

[1914b, 2846]

The small circle soon expanded, and in the course of the next few years often changed its composition. On the whole I could tell myself that it was hardly inferior, in wealth and variety of talent, to the staff of any clinical teacher one could think of. It included from the beginning the men who were later to play such a considerable, if not always a welcome, part in the history of the psycho-analytic movement. At that time, however, one could not yet guess at these developments. I had every reason to be satisfied, and I think I did everything possible to impart my own knowledge and experience to the others. There were only two inauspicious circumstances which at last estranged me inwardly from the group. I could not succeed in establishing among its members the friendly relations that ought to obtain between men who are all engaged upon the same difficult work; nor was I able to stifle the disputes about priority for which there were so many opportunities under these conditions of work in common. The difficulties in the way of giving instruction in the practice of psycho-analysis, which are quite particularly great and are responsible for much in the present dissensions, were evident already in this private Vienna Psycho-Analytical Society. I myself did not venture to put forward a still unfinished technique and a theory still in the making with an authority which would probably have enabled the others to avoid some wrong turnings and ultimate disasters. The self-reliance of intellectual workers, their early independence of their teacher, is always gratifying from a psychological point of view; but it is only of advantage to science if those workers fulfil certain personal conditions which are none too common. For psycho-analysis in particular a long and severe discipline and training in self-discipline would have been required. In view of the courage displayed by their devotion to a subject so much frowned upon and so poor in prospects, I was disposed to tolerate much among the members to which I should otherwise have made objection. Besides doctors, the circle included others - men of education who had recognized something important in psycho-analysis: writers, painters and so on. My Interpretation of Dreams and my book on jokes, among others, had shown from the beginning that the theories of psycho-analysis cannot be restricted to the medical field, but are capable of application to a variety of other mental sciences.

[1914d, 2892]
Hand in hand with this expansion of psycho-analysis in space went an expansion in content; it extended from the field of the neuroses and psychiatry to other fields of knowledge. I shall not treat this aspect of the development of our discipline in much detail, since this has been done with great success by Rank and Sachs in a volume (one of Löwenfeld's *Grenzfragen*) which deals exhaustively with precisely this side of analytic research. Moreover, this development is still in its infancy; it has been little worked at, consists mostly of tentative beginnings and in part of no more than plans. No reasonable person will see any grounds for reproach in this. An enormous mass of work confronts a small number of workers, most of whom have their main occupation elsewhere and can bring only the qualifications of an amateur to bear on the technical problems of these unfamiliar fields of science. These workers, who derive from psycho-analysis, make no secret of their amateurishness. Their aim is merely to act as sign-posts and stop-gaps for the specialists, and to put the analytic technique and principles at their disposal against a time when they in turn shall take up the work. That the results achieved are nevertheless not inconsiderable is due partly to the fruitfulness of the analytic method, and partly to the circumstance that there are already a few investigators who are not doctors, and have taken up the application of psycho-analysis to the mental sciences as their profession in life.

Most of these applications of analysis naturally go back to a hint in my earliest analytic writings. The analytic examination of neurotic people and the neurotic symptoms of normal people necessitated the assumption of psychological conditions which could not possibly be limited to the field in which they had been discovered. In this way analysis not only provided us with the explanation of pathological phenomena, but revealed their connection with normal mental life and disclosed unsuspected relationships between psychiatry and the most various other sciences dealing with activities of the mind. Certain typical dreams, for instance, yielded an explanation of some myths and fairy-tales. Riklin and Abraham followed this hint and initiated the researches into myths which have found their completion, in a manner complying with even expert standards, in Rank's works on mythology. Further investigation into dream-symbolism led to the heart of the problems of mythology, folklore (Jones and Storfer) and the abstractions of religion. A deep impression was made on all hearers at one of the psycho-analytical Congresses when a follower of Jung's demonstrated the correspondence between schizophrenic phantasies and the cosmogonies of primitive times and races. Mythological material later received further elaboration (which, though open to criticism, was none the less very interesting) at the hands of Jung, in works attempting to correlate the neuroses with religious and mythological phantasies.
Another path led from the investigation of dreams to the analysis of works of imagination and ultimately to the analysis of their creators - writers and artists themselves. At an early stage it was discovered that dreams invented by writers will often yield to analysis in the same way as genuine ones. (Cf. 'Gradiva'.) The conception of unconscious mental activity made it possible to form a preliminary idea of the nature of imaginative creative writing; and the realization, gained in the study of neurotics, of the part played by the instinctual impulses enabled us to perceive the sources of artistic production and confronted us with two problems: how the artist reacts to this instigation and what means he employs to disguise his reactions.¹ Most analysts with general interests have contributed something to the solution of these problems, which are the most fascinating among the applications of psycho-analysis. Naturally, opposition was not lacking in this direction either on the part of people who knew nothing of analysis; it took the same form as it did in the original field of psycho-analytic research - the same misconceptions and vehement rejections. It was only to be expected from the beginning that, whatever the regions into which psycho-analysis might penetrate, it would inevitably experience the same struggles with those already in possession of the field. These attempted invasions, however, have not yet stirred up the attention in some quarters which awaits them in the future. Among the strictly scientific applications of analysis to literature, Rank's exhaustive work on the theme of incest easily takes the first place. Its subject is bound to arouse the greatest unpopularity. Up to the present, little work based on psycho-analysis has been done in the sciences of language and history. I myself ventured the first approach to the problems of the psychology of religion by drawing a parallel between religious ritual and the ceremonials of neurotics (1907b). Dr. Pfister, a pastor in Zurich, has traced back the origin of religious fanaticism to perverse eroticism in his book on the piety of Count von Zinzendorf, as well as in other contributions. In the latest works of the Zurich school, however, we find analysis permeated with religious ideas rather than the opposite outcome that had been in view.

[1914d, 2902]

In the four essays with the title Totem and Taboo I have made an attempt to deal with the problems of social anthropology in the light of analysis; this line of investigation leads direct to the origins of the most important institutions of our civilization, of the structure of the state, of morality and religion, and, moreover, of the prohibition against incest and of conscience. It is no doubt too early to decide how far the conclusions thus reached will be able to withstand criticism.

[1914d, 2903]

The first example of an application of the analytic mode of thought to the problems of aesthetics was contained in my book on jokes. Everything beyond this is still awaiting workers, who may expect a particularly rich harvest in this field. We are entirely without the co-operation of specialists in all these branches of knowledge, and in order to attract them Hanns Sachs, in 1912, founded the periodical Imago which is edited by him and Rank. A beginning has been made by Hitschmann and von Winterstein in throwing psycho-analytic light on philosophical systems and personalities, and here there is much need both of extended and of deeper investigation.

[1914d, 2903]

With this incomplete outline I have attempted to give some idea of the still incalculable wealth of connections which have come to light between medical psycho-analysis and other fields of science. There is material here for a generation of investigators to work at, and I do not doubt that the work will be carried out as soon as the resistances against psycho-analysis are overcome on its original ground.¹

[1914d, 2904]
The parallels we have found to dream-symbolism also allow us to form an estimate of the characteristic of psycho-analysis which enables it to attract general interest in a way in which neither psychology nor psychiatry has succeeded in doing. In the work of psycho-analysis links are formed with numbers of other mental sciences, the investigation of which promises results of the greatest value: links with mythology and philology, with folklore, with social psychology and the theory of religion. You will not be surprised to hear that a periodical has grown up on psycho-analytic soil whose sole aim is to foster these links. This periodical is known as *Imago*, founded in 1912 and edited by Hanns Sachs and Otto Rank. In all these links the share of psycho-analysis is in the first instance that of giver and only to a less extent that of receiver. It is true that this brings it an advantage in the fact that its strange findings become more familiar when they are met with again in other fields; but on the whole it is psycho-analysis which provides the technical methods and the points of view whose application in these other fields should prove fruitful. The mental life of human individuals, when subjected to psycho-analytic investigation, offers us the explanations with the help of which we are able to solve a number of riddles in the life of human communities or at least to set them in a true light.

The dream-work is a process of quite a singular kind, of which the like has not yet become known in mental life. Condensations, displacements, regressive transformations of thoughts into images - such things are novelties whose discovery has already richly rewarded the labours of psycho-analysis. And you can see once more, from the parallels to the dream-work, the connections which have been revealed between psycho-analytic studies and other fields - especially those concerned in the development of speech and thought. You will only be able to form an idea of the further significance of these discoveries when you learn that the mechanism of dream-construction is the model of the manner in which neurotic symptoms arise.

What characterizes psycho-analysis as a science is not the material which it handles but the technique with which it works. It can be applied to the history of civilization, to the science of religion and to mythology, no less than to the theory of the neuroses, without doing violence to its essential nature. What it aims at and achieves is nothing other than the uncovering of what is unconscious in mental life. The problems of the 'actual' neuroses, whose symptoms are probably generated by direct toxic damage, offer psycho-analysis no points of attack. It can do little towards throwing light on them and must leave the task to biologico-medical research.

And now perhaps you understand better why I did not choose to arrange my material differently. If I had promised you an 'Introduction to the Theory of the Neuroses' the correct path would certainly have led from the simple forms of the 'actual' neuroses to the more complicated psychical illnesses due to disturbance of the libido. As regards the former I should have had to collect from various sources what we have learnt or believe we know, and in connection with the psychoneuroses psycho-analysis would have come up for discussion as the most important technical aid in throwing light on those conditions. But what I intended to give and what I announced was an 'Introduction to Psycho-Analysis'. It was more important for me that you should gain an idea of psycho-analysis than that you should obtain some pieces of knowledge about the neuroses; and for that reason the 'actual' neuroses, unproductive so far as psycho-analysis is concerned, could no longer have a place in the foreground. I believe, too, that I have made the better choice for you. For, on account of the profundity of its hypotheses and the comprehensiveness of its connections, psycho-analysis deserves a place in the interest of every educated person, while the theory of the neuroses is a chapter in medicine like any other.
But you will now tell me that, no matter whether we call the motive force of our analysis transference or suggestion, there is a risk that the influencing of our patient may make the objective certainty of our findings doubtful. What is advantageous to our therapy is damaging to our researches. This is the objection that is most often raised against psycho-analysis, and it must be admitted that, though it is groundless, it cannot be rejected as unreasonable. If it were justified, psycho-analysis would be nothing more than a particularly well-disguised and particularly effective form of suggestive treatment and we should have to attach little weight to all that it tells us about what influences our lives, the dynamics of the mind or the unconscious. That is what our opponents believe; and in especial they think that we have "talked" the patients into everything relating to the importance of sexual experiences - or even into those experiences themselves - after such notions have grown up in our own depraved imagination. These accusations are contradicted more easily by an appeal to experience than by the help of theory. Anyone who has himself carried out psycho-analyses will have been able to convince himself on countless occasions that it is impossible to make suggestions to a patient in that way. The doctor has no difficulty, of course, in making him a supporter of some particular theory and in thus making him share some possible error of his own. In this respect the patient is behaving like anyone else - like a pupil - but this only affects his intelligence, not his illness. After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor's conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct. We endeavour by a careful technique to avoid the occurrence of premature successes due to suggestion; but no harm is done even if they do occur, for we are not satisfied by a first success. We do not regard an analysis as at an end until all the obscurities of the case are cleared up, the gaps in the patient's memory filled in, the precipitating causes of the repressions discovered. We look upon successes that set in too soon as obstacles rather than as a help to the work of analysis; and we put an end to such successes by constantly resolving the transference on which they are based. It is this last characteristic which is the fundamental distinction between analytic and purely suggestive therapy, and which frees the results of analysis from the suspicion of being successes due to suggestion. In every other kind of suggestive treatment the transference is carefully preserved and left untouched; in analysis it is itself subjected to treatment and is dissected in all the shapes in which it appears. At the end of an analytic treatment the transference must itself be cleared away; and if success is then obtained or continues, it rests, not on suggestion, but on the achievement by its means of an overcoming of internal resistances, on the internal change that has been brought about in the patient.

[1916-1917, 3493]

(c) In the investigation of mental processes and intellectual functions, psycho-analysis pursues a specific method of its own. The application of this method is by no means confined to the field of psychological disorders, but extends also to the solution of problems in art, philosophy and religion. In this direction it has already yielded several new points of view and thrown valuable light on such subjects as the history of literature, on mythology, on the history of civilizations and on the philosophy of religion. Thus the general psycho-analytic course should be thrown open to the students of these branches of learning as well. The fertilizing effects of psycho-analytic thought on these other disciplines would certainly contribute greatly towards forging a closer link, in the sense of a universitas literarum, between medical science and the branches of learning which lie within the sphere of philosophy and the arts.

[1919], 3640]
A little reflection was bound to show that it would be impossible to restrict to the provinces of dreams and nervous disorders a view such as this of the life of the human mind. If that view has hit upon a truth, it must apply equally to normal mental events, and even the highest achievements of the human spirit must bear a demonstrable relation to the factors found in pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself pointed persistently in the direction of this new task, for it was obvious that the forms assumed by the different neuroses echoed the most highly admired productions of our culture. Thus hystericis are undoubtedly imaginative artists, even if they express their phantasies mimitically in the main and without considering their intelligibility to other people; the ceremonials and prohibitions of obsessional neurotics drive us to suppose that they have created a private religion of their own; and the delusions of paranoics have an unpalatable external similarity and internal kinship to the systems of our philosophers. It is impossible to escape the conclusion that these patients are, in an asocial fashion, making the very attempts at solving their conflicts and appeasing their pressing needs which, when those attempts are carried out in a fashion that is acceptable to the majority, are known as poetry, religion and philosophy.

[1919g, 3704]

In 1913 Otto Rank and Hanns Sachs, in an extremely interesting work, brought together the results which had been achieved up to that time in the application of psycho-analysis to the mental sciences. The most easily accessible branches of those sciences seem to be mythology and the history of literature and religion. No final formula has yet been found enabling us to give an appropriate place to myths in this connection. Otto Rank, in a large volume on the incest complex (1912), has produced evidence of the surprising fact that the choice of subject matter, especially for dramatic works, is principally determined by the ambit of what psycho-analysis has termed the 'Oedipus complex'. By working it over with the greatest variety of modifications, distortions and disguises, the dramatist seeks to deal with his own most personal relations to this emotional theme. It is in attempting to master the Oedipus complex - that is to say, a person's emotional attitude towards his family, or in a narrower sense towards his father and mother - that individual neurotics come to grief, and for this reason that complex habitually forms the nucleus of their neuroses. It does not owe its importance to any unintelligible conjunction; the emphasis laid upon the relation of children to their parents is an expression of the biological facts that the young of the human race pass through a long period of dependence and are slow in reaching maturity, as well as that their capacity for love undergoes a complicated course of development. Consequently, the overcoming of the Oedipus complex coincides with the most efficient way of mastering the archaic, animal heritage of humanity. It is true that that heritage comprises all the forces that are required for the subsequent cultural development of the individual, but they must first be sorted out and worked over. This archaic heirloom is not fit to be used for the purposes of civilized social life in the form in which it is inherited by the individual.

[1919g, 3704]
I am now almost at the end of what I wish to say. I might, however, add the observation that the instances of telepathic messages or productions which have been discussed here are clearly connected with emotions belonging to the sphere of the Oedipus complex. This may sound startling; I do not intend to give it out as a great discovery, however. I would rather revert to the result we arrived at through investigating the dream I considered first. Telepathy has no relation to the essential nature of dreams; it cannot deepen in any way what we already understand of them through analysis. On the other hand, psycho-analysis may do something to advance the study of telepathy, in so far as, by the help of its interpretations, many of the puzzling characteristics of telepathic phenomena may be rendered more intelligible to us; or other, still doubtful, phenomena may for the first time definitely be ascertained to be of a telepathic nature.

[1922a, 3897]

Psycho-Analysis as a Therapeutic Procedure. - Psycho-analysis has never set itself up as a panacea and has never claimed to perform miracles. In one of the most difficult spheres of medical activity it is the only possible method of treatment for certain illnesses and for others it is the method which yields the best or the most permanent results - though never without a corresponding expenditure of time and trouble. A physician who is not wholly absorbed in the work of giving help will find his labours amply repaid by obtaining an unhoped-for insight into the complications of mental life and the interrelations between the mental and the physical. Where at present it cannot offer help but only theoretical understanding, it may perhaps be preparing the way for some later, more direct means of influencing neurotic disorders. Its province is above all the two transference neuroses, hysteria and obsessional neurosis, in which it has contributed to the discovery of their internal structure and operative mechanisms; and, beyond them, all kinds of phobias, inhibitions, deformities of character, sexual perversions and difficulties in erotic life. Some analysts (Jelliffe, Groddeck, Felix Deutsch) have reported too that the analytic treatment of gross organic diseases is not unpromising, since a mental factor not infrequently contributes to the origin and continuance of such illnesses. Since psycho-analysis demands a certain amount of psychical plasticity from its patients, some kind of age-limit must be laid down in their selection; and since it necessitates the devotion of long and intense attention to the individual patient, it would be uneconomical to squander such expenditure upon completely worthless persons who happen to be neurotic. Experience upon material in clinics can alone show what modifications may be necessary in order to make psycho-analytic treatment accessible to wider strata of the population or to adapt it to weaker intelligences. [1923a, 3926]
The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phyllogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one’s own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

The papers here collected into a single volume, which were written by Putnam between 1909 and the end of his life, give a good picture of his relations to psycho-analysis. They show how he was at first occupied in correcting a provisional judgement which was based on insufficient knowledge; how he then accepted the essence of analysis, recognized its capacity for throwing a clear light upon the origin of human imperfections and failings, and how he was struck by the prospect of contributing towards the improvement of humanity along analytical lines; how he then became convinced by his own activities as a physician as to the truth of most of the psycho-analytical conclusions and postulates, and then in his turn bore witness to the fact that the physician who makes use of analysis understands far more about the sufferings of his patients and can do far more for them than was possible with the earlier methods of treatment; and finally how he began to extend beyond the limits of analysis, demanding that as a science it should be linked on to a particular philosophical system, and that its practice should be openly associated with a particular set of ethical doctrines.

[1923a, 3929]

[1921a, 3940]
In order to reach even half way to an understanding of how, in a hysterical girl, a forbidden sexual wish can change into a painful symptom, it had been necessary to make far-reaching and complicated hypotheses about the structure and functioning of the mental apparatus. There was an evident contradiction here between expenditure of effort and result. If the conditions postulated by psycho-analysis really existed, they were of a fundamental nature and must be able to find expression in other phenomena besides hysterical ones. But if this inference were correct, psycho-analysis would have ceased to be of interest only to neurologists; it could claim the attention of everyone to whom psychological research was of any importance. Its findings would not only have to be taken into account in the field of pathological mental life but could not be overlooked either in coming to an understanding of normal functioning.

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

Now a dream is not a morbid symptom but a product of the normal mind. The wishes which it represents as fulfilled are the same as those which are repressed in neuroses. Dreams owe the possibility of their genesis merely to the favourable circumstance that during the state of sleep, which paralyses man's power of movement, repression is mitigated into the dream-censorship. If, however, the process of dream-formation oversteps certain limits, the dreamer brings it to a stop and wakes up in a fright. Thus it is proved that the same forces and the same processes taking place between them operate in normal as in pathological mental life. From the date of *The Interpretation of Dreams* psycho-analysis had a twofold significance. It was not only a new method of treating the neuroses but it was also a new psychology; it claimed the attention not only of nerve-specialists but also of all those who were students of a mental science.

But the importance of psycho-analysis for psychiatry would never have drawn the attention of the intellectual world to it or won it a place in *The History of our Times*. This result was brought about by the relation of psycho-analysis to normal, not to pathological, mental life. Originally, analytic research had indeed no other aim than to establish the determinants of the onset (the genesis) of a few morbid mental states. In the course of its efforts, however, it succeeded in bringing to light facts of fundamental importance, in actually creating a new psychology, so that it became obvious that the validity of such findings could not possibly be restricted to the sphere of pathology. We have seen already when it was that the decisive proof was produced of the correctness of this conclusion. It was when dreams were successfully interpreted by analytic technique - dreams, which are a part of the mental life of normal people and which yet may in fact be regarded as pathological products that can regularly appear under healthy conditions.
If the psychological discoveries gained from the study of dreams were firmly kept in view, only one further step was needed before psycho-analysis could be proclaimed as the theory of the deeper mental processes not directly accessible to consciousness - as a 'depth-psychology' - and before it could be applied to almost all the mental sciences. This step lay in the transition from the mental activity of individual men to the psychical functions of human communities and peoples - that is, from individual to group psychology; and many surprising analogies forced this transition upon us. It had been found, for instance, that in the deep strata of unconscious mental activity contraries are not distinguished from each other but are expressed by the same element. But already in 1884 Karl Abel the philologist had put forward the view (in his 'Über den Gegensinn der Urworte') that the oldest languages known to us treat contraries in the same way. Thus Ancient Egyptian, for example, had in the first instance only one word for 'strong' and 'weak', and not till later were the two sides of the antithesis distinguished by slight modifications. Even in the most modern languages clear relics of such antithetical meanings are to be found. So in German 'Boden' means the highest as well as the lowest thing in the house; similarly in Latin 'altus' means 'high' and 'deep'. Thus the equivalence of contraries in dreams is a universal archaic trait in human thinking.

To take an instance from another field. It is impossible to escape the impression of the perfect correspondence which can be discovered between the obsessive actions of certain obsessional patients and the religious observances of believers all over the world. Some cases of obsessional neurosis actually behave like a caricature of a private religion, so that it is tempting to liken the official religions to an obsessional neurosis that has been mitigated by becoming universalized. This comparison, which is no doubt highly objectionable to all believers, has nevertheless proved most fruitful psychologically. For psycho-analysis soon discovered in the case of obsessional neurosis what the forces are that struggle with one another in it till their conflicts find a remarkable expression in the ceremonial of obsessive actions. Nothing similar was suspected in the case of religious ceremonial until, by tracing back religious feeling to the relation with the father as its deepest root, it became possible to point to an analogous dynamic situation in that case too. This instance, moreover, may warn the reader that even in its application to non-medical fields psycho-analysis cannot avoid wounding cherished prejudices, touching upon deeply-rooted sensibilities and thus provoking enmities which have an essentially emotional basis.

If we may assume that the most general features of unconscious mental life (conflicts between instinctual impulses, repressions and substitutive satisfactions) are present everywhere, and if there is a depth-psychology which leads to a knowledge of those features, then we may reasonably expect that the application of psycho-analysis to the most varied spheres of human mental activity will everywhere bring to light important and hitherto unattainable results. In an exceedingly valuable study, Otto Rank and Hanns Sachs (1913) have tried to bring together what the work of psycho-analysts had been able to achieve up to that time towards fulfilling these expectations. Lack of space prevents me from attempting to complete their enumeration here. I can only select for mention the most important findings with the addition of a few details.
We have seen that one part of human mental activity is directed towards obtaining control over the real external world. Psycho-analysis now tells us further that another, particularly highly-prized, part of creative mental work serves for the fulfilment of wishes - for the substitutive satisfaction of the repressed wishes which, from the days of childhood, live in the spirit of each of us, unsatisfied. Among these creations, whose connection with an incomprehensible unconscious was always suspected, are myths and works of imaginative writing and of art, and the researches of psycho-analysts have in fact thrown a flood of light on the fields of mythology, the science of literature, and the psychology of artists. It is enough to mention Otto Rank's work as an example. We have shown that myths and fairy tales can be interpreted like dreams, we have traced the convoluted paths that lead from the urge of the unconscious wish to its realization in a work of art, we have learnt to understand the emotional effect of a work of art on the observer, and in the case of the artist himself we have made clear his internal kinship with the neurotic as well as his distinction from him, and we have pointed out the connection between his innate disposition, his chance experiences and his achievements. The aesthetic appreciation of works of art and the elucidation of the artistic gift are, it is true, not among the tasks set to psycho-analysis. But it seems that psycho-analysis is in a position to speak the decisive word in all questions that touch upon the imaginative life of man.

And now, as a third point, psycho-analysis has shown us, to our growing astonishment, the enormously important part played by what is known as the 'Oedipus complex' - that is, the emotional relation of a child to its two parents - in the mental life of human beings. Our astonishment diminishes when we realize that the Oedipus complex is the psychical correlate of two fundamental biological facts: the long period of the human child's dependence, and the remarkable way in which its sexual life reaches a first climax in the third to fifth years of life, and then, after a period of inhibition, sets in again at puberty. And here, the discovery was made that a third and extremely serious part of human intellectual activity, the part which has created the great institutions of religion, law, ethics, and all forms of civic life, has as its fundamental aim the enabling of the individual to master his Oedipus complex and to divert his libido from its infantile attachments into the social ones that are ultimately desired. The applications of psycho-analysis to the science of religion and sociology (e.g. by the present writer, Theodor Reik and Oskar Pfister), which have led to these findings, are still young and insufficiently appreciated; but it cannot be doubted that further studies will only confirm the certainty of these important conclusions.

By way, as it were, of postscript, I must also mention that educationists, too, cannot avoid making use of the hints which they have received from the analytic exploration of the mental life of children; and further that voices have been raised among therapists (e.g. Groddeck and Jelliffe), maintaining that the psycho-analytic treatment of serious organic complaints shows promising results, since in many of these affections some part is played by a psychical factor on which it is possible to bring influence to bear.
Thus we may express our expectation that psycho-analysis, whose development and achievements hitherto have been briefly and inadequately related in these pages, will enter into the cultural development of the next decades as a significant ferment, and will help to deepen our understanding of the world and to fight against some things in life which are recognized as injurious. It must not be forgotten, however, that psycho-analysis alone cannot offer a complete picture of the world. If we accept the distinction which I have recently proposed of dividing the mental apparatus into an ego, turned towards the external world and equipped with consciousness, and an unconscious id, dominated by its instinctual needs, then psycho-analysis is to be described as a psychology of the id (and of its effects upon the ego). In each field of knowledge, therefore, it can make only contributions, which require to be completed from the psychology of the ego. If these contributions often contain the essence of the facts, this only corresponds to the important part which, it may be claimed, is played in our lives by the mental unconscious that has so long remained unknown.

[1924f, 4118]

A particularly bad reception was accorded to psycho-analysis, which the present writer began to develop nearly thirty years ago from the discoveries of Josef Breuer (of Vienna) on the origin of neurotic symptoms. It cannot be disputed that it possessed the quality of novelty, even though it made use of plenty of material which was well known from other sources (quite apart from Breuer's discoveries), such as the lessons from the teachings of Charcot, the great neuropathologist, and impressions derived from the sphere of hypnotic phenomena. Its original significance was purely therapeutic: it aimed at creating a new and efficient method for treating neurotic illnesses. But connections which could not be foreseen in the beginning caused psycho-analysis to reach out far beyond its original aim. It ended by claiming to have set our whole view of mental life upon a new basis and therefore to be of importance for every field of knowledge that is founded on psychology. After a decade of complete neglect it suddenly became a subject of general interest - and set loose a storm of indignant opposition.

[1925e, 4122]

The forms in which the resistance to psycho-analysis found expression need not now be considered. It is enough to say that the struggle over this innovation is by no means at an end, though it is already possible to see what direction it will take. Its opponents have not succeeded in suppressing the movement. Psycho-analysis, of which twenty years ago I was the only spokesman, has since attracted the support of numerous valuable and active workers, medical and non-medical, who make use of it as a procedure for the treatment of nervous diseases, as a method of psychological research and as an auxiliary instrument for scientific work in the most various departments of intellectual life. In the following pages our interest will be directed only to the motives of the resistance to psycho-analysis, with particular stress upon the composite character of that resistance and upon the differing amount of weight carried by its components.

[1925e, 4122]
It is easy to understand why doctors, with an attitude of this kind towards the mind, should have had no liking for psycho-analysis and should have demurred to its demand for learning many things afresh and for seeing many things in a different light. But as a compensation it might be supposed that the new theory would be all the more likely to meet with applause from philosophers. For philosophers were accustomed to putting abstract concepts (or, as unkind tongues would say, hazy words) in the forefront of their explanations of the universe, and it would be impossible that they should object to the extension of the sphere of psychology for which psycho-analysis had paved the way. But here another obstacle arose. The philosophers' idea of what is mental was not that of psycho-analysis. The overwhelming majority of philosophers regard as mental only the phenomena of consciousness. For them the world of consciousness coincides with the sphere of what is mental. Everything else that may take place in the 'mind' - an entity so hard to grasp - is relegated by them to the organic determinants of mental processes or to processes parallel to mental ones. Or, more strictly speaking, the mind has no contents other than the phenomena of consciousness, and consequently psychology, the science of the mind, has no other subject-matter. And on this point the layman's view is the same.

This state of affairs is enough to account for the reluctant and hesitant reception of analysis in scientific quarters. But it does not explain the outbursts of indignation, derision and scorn which, in disregard of every standard of logic and good taste, have characterized the controversial methods of its opponents. A reaction of such a kind suggests that resistances other than purely intellectual ones were stirred up and that powerful emotional forces were aroused. And there are indeed plenty of things to be found in the theory of psycho-analysis calculated to produce such an effect as this upon the passions of men of every kind and not of scientists alone. Above all there is the very important place in the mental life of human beings which psycho-analysis assigns to what are known as the sexual instincts. Psycho-analytic theory maintained that the symptoms of neuroses are distorted substitutive satisfactions of sexual instinctual forces, the direct satisfaction of which has been frustrated by internal resistances. Later on, when analysis had extended beyond its original field of work and began to be applied to normal mental life, it sought to show that these same sexual components, which could be diverted from their immediate aims and directed to other things, made the most important contributions to the cultural achievements of the individual and of society. These views were not entirely new. The incomparable significance of sexual life had been proclaimed by the philosopher Schopenhauer in an intensely impressive passage. Moreover, what psycho-analysis called sexuality was by no means identical with the impulsion towards a union of the two sexes or towards producing a pleasurable sensation in the genitals; it had far more resemblance to the all-inclusive and all-preserving Eros of Plato's Symposium.
But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.

It is possible to take repression as a centre and to bring all the elements of psycho-analytic theory into relation with it. But before doing so I have a further comment of a polemical nature to make. According to Janet's view a hysterical woman was a wretched creature who, on account of a constitutional weakness, was unable to hold her mental acts together, and it was for that reason that she fell a victim to a splitting of her mind and to a restriction of the field of her consciousness. The outcome of psycho-analytic investigations, on the other hand, showed that these phenomena were the result of dynamic factors - of mental conflict and of repression. This distinction seems to me to be far-reaching enough to put an end to the glib repetition of the view that whatever is of value in psycho-analysis is merely borrowed from the ideas of Janet. The reader will have learned from my account that historically psycho-analysis is completely independent of Janet's discoveries, just as in its content it diverges from them and goes far beyond them. Janet's works would never have had the implications which have made psycho-analysis of such importance to the mental sciences and have made it attract such universal interest. I always treated Janet himself with respect, since his discoveries coincided to a considerable extent with those of Breuer, which had been made earlier but were published later than his. But when in the course of time psycho-analysis became a subject of discussion in France, Janet behaved ill, showed ignorance of the facts and used ugly arguments. And finally he revealed himself to my eyes and destroyed the value of his own work by declaring that when he had spoken of 'unconscious' mental acts he had meant nothing by the phrase - it had been no more than a façon de parler.

[1925e, 4126]

[1925d, 4207]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of The Psychopathology of Everyday Life. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

Even to-day it is of course impossible for me to foresee the final judgment of posterity upon the value of psycho-analysis for psychiatry, psychology, and the mental sciences in general. But I fancy that, when the history of the phase we have lived through comes to be written, German science will not have cause to be proud of those who represented it. I am not thinking of the fact that they rejected psycho-analysis or of the decisive way in which they did so; both of these things were easily intelligible, they were only to be expected and at any rate they threw no discredit on the character of the opponents of analysis. But for the degree of arrogance which they displayed, for their conscienceless contempt of logic, and for the coarseness and bad taste of their attacks there could be no excuse. It may be said that it is childish of me to give free rein to such feelings as these now, after fifteen years have passed; nor would I do so unless I had something more to add. Years later, during the World War, when a chorus of enemies were bringing against the German nation the charge of barbarism, a charge which sums up all that I have written above, it none the less hurt deeply to feel that my own experience would not allow me to contradict it.

I must begin by adding that increasing experience showed more and more plainly that the Oedipus complex was the nucleus of the neurosis. It was at once the climax of infantile sexual life and the point of junction from which all of its later developments proceeded. But if so, it was no longer possible to expect analysis to discover a factor that was specific in the aetiology of the neuroses. It must be true, as Jung expressed it so well in the early days when he was still an analyst, that neuroses have no peculiar content which belongs exclusively to them but that neurotics break down at the same difficulties that are successfully overcome by normal people. This discovery was very far from being a disappointment. It was in complete harmony with another one: that the depth-psychology revealed by psycho-analysis was in fact the psychology of the normal mind. Our path had been like that of chemistry: the great qualitative differences between substances were traced back to quantitative variations in the proportions in which the same elements were combined.
In France the interest in psycho-analysis began among the men of letters. To understand this, it must be borne in mind that from the time of the writing of The Interpretation of Dreams psycho-analysis ceased to be a purely medical subject. Between its appearance in Germany and in France lies the history of its numerous applications to departments of literature and of aesthetics, to the history of religions and to prehistory, to mythology, to folklore, to education, and so on. None of these things have much to do with medicine; in fact it is only through psycho-analysis that they are connected with it. I have no business, therefore, to go into them in detail in these pages. I cannot pass them over completely in silence, however, for on the one hand they are essential to a correct appreciation of the nature and value of psycho-analysis, and on the other hand I have, after all, undertaken to give an account of my life-work. The beginnings of the majority of these applications of psycho-analysis will be found in my works. Here and there I have gone a little way along the path in order to gratify my non-medical interests. Later on, others (not only doctors, but specialists in the various fields as well) have followed in my tracks and penetrated far into the different subjects. But since my programme limits me to a mention of my own share in these applications of psycho-analysis, I can only give a quite inadequate picture of their extent and importance.

A number of suggestions came to me out of the Oedipus complex, the ubiquity of which gradually dawned on me. The poet’s choice, or his invention, of such a terrible subject seemed puzzling; and so too did the overwhelming effect of its dramatic treatment, and the general nature of such tragedies of destiny. But all of this became intelligible when one realized that a universal law of mental life had here been captured in all its emotional significance. Fate and the oracle were no more than materializations of an internal necessity; and the fact of the hero’s sinning without his knowledge and against his intentions was evidently a right expression of the unconscious nature of his criminal tendencies. From understanding this tragedy of destiny it was only a step further to understanding a tragedy of character - Hamlet, which had been admired for three hundred years without its meaning being discovered or its author’s motives guessed. It could scarcely be a chance that this neurotic creation of the poet should have come to grief, like his numberless fellows in the real world, over the Oedipus complex. For Hamlet was faced with the task of taking vengeance on another for the two deeds which are the subject of the Oedipus desires; and before that task his arm was paralysed by his own obscure sense of guilt. Shakespeare wrote Hamlet very soon after his father’s death.¹ The suggestions made by me for the analysis of this tragedy were fully worked out later on by Ernest Jones. And the same example was afterwards used by Otto Rank as the starting-point for his investigation of the choice of material made by dramatists. In his large volume on the incest theme (Rank, 1912) he was able to show how often imaginative writers have taken as their subject the themes of the Oedipus situation, and traced in the different literatures of the world the way in which the material has been transformed, modified, and softened.

¹[1925d, 4237]
I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.

I myself have contributed nothing to the application of analysis to education. It was natural, however, that the analytic discoveries about the sexual life and mental development of children should attract the attention of educators and make them see their problems in a new light. Dr. Oskar Pfister, a protestant pastor at Zurich, led the way as a tireless pioneer along these lines, nor did he find the practice of analysis incompatible with the retention of his religion, though it is true that this was of a sublimated kind. Among the many others who worked alongside of him I may mention Frau Dr. Hug-Hellmuth and Dr. S. Bernfeld, both of Vienna.¹ The application of analysis to the prophylactic upbringing of healthy children and to the correcting of those who, though not actually neurotic, have deviated from the normal course of development has led to one consequence which is of practical importance. It is no longer possible to restrict the practice of psycho-analysis to doctors and to exclude laymen from it. In fact, a doctor who has not been through a special training is, in spite of his diploma, a layman in analysis, and a non-doctor who has been suitably trained can, with occasional reference to a doctor, carry out the analytic treatment not only of children but also of neurotics.
By a process of development against which it would have been useless to struggle, the word 'psycho-analysis' has itself become ambiguous. While it was originally the name of a particular therapeutic method, it has now also become the name of a science - the science of unconscious mental processes. By itself this science is seldom able to deal with a problem completely, but it seems destined to give valuable contributory help in the most varied regions of knowledge. The sphere of application of psycho-analysis extends as far as that of psychology, to which it forms a complement of the greatest moment.

I must add a few more words on the history of psycho-analysis during the last decade. There can no longer be any doubt that it will continue; it has proved its capacity to survive and to develop both as a branch of knowledge and as a therapeutic method. The number of its supporters (organized into the International Psycho-Analytical Association) has considerably increased. In addition to the older local groups (in Vienna, Berlin, Budapest, London, Holland, Switzerland, and Russia), societies have since been formed in Paris and Calcutta, two in Japan, several in the United States, and quite recently one each in Jerusalem and South Africa and two in Scandinavia. Out of their own funds these local societies support (or are in process of forming) training institutes, in which instruction in the practice of psycho-analysis is given according to a uniform plan, and out-patient clinics in which experienced analysts as well as students give free treatment to patients of limited means. Every other year the members of the International Psycho-Analytical Association hold a Congress at which scientific papers are read and questions of organization decided. The thirteenth of these congresses (which I myself can no longer attend) took place at Lucerne in 1934. From a core of interests that are common to all members of the Association, their work radiates in many different directions. Some lay most stress upon clarifying and deepening our knowledge of psychology, while others are concerned with keeping in contact with medicine and psychiatry. From the practical point of view, some analysts have set themselves the task of bringing about the recognition of psycho-analysis at the universities and its inclusion in the medical curriculum, whereas others are content to remain outside these institutions and will not allow that psycho-analysis is less important in the field of education than in that of medicine. It happens from time to time that an analytic worker may find himself isolated in an attempt to emphasize some single one of the findings or views of psycho-analysis at the expense of all the rest. Nevertheless, the whole impression is a satisfactory one - of serious scientific work carried on at a high level.

There is much to be told, for which our expectations have not prepared us, about the contents, manifestations and achievements of this early period of sexuality. For instance, you will no doubt be surprised to hear how often little boys are afraid of being eaten up by their father. (And you may also be surprised at my including this fear among the phenomena of sexual life.) But I may remind you of the mythological tale which you may still recall from your schooldays of how the god Kronos swallowed his children. How strange this must have sounded to you when you first heard it! But I suppose none of us thought about it at the time. To-day we can also call to mind a number of fairy tales in which some ravenous animal like a wolf appears, and we shall recognize it as a disguise of the father. And this is an opportunity of assuring you that it was only through the knowledge of infantile sexuality that it became possible to understand mythology and the world of fairy tales. Here then something has been gained as a by-product of analytic studies.
For we do not consider it at all desirable for psycho-analysis to be swallowed up by medicine and to find its last resting-place in a text-book of psychiatry under the heading 'Methods of Treatment', alongside of procedures such as hypnotic suggestion, autosuggestion, and persuasion, which, born from our ignorance, have to thank the laziness and cowardice of mankind for their short-lived effects. It deserves a better fate and, it may be hoped, will meet with one. As a 'depth-psychology', a theory of the mental unconscious, it can become indispensable to all the sciences which are concerned with the evolution of human civilization and its major institutions such as art, religion and the social order. It has already, in my opinion, afforded these sciences considerable help in solving their problems. But these are only small contributions compared with what might be achieved if historians of civilization, psychologists of religion, philologists and so on would agree themselves to handle the new instrument of research which is at their service. The use of analysis for the treatment of the neuroses is only one of its applications; the future will perhaps show that it is not the most important one. In any case it would be wrong to sacrifice all the other applications to this single one, just because it touches on the circle of medical interests.

For here a further prospect stretches ahead, which cannot be encroached upon with impunity. If the representatives of the various mental sciences are to study psycho-analysis so as to be able to apply its methods and angles of approach to their own material, it will not be enough for them to stop short at the findings which are laid down in analytic literature. They must learn to understand analysis in the only way that is possible - by themselves undergoing an analysis. The neurotics who need analysis would thus be joined by a second class of persons, who accept analysis from intellectual motives, but who will no doubt also welcome the increase in their capacities which they will incidentally achieve. To carry out these analyses a number of analysts will be needed, for whom any medical knowledge will have particularly little importance. But these 'teaching analysts' - let us call them - will require to have had a particularly careful education. If this is not to be stunted, they must be given an opportunity of collecting experience from instructive and informative cases; and since healthy people who also lack the motive of curiosity do not present themselves for analysis, it is once more only upon neurotics that it will be possible for the teaching analysts - under careful supervision - to be educated for their subsequent non-medical activity. All this, however, requires a certain amount of freedom of movement, and is not compatible with petty restrictions.

Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.
Moreover, to return to our question of the analytic treatment of adult neurotics, even there we have not yet exhausted every line of approach. Our civilization imposes an almost intolerable pressure on us and it calls for a corrective. Is it too fantastic to expect that psycho-analysis in spite of its difficulties may be destined to the task of preparing mankind for such a corrective? Perhaps once more an American may hit on the idea of spending a little money to get the ‘social workers’ of his country trained analytically and to turn them into a band of helpers for combating the neuroses of civilization.

No doubt what I have just said throws little light on the problem of lay analysis; it was only intended to exhibit my personal credentials as being myself a supporter of the inherent value of psycho-analysis and of its independence of its application to medicine. But it will be objected at this point that whether psycho-analysis, regarded as a science, is a subdivision of medicine or of psychology is a purely academic question and of no practical interest. The real point at issue, it will be said, is a different one, namely the application of analysis to the treatment of patients; in so far as it claims to do this it must be content, the argument will run, to be accepted as a specialized branch of medicine, like radiology, for instance, and to submit to the rules laid down for all therapeutic methods. I recognize that that is so; I admit it. I only want to feel assured that the therapy will not destroy the science. Unluckily analogies never carry one more than a certain distance; a point is soon reached at which the subjects of the comparison take divergent paths. The case of analysis differs from that of radiology. A physicist does not require to have a patient in order to study the laws that govern X-rays. But the only subject-matter of psycho-analysis is the mental processes of human beings and it is only in human beings that it can be studied. For reasons which can easily be understood, neurotic human beings offer far more instructive and accessible material than normal ones, and to withhold that material from anyone who wishes to study and apply analysis is to dock him of a good half of his training possibilities. I have, of course, no intention of asking that the interests of neurotic patients should be sacrificed to those of instruction and scientific research. The aim of my small volume on the question of lay analysis was precisely to show that, if certain precautions are observed, the two interests can quite easily be brought into harmony and that the interests of medicine, as rightly understood, will not be the last to profit by such a solution.
Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I do know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?

[1926e, 4396]
Some remarks that have been made in the course of this discussion have led me to suspect that, in spite of everything, my book on lay analysis has been misunderstood in one respect. The doctors have been defended against me, as though I had declared that they were in general incompetent to practise analysis and as though I had given it out as a password that medical reinforcements were to be rejected. That was not my intention. The idea probably arose from my having been led to declare in the course of my observations (which had a controversial end in view) that untrained medical analysts were even more dangerous than laymen. I might make my true opinion on this question clear by echoing a cynical remark about women that once appeared in *Simplicissimus*. One man was complaining to another about the weaknesses and troublesome nature of the fair sex. 'All the same,' replied his companion, 'women are the best thing we have of the kind.' I am bound to admit that, so long as schools such as we desire for the training of analysts are not yet in existence, people who have had a preliminary education in medicine are the best material for future analysts. We have a right to demand, however, that they should not mistake their preliminary education for a complete training, that they should overcome the one-sidedness that is fostered by instruction in medical schools and that they should resist the temptation to flirt with endocrinology and the autonomic nervous system, when what is needed is an apprehension of psychological facts with the help of a framework of psychological concepts. I also share the view that all those problems which relate to the connection between psychical phenomena and their organic, anatomical and chemical foundations can be approached only by those who have studied both, that is, by medical analysts. It should not be forgotten, however, that this is not the whole of psycho-analysis, and that for its other aspect we can never do without the co-operation of people who have had a preliminary education in the mental sciences. For practical reasons we have been in the habit - and this is true, incidentally, of our publications as well - of distinguishing between medical and applied analysis. But that is not a logical distinction. The true line of division is between scientific analysis and its applications alike in medical and in non-medical fields.

The therapeutic influence of psycho-analysis depends on the replacement of unconscious mental acts by conscious ones and is effective within the limits of that factor. The replacement is effected by overcoming internal resistances in the patient's mind. The future will probably attribute far greater importance to psycho-analysis as the science of the unconscious than as a therapeutic procedure.

At this point two observations may be in place. It must not be supposed that these very general ideas are presuppositions upon which the work of psycho-analysis depends. On the contrary, they are its latest conclusions and are 'open to revision'. Psycho-analysis is founded securely upon the observation of the facts of mental life; and for that very reason its theoretical superstructure is still incomplete and subject to constant alteration. Secondly, there is no reason for surprise that psycho-analysis, which was originally no more than an attempt at explaining pathological mental phenomena, should have developed into a psychology of normal mental life. The justification for this arose with the discovery that the dreams and mistakes of normal men have the same mechanism as neurotic symptoms.
Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the 'sublimation' of instincts, the part played by symbolism, the problem of 'ambivalence', etc. Nor has there been space to allude to the applications of psycho-analysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Social Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psycho-analysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these other branches of mental science.

[1926f, 4406]

The reasons for this hostility were to be found, from the medical point of view, in the fact that psycho-analysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psycho-analysis. In spite of this widespread opposition, however, the movement in favour of psycho-analysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psycho-analysis to non-medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

[1926f, 4407]

I believe the line of thought which seeks to trace in the phenomena of cultural development the part played by a super-ego promises still further discoveries. I hasten to come to a close. But there is one question which I can hardly evade. If the development of civilization has such a far-reaching similarity to the development of the individual and if it employs the same methods, may we not be justified in reaching the diagnosis that, under the influence of cultural urges, some civilizations, or some epochs of civilization - possibly the whole of mankind - have become 'neurotic'? An analytic dissection of such neuroses might lead to therapeutic recommendations which could lay claim to great practical interest. I would not say that an attempt of this kind to carry psycho-analysis over to the cultural community was absurd or doomed to be fruitless. But we should have to be very cautious and not forget that, after all, we are only dealing with analogies and that it is dangerous, not only with men but also with concepts, to tear them from the sphere in which they have originated and been evolved. Moreover, the diagnosis of communal neuroses is faced with a special difficulty. In an individual neurosis we take as our starting-point the contrast that distinguishes the patient from his environment, which is assumed to be 'normal'. For a group all of whose members are affected by one and the same disorder no such background could exist; it would have to be found elsewhere. And as regards the therapeutic application of our knowledge, what would be the use of the most correct analysis of social neuroses, since no one possesses authority to impose such a therapy upon the group? But in spite of all these difficulties, we may expect that one day someone will venture to embark upon a pathology of cultural communities.

[1930a, 4531]
When psycho-analysis puts itself at the service of biography, it naturally has the right to be treated no more harshly than the latter itself. Psycho-analysis can supply some information which cannot be arrived at by other means, and can thus demonstrate new connecting threads in the 'weaver's masterpiece' spread between the instinctual endowments, the experiences and the works of an artist. Since it is one of the principal functions of our thinking to master the material of the external world psychically, it seems to me that thanks are due to psycho-analysis if, when it is applied to a great man, it contributes to the understanding of his great achievement. But, I admit, in the case of Goethe we have not yet succeeded very far. This is because Goethe was not only, as a poet, a great self-revealer, but also, in spite of the abundance of autobiographical records, a careful concealer. We cannot help thinking here of the words of Mephistopheles:

People in whom this unconscious sense of guilt is excessively strong betray themselves in analytic treatment by the negative therapeutic reaction which is so disagreeable from the prognostic point of view. When one has given them the solution of a symptom, which should normally be followed by at least its temporary disappearance, what they produce instead is a momentary exacerbation of the symptom and of the illness. It is often enough to praise them for their behaviour in the treatment or to say a few hopeful words about the progress of the analysis in order to bring about an unmistakable worsening of their condition. A non-analyst would say that the 'will to recovery' was absent. If you follow the analytic way of thinking, you will see in this behaviour a manifestation of the unconscious sense of guilt, for which being ill, with its sufferings and impediments, is just what is wanted. The problems which the unconscious sense of guilt has opened up, its connections with morality, education, crime and delinquency, are at present the preferred field of work for psycho-analysts.

One of the first applications of psycho-analysis was to teach us to understand the opposition offered to us by our contemporaries because we practised psycho-analysis. Other applications, of an objective nature, may claim a more general interest. Our first purpose, of course, was to understand the disorders of the human mind, because a remarkable experience had shown that here understanding and cure almost coincide, that a traversable road leads from the one to the other. And for a long time it was our only purpose. Then, however, we perceived the close relations, the internal identity indeed, between pathological processes and what are known as normal ones. Psycho-analysis became a depth-psychology; and, since nothing that men make or do is understandable without the co-operation of psychology, the applications of psycho-analysis to numerous fields of knowledge, in particular to those of the mental sciences, came about of their own accord, pushed their way to the front and called for ventilation. These tasks unluckily came up against obstacles which, rooted as they were in the circumstances, have not yet been overcome even to-day. An application of this kind presupposes specialized knowledge which an analyst does not possess, while those who possess it, the specialists, know nothing of analysis and perhaps want to know nothing. The result has been that analysts, as amateurs with an equipment of greater or less adequacy, often hastily scraped together, have made excursions into such fields of knowledge as mythology, the history of civilization, ethnology, the science of religion and so on. They were no better treated by the experts resident in those fields than are trespassers in general: their methods and their findings, in so far as they attracted attention, were in the first instance rejected. But these conditions are constantly improving, and in every region there is a growing number of people who study psycho-analysis in order to make use of it in their special subject, and in order, as colonists, to replace the pioneers. Here we may expect a rich harvest of new discoveries. Applications of analysis are always confirmations of it as well. There, too, where scientific work is further removed from practical activity, the inevitable differences of opinion will no doubt take a less embittered form.
But there is one topic which I cannot pass over so easily - not, however, because I understand particularly much about it or have contributed very much to it. Quite the contrary: I have scarcely concerned myself with it at all. I must mention it because it is so exceedingly important, so rich in hopes for the future, perhaps the most important of all the activities of analysis. What I am thinking of is the application of psycho-analysis to education, to the upbringing of the next generation. I am glad that I am at least able to say that my daughter, Anna Freud, has made this study her life-work and has in that way compensated for my neglect.

Parallel with the efforts of analysts to influence education, other investigations are being made into the origin and prevention of delinquency and crime. Here again I am only opening the door for you and showing you the rooms that lie beyond it, without leading you inside. I am certain that if you remain loyal to your interest in psycho-analysis you will be able to learn much that is new and valuable on these subjects. I must not, however, leave the topic of education without referring to one particular aspect of it. It has been said - and no doubt justly - that every education has a partisan aim, that it endeavours to bring the child into line with the established order of society, without considering how valuable or how stable that order may be in itself. If one is convinced of the defects in our present social arrangements, education with a psycho-analytic alignment cannot justifiably be put at their service as well: it must be given another and higher aim, liberated from the prevailing demands of society. In my opinion, however, this argument is out of place here. Such a demand goes beyond the legitimate function of analysis. In the same way, it is not the business of a doctor who is called in to treat a case of pneumonia to concern himself with whether the patient is an honest man or a suicide or a criminal, whether he deserves to remain alive or whether one ought to wish him to. This other aim which it is desired to give to education will also be a partisan one, and it is not the affair of an analyst to decide between the parties. I am leaving entirely on one side the fact that psycho-analysis would be refused any influence on education if it admitted to intentions inconsistent with the established social order. Psycho-analytic education will be taking an uninvited responsibility on itself if it proposes to mould its pupils into rebels. It will have played its part if it sends them away as healthy and efficient as possible. It itself contains enough revolutionary factors to ensure that no one educated by it will in later life take the side of reaction and suppression. It is even my opinion that revolutionary children are not desirable from any point of view.

I have told you that psycho-analysis began as a method of treatment; but I did not want to commend it to your interest as a method of treatment but on account of the truths it contains, on account of the information it gives us about what concerns human beings most of all - their own nature - and on account of the connections it discloses between the most different of their activities. As a method of treatment it is one among many, though, to be sure, primus inter pares. If it was without therapeutic value it would not have been discovered, as it was, in connection with sick people and would not have gone on developing for more than thirty years.

Yet more than a century before the emergence of psycho-analysis the French philosopher Diderot bore witness to the importance of the Oedipus complex by expressing the difference between the primitive and civilized worlds in this sentence: ‘Si le petit sauvage était abandonné à lui-même, qu'il conservât toute son imbécilité, et qu'il réunit au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le col à son père et coucherait avec sa mère.'² I venture to say that if psycho-analysis could boast of no other achievement than the discovery of the repressed Oedipus complex, that alone would give it a claim to be included among the precious new acquisitions of mankind.
All of the general discoveries and hypotheses which I brought forward in the first chapter were, of course, arrived at by laborious and patient detailed work of the kind of which I have given an example in the previous chapter. We may now feel tempted to make a survey of the increases in knowledge that we have achieved by work such as this and to consider what paths we have opened for further advances. In this connection we may be struck by the fact that we have so often been obliged to venture beyond the frontiers of the science of psychology. The phenomena with which we were dealing do not belong to psychology alone; they have an organic and biological side as well, and accordingly in the course of our efforts at building up psycho-analysis we have also made some important biological discoveries and have not been able to avoid framing new biological hypotheses.

[1940a [1938], 5002]
You may have formed an impression that the technique through whose armoury I have just conducted you is particularly difficult. In my opinion that technique is entirely in conformity with the material with which it has to do. But this much at least is clear: it is not a self-evident one and it must be learnt just as the techniques of histology or surgery must be learnt. You will perhaps be surprised to hear that in Europe we have heard a large number of judgements on psycho-analysis from people who know nothing of this technique and do not employ it; and who go on to demand with apparent scorn that we shall prove to them the correctness of our findings. Among these adversaries there are no doubt some to whom a scientific mode of thought is not as a rule alien, who, for instance, would not reject the results of a microscopic examination because it could not be confirmed on the anatomical preparation with the naked eye, but who would first form a judgement on the matter themselves with the help of a microscope. But, where psycho-analysis is concerned, the prospects of recognition are in truth less favourable. Psycho-analysis is seeking to bring to conscious recognition the things in mental life which are repressed; and everyone who forms a judgement on it is himself a human being, who possesses similar repressions and may perhaps be maintaining them with difficulty. They are therefore bound to call up the same resistance in him as in our patients; and that resistance finds it easy to disguise itself is an intellectual rejection and to bring up arguments like those which we ward off in our patients by means of the fundamental rule of psycho-analysis. We often become aware in our opponents, just as we do in our patients, that their power of judgement is very noticeably influenced affectively in the sense of being diminished. The arrogance of consciousness (in rejecting dreams with such contempt, for instance) is one of the most powerful of the devices with which we are provided as a universal protection against the incursion of unconscious complexes. That is why it is so hard to convince people of the reality of the unconscious and to teach them to recognize something new which is in contradiction to their conscious knowledge.

Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men’s emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psycho-analysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

A doctor who does what you have promised on his behalf will be welcome to all of us. Four-fifths of those whom I recognize as my pupils are in any case doctors. But allow me to point out to you how the relations of doctors to analysis have really developed and how they will probably continue to develop. Doctors have no historical claim to the sole possession of analysis. On the contrary, until recently they have met it with everything possible that could damage it, from the shallowest ridicule to the gravest calumny. You will justly reply that that belongs to the past and need not affect the future. I agree, but I fear the future will be different from what you have foretold.
In what follows I shall not rely exclusively upon either of the two methods of presentation: I shall make use now of one and now of the other. I am under no delusion about the difficulty of my task. Psycho-analysis has little prospect of becoming liked or popular. It is not merely that much of what it has to say offends people’s feelings. Almost as much difficulty is created by the fact that our science involves a number of hypotheses - it is hard to say whether they should be regarded as postulates or as products of our researches - which are bound to seem very strange to ordinary modes of thought and which fundamentally contradict current views. But there is no help for it. We must begin our brief study with two of these hazardous hypotheses. [1940b [1938], 5067]
Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psycho-analysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

[1910d, 2311]

Or let me examine these developments, which I have been describing as taking place in the future, in an analogous situation which is on a smaller scale and consequently easier to take in. Suppose a number of ladies and gentlemen in good society have planned to have a picnic one day at an inn in the country. The ladies have arranged among themselves that if one of them wants to relieve a natural need she will announce that she is going to pick flowers. Some malicious person, however, has got wind of this secret and has had printed on the programme which is sent round to the whole party: 'Ladies who wish to retire are requested to announce that they are going to pick flowers.' After this, of course, no lady will think of availing herself of this flowery pretext, and, in the same way, other similar formulas, which may be freshly agreed upon, will be seriously compromised. What will be the result? The ladies will admit their natural needs without shame and none of the men will object.

[1910d, 2313]

Let us return to our more serious case. A certain number of people, faced in their lives by conflicts which they have found too difficult to solve, have taken flight into neurosis and in this way won an unmistakable, although in the long run too costly, gain from illness. What will these people have to do if their flight into illness is barred by the indiscreet revelations of psycho-analysis? They will have to be honest, confess to the instincts that are at work in them, face the conflict, fight for what they want, or go without it; and the tolerance of society, which is bound to ensue as a result of psycho-analytic enlightenment, will help them in their task.

[1910d, 2314]
This presents a gloomy prospect for the effectiveness of psycho-analysis as a therapy - does it not? - even though we are able to explain the great majority of our failures by attributing them to interfering external factors. Friends of analysis have advised us to meet the threatened publication of our failures with statistics of our successes drawn up by ourselves. I did not agree to this. I pointed out that statistics are worthless if the items assembled in them are too heterogeneous; and the cases of neurotic illness which we had taken into treatment were in fact incomparable in a great variety of respects. Moreover, the period of time that could be covered was too short to make it possible to judge the durability of the cures. And it was altogether impossible to report on many of the cases: they concerned people who had kept both their illness and its treatment secret, and their recovery had equally to be kept secret. But the strongest reason for holding back lay in the realization that in matters of therapy people behave highly irrationally, so that one has no prospect of accomplishing anything with them by rational means. A therapeutic novelty is either received with delirious enthusiasm - as, for instance, when Koch introduced his first tuberculin against tuberculosis to the public - or it is treated with abysmal distrust - like Jenner's vaccination, which was in fact a blessing and which even to-day has its irreconcilable opponents. There was obviously a prejudice against psycho-analysis. If one had cured a severe case, one might hear people say: 'That proves nothing. He would have recovered on his own account by this time.' And when a woman patient, who had already passed through four cycles of depression and mania, came to be treated by me during an interval after an attack of melancholia and three weeks later started on a phase of mania, all the members of her family and a high medical authority, too, who was called in for consultation - were convinced that the fresh attack could only be the result of my attempted analysis. Nothing can be done against prejudices. You can see it again to-day in the prejudices which each group of nations at war has developed against the other. The most sensible thing to do is to wait, and to leave such prejudices to the eroding effects of time. One day the same people begin to think about the same things in quite a different way from before; why they did not think so earlier remains a dark mystery.

[1916-1917, 3500]

Now let us assume that by some kind of organization we succeeded in increasing our numbers to an extent sufficient for treating a considerable mass of the population. On the other hand, it is possible to foresee that at some time or other the conscience of society will awake and remind it that the poor man should have just as much right to assistance for his mind as he now has to the life-saving help offered by surgery; and that the neuroses threaten public health no less than tuberculosis, and can be left as little as the latter to the impotent care of individual members of the community. When this happens, institutions or out-patient clinics will be started, to which analytically-trained physicians will be appointed, so that men who would otherwise give way to drink, women who have nearly succumbed under their burden of privations, children for whom there is no choice but between running wild or neurosis, may be made capable, by analysis, of resistance and of efficient work. Such treatments will be free. It may be a long time before the State comes to see these duties as urgent. Present conditions may delay its arrival even longer. Probably these institutions will first be started by private charity. Some time or other, however, it must come to this.

[1919a, 3635]
We shall then be faced by the task of adapting our technique to the new conditions. I have no doubt that the validity of our psychological assumptions will make its impression on the uneducated too, but we shall need to look for the simplest and most easily intelligible ways of expressing our theoretical doctrines. We shall probably discover that the poor are even less ready to part with their neuroses than the rich, because the hard life that awaits them if they recover offers them no attraction, and illness gives them one more claim to social help. Often, perhaps, we may only be able to achieve anything by combining mental assistance with some material support, in the manner of the Emperor Joseph. It is very probable, too, that the large-scale application of our therapy will compel us to alloy the pure gold of analysis freely with the copper of direct suggestion; and hypnotic influence, too, might find a place in it again, as it has in the treatment of war neuroses. But, whatever form this psychotherapy for the people may take, whatever the elements out of which it is compounded, its most effective and most important ingredients will assuredly remain those borrowed from strict and untendentious psycho-analysis.

[1919a, 3635]

I must add a few more words on the history of psycho-analysis during the last decade. There can no longer be any doubt that it will continue; it has proved its capacity to survive and to develop both as a branch of knowledge and as a therapeutic method. The number of its supporters (organized into the International Psycho-Analytical Association) has considerably increased. In addition to the older local groups (in Vienna, Berlin, Budapest, London, Holland, Switzerland, and Russia), societies have since been formed in Paris and Calcutta, two in Japan, several in the United States, and quite recently one each in Jerusalem and South Africa and two in Scandinavia. Out of their own funds these local societies support (or are in process of forming) training institutes, in which instruction in the practice of psycho-analysis is given according to a uniform plan, and out-patient clinics in which experienced analysts as well as students give free treatment to patients of limited means. Every other year the members of the International Psycho-Analytical Association hold a Congress at which scientific papers are read and questions of organization decided. The thirteenth of these congresses (which I myself can no longer attend) took place at Lucerne in 1934. From a core of interests that are common to all members of the Association, their work radiates in many different directions. Some lay most stress upon clarifying and deepening our knowledge of psychology, while others are concerned with keeping in contact with medicine and psychiatry. From the practical point of view, some analysts have set themselves the task of bringing about the recognition of psycho-analysis at the universities and its inclusion in the medical curriculum, whereas others are content to remain outside these institutions and will not allow that psycho-analysis is less important in the field of education than in that of medicine. It happens from time to time that an analytic worker may find himself isolated in an attempt to emphasize some single one of the findings or views of psycho-analysis at the expense of all the rest. Nevertheless, the whole impression is a satisfactory one - of serious scientific work carried on at a high level.

[1925d, 4245]
It can be done very well. It is hardly to be believed what goes on in a child of four or five years old. Children are very active-minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupider. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreproachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians to-day, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition.

[1926e, 4357]
Thus we may express our expectation that psycho-analysis, whose development and achievements hitherto have been briefly and inadequately related in these pages, will enter into the cultural development of the next decades as a significant ferment, and will help to deepen our understanding of the world and to fight against some things in life which are recognized as injurious. It must not be forgotten, however, that psycho-analysis alone cannot offer a complete picture of the world. If we accept the distinction which I have recently proposed of dividing the mental apparatus into an ego, turned towards the external world and equipped with consciousness, and an unconscious id, dominated by its instinctual needs, then psycho-analysis is to be described as a psychology of the id (and of its effects upon the ego). In each field of knowledge, therefore, it can make only contributions, which require to be completed from the psychology of the ego. If these contributions often contain the essence of the facts, this only corresponds to the important part which, it may be claimed, is played in our lives by the mental unconscious that has so long remained unknown.

[1924f, 4118]

I must confess that I am not at all partial to the fabrication of Weltanschauungen. Such activities may be left to philosophers, who avowedly find it impossible to make their journey through life without a Baedeker of that kind to give them information on every subject. Let us humbly accept the contempt with which they look down on us from the vantage-ground of their superior needs. But since we cannot forgo our narcissistic pride either, we will draw comfort from the reflection that such 'Handbooks to Life' soon grow out of date and that it is precisely our short-sighted, narrow and finicky work which obliges them to appear in new editions, and that even the most up-to-date of them are nothing but attempts to find a substitute for the ancient, useful and all-sufficient Church Catechism. We know well enough how little light science has so far been able to throw on the problems that surround us. But however much ado the philosophers may make, they cannot alter the situation. Only patient, persevering research, in which everything is subordinated to the one requirement of certainty, can gradually bring about a change. The benighted traveller may sing aloud in the dark to deny his own fears; but, for all that, he will not see an inch further beyond his nose.

[1926d, 4257]

LADIES AND GENTLEMEN, - At our last meeting we were occupied with little everyday concerns - putting our own modest house in order, as it were. I propose that we should now take a bold leap and venture upon answering a question which is constantly being asked in other quarters: does psycho-analysis lead to a particular Weltanschauung and, if so, to which?

[1933a, 4757]

'Weltanschauung' is, I am afraid, a specifically German concept, the translation of which into foreign languages might well raise difficulties. If I try to give you a definition of it, it is bound to seem clumsy to you. In my opinion, then, a Weltanschauung is an intellectual construction which solves all the problems of our existence uniformly on the basis of one overriding hypothesis, which, accordingly, leaves no question unanswered and in which everything that interests us finds its fixed place. It will easily be understood that the possession of a Weltanschauung of this kind is among the ideal wishes of human beings. Believing in it one can feel secure in life, one can know what to strive for, and how one can deal most expeditiously with one's emotions and interests.

[1933a, 4757]
If that is the nature of a Weltanschauung, the answer as regards psycho-analysis is made easy. As a specialist science, a branch of psychology - a depth-psychology or psychology of the unconscious - it is quite unfit to construct a Weltanschauung of its own: it must accept the scientific one. But the Weltanschauung of science already departs noticeably from our definition. It is true that it too assumes the uniformity of the explanation of the universe; but it does so only as a programme, the fulfilment of which is relegated to the future. Apart from this it is marked by negative characteristics, by its limitation to what is at the moment knowable and by its sharp rejection of certain elements that are alien to it. It asserts that there are no sources of knowledge of the universe other than the intellectual working-over of carefully scrutinized observations - in other words, what we call research - and alongside of it no knowledge derived from revelation, intuition or divination. It seems as though this view came very near to being generally recognized in the course of the last few centuries that have passed; and it has been left to our century to discover the presumptuous objection that a Weltanschauung like this is alike paltry and cheerless, that it overlooks the claims of the human intellect and the needs of the human mind.

[1933a, 4757]

This objection cannot be too energetically repudiated. It is quite without a basis, since the intellect and the mind are objects for scientific research in exactly the same way as any non-human things. Psycho-analysis has a special right to speak for the scientific Weltanschauung at this point, since it cannot be reproached with having neglected what is mental in the picture of the universe. Its contribution to science lies precisely in having extended research to the mental field. And, incidentally, without such a psychology science would be very incomplete. If, however, the investigation of the intellectual and emotional functions of men (and of animals) is included in science, then it will be seen that nothing is altered in the attitude of science as a whole, that no new sources of knowledge or methods of research have come into being. Intuition and divination would be such, if they existed; but they may safely be reckoned as illusions, the fulfilments of wishful impulses. It is easy to see, too, that these demands upon a Weltanschauung are only based on emotion. Science takes notice of the fact that the human mind produces these demands and is ready to examine their sources; but it has not the slightest reason to regard them as justified. On the contrary it sees this as a warning carefully to separate from knowledge everything that is illusion and an outcome of emotional demands like these.

[1933a, 4758]

Ladies and Gentlemen, - Allow me in conclusion to sum up what I had to say of the relation of psycho-analysis to the question of a Weltanschauung. Psycho-analysis, in my opinion, is incapable of creating a Weltanschauung of its own. It does not need one; it is a part of science and can adhere to the scientific Weltanschauung. This, however, scarcely deserves such a grandiloquent title, for it is not all-comprehensive, it is too incomplete and makes no claim to being self-contained and to the construction of systems. Scientific thought is still very young among human beings; there are too many of the great problems which it has not yet been able to solve. A Weltanschauung erected upon science has, apart from its emphasis on the real external world, mainly negative traits, such as submission to the truth and rejection of illusions. Any of our fellow-men who is dissatisfied with this state of things, who calls for more than this for his momentary consolation, may look for it where he can find it. We shall not grudge it him, we cannot help him, but nor can we on his account think differently.

[1933a, 4778]
In 1909 G. Stanley Hall invited me to Clark University, in Worcester, to give the first lectures on psycho-analysis. In the same year Dr. Brill published the first of his translations of my writings, which were soon followed by further ones. If psycho-analysis now plays a role in American intellectual life, or if it does so in the future, a large part of this result will have to be attributed to this and other activities of Dr. Brill's.

[1900a, 515]

I must admit, Ladies and Gentlemen, that I hesitated for a long time whether, instead of giving you this condensed general survey of the whole field of psycho-analysis, it might not be better to present you with a detailed account of dream-interpretation.¹ I was held back by a purely subjective and seemingly secondary motive. It seemed to me almost indecent in a country which is devoted to practical aims to make my appearance as a 'dream-interpreter', before you could possibly know the importance that can attach to that antiquated and derided art. The interpretation of dreams is in fact the royal road to a knowledge of the unconscious; it is the securest foundation of psycho-analysis and the field in which every worker must acquire his convictions and seek his training. If I am asked how one can become a psycho-analyst, I reply: 'By studying one's own dreams.' Every opponent of psycho-analysis hitherto has, with a nice discrimination, either evaded any consideration of The Interpretation of Dreams, or has sought to skirt over it with the most superficial objections. If, on the contrary, you can accept the solutions of the problems of dream-life, the novelties with which psycho-analysis confronts your minds will offer you no further difficulties.

[1910a, 2220]

By a lucky chance I am in a position to call a witness in favour of my assertions from your very midst. I have here in my hand a paper written by a Dr. Sanford Bell, which was published in The American Journal of Psychology in 1902. The author is a Fellow of Clark University, of the very institution in whose lecture-room we are now assembled. In this work, which is entitled 'A Preliminary Study of the Emotion of Love between the Sexes', and which appeared three years before my Three Essays on the Theory of Sexuality, the author says exactly what I have just told you: 'The emotion of sex-love . . . does not make its appearance for the first time at the period of adolescence, as has been thought.' He carried out his work in what we in Europe would call 'the American manner', collecting no fewer than 2,500 positive observations in the course of fifteen years, among them 800 of his own. Concerning the signs by which these instances of falling in love are revealed he writes as follows: 'The unprejudiced mind in observing these manifestations in hundreds of couples of children cannot escape referring them to sex origin. The most exacting mind is satisfied when to these observations are added the confessions of those who have, as children, experienced the emotion to a marked degree of intensity and whose memories of childhood are relatively distinct.' But those of you who do not wish to believe in infantile sexuality will be most of all surprised to hear that not a few of these children who have fallen in love so early are of the tender age of three, four and five.

[1910a, 2229]
The introduction of psycho-analysis into North America was accompanied by very special marks of honour. In the autumn of 1909, Stanley Hall, the President of Clark University, Worcester, Massachusetts, invited Jung and myself to take part in the celebration of the twentieth anniversary of the foundation of the University by giving a number of lectures in German. To our great surprise, we found the members of that small but highly esteemed University for the study of education and philosophy so unprejudiced that they were acquainted with all the literature of psycho-analysis and had given it a place in their lectures to students. In prudish America it was possible, in academic circles at least, to discuss freely and scientifically everything that in ordinary life is regarded as objectionable. The five lectures which I improvised in Worcester appeared in an English translation in the *American Journal of Psychology*, and were shortly afterwards published in German under the title *Über Psychoanalyse*. Jung read a paper on diagnostic association experiments and another on conflicts in the mind of the child. We were rewarded with the honorary degree of Doctor of Laws. During that week of celebrations at Worcester, psycho-analysis was represented by five men: besides Jung and myself, there were Ferenczi, who had joined me for the journey, Ernest Jones, then at the University of Toronto (Canada) and now in London, and A. A. Brill, who was already practising psycho-analysis in New York.

For the further spread of this movement Brill and Jones deserve the greatest credit: in their writings they drew their countrymen's attention with unremitting assiduity to the easily observable fundamental facts of everyday life, of dreams and neurosis. Brill has contributed still further to this effect by his medical practice and by his translations of my works, and Jones by his instructive lectures and by his skill in debate at congresses in America.¹ The absence of any deep-rooted scientific tradition in America and the much less stringent rule of official authority there have been of decided advantage to the impetus given by Stanley Hall. It was characteristic of that country that from the beginning professors and superintendents of mental hospitals showed as much interest in analysis as independent practitioners. But it is clear that precisely for this reason the ancient centres of culture, where the greatest resistance has been displayed, must be the scene of the decisive struggle over psycho-analysis.

But this attitude of ours towards death has a powerful effect on our lives. Life is impoverished, it loses in interest, where the highest stake in the game of living, life itself, may not be risked. It becomes as shallow and empty as, let us say, an American flirtation, in which it is understood from the first that nothing is to happen, as contrasted with a Continental love-affair in which both partners must constantly bear its serious consequences in mind. Our emotional ties, the unbearable intensity of our grief, make us disinclined to court danger for ourselves and for those who belong to us. We dare not contemplate a great many undertakings which are dangerous but in fact indispensable, such as attempts at artificial flight, expeditions to distant countries or experiments with explosive substances. We are paralysed by the thought of who is to take the son's place with his mother, the husband's with his wife, the father's with his children, if a disaster should occur. Thus the tendency to exclude death from our calculations in life brings in its train many other renunciations and exclusions. Yet the motto of the Hanseatic League ran: *Navigare necesse est, vivere non necesse.* ('It is necessary to sail the seas, it is not necessary to live.')
At that time I was only fifty-three. I felt young and healthy, and my short visit to the new world encouraged my self-respect in every way. In Europe I felt as though I were despised; but over there I found myself received by the foremost men as an equal. As I stepped on to the platform at Worcester to deliver my Five Lectures on Psycho-Analysis it seemed like the realization of some incredible day-dream: psycho-analysis was no longer a product of delusion, it had become a valuable part of reality. It has not lost ground in America since our visit; it is extremely popular among the lay public and is recognized by a number of official psychiatrists as an important element in medical training. Unfortunately, however, it has suffered a great deal from being watered down. Moreover, many abuses which have no relation to it find a cover under its name, and there are few opportunities for any thorough training in technique or theory. In America, too, it has come in conflict with Behaviourism, a theory which is naïve enough to boast that it has put the whole problem of psychology completely out of court.

Moreover, to return to our question of the analytic treatment of adult neurotics, even there we have not yet exhausted every line of approach. Our civilization imposes an almost intolerable pressure on us and it calls for a corrective. Is it too fantastic to expect that psycho-analysis in spite of its difficulties may be destined to the task of preparing mankind for such a corrective? Perhaps once more an American may hit on the idea of spending a little money to get the 'social workers' of his country trained analytically and to turn them into a band of helpers for combating the neuroses of civilization.

In these discussions the bluntest rejection of lay analysis has been expressed by our American colleagues. A few words to them in reply will, I think, not be out of place. I can scarcely be accused of making a misuse of analysis for controversial purposes if I express an opinion that their resistance is derived wholly from practical factors. They see how in their own country lay analysts put analysis to all kinds of mischievous and illegitimate purposes and in consequence cause injury both to their patients and to the good name of analysis. It is therefore not to be wondered at if in their indignation they give the widest possible berth to such unscrupulous mischief-makers and try to prevent any laymen from having a share in analysis. But these facts are already enough to diminish the significance of the American position; for the question of lay analysis must not be decided on practical considerations alone, and local conditions in America cannot be the sole determining influence on our views.

The resolution passed by our American colleagues against lay analysts, based as it essentially is upon practical reasons, appears to me nevertheless to be unpractical; for it cannot affect any of the factors which govern the situation. It is more or less equivalent to an attempt at repression. If it is impossible to prevent the lay analysts from pursuing their activities and if the public does not support the campaign against them, would it not be more expedient to recognize the fact of their existence by offering them opportunities for training? Might it not be possible in this way to gain some influence over them? And, if they were offered as an inducement the possibility of receiving the approval of the medical profession and of being invited to co-operate, might they not have some interest in raising their own ethical and intellectual level?
And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overwhelming and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid. [1927c, 4431]

The scientific spirit brings about a particular attitude towards worldly matters; before religious matters it pauses for a little, hesitates, and finally there too crosses the threshold. In this process there is no stopping; the greater the number of men to whom the treasures of knowledge become accessible, the more widespread is the falling-away from religious belief - at first only from its obsolete and objectionable trappings, but later from its fundamental postulates as well. The Americans who instituted the 'monkey trial' at Dayton have alone shown themselves consistent. Elsewhere the inevitable transition is accomplished by way of half-measures and insincerities. [1927c, 4447]
On another point I agree with you unreservedly. It is certainly senseless to begin by trying to do away with religion by force and at a single blow. Above all, because it would be hopeless. The believer will not let his belief be torn from him, either by arguments or by prohibitions. And even if this did succeed with some it would be cruelty. A man who has been taking sleeping draughts for tens of years is naturally unable to sleep if his sleeping draught is taken away from him. That the effect of religious consolations may be likened to that of a narcotic is well illustrated by what is happening in America. There they are now trying - obviously under the influence of petticoat government - to deprive people of all stimulants, intoxicants, and other pleasure-producing substances, and instead, by way of compensation, are surfeiting them with piety. This is another experiment as to whose outcome we need not feel curious.

[1927c, 4456]

When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]

In the autumn of 1927, G. S. Viereck, a German-American journalist who had paid me a welcome visit, published an account of a conversation with me, in the course of which he mentioned my lack of religious faith and my indifference on the subject of survival after death. This 'interview, as it was called, was widely read and brought me, among others, the following letter from an American physician:

[1928a, 4548]
I often hear that psycho-analysis is very popular in the United States and that it does not come up against the same stubborn resistance there as it does in Europe. My satisfaction over this is, however, clouded by several circumstances. It seems to me that the popularity of the name of psycho-analysis in America signifies neither a friendly attitude to the thing itself nor any specially wide or deep knowledge of it. As evidence of the former fact I may point out that, although financial support is to be had easily and in plenty for every kind of scientific and pseudo-scientific enterprise, we have never succeeded in obtaining a backing for our psycho-analytic institutions. Nor is it hard to find evidence for my second assertion. Although America possesses several excellent analysts and, in Dr. A. A. Brill, at least one authority, the contributions to our science from that vast country are exiguous and provide little that is new. Psychiatrists and neurologists make frequent use of psycho-analysis as a therapeutic method, but as a rule they show little interest in its scientific problems and its cultural significance. Quite particularly often we find in American physicians and writers a very insufficient familiarity with psycho-analysis, so that they know only its terms and a few catch-words - though this does not shake them in the certainty of their judgement. And these same men lump psycho-analysis with other systems of thought, which may have developed out of it but are incompatible with it to-day. Or they make a hotch-potch out of psycho-analysis and other elements and quote this procedure as evidence of their broad-mindedness, whereas it only proves their lack of judgement.

[1930c, 4612]

Many of these evils which I have mentioned with regret no doubt arise from the fact that there is a general tendency in America to shorten study and preparation and to proceed as fast as possible to practical application. There is a preference, too, for studying a subject like psycho-analysis not from the original sources but from second-hand and often inferior accounts. Thoroughness is bound to suffer from this.

[1930c, 4612]

In the literature of this period you will of course find a large quantity of confirmatory material and of presentation of details, of which I intend only to give you samples. I shall also, incidentally, be able to tell you a few things that were in fact already known earlier. What is in question is principally the symbolism in dreams and the other methods of representation in them. Now listen to this. Only quite a short while ago the medical faculty in an American University refused to allow psycho-analysis the status of a science, on the ground that it did not admit of any experimental proof. They might have raised the same objection to astronomy; indeed, experimentation with the heavenly bodies is particularly difficult. There one has to fall back on observation. Nevertheless, some Viennese investigators have actually made a beginning with experimental confirmation of our dream symbolism. As long ago as in 1912 a Dr. Schrötter found that if instructions to dream of sexual matters are given to deeply hypnotized subjects, then in the dream that is thus provoked the sexual material emerges with its place taken by the symbols that are familiar to us. For instance, a woman was told to dream of sexual intercourse with a female friend. In her dream this friend appeared with a travelling-bag on which was pasted the label 'Ladies Only'. Still more impressive experiments were carried out by Betheim and Hartmann in 1924. They worked with patients suffering from what is known as the Korsakoff confusional psychosis. They told these patients stories of a grossly sexual kind and observed the distortions which appeared when the patients were instructed to reproduce what they had been told. Once more there emerged the symbols for sexual organs and sexual intercourse that are familiar to us - among them the symbol of the staircase which, as the writers justly remark, could never have been reached by a conscious wish to distort.

[1933a, 4635]
But first a short interpolation. I suspect that you feel dissatisfied because the three qualities of
the characteristic of consciousness and the three provinces of the mental apparatus do not fall
together into three peaceable couples, and you may regard this as in some sense obscuring our
findings. I do not think, however, that we should regret it, and we should tell ourselves that we
had no right to expect any such smooth arrangement. Let me give you an analogy; analogies, it is
true, decide nothing, but they can make one feel more at home. I am imagining a country with a
landscape of varying configuration - hill-country, plains, and chains of lakes -, and with a mixed
population; it is inhabited by Germans, Magyars and Slovaks, who carry on different activities.
Now things might be partitioned in such a way that the Germans, who breed cattle, live in the hill-
country, the Magyars, who grow cereals and wine, live in the plains, and the Slovaks, who catch
fish and plait reeds, live by the lakes. If the partitioning could be neat and clear-cut like this, a
Woodrow Wilson would be delighted by it; it would also be convenient for a lecture in a
geography lesson. The probability is, however, that you will find less orderliness and more mixing,
if you travel through the region. Germans, Magyars and Slovaks live interspersed all over it; in the
hill-country there is agricultural land as well, cattle are bred in the plains too. A few things are
naturally as you expected, for fish cannot be caught in the mountains and wine does not grow in
the water. Indeed, the picture of the region that you brought with you may on the whole fit the
facts; but you will have to put up with deviations in the details.
[1933a, 4681]

Well, I will try to do so; but only in brief, since they contribute less to an understanding of
analysis than you might expect. I feel sure you will be thinking in the first place of Adler's
'Individual Psychology', which, in America for instance, is regarded as a line of thought collateral
with our psycho-analysis and on a par with it and which is regularly mentioned alongside of it.
Actually, Individual Psychology has very little to do with psycho-analysis but, as a result of certain
historical circumstances, leads a kind of parasitic existence at its expense. The determinants
which we have attributed to this group of opponents apply to the founders of Individual
Psychology only to a limited extent. Its very name is inappropriate and seems to have been the
product of embarrassment. We cannot allow the legitimate use of the term as an antithesis to
'group psychology' to be interfered with; moreover, our own activity is concerned for the most part
and primarily with the psychology of human individuals. I shall not enter to-day upon an objective
criticism of Adler's Individual Psychology; there is no place for it in the plan of these introductory
lectures. Besides, I have already attempted it once, and feel no temptation to change anything in
what I said then. I will, however, illustrate the impression his views produce by a small episode
dating from the years before analysis.
[1933a, 4742]

Criticism from specialist circles, which is so relentless against psycho-analysis, has in general
handled Individual Psychology with kid gloves. It is true that in America one of the most highly
respected psychiatrists published a paper against Adler under the title 'Enough', in which he gave
energetic expression to his boredom at the 'compulsion to repeat' of Individual Psychology. If
others have treated it far more amiably, no doubt their antagonism to analysis has had much to
do with it.
[1933a, 4744]
What further claims do you make in the name of tolerance? That when someone has uttered an opinion which we regard as completely false we should say to him: ‘Thank you very much for having given voice to this contradiction. You are guarding us against the danger of complacency and are giving us an opportunity of showing the Americans that we are really as "broad-minded" as they always wish. To be sure, we do not believe a word of what you are saying, but that makes no difference. Probably you are just as right as we are. After all, who can possibly know who is right? In spite of our antagonism, pray allow us to represent your point of view in our publications. We hope that you will be kind enough in exchange to find a place for our views which you deny.’

In the future, when the misuse of Einstein's relativity has been entirely achieved, this will obviously become the regular custom in scientific affairs. For the moment, it is true, we have not gone quite so far. We restrict ourselves, in the old fashion, to putting forward only our own convictions, we expose ourselves to the risk of error because it cannot be guarded against, and we reject what is in contradiction to us. We have made plentiful use in psycho-analysis of the right to change our opinions if we think we have found something better.

[1933a, 4745]

The starting-point for this investigation is provided by a fact without parallel, which defies all explanation or description - the fact of consciousness. Nevertheless, if anyone speaks of consciousness we know immediately and from our most personal experience what is meant by it.¹ Many people, both inside and outside science, are satisfied with the assumption that consciousness alone is psychical; in that case nothing remains for psychology but to discriminate among psychical phenomena between perceptions, feelings, thought-processes and volitions. It is generally agreed, however, that these conscious processes do not form unbroken sequences which are complete in themselves; there would thus be no alternative left to assuming that there are physical or somatic processes which are concomitant with the psychical ones and which we should necessarily have to recognize as more complete than the psychical sequences, since some of them would have conscious processes parallel to them but others would not. If so, it of course becomes plausible to lay the stress in psychology on these somatic processes, to see in them the true essence of what is psychical and to look for some other assessment of the conscious processes. The majority of philosophers, however, as well as many other people, dispute this and declare that the idea of something psychical being unconscious is self-contradictory.

[1940a [1938], 4967]

¹ One extreme line of thought, exemplified in the American doctrine of behaviourism, thinks it possible to construct a psychology which disregards this fundamental fact!

[1940a [1938], 4967]
A particularly energetic attempt in this direction was made by Otto Rank, following upon his book, *The Trauma of Birth* (1924). He supposed that the true source of neurosis was the act of birth, since this involves the possibility of a child's 'primal fixation' to his mother not being surmounted but persisting as a 'primal repression'. Rank hoped that if this primal trauma were dealt with by a subsequent analysis the whole neurosis would be got rid of. Thus this one small piece of analytic work would save the necessity for all the rest. And a few months should be enough to accomplish this. It cannot be disputed that Rank's argument was bold and ingenious; but it did not stand the test of critical examination. Moreover, it was a child of its time, conceived under the stress of the contrast between the post-war misery of Europe and the 'prosperity' of America, and designed to adapt the tempo of analytic therapy to the haste of American life. We have not heard much about what the implementation of Rank's plan has done for cases of sickness. Probably not more than if the fire-brigade, called to deal with a house that had been set on fire by an overturned oil-lamp, contented themselves with removing the lamp from the room in which the blaze had started. No doubt a considerable shortening of the brigade's activities would be effected by this means. The theory and practice of Rank's experiment are now things of the past - no less than American 'prosperity' itself.

[1937c, 5014]
The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialistic tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

It no longer seems possible to keep away from the study of what are known as 'occult' phenomena - of facts, that is, that profess to speak in favour of the real existence of psychical forces other than the human and animal minds with which we are familiar, or that seem to reveal the possession by those minds of faculties hitherto unrecognized. The impetus towards such an investigation seems irresistibly strong. During this last brief vacation I have three times had occasion to refuse to associate myself with newly founded periodicals concerned with these studies. Nor is there much doubt as to the origin of this trend. It is a part expression of the loss of value by which everything has been affected since the world catastrophe of the Great War, a part of the tentative approach to the great revolution towards which we are heading and of whose extent we can form no estimate; but no doubt it is also an attempt at compensation, at making up in another, a supermundane, sphere for the attractions which have been lost by life on this earth. Some, indeed, of the proceedings of the exact sciences themselves may have contributed to this development. The discovery of radium has confused no less than it has advanced the possibilities of explaining the physical world; and the knowledge that has been so very recently acquired of what is called the theory of relativity has had the effect upon many of those who admire without comprehending it of diminishing their belief in the objective trustworthiness of science. You will remember that not long ago Einstein himself took occasion to protest against such misunderstanding.

I should not like to give the impression that I have strayed a long way from the line laid down for my enquiry. Let me therefore give an express assurance that I have not the least intention of making judgements on the great experiment in civilization that is now in progress in the vast country that stretches between Europe and Asia. I have neither the special knowledge nor the capacity to decide on its practicability, to test the expediency of the methods employed or to measure the width of the inevitable gap between intention and execution. What is in preparation there is unfinished and therefore eludes an investigation for which our own long-consolidated civilization affords us material.
'Besides, have you learned nothing from history? Once before an attempt of this kind was made to substitute reason for religion, officially and in the grand manner. Surely you remember the French Revolution and Robespierre? And you must also remember how short-lived and miserably ineffectual the experiment was? The same experiment is being repeated in Russia at the present time, and we need not feel curious as to its outcome. Do you not think we may take it for granted that men cannot do without religion?

The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone’s needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother’s relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

¹ Anyone who has tasted the miseries of poverty in his own youth and has experienced the indifference and arrogance of the well-to-do, should be safe from the suspicion of having no understanding or good will towards endeavours to fight against the inequality of wealth among men and all that it leads to. To be sure, if an attempt is made to base this fight upon an abstract demand, in the name of justice, for equality for all men, there is a very obvious objection to be made - that nature, by endowing individuals with extremely unequal physical attributes and mental capacities, has introduced injustices against which there is no remedy.

[1930a, 4505]
It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [1930a, 4530]
But let us return to the super-ego. We have allotted it the functions of self-observation, of conscience and of the ideal. It follows from what we have said about its origin that it presupposes an immensely important biological fact and a fateful psychological one: namely, the human child's long dependence on its parents and the Oedipus complex, both of which, again, are intimately interconnected. The super-ego is the representative for us of every moral restriction, the advocate of a striving towards perfection - it is, in short, as much as we have been able to grasp psychologically of what is described as the higher side of human life. Since it itself goes back to the influence of parents, educators and so on, we learn still more of its significance if we turn to those who are its sources. As a rule parents and authorities analogous to them follow the precepts of their own super-egos in educating children. Whatever understanding their ego may have come to with their super-ego, they are severe and exacting in educating children. They have forgotten the difficulties of their own childhood and they are glad to be able now to identify themselves fully with their own parents who in the past laid such severe restrictions upon them. Thus a child's super-ego is in fact constructed on the model not of its parents but of its parents' super-ego; the contents which fill it are the same and it becomes the vehicle of tradition and of all the time-resisting judgements of value which have propagated themselves in this manner from generation to generation. You may easily guess what important assistance taking the super-ego into account will give us in our understanding of the social behaviour of mankind - in the problem of delinquency, for instance - and perhaps even what practical hints on education. It seems likely that what are known as materialistic views of history sin in under-estimating this factor. They brush it aside with the remark that human 'ideologies' are nothing other than the product and superstructure of their contemporary economic conditions. That is true, but very probably not the whole truth. Mankind never lives entirely in the present. The past, the tradition of the race and of the people, lives on in the ideologies of the super-ego, and yields only slowly to the influences of the present and to new changes; and so long as it operates through the super-ego it plays a powerful part in human life, independently of economic conditions.

[1933a, 4676]
The other opposition has to be taken far more seriously, and in this instance I feel the liveliest regret at the inadequacy of my information. I suspect that you know more about this business than I do and that you took up your position long ago in favour of Marxism or against it. Karl Marx's investigations into the economic structure of society and into the influence of different economic systems upon every department of human life have in our days acquired an undeniable authority. How far his views in detail are correct or go astray, I cannot of course tell. I understand that this is not an easy matter even for others better instructed than I am. There are assertions contained in Marx's theory which have struck me as strange: such as that the development of forms of society is a process of natural history, or that the changes in social stratification arise from one another in the manner of a dialectical process. I am far from sure that I understand these assertions aright; nor do they sound to me 'materialistic' but, rather, like a precipitate of the obscure Hegelian philosophy in whose school Marx graduated. I do not know how I can shake off my lay opinion that the class structure of society goes back to the struggles which, from the beginning of history, took place between human hordes only slightly differing from each other. Social distinctions, so I thought, were originally distinctions between clans or races. Victory was decided by psychological factors, such as the amount of constitutional aggressiveness, but also by the firmness of the organization within the horde, and by material factors, such as the possession of superior weapons. Living together in the same area, the victors became the masters and the vanquished the slaves. There is no sign to be seen in this of a natural law or of a conceptual evolution. On the other hand the influence exercised upon the social relations of mankind by progressive control over the forces of Nature is unmistakable. For men always put their newly acquired instruments of power at the service of their aggressiveness and use them against one another. The introduction of metals - bronze and iron - made an end to whole epochs of civilization and their social institutions. I really believe that it was gunpowder and fire-arms that abolished chivalry and aristocratic rule, and that the Russian despotism was already doomed before it lost the War, because no amount of inbreeding among the ruling families of Europe could have produced a race of Tsars capable of withstanding the explosive force of dynamite.

[1933a, 4774]
I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a Weltanschauung, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

[1933a, 4775]

The newly achieved discovery of the far-reaching importance of economic relations brought with it a temptation not to leave alterations in them to the course of historical development but to put them into effect oneself by revolutionary action. Theoretical Marxism, as realized in Russian Bolshevism, has acquired the energy and the self-contained and exclusive character of a Weltanschauung, but at the same time an uncanny likeness to what it is fighting against. Though originally a portion of science and built up, in its implementation, upon science and technology, it has created a prohibition of thought which is just as ruthless as was that of religion in the past. Any critical examination of Marxist theory is forbidden, doubts of its correctness are punished in the same way as heresy was once punished by the Catholic Church. The writings of Marx have taken the place of the Bible and the Koran as a source of revelation, though they would seem to be no more free from contradictions and obscurities than those older sacred books.

[1933a, 4776]
And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinclual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

There is no doubt of how Bolshevism will reply to these objections. It will say that so long as men's nature has not yet been transformed it is necessary to make use of the means which affect them to-day. It is impossible to do without compulsion in their education, without the prohibition of thought and without the employment of force to the point of bloodshed; and if the illusions were not awakened in them, they could not be brought to acquiesce in this compulsion. And we should be politely asked to say how things could be managed differently. This would defeat us. I could think of no advice to give. I should admit that the conditions of this experiment would have deterred me and those like me from undertaking it; but we are not the only people concerned. There are men of action, unshakable in their convictions, inaccessible to doubt, without feeling for the sufferings of others if they stand in the way of their intentions. We have to thank men of this kind for the fact that the tremendous experiment of producing a new order of this kind is now actually being carried out in Russia. At a time when the great nations announce that they expect salvation only from the maintenance of Christian piety, the revolution in Russia - in spite of all its disagreeable details - seems nonetheless like the message of a better future. Unluckily neither our scepticism nor the fanatical faith of the other side gives a hint as to how the experiment will turn out. The future will tell us; perhaps it will show that the experiment was undertaken prematurely, that a sweeping alteration of the social order has little prospect of success until new discoveries have increased our control over the forces of Nature and so made easier the satisfaction of our needs. Only then perhaps may it become possible for a new social order not only to put an end to the material need of the masses but also to give a hearing to the cultural demands of the individual. Even then, to be sure, we shall still have to struggle for an incalculable time with the difficulties which the untameable character of human nature presents to every kind of social community.
If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians - an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games - was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist to-day which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one to-day, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force by the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute violence and that even to-day it cannot do without the support of violence.

[1933b, 4797]

For our immediate purpose then, this much follows from what has been said: there is no use in trying to get rid of men's aggressive inclinations. We are told that in certain happy regions of the earth, where nature provides in abundance everything that man requires, there are races whose life is passed in tranquillity and who know neither coercion nor aggression. I can scarcely believe it and I should be glad to hear more of these fortunate beings. The Russian Communists, too, hope to be able to cause human aggressiveness to disappear by guaranteeing the satisfaction of all material needs and by establishing equality in other respects among all the members of the community. That, in my opinion, is an illusion. They themselves are armed to-day with the most scrupulous care and not the least important of the methods by which they keep their supporters together is hatred of everyone beyond their frontiers. In any case, as you yourself have remarked, there is no question of getting rid entirely of human aggressive impulses; it is enough to try to divert them to such an extent that they need not find expression in war.

[1933b, 4800]
And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods’ names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in Totem and Taboo. But I no longer feel that I have the strength to do so.

[1939a, 4881]

We are living in a specially remarkable period. We find to our astonishment that progress has allied itself with barbarism. In Soviet Russia they have set about improving the living conditions of some hundred millions of people who were held firmly in subjection. They have been rash enough to withdraw the ‘opium’ of religion from them and have been wise enough to give them a reasonable amount of sexual liberty; but at the same time they have submitted them to the most cruel coercion and robbed them of any possibility of freedom of thought. With similar violence, the Italian people are being trained up to orderliness and a sense of duty. We feel it as a relief from an oppressive apprehension when we see in the case of the German people that a relapse into almost prehistoric barbarism can occur as well without being attached to any progressive ideas. In any case, things have so turned out that to-day the conservative democracies have become the guardians of cultural advance and that, strange to say, it is precisely the institution of the Catholic Church which puts up a powerful defence against the spread of this danger to civilization - the Church which has hitherto been the relentless foe to freedom of thought and to advances towards the discovery of the truth!

[1939a, 4882]

How is it possible for a single man to evolve such extraordinary effectiveness that he can form a people out of random individuals and families, can stamp them with their definitive character and determine their fate for thousands of years? Is not a hypothesis such as this a relapse into the mode of thought which led to myths of a creator and to the worship of heroes, into times in which the writing of history was nothing more than a report of the deeds and destinies of single individuals, of rulers or conquerors? The modern tendency is rather towards tracing back the events of human history to more concealed, general and impersonal factors, to the compelling influence of economic conditions, to alterations in food habits, to advances in the use of materials and tools, to migrations brought about by increases in population and climatic changes. Individuals have no other part to play in this than as exponents or representatives of group trends, which are bound to find expression and do so in these particular individuals largely by chance.

[1939a, 4928]
This short analysis has received much attention in the literature of the subject and has provoked lively discussion. Basing himself directly on it, Bleuler (1919) has attempted to determine mathematically the credibility of psycho-analytic interpretations, and has come to the conclusion that it has a higher probability value than thousands of medical 'truths' which have gone unchallenged, and that it owes its exceptional position only to the fact that we are not yet accustomed to take psychological probabilities into consideration in science.

[1901b, 1109]

I can quote a further instance from my psychotherapeutic experience in which eloquent testimony was borne by a hand playing with a lump of bread-crumbe. My patient was a boy of not yet thirteen; for almost two years he had been severely hysterical and I finally took him for psycho-analytic treatment after a lengthy stay in a hydropathic institution had brought no success. I was going on the assumption that he must have had sexual experiences and be tormented by sexual questions, which was likely enough at his age; but I refrained from helping him with explanations as I wished to put my hypotheses once again to the test. I was therefore naturally curious as to the way in which he would bring out what I was looking for. One day it struck me that he was rolling something between the fingers of his right hand; he would thrust it in his pocket and continue playing with it there, and then take it out again, and so on. I did not ask what he had in his hand; but he suddenly opened his hand and showed me. It was bread-crumbe kneaded into a lump. At the next session he again brought along a similar lump and this time, while we were talking, he modelled figures out of it which excited my interest; he did this with incredible rapidity, with his eyes closed. They were undoubtedly little men, with a head, two arms and two legs, like the crudest prehistoric idols, and with an appendage between the legs which he drew out into a long point. He had hardly completed this when he kneaded the figure together again; later he allowed it to remain, but drew out a similar appendage from the surface of the back and other parts of the body in order to disguise the meaning of the first one. I wanted to show him I had understood him, but at the same time I wanted to prevent him from pretending that he had not thought of anything while he was engaged in making these figures. With this in mind I suddenly asked him if he remembered the story of the Roman king who gave his son's envoy an answer in dumb-show in his garden. The boy failed to recall it, although he must have learnt it so much more recently than I. He asked whether it was the story of the slave and the answer that was written on his shaven head. No, I answered, that is from Greek history, and I told him the story. King Tarquinius Superbus had made his son Sextus find his way secretly into a hostile Latin city. The son, who had meanwhile collected a following in the city, sent a messenger to the king asking what steps he should take next. The king did not answer, but went into his garden, had the question repeated to him there, and then silently struck off the heads of the tallest and finest poppies. All that the messenger could do was to report this to Sextus, who understood his father and arranged for the most distinguished citizens in the city to be removed by assassination.

[1901b, 1276]
The little girl went through the usual infectious diseases of childhood without suffering any lasting damage. As she herself told me - and her words were intended to convey a deeper meaning - her brother was as a rule the first to start the illness and used to have it very slightly, and she would then follow suit with a severe form of it. When she was about twelve she began to suffer from unilateral headaches in the nature of a migraine, and from attacks of nervous coughing. At first these two symptoms always appeared together, but they became separated later on and ran different courses. The migraine grew rarer, and by the time she was sixteen she had quite got over it. But attacks of *tussis nervosa*, which had no doubt been started by a common catarrh, continued to occur over the whole period. When, at the age of eighteen, she came to me for treatment, she was again coughing in a characteristic manner. The number of these attacks could not be determined; but they lasted from three to five weeks, and on one occasion for several months. The most troublesome symptom during the first half of an attack of this kind, at all events in the last few years, used to be a complete loss of voice. The diagnosis that this was once more a nervous complaint had been established long since; but the various methods of treatment which are usual, including hydrotherapy and the local application of electricity, had produced no result. It was in such circumstances as these that the child had developed into a mature young woman of very independent judgement, who had grown accustomed to laugh at the efforts of doctors, and in the end to renounce their help entirely. Moreover, she had always been against calling in medical advice, though she had no personal objection to her family doctor. Every proposal to consult a new physician aroused her resistance, and it was only her father's authority which induced her to come to me at all.

[1905e, 1362]

"He explained it as nervous weakness; it would soon pass off, he thought; and he prescribed a tonic."

[1905e, 1409]

For instance, Lichtenberg coined the saying: 'New spas cure well', which at once reminds us of the proverb: 'New brooms sweep clean.' The two phrases share the first one and a half words and the last word, as well as the whole structure of the sentence. And there is no doubt that the sentence came into the witty philosopher's head as an imitation of the familiar proverb. Thus Lichtenberg's saying becomes an allusion to the proverb. By means of this allusion something is suggested that is not said straight out - namely that something else is responsible for the effects produced by spas besides the unvarying characteristics of thermal springs.

[1905c, 1675]
If within ten years of the publication of this book (which is very far from being an easy one to read) a second edition is called for, this is not due to the interest taken in it by the professional circles to whom my original preface was addressed. My psychiatric colleagues seem to have taken no trouble to overcome the initial bewilderment created by my new approach to dreams. The professional philosophers have become accustomed to polishing off the problems of dream-life (which they treat as a mere appendix to conscious states) in a few sentences - and usually in the same ones; and they have evidently failed to notice that we have something here from which a number of inferences can be drawn that are bound to transform our psychological theories. The attitude adopted by reviewers in the scientific periodicals could only lead one to suppose that my work was doomed to be sunk into complete silence; while the small group of gallant supporters, who practise medical psycho-analysis under my guidance and who follow my example in interpreting dreams and make use of their interpretations in treating neurotics, would never have exhausted the first edition of the book. Thus it is that I feel indebted to a wider circle of educated and curious-minded readers, whose interest has led me to take up once more after nine years this difficult, but in many respects fundamental, work.

[1900a, 509]

The most original and far-reaching attempt to explain dreaming as a special activity of the mind, capable of free expansion only during the state of sleep, was that undertaken by Scherner in 1861. His book is written in a turgid and high-flown style and is inspired by an almost intoxicated enthusiasm for his subject which is bound to repel anyone who cannot share in his fervour. It puts such difficulties in the way of an analysis of its contents that we turn with relief to the clearer and briefer exposition of Scherner's doctrines given by the philosopher Volkelt. 'Suggestive gleams of meaning proceed like lightning flashes out of these mystical agglomerations, these clouds of glory and splendour - but they do not illuminate a philosopher's path.' It is in these terms that Scherner's writings are judged even by his disciple.

[1900a, 589]

Dream-imagination may, however, not merely direct its attention to the form of the stimulating organ; it may equally well symbolize the substance contained in that organ. In this way, a dream with an intestinal stimulus may lead the dreamer along muddy streets, or one with a urinary stimulus may lead him to a foaming stream. Or the stimulus as such, the nature of the excitement it produces, or the object it desires, may be symbolically represented. Or the dream-ego may enter into concrete relations with the symbols of its own state; for instance, in the case of painful stimuli the dreamer may engage in a desperate struggle with fierce dogs or savage bulls, or a woman in a sexual dream may find herself pursued by a naked man. Quite apart from the wealth of the means that it employs, the symbolizing activity of the imagination remains the central force in every dream. The task of penetrating more deeply into the nature of this imagination and of finding a place for it in a system of philosophical thought is attempted by Volkelt in the pages of his book. But, though it is well and feelingly written, it remains excessively hard to understand for anyone whose early education has not prepared him for a sympathetic grasp of the conceptual constructions of philosophy.

[1900a, 592]
The thing that distinguishes and at the same time reveals this part of the dream-work is its purpose. This function behaves in the manner which the poet maliciously ascribes to philosophers: it fills up the gaps in the dream-structure with shreds and patches. As a result of its efforts, the dream loses its appearance of absurdity and disconnectedness and approximates to the model of an intelligible experience. But its efforts are not always crowned with success. Dreams occur which, at a superficial view, may seem faultlessly logical and reasonable; they start from a possible situation, carry it on through a chain of consistent modifications and - though far less frequently - bring it to a conclusion which causes no surprise. Dreams which are of such a kind have been subjected to a far-reaching revision by this psychical function that is akin to waking thought; they appear to have a meaning, but that meaning is as far removed as possible from their true significance. If we analyse them, we can convince ourselves that it is in these dreams that the secondary revision has played about with the material the most freely, and has retained the relations present in that material to the least extent. They are dreams which might be said to have been already interpreted once, before being submitted to waking interpretation. In other dreams this tendentious revision has only partly succeeded; coherence seems to rule for a certain distance, but the dream then becomes senseless or confused, while perhaps later on in its course it may for a second time present an appearance of rationality. In yet other dreams the revision has failed altogether; we find ourselves hopelessly face to face with a heap of fragmentary material.

We are ready to recognize the fact that Silberer's phenomena constitute a second contribution on the part of waking thought to the construction of dreams; though it is less regularly present and less significant than the first one, which has already been introduced under the name of 'secondary revision.' It has been shown that a part of the attention which operates during the day continues to be directed towards dreams during the state of sleep, that it keeps a check on them and criticizes them and reserves the power to interrupt them. It has seemed plausible to recognize in the mental agency which thus remains awake the censor to whom we have had to attribute such a powerful restricting influence upon the form taken by dreams. What Silberer's observations have added to this is the fact that in certain circumstances a species of self-observation plays a part in this and makes a contribution to the content of the dream. The probable relations of this self-observing agency, which may be particularly prominent in philosophical minds, to endopsychic perception, to delusions of observation, to conscience and to the censor of dreams can be more appropriately treated elsewhere.¹

[1900a, 930]

[1900a, 943]
So far we have been psychologizing on our own account. It is time now to consider the theoretical views which govern present-day psychology and to examine their relation to our hypotheses. The problem of the unconscious in psychology is, in the forcible words of Lipps (1897), less a psychological problem than the problem of psychology. So long as psychology dealt with this problem by a verbal explanation to the effect that 'psychical' meant 'conscious' and that to speak of 'unconscious psychical processes' was palpable nonsense, any psychological evaluation of the observations made by physicians upon abnormal mental states was out of the question. The physician and the philosopher can only come together if they both recognize that the term 'unconscious psychical processes' is 'the appropriate and justified expression of a solidly established fact'. The physician can only shrug his shoulders when he is assured that 'consciousness is an indispensable characteristic of what is psychical', and perhaps, if he still feels enough respect for the utterances of philosophers, he may presume that they have not been dealing with the same thing or working at the same science. For even a single understanding observation of a neurotic's mental life or a single analysis of a dream must leave him with an unshakeable conviction that the most complicated and most rational thought-processes, which can surely not be denied the name of psychical processes, can occur without exciting the subject's consciousness.¹ It is true that the physical cannot learn of these unconscious processes until they have produced some effect upon consciousness which can be communicated or observed. But this conscious effect may exhibit a psychical character quite different from that of the unconscious process, so that internal perception cannot possibly regard the one as a substitute for the other. The physician must feel at liberty to proceed by inference from the conscious effect to the unconscious psychical process. He thus learns that the conscious effect is only a remote psychical result of the unconscious process and that the latter has not become conscious as such; and moreover that the latter was present and operative even without betraying its existence in any way to consciousness.

[1900a, 1037]
A number of the results of the analysis have been omitted, because at the time when work was broken off they had either not been established with sufficient certainty or they required further study before any general statement could be made about them. At other points, where it seemed to be permissible, I have indicated the direction along which some particular solution would probably have been found to lie. I have in this paper left entirely out of account the technique, which does not at all follow as a matter of course, but by whose means alone the pure metal of valuable unconscious thoughts can be extracted from the raw material of the patient's associations. This brings with it the disadvantage of the reader being given no opportunity of testing the correctness of my procedure in the course of this exposition of the case. I found it quite impracticable, however, to deal simultaneously with the technique of analysis and with the internal structure of a case of hysteria: I could scarcely have accomplished such a task, and if I had, the result would have been almost unreadable. The technique of analysis demands an entirely separate exposition, which would have to be illustrated by numerous examples chosen from a very great variety of cases and which would not have to take the results obtained in each particular case into account. Nor have I attempted in this paper to substantiate the psychological postulates which will be seen to underlie my descriptions of mental phenomena. A cursory attempt to do so would have effected nothing; an exhaustive one would have been a volume in itself. I can only assure the reader that I approached the study of the phenomena revealed by observation of the psychoneuroses without being pledged to any particular psychological system, and that I then proceeded to adjust my views until they seemed adapted for giving an account of the collection of facts which had been observed. I take no pride in having avoided speculation; the material for my hypotheses was collected by the most extensive and laborious series of observations. The decidedness of my attitude on the subject of the unconscious is perhaps specially likely to cause offence, for I handle unconscious ideas, unconscious trains of thought, and unconscious impulses as though they were no less valid and unimpeachable psychological data than conscious ones. But of this I am certain - that any one who sets out to investigate the same region of phenomena and employs the same method will find himself compelled to take up the same position, however much philosophers may expostulate.

[1905e, 1446]

(f) Finally, Gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psycho-analytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this: This therapy, then, is based on the recognition that unconscious ideas - or better, the unconsciousness of certain mental processes - are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious idée fixe. Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of 'unconscious mental processes'. If, however, you will look at the matter from our point of view, you will understand that the transformation of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious will-power governs only conscious mental processes, and every mental compulsion is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses.

[1905a, 1571]
I am well aware that these scanty extracts from the works of writers upon jokes cannot do them justice. In view of the difficulties standing in the way of my giving an unmistakably correct account of such complicated and subtle trains of thought, I cannot spare curious enquirers the labour of obtaining the information they desire from the original sources. But I am not sure that they will come back fully satisfied. The criteria and characteristics of jokes brought up by these authors and collected above - activity, relation to the content of our thoughts, the characteristic of playful judgement, the coupling of dissimilar things, contrasting ideas, 'sense in nonsense', the succession of bewilderment and enlightenment, the bringing forward of what is hidden, and the peculiar brevity of wit - all this, it is true, seems to us at first sight so very much to the point and so easily confirmed by instances that we cannot be in any danger of underrating such views. But they are *dijecta membra*, which we should like to see combined into an organic whole. When all is said and done, they contribute to our knowledge of jokes no more than would a series of anecdotes to the description of some personality of whom we have a right to ask for a biography. We are entirely without insight into the connection that presumably exists between the separate determinants - what, for instance, the brevity of a joke can have to do with its characteristic of being a playful judgement. We need to be told, further, whether a joke must satisfy all these determinants in order to be a proper joke, or need only satisfy some, and if so which can be replaced by others and which are indispensable. We should also wish to have a grouping and classification of jokes on the basis of the characteristics considered essential. The classification that we find in the literature rests on the one hand on the technical methods employed in them (e.g. punning or play upon words) and on the other hand on the use made of them in speech (e.g. jokes used for the purposes of caricature or of characterization, or joking snubs).

[1905c, 1620]

‘There are more things in heaven and earth than are dreamt of in your philosophy’, said Prince Hamlet contemptuously. Lichtenberg knew that this condemnation is not nearly severe enough, for it does not take into account all the objections that can be made to philosophy. He therefore added what was missing: 'But there is much, too, in philosophy that is not to be found in heaven or earth.' His addition, it is true, emphasizes the way in which philosophy compensates us for the insufficiency for which Hamlet censures it. But this compensation implies another and still greater reproach.

[1905c, 1671]

We cannot proceed further at this point without a discussion with our philosophical authorities.

[1905c, 1692]
A theory which is novel, which lacks simplicity and which runs counter to our habits of thought, can scarcely gain in clarity from a concise presentation. All I can aim at in these remarks, therefore, is to draw attention to the fuller treatment of the unconscious in my *Interpretation of Dreams* and to the writings of Lipps, which seem to me of the highest importance. I am aware that anyone who is under the spell of a good academic philosophical education, or who takes his opinions at long range from some so-called system of philosophy, will be opposed to the assumption of an 'unconscious psychical' in the sense in which Lipps and I use the term, and will prefer to prove its impossibility on the basis of a definition of the psychical. But definitions are a matter of convention and can be altered. I have often found that people who dispute the unconscious as being something absurd and impossible have not formed their impressions from the sources from which I at least was brought to the necessity of recognizing it. These opponents of the unconscious had never witnessed the effect of a post-hypnotic suggestion, and when I have told them examples from my analyses with non-hypnotized neurotics they have been filled with the greatest astonishment. They had never realized the idea that the unconscious is something which we really do not know, but which we are obliged by compelling inferences to supply; they had understood it as being something capable of becoming conscious but which was not being thought of at the moment, which did not occupy 'the focal point of attention'. Nor had they ever tried to convince themselves of the existence in their own minds of unconscious thoughts like these by analysing one of their own dreams; and when I attempted to do so with them they could only greet their own associations with surprise and confusion. I have also formed an impression that fundamental emotional resistances stand in the way of accepting the 'unconscious', and that these are based on the fact that no one wants to get to know his unconscious and that the most convenient plan is to deny its possibility altogether.

[1905c, 1747]

These false sexual theories, which I shall now discuss, all have one very curious characteristic. Although they go astray in a grotesque fashion, yet each one of them contains a fragment of real truth; and in this they are analogous to the attempts of adults, which are looked at as strokes of genius, at solving the problems of the universe which are too hard for human comprehension. What is correct and hits the mark in such theories is to be explained by their origin from the components of the sexual instinct which are already stirring in the childish organism. For it is not owing to any arbitrary mental act or to chance impressions that those notions arise, but to the necessities of the child's psychosexual constitution; and this is why we can speak of sexual theories in children as being typical, and why we find the same mistaken beliefs in every child whose sexual life is accessible to us.

[1908c, 1970]

We can go a step further in vindicating little Hans's honour. As a matter of fact, he was behaving no worse than a philosopher of the school of Wundt. In the view of that school, consciousness is the invariable characteristic of what is mental, just as in the view of little Hans a widdler is the indispensable criterion of what is animate. If now the philosopher comes across mental processes whose existence cannot but be inferred, but about which there is not a trace of consciousness to be detected - for the subject, in fact, knows nothing of them, although it is impossible to avoid inferring their existence - then, instead of saying that they are unconscious mental processes, he calls them semi-conscious. The widdler's still very small! And in this comparison the advantage is in favour of little Hans. For, as is so often the case with the sexual researches of children, behind the mistake a piece of genuine knowledge lies concealed. Little girls do possess a small widdler, which we call a clitoris, though it does not grow any larger but remains permanently stunted. Compare my short paper on 'The Sexual Theories of Children' (1908c).

[1909b, 2007]
I shall not in the present paper attempt any discussion of the psychological significance of obsessional thinking. Such a discussion would be of extraordinary value in its results, and would do more to clarify our ideas upon the nature of the conscious and the unconscious than any study of hysteria or the phenomena of hypnosis. It would be a most desirable thing if the philosophers and psychologists who develop brilliant theoretical views on the unconscious upon a basis of hearsay knowledge or from their own conventional definitions would first submit to the convincing impressions which may be gained from a first-hand study of the phenomena of obsessional thinking. We might almost go to the length of requiring it of them, if the task were not so far more laborious than the methods of work to which they are accustomed. I will only add here that in obsessional neuroses the unconscious mental processes occasionally break through into consciousness in their pure and undistorted form, that such incursions may take place at every possible stage of the unconscious process of thought, and that at the moment of the incursion the obsessional ideas can, for the most part, be recognized as formations of very long standing. This accounts for the striking circumstance that, when the analyst tries, with the patient's help, to discover the date of the first occurrence of an obsessional idea, the patient is obliged to place it further and further back as the analysis proceeds, and is constantly finding fresh 'first' occasions for the appearance of the obsession.

[1909d, 2178]

The theory of repression quite certainly came to me independently of any other source; I know of no outside impression which might have suggested it to me, and for a long time I imagined it to be entirely original, until Otto Rank (1911a) showed us a passage in Schopenhauer's *World as Will and Idea* in which the philosopher seeks to give an explanation of insanity. What he says there about the struggle against accepting a distressing piece of reality coincides with my concept of repression so completely that once again I owe the chance of making a discovery to my not being well-read. Yet others have read the passage and passed it by without making this discovery, and perhaps the same would have happened to me if in my young days I had had more taste for reading philosophical works. In later years I have denied myself the very great pleasure of reading the works of Nietzsche, with the deliberate object of not being hampered in working out the impressions received in psycho-analysis by any sort of anticipatory ideas. I had therefore to be prepared - and I am so, gladly - to forgo all claims to priority in the many instances in which laborious psycho-analytic investigation can merely confirm the truths which the philosopher recognized by intuition.

[1914d, 2884]

The complaints made by paranoics also show that at bottom the self-criticism of conscience coincides with the self-observation on which it is based. Thus the activity of the mind which has taken over the function of conscience has also placed itself at the service of internal research, which furnishes philosophy with the material for its intellectual operations. This may have some bearing on the characteristic tendency of paranoics to construct speculative systems.¹

[1914c, 2949]
It is obvious that a case such as that which is described in these pages might be made an excuse for dragging into the discussion every one of the findings and problems of psycho-analysis. But this would be an endless and unjustifiable labour. It must be recognized that everything cannot be learnt from a single case and that everything cannot be decided by it; we must content ourselves with exploiting whatever it may happen to show most clearly. There are in any case narrow limits to what a psycho-analysis is called upon to explain. For, while it is its business to explain the striking symptoms by revealing their genesis, it is not its business to explain but merely to describe the psychical mechanisms and instinctual processes to which one is led by that means. In order to derive fresh generalizations from what has thus been established with regard to the mechanisms and instincts, it would be essential to have at one’s disposal numerous cases as thoroughly and deeply analysed as the present one. But they are not easily to be had, and each one of them requires years of labour. So that advances in these spheres of knowledge must necessarily be slow. There is no doubt a great temptation to content oneself with ‘scratching’ the mental surface of a number of people and of replacing what is left undone by speculation - the latter being put under the patronage of some school or other of philosophy. Practical requirements may also be adduced in favour of this procedure; but no substitute can satisfy the requirements of science.

[1918b, 3583]

It is easy to understand why doctors, with an attitude of this kind towards the mind, should have had no liking for psycho-analysis and should have demurred to its demand for learning many things afresh and for seeing many things in a different light. But as a compensation it might be supposed that the new theory would be all the more likely to meet with applause from philosophers. For philosophers were accustomed to putting abstract concepts (or, as unkind tongues would say, hazy words) in the forefront of their explanations of the universe, and it would be impossible that they should object to the extension of the sphere of psychology for which psycho-analysis had paved the way. But here another obstacle arose. The philosophers’ idea of what is mental was not that of psycho-analysis. The overwhelming majority of philosophers regard as mental only the phenomena of consciousness. For them the world of consciousness coincides with the sphere of what is mental. Everything else that may take place in the ‘mind’ - an entity so hard to grasp - is relegated by them to the organic determinants of mental processes or to processes parallel to mental ones. Or, more strictly speaking, the mind has no contents other than the phenomena of consciousness, and consequently psychology, the science of the mind, has no other subject-matter. And on this point the layman’s view is the same.

[1925e, 4124]

What, then, can a philosopher say to a theory which, like psycho-analysis, asserts that on the contrary what is mental is in itself unconscious and that being conscious is only a quality, which may or may not accrue to a particular mental act and the withholding of which may perhaps alter that act in no other respect? He will naturally say that anything both unconscious and mental would be an impossibility, a *contradictio in adjecto*, and he will fail to observe that in making this judgement he is merely repeating his own definition of what is mental, a definition which may perhaps be too narrow. It is easy for philosophers to feel this certainty, since they have no acquaintance with the material whose investigation has compelled analysts to believe in unconscious mental acts. Philosophers have never taken account of hypnosis, they have not concerned themselves with the interpreting of dreams - on the contrary, like doctors, they regard dreams as the meaningless products of reduced mental activity during sleep - they are scarcely aware that there are such things as obsessions and delusions and they would find themselves in a most embarrassing situation if they were asked to explain them on the basis of their own psychological premisses. Analysts, too, refuse to say what the unconscious is, but they can indicate the domain of phenomena whose observation has obliged them to assume its existence. Philosophers, who know no kind of observation other than self-observation, cannot follow them into that domain.

[1925e, 4124]
So it comes about that psycho-analysis derives nothing but disadvantages from its middle position between medicine and philosophy. Doctors regard it as a speculative system and refuse to believe that, like every other natural science, it is based on a patient and tireless elaboration of facts from the world of perception; philosophers, measuring it by the standard of their own artificially constructed systems, find that it starts from impossible premises and reproach it because its most general concepts (which are only now in process of evolution) lack clarity and precision.

I should not like to create an impression that during this last period of my work I have turned my back upon patient observation and have abandoned myself entirely to speculation. I have on the contrary always remained in the closest touch with the analytic material and have never ceased working at detailed points of clinical or technical importance. Even when I have moved away from observation, I have carefully avoided any contact with philosophy proper. This avoidance has been greatly facilitated by constitutional incapacity. I was always open to the ideas of G. T. Fechner and have followed that thinker upon many important points. The large extent to which psycho-analysis coincides with the philosophy of Schopenhauer - not only did he assert the dominance of the emotions and the supreme importance of sexuality but he was even aware of the mechanism of repression - is not to be traced to my acquaintance with his teaching. I read Schopenhauer very late in my life. Nietzsche, another philosopher whose guesses and intuitions often agree in the most astonishing way with the laborious findings of psycho-analysis, was for a long time avoided by me on that very account; I was less concerned with the question of priority than with keeping my mind unembarrassed.

I must confess that I am not at all partial to the fabrication of Weltanschauungen. Such activities may be left to philosophers, who avowedly find it impossible to make their journey through life without a Baedeker of that kind to give them information on every subject. Let us humbly accept the contempt with which they look down on us from the vantage-ground of their superior needs. But since we cannot forgo our narcissistic pride either, we will draw comfort from the reflection that such 'Handbooks to Life' soon grow out of date and that it is precisely our short-sighted, narrow and finicky work which obliges them to appear in new editions, and that even the most up-to-date of them are nothing but attempts to find a substitute for the ancient, useful and all-sufficient Church Catechism. We know well enough how little light science has so far been able to throw on the problems that surround us. But however much ado the philosophers may make, they cannot alter the situation. Only patient, persevering research, in which everything is subordinated to the one requirement of certainty, can gradually bring about a change. The benighted traveller may sing aloud in the dark to deny his own fears; but, for all that, he will not see an inch further beyond his nose.

But to proceed. Putting ourselves on the footing of everyday knowledge, we recognize in human beings a mental organization which is interpolated between their sensory stimuli and the perception of their somatic needs on the one hand and their motor acts on the other, and which mediates between them for a particular purpose. We call this organization their 'Ich'. Now there is nothing new in this. Each one of us makes this assumption without being a philosopher, and some people even in spite of being philosophers. But this does not, in our opinion, exhaust the description of the mental apparatus. Besides this 'I', we recognize another mental region, more extensive, more imposing and more obscure than the 'I', and this we call the 'Es'. The relation between the two must be our immediate concern.
At this point one must expect to meet with an objection. 'Well then, if even obdurate sceptics admit that the assertions of religion cannot be refuted by reason, why should I not believe in them, since they have so much on their side - tradition, the agreement of mankind, and all the consolations they offer?' Why not, indeed? Just as no one can be forced to believe, so no one can be forced to disbelieve. But do not let us be satisfied with deceiving ourselves that arguments like these take us along the road of correct thinking. If ever there was a case of a lame excuse we have it here. Ignorance is ignorance; no right to believe anything can be derived from it. In other matters no sensible person will behave so irresponsibly or rest content with such feeble grounds for his opinions and for the one he takes. It is only in the highest and most sacred things that he allows himself to do so. In reality these are only attempts at pretending to oneself or to other people that one is still firmly attached to religion, when one has long since cut oneself loose from it. Where questions of religion are concerned, people are guilty of every possible sort of dishonesty and intellectual misdemeanour. Philosophers stretch the meaning of words until they retain scarcely anything of their original sense. They give the name of ‘God’ to some vague abstraction which they have created for themselves; having done so they can pose before all the world as deists, as believers in God, and they can even boast that they have recognized a higher, purer concept of God, notwithstanding that their God is now nothing more than an insubstantial shadow and no longer the mighty personality of religious doctrines. Critics persist in describing as ‘deeply religious’ anyone who admits to a sense of man’s insignificance or impotence in the face of the universe, although what constitutes the essence of the religious attitude is not this feeling but only the next step after it, the reaction to it which seeks a remedy for it. The man who goes no further, but humbly acquiesces in the small part which human beings play in the great world - such a man is, on the contrary, irreligious in the truest sense of the word.

Occultism asserts that there are in fact ‘more things in heaven and earth than are dreamt of in our philosophy’. Well, we need not feel bound by the narrow-mindedness of academic philosophy; we are ready to believe what is shown to us to deserve belief.

Of the three powers which may dispute the basic position of science, religion alone is to be taken seriously as an enemy. Art is almost always harmless and beneficent; it does not seek to be anything but an illusion. Except for a few people who are spoken of as being ‘possessed’ by art, it makes no attempt at invading the realm of reality. Philosophy is not opposed to science, it behaves like a science and works in part by the same methods; it departs from it, however, by clinging to the illusion of being able to present a picture of the universe which is without gaps and is coherent, though one which is bound to collapse with every fresh advance in our knowledge. It goes astray in its method by over-estimating the epistemological value of our logical operations and by accepting other sources of knowledge such as intuition. And it often seems that the poet’s derisive comment is not unjustified when he says of the philosopher:

But philosophy has no direct influence on the great mass of mankind; it is of interest to only a small number even of the top layer of intellectuals and is scarcely intelligible to anyone else. On the other hand, religion is an immense power which has the strongest emotions of human beings at its service. It is well known that at an earlier date it comprised everything that played an intellectual part in men’s lives, that it took the place of science when there was scarcely yet such a thing as science, and that it constructed a Weltanschauung, consistent and self-contained to an unparalleled degree, which, although it has been profoundly shaken, persists to this day.
And here I must first mention the various systems of philosophy which have ventured to draw a picture of the universe as it is reflected in the mind of thinkers who were for the most part turned away from the world. But I have already attempted to give a general account of the characteristics of philosophy and I am probably as unqualified as few people have ever been to form an estimate of the different systems. So I will invite you to join me in turning to a consideration of two other phenomena which, particularly in our days, it is impossible to disregard.

[1933a, 4773]

The other opposition has to be taken far more seriously, and in this instance I feel the liveliest regret at the inadequacy of my information. I suspect that you know more about this business than I do and that you took up your position long ago in favour of Marxism or against it. Karl Marx's investigations into the economic structure of society and into the influence of different economic systems upon every department of human life have in our days acquired an undeniable authority. How far his views in detail are correct or go astray, I cannot of course tell. I understand that this is not an easy matter even for others better instructed than I am. There are assertions contained in Marx's theory which have struck me as strange: such as that the development of forms of society is a process of natural history, or that the changes in social stratification arise from one another in the manner of a dialectical process. I am far from sure that I understand these assertions aright; nor do they sound to me 'materialistic' but, rather, like a precipitate of the obscure Hegelian philosophy in whose school Marx graduated. I do not know how I can shake off my lay opinion that the class structure of society goes back to the struggles which, from the beginning of history, took place between human hordes only slightly differing from each other. Social distinctions, so I thought, were originally distinctions between clans or races. Victory was decided by psychological factors, such as the amount of constitutional aggressiveness, but also by the firmness of the organization within the horde, and by material factors, such as the possession of superior weapons. Living together in the same area, the victors became the masters and the vanquished the slaves. There is no sign to be seen in this of a natural law or of a conceptual evolution. On the other hand the influence exercised upon the social relations of mankind by progressive control over the forces of Nature is unmistakable. For men always put their newly acquired instruments of power at the service of their aggressiveness and use them against one another. The introduction of metals - bronze and iron - made an end to whole epochs of civilization and their social institutions. I really believe that it was gunpowder and fire-arms that abolished chivalry and aristocratic rule, and that the Russian despotism was already doomed before it lost the War, because no amount of inbreeding among the ruling families of Europe could have produced a race of Tsars capable of withstanding the explosive force of dynamite.

[1933a, 4774]
Now it would look as though this dispute between psycho-analysis and philosophy is concerned only with a trifling matter of definition - the question whether the name 'psychical' should be applied to one or another sequence of phenomena. In fact, however, this step has become of the highest significance. Whereas the psychology of consciousness never went beyond the broken sequences which were obviously dependent on something else, the other view, which held that the psychical is unconscious in itself, enabled psychology to take its place as a natural science like any other. The processes with which it is concerned are in themselves just as unknowable as those dealt with by other sciences, by chemistry or physics, for example; but it is possible to establish the laws which they obey and to follow their mutual relations and interdependences unbroken over long stretches - in short, to arrive at what is described as an 'understanding' of the field of natural phenomena in question. This cannot be effected without framing fresh hypotheses and creating fresh concepts; but these are not to be despised as evidence of embarrassment on our part but deserve on the contrary to be appreciated as an enrichment of science. They can lay claim to the same value as approximations that belongs to the corresponding intellectual scaffolding found in other natural sciences, and we look forward to their being modified, corrected and more precisely determined as further experience is accumulated and sifted. So too it will be entirely in accordance with our expectations if the basic concepts and principles of the new science (instinct, nervous energy, etc.) remain for a considerable time no less indeterminate than those of the older sciences (force, mass, attraction, etc.). [1940a [1938], 4968]
Let us consider first the relation between father and son. The sanctity which we attribute to the rules laid down in the Decalogue has, I think, blunted our powers of perceiving the real facts. We seem scarcely to venture to observe that the majority of mankind disobey the Fifth Commandment. Alike in the lowest and in the highest strata of human society filial piety is wont to give way to other interests. The obscure information which is brought to us by mythology and legend from the primaeval ages of human society gives an unpleasing picture of the father’s despotic power and of the ruthlessness with which he made use of it. Kronos devoured his children, just as the wild boar devours the sow’s litter; while Zeus emasculated his father² and made himself ruler in his place. The more unrestricted was the rule of the father in the ancient family, the more must the son, as his destined successor, have found himself in the position of an enemy, and the more impatient must he have been to become ruler himself though his father’s death. Even in our middle-class families fathers are as a rule inclined to refuse their sons independence and the means necessary to secure it and thus to foster the growth of the germ of hostility which is inherent in their relation. A physician will often be in a position to notice how a son’s grief at the loss of his father cannot suppress his satisfaction at having at length won his freedom. In our society to-day fathers are apt to cling desperately to what is left of a now sadly antiquated protestas patris familias; and an author who, like Ibsen, brings the immemorial struggle between fathers and sons into prominence in his writings may be certain of producing his effect.

Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: ‘Where we now say “Excuse me!” we used to give a box on the ears.’ Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent ‘tout comprendre c’est tout pardonner’ - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]
I may recall the two stories - one of the impoverished gourmet who was caught eating 'salmon mayonnaise' and the other of the dipsomaniac tutor - which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously 'the man is right', but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is wrong. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: 'Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.' This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's 'Carpe diem', which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the 'salmon mayonnaise' joke was right has such a repellent effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - 'Carpe diem' has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? 'Di doman non c'è certezza.'¹

[1905c, 1703]

Other jokes, which are in the same sense cynical and which are not only Jewish anecdotes, attack religious dogmas and even the belief in God. The story of the Rabbi's 'Kück, the technique of which lay in the faulty thinking which equated phantasy and reality (another possible view was to regard it as a displacement), is a cynical or critical joke of this kind, directed against miracle-workers and certainly against the belief in miracles as well. Heine is said to have made a definitely blasphemous joke on his death-bed. When a friendly priest reminded him of God's mercy and gave him hope that God would forgive him his sins, he is said to have replied: 'Bien sûr qu'il me pardonnera: c'est son métier.'¹ This is a disparaging comparison (technically perhaps only having the value of an allusion), since a 'métier', a trade or profession, is what a workman or a doctor has - and he has only a single métier. But the force of the joke lies in its purpose. What it means to say is nothing else than: 'Of course he'll forgive me. That's what he's there for, and that's the only reason I've taken him on (as one engages one's doctor or one's lawyer).'. So in the dying man, as he lay there powerless, a consciousness stirred that he had created God and equipped him with power so as to make use of him when the occasion arose. What was supposed to be the created being revealed itself just before its annihilation as the creator.

[1905c, 1708]
There does not seem to me to be a single good reason for denying children the enlightenment which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child’s power of independent thought as early as possible, in favour of the ‘goodness’ which they think so much of, they cannot set about this better than by deceiving him in sexual matters and intimidating him in matters of religion. The stronger natures will, it is true, withstand these influences and become rebels against the authority of their parents and later against every other authority. If children are not given the explanations for which they turn to their elders, they go on tormenting themselves with the problem in secret and produce attempts at solution in which the truth they have guessed is mingled in the most extraordinary way with grotesque untruths; or they whisper information to one another in which, because of the young enquirers’ sense of guilt, everything sexual is stamped as being horrible and disgusting. These infantile sexual theories would be well worth collecting and examining. From this time on, children usually lose the only proper attitude to sexual questions, and many of them never regain it.

[1907c, 1917]

I consider it the most significant advance in child education that in France the State should have introduced, in place of the catechism, a primer which gives the child his first instruction in his position as a citizen and in the ethical duties which will later devolve on him. But such elementary instruction is seriously deficient, so long as it does not include the field of sexuality. Here is the gap which educators and reformers should set about filling. In countries which have placed the education of children wholly or in part in the hands of the clergy, it will, of course, be impossible to ask for this. A priest will never admit that men and animals have the same nature, since he cannot do without the immortality of the soul, which he requires as the basis for moral precepts. Here, once again, we see the unwisdom of sewing a single silk patch on to a tattered coat - the impossibility of carrying out an isolated reform without altering the foundations of the whole system.

[1907c, 1918]

These false sexual theories, which I shall now discuss, all have one very curious characteristic. Although they go astray in a grotesque fashion, yet each one of them contains a fragment of real truth; and in this they are analogous to the attempts of adults, which are looked at as strokes of genius, at solving the problems of the universe which are too hard for human comprehension. What is correct and hits the mark in such theories is to be explained by their origin from the components of the sexual instinct which are already stirring in the childish organism. For it is not owing to any arbitrary mental act or to chance impressions that those notions arise, but to the necessities of the child’s psychosexual constitution; and this is why we can speak of sexual theories in children as being typical, and why we find the same mistaken beliefs in every child whose sexual life is accessible to us.

[1908c, 1970]
Concealed behind this somewhat unpromising title is the book of a brave man who succeeds in telling the reader much that is worthy of consideration. The sub-title of the work reveals more of its content: 'A Philosophy of Small Words'. The author is in fact fighting against those 'little words and arrangements of words which exclude or include too much' and which reveal, in people who have the habit of using them for preference, a tendency towards 'exclusive or superlative judgements'. It is self-evident - our author would contest even this phrase - that the fight is not concerned with these harmless words but with the tendency to become intoxicated by them and to forget, on account of the exaggerated representation thus achieved, the necessary limitations on our pronouncements and the inevitable relativity of our judgements. It really serves as a useful warning if one is shown how much that was described by people of an earlier generation as 'self-evident' or as 'nonsensical' ranks with us to-day conversely as nonsensical or self-evident; or if we observe, in a series of well-chosen examples, to what a narrowing of their mental horizon even important writers must plead guilty, as a result of their misuse of superlatives. The exhortation to moderation in judgement and expression actually serves our author only as a point of departure for further discussions on other 'errors of thought' of human beings - on the central delusion, faith, on atheistic morality, and the like. In all these observations is manifest the author's honest endeavour to take seriously the implications of the particular view of the world necessitated by the discoveries of modern science, in particular of the theory of evolution. A lot that is psychologically accurate is included, and many truths of the kind that have often been said before but cannot be often enough repeated. The author has set himself the thankless task 'of improving and converting people' by means of exerting a sober influence, without seeking to move them to laughter by humour or sweep them along with him by passion. Let us wish him all success.

[1903-1904, 1996]

Solving the mystery of sleep might well have been reserved to science; the pious author, however, operates with biblical arguments and teleological causes. For example: it would be an idea unworthy of divine providence to suppose that it would allow human beings to spend a full third of their life in spiritual inactivity. Sleep is rather that state in which divine influence penetrates most freely and most effectively into human mental life. But in spite of all objections to the author's way of thinking we will not omit to emphasize the kernel of truth in his assertion. Scientific studies of the state of mental life during sleep, too, oblige us to relinquish as inadequate our previous assumption that sleep reduces the play of mental activity to a minimum. The important processes of unconscious mental and even intellectual activity continue - as the elucidation of dreams given by your reviewer demonstrates - even during profound sleep. This unconscious mental activity deserves to be called 'daemonic' but scarcely divine.

[1903-1904, 1997]
When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neuritic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neuritic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

When anyone has, like Leonardo, escaped being intimidated by his father during his earliest childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psycho-analysis has made us familiar with the intimate connection between the father-complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather, as revivals and restorations of the young child's ideas of them. Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neuritic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.

It does not seem as if the instance of Leonardo could show this view of religious belief to be mistaken. Accusations charging him with unbelief or (what at that time came to the same thing) with apostasy from Christianity were brought against him while he was still alive, and are clearly described in the first biography which Vasari wrote of him, (Müntz, 1899, 292 ff.) In the second (1568) edition of his Vite Vasari omitted these observations. In view of the extraordinary sensitiveness of his age where religious matters were in question, we can understand perfectly why even in his notebooks Leonardo should have refrained from directly stating his attitude to Christianity. In his researches he did not allow himself to be led astray in the slightest degree by the account of the Creation in Holy Writ; he challenged, for example, the possibility of a universal Deluge, and in geology he calculated in terms of hundreds of thousands of years with no more hesitation than men in modern times.
But may one not take objection to the findings of an enquiry which ascribes to accidental circumstances of his parental constellation so decisive an influence on a person's fate - which, for example, makes Leonardo's fate depend on his illegitimate birth and on the barrenness of his first stepmother Donna Albiera? I think one has no right to do so. If one considers chance to be unworthy of determining our fate, it is simply a relapse into the pious view of the Universe which Leonardo himself was on the way to overcoming when he wrote that the sun does not move. We naturally feel hurt that a just God and a kindly providence do not protect us better from such influences during the most defenceless period of our lives. At the same time we are all too ready to forget that in fact everything to do with our life is chance, from our origin out of the meeting of spermatozoon and ovum onwards - chance which nevertheless has a share in the law and necessity of nature, and which merely lacks any connection with our wishes and illusions. The apportioning of the determining factors of our life between the 'necessities' of our constitution and the 'chances' of our childhood may still be uncertain in detail; but in general it is no longer possible to doubt the importance precisely of the first years of our childhood. We all still show too little respect for Nature which (in the obscure words of Leonardo which recall Hamlet's lines) 'is full of countless causes ['ragioni'] that never enter experience'.¹

4 On one single occasion during his illness the patient was vouchsafed the privilege of seeing, with his spiritual eyes, God Almighty clear and undisguised before him. On that occasion God uttered what was a very current word in the basic language, and a forcible though not an amiable one - the word 'Slut!' (136). [In German 'Luder'. This term of abuse is occasionally applied to males, though much more often to females.]

Repeated attempts are therefore made to find a justification for God's behaviour to the patient. In these attempts, which display as much ingenuity as every other theodicy, the explanation is based now upon the general nature of souls, and now upon the necessity for self-preservation under which God lay, and upon the misleading influence of the Flechsig soul (60-1 and 160). In general, however, the illness is looked upon as a struggle between Schreber the man and God, in which victory lies with the man, weak though he is, because the Order of Things is on his side (61).

It seems plausible to explain the complicated and contradictory attitude of primitive peoples to their rulers in some such way as the following. For superstitious and other reasons, a variety of different impulses find expression in relation to kings; and each of these impulses is developed to an extreme point without regard to the others. This gives rise to contradictions - by which, incidentally, a savage intellect is as little disturbed as is a highly civilized one when it comes to such matters as religion or 'loyalty'.

The question of why the emotional attitude towards rulers includes such a powerful unconscious element of hostility raises a very interesting problem, but one that lies outside the limits of the present study. I have already hinted at the fact that the child's complex of emotions towards his father - the father-complex - has a bearing on the subject, and I may add that more information on the early history of the kingship would throw a decisive light on it. Frazer (1911a) has put forward impressive reasons, though, as he himself admits, not wholly conclusive ones, for supposing that the earliest kings were foreigners who, after a brief reign, were sacrificed with solemn festivities as representatives of the deity. It is possible that the course taken by the evolution of kings may also have had an influence upon the myths of Christendom.
I pictured the future as follows: - I should probably succeed in maintaining myself by means of the therapeutic success of the new procedure, but science would ignore me entirely during my lifetime; some decades later, someone else would infallibly come upon the same things - for which the time was not now ripe - would achieve recognition for them and bring me honour as a forerunner whose failure had been inevitable. Meanwhile, like Robinson Crusoe, I settled down as comfortably as possible on my desert island. When I look back to those lonely years, away from the pressures and confusions of to-day, it seems like a glorious heroic age. My 'splendid isolation' was not without its advantages and charms. I did not have to read any publications, nor listen to any ill-informed opponents; I was not subject to influence from any quarter; there was nothing to hustle me. I learnt to restrain speculative tendencies and to follow the unforgotten advice of my master, Charcot: to look at the same things again and again until they themselves begin to speak. My publications, which I was able to place with a little trouble, could always lag far behind my knowledge, and could be postponed as long as I pleased, since there was no doubtful 'priority' to be defended. The Interpretation of Dreams, for instance, was finished in all essentials at the beginning of 1896 but was not written out until the summer of 1899. The analysis of 'Dora' was over at the end of 1899; the case history was written in the next two weeks, but was not published until 1905. Meanwhile my writings were not reviewed in the medical journals, or, if as an exception they were reviewed, they were dismissed with expressions of scornful or pitying superiority. Occasionally a colleague would make some reference to me in one of his publications; it would be very short and not at all flattering - words such as 'eccentric', 'extreme', or 'very peculiar' would be used. It once happened that an assistant at the clinic in Vienna where I gave my University lectures asked me for permission to attend the course. He listened very attentively and said nothing; after the last lecture was over he offered to join me outside. As we walked away, he told me that with his chief's knowledge he had written a book combating my views; he regretted very much, however, that he had not first learnt more about them from my lectures, for in that case he would have written much of it differently. He had indeed enquired at the clinic whether he had not better first read The Interpretation of Dreams, but had been advised against doing so - it was not worth the trouble. He then himself compared the structure of my theory, so far as he now understood it, with that of the Catholic Church as regards its internal solidity. In the interests of the salvation of his soul, I shall assume that this remark implied a certain amount of appreciation. But he concluded by saying that it was too late to alter anything in his book, since it was already in print. Nor did my colleague think it necessary later to make any public avowal of his change of views on the subject of psycho-analysis; but preferred, in his capacity as a regular reviewer for a medical journal, to follow its development with flippant comments.

Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psycho-analysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psycho-analysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial. A reader who suspends his judgement and allows psycho-analysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.
But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.
[1941d [1921], 3864]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book Inhibitions, Symptoms and Anxiety (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in Totem and Taboo to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, The Future of an Illusion (1927c) and Civilization and its Discontents (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primitive experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In The Future of an Illusion I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

I must confess that I am not at all partial to the fabrication of Weltanschauungen. Such activities may be left to philosophers, who avowedly find it impossible to make their journey through life without a Baedeker of that kind to give them information on every subject. Let us humbly accept the contempt with which they look down on us from the vantage-ground of their superior needs. But since we cannot forgo our narcissistic pride either, we will draw comfort from the reflection that such 'Handbooks to Life' soon grow out of date and that it is precisely our short-sighted, narrow and finicky work which obliges them to appear in new editions, and that even the most up-to-date of them are nothing but attempts to find a substitute for the ancient, useful and all-sufficient Church Catechism. We know well enough how little light science has so far been able to throw on the problems that surround us. But however much ado the philosophers may make, they cannot alter the situation. Only patient, persevering research, in which everything is subordinated to the one requirement of certainty, can gradually bring about a change. The benighted traveller may sing aloud in the dark to deny his own fears; but, for all that, he will not see an inch further beyond his nose.

'I understand,' says our Impartial Person. 'You assume that every neurotic has something oppressing him, some secret. And by getting him to tell you about it you relieve his oppression and do him good. That, of course, is the principle of Confession, which the Catholic Church has used from time immemorial in order to make secure its dominance over people's minds.'
I come now to a question the discussion of which seems to me more important. Is the practice of psycho-analysis a matter which should in general be subject to official interference, or would it be more expedient to leave it to follow its natural development? I shall certainly not come to any decision on this point here and now, but I shall take the liberty of putting the problem before you for your consideration. In our country from of old a positive "furor prohibendi" has been the rule, a tendency to keep people under tutelage, to interfere and to forbid, which, as we all know, has not borne particularly good fruit. In our new republican Austria, it seems, things have not yet changed very much. I fancy you will have an important word to say in deciding the case of psycho-analysis which we are now considering; I do not know whether you have the wish or the influence with which to oppose these bureaucratic tendencies. At all events, I shall not spare you my unauthoritative thoughts on the subject. In my opinion a superabundance of regulations and prohibitions injures the authority of the law. It can be observed that where only a few prohibitions exist they are carefully observed, but where one is accompanied by prohibitions at every step, one feels definitely tempted to disregard them. Moreover, it does not mean one is quite an anarchist if one is prepared to realize that laws and regulations cannot from their origin claim to possess the attribute of being sacred and untransgressable, that they are often inadequately framed and offend our sense of justice, or will do so after a time, and that, in view of the sluggishness of the authorities, there is often no other means of correcting such inexpedient laws than by boldly violating them. Furthermore, if one desires to maintain respect for laws and regulations it is advisable not to enact any where a watch cannot easily be kept on whether they are obeyed or transgressed. Much of what I have quoted above on the practice of analysis by doctors could be repeated here in regard to genuine analysis by laymen which the law is seeking to suppress. The course of an analysis is most inconspicuous, it employs neither medicines nor instruments and consists only in talking and an exchange of information; it will not be easy to prove that a layman is practising 'analysis', if he asserts that he is merely giving encouragement and explanations and trying to establish a healthy human influence on people who are in search of mental assistance. It would surely not be possible to forbid that merely because doctors sometimes do the same thing. In English-speaking countries the practices of Christian Science have become very widespread: a kind of dialectical denial of the evils in life, based on an appeal to the doctrines of the Christian religion. I do not hesitate to assert that that procedure represents a regrettable aberration of the human spirit; but who in America or England would dream of forbidding it and making it punishable? Are the authorities so certain of the right path to salvation that they venture to prevent each man from trying 'to be saved after his own fashion'. And granted that many people if they are left to themselves run into danger and come to grief, would not the authorities do better carefully to mark the limits of the regions which are to be regarded as not to be trespassed upon, and for the rest, so far as possible, to allow human beings to be educated by experience and mutual influence? Psycho-analysis is something so new in the world, the mass of mankind is so little instructed about it, the attitude of official science to it is still so vacillating, that it seems to me over-hasty to intervene in its development with legislative regulations. Let us allow patients themselves to discover that it is damaging to them to look for mental assistance to people who have not learnt how to give it. If we explain this to them and warn them against it, we shall have spared ourselves the need to forbid it. On the main roads of Italy the pylons that carry high-tension cables bear the brief and impressive inscription: 'Chi tocca, muore.' This is perfectly calculated to regulate the behaviour of passers-by to any wires that may be hanging down. The corresponding German notices exhibit an unnecessary and offensive verbosity: 'Das Berühren der Leitungsdrähte ist, weil lebensgefährlich, strengstens verboten.' Why the prohibition? Anyone who holds his life dear will make the prohibition for himself; and anyone who wants to kill himself in that way will not ask for permission.

[1926e, 4377]
We know the reason for this behaviour and what their secret treasure is. They really regard themselves as God’s chosen people, they believe that they stand especially close to him; and this makes them proud and confident. Trustworthy reports tell us that they behaved in Hellenistic times just as they do to-day, so that the complete Jew was already there; and the Greeks, among whom and alongside of whom they lived, reacted to the Jewish characteristics in the same way as their ‘hosts’ do to-day. It might be thought that they reacted as though they too believed in the superiority which the people of Israel claimed for themselves. If one is the declared favourite of the dreaded father, one need not be surprised at the jealousy of one’s brothers and sisters, and the Jewish legend of Joseph and his brethren shows very well where this jealousy can lead. The course of world-history seemed to justify the presumption of the Jews, since, when later on it pleased God to send mankind a Messiah and redeemer, he once again chose him from the Jewish people. The other peoples might have had occasion then to say to themselves: ‘Indeed, they were right, they are God’s chosen people.’ But instead of this, what happened was that redemption by Jesus Christ only intensified their hatred of the Jews, while the Jews themselves gained no advantage from this second act of favouritism, since they did not recognize the redeemer.

[1939a, 4927]

How envious, to those of us who are poor in faith, do those enquirers seem who are convinced of the existence of a Supreme Being! To that great Spirit the world offers no problems, for he himself created all its institutions. How comprehensive, how exhaustive and how definitive are the doctrines of believers compared with the laborious, paltry and fragmentary attempts at explanation which are the most we are able to achieve! The divine Spirit, which is itself the ideal of ethical perfection, has planted in men the knowledge of that ideal and, at the same time, the urge to assimilate their own nature to it. They perceive directly what is higher and nobler and what is lower and more base. Their affective life is regulated in accordance with their distance from the ideal at any moment. When they approach to it - at their perihelion, as it were - they are brought high satisfaction; when, at their aphelion, they have become remote from it, the punishment is severe unpleasure. All of this is laid down so simply and so unshakeably. We can only regret that certain experiences in life and observations in the world make it impossible for us to accept the premiss of the existence of such a Supreme Being. As though the world had not riddles enough, we are set the new problem of understanding how these other people have been able to acquire their belief in the Divine Being and whence that belief obtained its immense power, which overwhelms ‘reason and science’.

[1939a, 4941]
I may recall the two stories - one of the impoverished *gourmet* who was caught eating ‘salmon mayonnaise’ and the other of the dipsomaniac tutor - which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tucked on to the façade of a story the thought would like to say seriously ‘the man is right’, but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is wrong. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: ‘Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.’ This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's *Carpe diem*, which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the ‘salmon mayonnaise’ joke was right has such a repellant effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - *Carpe diem* has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? *Di doman' non c'è certezza.*¹

I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain that society will reward this renunciation by offering me one of the permitted methods - even after a certain amount of postponement? What these jokes whisper may be said aloud: that the wishes and desires of men have a right to make themselves acceptable alongside of exacting and ruthless morality. And in our days it has been said in forceful and stirring sentences that this morality is only a selfish regulation laid down by the few who are rich and powerful and who can satisfy their wishes at any time without any postponement. So long as the art of healing has not gone further in making our life safe and so long as social arrangements do no more to make it more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the demands of morality. Every honest man will end by making this admission, at least to himself. The decision in this conflict can only be reached by the roundabout path of fresh insight. One must bind one's own life to that of others so closely and be able to identify oneself with others so intimately that the brevity of one's own life can be overcome; and one must not fulfil the demands of one's own needs illegitimately, but must leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to change the order of society. But not every personal need can be postponed in this way and transferred to other people, and there is no general and final solution of the conflict.

¹[1905c, 1703]

[1905c, 1704]
A man who was hard of hearing consulted the doctor, who correctly diagnosed that the patient probably drank too much brandy and was on that account deaf. He advised him against it and the deaf man promised to take his advice to heart. After a while the doctor met him in the street and asked him in a loud voice how he was. "Thank you", was the answer. "You needn't shout so loud, doctor. I've given up drinking and hear quite well again." A little while later they met once more. The doctor asked him how he was in his ordinary voice, but noticed that his question had not been understood. "Eh? What was that?" - "It seems to me you're drinking brandy again", shouted the doctor in his ear, "and that's why you're deaf again." "You may be right," replied the deaf man, "I have begun drinking brandy again and I'll tell you why. So long as I didn't drink I was able to hear. But nothing I heard was as good as the brandy." Technically this joke is nothing other than an object-lesson: dialect or skill in narrative are necessary for raising a laugh, but in the background lies the sad question: may not the man have been right in his choice?

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality by pointing to the important bearing of that morality upon the spread of modern nervous illness.

We must not omit to consider the third of the possible outcomes of the work of psychoanalysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction and ought to find it in life. Our civilized standards make life too difficult for the majority of human organizations. Those standards consequently encourage the retreat from reality and the generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual repression. We ought not to exalt ourselves so high as completely to neglect what was originally animal in our nature. Nor should we forget that the satisfaction of the individual's happiness cannot be erased from among the aims of our civilization. The plasticity of the components of sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive for still greater cultural achievements by still further sublimation. But, just as we do not count on our machines converting more than a certain fraction of the heat consumed into useful mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual instinct from its proper ends. We cannot succeed in doing so; and if the restriction upon sexuality were to be carried too far it would inevitably bring with it all the evils of soil-exhaustion.
Are we, then, to abandon our efforts to explain the hidden meaning of neurosis as being in the last resort dangerous to the individual and harmful to the workings of society? Are we to give up drawing the practical conclusion from a piece of scientific insight? No; I think that in spite of this our duty lies in the other direction. The gain from illness provided by the neuroses is nevertheless on the whole and in the end detrimental to individuals as well as to society. The unhappiness that our work of enlightenment may cause will after all only affect some individuals. The change-over to a more realistic and creditable attitude on the part of society will not be bought too dearly by these sacrifices. But above all, all the energies which are to-day consumed in the production of neurotic symptoms serving the purposes of a world of phantasy isolated from reality, will, even if they cannot at once be put to uses in life, help to strengthen the clamour for the changes in our civilization through which alone we can look for the well-being of future generations.

[1910d, 2314]

When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

[1915b, 3068]
It should not be objected that the state cannot refrain from wrong-doing, since that would place it at a disadvantage. It is no less disadvantageous, as a general rule, for the individual man to conform to the standards of morality and refrain from brutal and arbitrary conduct; and the state seldom proves able to indemnify him for the sacrifices it exacts. Nor should it be a matter for surprise that this relaxation of all the moral ties between the collective individuals of mankind should have had repercussions on the morality of individuals; for our conscience is not the inflexible judge that ethical teachers declare it, but in its origin is 'social anxiety' and nothing else. When the community no longer raises objections, there is an end, too, to the suppression of evil passions, and men perpetrate deeds of cruelty, fraud, treachery and barbarity so incompatible with their level of civilization that one would have thought them impossible.

Civilized society, which demands good conduct and does not trouble itself about the instinctual basis of this conduct, has thus won over to obedience a great many people who are not in this following their own natures. Encouraged by this success, society has allowed itself to be misled into tightening the moral standard to the greatest possible degree, and it has thus forced its members into a yet greater estrangement from their instinctual disposition. They are consequently subject to an unceasing suppression of instinct, and the resulting tension betrays itself in the most remarkable phenomena of reaction and compensation. In the domain of sexuality, where such suppression is most difficult to carry out, the result is seen in the reactive phenomena of neurotic disorders. Elsewhere the pressure of civilization brings in its train no pathological results, it is true, but is shown in malformations of character, and in the perpetual readiness of the inhibited instincts to break through to satisfaction at any suitable opportunity. Anyone thus compelled to act continually in accordance with precepts which are not the expression of his instinctual inclinations, is living, psychologically speaking, beyond his means, and may objectively be described as a hypocrite, whether he is clearly aware of the incongruity or not. It is undeniable that our contemporary civilization favours the production of this form of hypocrisy to an extraordinary extent. One might venture to say that it is built up on such hypocrisy, and that it would have to submit to far-reaching modifications if people were to undertake to live in accordance with psychological truth. Thus there are very many more cultural hypocrites than truly civilized men - indeed, it is a debatable point whether a certain degree of cultural hypocrisy is not indispensable for the maintenance of civilization, because the susceptibility to culture which has hitherto been organized in the minds of present-day men would perhaps not prove sufficient for the task. On the other hand, the maintenance of civilization even on so dubious a basis offers the prospect of paving the way in each new generation for a more far-reaching transformation of instinct which shall be the vehicle of a better civilization.

[1915b, 3072]
But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients’ ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

Moreover, to return to our question of the analytic treatment of adult neurotics, even there we have not yet exhausted every line of approach. Our civilization imposes an almost intolerable pressure on us and it calls for a corrective. Is it too fantastic to expect that psycho-analysis in spite of its difficulties may be destined to the task of preparing mankind for such a corrective? Perhaps once more an American may hit on the idea of spending a little money to get the ‘social workers’ of his country trained analytically and to turn them into a band of helpers for combating the neuroses of civilization.
When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

[1930a, 4530]
For a wide variety of reasons, it is very far from my intention to express an opinion upon the value of human civilization. I have endeavoured to guard myself against the enthusiastic prejudice which holds that our civilization is the most precious thing that we possess or could acquire and that its path will necessarily lead to heights of unimagined perfection. I can at least listen without indignation to the critic who is of the opinion that when one surveys the aims of cultural endeavour and the means it employs, one is bound to come to the conclusion that the whole effort is not worth the trouble, and that the outcome of it can only be a state of affairs which the individual will be unable to tolerate. My impartiality is made all the easier to me by my knowing very little about all these things. One thing only do I know for certain and that is that man's judgements of value follow directly his wishes for happiness - that, accordingly, they are an attempt to support his illusions with arguments. I should find it very understandable if someone were to point out the obligatory nature of the course of human civilization and were to say, for instance, that the tendencies to a restriction of sexual life or to the institution of a humanitarian ideal at the expense of natural selection were developmental trends which cannot be averted or turned aside and to which it is best for us to yield as though they were necessities of nature. I know, too, the objection that can be made against this, to the effect that in the history of mankind, trends such as these, which were considered unsurmountable, have often been thrown aside and replaced by other trends. Thus I have not the courage to rise up before my fellow-men as a prophet, and I bow to their reproach that I can offer them no consolation: for at bottom that is what they are all demanding - the wildest revolutionaries no less passionately than the most virtuous believers.

I hold firmly to a scientifically objective social assessment of ethics, and for that reason I should not wish to deny the excellent Philistine a certificate of good ethical conduct, even though it has cost him little self-discipline. But alongside of this I grant the validity of the subjective psychological view of ethics which you support. Though I agree with your judgement of the world and mankind as they are to-day, I cannot, as you know, regard your pessimistic dismissal of a better future as justified.
But you may raise the question of why these people - both the ones who write books and the conversationalists - behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psycho-analysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement - the judgement, namely, that was formed upon the young psycho-analysis by the representatives of official science. I once complained of this in a historical account I wrote, and I shall not do so again - perhaps that once was too often - but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psycho-analysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob. You may not realize clearly, perhaps, how far upwards in our society mob-characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that it was equally senseless to lament and to invoke the help of kindlier spirits, for there were not courts to which such appeals could be made. So I took another road. I made a first application of psycho-analysis by explaining to myself that this behaviour of the crowd was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This procedure was the right one. The interdict which lay upon psycho-analysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psycho-analysis by scientific circles persists to-day in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.

[1933a, 4739]

Parallel with the efforts of analysts to influence education, other investigations are being made into the origin and prevention of delinquency and crime. Here again I am only opening the door for you and showing you the rooms that lie beyond it, without leading you inside. I am certain that if you remain loyal to your interest in psycho-analysis you will be able to learn much that is new and valuable on these subjects. I must not, however, leave the topic of education without referring to one particular aspect of it. It has been said - and no doubt justly - that every education has a partisan aim, that it endeavours to bring the child into line with the established order of society, without considering how valuable or how stable that order may be in itself. If one is convinced of the defects in our present social arrangements, education with a psycho-analytic alignment cannot justifiably be put at their service as well: it must be given another and higher aim, liberated from the prevailing demands of society. In my opinion, however, this argument is out of place here. Such a demand goes beyond the legitimate function of analysis. In the same way, it is not the business of a doctor who is called in to treat a case of pneumonia to concern himself with whether the patient is an honest man or a suicide or a criminal, whether he deserves to remain alive or whether one ought to wish him to. This other aim which it is desired to give to education will also be a partisan one, and it is not the affair of an analyst to decide between the parties. I am leaving entirely on one side the fact that psycho-analysis would be refused any influence on education if it admitted to intentions inconsistent with the established social order. Psycho-analytic education will be taking an uninvited responsibility on itself if it proposes to mould its pupils into rebels. It will have played its part if it sends them away as healthy and efficient as possible. It itself contains enough revolutionary factors to ensure that no one educated by it will in later life take the side of reaction and suppression. It is even my opinion that revolutionary children are not desirable from any point of view.

[1933a, 4750]
Overwhelmed by meeting with such wisdom, I began to read all his works — his books on Voltaire, on Religion, on War, on the Universal Provision of Subsistence, etc. — till there was built up clearly before my eyes a picture of this simple-minded, great man, who was a thinker and a critic and at the same time a kindly humanitarian and reformer. I reflected much over the rights of the individual which he advocated and to which I should gladly have added my support had I not been restrained by the thought that neither the processes of Nature nor the aims of human society quite justified such claims. A special feeling of sympathy drew me to him, since he too had clearly had painful experience of the bitterness of the life of a Jew and of the hollowness of the ideals of present-day civilization. Yet I never saw him in the flesh. He knew of me through common acquaintances, and I once had occasion to answer a letter from him in which he asked for some piece of information. But I never sought him out. My innovations in psychology had estranged me from my contemporaries, and especially from the older among them: often enough when I approached some man whom I had honoured from a distance, I found myself repelled, as it were, by his lack of understanding for what had become my whole life to me. And after all Josef Popper had been a physicist: he had been a friend of Ernst Mach. I was anxious that the happy impression of our agreement upon the problem of dream-distortion should not be spoilt. So it came about that I put off calling upon him till it was too late and I could now only salute his bust in the gardens in front of our Rathaus.

[1932c, 4811]

After reading your letter I felt a wave of the deepest sympathy, but it was soon halted by two reflections - an internal difficulty and an external obstacle. A sentence from your own preface offers me an apt expression of the former: 'No doubt, however, there are people who have so poor an opinion of the civilized humanity of to-day that they deny the existence of a world conscience.' I believe I am one of those people. For instance, I could not subscribe to the assertion that the treatment of convicted prisoners is a disgrace to our civilization. On the contrary, a voice would tell me, it is in perfect harmony with our civilization, a necessary expression of the brutality and lack of understanding which dominate the civilized humanity of the present time. And if by some miracle people suddenly became convinced that the reform of the penal system is the first and most urgent task before our civilization, what else would emerge than that capitalist society has not now the means for meeting the expenditure which that reform would demand? The second, the external, difficulty is brought to light in the passages in your letter in which you exalt me into a recognized intellectual leader and cultural innovator and attribute to me the privilege of having the ear of the civilized world. I only wish, my dear Sir, that it were so: I should not in that case refuse your request. But it seems to me that I am persona ingrata, if not ingratissima, with the German people - and moreover with the learned and the unlearned alike. I hope most positively that you will not think that I feel seriously aggrieved by these signs of disapproval. It is tens of years since I have been so foolish; measured by your example, moreover, it would be too ridiculous. I only mention these trivialities to confirm the fact that I am no desirable advocate for a book which seeks to kindle its readers’ sympathies on behalf of a good cause. Let me add that your book is a moving one, noble, wise and good.

[1931f, 4832]
If this evolution of the sexual instinct is borne in mind, three stages of civilization can be distinguished: a first one, in which the sexual instinct may be freely exercised without regard to the aims of reproduction; a second, in which all of the sexual instinct is suppressed except what serves the aims of reproduction; and a third, in which only legitimate reproduction is allowed as a sexual aim. This third stage is reflected in our present-day 'civilized' sexual morality.

[1908d, 1953]

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

[1908d, 1958]

Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality by pointing to the important bearing of that morality upon the spread of modern nervous illness.

[1908d, 1963]

We must not omit to consider the third of the possible outcomes of the work of psycho-analysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction and ought to find it in life. Our civilized standards make life too difficult for the majority of human organizations. Those standards consequently encourage the retreat from reality and the generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual repression. We ought not to exalt ourselves so high as completely to neglect what was originally animal in our nature. Nor should we forget that the satisfaction of the individual's happiness cannot be erased from among the aims of our civilization. The plasticity of the components of sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive for still greater cultural achievements by still further sublimation. But, just as we do not count on our machines converting more than a certain fraction of the heat consumed into useful mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual instinct from its proper ends. We cannot succeed in doing so; and if the restriction upon sexuality were to be carried too far it would inevitably bring with it all the evils of soil-exhaustion.

[1910a, 2239]
It may be that you for your part will regard the warning with which I close as an exaggeration. I shall only venture on an indirect picture of my conviction by telling you an old story and leaving you to make what use you like of it. German literature is familiar with a little town called Schilda, to whose inhabitants clever tricks of every possible sort are attributed. The citizens of Schilda, so we are told, possessed a horse with whose feats of strength they were highly pleased and against which they had only one objection - that it consumed such a large quantity of expensive oats. They determined to break it of this bad habit very gently by reducing its ration by a few stalks every day, till they had accustomed it to complete abstinence. For a time things went excellently: the horse was weaned to the point of eating only one stalk a day, and on the succeeding day it was at length to work without any oats at all. On the morning of that day the spiteful animal was found dead; and the citizens of Schilda could not make out what it had died of.

[1910a, 2239]

In view of the strenuous efforts being made in the civilized world to-day to reform sexual life, it will not be superfluous to give a reminder that psycho-analytic research is as remote from tendentiousness as any other kind of research. It has no other end in view than to throw light on things by tracing what is manifest back to what is hidden. It is quite satisfied if reforms make use of its findings to replace what is injurious by something more advantageous; but it cannot predict whether other institutions may not result in other, and perhaps graver, sacrifices.

[1912d, 2344]

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]
At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction - but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What does awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so you are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education. For society must undertake as one of its most important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical with the bidding of society. It is also concerned to postpone the full development of the instinct till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct, educability is for practical purposes at an end. Otherwise, the instinct would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, by the eternal, primaevaeal exigencies of life, which are with us to this day.

[1916-1917, 3382]

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients’ ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

[1916-1917, 3477]
But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

[1925e, 4127]

[1925e, 4128]
The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.¹

This, of course, is an extreme picture. Everybody knows that it has proved impossible to put it into execution, even for quite short periods. Only the weaklings have submitted to such an extensive encroachment upon their sexual freedom, and stronger natures have only done so subject to a compensatory condition, which will be mentioned later. Civilized society has found itself obliged to pass over in silence many transgressions which, according to its own prescripts, it ought to have punished. But we must not err on the other side and assume that, because it does not achieve all its aims, such an attitude on the part of society is entirely innocuous. The sexual life of civilized man is notwithstanding severely impaired; it sometimes gives the impression of being in process of involution as a function, just as our teeth and hair seem to be as organs. One is probably justified in assuming that its importance as a source of feelings of happiness, and therefore in the fulfilment of our aim in life, has sensibly diminished.² Sometimes one seems to perceive that it is not only the pressure of civilization but something in the nature of the function itself which denies us full satisfaction and urges us along other paths. This may be wrong; it is hard to decide.²

¹ Among the works of that sensitive English writer, John Galsworthy, who enjoys general recognition today, there is a short story of which I early formed a high opinion. It is called 'The Apple-Tree', and it brings home to us how the life of present-day civilized people leaves no room for the simple natural love of two human beings. [1930a, 4499]

² [1930a, 4499]
We are living in a specially remarkable period. We find to our astonishment that progress has allied itself with barbarism. In Soviet Russia they have set about improving the living conditions of some hundred millions of people who were held firmly in subjection. They have been rash enough to withdraw the 'opium' of religion from them and have been wise enough to give them a reasonable amount of sexual liberty; but at the same time they have submitted them to the most cruel coercion and robbed them of any possibility of freedom of thought. With similar violence, the Italian people are being trained up to orderliness and a sense of duty. We feel it as a relief from an oppressive apprehension when we see in the case of the German people that a relapse into almost prehistoric barbarism can occur as well without being attached to any progressive ideas. In any case, things have so turned out that to-day the conservative democracies have become the guardians of cultural advance and that, strange to say, it is precisely the institution of the Catholic Church which puts up a powerful defence against the spread of this danger to civilization - the Church which has hitherto been the relentless foe to freedom of thought and to advances towards the discovery of the truth!
[1939a, 4882]
This does not exhaust the possibilities which flow from a recognition of the sexual aetiology of the neuroses. The main benefit which we obtain from it for neurasthenics lies in the sphere of prophylaxis. If masturbation is the cause of neurasthenia in youth, and if, later on, it acquires aetiological significance for anxiety neurosis as well, by reason of the reduction of potency which it brings about, then the prevention of masturbation in both sexes is a task that deserves more attention than it has hitherto received. When we reflect upon all the injuries, both the grosser and the finer ones, which proceed from neurasthenia - a disorder which we are told is growing more and more prevalent - we see that it is positively a matter of public interest that men should enter upon sexual relations with full potency. In matters of prophylaxis, however, the individual is relatively helpless. The whole community must become interested in the matter and give their assent to the creation of generally acceptable regulations. At present we are still far removed from such a state of affairs which would promise relief, and it is for this reason that we may with justice regard civilization, too, as responsible for the spread of neurasthenia. Much would have to be changed. The resistance of a generation of physicians who can no longer remember their own youth must be broken down; the pride of fathers, who are unwilling to descend to the level of humanity in their children's eyes, must be overcome; and the unreasonable prudery of mothers must be combated - the mothers who at present look upon it as an incomprehensible and undeserved stroke of fate that 'their' children should have been the ones to become neurotic'. But above all, a place must be created in public opinion for the discussion of the problems of sexual life. It will have to become possible to talk about these things without being stamped as a trouble-maker or as a person who makes capital out of the lower instincts. And so here, too, there is enough work left to do for the next hundred years - in which our civilization will have to learn to come to terms with the claims of our sexuality.

Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality by pointing to the important bearing of that morality upon the spread of modern nervous illness.

[1897b, 470]

[1908d, 1963]
But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

[1925E, 4128]
It would be more dignified as well as more helpful to the patient - who, after all, has to come to terms with his ailments - for the doctor to tell the truth, as he knows it from his daily practice. The psychoneuroses as a genus are by no means mild illnesses. When hysteria sets in, no one can foretell when it will come to an end. We mostly comfort ourselves with the vain prophecy that 'one day it will suddenly disappear'. Recovery often enough turns out to be merely an agreement to mutual toleration between the sick part of the patient and the healthy part; or it is the result of the transformation of a symptom into a phobia. A girl's hysteria, calmed down with difficulty, revives in her as a wife after the short interruption of young married happiness. The only difference is that another person, the husband, is now driven by his own interests to keep silence about her condition. Even if an illness of this kind leads to no manifest incapacity on the patients' part to carry on their life, it nearly always prevents free unfolding of their mental powers. Obsessions recur throughout their lives; and phobias and other restrictions upon the will have hitherto been unamenable to treatment of any kind. All this is kept from the knowledge of the layman. The father of a hysterical girl is consequently horrified if, for instance, he is asked to agree to her being given a year's treatment, when she has perhaps only been ill for a few months. The layman is, as it were, deeply convinced in himself that all these psychoneuroses are unnecessary; so he has no patience with the processes of the illness and no readiness to make sacrifices for its treatment. If, in face of a case of typhus which lasts three weeks, or of a broken leg which takes six months to mend, he adopts a more understanding attitude, and if, as soon as his child shows the first signs of a curvature of the spine, he finds it reasonable that orthopaedic treatment should be carried on over several years, the difference in his behaviour is due to the better knowledge on the part of the physicians who pass on their knowledge honestly to the layman. Honesty on the part of the physician and willing acquiescence on the part of the layman will be established for the neuroses too, as soon as an insight into the nature of those affections becomes common property in the medical world. Radical treatment of these disorders will no doubt always require special training and will be incompatible with other kinds of medical activity. On the other hand, this class of physicians, which will, I believe, be a large one in the future, has the prospect of achieving noteworthy results and of obtaining a satisfying insight into the mental life of mankind.

[1897b, 475]
I owe the following dream, not to a patient, but to an intelligent jurist of my acquaintance. He told it to me, once again, in order to restrain me from rash generalizing on the theory of wishful dreams. 'I dreamt', said my informant, 'that I came up to my house with a lady on my arm. A closed carriage was standing in front of it and a man came up to me, showed me his credentials as a police officer and requested me to follow him. I asked him to allow me a little time to put my affairs in order. Can you suppose that I have a wish to be arrested?' - Of course not, I could only agree. Do you happen to know the charge on which you were arrested? - 'Yes, for infanticide, I believe.' - Infanticide? But surely you're aware that that's a crime that can only be committed by a mother on a new-born child? - 'Quite true.' - And what were the circumstances in which you had the dream? What happened on the previous evening? - 'I would prefer not to tell you. It's a delicate matter.' - Nevertheless I shall have to hear it; otherwise we shall have to give up the idea of interpreting the dream. - 'Very well then, listen. I didn't spend last night at home but with a lady who means a great deal to me. When we woke up in the morning there was a further passage between us, after which I went to sleep again and had the dream I described to you.' - Is she a married woman? - 'Yes.' - And you don't want to have a child by her? - 'Oh, no; that might give us away.' - So you don't practice normal intercourse? - 'I take the precaution of withdrawing before ejaculation.' - I think I may assume that you had used this device several times during the night, and that after repeating it in the morning you felt a little uncertain whether you had carried it out successfully. - 'That's possible, no doubt.' - In that case your dream was the fulfilment of a wish. It gave you a reassurance that you had not procreated a child, or, what amounts to the same thing, that you had killed a child. The intermediate links are easily indicated. You remember that a few days ago we were talking about marriage difficulties and how inconsistent it is that there should be no objection to carrying out intercourse in such a way that no fertilization takes place, whereas any interference when once the ovum and semen have come together and a foetus has been formed is punished as a crime. We went on to recall the mediaeval controversy over the exact point of time at which the soul enters the foetus, since it is not until after that that the concept of murder becomes applicable. No doubt, too, you know Lenau's gruesome poem in which child murder and child prevention are equated. - 'Oddly enough I happened to think of Lenau this morning, quite by chance, as it seemed.' - An after-echo of your dream. And now I can show you another incidental wish-fulfilment contained in your dream. You came up to your house with the lady on your arm. Thus you were bringing her home, instead of spending the night in her house as you did in reality. There may be more than one reason why the wish-fulfilment which constitutes the core of the dream was disguised in such a disagreeable form. Perhaps you have learned from my paper on the aetiology of anxiety neurosis that I regard coitus interruptus as one of the aetiological factors in the development of neurotic anxiety? It would tally with this if, after carrying out sexual intercourse in this way several times, you were left in an uneasy mood which afterwards became an element in the construction of your dream. Moreover, you made use of this moodiness to help disguise the wish-fulfilment. Incidentally, your reference to infanticide has not been explained. How did you come to light on this specifically feminine crime? - 'I must admit that some years ago I became involved in an occurrence of that kind. I was responsible for a girl's trying to avoid the consequence of a love-affair with me by means of an abortion. I had nothing to do with her carrying out her intention, but for a long time I naturally felt very nervous in case the business came out.' - I quite understand that. This recollection provides a second reason why you must have been worried by your suspicion that your device might have gone wrong.

[1900a, 650]
Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage-broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade - sophistical conceptual jokes. In one of them (p. 1664 f.) the broker succeeds in arguing away the bride's defect of being lame. It is at least a 'fait accompli'; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains, and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote, in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments till he replies to the last, which cannot be countered: 'What do you want? Isn't she to have a single fault? ', as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness by the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment of sophistry for the disguised representation of the truth that gives it the character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable - mutual attraction and readiness for affectionate adaptation - is quite left out of account in the whole transaction. [1905c, 1701]

We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it has declared it. [1905c, 1705]
This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place only for a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure in so far as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus doomed puts both partners back in the state they were in before their marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual instinct. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them - although only with reluctance and under a veil of silence - by even the strictest sexual code. The 'double' sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their instincts, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child - experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives.(Under the cultural conditions of to-day, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual instinct of the civilized person in his youth, proves to be inadequate even to the demands of the actual period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it. [1908d, 1957]

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated. [1908d, 1958]
The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

[1908d, 1959]

All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulses. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anæsthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anæsthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

[1908d, 1961]
I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1962]
The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]

But we are able to bring forward other motives than these, thanks to the knowledge of concealed mental impulses which we have acquired from the psycho-analytic examination of individual human beings. A woman whose psychosexual needs should find satisfaction in her marriage and her family life is often threatened with the danger of being left unsatisfied, because her marriage relation has come to a premature end and because of the uneventfulness of her emotional life. A mother, as she grows older, saves herself from this by putting herself in her children's place, by identifying herself with them; and this she does by making their emotional experiences her own. Parents are said to stay young with their children, and that is indeed one of the most precious psychological gains that parents derive from their children. Where a marriage is childless, the wife has lost one of the things which might be of most help to her in tolerating the resignation that her own marriage demands from her. A mother's sympathetic identification with her daughter can easily go so far that she herself falls in love with the man her daughter loves; and in glaring instances this may lead to severe forms of neurotic illness as a result of her violent mental struggles against this emotional situation. In any case, it very frequently happens that a mother-in-law is subject to an impulse to fall in love in this way, and this impulse itself or an opposing trend are added to the tumult of conflicting forces in her mind. And very often the unkind, sadistic components of her love are directed on to her son-in-law in order that the forbidden, affectionate ones may be the more severely suppressed.

[1912-1913, 2663]
We are justified in saying that they have been diverted from these sexual aims, even though there is some difficulty in giving a description of such a diversion of aim which will conform to the requirements of metapsychology. Moreover, those instincts which are inhibited in their aims always preserve some few of their original sexual aims; even an affectionate devotee, even a friend or an admirer, desires the physical proximity and the sight of the person who is now loved only in the 'Pauline' sense. If we choose, we may recognize in this diversion of aim a beginning of the sublimation of the sexual instincts, or on the other hand we may fix the limits of sublimation at some more distant point. Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited. Since they are not capable of really complete satisfaction, they are especially adapted to create permanent ties; while those instincts which are directly sexual incur a loss of energy each time they are satisfied, and must wait to be renewed by a fresh accumulation of sexual libido, so that meanwhile the object may have been changed. The inhibited instincts are capable of any degree of admixture with the uninhibited; they can be transformed back into them, just as they arose out of them. It is well known how easily erotic wishes develop out of emotional relations of a friendly character, based upon appreciation and admiration (compare Molière's 'Kiss me for the love of Greek'), between a master and a pupil, between a performer and a delighted listener, and especially in the case of women. In fact the growth of emotional ties of this kind, with their purposeless beginnings, provides a much frequented pathway to sexual object-choice. Pfister, in his *Frömmigkeit des Grafen von Zinzendorf* (1910), has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement. On the other hand it is also very usual for directly sexual impulsions, short-lived in themselves, to be transformed into a lasting and purely affectionate tie; and the consolidation of a passionate love marriage rests to a large extent upon this process.

We see, then, that the phase of exclusive attachment to the mother, which may be called the pre-Oedipus phase, possesses a far greater importance in women than it can have in men. Many phenomena of female sexual life which were not properly understood before can be fully explained by reference to this phase. Long ago, for instance, we noticed that many women who have chosen their husband on the model of their father, or have put him in their father's place, nevertheless repeat towards him, in their married life, their bad relations with their mother. The husband of such a woman was meant to be the inheritor of her relation to her father, but in reality he became the inheritor of her relation to her mother. This is easily explained as an obvious case of regression. Her relation to her mother was the original one, and her attachment to her father was built up on it, and now, in marriage, the original relation emerges from repression. For the main content of her development to womanhood lay in the carrying over of her affective object attachments from her mother to her father.

With many women we have the impression that their years of maturity are occupied by a struggle with their husband, just as their youth was spent in a struggle with their mother. In the light of the previous discussions we shall conclude that their hostile attitude to their mother is not a consequence of the rivalry implicit in the Oedipus complex, but originates from the preceding phase and has merely been reinforced and exploited in the Oedipus situation. And actual analytic examination confirms this view. Our interest must be directed to the mechanisms that are at work in her turning away from the mother who was an object so intensely and exclusively loved. We are prepared to find, not a single factor, but a whole number of them operating together towards the same end.
When we survey the whole range of motives for turning away from the mother which analysis brings to light - that she failed to provide the little girl with the only proper genital, that she did not feed her sufficiently, that she compelled her to share her mother's love with others, that she never fulfilled all the girl's expectations of love, and, finally, that she first aroused her sexual activity and then forbade it - all these motives seem nevertheless insufficient to justify the girl's final hostility. Some of them follow inevitably from the nature of infantile sexuality; others appear like rationalizations devised later to account for the uncomprehended change in feeling. Perhaps the real fact is that the attachment to the mother is bound to perish, precisely because it was the first and was so intense; just as one can often see happen in the first marriages of young women which they have entered into when they were most passionately in love. In both situations the attitude of love probably comes to grief from the disappointments that are unavoidable and from the accumulation of occasions for aggression. As a rule, second marriages turn out much better.

[1931b, 4598]

You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitoridal masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

[1933a, 4729]
The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him.

[1933a, 4735]
I owe the following dream, not to a patient, but to an intelligent jurist of my acquaintance. He told it to me, once again, in order to restrain me from rash generalizing on the theory of wishful dreams. 'I dreamt', said my informant, 'that I came up to my house with a lady on my arm. A closed carriage was standing in front of it and a man came up to me, showed me his credentials as a police officer and requested me to follow him. I asked him to allow me a little time to put my affairs in order. Can you suppose that I have a wish to be arrested?' - Of course not, I could only agree. Do you happen to know the charge on which you were arrested? - 'Yes, for infanticide, I believe.' - Infanticide? But surely you're aware that that's a crime that can only be committed by a mother on a new-born child? - 'Quite true.' - And what were the circumstances in which you had the dream? What happened on the previous evening? - 'I would prefer not to tell you. It's a delicate matter.' - Nevertheless I shall have to hear it; otherwise we shall have to give up the idea of interpreting the dream. - 'Very well then, listen. I didn't spend last night at home but with a lady who means a great deal to me. When we woke up in the morning there was a further passage between us, after which I went to sleep again and had the dream I described to you.' - Is she a married woman? - 'Yes.' - And you don't want to have a child by her? - 'Oh, no; that might give us away.' - So you don't practice normal intercourse? - 'I take the precaution of withdrawing before ejaculation.' - I think I may assume that you had used this device several times during the night, and that after repeating it in the morning you felt a little uncertain whether you had carried it out successfully. - 'That's possible, no doubt.' - In that case your dream was the fulfilment of a wish. It gave you a reassurance that you had not procreated a child, or, what amounts to the same thing, that you had killed a child. The intermediate links are easily indicated. You remember that a few days ago we were talking about marriage difficulties and how inconsistent it is that there should be no objection to carrying out intercourse in such a way that no fertilization takes place, whereas any interference when once the ovum and semen have come together and a foetus has been formed is punished as a crime. We went on to recall the mediaeval controversy over the exact point of time at which the soul enters the foetus, since it is not until after that that the concept of murder becomes applicable. No doubt, too, you know Lenau's gruesome poem in which child murder and child prevention are equated. - 'Oddly enough I happened to think of Lenau this morning, quite by chance, as it seemed.' - An after-echo of your dream. And now I can show you another incidental wish-fulfilment contained in your dream. You came up to your house with the lady on your arm. Thus you were bringing her home, instead of spending the night in her house as you did in reality. There may be more than one reason why the wish-fulfilment which constitutes the core of the dream was disguised in such a disagreeable form. Perhaps you have learned from my paper on the aetiology of anxiety neurosis that I regard coitus interruptus as one of the aetiological factors in the development of neurotic anxiety? It would tally with this if, after carrying out sexual intercourse in this way several times, you were left in an uneasy mood which afterwards became an element in the construction of your dream. Moreover, you made use of this moodiness to help disguise the wish-fulfilment. Incidentally, your reference to infanticide has not been explained. How did you come to light on this specifically feminine crime? - 'I must admit that some years ago I became involved in an occurrence of that kind. I was responsible for a girl's trying to avoid the consequence of a love-affair with me by means of an abortion. I had nothing to do with her carrying out her intention, but for a long time I naturally felt very nervous in case the business came out.' - I quite understand that. This recollection provides a second reason why you must have been worried by your suspicion that your device might have gone wrong.

[1900a, 650]
This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place only for a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure in so far as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus doomed puts both partners back in the state they were in before their marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual instinct. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them - although only with reluctance and under a veil of silence - by even the strictest sexual code. The 'double' sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their instincts, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child - experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives.(Under the cultural conditions of to-day, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual instinct of the civilized person in his youth, proves to be inadequate even to the demands of the actual period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it. [1908d, 1957]"
All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulses. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.
[1908d, 1961]
But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

[1908d, 1958]

The retardation of sexual development and sexual activity at which our education and civilization aim is certainly not injurious to begin with. It is seen to be a necessity, when one considers the late age at which young people of the educated classes reach independence and are able to earn a living. (This reminds one, incidentally, of the intimate interconnection between all our cultural institutions and of the difficulty of altering any part of them without regard to the whole.) But abstinence continued long after the age of twenty is no longer unobjectionable for a young man; and it leads to other damage even when it does not lead to neurosis. People say, to be sure, that the struggle against such a powerful instinct, and the strengthening of all the ethical and aesthetic forces which are necessary for this struggle, 'steel' the character; and this is true for a few specially favourably organized natures. It must also be admitted that the differentiation of individual character, which is so marked in our day, has only become possible with the existence of sexual restriction. But in the vast majority of cases the struggle against sexuality eats up the energy available in a character and this at the very time when a young man is in need of all his forces in order to win his share and place in society. The relationship between the amount of sublimation possible and the amount of sexual activity necessary naturally varies very much from person to person and even from one calling to another. An abstinent artist is hardly conceivable; but an abstinent young savant is certainly no rarity. The latter can, by his self-restraint, liberate forces for his studies; while the former probably finds his artistic achievements powerfully stimulated by his sexual experience. In general I have not gained the impression that sexual abstinence helps to bring about energetic and self-reliant men of action or original thinkers or bold emancipators and reformers. Far more often it goes to produce well-behaved weaklings who later become lost in the great mass of people that tends to follow, unwillingly, the leads given by strong individuals.

[1908d, 1958]
The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

In considering the question of abstinence, the distinction is not nearly strictly enough made between two forms of it - namely abstention from any sexual activity whatever and abstention from sexual intercourse with the opposite sex. Many people who boast of succeeding in being abstinent have only been able to do so with the help of masturbation and similar satisfactions which are linked with the auto-erotic sexual activities of early childhood. But precisely because of this connection such substitutive means of sexual satisfaction are by no means harmless; they predispose to the numerous varieties of neuroses and psychoses which are conditional on an involution of sexual life to its infantile forms. Masturbation, moreover, is far from meeting the ideal demands of civilized sexual morality, and consequently drives young people into the same conflicts with the ideals of education which they hoped to escape by abstinence. Furthermore, it vitiates the character through indulgence, and this in more than one way. In the first place, it teaches people to achieve important aims without taking trouble and by easy paths instead of through an energetic exertion of force - that is, it follows the principle that sexuality lays down the pattern of behaviour; secondly, in the phantasies that accompany satisfaction the sexual object is raised to a degree of excellence which is not easily found again in reality. A witty writer (Karl Kraus in the Vienna paper Die Fackel) once expressed this truth in reverse by cynically remarking: 'Copulation is no more than an unsatisfying substitute for masturbation.'
The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulsions. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.
But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

[1916-1917, 3477]
Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²
[1910c, 2273]

The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and though those of perverts have been recognized it has been with moral indignation and without understanding. Looked at from the psycho-analytic standpoint, even the most eccentric and repellent perversions are explicable as manifestations of component instincts of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psycho-analysis enables us to point to some trace or other of a homosexual object-choice in everyone. If I have described children as 'polymorphously perverse', I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psycho-analysis has no concern whatever with such judgements of value.
[1925d, 4213]
It is not so rare an event for a parapraxis like losing or mislaying something to be undone by means of a dream - by one's learning in the dream where the missing object is to be found; but this has nothing about it in the nature of the occult, so long as dreamer and loser are the same person. A young lady writes: 'About four months ago at the bank I lost a very beautiful ring. I hunted in every nook and cranny of my room without finding it. A week ago I dreamt it was lying beside the cupboard by the radiator. Naturally the dream gave me no rest, and next morning I did in fact really find it in that very spot.' She is surprised at this incident, and maintains that it often happens that her thoughts and wishes are fulfilled in this way, but omits to ask herself what change had occurred in her life between the loss and the recovery of the ring.

Though we admit that these remarks of ours in no way exhaust the psychology of superstition, we shall at least have to touch on the question of whether we are to deny entirely that superstition has any real roots: whether there are definitely no such things as true presentiments, prophetic dreams, telepathic experiences, manifestations of supernatural forces and the like. I am far from meaning to pass so sweeping a condemnation of these phenomena, of which so many detailed observations have been made even by men of outstanding intellect, and which it would be best to make the subject of further investigations. We may even hope that some portion of these observations will then be explained by our growing recognition of unconscious mental processes, without necessitating radical alterations in the views we hold today. If the existence of still other phenomena - those, for example, claimed by spiritualists - were to be established, we should merely set about modifying our 'laws' in the way demanded by the new discovery, without being shaken in our belief in the coherence of things in the world.

In the compass of these discussions the only answer I can give to the questions raised here is a subjective one - that is, one in accordance with my personal experience. To my regret I must confess that I am one of those unworthy people in whose presence spirits suspend their activity and the supernatural vanishes away, so that I have never been in a position to experience anything myself which might arouse a belief in the miraculous. Like every human being, I have had presentiments and experienced trouble, but the two failed to coincide with one another, so that nothing followed the presentiments, and the trouble came upon me unannounced. During the days when I was living alone in a foreign city - I was a young man at the time - I quite often heard my name suddenly called by an unmistakable and beloved voice; I then noted down the exact moment of the hallucination and made anxious enquiries of those at home about what had happened at that time. Nothing had happened. To balance this, there was a later occasion when I went on working with my patients without any disturbance or foreboding while one of my children was in danger of bleeding to death. Nor have I ever been able to regard any of the presentiments reported to me by patients as veridical. - I must however confess that in the last few years I have had a few remarkable experiences which might easily have been explained on the hypothesis of telepathic thought-transference.
The 'remarkable coincidence' of meeting a person we were at that very moment thinking about is a familiar one. I have observed a simple and easily explained example of it in myself, which is probably a good model for similar occurrences. A few days after I had been awarded the title of professor - which carries considerable authority with it in countries under monarchical rule - my thoughts, while I was walking through the Inner Town, suddenly turned to a childish phantasy of revenge directed against a particular married couple. Some months earlier they had called me in to see their little daughter, who had developed an interesting obsessional symptom following upon a dream. I took a great interest in the case, whose genesis I thought I understood. My offer of treatment was however declined by her parents and I was given to understand that they thought of changing over to a foreign authority who effected cures by hypnotism. My present phantasy was that after the total failure of that attempt the parents begged me to start my treatment, saying that now they had complete confidence in me, and so on. I however answered: 'Yes, now you have confidence in me - now that I too have become a professor. The title has done nothing to alter my capacities; if you could not make use of me as a university lecturer you can do without me as a professor as well.' - At this point my phantasy was interrupted by a loud 'Good day to you, Professor!' and I looked up and saw walking past me the very married couple on whom I had just taken my revenge by rejecting their offer. Immediate reflection destroyed the impression of something miraculous. I had been walking towards the couple along a wide, straight and almost deserted street; when I was about twenty paces from them I had glanced up for a moment and caught a glimpse of their impressive figures and recognized them, but had set the perception aside - on the pattern of a negative hallucination - for the emotional reasons which then took effect in the phantasy that arose with apparent spontaneity.

[1901b, 1333]

The affects in the narrower sense are, it is true, characterized by a quite special connection with somatic processes; but, strictly speaking, all mental states, including those that we usually regard as 'processes of thought', are to some degree 'affective', and not one of them is without its physical manifestations or is incapable of modifying somatic processes. Even when a person is engaged in quietly thinking in a string of 'ideas', there are a constant series of excitations, corresponding to the content of these ideas, which are discharged into the smooth or striated muscles. These excitations can be made apparent if they are appropriately reinforced, and certain striking and, indeed, ostensibly 'supernatural' phenomena can be explained by this means. Thus, what is known as 'thought-reading' [Gedanken erraten] may be explained by small, involuntary muscular movements carried out by the 'medium' in the course of an experiment - when, for instance, he has to make someone discover a hidden object. The whole phenomenon might more suitably be described as 'thought-betraying' [Gedanken verraten].

[1890a, 1590]
Nevertheless, on closer consideration this delusion of Hanold’s seems to me to lose the greater part of its improbability. The author, indeed, has made himself responsible for one part of it by basing his story on the premiss that Zoe was in every detail a duplicate of the relief. We must therefore avoid shifting the improbability of this premiss on to its consequence - that Hanold took the girl for Gradiva come to life. Greater value is given to the delusional explanation by the fact that the author has put no rational one at our disposal. Moreover the author has adduced contributory and mitigating circumstances on behalf of his hero’s excesses in the shape of the glare of the *campagna* sunlight and the intoxicating magic of the wine grown on the slopes of Vesuvius. But the most important of all the explanatory and exculpatory factors remains the ease with which our intellect is prepared to accept something absurd provided it satisfies powerful emotional impulses. It is an astonishing fact, and one that is too generally overlooked, how readily and frequently under these psychological conditions people of even the most powerful intelligence react as though they were feeble-minded; and anyone who is not too conceited may see this happening in himself as often as he pleases. And this is far more so if some of the mental processes concerned are linked with unconscious or repressed motives. In this connection I am happy to quote the words of a philosopher, who writes to me: ‘I have been noting down the instances I myself experience of striking mistakes and unthinking actions, for which one finds motives afterwards (in a most unreasonable way). It is an alarming thing, but typical, to find how much folly this brings to light.’ It must be remembered, too, that the belief in spirits and ghosts and the return of the dead, which finds so much support in the religions to which we have all been attached, at least in our childhood, is far from having disappeared among educated people, and that many who are sensible in other respects find it possible to combine spiritualism with reason. A man who has grown rational and sceptical, even, may be ashamed to discover how easily he may for a moment return to a belief in spirits under the combined impact of strong emotion and perplexity. I know of a doctor who had once lost one of his women patients suffering from Graves’ disease, and who could not get rid of a faint suspicion that he might perhaps have contributed to the unhappy outcome by a thoughtless prescription. One day, several years later, a girl entered his consulting-room, who, in spite of all his efforts, he could not help recognizing as the dead one. He could frame only a single thought: ‘So after all it’s true that the dead can come back to life.’ His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves’ disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold’s temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities.

[1907a, 1865]
The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psycho-analysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'.² But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life.³ We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats' [Dukatenscheisser].⁴ Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = ilu manmans). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.

[1908b, 1944]

There can be no doubt that the patient felt a need for finding experiences of this kind to act as props for his superstition, and that it was for that reason that he occupied himself so much with the inexplicable coincidences of everyday life with which we are all familiar, and helped out their shortcomings with unconscious activity of his own. I have come across a similar need in many other obsessional patients and have suspected its presence in many more besides. It seems to me easily explicable in view of the psychological characteristics of the obsessional neurosis. In this disorder, as I have already explained (p. 2155), repression is effected not by means of amnesia but by a severance of causal connections brought about by a withdrawal of affect. These repressed connections appear to persist in some kind of shadowy form (which I have elsewhere compared to an endopsychic perception),¹ and they are thus transferred, by a process of projection, into the external world, where they bear witness to what has been effaced from consciousness.

[1909d, 2181]

More than ten years ago a highly intelligent man told me a dream which he wanted to use as evidence of the telepathic nature of dreams. In it he saw an absent friend from whom he had received no news for a very long time, and reproached him energetically for his silence. The friend made no reply. It afterwards turned out that he had met his death by suicide at about the time of the dream. Let us leave the problem of telepathy on one side: there seems, however, not to be any doubt that here the dumbness in the dream represented death. Hiding and being unfindable - a thing which confronts the prince in the fairly tale of Cinderella three times, is another unmistakable symbol of death in dreams; so, too, is a marked pallor, of which the 'paleness' of the lead in one reading of Shakespeare's text is a reminder.² It would be very much easier for us to transpose these interpretations from the language of dreams to the mode of expression used in the myth that is now under consideration if we could make it seem probable that dumbness must be interpreted as a sign of being dead in productions other than dreams.

[1913f, 2608]
Spirits and demons, as I have shown in the last essay, are only projections of man’s own emotional impulses.¹ He turns his emotional cathexes into persons, he peoples the world with them and meets his internal mental processes again outside himself - in just the same way as that intelligent paranoic, Schreber, found a reflection of the attachments and detachments of his libido in the vicissitudes of his confabulated ‘rays of God’.²

[1912-1913, 2735]

It is a very remarkable thing that the Ucs. of one human being can react upon that of another, without passing through the Cs. This deserves closer investigation, especially with a view to finding out whether preconscious activity can be excluded as playing a part in it; but, descriptively speaking, the fact is incontestable.

[1915e, 3016]

It no longer seems possible to keep away from the study of what are known as ‘occult’ phenomena - of facts, that is, that profess to speak in favour of the real existence of psychical forces other than the human and animal minds with which we are familiar, or that seem to reveal the possession by those minds of faculties hitherto unrecognized. The impetus towards such an investigation seems irresistibly strong. During this last brief vacation I have three times had occasion to refuse to associate myself with newly founded periodicals concerned with these studies. Nor is there much doubt as to the origin of this trend. It is a part expression of the loss of value by which everything has been affected since the world catastrophe of the Great War, a part of the tentative approach to the great revolution towards which we are heading and of whose extent we can form no estimate; but no doubt it is also an attempt at compensation, at making up in another, a supermundane, sphere for the attractions which have been lost by life on this earth. Some, indeed, of the proceedings of the exact sciences themselves may have contributed to this development. The discovery of radium has confused no less than it has advanced the possibilities of explaining the physical world; and the knowledge that has been so very recently acquired of what is called the theory of relativity has had the effect upon many of those who admire without comprehending it of diminishing their belief in the objective trustworthiness of science. You will remember that not long ago Einstein himself took occasion to protest against such misunderstanding.

[1941d [1921], 3863]

It does not follow as a matter of course that an intensified interest in occultism must involve a danger to psycho-analysis. We should, on the contrary, be prepared to find reciprocal sympathy between them. They have both experienced the same contemptuous and arrogant treatment by official science. To this day psycho-analysis is regarded as savouring of mysticism, and its unconscious is looked upon as one of the things between heaven and earth which philosophy refuses to dream of. The numerous suggestions made to us by occultists that we should cooperate with them show that they would like to treat us as half belonging to them and that they count on our support against the pressure of exact authority. Nor, on the other hand, has psycho-analysis any interest in going out of its way to defend that authority, for it itself stands in opposition to everything that is conventionally restricted, well-established and generally accepted. Not for the first time would it be offering its help to the obscure but indestructible surmises of the common people against the obscurantism of educated opinion. Alliance and cooperation between analysts and occultists might thus appear both plausible and promising.

[1941d [1921], 3864]
But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.

In view of this difference between their mental attitudes co-operation between analysts and occultists offers small prospect of gain. The analyst has his own province of work, which he must not abandon: the unconscious element of mental life. If in the course of his work he were to be on the watch for occult phenomena, he would be in danger of overlooking everything that more nearly concerned him. He would be surrendering the impartiality, the lack of prejudices and prepossessions, which have formed an essential part of his analytic armour and equipment. If occult phenomena force themselves on him in the same way in which others do, he will evade them no more than he evades the others. This would appear to be the only plan of behaviour consistent with the activity of an analyst.

By self-discipline the analyst can defend himself against one danger - the subjective one of allowing his interest to be drawn away on to occult phenomena. As regards the objective danger, the situation is different. There is little doubt that if attention is directed to occult phenomena the outcome will very soon be that the occurrence of a number of them will be confirmed; and it will probably be a very long time before an acceptable theory covering these new facts can be arrived at. But the eagerly attentive onlookers will not wait so long. At the very first confirmation the occultists will proclaim the triumph of their views. They will carry over an acceptance of one phenomenon on to all the rest and will extend belief in the phenomena to belief in whatever explanations are easiest and most to their taste. They will be ready to employ the methods of scientific enquiry only as a ladder to raise them over the head of science. Heaven help us if they climb to such a height! There will be no scepticism from the surrounding spectators to make them hesitate, there will be no popular outcry to bring them to a halt. They will be hailed as liberators from the burden of intellectual bondage, they will be joyfully acclaimed by all the credulity lying ready to hand since the infancy of the human race and the childhood of the individual. There may follow a fearful collapse of critical thought, of determinist standards and of mechanistic science. Will it be possible for scientific method, by a ruthless insistence on the magnitude of the forces, the masses and qualities of the material concerned, to prevent this collapse?
It is a vain hope to suppose that analytic work, precisely because it relates to the mysterious unconscious, will be able to escape such a collapse in values as this. If spiritual beings who are the intimate friends of human enquirers can supply ultimate explanations of everything, no interest can be left over for the laborious approaches to unknown mental forces made by analytic research. So, too, the methods of analytic technique will be abandoned if there is a hope of getting into direct touch with the operative spirits by means of occult procedures, just as habits of patient humdrum work are abandoned if there is a hope of growing rich at a single blow by means of a successful speculation. We have heard during the war of people who stood half-way between two hostile nations, belonging to one by birth and to the other by choice and domicile; it was their fate to be treated as enemies first by one side and then, if they were lucky enough to escape, by the other. Such might equally be the fate of psycho-analysis. However, one must put up with one's fate whatever it may be; and psycho-analysis will somehow or other come to terms with hers.

Let us return to the present situation, to our immediate task. In the course of the last few years I have made a few observations which I shall not hold back - at all events from the circle that is closest to me. A dislike of falling in with what is to-day a prevailing current, a dread of distracting interest from psycho-analysis and the total absence of any veil of discretion over what I have to say - all these combine as motives for withholding my remarks from a wider public. My material can lay claim to two advantages which are rarely present. In the first place it is exempt from the uncertainties and doubts to which most of the observations of the occultists are prone; and in the second place it only develops its convincing force after it has been worked over analytically. It consists, I should mention, of only two cases of a similar character; a third case, of another kind and open to a different assessment, is only added by way of appendix. The first two cases, which I shall now report at length, are concerned with events of the same sort - namely, with prophecies made by professional fortune-tellers which did not come true. In spite of this, these prophecies made an extraordinary impression on the people to whom they were announced, so that their relation to the future cannot be their essential point. Anything that may contribute to their explanation, as well as anything that throws doubt on their evidential force, will be extremely welcome to me. My personal attitude to the material remains unenthusiastic and ambivalent.

The application of analysis to this case does more than this, however; it further increases its significance. It teaches us that what has been communicated by this means of induction from one person to another is not merely a chance piece of indifferent knowledge. It shows that an extraordinarily powerful wish harboured by one person and standing in a special relation to his consciousness has succeeded, with the help of a second person, in finding conscious expression in a slightly disguised form - just as the invisible end of the spectrum reveals itself to the senses on a light-sensitive plate as a coloured extension. It seems possible to reconstruct the young man's train of thought after the illness and recovery of the brother-in-law who was his hated rival: 'Well, he's got over it this time; but he won't give up his dangerous taste on that account, and let's hope that next time it will be the end of him.' It was this 'let's hope' that was changed into the prophecy. I could quote a parallel to this from a dream (dreamt by another person), in which a prophecy was part of the subject-matter. The analysis of the dream showed that the content of the prophecy coincided with the fulfilment of a wish.
As you will observe, the part played by analytic interpretation is even more important in this example than in the last one. Analysis may actually be said to have created the occult fact. Accordingly, this example, too, would seem to offer positively conclusive evidence of its being possible to transfer an unconscious wish and the thoughts and knowledge relating to it. I can see only one way of evading the conclusiveness of this last case and you may be sure that I shall not conceal it. It is possible that in the course of the twelve or thirteen years that elapsed between the prophecy and the account of it given during the treatment the patient may have formed a paramnesia: the Professor may have uttered some general and colourless consolation - which would be nothing to wonder at - and the patient may have gradually inserted the significant numbers out of her unconscious. If so, we should have avoided the fact which threatened us with such momentous consequences. We will gladly identify ourselves with the sceptics who will only attach value to a report of this kind if it is made immediately after the event - and even then, perhaps, not without hesitation. I remember that after I was appointed to a professorship I had an audience with the Minister to express my thanks. As I was on my way home from this audience I caught myself in the act of trying to falsify the words that had passed between us and I was never able to recapture correctly the actual conversation. I must leave it to you to decide whether the explanation I have suggested is tenable. I can neither prove nor disprove it. Thus, this second observation, though in itself more impressive than the first, is not equally free from doubt.

The two cases that I have reported to you are both concerned with unfulfilled prophecies. Observations of this kind, in my opinion, can provide the best material on the question of thought-transference, and I should like to encourage you to collect similar ones. I had also intended to bring you an example based on material of another kind - a case in which a patient of a special sort talked during one session of things which touched in the most remarkable way on an experience which I had had myself immediately before. But I can now give you visible proof of the fact that I discuss the subject of occultism under the pressure of the greatest resistance. When, while I was at Gastein, I looked out the notes which I had put together and brought with me for the purpose of this paper, the sheet on which I had noted down this last observation was not there, but in its place I found another sheet of indifferent memoranda on quite another topic, which I had brought with me by mistake. Nothing can be done against such a clear resistance. I must ask you to excuse me for omitting this case, for I cannot make the loss good from memory.

I will instead add a few remarks about someone who is very well known in Vienna, a graphologist, Rafael Schermann, who has a reputation for the most astonishing performances. He is said to be able not merely to read a person's character from a specimen of his handwriting, but also to describe his appearance and to add predictions about him which later come true. Incidentally, many of these remarkable achievements are based on his own stories. A friend of mine once, without my previous knowledge, made the experiment of getting him to allow his imagination to play over a specimen of my writing. All that he produced was that the writing was that of an old gentleman (which it was easy to guess), with whom it was hard to live since he was an intolerable tyrant in his home. Those who share my house would hardly confirm this. But, as we know, the field of the occult is subject to the convenient principle that negative cases prove nothing. I have made no direct observations on Schermann, but through a patient of mine I have been in contact with him without his knowing it. I will tell you about it.
You will have grasped the sense in which I am inclined to interpret these experiences of mine with Schermann. You will see that all my material touches only on the single point of thought-transference. I have nothing to say about all the other miracles that are claimed by occultism. My own life, as I have already openly admitted, has been particularly poor in an occult sense. Perhaps the problem of thought-transference may seem very trivial to you in comparison with the great magical world of the occult. But consider what a momentous step beyond what we have hitherto believed would be involved in this hypothesis alone. What the custodian of Saint-Denis used to add to his account of the saint's martyrdom remains true. Saint-Denis is said, after his head was cut off, to have picked it up and to have walked quite a distance with it under his arm. But the custodian used to remark: 'Dans des cas pareils, ce n'est que le premier pas qui coûte.' The rest is easy.

At the present time, when such great interest is felt in what are called 'occult' phenomena, very definite anticipations will doubtless be aroused by the announcement of a paper with this title. I will therefore hasten to explain that there is no ground for any such anticipations. You will learn nothing from this paper of mine about the enigma of telepathy; indeed, you will not even gather whether I believe in the existence of 'telepathy' or not. On this occasion I have set myself the very modest task of examining the relation of the telepathic occurrences in question, whatever their origin may be, to dreams, or more exactly, to our theory of dreams. You will know that the connection between dreams and telepathy is commonly held to be a very intimate one; I shall put forward the view that the two have little to do with each other, and that if the existence of telepathic dreams were to be established there would be no need to alter our conception of dreams in any way.

The material on which the present communication is based is very slight. In the first place, I must express my regret that I could make no use of my own dreams, as I did when I wrote my *Interpretation of Dreams* (1900a). But I have never had a 'telepathic' dream. Not that I have been without dreams of the kind that convey an impression that a certain definite event is happening at some distant place, leaving it to the dreamer to decide whether the event is happening at that moment or will do so at some later time. In waking life, too, I have often become aware of presentiments of distant events. But these hints, foretellings and premonitions have none of them 'come true', as we say; there proved to be no external reality corresponding to them, and they had therefore to be regarded as purely subjective anticipations.

Another fact certainly seems to me of more significance, namely, that during some twenty-seven years of work as an analyst I have never been in a position to observe a truly telepathic dream in any of my patients. And yet those patients made up a fair collection of severely neuropathic and 'highly sensitive' natures. Many of them have related to me most remarkable incidents in their earlier life on which they based a belief in mysterious occult influences. Events such as accidents or illnesses of near relatives, in particular the death of a parent, have often enough happened during the treatment and interrupted it; but not on one single occasion did these occurrences, eminently suitable as they were in character, afford me the opportunity of registering a single telepathic dream, although treatment extended over several months or even years. Anyone who cares to may look for an explanation of this fact, which still further restricts the material at my disposal. In any case it will be seen that such an explanation would not affect the subject of this paper.

[1922a, 3878]
I am afraid that you may behave like the writer of these two letters. You, too, will be primarily interested in the question whether this dream can really be regarded as a telepathic notification of the unexpected birth of the twin children, and you will not be disposed to submit this dream to analysis like any other. I foresee that it will always be so when psycho-analysis and occultism encounter each other. The former has, so to speak, all our mental instincts against it; the latter is met half-way by powerful and mysterious sympathies. I am not, however, going to take up the position that I am nothing but a psycho-analyst, that the problems of occultism do not concern me: you would rightly judge that to be only an evasion of a problem. On the contrary, I may say that it would be a great satisfaction to me if I could convince myself and others on unimpeachable evidence of the existence of telepathic processes, but I also consider that the information provided about this dream is altogether inadequate to justify any such pronouncement. You will observe that it does not once occur to this intelligent man, deeply interested as he is in the problem of his dream, to tell us when he had last seen his daughter or what news he had lately had from her. He writes in the first letter that the birth was a month too soon; in the second, however, the month has become three weeks only, and in neither are we told whether the birth was really premature, or whether, as so often happens, those concerned were out in their reckoning. But we should have to consider these and other details of the occurrence if we are to weigh the probability of the dreamer having made unconscious estimates and guesses. I felt too that it would be of no use even if I succeeded in getting answers to such questions. In the course of arriving at the information new doubts would constantly arise, which could only be set at rest if one had the man in front of one and could revive all the relevant memories which he had perhaps dismissed as unessential. He is certainly right in what he says at the beginning of his second letter that more would have come out in talking.

[1922a, 3885]

Consider another and similar case, in which the disturbing interest of occultism has no part. You must often have been in a position to compare the anamnesis and the information about the illness given during the first session by any neurotic with what you have gained from him after some months of psycho-analysis. Apart from inevitable abbreviations, how many essentials were left out or suppressed, how many connections were displaced - in fact, how much that was incorrect or untrue was told you on that first occasion! You will not call me hyper-critical if I refuse in the circumstances to make any pronouncement whether the dream in question is a telepathic event or a particularly subtle achievement on the part of the dreamer's unconscious or whether it is simply to be taken as a striking coincidence. Our curiosity must be satisfied with the hope of some later occasion on which it may be possible to make a detailed oral examination of the dreamer. But you cannot say that this outcome of our investigation has disappointed you, for I prepared you for it; I said you would hear nothing which would throw any light on the problem of telepathy.

[1922a, 3885]

If we now pass on to the analytic treatment of this dream, we are obliged once more to express dissatisfaction. The thoughts that the dreamer associates with the manifest content of the dream are again insufficient; they do not enable us to make any analysis of the dream. For instance, the dream goes into great detail over the likeness of the children to the parents, discusses the colour of their hair and the probable change of colour at a later age, and as an explanation of these elaborate details we only have the dry piece of information from the dreamer that he has always been interested in questions of likeness and heredity. We are accustomed to expect rather more material than this! But at one point the dream does admit of an analytic interpretation, and precisely at this point analysis, which has otherwise no connection with occultism, comes to the aid of telepathy in a remarkable way. It is only on account of this single point that I am asking for your attention to this dream at all.

[1922a, 3886]
Correctly speaking, this dream has no right whatever to be called 'telepathic'. It did not inform the dreamer of anything which (outside his normal knowledge) was taking place elsewhere. What the dream did relate was something quite different from the event reported in the telegram received on the second day after the night of the dream. The dream and the actual occurrence diverge at a particularly important point; but they agree, apart from the coincidence of time, in another very interesting element. In the dream the dreamer's wife had twins. The occurrence, however, was that his daughter had given birth to twins in her distant home. The dreamer did not overlook this difference; he did not seem to know any way of getting over it and, as according to his own account he had no leaning towards the occult, he only asked quite tentatively whether the coincidence between dream and occurrence on the point of the twin-birth could be more than an accident. The psycho-analytic interpretation of dreams, however, does away with this difference between the dream and the event, and gives both the same content. If we consult the associative material to this dream, it shows, in spite of its sparseness, that an intimate bond of feeling existed between the father and daughter, a bond of feeling which is so usual and so natural that we ought to cease to be ashamed of it, one that in daily life merely finds expression as a tender interest and is only pushed to its logical conclusion in dreams. The father knew that his daughter clung to him, he was convinced that she often thought of him during her labour. In his heart I think he grudged her to his son-in-law, to whom in one letter he makes a few disparaging references. On the occasion of her confinement (whether expected or communicated by telepathy) the unconscious wish became active in the repressed part of his mind: 'she ought to be my (second) wife instead'; it was this wish that had distorted the dream-thoughts and was the cause of the difference between the manifest content of the dream and the event. We are entitled to replace the second wife in the dream by the daughter. If we possessed more associations to the dream, we could undoubtedly verify and deepen this interpretation.

[1922a, 3886]

If you prefer to assume that a telepathic message about the daughter's confinement reached the sleeper, further questions arise of the relation of a message such as this to a dream and of its influence on the formation of dreams. The answer is not far to seek and is quite unambiguous. A telepathic message will be treated as a portion of the material that goes to the formation of a dream, like any other external or internal stimulus, like a disturbing noise in the street or an insistent organic sensation in the sleeper's own body. In our example it is evident how the message, with the help of a lurking repressed wish, became remodelled into a wish-fulfilment; it is unfortunately less easy to show that it combined with other material that had become active at the same time and was blended into a dream. Telepathic messages - if we are justified in recognizing their existence - can thus make no alteration in the process of forming a dream; telepathy has nothing to do with the nature of dreams. And in order to avoid the impression that I am trying to conceal a vague notion behind abstract and fine-sounding words, I am willing to repeat: the essential nature of dreams consists in the peculiar process of 'dream-work' which, with the help of an unconscious wish, carries the preconscious thoughts (day's residues) over into the manifest content of the dream. The problem of telepathy concerns dreams as little as does the problem of anxiety.

[1922a, 3887]
I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely telepathic dream lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]

The dead brother, however, was not only our correspondent's imaginary child; he also represented a rival whom she had regarded with hatred from the time of his birth. By far the greater number of all telepathic intimations relate to death or the possibility of death; when patients under analysis keep telling us of the frequency and infallibility of their gloomy forebodings, we can with equal regularity show them that they are fostering particularly strong death-wishes in their unconscious against their nearest relations and have long been thus suppressing them. The patient whose history I related in 1909 was an example to the point; he was called a 'carrion crow' by his relations. But when this kindly and highly intelligent man - who has since himself perished in the war - began to make progress towards recovery, he himself gave me considerable assistance in clearing up his own psychological conjuring tricks. In the same way, the account given in our first correspondent's letter, of how he and his three brothers had received the news of their youngest brother's death as a thing they had long been inwardly aware of, appears to need no other explanation. The elder brothers would all have been equally convinced of the superfluousness of the youngest arrival.

[1922a, 3896]
I am now almost at the end of what I wish to say. I might, however, add the observation that the instances of telepathic messages or productions which have been discussed here are clearly connected with emotions belonging to the sphere of the Oedipus complex. This may sound startling; I do not intend to give it out as a great discovery, however. I would rather revert to the result we arrived at through investigating the dream I considered first. Telepathy has no relation to the essential nature of dreams; it cannot deepen in any way what we already understand of them through analysis. On the other hand, psycho-analysis may do something to advance the study of telepathy, in so far as, by the help of its interpretations, many of the puzzling characteristics of telepathic phenomena may be rendered more intelligible to us; or other, still doubtful, phenomena may for the first time definitely be ascertained to be of a telepathic nature.

[1922a, 3897]

There remains one element of the apparently intimate connection between telepathy and dreams which is not affected by any of these considerations: namely, the incontestable fact that sleep creates favourable conditions for telepathy. Sleep is not, it is true, indispensable to the occurrence of telepathic processes - whether they originate in messages or in unconscious activity. If you are not already aware of this, you will learn it from the instance given by our second correspondent, of the young man's message which came between nine and ten in the morning. We must add, however, that no one has a right to take exception to telepathic occurrences if the event and the intimation (or message) do not exactly coincide in astronomical time. It is perfectly conceivable that a telepathic message might arrive contemporaneously with the event and yet only penetrate to consciousness the following night during sleep (or even in waking life only after a while, during some pause in the activity of the mind). We are, as you know, of opinion that dream-formation itself does not necessarily wait for the onset of sleep before it begins. Often the latent dream-thoughts may have been being got ready during the whole day, till at night they find the contact with the unconscious wish that shapes them into a dream. But if the phenomenon of telepathy is only an activity of the unconscious mind, then, of course, no fresh problem lies before us. The laws of unconscious mental life may then be taken for granted as applying to telepathy.

[1922a, 3897]

Have I given you the impression that I am secretly inclined to support the reality of telepathy in the occult sense? If so, I should very much regret that it is so difficult to avoid giving such an impression. For in reality I have been anxious to be strictly impartial. I have every reason to be so, since I have no opinion on the matter and know nothing about it.

[1922a, 3897]

The position is just the same, I think, in the matter of the relation of dreams to the alleged facts of the occult world. But, since dreams themselves have always been mysterious things, they have been brought into intimate connection with the other unknown mysteries. No doubt, too, they have a historic claim to that position, since in primaeval ages, when our mythology was being formed, dream-images may have played a part in the origin of ideas about spirits.

[1925i, 4052]
There can, indeed, be no doubt that there are such things as prophetic dreams, in the sense that their content gives some sort of picture of the future; the only question is whether these predictions coincide to any noticeable extent with what really happens subsequently. I must confess that upon this point my resolution in favour of impartiality deserts me. The notion that there is any mental power, apart from acute calculation, which can foresee future events in detail is on the one hand too much in contradiction to all the expectations and presumptions of science and on the other hand corresponds too closely to certain ancient and familiar human desires which criticism must reject as unjustifiable pretensions. I am therefore of opinion that after one has taken into account the untrustworthiness, credulity and unconvincingness of most of these reports, together with the possibility of falsifications of memory facilitated by emotional causes and the inevitability of a few lucky shots, it may be anticipated that the spectre of veridical prophetic dreams will disappear into nothing. Personally, I have never experienced anything or learnt of anything that could encourage a more favourable presumption.

It is otherwise with telepathic dreams. But at this point it must be made quite clear that no one has yet maintained that telepathic phenomena - the reception of a mental process by one person from another by means other than sensory perception - are exclusively related to dreams. Thus once again telepathy is not a dream-problem: our judgement upon whether it exists or not need not be based on a study of telepathic dreams.

If reports of telepathic occurrences (or, to speak less exactly, of thought-transference) are submitted to the same criticism as stories of other occult events, there remains a considerable amount of material which cannot be so easily neglected. Further, it is much more possible to collect observations and experiences of one's own in this field which justify a favourable attitude to the problem of telepathy, even though they may not be enough to carry an assured conviction. One arrives at a provisional opinion that it may well be that telepathy really exists and that it provides the kernel of truth in many other hypotheses that would otherwise be incredible.

It is certainly right in what concerns telepathy to adhere obstinately to the same sceptical position and only to yield grudgingly to the force of evidence. I believe I have found a class of material which is exempt from the doubts which are otherwise justified - namely, unfulfilled prophecies made by professional fortune-tellers. Unluckily, I have but few such observations at my disposal; but two among these have made a powerful impression on me. I am not in a position to describe them in such detail as would produce a similar effect upon other people, and I must restrict myself to bringing out a few essential points.
A prediction had been made, then, to the enquirers (at a strange place and by a strange fortune-teller, who was at the same time carrying out some, presumably irrelevant, ritual) that something would happen to them at a particular time, which in fact did not come true. The date at which the prophecy should have been fulfilled was long past. It was striking that those concerned reported their experience not with derision or disappointment but with obvious satisfaction. Included among what had been told them there were certain quite definite details which seemed capricious and unintelligible and would only have been justified if they had hit the mark. Thus, for instance, the palmist told a woman who was twenty-seven (though she looked much younger) and who had taken off her wedding-ring, that she would be married and have two children before she was thirty-two. The woman was forty-three when, now seriously ill, she told me the story in her analysis: she had remained childless. If one knew her private history (of which the 'Professor' in the lounge of the Paris hotel was certainly ignorant) one could understand the two numbers included in the prophecy. The girl had married after an unusually intense attachment to her father and had then had a passionate longing for children, so as to be able to put her husband in the place of her father. After years of disappointment, when she was on the brink of a neurosis, she obtained the prophecy, which promised her - the lot of her mother. For it was a fact that the latter had had two children by the time she was thirty-two. Thus it was only by the help of psycho-analysis that it was possible to give a significant interpretation of the peculiarities of this pretended message from without. But there was then no better explanation of the whole, unequivocally determined chain of events than to suppose that a strong wish on the part of the questioner - the strongest unconscious wish, in fact, of her whole emotional life and the motive force of her impending neurosis - had made itself manifest to the fortune-teller by being directly transferred to him while his attention was being distracted by the performances he was going through.

I have often had an impression, in the course of experiments in my private circle, that strongly emotionally coloured recollections can be successfully transferred without much difficulty. If one has the courage to subject to an analytic examination the associations of the person to whom the thoughts are supposed to be transferred, correspondences often come to light which would otherwise have remained undiscovered. On the basis of a number of experiences I am inclined to draw the conclusion that thought-transference of this kind comes about particularly easily at the moment at which an idea emerges from the unconscious, or, in theoretical terms, as it passes over from the 'primary process' to the 'secondary process'.

In spite of the caution which is prescribed by the importance, novelty and obscurity of the subject, I feel that I should not be justified in holding back any longer these considerations upon the problem of telepathy. All of this has only this much to do with dreams: if there are such things as telepathic messages, the possibility cannot be dismissed of their reaching someone during sleep and coming to his knowledge in a dream. Indeed, on the analogy of other perceptual and intellectual material, the further possibility arises that telepathic messages received in the course of the day may only be dealt with during a dream of the following night. There would then be nothing contradictory in the material that has been telepathically communicated being modified and transformed in the dream like any other material. It would be satisfactory if with the help of psycho-analysis we could obtain further and better authenticated knowledge of telepathy.
I cannot say that I am an admirer of these measures. The second one is a quite undisguised encroachment of police supervision to the detriment of intellectual freedom. I am beyond suspicion of having much belief in what are known as 'occult phenomena' or of feeling any desire that they should be recognized. But prohibitions like these will not stifle people's interest in that supposedly mysterious world. They may on the contrary have done much harm and have closed the door to an impartial curiosity which might have arrived at a judgement that would have set us free from these harassing possibilities. But once again this only applies to Austria. In other countries 'para-psychical' researches are not met by any legal obstacles. The case of hypnotism is somewhat different from that of analysis. Hypnotism is the evoking of an abnormal mental state and is used by laymen to-day only for the purpose of public shows. If hypnotic therapy had maintained its very promising beginnings, a position would have been arrived at similar to that of analysis. And incidentally the history of hypnotism provides a precedent for that of analysis in another direction. When I was a young lecturer in neuropathology, the doctors inveighed passionately against hypnotism, declared that it was a swindle, a deception of the Devil's and a highly dangerous procedure. To-day they have monopolized this same hypnotism and they make use of it unhesitatingly as a method of examination; for some nerve specialists it is still their chief therapeutic instrument.

If all the evidence put forward for the authenticity of religious teachings originates in the past, it is natural to look round and see whether the present, about which it is easier to form judgements, may not also be able to furnish evidence of the sort. If by this means we could succeed in clearing even a single portion of the religious system from doubt, the whole of it would gain enormously in credibility. The proceedings of the spiritualists meet us at this point; they are convinced of the survival of the individual soul and they seek to demonstrate to us beyond doubt the truth of this one religious doctrine. Unfortunately they cannot succeed in refuting the fact that the appearance and utterances of their spirits are merely the products of their own mental activity. They have called up the spirits of the greatest men and of the most eminent thinkers, but all the pronouncements and information which they have received from them have been so foolish and so wretchedly meaningless that one can find nothing credible in them but the capacity of the spirits to adapt themselves to the circle of people who have conjured them up.

You will scarcely be surprised by the news that I am going to speak to you on the relation of dreams to occultism. Dreams have, indeed, often been regarded as the gateway into the world of mysticism, and even to-day are themselves looked on by many people as an occult phenomenon. Even we, who have made them into a subject for scientific study, do not dispute that one or more threads link them to those obscure matters. Mysticism, occultism - what is meant by these words? You must not expect me to make any attempt at embracing this ill-circumscribed region with definitions. We all know in a general and indefinite manner what the words imply to us. They refer to some sort of 'other world', lying beyond the bright world governed by relentless laws which has been constructed for us by science.

Occultism asserts that there are in fact 'more things in heaven and earth than are dreamt of in our philosophy'. Well, we need not feel bound by the narrow-mindedness of academic philosophy; we are ready to believe what is shown to us to deserve belief.
We propose to proceed with these things as we do with any other scientific material: first of all to establish whether such events can really be shown to occur, and then and only then, when their factual nature cannot be doubted, to concern ourselves with their explanation. It cannot be denied, however, that even the putting of this decision into action is made hard for us by intellectual, psychological and historical factors. The case is not the same as when we approach other investigations.

[1933a, 4643]

First, the intellectual difficulty. Let me give you a crude and obvious explanation of what I have in mind. Let us suppose that the question at issue is the constitution of the interior of the earth. We have, as you are aware, no certain knowledge about it. We suspect that it consists of heavy metals in an incandescent state. Then let us imagine that someone puts forward an assertion that the interior of the earth consists of water saturated with carbonic acid - that is to say, with a kind of soda-water. We shall no doubt say that this is most improbable, that it contradicts all our expectations and pays no attention to the known facts which have led us to adopt the metal hypothesis. Nevertheless it is not inconceivable; if someone were to show us a way of testing the soda-water hypothesis we should follow it without objecting. But suppose now that someone else comes along and seriously asserts that the core of the earth consists of jam. Our reaction to this will be quite different. We shall tell ourselves that jam does not occur in nature, that it is a product of human cooking, that, moreover, the existence of this material presupposes the presence of fruit-trees and their fruit, and that we cannot see how we can locate vegetation and human cookery in the interior of the earth. The result of these intellectual objections will be a switching of our interest: instead of starting upon an investigation of whether the core of the earth really consists of jam, we shall ask ourselves what sort of person this must be who can arrive at such a notion, or at most we shall ask him where he got it from. The unlucky inventor of the jam theory will be very much insulted and will complain that we are refusing to make an objective investigation of his assertion on the ground of a pretendedly scientific prejudice. But this will be of no help to him. We perceive that prejudices are not always to be reprobated, but that they are sometimes justified and expedient because they save us useless labour. In fact they are only conclusions based on an analogy with other well-founded judgements.

[1933a, 4644]

A whole number of occultist assertions have the same sort of effect on us as the jam hypothesis; so that we consider ourselves justified in rejecting them at sight, without further investigation. But all the same, the position is not so simple. A comparison like the one I have chosen proves nothing, or proves as little as comparisons in general. It remains doubtful whether it fits the case, and it is clear that its choice was already determined by our attitude of contemptuous rejection. Prejudices are sometimes expedient and justified; but sometimes they are erroneous and detrimental, and one can never tell when they are the one and when the other. The history of science itself abounds in instances which are a warning against premature condemnation. For a long time it was regarded as a senseless hypothesis to suppose that the stones, which we now call meteorites, could have reached the earth from outer space or that the rocks forming mountains, in which the remains of shells are imbedded, could have once formed the bed of the sea. Incidentally, much the same thing happened to our psycho-analysis when it brought forward its inference of there being an unconscious. Thus we analysts have special reason to be careful in using intellectual considerations for rejecting new hypotheses and must admit that they do not relieve us from feelings of antipathy, doubt and uncertainty.

[1933a, 4645]
I have spoken of the second factor as the psychological one. By that I mean the general tendency of mankind to credulity and a belief in the miraculous. From the very beginning, when life takes us under its strict discipline, a resistance stirs within us against the relentlessness and monotony of the laws of thought and against the demands of reality-testing. Reason becomes the enemy which withholds from us so many possibilities of pleasure. We discover how much pleasure it gives us to withdraw from it, temporarily at least, and to surrender to the allurements of nonsense. Schoolboys delight in the twisting of words; when a scientific congress is over, the specialists make fun of their own activities; even earnest-minded men enjoy a joke. More serious hostility to 'Reason and Science, the highest strength possessed by man', awaits its opportunity; it hastens to prefer the miracle-doctor or the practitioner of nature-cures to the 'qualified' physician; it is favourable to the assertions of occultism so long as those alleged facts can be taken as breaches of laws and rules; it lulls criticism to sleep, falsifies perceptions and enforces confirmations and agreements which cannot be justified. If this human tendency is taken into account, there is every reason to discount much of the information put forward in occultist literature.

[1933a, 4645]

I have called the third doubt the historical one; and by it I mean to point out that there is in fact nothing new in the world of occultism. There emerge in it once more all the signs, miracles, prophecies and apparitions which have been reported to us from ancient times and in ancient books and which we thought had long since been disposed of as the offspring of unbridled imagination or of tendentious fraud, as the product of an age in which man's ignorance was very great and the scientific spirit was still in its cradle. If we accept the truth of what, according to the occultists' information, still occurs to-day, we must also believe in the authenticity of the reports which have come down to us from ancient times. And we must then reflect that the tradition and sacred books of all peoples are brimful of similar marvellous tales and that the religions base their claim to credibility on precisely such miraculous events and find proof in them of the operation of superhuman powers. That being so, it will be hard for us to avoid a suspicion that the interest in occultism is in fact a religious one and that one of the secret motives of the occultist movement is to come to the help of religion, threatened as it is by the advance of scientific thought. And with the discovery of this motive our distrust must increase and our disinclination to embark on the examination of these supposedly occult phenomena.

[1933a, 4646]

Sooner or later, however, this disinclination must be overcome. We are faced by a question of fact: is what the occultists tell us true or not? It must, after all, be possible to decide this by observation. At bottom we have cause for gratitude to the occultists. The miraculous stories from ancient times are beyond the reach of our testing. If in our opinion they cannot be substantiated, we must admit that they cannot, strictly speaking, be disproved. But about contemporary happenings, at which we are able to be present, it must be possible for us to reach a definite judgement. If we arrive at a conviction that such miracles do not occur to-day, we need not fear the counter-argument that they may nevertheless have taken place in ancient times: in that case other explanations will be much more plausible. Thus we have settled our doubts and are ready to take part in an investigation of occult phenomena.

[1933a, 4646]
But here unluckily we are met by circumstances which are exceedingly unfavourable to our honest intentions. The observations on which our judgement is supposed to depend take place under conditions which make our sensory perceptions uncertain and which blunt our power of attention; they occur in darkness or in dimmed light after long periods of blank expectation. We are told that in fact our unbelieving - that is to say, critical - attitude may prevent the expected phenomena from happening. The situation thus brought about is nothing less than a caricature of the circumstances in which we are usually accustomed to carry out scientific enquiries. The observations are made upon what are called 'mediums' - individuals to whom peculiarly 'sensitive' faculties are ascribed, but who are by no means distinguished by outstanding qualities of intellect or character and who are not, like the miracle-workers of the past, inspired by any great idea or serious purpose. On the contrary, they are looked upon, even by those who believe in their secret powers, as particularly untrustworthy; most of them have already been detected as cheats and we may reasonably expect that the same fate awaits the remainder. Their performances give one the impression of children's mischievous pranks or of conjuring tricks. Never has anything of importance yet emerged from séances with these mediums - the revelation of a new source of power, for instance. We do not, it is true, expect to receive hints on pigeon-breeding from the conjurer who produces pigeons by magic from his empty top-hat. I can easily put myself in the place of a person who tries to fulfil the demands of an objective attitude and so takes part in occult séances, but who grows tired after a while and turns away in disgust from what is expected of him and goes back unenlightened to his former prejudices. The reproach may be made against such a person that this is not the right way of behaving: that one ought not to lay down in advance what the phenomena one is seeking to study shall be like and in what circumstances they shall appear. One should, on the contrary, persevere, and give weight to the precautionary and supervisory measures by which efforts have recently been made to provide against the untrustworthiness of mediums. Unfortunately this modern protective technique makes an end of the easy accessibility of occult observations. The study of occultism becomes a specialized and difficult profession - an activity one cannot pursue alongside of one's other interests. And until those concerned in these investigations have reached their conclusions, we are left to our doubts and our own conjectures.

[1933a, 4647]

Of these conjectures no doubt the most probable is that there is a real core of yet unrecognized facts in occultism round which cheating and phantasy have spun a veil which it is hard to pierce. But how can we even approach this core? at what point can we attack the problem? It is here, I think, that dreams come to our help, by giving us a hint that from out of this chaos we should pick the subject of telepathy.

[1933a, 4648]

What we call 'telepathy' is, as you know, the alleged fact that an event which occurs at a particular time comes at about the same moment to the consciousness of someone distant in space, without the paths of communication that are familiar to us coming into question. It is implicitly presupposed that this event concerns a person in whom the other one (the receiver of the intelligence) has a strong emotional interest. For instance, Person A may be the victim of an accident or may die, and Person B, someone nearly attached to him - his mother or daughter or fiancée - learns the fact at about the same time through a visual or auditory perception. In this latter case, then, it is as if she had been informed by telephone, though such was not the case; it is a kind of psychical counterpart to wireless telegraphy. I need not insist to you on the improbability of such events, and there is good reason for dismissing the majority of such reports. A few are left over which cannot be so easily disposed of in this way. Permit me now, for the purpose of what I have to tell you, to omit the cautious little word 'alleged' and to proceed as though I believed in the objective reality of the phenomenon of telepathy. But bear firmly in mind that that is not the case and that I have committed myself to no conviction.

[1933a, 4648]
Actually I have little to tell you - only a modest fact. I will also at once reduce your expectations still further by saying that at bottom dreams have little to do with telepathy. Telepathy does not throw any fresh light on the nature of dreams nor do dreams give any direct evidence of the reality of telepathy. Moreover the phenomenon of telepathy is by no means bound up with dreams; it can occur as well during the waking state. The only reason for discussing the relation between dreams and telepathy is that the state of sleep seems particularly suited for receiving telepathic messages. In such cases one has what is called a telepathic dream and, when it is analysed, one forms a conviction that the telepathic news has played the same part as any other portion of the day's residues and that it has been changed in the same way by the dream-work and made to serve its purpose.

[1933a, 4649]

If it were a question of one case only like that of my patient, one would shrug it aside. No one would dream of erecting upon a single observation a belief which implies taking such a decisive line. But you must believe me when I assure you that this is not the only case in my experience. I have collected a whole number of such prophecies and from all of them I gained the impression that the fortune-teller had merely brought to expression the thoughts, and more especially the secret wishes, of those who were questioning him, and that we were therefore justified in analysing these prophecies as though they were subjective products, phantasies or dreams of the people concerned. Not every case, of course, is equally convincing and in not every case is it equally possible to exclude more rational explanations; but, taking them as a whole, there remains a strong balance of probability in favour of thought-transference as a fact. The importance of the subject would justify me in producing all my cases to you; but that I cannot do, owing to the prolixity of description that would be involved and to the inevitable breach of the obligations of discretion. I will try so far as possible to appease my conscience in giving you a few more examples.

[1933a, 4653]

Ladies and Gentlemen, - You have now heard how dream-interpretation and psycho-analysis in general assist occultism. I have shown you from examples that by their application occult facts have been brought to light which would otherwise have remained unknown. Psycho-analysis cannot give a direct answer to the question that no doubt interests you the most - whether we are to believe in the objective reality of these findings. But the material revealed by its help makes an impression which is at all events favourable to an affirmative reply. Your interest will not come to a stop at this point, however. You will want to know what conclusions are justified by the incomparably richer material in which psycho-analysis has no part. But I cannot follow you there: it lies outside my province. The only further thing I could do would be to report observations to you which have at least so much relation to analysis that they were made during psycho-analytic treatment and were even perhaps made possible by its influence. I will tell you one such example - the one which has left the strongest impression behind on me. I shall tell it at great length and shall ask for your attention to a large number of details, though even so I shall have to suppress much that would have greatly increased the convincing force of the observation. It is an example in which the fact came clearly to light and did not need to be developed by analysis. In discussing it, however, we shall not be able to do without the help of analysis. But I will tell you in advance that this example too of apparent thought-transference in the analytic situation is not exempt from all doubts and that it does not allow us to take up an unqualified position in support of the reality of occult phenomena.

[1933a, 4657]
I am sure you will not feel very well satisfied with my attitude to this problem - with my not being entirely convinced but prepared to be convinced. You may perhaps say to yourselves: 'Here's another case of a man who has done honest work as a scientist all through his life and has grown feeble-minded, pious and credulous in his old age.' I am aware that a few great names must be included in this class, but you should not reckon me among them. At least I have not become pious, and I hope not credulous. It is only that, if one has gone about all one's life bending in order to avoid a painful collision with the facts, so too in one's old age one still keeps one's back ready to bow before new realities. No doubt you would like me to hold fast to a moderate theism and show myself relentless in my rejection of everything occult. But I am incapable of currying favour and I must urge you to have kindlier thoughts on the objective possibility of thought-transference and at the same time of telepathy as well.

[1933a, 4664]

You will not forget that here I am only treating these problems in so far as it is possible to approach them from the direction of psycho-analysis. When they first came into my range of vision more than ten years ago, I too felt a dread of a threat against our scientific Weltanschauung, which, I feared, was bound to give place to spiritualism or mysticism if portions of occultism were proved true. To-day I think otherwise. In my opinion it shows no great confidence in science if one does not think it capable of assimilating and working over whatever may perhaps turn out to be true in the assertions of occultists. And particularly so far as thought-transference is concerned, it seems actually to favour the extension of the scientific - or, as our opponents say, the mechanistic - mode of thought to the mental phenomena which are so hard to lay hold of. The telepathic process is supposed to consist in a mental act in one person instigating the same mental act in another person. What lies between these two mental acts may easily be a physical process into which the mental one is transformed at one end and which is transformed back once more into the same mental one at the other end. The analogy with other transformations, such as occur in speaking and hearing by telephone, would then be unmistakable. And only think if one could get hold of this physical equivalent of the psychical act! It would seem to me that psycho-analysis, by inserting the unconscious between what is physical and what was previously called 'psychical', has paved the way for the assumption of such processes as telepathy. If only one accustoms oneself to the idea of telepathy, one can accomplish a great deal with it - for the time being, it is true, only in imagination. It is a familiar fact that we do not know how the common purpose comes about in the great insect communities: possibly it is done by means of a direct psychical transference of this kind. One is led to a suspicion that this is the original, archaic method of communication between individuals and that in the course of phylogenetic evolution it has been replaced by the better method of giving information with the help of signals which are picked up by the sense organs. But the older method might have persisted in the background and still be able to put itself into effect under certain conditions - for instance, in passionately excited mobs. All this is still uncertain and full of unsolved riddles; but there is no reason to be frightened by it.

[1933a, 4664]
If there is such a thing as telepathy as a real process, we may suspect that, in spite of its being so hard to demonstrate, it is quite a common phenomenon. It would tally with our expectations if we were able to point to it particularly in the mental life of children. Here we are reminded of the frequent anxiety felt by children over the idea that their parents know all their thoughts without having to be told them - an exact counterpart and perhaps the source of the belief of adults in the omniscience of God. A short time ago Dorothy Burlingham, a trustworthy witness, in a paper on child analysis and the mother published some observations which, if they can be confirmed, would be bound to put an end to the remaining doubts on the reality of thought-transference. She made use of the situation, no longer a rare one, in which a mother and child are simultaneously in analysis, and reported some remarkable events such as the following. One day the mother spoke during her analytic session of a gold coin that had played a particular part in one of the scenes of her childhood. Immediately afterwards, after she had returned home, her little boy, about ten years old, came to her room and brought her a gold coin which he asked her to keep for him. She asked him in astonishment where he had got it from. He had been given it on his birthday; but his birthday had been several months earlier and there was no reason why the child should have remembered the gold coin precisely then. The mother reported the occurrence to the child's analyst and asked her to find out from the child the reason for his action. But the child's analysis threw no light on the matter; the action had forced its way that day into the child's life like a foreign body. A few weeks later the mother was sitting at her writing-desk to write down, as she had been told to do, an account of the experience, when in came the boy and asked for the gold coin back, as he wanted to take it with him to show in his analytic session. Once again the child's analysis could discover no explanation of his wish.

LADIES AND GENTLEMEN, - All the while I am preparing to talk to you I am struggling with an internal difficulty. I feel uncertain, so to speak, of the extent of my licence. It is true that in the course of fifteen years of work psycho-analysis has changed and grown richer; but, in spite of that, an introduction to psycho-analysis might have been left without alteration or supplement. It is constantly in my mind that these lectures are without a raison d'être. For analysts I am saying too little and nothing at all that is new; but for you I am saying too much and saying things which you are not equipped to understand and which are not in your province. I have looked around for excuses and I have tried to justify each separate lecture on different grounds. The first one, on the theory of dreams, was supposed to put you back again at one blow into the analytic atmosphere and to show you how durable our views have turned out to be. I was led on to the second one, which followed the paths from dreams to what is called occultism, by the opportunity of speaking my mind without constraint on a department of work in which prejudiced expectations are fighting to-day against passionate resistances, and I could hope that your judgement, educated to tolerance on the example of psycho-analysis, would not refuse to accompany me on the excursion. The third lecture, on the dissection of the personality, certainly made the hardest demands upon you with its unfamiliar subject-matter; but it was impossible for me to keep this first beginning of an ego-psychology back from you, and if we had possessed it fifteen years ago I should have had to mention it to you then. My last lecture, finally, which you were probably able to follow only by great exertions, brought forward necessary corrections - fresh attempts at solving the most important conundrums; and my introduction would have been leading you astray if I had been silent about them. As you see, when one starts making excuses it turns out in the end that it was all inevitable, all the work of destiny. I submit to it, and I beg you to do the same.

[1933a, 4665]
The pre-scientific view of dreams adopted by the peoples of antiquity was certainly in complete harmony with their view of the universe in general, which led them to project into the external world as realities things which in fact enjoyed reality only within their own minds. Moreover, their view of dreams took into account the principal impression produced upon the waking mind in the morning by what is left of a dream in the memory: an impression of something alien, arising from another world and contrasting with the remaining contents of the mind. Incidentally, it would be a mistake to suppose that the theory of the supernatural origin of dreams is without its supporters in our own days. We may leave on one side pietistic and mystical writers, who, indeed, are perfectly justified in remaining in occupation of what is left of the once wide domain of the supernatural so long as that field is not conquered by scientific explanation. But apart from them, one comes across clear-headed men, without any extravagant ideas, who seek to support their religious faith in the existence and activity of superhuman spiritual forces precisely by the inexplicable nature of the phenomena of dreaming. (Cf. Haffner, 1887.) The high esteem in which dream-life is held by some schools of philosophy (by the followers of Schelling, for instance) is clearly an echo of the divine nature of dreams which was undisputed in antiquity. Nor are discussions of the premonitory character of dreams and their power to foretell the future at an end. For attempts at giving a psychological explanation have been inadequate to cover the material collected, however decidedly the sympathies of those of a scientific cast of mind may incline against accepting any such beliefs.  

I can imagine that to point out the existence of lying dreams of this kind, 'obliging' dreams, will arouse a positive storm of helpless indignation in some readers who call themselves analysts. 'What!' they will exclaim, 'the unconscious, the real centre of our mental life, the part of us that is so much nearer the divine than our poor consciousness - it too can lie! Then how can we still build on the interpretations of analysis and the accuracy of our findings?' To which one must reply that the recognition of these lying dreams does not constitute any shattering novelty. I know, indeed, that the craving of mankind for mysticism is ineradicable, and that it makes ceaseless efforts to win back for mysticism the territory it has been deprived of by The Interpretation of Dreams, but surely in the case under consideration everything is simple enough. A dream is not the 'unconscious'; it is the form into which a thought left over from preconscious, or even from conscious, waking life, can, thanks to the favouring state of sleep, be recast. In the state of sleep this thought has been reinforced by unconscious wishful impulses and has thus experienced distortion through the dream-work, which is determined by the mechanisms prevailing in the unconscious. With our dreamer, the intention to mislead me, just as she did her father, certainly emanated from the preconscious, and may indeed have been conscious; it could come to expression by entering into connection with the unconscious wishful impulse to please her father (or father-substitute), and in this way it created a lying dream. The two intentions, to betray and to please her father, originated in the same complex; the former resulted from the repression of the latter, and the later one was brought back by the dream-work to the earlier one. There can therefore be no question of any devaluation of the unconscious, nor of a shattering of our confidence in the results of analysis.  

You will scarcely be surprised by the news that I am going to speak to you on the relation of dreams to occultism. Dreams have, indeed, often been regarded as the gateway into the world of mysticism, and even to-day are themselves looked on by many people as an occult phenomenon. Even we, who have made them into a subject for scientific study, do not dispute that one or more threads link them to those obscure matters. Mysticism, occultism - what is meant by these words? You must not expect me to make any attempt at embracing this ill-circumscribed region with definitions. We all know in a general and indefinite manner what the words imply to us. They refer to some sort of 'other world', lying beyond the bright world governed by relentless laws which has been constructed for us by science.  

You will scarcely be surprised by the news that I am going to speak to you on the relation of dreams to occultism. They refer to some sort of 'other world', lying beyond the bright world governed by relentless laws which has been constructed for us by science.
And here is another warning, to conclude these remarks, which have certainly been exacting and not, perhaps, very illuminating. In thinking of this division of the personality into an ego, a super-ego and an id, you will not, of course, have pictured sharp frontiers like the artificial ones drawn in political geography. We cannot do justice to the characteristics of the mind by linear outlines like those in a drawing or in primitive painting, but rather by areas of colour melting into one another as they are presented by modern artists. After making the separation we must allow what we have separated to merge together once more. You must not judge too harshly a first attempt at giving a pictorial representations of something so intangible as psychical processes. It is highly probable that the development of these divisions is subject to great variations in different individuals; it is possible that in the course of actual functioning they may change and go through a temporary phase of involution. Particularly in the case of what is phylogenetically the last and most delicate of these divisions - the differentiation between the ego and the super-ego - something of the sort seems to be true. There is no question but that the same thing results from psychical illness. It is easy to imagine, too, that certain mystical practices may succeed in upsetting the normal relations between the different regions of the mind, so that, for instance, perception may be able to grasp happenings in the depths of the ego and in the id which were otherwise inaccessible to it. It may safely be doubted, however, whether this road will lead us to the ultimate truths from which salvation is to be expected. Nevertheless it may be admitted that the therapeutic efforts of psycho-analysis have chosen a similar line of approach. Its intention is, indeed, to strengthen the ego, to make it more independent of the super-ego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id. Where id was, there ego shall be. It is a work of culture - not unlike the draining of the Zuider Zee.
[1933a, 4687]
We can understand children telling lies, when in doing so, they are imitating the lies told by
grown-up people. But a number of lies told by well-brought-up children have a particular
significance and should cause those in charge of them to reflect rather than be angry. These lies
occur under the influence of excessive feelings of love, and become momentous when they lead
to a misunderstanding between the child and the person it loves.
[1913g, 2617]

When I speak of disillusionment, everyone will know at once what I mean. One need not be a
sentimentalist; one may perceive the biological and psychological necessity for suffering in the
economy of human life, and yet condemn war both in its means and ends and long for the
cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as
nations live under such widely differing conditions, so long as the value of individual life is so
variously assessed among them, and so long as the animosities which divide them represent
such powerful motive forces in the mind. We were prepared to find that wars between the
primitive and the civilized peoples, between the races who are divided by the colour of their skin
-wars, even, against and among the nationalities of Europe whose civilization is little developed or
has been lost - would occupy mankind for some time to come. But we permitted ourselves to
have other hopes. We had expected the great world-dominating nations of white race upon whom
the leadership of the human species has fallen, who were known to have world-wide interests as
their concern, to whose creative powers were due not only our technical advances towards the
control of nature but the artistic and scientific standards of civilization - we had expected these
peoples to succeed in discovering another way of settling misunderstandings and conflicts of
interest. Within each of these nations high norms of moral conduct were laid down for the
individual, to which his manner of life was bound to conform if he desired to take part in a civilized
community. These ordinances, often too stringent, demanded a great deal of him - much self-
restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of
the immense advantages to be gained by the practice of lying and deception in the competition
with his fellow-men. The civilized states regarded these moral standards as the basis of their
existence. They took serious steps if anyone ventured to tamper with them, and often declared it
improper even to subject them to examination by a critical intelligence. It was to be assumed,
therefore, that the state itself would respect them, and would not think of undertaking anything
against them which would contradict the basis of its own existence. Observation showed, to be
sure, that embedded in these civilized states there were remnants of certain other peoples, which
were universally unpopular and had therefore been only reluctantly, and even so not fully,
admitted to participation in the common work of civilization, for which they had shown themselves
suitable enough. But the great nations themselves, it might have been supposed, would have
acquired so much comprehension of what they had in common, and so much tolerance for their
differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical
antiquity, into a single concept.
[1915b, 3068]

It should not be objected that the state cannot refrain from wrong-doing, since that would place
it at a disadvantage. It is no less disadvantageous, as a general rule, for the individual man to
conform to the standards of morality and refrain from brutal and arbitrary conduct; and the state
seldom proves able to indemnify him for the sacrifices it exacts. Nor should it be a matter for
surprise that this relaxation of all the moral ties between the collective individuals of mankind
should have had repercussions on the morality of individuals; for our conscience is not the
inflexible judge that ethical teachers declare it, but in its origin is 'social anxiety' and nothing else.
When the community no longer raises objections, there is an end, too, to the suppression of evil
passions, and men perpetrate deeds of cruelty, fraud, treachery and barbarity so incompatible
with their level of civilization that one would have thought them impossible.
[1915b, 3072]
There is something to be said, however, in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. We welcome illusions because they spare us unpleasurable feelings, and enable us to enjoy satisfactions instead. We must not complain, then, if now and again they come into collision with some portion of reality, and are shattered against it.

Let us begin with the second point and try to formulate, in a few brief words, the point of view that we wish to criticize. How, in point of fact, do we imagine the process by which an individual rises to a comparatively high plane of morality? The first answer will no doubt simply be that he is virtuous and noble from birth - from the very start. We shall not consider this view any further here. A second answer will suggest that we are concerned with a developmental process, and will probably assume that the development consists in eradicating his evil human tendencies and, under the influence of education and a civilized environment, replacing them by good ones. If so, it is nevertheless surprising that evil should re-emerge with such force in anyone who has been brought up in this way.

It is not until all these 'instinctual vicissitudes' have been surmounted that what we call a person's character is formed, and this, as we know, can only very inadequately be classified as 'good' or 'bad'. A human being is seldom altogether good or bad; he is usually 'good' in one relation and 'bad' in another, or 'good' in certain external circumstances and in others decidedly 'bad'. It is interesting to find that the pre-existence of strong 'bad' impulses in infancy is often the actual condition for an unmistakable inclination towards 'good' in the adult. Those who as children have been the most pronounced egoists may well become the most helpful and self-sacrificing members of the community; most of our sentimentalists, friends of humanity and protectors of animals have been evolved from little sadists and animal-tormentors.

If we give the name of 'susceptibility to culture' to a man's personal capacity for the transformation of the egoistic impulses under the influence of erotism, we may further affirm that this susceptibility is made up of two parts, one innate and the other acquired in the course of life, and that the relation of the two to each other and to that portion of the instinctual life which remains untransformed is a very variable one.

We have learned that the external compulsion exercised on a human being by his upbringing and environment produces a further transformation towards good in his instinctual life - a further turning from egoism towards altruism. But this is not the regular or necessary effect of the external compulsion. Upbringing and environment not only offer benefits in the way of love, but also employ other kinds of incentive, namely, rewards and punishments. In this way their effect may turn out to be that a person who is subjected to their influence will choose to behave well in the cultural sense of the phrase, although no ennoblement of instinct, no transformation of egoistic into altruistic inclinations, has taken place in him. The result will, roughly speaking, be the same; only a particular concatenation of circumstances will reveal that one man always acts in a good way because his instinctual inclinations compel him to, and the other is good only in so far and for so long as such cultural behaviour is advantageous for his own selfish purposes. But superficial acquaintance with an individual will not enable us to distinguish between the two cases, and we are certainly misled by our optimism into grossly exaggerating the number of human beings who have been transformed in a cultural sense.
We may already derive one consolation from this discussion: our mortification and our painful disillusionment on account of the uncivilized behaviour of our fellow-citizens of the world during this war were unjustified. They were based on an illusion to which we had given way. In reality our fellow-citizens have not sunk so low as we feared, because they had never risen so high as we believed. The fact that the collective individuals of mankind, the peoples and states, mutually abrogated their moral restraints naturally prompted these individual citizens to withdraw for a while from the constant pressure of civilization and to grant a temporary satisfaction to the instincts which they had been holding in check. This probably involved no breach in their relative morality within their own nations.
[1915b, 3077]

When it comes to someone else's death, the civilized man will carefully avoid speaking of such a possibility in the hearing of the person under sentence. Children alone disregard this restriction; they unashamedly threaten one another with the possibility of dying, and even go so far as to do the same thing to someone whom they love, as, for instance: 'Dear Mummy, when you're dead I'll do this or that.' The civilized adult can hardly even entertain the thought of another person's death without seeming to himself hard-hearted or wicked; unless, of course, as a doctor or lawyer or something of the kind, he has to deal with death professionally. Least of all will he allow himself to think of the other person's death if some gain to himself in freedom, property or position is bound up with it. This sensitiveness of ours does not, of course, prevent the occurrence of deaths; when one does happen, we are always deeply affected, and it is as though we were badly shaken in our expectations. Our habit is to lay stress on the fortuitous causation of the death - accident, disease, infection, advanced age; in this way we betray an effort to reduce death from a necessity to a chance event. A number of simultaneous deaths strikes us as something extremely terrible. Towards the actual person who has died we adopt a special attitude - something almost like admiration for someone who has accomplished a very difficult task. We suspend criticism of him, overlook his possible misdeeds, declare that 'de mortuis nil nisi bonum', and think it justifiable to set out all that is most favourable to his memory in the funeral oration and upon the tombstone. Consideration for the dead, who, after all, no longer need it, is more important to us than the truth, and certainly, for most of us, than consideration for the living.
[1915b, 3082]

Primaeval man took up a very remarkable attitude towards death. It was far from consistent; it was indeed most contradictory. On the one hand, he took death seriously, recognized it as the termination of life and made use of it in that sense; on the other hand, he also denied death and reduced it to nothing. This contradiction arose from the fact that he took up radically different attitudes towards the death of other people, of strangers, of enemies, and towards his own. He had no objection to someone else's death; it meant the annihilation of someone he hated, and primitive man had no scruples against bringing it about. He was no doubt a very passionate creature and more cruel and more malignant than other animals. He liked to kill, and killed as a matter of course. The instinct which is said to restrain other animals from killing and devouring their own species need not be attributed to him.
[1915b, 3084]
Pious souls, no doubt, who would like to believe that our nature is remote from any contact with what is evil and base, will not fail to use the early appearance and the urgency of the prohibition against murder as the basis for gratifying conclusions as to the strength of the ethical impulses which must have been implanted in us. Unfortunately this argument proves even more for the opposite view. So powerful a prohibition can only be directed against an equally powerful impulse. What no human soul desires stands in no need of prohibition;¹ it is excluded automatically. The very emphasis laid on the commandment 'Thou shalt not kill' makes it certain that we spring from an endless series of generations of murderers, who had the lust for killing in their blood, as, perhaps, we ourselves have to-day. Mankind's ethical strivings, whose strength and significance we need not in the least depreciate, were acquired in the course of man's history; since then they have become, though unfortunately only in a very variable amount, the inherited property of contemporary men.

[1915b, 3088]

You will promise now, perhaps, to disregard the repellent character of the censored dream-wishes and will withdraw upon the argument that after all it is unlikely that such a large space should be given to the evil in the constitution of human beings. But do your own experiences justify your saying this? I will not discuss how you may appear to yourselves; but have you found so much benevolence among your superiors and competitors, so much chivalry among your enemies and so little envy in your social surroundings that you feel it your duty to protest against egoistic evil having a share in human nature? Are you not aware of how uncontrolled and untrustworthy the average person is in everything to do with sexual life? Or do you not know that all the transgressions and excesses of which we dream at night are daily committed in real life by waking men? what does psycho-analysis do here but confirm Plato's old saying that the good are those who are content to dream of what the others, the bad, really do?

[1916-1917, 3241]

And now turn your eyes away from individuals and consider the Great War which is still laying Europe waste. Think of the vast amount of brutality, cruelty and lies which are able to spread over the civilized world. Do you really believe that a handful of ambitious and deluding men without conscience could have succeeded in unleashing all these evil spirits if their millions of followers did not share their guilt? Do you venture, in such circumstances, to break a lance on behalf of the exclusion of evil from the mental constitution of mankind?

[1916-1917, 3241]

We are reminded that sufferers from persecutory paranoia act in just the same way. They, too, cannot regard anything in other people as indifferent, and they, too, take up minute indications with which these other, unknown, people present them, and use them in their delusions of reference. The meaning of their delusion of reference is that they expect from all strangers something like love. But these people show them nothing of the kind; they laugh to themselves, flourish their sticks, even spit on the ground as they go by - and one really does not do such things while a person in whom one takes a friendly interest is near. One does them only when one feels quite indifferent to the passer-by, when one can treat him like air; and, considering, too, the fundamental kinship of the concepts of 'stranger' and 'enemy', the paranoic is not so far wrong in regarding this indifference as hate, in contrast to his claim for love.

[1922b, 3903]
There is really a great deal of truth in what you say. It is true that the interpretation of dreams has come to have unequalled importance both for the theory and the practice of analysis. If I seem to be aggressive, that is only a way of defending myself. And when I think of all the mischief some analysts have done with the interpretation of dreams I might lose heart and echo the pessimistic pronouncement of our great satirist Nestroy when he says that every step forward is only half as big as it looks at first. But have you ever found that men do anything but confuse and distort what they get hold of? By the help of a little foresight and self-discipline most of the dangers of dream-interpretation can be avoided with certainty. But you will agree that I shall never come to my exposition if we let ourselves be led aside like this.

For we do not consider it at all desirable for psycho-analysis to be swallowed up by medicine and to find its last resting-place in a text-book of psychiatry under the heading 'Methods of Treatment', alongside of procedures such as hypnotic suggestion, autosuggestion, and persuasion, which, born from our ignorance, have to thank the laziness and cowardice of mankind for their short-lived effects. It deserves a better fate and, it may be hoped, will meet with one. As a 'depth-psychology', a theory of the mental unconscious, it can become indispensable to all the sciences which are concerned with the evolution of human civilization and its major institutions such as art, religion and the social order. It has already, in my opinion, afforded these sciences considerable help in solving their problems. But these are only small contributions compared with what might be achieved if historians of civilization, psychologists of religion, philologists and so on would agree themselves to handle the new instrument of research which is at their service. The use of analysis for the treatment of the neuroses is only one of its applications; the future will perhaps show that it is not the most important one. In any case it would be wrong to sacrifice all the other applications to this single one, just because it touches on the circle of medical interests.

These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.
But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they must be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeble-mindedness' - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

In my Future of an Illusion I was concerned much less with the deepest sources of the religious feeling than with what the common man understands by his religion - with the system of doctrines and promises which on the one hand explains to him the riddles of this world with enviable completeness, and, on the other, assures him that a careful Providence will watch over his life and will compensate him in a future existence for any frustrations he suffers here. The common man cannot imagine this Providence otherwise than in the figure of an enormously exalted father. Only such a being can understand the needs of the children of men and be softened by their prayers and placated by the signs of their remorse. The whole thing is so patently infantile, so foreign to reality, that to anyone with a friendly attitude to humanity it is painful to think that the great majority of mortals will never be able to rise above this view of life. It is still more humiliating to discover how large a number of people living to-day, who cannot but see that this religion is not tenable, nevertheless try to defend it piece by piece in a series of pitiful rearguard actions. One would like to mix among the ranks of the believers in order to meet these philosophers, who think they can rescue the God of religion by replacing him by an impersonal, shadowy and abstract principle, and to address them with the warning words: 'Thou shalt not take the name of the Lord thy God in Vain!' And if some of the great men of the past acted in the same way, no appeal can be made to their example: we know why they were obliged to.

[1927c, 4455]

[1930a, 4473]
¹ When there is no special disposition in a person which imperatively prescribes what direction his interests in life shall take, the ordinary professional work that is open to everyone can play the part assigned to it by Voltaire's wise advice. It is not possible, within the limits of a short survey, to discuss adequately the significance of work for the economics of the libido. No other technique for the conduct of life attaches the individual so firmly to reality as laying emphasis on work; for his work at least gives him a secure place in a portion of reality, in the human community. The possibility it offers of displacing a large amount of libidinal components, whether narcissistic, aggressive or even erotic, on to professional work and on to the human relations connected with it lends it a value by no means second to what it enjoys as something indispensible to the preservation and justification of existence in society. Professional activity is a source of special satisfaction if it is a freely chosen one - if, that is to say, by means of sublimation, it makes possible the use of existing inclinations, of persisting or constitutionally reinforced instinctual impulses. And yet, as a path to happiness, work is not highly prized by men. They do not strive after it as they do after other possibilities of satisfaction. The great majority of people only work under the stress of necessity, and this natural human aversion to work raises most difficult social problems.

[1930a, 4479]
We recognize, then, that countries have attained a high level of civilization if we find that in them everything which can assist in the exploitation of the earth by man and in his protection against the forces of nature - everything, in short, which is of use to him - is attended to and effectively carried out. In such countries rivers which threaten to flood the land are regulated in their flow, and their water is directed through canals to places where there is a shortage of it. The soil is carefully cultivated and planted with the vegetation which it is suited to support; and the mineral wealth below ground is assiduously brought to the surface and fashioned into the required implements and utensils. The means of communication are ample, rapid and reliable. Wild and dangerous animals have been exterminated, and the breeding of domesticated animals flourishes. But we demand other things from civilization besides these, and it is a noticeable fact that we hope to find them realized in these same countries. As though we were seeking to repudiate the first demand we made, we welcome it as a sign of civilization as well if we see people directing their care too to what has no practical value whatever, to what is useless - if, for instance, the green spaces necessary in a town as playgrounds and as reservoirs of fresh air are also laid out with flower-beds, or if the windows of the houses are decorated with pots of flowers. We soon observe that this useless thing which we expect civilization to value is beauty. We require civilized man to reverence beauty wherever he sees it in nature and to create it in the objects of his handiwork so far as he is able. But this is far from exhausting our demands on civilization. We expect besides to see the signs of cleanliness and order. We do not think highly of the cultural level of an English country town in Shakespeare's time when we read that there was a big dung heap in front of his father's house in Stratford; we are indignant and call it 'barbarous' (which is the opposite of civilized) when we find the paths in the Wiener Wald littered with paper. Dirtiness of any kind seems to us incompatible with civilization. We extend our demand for cleanliness to the human body too. We are astonished to learn of the objectionable smell which emanated from the Roi Soleil; and we shake our heads on the Isola Bella when we are shown the tiny wash-basin in which Napoleon made his morning toilet. Indeed, we are not surprised by the idea of setting up the use of soap as an actual yardstick of civilization. The same is true of order. It, like cleanliness, applies solely to the works of man. But whereas cleanliness is not to be expected in nature, order, on the contrary, has been imitated from her. Man's observation of the great astronomical regularities not only furnished him with a model for introducing order into his life, but gave him the first points of departure for doing so. Order is a kind of compulsion to repeat which, when a regulation has been laid down once and for all, decides when, where and how a thing shall be done, so that in every similar circumstance one is spared hesitation and indecision. The benefits of order are incontestable. It enables men to use space and time to the best advantage, while conserving their psychical forces. We should have a right to expect that order would have taken its place in human activities from the start and without difficulty; and we may well wonder that this has not happened - that, on the contrary, human beings exhibit an inborn tendency to carelessness, irregularity and unreliability in their work, and that a laborious training is needed before they learn to follow the example of their celestial models.
[1930a, 4490]
A small minority are enabled by their constitution to find happiness, in spite of everything, along the path of love. But far-reaching mental changes in the function of love are necessary before this can happen. These people make themselves independent of their object's acquiescence by displacing what they mainly value from being loved on to loving; they protect themselves against the loss of the object by directing their love, not to single objects but to all men alike; and they avoid the uncertainties and disappointments of genital love by turning away from its sexual aims and transforming the instinct into an impulse with an inhibited aim. What they bring about in themselves in this way is a state of evenly suspended, steadfast, affectionate feeling, which has little external resemblance any more to the stormy agitations of genital love, from which it is nevertheless derived. Perhaps St. Francis of Assisi went furthest in thus exploiting love for the benefit of an inner feeling of happiness. Moreover, what we have recognized as one of the techniques for fulfilling the pleasure principle has often been brought into connection with religion; this connection may lie in the remote regions where the distinction between the ego and objects or between objects themselves is neglected. According to one ethical view, whose deeper motivation will become clear to us presently, this readiness for a universal love of mankind and the world represents the highest standpoint which man can reach. Even at this early stage of the discussion I should like to bring forward my two main objections to this view. A love that does not discriminate seems to me to forfeit a part of its own value, by doing an injustice to its object; and secondly, not all men are worthy of love.

The clue may be supplied by one of the ideal demands, as we have called them, of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naïve attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too - I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earth-worm or a grass-snake, then I fear that only a small modicum of my love will fall to his share - not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable?
On closer inspection, I find still further difficulties. Not merely is this stranger in general unworthy of my love; I must honestly confess that he has more claim to my hostility and even my hatred. He seems not to have the least trace of love for me and shows me not the slightest consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask himself whether the amount of advantage he gains bears any proportion to the extent of the harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his superior power; and the more secure he feels and the more helpless I am, the more certainly I can expect him to behave like this to me. If he behaves differently, if he shows me consideration and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as thy neighbour loves thee', I should not take exception to it. And there is a second commandment, which seems to me even more incomprehensible and arouses still stronger opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in treating it as a greater imposition. At bottom it is the same thing.¹

I think I can now hear a dignified voice admonishing me: 'It is precisely because your neighbour is not worthy of love, and is on the contrary your enemy, that you should love him as yourself.' I then understand that the case is one like that of Credo quia absurdum.²

Now it is very probable that my neighbour, when he is enjoined to love me as himself, will answer exactly as I have done and will repel me for the same reasons. I hope he will not have the same objective grounds for doing so, but he will have the same idea as I have. Even so, the behaviour of human beings shows differences, which ethics, disregarding the fact that such differences are determined, classifies as 'good' or 'bad'. So long as these undeniable differences have not been removed, obedience to high ethical demands entails damage to the aims of civilization, for it puts a positive premium on being bad. One is irresistibly reminded of an incident in the French Chamber when capital punishment was being debated. A member had been passionately supporting its abolition and his speech was being received with tumultuous applause, when a voice from the hall called out: 'Que messieurs les assassins commencent!'³

The element of truth behind all this, which people are so ready to disavow, is that men are not gentle creatures who want to be loved, and who at the most can defend themselves if they are attacked; they are, on the contrary, creatures among whose instinctual endowments is to be reckoned a powerful share of aggressiveness. As a result, their neighbour is for them not only a potential helper or sexual object, but also someone who tempts them to satisfy their aggressiveness on him, to exploit his capacity for work without compensation, to use him sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to torture and to kill him. Homo homini lupus. Who, in the face of all his experience of life and of history, will have the courage to dispute this assertion? As a rule this cruel aggressiveness waits for some provocation or puts itself at the service of some other purpose, whose goal might also have been reached by milder measures. In circumstances that are favourable to it, when the mental counter-forces which ordinarily inhibit it are out of action, it also manifests itself spontaneously and reveals man as a savage beast to whom consideration towards his own kind is something alien. Anyone who calls to mind the atrocities committed during the racial migrations or the invasions of the Huns, or by the people known as Mongols under Jenghiz Khan and Tamerlane, or at the capture of Jerusalem by the pious Crusaders, or even, indeed, the horrors of the recent World War - anyone who calls these things to mind will have to bow humbly before the truth of this view. [1930a, 4503]
The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

¹ Anyone who has tasted the miseries of poverty in his own youth and has experienced the indifference and arrogance of the well-to-do, should be safe from the suspicion of having no understanding or good will towards endeavours to fight against the inequality of wealth among men and all that it leads to. To be sure, if an attempt is made to base this fight upon an abstract demand, in the name of justice, for equality for all men, there is a very obvious objection to be made - that nature, by endowing individuals with extremely unequal physical attributes and mental capacities, has introduced injustices against which there is no remedy.

I hold firmly to a scientifically objective social assessment of ethics, and for that reason I should not wish to deny the excellent Philistine a certificate of good ethical conduct, even though it has cost him little self-discipline. But alongside of this I grant the validity of the subjective psychological view of ethics which you support. Though I agree with your judgement of the world and mankind as they are to-day, I cannot, as you know, regard your pessimistic dismissal of a better future as justified.
Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious Weltanschauung. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfil certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual's fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine man's fate; the system of rewards and punishments which religion ascribes to the government of the universe seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion. [1933a, 4765]

The prohibition against thought issued by religion to assist in its self-preservation is also far from being free from danger either for the individual or for human society. Analytic experience has taught us that a prohibition like this, even if it is originally limited to a particular field, tends to widen out and thereafter to become the cause of severe inhibitions in the subject's conduct of life. This result may be observed, too, in the female sex, following from their being forbidden to have anything to do with their sexuality even in thought. Biography is able to point to the damage done by the religious inhibition of thought in the life stories of nearly all eminent individuals in the past. On the other hand intellect - or let us call it by the name that is familiar to us, reason - is among the powers which we may most expect to exercise a unifying influence on men - on men who are held together with such difficulty and whom it is therefore scarcely possible to rule. It may be imagined how impossible human society would be, merely if everyone had his own multiplication table and his own private units of length and weight. Our best hope for the future is that intellect - the scientific spirit, reason - may in process of time establish a dictatorship in the mental life of man. The nature of reason is a guarantee that afterwards it will not fail to give man's emotional impulses and what is determined by them the position they deserve. But the common compulsion exercised by such a dominance of reason will prove to be the strongest uniting bond among men and lead the way to further unions. Whatever, like religion's prohibition against thought, opposes such a development, is a danger for the future of mankind. [1933a, 4769]
The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as 'phantasy'. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call 'reality-testing'. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfilments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. 'We cannot do without auxiliary constructions', as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of 'reservations' or 'nature reserves' in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

[1916-1917, 3427]

The ego takes a similar interest, however, in the development and maintenance of the neurosis in every other case. I have already shown that symptoms are supported by the ego, too, because they have a side with which they offer satisfaction to the repressing purpose of the ego. Moreover, settling the conflict by constructing a symptom is the most convenient way out and the one most agreeable to the pleasure principle: it unquestionably spares the ego a large amount of internal work which is felt as distressing. Indeed there are cases in which even the physician must admit that for a conflict to end in neurosis is the most harmless and socially tolerable solution. You must not be surprised to hear that even the physician may occasionally take the side of the illness he is combating. It is not his business to restrict himself in every situation in life to being a fanatic in favour of health. He knows that there is not only neurotic misery in the world but real, irremovable suffering as well, that necessity may even require a person to sacrifice his health; and he learns that a sacrifice of this kind made by a single person can prevent immeasurable unhappiness for many others. If we may say, then, that whenever a neurotic is faced by a conflict he takes flight into illness, yet we must allow that in some cases that flight is fully justified, and a physician who has recognized how the situation lies will silently and solicitously withdraw.

[1916-1917, 3435]
This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet’s authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. ‘We cannot do without auxiliary constructions’, as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends Candide with the advice to cultivate one’s garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

[1930a, 4474]

There is also an added factor of disappointment. During the last few generations mankind has made an extraordinary advance in the natural sciences and in their technical application and has established his control over nature in a way never before imagined. The single steps of this advance are common knowledge and it is unnecessary to enumerate them. Men are proud of those achievements, and have a right to be. But they seem to have observed that this newly-won power over space and time, this subjugation of the forces of nature, which is the fulfilment of a longing that goes back thousands of years, has not increased the amount of pleasurable satisfaction which they may expect from life and has not made them feel happier. From the recognition of this fact we ought to be content to conclude that power over nature is not the only precondition of human happiness, just as it is not the only goal of cultural endeavour; we ought not to infer from it that technical progress is without value for the economics of our happiness. One would like to ask: is there, then, no positive gain in pleasure, no unequivocal increase in my feeling of happiness, if I can, as often as I please, hear the voice of a child of mine who is living hundreds of miles away or if I can learn in the shortest possible time after a friend has reached his destination that he has come through the long and difficult voyage unharmed? Does it mean nothing that medicine has succeeded in enormously reducing infant mortality and the danger of infection for women in childbirth, and, indeed, in considerably lengthening the average life of a civilized man? And there is a long list that might be added to benefits of this kind which we owe to the much-despised era of scientific and technical advances. But here the voice of pessimistic criticism makes itself heard and warns us that most of these satisfactions follow the model of the ‘cheap enjoyment’ extolled in the anecdote - the enjoyment obtained by putting a bare leg from under the bedclothes on a cold winter night and drawing it in again. If there had been no railway to conquer distances, my child would never have left his native town and I should need no telephone to hear his voice; if travelling across the ocean by ship had not been introduced, my friend would not have embarked on his sea-voyage and I should not need a cable to relieve my anxiety about him. What is the use of reducing infantile mortality when it is precisely that reduction which imposes the greatest restraint on us in the begetting of children, so that, taken all round, we nevertheless rear no more children than in the days before the reign of hygiene, while at the same time we have created difficult conditions for our sexual life in marriage, and have probably worked against the beneficial effects of natural selection? And, finally, what good to us is a long life if it is difficult and barren of joys, and if it is so full of misery that we can only welcome death as a deliverer?

[1930a, 4486]
I hold firmly to a scientifically objective social assessment of ethics, and for that reason I should not wish to deny the excellent Philistine a certificate of good ethical conduct, even though it has cost him little self-discipline. But alongside of this I grant the validity of the subjective psychological view of ethics which you support. Though I agree with your judgement of the world and mankind as they are to-day, I cannot, as you know, regard your pessimistic dismissal of a better future as justified.
[1928b, 4570]

I return now to our topic. In face of the doubt whether the ego and super-ego are themselves unconscious or merely produce unconscious effects, we have, for good reasons, decided in favour of the former possibility. And it is indeed the case that large portions of the ego and super-ego can remain unconscious and are normally unconscious. That is to say, the individual knows nothing of their contents and it requires an expenditure of effort to make them conscious. It is a fact that ego and conscious, repressed and unconscious do not coincide. We feel a need to make a fundamental revision of our attitude to the problem of conscious-unconscious. At first we are inclined greatly to reduce the value of the criterion of being conscious since it has shown itself so untrustworthy. But we should be doing it an injustice. As may be said of our life, it is not worth much, but it is all we have. Without the illumination thrown by the quality of consciousness, we should be lost in the obscurity of depth-psychology; but we must attempt to find our bearings afresh.
[1933a, 4678]

My Dear Thomas Mann, Accept as a friend my affectionate greetings on your sixtieth birthday. I am one of your 'oldest' readers and admirers and I might wish you a very long and happy life as is the custom on such occasions. But I shall not do so. Wishing is cheap and strikes me as a relapse into the days when people believed in the magical omnipotence of thoughts. I think, too, from my most personal experience, that it is well if a compassionate fate sets a timely end to the length of our life.
[1935c, 4835]

¹ I do not share the opinion of my contemporary Bernard Shaw, that human beings would only achieve anything good if they could live to be three hundred years old. A prolongation of life would achieve nothing unless many other fundamental changes were to be made in the conditions of life.
[1939a, 4882]
It no longer seems possible to keep away from the study of what are known as 'occult' phenomena - of facts, that is, that profess to speak in favour of the real existence of psychical forces other than the human and animal minds with which we are familiar, or that seem to reveal the possession by those minds of faculties hitherto unrecognized. The impetus towards such an investigation seems irresistibly strong. During this last brief vacation I have three times had occasion to refuse to associate myself with newly founded periodicals concerned with these studies. Nor is there much doubt as to the origin of this trend. It is a part expression of the loss of value by which everything has been affected since the world catastrophe of the Great War, a part of the tentative approach to the great revolution towards which we are heading and of whose extent we can form no estimate; but no doubt it is also an attempt at compensation, at making up in another, a supermundane, sphere for the attractions which have been lost by life on this earth. Some, indeed, of the proceedings of the exact sciences themselves may have contributed to this development. The discovery of radium has confused no less than it has advanced the possibilities of explaining the physical world; and the knowledge that has been so very recently acquired of what is called the theory of relativity has had the effect upon many of those who admire without comprehending it of diminishing their belief in the objective trustworthiness of science. You will remember that not long ago Einstein himself took occasion to protest against such misunderstanding.

But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.
Education freed from the burden of religious doctrines will not, it may be, effect much change in men's psychological nature. Our god Λσγοξ is perhaps not a very almighty one, and he may only be able to fulfil a small part of what his predecessors have promised. If we have to acknowledge this we shall accept it with resignation. We shall not on that account lose our interest in the world and in life, for we have one sure support which you lack. We believe that it is possible for scientific work to gain some knowledge about the reality of the world, by means of which we can increase our power and in accordance with which we can arrange our life. If this belief is an illusion, then we are in the same position as you. But science has given us evidence by its numerous and important successes that it is no illusion. Science has many open enemies, and many more secret ones, among those who cannot forgive her for having weakened religious faith and for threatening to overthrow it. She is reproached for the smallness of the amount she has taught us and for the incomparably greater field she has left in obscurity. But, in this, people forget how young she is, how difficult her beginnings were and how infinitesimally small is the period of time since the human intellect has been strong enough for the tasks she sets. Are we not all at fault, in basing our judgements on periods of time that are too short? We should make the geologists our pattern. People complain of the unreliability of science - how she announces as a law to-day what the next generation recognizes as an error and replaces by a new law whose accepted validity lasts no longer. But this is unjust and in part untrue. The transformations of scientific opinion are developments, advances, not revolutions. A law which was held at first to be universally valid proves to be a special case of a more comprehensive uniformity, or is limited by another law, not discovered till later; a rough approximation to the truth is replaced by a more carefully adapted one, which in turn awaits further perfectioning. There are various fields where we have not yet surmounted a phase of research in which we make trial with hypotheses that soon have to be rejected as inadequate; but in other fields we already possess an assured and almost unalterable core of knowledge. Finally, an attempt has been made to discredit scientific endeavour in a radical way, on the ground that, being bound to the conditions of our own organization, it can yield nothing else than subjective results, whilst the real nature of things outside ourselves remains inaccessible. But this is to disregard several factors which are of decisive importance for the understanding of scientific work. In the first place, our organization - that is, our mental apparatus - has been developed precisely in the attempt to explore the external world, and it must therefore have realized in its structure some degree of expediency; in the second place, it is itself a constituent part of the world which we set out to investigate, and it readily admits of such an investigation; thirdly, the task of science is fully covered if we limit it to showing how the world must appear to us in consequence of the particular character of our organization; fourthly, the ultimate findings of science, precisely because of the way in which they are acquired, are determined not only by our organization but by the things which have affected that organization; finally, the problem of the nature of the world without regard to our percipient mental apparatus is an empty abstraction, devoid of practical interest.

No, our science is no illusion. But an illusion it would be to suppose that what science cannot give us we can get elsewhere.
There is also an added factor of disappointment. During the last few generations mankind has made an extraordinary advance in the natural sciences and in their technical application and has established his control over nature in a way never before imagined. The single steps of this advance are common knowledge and it is unnecessary to enumerate them. Men are proud of those achievements, and have a right to be. But they seem to have observed that this newly-won power over space and time, this subjugation of the forces of nature, which is the fulfilment of a longing that goes back thousands of years, has not increased the amount of pleasurable satisfaction which they may expect from life and has not made them feel happier. From the recognition of this fact we ought to be content to conclude that power over nature is not the only precondition of human happiness, just as it is not the only goal of cultural endeavour; we ought not to infer from it that technical progress is without value for the economics of our happiness. One would like to ask: is there, then, no positive gain in pleasure, no unequivocal increase in my feeling of happiness, if I can, as often as I please, hear the voice of a child of mine who is living hundreds of miles away or if I can learn in the shortest possible time after a friend has reached his destination that he has come through the long and difficult voyage unharmed? Does it mean nothing that medicine has succeeded in enormously reducing infant mortality and the danger of infection for women in childbirth, and, indeed, in considerably lengthening the average life of a civilized man? And there is a long list that might be added to benefits of this kind which we owe to the much-despised era of scientific and technical advances. But here the voice of pessimistic criticism makes itself heard and warns us that most of these satisfactions follow the model of the 'cheap enjoyment' extolled in the anecdote - the enjoyment obtained by putting a bare leg from under the bedclothes on a cold winter night and drawing it in again. If there had been no railway to conquer distances, my child would never have left his native town and I should need no telephone to hear his voice; if travelling across the ocean by ship had not been introduced, my friend would not have embarked on his sea-voyage and I should not need a cable to relieve my anxiety about him. What is the use of reducing infantile mortality when it is precisely that reduction which imposes the greatest restraint on us in the begetting of children, so that, taken all round, we nevertheless rear no more children than in the days before the reign of hygiene, while at the same time we have created difficult conditions for our sexual life in marriage, and have probably worked against the beneficial effects of natural selection? And, finally, what good to us is a long life if it is difficult and barren of joys, and if it is so full of misery that we can only welcome death as a deliverer?

These things that, by his science and technology, man has brought about on this earth, on which he first appeared as a feeble animal organism and on which each individual of his species must once more make its entry ('oh inch of nature!') as a helpless suckling - these things do not only sound like a fairy tale, they are an actual fulfilment of every - or of almost every - fairy-tale wish. All these assets he may lay claim to as his cultural acquisition. Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods. To these gods he attributed everything that seemed unattainable to his wishes, or that was forbidden to him. One may say, therefore, that these gods were cultural ideals. To-day he has come very close to the attainment of this ideal, he has almost become a god himself. Only, it is true, in the fashion in which ideals are usually attained according to the general judgement of humanity. Not completely; in some respects not at all, in others only half way. Man has, as it were, become a kind of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times. Nevertheless, he is entitled to console himself with the thought that this development will not come to an end precisely with the year 1930 A.D. Future ages will bring with them new and probably unimaginably great advances in this field of civilization and will increase man's likeness to God still more. But in the interests of our investigations, we will not forget that present-day man does not feel happy in his Godlike character.
SEXUAL INHIBITIONS   It is during this period of total or only partial latency that are built up the mental forces which are later to impede the course of the sexual instinct and, like dams, restrict its flow - disgust, feelings of shame and the claims of aesthetic and moral ideals. One gets an impression from civilized children that the construction of these dams is a product of education, and no doubt education has much to do with it. But in reality this development is organically determined and fixed by heredity, and it can occasionally occur without any help at all from education. Education will not be trespassing beyond its appropriate domain if it limits itself to following the lines which have already been laid down organically and to impressing them somewhat more clearly and deeply.

[1905d, 1500]

INTERRUPTIONS OF THE LATENCY PERIOD   We must not deceive ourselves as to the hypothetical nature and insufficient clarity of our knowledge concerning the processes of the infantile period of latency or deferment; but we shall be on firmer ground in pointing out that such an application of infantile sexuality represents an educational ideal from which individual development usually diverges at some point and often to a considerable degree. From time to time a fragmentary manifestation of sexuality which has evaded sublimation may break through; or some sexual activity may persist through the whole duration of the latency period until the sexual instinct emerges with greater intensity at puberty. In so far as educators pay any attention at all to infantile sexuality, they behave exactly as though they shared our views as to the construction of the moral defensive forces at the cost of sexuality, and as though they knew that sexual activity makes a child ineducable: for they stigmatize every sexual manifestation by children as a 'vice', without being able to do much against it. We, on the other hand, have every reason for turning our attention to these phenomena which are so much dreaded by education, for we may expect them to help us to discover the original configuration of the sexual instincts.

[1905d, 1501]

The cruel component of the sexual instinct develops in childhood even more independently of the sexual activities that are attached to erotogenic zones. Cruelty in general comes easily to the childish nature, since the obstacle that brings the instinct for mastery to a halt at another person's pain - namely a capacity for pity - is developed relatively late. The fundamental psychological analysis of this instinct has, as we know, not yet been satisfactorily achieved. It may be assumed that the impulse of cruelty arises from the instinct for mastery and appears at a period of sexual life at which the genitals have not yet taken over their later role. It then dominates a phase of sexual life which we shall later describe as a pregenital organization. Children who distinguish themselves by special cruelty towards animals and playmates usually give rise to a just suspicion that sexual activity makes a child ineducable: for they stigmatize every sexual manifestation by children as a ‘vice’, without being able to do much against it. We, on the other hand, have every reason for turning our attention to these phenomena which are so much dreaded by education, for we may expect them to help us to discover the original configuration of the sexual instincts.

[1905d, 1512]

² [Footnote added 1910:] The analysis of cases of neurotic abasia and agoraphobia removes all doubt as to the sexual nature of pleasure in movement. Modern education, as we know, makes great use of games in order to divert young people from sexual activity. It would be more correct to say that in these young people it replaces sexual enjoyment by pleasure in movement - and forces sexual activity back to one of its auto-erotic components.

[1905d, 1521]
There is, however, another angle from which you may seek to understand the psycho-analytic method. The uncovering and translating of the unconscious occurs in the face of a continuous resistance on the part of the patient. The process of bringing this unconscious material to light is associated with unpleasure, and because of this the patient rejects it again and again. It is for you then to interpose in this conflict in the patient's mental life. If you succeed in persuading him to accept, by virtue of a better understanding, something that up to now, in consequence of this automatic regulation by unpleasure, he has rejected (repressed), you will have accomplished something towards his education. For it is education even to induce someone who dislikes getting up early to do so all the same. Psycho-analytic treatment may in general be conceived of as such a re-education in overcoming internal resistances. Re-education of this kind is, however, in no respect more necessary to nervous patients than in regard to the mental element in their sexual life. For nowhere else have civilization and education done so much harm as in this field, and this is the point, as experience will show you, at which to look for those aetiologies of the neuroses that are amenable to influence; for the other aetiological factor, the constitutional component, consists of something fixed and unalterable. And from this it follows that one important qualification is required of the physician in this work: not only must his own character be irreprouachable - 'As to morals, that goes without saying', as the hero of Vischer's novel Auch Einer was in the habit of declaring - but he must also have overcome in his own mind that mixture of prurience and prudery with which, unfortunately, so many people habitually consider sexual problems.

[1905a, 1571]

The second case, in which the comic depends entirely on 'empathy', includes the most numerous possibilities - the comic of situation, of exaggeration (caricature), of mimicry, of degradation and of unmasking. This is the case in which the introduction of the infantile point of view proves most useful. For the comic of situation is mostly based on embarrassments, in which we rediscover the child's helplessness. The worst of the embarrassments, the interference by the peremptory demands of natural needs with other functions, corresponds to the child's incomplete control over his bodily functions. Where the comic of situation operates by means of repetitions, it is based on the child's peculiar pleasure in constant repetition (of questions or of being told stories) which make him a nuisance to the adult. Exaggeration, which still gives pleasure to adults in so far as it can find justification with their critical faculty, is connected with the child's peculiar lack of a sense of proportion, his ignorance of all quantitative relations, which he comes to know later than qualitative ones. The use of moderation and restraint, even in the case of permitted impulses, is a late fruit of education and is acquired by the mutual inhibition of mental activities brought together in a combination. Where such combinations are weakened, as in the unconscious of dreams or in the mono-ideism of psychoneuroses, the child's lack of moderation re-emerges.

[1905c, 1801]

There does not seem to me to be a single good reason for denying children the enlightenment which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child's power of independent thought as early as possible, in favour of the 'goodness' which they think so much of, they cannot set about this better than by deceiving him in sexual matters and intimidating him in matters of religion. The stronger natures will, it is true, withstand these influences and become rebels against the authority of their parents and later against every other authority. If children are not given the explanations for which they turn to their elders, they go on tormenting themselves with the problem in secret and produce attempts at solution in which the truth they have guessed is mingled in the most extraordinary way with grotesque untruths; or they whisper information to one another in which, because of the young enquirers' sense of guilt, everything sexual is stamped as being horrible and disgusting. These infantile sexual theories would be well worth collecting and examining. From this time on, children usually lose the only proper attitude to sexual questions, and many of them never regain it.

[1907c, 1917]
I consider it the most significant advance in child education that in France the State should have introduced, in place of the catechism, a primer which gives the child his first instruction in his position as a citizen and in the ethical duties which will later devolve on him. But such elementary instruction is seriously deficient, so long as it does not include the field of sexuality. Here is the gap which educators and reformers should set about filling. In countries which have placed the education of children wholly or in part in the hands of the clergy, it will, of course, be impossible to ask for this. A priest will never admit that men and animals have the same nature, since he cannot do without the immortality of the soul, which he requires as the basis for moral precepts. Here, once again, we see the unwisdom of sewing a single silk patch on to a tattered coat - the impossibility of carrying out an isolated reform without altering the foundations of the whole system.

The retardation of sexual development and sexual activity at which our education and civilization aim is certainly not injurious to begin with. It is seen to be a necessity, when one considers the late age at which young people of the educated classes reach independence and are able to earn a living. (This reminds one, incidentally, of the intimate interconnection between all our cultural institutions and of the difficulty of altering any part of them without regard to the whole.) But abstinence continued long after the age of twenty is no longer unobjectionable for a young man; and it leads to other damage even when it does not lead to neurosis. People say, to be sure, that the struggle against such a powerful instinct, and the strengthening of all the ethical and aesthetic forces which are necessary for this struggle, 'steel' the character; and this is true for a few specially favourably organized natures. It must also be admitted that the differentiation of individual character, which is so marked in our day, has only become possible with the existence of sexual restriction. But in the vast majority of cases the struggle against sexuality eats up the energy available in a character and this at the very time when a young man is in need of all his forces in order to win his share and place in society. The relationship between the amount of sublimation possible and the amount of sexual activity necessary naturally varies very much from person to person and even from one calling to another. An abstinent artist is hardly conceivable; but an abstinent young savant is certainly no rarity. The latter can, by his self-restraint, liberate forces for his studies; while the former probably finds his artistic achievements powerfully stimulated by his sexual experience. In general I have not gained the impression that sexual abstinence helps to bring about energetic and self-reliant men of action or original thinkers or bold emancipators and reformers. Far more often it goes to produce well-behaved weaklings who later become lost in the great mass of people that tends to follow, unwillingly, the leads given by strong individuals.
The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

[1908d, 1959]

I shall now proceed to examine this observation of the development and resolution of a phobia in a boy under five years of age, and I shall have to do so from three points of view. In the first place I shall consider how far it supports the assertions which I put forward in my Three Essays on the Theory of Sexuality (1905d). Secondly, I shall consider to what extent it can contribute towards our understanding of this very frequent form of disorder. And thirdly, I shall consider whether it can be made to shed any light upon the mental life of children or to afford any criticism of our educational aims.

[1909b, 2087]

Little Hans is described by his parents as a cheerful, straightforward child, and so he should have been, considering the education given him by his parents, which consisted essentially in the omission of our usual educational sins. So long as he was able to carry on his researches in a state of happy naïveté, without a suspicion of the conflicts which were soon to arise out of them, he kept nothing back; and the observations made during the period before the phobia admit of no doubt or demur. It was with the outbreak of the illness and during the analysis that discrepancies began to make their appearance between what he said and what he thought; and this was partly because unconscious material, which he was unable to master all at once, was forcing itself upon him, and partly because the content of his thoughts provoked reservations on account of his relation to his parents. It is my unbiased opinion that these difficulties, too, turned out no greater than in many analyses of adults.

[1909b, 2089]
That no sharp line can be drawn between ‘neurotic’ and ‘normal’ people - whether children or adults - that our conception of ‘disease’ is a purely practical one and a question of summation, that predisposition and the eventualities of life must combine before the threshold of this summation is overstepped, and that consequently a number of individuals are constantly passing from the class of healthy people into that of neurotic patients, while a far smaller number also make the journey in the opposite direction, - all of these are things which have been said so often and have met with so much agreement that I am certainly not alone in maintaining their truth. It is, to say the least of it, extremely probable that a child's upbringing can exercise a powerful influence for good or for evil upon the predisposition which we have just mentioned as one of the factors in the occurrence of ‘disease’; but what that upbringing is to aim at and at what point it is to be brought to bear seem at present to be very doubtful questions. Hitherto education has only set itself the task of controlling, or, it would often be more proper to say, of suppressing, the instincts. The results have been by no means gratifying, and where the process has succeeded it has only been to the advantage of a small number of favoured individuals who have not been required to suppress their instincts. Nor has any one enquired by what means and at what cost the suppression of the inconvenient instincts has been achieved. Supposing now that we substitute another task for this one, and aim instead at making the individual capable of becoming a civilized and useful member of society with the least possible sacrifice of his own activity; in that case the information gained by psycho-analysis, upon the origin of pathogenic complexes and upon the nucleus of every nervous affection, can claim with justice that it deserves to be regarded by educators as an invaluable guide in their conduct towards children. What practical conclusions may follow from this, and how far experience may justify the application of those conclusions within our present social system, are matters which I leave to the examination and decision of others.

[1909b, 2122]

It is inevitable and perfectly normal that a child should take his parents as the first objects of his love. But his libido should not remain fixated to these first objects; later on, it should merely take them as a model, and should make a gradual transition from them on to extraneous people when the time for the final choice of an object arrives. The detachment of the child from his parents is thus a task that cannot be evaded if the young individual's social fitness is not to be endangered. During the time at which repression is making its selection among the component instincts, and later, when there should be a slackening of the parents' influence, which is essentially responsible for the expenditure of energy on these repressions, the task of education meets with great problems, which at the present time are certainly not always dealt with in an understanding and unobjectionable manner.

[1910a, 2233]
When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

[1910c, 2256]

Gentlemen, - You have all listened with much satisfaction to the plea put forward by an educationalist who will not allow an unjustified charge to be levelled against the institution that is so dear to him. But I know that in any case you were not inclined to give easy credence to the accusation that schools drive their pupils to suicide. Do not let us be carried too far, however, by our sympathy with the party which has been unjustly treated in this instance. Not all the arguments put forward by the opener of the discussion seem to me to hold water. If it is the case that youthful suicide occurs not only among pupils in secondary schools but also among apprentices and others, this fact does not acquit the secondary schools; it must perhaps be interpreted as meaning that as regards its pupils the secondary school takes the place of the traumas with which other adolescents meet in other walks of life. But a secondary school should achieve more than not driving its pupils to suicide. It should give them a desire to live and should offer them support and backing at a time of life at which the conditions of their development compel them to relax their ties with their parental home and their family. It seems to me indisputable that schools fail in this, and in many respects fall short of their duty of providing a substitute for the family and of arousing interest in life in the world outside. This is not a suitable occasion for a criticism of secondary schools in their present shape; but perhaps I may emphasize a single point. The school must never forget that it has to deal with immature individuals who cannot be denied a right to linger at certain stages of development and even at certain disagreeable ones. The school must not take on itself the inexorable character of life: it must not seek to be more than a game of life.

[1910g, 2381]

(5) Education can be described without more ado as an incitement to the conquest of the pleasure principle, and to its replacement by the reality principle; it seeks, that is, to lend its help to the developmental process which affects the ego. To this end it makes use of an offer of love as a reward from the educators; and it therefore fails if a spoilt child thinks that it possesses that love in any case and cannot lose it whatever happens.

[1911b, 2556]
Education and therapeutics stand in an assignable relation to each other. Education seeks to ensure that certain of a child's dispositions and inclinations shall not cause any damage either to the individual or to society. Therapeutics come into action if these same dispositions have already led to the unwished-for result of pathological symptoms. The alternative outcome - of the child's unserviceable dispositions leading, not to substitutes in the form of symptoms, but to direct perversions of character - is almost inaccessible to therapeutics and as a rule beyond the influence of an educator. Education is a prophylaxis, which is intended to obviate both outcomes - neurosis and perversion alike; psychotherapy seeks, to undo the less stable of the two outcomes and to institute a kind of after-education.

In view of this position of affairs, the question automatically arises whether psycho-analysis should not be used for educative purposes just as hypnotic suggestion was in the past. The advantages would be obvious. The educator would, on the one hand, be prepared by his knowledge of the general human dispositions of childhood to judge which of those dispositions are threatening to lead to an undesirable outcome; and, if psycho-analysis can influence the course taken by such developments, he could bring it into use before the signs of an unfavourable development set in. Thus, with the help of analysis, he could have a prophylactic influence on the child while it was still healthy. On the other hand, he could detect the first indications of a development in the direction of neurosis and could guard the child against its further development at a time at which, for various reasons, a child is never taken to see a doctor. One cannot but think that a psycho-analytic activity such as this on the part of the educator - and of the similarly placed pastoral worker in protestant countries - would inevitably be of inestimable value and might often make the intervention of a doctor unnecessary.

Let us hope that the application of psycho-analysis to the service of education will quickly fulfil the hopes which educators and doctors may rightly attach to it. A book such as this of Pfister's, which seeks to acquaint educators with analysis, will then be able to count on the gratitude of later generations.

The overmastering interest which must be felt in psycho-analysis by the theory of education is based upon a fact which has become evident. Only someone who can feel his way into the minds of children can be capable of educating them; and we grown-up people cannot understand children because we no longer understand our own childhood. Our infantile amnesia proves that we have grown estranged from our childhood. Psycho-analysis has brought to light the wishes, the thought structures and the developmental processes of childhood. All earlier attempts in this direction have been in the highest degree incomplete and misleading because they have entirely overlooked the inestimably important factor of sexuality in its physical and mental manifestations. The incredulous astonishment which meets the most certainly established findings of psycho-analysis on the subject of childhood - the Oedipus complex, self-love (or 'narcissism'), the disposition to perversions, anal erotism, sexual curiosity - is a measure of the gulf which separates our mental life, our judgements of value and, indeed, our processes of thought from those of even normal children.
When educators have become familiar with the findings of psycho-analysis, it will be easier for them to reconcile themselves to certain phases of infantile development and they will, among other things, not be in danger of over-estimating the importance of the socially unserviceable or perverse instinctual impulses which emerge in children. On the contrary they will refrain from any attempt at forcibly suppressing such impulses, when they learn that efforts of this kind often produce no less undesirable results than the alternative, which is so much dreaded by educators, of giving free play to children's naughtiness. The forcible suppression of strong instincts by external means never has the effect in a child of these instincts being extinguished or brought under control; it leads to repression, which establishes a predisposition to later nervous illness. Psycho-analysis has frequent opportunities of observing the part played by inopportune and undiscerning severity of upbringing in the production of neuroses, or the price, in loss of efficiency and of capacity for enjoyment, which has to be paid for the normality upon which the educator insists. And psycho-analysis can also show what precious contributions to the formation of character are made by these asocial and perverse instincts in the child, if they are not subjected to repression but are diverted from their original aims to more valuable ones by the process known as 'sublimation'. Our highest virtues have grown up, as reaction formations and sublimations, out of our worst dispositions. Education should scrupulously refrain from burying these precious springs of action and should restrict itself to encouraging the processes by which these energies are led along safe paths. Whatever we can expect in the way of prophylaxis against neurosis in the individual lies in the hands of a psycho-analytically enlightened education.¹

[1913j, 2825]

The revolutionary discoveries of psycho-analysis in regard to the mental life of children - the part played in it by sexual impulses (von Hug-Hellmuth), and the fate of those components of sexuality which become unserviceable in the function of reproduction - were bound early to direct attention to education and to stimulate an attempt to bring analytic points of view into the foreground in that field of work. Recognition is due to Dr. Pfister for having, with sincere enthusiasm, initiated the application of psycho-analysis in this direction and brought it to the notice of ministers of religion and those concerned with education. (Cf. The Psycho-Analytic Method, 1913.) He has succeeded in gaining the sympathy and participation of a number of Swiss teachers in this. Other members of his profession are said to share his views but to have preferred nevertheless to remain cautiously in the background. In their retreat from psycho-analysis, a section of Vienna analysts seem to have arrived at a kind of combination of medicine and education.¹

[1914d, 2903]

Let us begin with the second point and try to formulate, in a few brief words, the point of view that we wish to criticize. How, in point of fact, do we imagine the process by which an individual rises to a comparatively high plane of morality? The first answer will no doubt simply be that he is virtuous and noble from birth - from the very start. We shall not consider this view any further here. A second answer will suggest that we are concerned with a developmental process, and will probably assume that the development consists in eradicating his evil human tendencies and, under the influence of education and a civilized environment, replacing them by good ones. If so, it is nevertheless surprising that evil should re-emerge with such force in anyone who has been brought up in this way.

[1915b, 3073]
At all events you will now see the perversions in a new light and no longer fail to realize their
connection with the sexual life of human beings: but at the price of what surprises and of what
feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the
whole business: the fact that children have anything that can be described as sexual life, the
correctness of our observations and the justification for finding any kinship between the behaviour
of children and what is later condemned as perversion. So allow me to begin by explaining to you
the motives for your opposition, and then to present you with the sum of our observations. To
suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction
- but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any
observations) be as improbable, and indeed senseless, biologically as to suppose that they
brought no genitals with them into the world and only grew them at the time of puberty. What
does awaken in them at this time is the reproductive function, which makes use for its purposes
of physical and mental material already present. You are committing the error of confusing
sexuality and reproduction and by doing so you are blocking your path to an understanding of
sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely
enough, it has its source in the fact that you yourselves were once children and, while you were
children, came under the influence of education. For society must undertake as one of its most
important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to
reproduction, and to subject it to an individual will which is identical with the bidding of society. It
is also concerned to postpone the full development of the instinct till the child shall have reached
a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct,
educability is for practical purposes at an end. Otherwise, the instinct would break down every
dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever
an easy one; its success is sometimes too small, sometimes too great. The motive of human
society is in the last resort an economic one; since it does not possess enough provisions to keep
its members alive unless they work, it must restrict the number of its members and divert their
energies from sexual activity to work. It is faced, in short, by the eternal, primate exigencies of
life, which are with us to this day.
[1916-1917, 3382]

Experience must no doubt have taught the educators that the task of making the sexual will of
the new generation tractable could only be carried out if they began to exercise their influence
very early, if they did not wait for the storm of puberty but intervened already in the sexual life of
children which is preparatory to it. For this reason almost all infantile sexual activities were
forbidden to children and frowned upon; an ideal was set up of making the life of children asexual,
and in course of time came to the point at which people really believed they were asexual
and thereafter science pronounced this as its doctrine. To avoid contradicting their belief and their
intentions, people since then overlook the sexual activities of children (no mean achievement) or
are content in science to take a different view of them. Children are pure and innocent, and
anyone who describes them otherwise can be charged with being an infamous blasphemer
against the tender and sacred feelings of mankind.
[1916-1917, 3383]

Children are alone in not falling in with these conventions. They assert their animal rights with
complete naïveté and give constant evidence that they have still to travel the road to purity.
Strangely enough, the people who deny the existence of sexuality in children do not on that
account become milder in their educational efforts but pursue the manifestations of what they
deny exists with the utmost severity - describing them as ‘childish naughtinesses’. It is also of the
highest theoretical interest that the period of life which contradicts the prejudice of an asexual
childhood most glaringly - the years of a child’s life up to the age of five or six - is afterwards
covered in most people by the veil of amnesia which is only completely torn away by an analytic
enquiry, though it has been permeable earlier for the construction of a few dreams.
[1916-1917, 3383]
In forming this opinion of sensual sucking we have already become acquainted with two
decisive characteristics of infantile sexuality. It makes its appearance attached to the satisfaction
of the major organic needs, and it behaves *auto-erotically* - that is, it seeks and finds its objects in
the infant's own body. What has been shown most clearly in connection with the intake of
nourishment is repeated in part with the excretions. We conclude that infants have feelings of
pleasure in the process of evacuating urine and faeces and that they soon contrive to arrange
those actions in such a way as to bring them the greatest possible yield of pleasure through the
corresponding excitations of the erotogenic zones of the mucous membrane. It is here for the first
time (as Lou Andreas-Salomé has subtly perceived) that they encounter the external world as an
inhibiting power, hostile to their desire for pleasure, and have a glimpse of later conflicts both
external and internal. An infant must not produce his excreta at whatever moment he chooses,
but when other people decide that he shall. In order to induce him to forgo these sources of
pleasure, he is told that everything that has to do with these functions is improper and must be
kept secret. This is where he is first obliged to exchange pleasure for social respectability. To
begin with, his attitude to his excreta themselves is quite different. He feels no disgust at his
faeces, values them as a portion of his own body with which he will not readily part, and makes
use of them as his first 'gift', to distinguish people whom he values especially highly. Even after
education has succeeded in its aim of making these inclinations alien to him, he carries on his
high valuation of faeces in his estimate of 'gifts' and 'money'. On the other hand he seems to
regard his achievements in urinating with peculiar pride.
[1916-1917, 3385]

Now it is a very noteworthy fact that the sexual instincts and the self-preservative instincts do
not behave in the same way towards real necessity. The self-preservative instincts, and
everything to do with them, are much easier to educate: they learn early to comply with necessity
and to arrange their developments in accordance with the instructions of reality. This is
intelligible, since they could not obtain the objects they need in any other way; and without those
objects the individual would inevitably perish. The sexual instincts are harder to educate, for at
first they have no need of an object. Since they are attached like parasites, as it were, to the other
bodily functions, and find their satisfaction auto-erotically on the subject's own body, they are to
begin with withdrawn from the educative influence of real necessity, and they retain this
characteristic of being self-willed and inaccessible to influence (what we describe as being
'unreasonable') in most people in some respect all through their lives. Moreover, as a rule the
educability of a youthful individual is at an end when his sexual needs arise in their full strength.
Educators are aware of this and act accordingly; but the findings of psycho-analysis may perhaps
also induce them to shift the main impact of education on to the earliest years of childhood, from
infancy onwards. The little creature is often completed by the fourth or fifth year of life, and after
that merely brings gradually to light what is already within him.
[1916-1917, 3415]
These facts have a certain interest from the point of view of education, which plans the prevention of neuroses by intervening at an early stage in children's sexual development. So long as one focuses attention principally on infantile sexual experiences, one must suppose that one has done everything for the prophylaxis of nervous illnesses by taking care that the child's development is delayed and that it is spared experiences of the sort. We already know, however, that the preconditions for the causation of neuroses are complex and cannot be influenced in general if we take account of only a single factor. Strict protection of the young loses value because it is powerless against the constitutional factor. Besides, it is more difficult to carry out than educationists imagine and it brings with it two fresh dangers which must not be underestimated: the fact that it may achieve too much - that it may encourage an excess of sexual repression, with damaging results, and the fact that it may send the child out into life without any defence against the onrush of sexual demands that is to be looked for at puberty. Thus it remains extremely doubtful how far prophylaxis in childhood can be carried with advantage and whether an altered attitude to the immediate situation may not offer a better angle of approach for the prevention of neuroses.

I do not know how often parents and educators, faced with inexplicable naughtiness on the part of a child, might not have occasion to bear this typical state of affairs in mind. A child who behaves in this unmanageable way is making a confession and trying to provoke punishment. He hopes for a beating as a simultaneous means of setting his sense of guilt at rest and of satisfying his masochistic sexual trend.

Apart from these pathological phenomena, it may be said that in the present case religion achieved all the aims for the sake of which it is included in the education of the individual. It put a restraint on his sexual impulses by affording them a sublimation and a safe mooring; it lowered the importance of his family relationships, and thus protected him from the threat of isolation by giving him access to the great community of mankind. The untamed and fear-ridden child became social, well-behaved, and amenable to education.

None of the applications of psycho-analysis has excited so much interest and aroused so many hopes, and none, consequently, has attracted so many capable workers, as its use in the theory and practice of education. It is easy to understand why; for children have become the main subject of psycho-analytic research and have thus replaced in importance the neurotics on whom its studies began. Analysis has shown how the child lives on, almost unchanged, in the sick man as well as in the dreamer and the artist; it has thrown light on the motive forces and trends which set its characteristic stamp upon the childish nature; and it has traced the stages through which a child grows to maturity. No wonder, therefore, if an expectation has arisen that psycho-analytic concern with children will benefit the work of education, whose aim it is to guide and assist children on their forward path and to shield them from going astray.
The second lesson has a somewhat conservative ring. It is to the effect that the work of education is something *sui generis*: it is not to be confused with psycho-analytic influence and cannot be replaced by it. Psycho-analysis can be called in by education as an auxiliary means of dealing with a child; but it is not a suitable substitute for education. Not only is such a substitution impossible on practical grounds but it is also to be disrecommended for theoretical reasons. The relation between education and psycho-analytic treatment will probably before long be the subject of a detailed investigation. Here I will only give a few hints. One should not be misled by the statement - incidentally a perfectly true one - that the psycho-analysis of an adult neurotic is equivalent to an after-education. A child, even a wayward and delinquent child, is still not a neurotic; and after-education is something quite different from the education of the immature. The possibility of analytic influence rests on quite definite preconditions which can be summed up under the term 'analytic situation'; it requires the development of certain psychical structures and a particular attitude to the analyst. Where these are lacking - as in the case of children, of juvenile delinquents, and, as a rule, of impulsive criminals - something other than analysis must be employed, though something which will be at one with analysis in its *purpose*. The theoretical chapters of the present volume will give the reader a preliminary grasp of the multiplicity of the decisions involved.

[1925f, 4168]

I will end with a further inference, and this time one which is important not for the theory of education but for the status of those who are engaged in education. If one of these has learnt analysis by experiencing it on his own person and is in a position of being able to employ it in borderline and mixed cases to assist him in his work, he should obviously be given the right to practise analysis, and narrow-minded motives should not be allowed to try to put obstacles in his way.

[1925f, 4168]
But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they must be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeble-mindedness' - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

[1927c, 4455]
That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the instincts. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken - one knows so little about other civilizations - there are even to-day peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion - the same sanctity, rigidity and intolerance, the same prohibition of thought - for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life-tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years - which is exactly what you reproach religion with doing to-day. Do you not observe that it is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, the making of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master the task set before it. Such, then, are the prospects for your "primacy of the intellect".

That the education of young people at the present day conceals from them the part which sexuality will play in their lives is not the only reproach which we are obliged to make against it. Its other sin is that it does not prepare them for the aggressiveness of which they are destined to become the objects. In sending the young out into life with such a false psychological orientation, education is behaving as though one were to equip people starting on a Polar expedition with summer clothing and maps of the Italian Lakes. In this it becomes evident that a certain misuse is being made of ethical demands. The strictness of those demands would not do so much harm if education were to say: 'This is how men ought to be, in order to be happy and to make others happy; but you have to reckon on their not being like that.' Instead of this the young are made to believe that everyone else fulfils those ethical demands - that is, that everyone else is virtuous. It is on this that the demand is based that the young, too, shall become virtuous.
But let us return to the super-ego. We have allotted it the functions of self-observation, of conscience and of the ideal. It follows from what we have said about its origin that it presumes an immensely important biological fact and a fateful psychological one: namely, the human child's long dependence on its parents and the Oedipus complex, both of which, again, are intimately interconnected. The super-ego is the representative for us of every moral restriction, the advocate of a striving towards perfection - it is, in short, as much as we have been able to grasp psychologically of what is described as the higher side of human life. Since it itself goes back to the influence of parents, educators and so on, we learn still more of its significance if we turn to those who are its sources. As a rule parents and authorities analogous to them follow the precepts of their own super-egos in educating children. Whatever understanding their ego may have come to with their super-ego, they are severe and exacting in educating children. They have forgotten the difficulties of their own childhood and they are glad to be able now to identify themselves fully with their own parents who in the past laid such severe restrictions upon them. Thus a child's super-ego is in fact constructed on the model not of its parents but of its parents' super-ego; the contents which fill it are the same and it becomes the vehicle of tradition and of all the time-resisting judgements of value which have propagated themselves in this manner from generation to generation. You may easily guess what important assistance taking the super-ego into account will give us in our understanding of the social behaviour of mankind - in the problem of delinquency, for instance - and perhaps even what practical hints on education. It seems likely that what are known as materialistic views of history sin in under-estimating this factor. They brush it aside with the remark that human 'ideologies' are nothing other than the product and superstructure of their contemporary economic conditions. That is true, but very probably not the whole truth. Mankind never lives entirely in the present. The past, the tradition of the race and of the people, lives on in the ideologies of the super-ego, and yields only slowly to the influences of the present and to new changes; and so long as it operates through the super-ego it plays a powerful part in human life, independently of economic conditions.

[1933a, 4676]

You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitorial masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

[1933a, 4729]
But there is one topic which I cannot pass over so easily - not, however, because I understand particularly much about it or have contributed very much to it. Quite the contrary: I have scarcely concerned myself with it at all. I must mention it because it is so exceedingly important, so rich in hopes for the future, perhaps the most important of all the activities of analysis. What I am thinking of is the application of psycho-analysis to education, to the upbringing of the next generation. I am glad that I am at least able to say that my daughter, Anna Freud, has made this study her life-work and has in that way compensated for my neglect.

[1933a, 4746]

The road that led to this application is easily traced. When in the treatment of an adult neurotic we followed up the determinants of his symptoms, we were regularly led back to his early childhood. A knowledge of the later aetiological factors was not sufficient either for understanding the case or for producing a therapeutic effect. We were therefore compelled to make ourselves acquainted with the psychical peculiarities of childhood; we learnt a quantity of things which could not have been learnt except through analysis, and we were able to put right many opinions that were generally held about childhood. We recognized that particular importance attached to the first years of childhood - up to the age of five, perhaps - for several reasons. Firstly, because those years include the early efflorescence of sexuality which leaves behind it decisive instigating factors for the sexual life of maturity. Secondly, because the impressions of this period impinge upon an immature and feeble ego, and act upon it like traumas. The ego cannot fend off the emotional storms which they provoke in any way except by repression and in this manner acquires in childhood all its dispositions to later illnesses and functional disturbances. We realized that the difficulty of childhood lies in the fact that in a short span of time a child has to appropriate the results of a cultural evolution which stretches over thousands of years, including the acquisition of control over his instincts and adaptation to society - or at least the first beginnings of these two. He can only achieve a part of this modification through his own development; much must be imposed on him by education. We are not surprised that children often carry out this task very imperfectly. During these early times many of them pass through states that may be put on a par with neuroses - and this is certainly so in the case of all those who produce manifest illnesses later on. In some children the neurotic illness does not wait till maturity but breaks out already in childhood and gives parents and doctors plenty of trouble.

[1933a, 4747]
The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice. [1933a, 4749]
Parallel with the efforts of analysts to influence education, other investigations are being made into the origin and prevention of delinquency and crime. Here again I am only opening the door for you and showing you the rooms that lie beyond it, without leading you inside. I am certain that if you remain loyal to your interest in psycho-analysis you will be able to learn much that is new and valuable on these subjects. I must not, however, leave the topic of education without referring to one particular aspect of it. It has been said - and no doubt justly - that every education has a partisan aim, that it endeavours to bring the child into line with the established order of society, without considering how valuable or how stable that order may be in itself. If one is convinced of the defects in our present social arrangements, education with a psycho-analytic alignment cannot justifiably be put at their service as well: it must be given another and higher aim, liberated from the prevailing demands of society. In my opinion, however, this argument is out of place here. Such a demand goes beyond the legitimate function of analysis. In the same way, it is not the business of a doctor who is called in to treat a case of pneumonia to concern himself with whether the patient is an honest man or a suicide or a criminal, whether he deserves to remain alive or whether one ought to wish him to. This other aim which it is desired to give to education will also be a partisan one, and it is not the affair of an analyst to decide between the parties. I am leaving entirely on one side the fact that psycho-analysis would be refused any influence on education if it admitted to intentions inconsistent with the established social order. Psycho-analytic education will be taking an uninvited responsibility on itself if it proposes to mould its pupils into rebels. It will have played its part if it sends them away as healthy and efficient as possible. It itself contains enough revolutionary factors to ensure that no one educated by it will in later life take the side of reaction and suppression. It is even my opinion that revolutionary children are not desirable from any point of view.

[1933a, 4750]
THE SEXUAL OBJECT DURING EARLY INFANCY  But even after sexual activity has become detached from the taking of nourishment, an important part of this first and most significant of all sexual relations is left over, which helps to prepare for the choice of an object and thus to restore the happiness that has been lost. All through the period of latency children learn to feel for other people who help them in their helplessness and satisfy their needs a love which is on the model of, and a continuation of, their relation as sucklings to their nursing mother. There may perhaps be an inclination to dispute the possibility of identifying a child's affection and esteem for those who look after him with sexual love. I think, however, that a closer psychological examination may make it possible to establish this identity beyond any doubt. A child's intercourse with anyone responsible for his care affords him an unending source of sexual excitation and satisfaction from his erotogenic zones. This is especially so since the person in charge of him, who, after all, is as a rule his mother, herself regards him with feelings that are derived from her own sexual life: she strokes him, kisses him, rocks him and quite clearly treats him as a substitute for a complete sexual object.¹ A mother would probably be horrified if she were made aware that all her marks of affection were rousing her child's sexual instinct and preparing for its later intensity. She regards what she does as asexual, 'pure' love, since, after all, she carefully avoids applying more excitations to the child's genitals than are unavoidable in nursery care. As we know, however, the sexual instinct is not aroused only by direct excitation of the genital zone. What we call affection will unfailingly show its effects one day on the genital zones as well. Moreover, if the mother understood more of the high importance of the part played by instincts in mental life as a whole - in all its ethical and psychical achievements - she would spare herself any self-reproaches even after her enlightenment. She is only fulfilling her task in teaching the child to love. After all, he is meant to grow up into a strong and capable person with vigorous sexual needs and to accomplish during his life all the things that human beings are urged to do by their instincts. It is true that an excess of parental affection does harm by causing precocious sexual maturity and also because, by spoiling the child, it makes him incapable in later life of temporarily doing without love or of being content with a smaller amount of it. One of the clearest indications that a child will later become neurotic is to be seen in an insatiable demand for his parents' affection. And on the other hand neuropathic parents, who are inclined as a rule to display excessive affection, are precisely those who are most likely by their caresses to arouse the child's disposition to neurotic illness. Incidentally, this example shows that there are ways more direct than inheritance by which neurotic parents can hand their disorder on to their children.

¹[1905d, 1536]

Further prospects are opened up when we take into consideration the fact that in man the sexual instinct does not originally serve the purposes of reproduction at all, but has as its aim the gaining of particular kinds of pleasure.¹ It manifests itself in this way in human infancy, during which it attains its aim of gaining pleasure not only from the genitals but from other parts of the body (the erotogenic zones), and can therefore disregard any objects other than these convenient ones. We call this stage the stage of auto-erotism, and the child's upbringing has, in our view, the task of restricting it, because to linger in it would make the sexual instinct uncontrollable and unserviceable later on. The development of the sexual instinct then proceeds from auto-erotism to object-love and from the autonomy of the erotogenic zones to their subordination under the primacy of the genitals, which are put at the service of reproduction. During this development a part of the sexual excitation which is provided by the subject's own body is inhibited as being unserviceable for the reproductive function and in favourable cases is brought to sublimation. The forces that can be employed for cultural activities are thus to a great extent obtained through the suppression of what are known as the perverse elements of sexual excitation.

¹[1908d, 1953]
The sexual behaviour of a human being often lays down the pattern for all his other modes of reacting to life. If a man is energetic in winning the object of his love, we are confident that he will pursue his other aims with an equally unswerving energy; but if, for all sorts of reasons, he refrains from satisfying his strong sexual instincts, his behaviour will be conciliatory and resigned rather than vigorous in other spheres of life as well. A special application of this proposition that sexual life lays down the pattern for the exercise of other functions can easily be recognized in the female sex as a whole. Their upbringing forbids their concerning themselves intellectually with sexual problems though they nevertheless feel extremely curious about them, and frightens them by condemning such curiosity as unwomanly and a sign of a sinful disposition. In this way they are scared away from any form of thinking, and knowledge loses its value for them. The prohibition of thought extends beyond the sexual field, partly through unavoidable association, partly automatically, like the prohibition of thought about religion among men, or the prohibition of thought about loyalty among faithful subjects. I do not believe that women's 'physiological feeble-mindedness' is to be explained by a biological opposition between intellectual work and sexual activity, as Moebius has asserted in a work which has been widely disputed. I think that the undoubted intellectual inferiority of so many women can rather be traced back to the inhibition of thought necessitated by sexual suppression.

I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.
With this end in view I have for many years been urging my pupils and my friends to collect observations of the sexual life of children - the existence of which has as a rule been cleverly overlooked or deliberately denied. Among the material which came into my possession as a result of these requests, the reports which I received at regular intervals about little Hans soon began to take a prominent place. His parents were both among my closest adherents, and they had agreed that in bringing up their first child they would use no more coercion than might be absolutely necessary for maintaining good behaviour. And, as the child developed into a cheerful, good-natured and lively little boy, the experiment of letting him grow up and express himself without being intimidated went on satisfactorily. I shall now proceed to reproduce his father's records of little Hans just as I received them; and I shall of course refrain from any attempt at spoiling the naïveté and directness of the nursery by making any conventional emendations.

I shall now proceed to what I hope will be a brief discussion of how far little Hans's phobia offers any contribution of general importance to our views upon the life and upbringing of children. But before doing so I must return to the objection which has so long been held over, and according to which Hans was a neurotic, a 'degenerate' with a bad heredity, and not a normal child, knowledge about whom could be applied to other children. I have for some time been thinking with pain of the way in which the adherents of 'the normal person' will fall upon poor little Hans as soon as they are told that he can in fact be shown to have had a hereditary taint. His beautiful mother fell ill with a neurosis as a result of a conflict during her girlhood. I was able to be of assistance to her at the time, and this had in fact been the beginning of my connection with Hans's parents. It is only with the greatest diffidence that I venture to bring forward one or two considerations in his favour.
Furthermore, let me say in Hans's favour (and I frankly admit my partisan attitude) that he is not the only child who has been overtaken by a phobia at some time or other in his childhood. Troubles of that kind are well known to be quite extraordinarily frequent, even in children the strictness of whose upbringing has left nothing to be desired. In later life these children either become neurotic or remain healthy. Their phobias are shouted down in the nursery because they are inaccessible to treatment and are decidedly inconvenient. In the course of months or years they diminish, and the child seems to recover; but no one can tell what psychological changes are necessitated by such a recovery, or what alterations in character are involved in it. When, however, an adult neurotic patient comes to us for psycho-analytic treatment (and let us assume that his illness has only become manifest after he has reached maturity), we find regularly that his neurosis has as its point of departure an infantile anxiety such as we have been discussing, and is in fact a continuation of it; so that, as it were, a continuous and undisturbed thread of psychical activity, taking its start from the conflicts of his childhood, has been spun through his life - irrespective of whether the first symptom of those conflicts has persisted or has retreated under the pressure of circumstances. I think, therefore, that Hans's illness may perhaps have been no more serious than that of many other children who are not branded as 'degenerates'; but since he was brought up without being intimidated, and with as much consideration and as little coercion as possible, his anxiety dared to show itself more boldly. With him there was no place for such motives as a bad conscience or a fear of punishment, which with other children must no doubt contribute to making the anxiety less. It seems to me that we concentrate too much upon symptoms and concern ourselves too little with their causes. In bringing up children we aim only at being left in peace and having no difficulties, in short, at training up a model child, and we pay very little attention to whether such a course of development is for the child's good as well. I can therefore quite imagine that it may have been to Hans's advantage to have produced this phobia. For it directed his parents' attention to the unavoidable difficulties by which a child is confronted when in the course of his cultural training he is called upon to overcome the innate instinctual components of his mind; and his trouble brought his father to his assistance. It may be that Hans now enjoys an advantage over other children, in that he no longer carries within him that seed in the shape of repressed complexes which must always be of some significance for a child's later life, and which undoubtedly brings with it a certain degree of deformity of character if not a predisposition to a subsequent neurosis. I am inclined to think that this is so, but I do not know if many others will share my opinion; nor do I know whether experience will prove me right.

[1909b, 2120]
That no sharp line can be drawn between 'neurotic' and 'normal' people - whether children or adults - that our conception of 'disease' is a purely practical one and a question of summation, that predisposition and the eventualities of life must combine before the threshold of this summation is overstepped, and that consequently a number of individuals are constantly passing from the class of healthy people into that of neurotic patients, while a far smaller number also make the journey in the opposite direction, - all of these are things which have been said so often and have met with so much agreement that I am certainly not alone in maintaining their truth. It is, to say the least of it, extremely probable that a child's upbringing can exercise a powerful influence for good or for evil upon the predisposition which we have just mentioned as one of the factors in the occurrence of 'disease': but what that upbringing is to aim at and at what point it is to be brought to bear seem at present to be very doubtful questions. Hitherto education has only set itself the task of controlling, or, it would often be more proper to say, of suppressing, the instincts. The results have been by no means gratifying, and where the process has succeeded it has only been to the advantage of a small number of favoured individuals who have not been required to suppress their instincts. Nor has any one enquired by what means and at what cost the suppression of the inconvenient instincts has been achieved. Supposing now that we substitute another task for this one, and aim instead at making the individual capable of becoming a civilized and useful member of society with the least possible sacrifice of his own activity; in that case the information gained by psycho-analysis, upon the origin of pathogenic complexes and upon the nucleus of every nervous affection, can claim with justice that it deserves to be regarded by educators as an invaluable guide in their conduct towards children. What practical conclusions may follow from this, and how far experience may justify the application of those conclusions within our present social system, are matters which I leave to the examination and decision of others.

[1909b, 2122]

A second outcome of the work of psycho-analysis is that it then becomes possible for the unconscious instincts revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called 'sublimation', in which the energy of the infantile wishful impulses is not cut off but remains ready for use - the unserviceable aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the sexual instinct that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed instinct impossible; when the repression is lifted, the path to sublimation becomes free once more.

[1910a, 2238]
When educators have become familiar with the findings of psycho-analysis, it will be easier for them to reconcile themselves to certain phases of infantile development and they will, among other things, not be in danger of over-estimating the importance of the socially unserviceable or perverse instinctual impulses which emerge in children. On the contrary they will refrain from any attempt at forcibly suppressing such impulses, when they learn that efforts of this kind often produce no less undesirable results than the alternative, which is so much dreaded by educators, of giving free play to children's naughtiness. The forcible suppression of strong instincts by external means never has the effect in a child of these instincts being extinguished or brought under control; it leads to repression, which establishes a predisposition to later nervous illness. Psycho-analysis has frequent opportunities of observing the part played by inopportune and undiscerning severity of upbringing in the production of neuroses, or the price, in loss of efficiency and of capacity for enjoyment, which has to be paid for the normality upon which the educator insists. And psycho-analysis can also show what precious contributions to the formation of character are made by these asocial and perverse instincts in the child, if they are not subjected to repression but are diverted from their original aims to more valuable ones by the process known as 'sublimation'. Our highest virtues have grown up, as reaction formations and sublimations, out of our worst dispositions. Education should scrupulously refrain from burying these precious springs of action and should restrict itself to encouraging the processes by which these energies are led along safe paths. Whatever we can expect in the way of prophylaxis against neurosis in the individual lies in the hands of a psycho-analytically enlightened education.¹

[1913j, 2825]

The transformation of 'bad' instincts is brought about by two factors working in the same direction, an internal and an external one. The internal factor consists in the influence exercised on the bad (let us say, the egoistic) instincts by erotism - that is, by the human need for love, taken in its widest sense. By the admixture of erotic components the egoistic instincts are transformed into social ones. We learn to value being loved as an advantage for which we are willing to sacrifice other advantages. The external factor is the force exercised by upbringing, which represents the claims of our cultural environment, and this is continued later by the direct pressure of that environment. Civilization has been attained through the renunciation of instinctual satisfaction, and it demands the same renunciation from each newcomer in turn. Throughout an individual's life there is a constant replacement of external by internal compulsion. The influences of civilization cause an ever-increasing transformation of egoistic trends into altruistic and social ones by an admixture of erotic elements. In the last resort it may be assumed that every internal compulsion which makes itself felt in the development of human beings was originally - that is, in the history of mankind - only an external one. Those who are born to-day bring with them as an inherited organization some degree of tendency (disposition) towards the transformation of egoistic into social instincts, and this disposition is easily stimulated into bringing about that result. A further portion of this instinctual transformation has to be accomplished during the life of the individual himself. So the human being is subject not only to the pressure of his immediate cultural environment, but also to the influence of the cultural history of his ancestors.

[1915b, 3074]
We have learned that the *external compulsion* exercised on a human being by his upbringing and environment produces a further transformation towards good in his instinctual life - a further turning from egoism towards altruism. But this is not the regular or necessary effect of the external compulsion. Upbringing and environment not only offer benefits in the way of love, but also employ other kinds of incentive, namely, rewards and punishments. In this way their effect may turn out to be that a person who is subjected to their influence will choose to behave well in the cultural sense of the phrase, although no ennoblement of instinct, no transformation of egoistic into altruistic inclinations, has taken place in him. The result will, roughly speaking, be the same; only a particular concatenation of circumstances will reveal that one man always acts in a good way because his instinctual inclinations compel him to, and the other is good only in so far and for so long as such cultural behaviour is advantageous for his own selfish purposes. But superficial acquaintance with an individual will not enable us to distinguish between the two cases, and we are certainly misled by our optimism into grossly exaggerating the number of human beings who have been transformed in a cultural sense.

[1915b, 3075]

The undesirable result of 'spoiling' a small child is to magnify the importance of the danger of losing the object (the object being a protection against every situation of helplessness) in comparison with every other danger. It therefore encourages the individual to remain in the state of childhood, the period of life which is characterized by motor and psychical helplessness.

[1926d, 4319]

Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.

[1926e, 4390]
Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the instincts. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken - one knows so little about other civilizations - there are even to-day peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion - the same sanctity, rigidity and intolerance, the same prohibition of thought - for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life-tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years - which is exactly what you reproach religion with doing to-day. Do you not observe that it is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, the making of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master the task set before it. Such, then, are the prospects for your "primacy of the intellect".

[1927c, 4453]
A social factor is also unmistakably present in the cultural trend towards cleanliness, which has received ex post facto justification in hygienic considerations but which manifested itself before their discovery. The incitement to cleanliness originates in an urge to get rid of the excreta, which have become disagreeable to the sense perceptions. We know that in the nursery things are different. The excreta arouse no disgust in children. They seem valuable to them as being a part of their own body which has come away from it. Here upbringing insists with special energy on hastening the course of development which lies ahead, and which should make the excreta worthless, disgusting, abhorrent and abominable. Such a reversal of values would scarcely be possible if the substances that are expelled from the body were not doomed by their strong smells to share the fate which overtook olfactory stimuli after man adopted the erect posture. Anal erotism, therefore, succumbs in the first instance to the 'organic repression' which paved the way to civilization. The existence of the social factor which is responsible for the further transformation of anal erotism is attested by the circumstance that, in spite of all man's developmental advances, he scarcely finds the smell of his own excreta repulsive, but only that of other people's. Thus a person who is not clean - who does not hide his excreta - is offending other people; he is showing no consideration for them. And this is confirmed by our strongest and commonest terms of abuse. It would be incomprehensible, too, that man should use the name of his most faithful friend in the animal world - the dog - as a term of abuse if that creature had not incurred his contempt through two characteristics: that it is an animal whose dominant sense is that of smell and one which has no horror of excrement, and that it is not ashamed of its sexual functions.

[1930a, 4495]

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]
Which of these two views is correct? The earlier one, which genetically seemed so unassailable, or the newer one, which rounds off the theory in such a welcome fashion? Clearly, and by the evidence, too, of direct observations, both are justified. They do not contradict each other, and they even coincide at one point, for the child's revengeful aggressiveness will be in part determined by the amount of punitive aggression which he expects from his father. Experience shows, however, that the severity of the super-ego which a child develops in no way corresponds to the severity of treatment which he has himself met with.¹ The severity of the former seems to be independent of that of the latter. A child who has been very leniently brought up can acquire a very strict conscience. But it would also be wrong to exaggerate this independence; it is not difficult to convince oneself that severity of upbringing does also exert a strong influence on the formation of the child's super-ego. What it amounts to is that in the formation of the super-ego and the emergence of a conscience innate constitutional factors and influences from the real environment act in combination. This is not at all surprising; on the contrary, it is a universal aetiological condition for all such processes.²

¹ The two main types of pathogenic methods of upbringing - over-strictness and spoiling - have been accurately assessed by Franz Alexander in his book *The Psychoanalysis of the Total Personality* (1927) in connection with Aichhorn's study of delinquency. The 'unduly lenient and indulgent father' is the cause of children's forming an over-severe super-ego, because, under the impression of the love that they receive, they have no other outlet for their aggressiveness but turning it inwards. In delinquent children, who have been brought up without love, the tension between ego and super-ego is lacking, and the whole of their aggressiveness can be directed outwards. Apart from a constitutional factor which may be supposed to be present, it can be said, therefore, that a severe conscience arises from the joint operation of two factors: the frustration of instinct, which unleashes aggressiveness, and the experience of being loved, which turns the aggressiveness inwards and hands it over to the super-ego.

² An abundant source of a child's hostility to its mother is provided by its multifarious sexual wishes, which alter according to the phase of the libido and which cannot for the most part be satisfied. The strongest of these frustrations occur at the phallic period, if the mother forbids pleasurable activity with the genitals - often with severe threats and every sign of displeasure - activity to which, after all, she herself had introduced the child. One would think these were reasons enough to account for a girl's turning away from her mother. One would judge, if so, that the estrangement follows inevitably from the nature of children's sexuality, from the immoderate character of their demand for love and the impossibility of fulfilling their sexual wishes. It might be thought indeed that this first love-relation of the child's is doomed to dissolution for the very reason that it is the first, for these early object-cathexes are regularly ambivalent to a high degree. A powerful tendency to aggressiveness is always present beside a powerful love, and the more passionately a child loves its object the more sensitive does it become to disappointments and frustrations from that object; and in the end the love must succumb to the accumulated hostility. Or the idea that there is an original ambivalence such as this in erotic cathexes may be rejected, and it may be pointed out that it is the special nature of the mother-child relation that leads, with equal inevitability, to the destruction of the child's love; for even the mildest upbringing cannot avoid using compulsion and introducing restrictions, and any such intervention in the child's liberty must provoke as a reaction an inclination to rebelliousness and aggressiveness. A discussion of these possibilities might, I think, be most interesting; but an objection suddenly emerges which forces our interest in another direction. All these factors - the slights, the disappointments in love, the jealousy, the seduction followed by prohibition - are, after all, also in operation in the relation of a boy to his mother and are yet unable to alienate him from the maternal object. Unless we can find something that is specific for girls and is not present or not in the same way present in boys, we shall not have explained the termination of the attachment of girls to their mother.
You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitoral masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

[1933a, 4729]

We may mention, though only as an incidental consideration, an indirect way in which the upbringing of children may be helped by analysis and which may with time acquire a greater influence. Parents who have themselves experienced an analysis and owe much to it, including an insight into the faults of their own upbringing, will treat their children with better understanding and will spare them much of what they themselves were not spared.

[1933a, 4750]
The third main item in the religious programme, the ethical demand, also fits into this childhood situation with ease. I may remind you of Kant's famous pronouncement in which he names, in a single breath, the starry heavens and the moral law within us. However strange this juxtaposition may sound - for what have the heavenly bodies to do with the question of whether one human creature loves another or kills him? - it nevertheless touches on a great psychological truth. The same father (or parental agency) which gave the child life and guarded him against its perils, taught him as well what he might do and what he must leave undone, instructed him that he must adapt himself to certain restrictions on his instinctual wishes, and made him understand what regard he was expected to have for his parents and brothers and sisters, if he wanted to become a tolerated and welcome member of the family circle and later on of larger associations. The child is brought up to a knowledge of his social duties by a system of loving rewards and punishments, he is taught that his security in life depends on his parents (and afterwards other people) loving him and on their being able to believe that he loves them. All these relations are afterwards introduced by men unaltered into their religion. Their parents' prohibitions and demands persist within them as a moral conscience. With the help of this same system of rewards and punishments, God rules the world of men. The amount of protection and happy satisfaction assigned to an individual depends on his fulfilment of the ethical demands; his love of God and his consciousness of being loved by God are the foundations of the security with which he is armed against the dangers of the external world and of his human environment. Finally, in prayer he has assured himself a direct influence on the divine will and with it a share in the divine omnipotence.

[1933a, 4762]
We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fend them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

[1940a [1938], 4993]
In the second section of his acute paper 'Quelques définitions . . .' Janet has himself dealt with the objection which argues that splitting of consciousness occurs in psychoses and in so-called 'psychasthenia' as well as in hysteria, but in my judgement he has not met it satisfactorily. It is in the main this objection which obliges him to describe hysteria as a form of degeneracy. But he has failed to produce any characteristic which sufficiently distinguishes the splitting of consciousness in hysteria from that in psychoses and similar states. [1894a, 306]

This does not exhaust the possibilities which flow from a recognition of the sexual aetiology of the neuroses. The main benefit which we obtain from it for neurasthenics lies in the sphere of prophylaxis. If masturbation is the cause of neurasthenia in youth, and if, later on, it acquires aetiological significance for anxiety neurosis as well, by reason of the reduction of potency which it brings about, then the prevention of masturbation in both sexes is a task that deserves more attention than it has hitherto received. When we reflect upon all the injuries, both the grosser and the finer ones, which proceed from neurasthenia - a disorder which we are told is growing more and more prevalent - we see that it is positively a matter of public interest that men should enter upon sexual relations with full potency. In matters of prophylaxis, however, the individual is relatively helpless. The whole community must become interested in the matter and give their assent to the creation of generally acceptable regulations. At present we are still far removed from such a state of affairs which would promise relief, and it is for this reason that we may with justice regard civilization, too, as responsible for the spread of neurasthenia. Much would have to be changed. The resistance of a generation of physicians who can no longer remember their own youth must be broken down; the pride of fathers, who are unwilling to descend to the level of humanity in their children's eyes, must be overcome; and the unreasonable prudery of mothers must be combated - the mothers who at present look upon it as an incomprehensible and undeserved stroke of fate that 'their children should have been the ones to become neurotic'. But above all, a place must be created in public opinion for the discussion of the problems of sexual life. It will have to become possible to talk about these things without being stamped as a trouble-maker or as a person who makes capital out of the lower instincts. And so here, too, there is enough work left to do for the next hundred years - in which our civilization will have to learn to come to terms with the claims of our sexuality. [1897b, 470]

The authors whose views I am now giving picture the process of forming dreams in some such way as this. The totality of the sensory stimuli generated during sleep from the various sources which I have already enumerated arouse in the mind in the first place a number of ideas, which are represented in the form of hallucinations or more properly, according to Wundt, of illusions, in view of their derivation from external and internal stimuli. These ideas become linked together according to the familiar laws of association and, according to the same laws, call up a further series of ideas (or images). The whole of this material is then worked over, so far as it will allow, by what still remain in operation of the organizing and thinking faculties of the mind. (See, for instance, Wundt and Weygandt.) All that remain undiscovered are the motives which decide whether the calling up of images arising from non-external sources shall proceed along one chain of associations or another. [1900a, 566]
When you ask me for an expression of opinion on 'the sexual enlightenment of children', I assume that what you want is not a regular, formal treatise on the subject which shall take into account the excessive mass of literature that has grown up around it, but the independent judgement of an individual doctor whose professional activities have offered him special opportunities for concerning himself with sexual problems. I know that you have followed my scientific efforts with interest and that, unlike many of our colleagues, you do not dismiss my ideas without examining them because I regard the psychosexual constitution and certain noxae of sexual life as the most important causes of the neurotic disorders that are so common. My *Three Essays on the Theory of Sexuality*, too, where I have described the way in which the sexual instinct is compounded and the disturbances which may occur in its development into the function of sexuality, have recently had a friendly reception in your journal.

I am expected, therefore, to answer questions on the following points: whether children ought to be given any enlightenment at all about the facts of sexual life, at what age this ought to happen and in what manner it should be carried out. Let me admit to you at once that I find a discussion of the second and third points perfectly reasonable, but that to my mind it is quite incomprehensible how there could be a difference of opinion on the first point. What can be the purpose of withholding from children - or, let us say, from young people - enlightenment of this kind about the sexual life of human beings? Is it from a fear of arousing their interest in these matters prematurely, before it awakens in them spontaneously? Is it from a hope that a concealment of this kind may retard the sexual instinct altogether until such time as it can find its way into the only channels open to it in our middle-class social order? Is it supposed that children would show no interest or understanding for the facts and riddles of sexual life if they were not prompted to do so by outside influences? Is it thought possible that the knowledge which is withheld from them will not reach them in other ways? Or is it genuinely and seriously intended that later on they should regard everything to do with sex as something degraded and detestable from which their parents and teachers wished to keep them away as long as possible?

I really do not know in which of these purposes to look for the motive for the concealment of what is sexual from children that is in fact carried out. I only know that they are all equally absurd and that I find it difficult to honour them with a serious refutation. I remember, however, that in the family letters of that great thinker and humanitarian Multatuli, I once found a few lines which are a more than adequate answer:

'To my mind, certain things are in general too much wrapped in a veil. It is right to keep a child's imagination pure, but this purity will not be preserved by ignorance. On the contrary, I think that concealment leads a boy or girl to suspect the truth more than ever. Curiosity leads us to pry into things which, if they had been told us without any great to do, would have aroused little or no interest in us. If this ignorance could be maintained even, I might become reconciled to it, but that is impossible. The child comes into contact with other children, books come his way which lead him to reflect, and the mystery-making with which his parents treat what he has nevertheless discovered actually increases his desire to know more. This desire, which is only partly satisfied and only in secret, excites his feeling and corrupts his imagination, so that the child already sins while his parents still believe that he does not know what sin is.'

"[1907c, 1912]
I do not know how the case could be better stated, but perhaps I may add a few remarks. It is undoubtedly nothing else but the customary prudishness and their own bad conscience over sexual matters that causes adults to adopt this attitude of 'mystery-making' in front of children; but possibly a part is also played by a piece of theoretical ignorance on their part, which we can counteract by giving the adults some enlightenment. It is commonly believed that the sexual instinct is absent in children and only begins to emerge in them at puberty when the sexual organs mature. This is a gross error, equally serious in its effects both on knowledge and on practice; and it is so easily corrected by observation that one wonders how it could ever have been made. As a matter of fact, the new-born baby brings sexuality with it into the world, certain sexual sensations accompany its development as a suckling and during early childhood, and only very few children would seem to escape sexual activities and sensations before puberty. Anyone who would like to find a detailed exposition of these statements can do so in my Three Essays on the Theory of Sexuality, to which I have referred above. There he will learn that the organs of reproduction proper are not the only parts of the body which provide sexual sensations of pleasure, and that nature has even so ordered matters that actual stimulations of the genitals are unavoidable during early childhood. This period of life, during which a certain quota of what is undoubtedly sexual pleasure is produced by the excitation of various parts of the skin (erogenetic zones), by the activity of certain biological instincts and as an accompanying excitation in many affective states, is called the period of auto-erotism, to use a term introduced by Havelock Ellis. All that puberty does is to give the genitals primacy among all the other zones and sources which produce pleasure, and thus to force erotism into the service of the function of reproduction. This process can naturally undergo certain inhibitions, and in many people (those who later become perverts and neurotics) it is only incompletely accomplished. On the other hand, the child is capable long before puberty of most of the psychical manifestations of love-tenderness, for example, devotion and jealousy. Often enough, too, an irruption of these mental states is associated with the physical sensations of sexual excitation, so that the child cannot remain in doubt as to the connection between the two. In short, except for his reproductive power, a child has a fully-developed capacity for love long before puberty; and it may be asserted that the 'mystery-making' merely prevents him from being able to gain an intellectual grasp of activities for which he is psychically prepared and physically adjusted.

There does not seem to me to be a single good reason for denying children the enlightenment which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child's power of independent thought as early as possible, in favour of the 'goodness' which they think so much of, they cannot set about this better than by deceiving him in sexual matters and intimidating him in matters of religion. The stronger natures will, it is true, withstand these influences and become rebels against the authority of their parents and later against every other authority. If children are not given the explanations for which they turn to their elders, they go on tormenting themselves with the problem in secret and produce attempts at solution in which the truth they have guessed is mingled in the most extraordinary way with grotesque untruths; or they whisper information to one another in which, because of the young enquirers' sense of guilt, everything sexual is stamped as being horrible and disgusting. These infantile sexual theories would be well worth collecting and examining. From this time on, children usually lose the only proper attitude to sexual questions, and many of them never regain it.
It seems that the large majority of authors, both men and women, who have written about the sexual enlightenment of youth have concluded in favour of it. But the clumsiness of most of their proposals as to when and how this enlightenment is to take place tempts one to think that they have not found it easy to arrive at this conclusion. So far as my knowledge of the literature goes, a single outstanding exception is provided by the charming letter of explanation which a certain Frau Emma Eckstein quotes as having been written by her to her son when he was about ten years old.¹ The customary method is obviously not quite the right one: all sexual knowledge is kept from children as long as possible, and then on one single occasion a disclosure is made to them in solemn and turgid language, and even so is only half the truth and generally comes too late. Most of the answers to the question 'How am I to tell my children?' make such a miserable impression, on me at least, that I should prefer parents not to embark on the business of enlightenment at all. What is really important is that children should never get the idea that one wants to make more of a secret of the facts of sexual life than of any other matter which is not yet accessible to their understanding; and to ensure this it is necessary that from the very first what has to do with sexuality should be treated like anything else that is worth knowing about. Above all, it is the duty of schools not to evade the mention of sexual matters. The main facts of reproduction and their significance should be included in lessons about the animal kingdom, and at the same time stress should be laid on the fact that man shares every essential in his organization with the higher animals. Then, provided that the child's home environment does not aim directly at frightening him off thinking, something that I once overheard in a nursery will probably happen more often. I heard a boy saying to his little sister: 'How can you think babies are brought by the stork! You know man's a mammal; d'you think storks bring other mammals their babies too?'

¹ [1907c, 1917]

The child's curiosity will never reach a very high degree of intensity provided it finds appropriate satisfaction at each stage of his learning. Enlightenment about the specific facts of human sexuality and an indication of its social significance should, therefore, be given to the child at the end of his time at his elementary school [Volksschule] and before he enters his intermediate school [Mittelschule] - that is to say, before he is ten years old. The period of confirmation would be a more suitable time than any other at which to instruct the child, who will by that time have a full knowledge of all the physical facts, in the moral obligations which are attached to the actual satisfaction of the instinct. Enlightenment about sexual life carried out along such lines as this, proceeding step by step and without any real interruption, and in which the school takes the initiative, seems to me to be the only kind which takes into account the child's development and thus successfully avoids the dangers involved.

¹ [1907c, 1918]

I consider it the most significant advance in child education that in France the State should have introduced, in place of the catechism, a primer which gives the child his first instruction in his position as a citizen and in the ethical duties which will later devolve on him. But such elementary instruction is seriously deficient, so long as it does not include the field of sexuality. Here is the gap which educators and reformers should set about filling. In countries which have placed the education of children wholly or in part in the hands of the clergy, it will, of course, be impossible to ask for this. A priest will never admit that men and animals have the same nature, since he cannot do without the immortality of the soul, which he requires as the basis for moral precepts. Here, once again, we see the unwisdom of sewing a single silk patch on to a tattered coat - the impossibility of carrying out an isolated reform without altering the foundations of the whole system.

¹ [1907c, 1918]
In about their tenth or eleventh year, children get to hear about sexual matters. A child who has grown up in a comparatively uninhibited social atmosphere, or who has found better opportunities for observation, tells other children what he knows, because this makes him feel mature and superior. What children learn in this way is mostly correct - that is, the existence of the vagina and its purpose is revealed to them; but otherwise the explanations they get from one another are not infrequently mixed with false ideas and burdened with remains of the older infantile sexual theories. They are scarcely ever complete or sufficient to solve the primordial problem. Just as formerly it was ignorance of the vagina which prevented the whole process from being understood, so now is it ignorance of the semen. The child cannot guess that another substance besides urine is excreted from the male sexual organ, and occasionally an 'innocent' girl on her wedding night is still indignant at her husband 'urinating into her'. This information acquired in the years of pre-puberty is followed by a new access of sexual researches by the child. But the theories which he now produces no longer have the typical and original stamp which was characteristic of the primary theories of early childhood as long as the infantile sexual components could find expression in theories in an uninhibited and unmodified fashion. The child's later intellectual efforts at solving the puzzles of sex have not seemed to me worth collecting, nor can they have much claim to a pathogenic significance. Their multiplicity is of course mainly dependent on the nature of the enlightenment which a child receives; but their significance consists rather in the fact that they re-awaken the traces, which have since become unconscious, of his first period of sexual interest; so that it is not infrequent for masturbatory sexual activity and some degree of emotional detachment from his parents to be linked up with them. Hence the condemnatory judgement of teachers that enlightenment of such a kind at this age 'corrupts' children.

The way in which children react to the information they are given also has its significance. In some, sexual repression has gone so far that they will not listen to anything; and these succeed in remaining ignorant even in later life - apparently ignorant, at least - until, in the psycho-analysis of neurotics, the knowledge that originated in early childhood comes to light. I also know of two boys between ten and thirteen years old who, though it is true that they listened to the sexual information, rejected it with the words: 'Your father and other people may do something like that, but I know for certain my father never would.' But however widely children's later reactions to the satisfaction of their sexual curiosity may vary, we may assume that in the first years of childhood their attitude was absolutely uniform, and we may feel certain that at that time all of them tried most eagerly to discover what it was that their parents did with each other so as to produce babies.

I arranged with Hans's father that he should tell the boy that all this business about horses was a piece of nonsense and nothing more. The truth was, his father was to say, that he was very fond of his mother and wanted to be taken into her bed. The reason he was afraid of horses now was that he had taken so much interest in their widdlers. He himself had noticed that it was not right to be so very much preoccupied with widdlers, even with his own, and he was quite right in thinking this. I further suggested to his father that he should begin giving Hans some enlightenment in the matter of sex knowledge. The child's past behaviour justified us in assuming that his libido was attached to a wish to see his mother's widdler; so I proposed to his father that he should take away this aim from Hans by informing him that his mother and all other female beings (as he could see from Hanna) had no widdler at all. This last piece of enlightenment was to be given him on a suitable occasion when it had been led up to by some question or some chance remark on Hans's part.
As his parents still hesitated to give him the information which was already long overdue, little Hans had by a bold stroke taken the conduct of the analysis into his own hands. By means of a brilliant symptomatic act, 'Look!' he had said to them, 'This is how I imagine that a birth takes place.' What he had told the maid-servant about the meaning of his game with the doll had been insincere; to his father he explicitly denied that he had only wanted to see its widdler. After his father had told him, as a kind of payment on account, how chickens come out of eggs, Hans gave a combined expression to his dissatisfaction, his mistrust, and his superior knowledge in a charming piece of persiflage, which culminated with his last words in an unmistakable allusion to his sister's birth.

I shall now proceed to examine this observation of the development and resolution of a phobia in a boy under five years of age, and I shall have to do so from three points of view. In the first place I shall consider how far it supports the assertions which I put forward in my Three Essays on the Theory of Sexuality (1905d). Secondly, I shall consider to what extent it can contribute towards our understanding of this very frequent form of disorder. And thirdly, I shall consider whether it can be made to shed any light upon the mental life of children or to afford any criticism of our educational aims.

If matters had lain entirely in my hands, I should have ventured to give the child the one remaining piece of enlightenment which his parents withheld from him. I should have confirmed his instinctive premonitions, by telling him of the existence of the vagina and of copulation; thus I should have still further diminished his unsolved residue, and put an end to his stream of questions. I am convinced that this new piece of enlightenment would have made him lose neither his love for his mother nor his own childish nature, and that he would have understood that his preoccupation with these important, these momentous things must rest for the present - until his wish to be big had been fulfilled. But the educational experiment was not carried so far.

This therefore leaves only the one method open to us - the one which was in all probability the only one originally contemplated. We tell the patient about the possibilities of other instinctual conflicts, and we arouse his expectation that such conflicts may occur in him. What we hope is that this information and this warning will have the effect of activating in him one of the conflicts we have indicated, in a modest degree and yet sufficiently for treatment. But this time experience speaks with no uncertain voice. The expected result does not come about. The patient hears our message, but there is no response. He may think to himself: 'This is very interesting, but I feel no trace of it.' We have increased his knowledge, but altered nothing else in him. The situation is much the same as when people read psycho-analytic writings. The reader is 'stimulated' only by those passages which he feels apply to himself - that is, which concern conflicts that are active in him at the time. Everything else leaves him cold. We can have analogous experiences, I think, when we give children sexual enlightenment. I am far from maintaining that this is a harmful or unnecessary thing to do, but it is clear that the prophylactic effect of this liberal measure has been greatly over-estimated. After such enlightenment, children know something they did not know before, but they make no use of the new knowledge that has been presented to them. We come to see that they are not even in so great a hurry to sacrifice for this new knowledge the sexual theories which might be described as a natural growth and which they have constructed in harmony with, and dependence on, their imperfect libidinal organization - theories about the part played by the stork, about the nature of sexual intercourse and about the way in which babies are made. For a long time after they have been given sexual enlightenment they behave like primitive races who have had Christianity thrust upon them and who continue to worship their old idols in secret.

[1909b, 2072]

[1909b, 2087]

[1937c, 5029]
Another of the great creations of tragic poetry, Shakespeare's *Hamlet*, has its roots in the same soil as *Oedipus Rex*. But the changed treatment of the same material reveals the whole difference in the mental life of these two widely separated epochs of civilization: the secular advance of repression in the emotional life of mankind. In the *Oedipus* the child's wishful phantasy that underlies it is brought into the open and realized as it would be in a dream. In *Hamlet* it remains repressed; and - just as in the case of a neurosis - we only learn of its existence from its inhibiting consequences. Strangely enough, the overwhelming effect produced by the more modern tragedy has turned out to be compatible with the fact that people have remained completely in the dark as to the hero's character. The play is built up on Hamlet's hesitations over fulfilling the task of revenge that is assigned to him; but its text offers no reasons or motives for these hesitations and an immense variety of attempts at interpreting them have failed to produce a result. According to the view which was originated by Goethe and is still the prevailing one to-day, Hamlet represents the type of man whose power of direct action is paralysed by an excessive development of his intellect. (He is 'sicklied o'er with the pale cast of thought'.) According to another view, the dramatist has tried to portray a pathologically irresolute character which might be classed as neurasthenic. The plot of the drama shows us, however, that Hamlet is far from being represented as a person incapable of taking any action. We see him doing so on two occasions: first in a sudden outburst of temper, when he runs his sword through the eavesdropper behind the arras, and secondly in a premeditated and even crafty fashion, when, with all the callousness of a Renaissance prince, he sends the two courtiers to the death that had been planned for himself. What is it, then, that inhibits him in fulfilling the task set by his father's ghost? The answer, once again, is that it is the peculiar nature of the task. Hamlet is able to do anything - except take vengeance on the man who did away with his father and took that father's place with his mother, the man who shows him the repressed wishes of his own childhood realized. Thus the loathing which should drive him on to revenge is replaced in him by self-reproaches, by scruples of conscience, which remind him that he himself is literally no better than the sinner whom he is to punish. Here I have translated into conscious terms what was bound to remain unconscious in Hamlet's mind; and if any one is inclined to call him a hysteric, I can only accept the fact as one that is implied by my interpretation. The distaste for sexuality expressed by Hamlet in his conversation with Ophelia fits in very well with this: the same distaste which was destined to take possession of the poet's mind more and more during the years that followed, and which reached its extreme expression in *Timon of Athens*. For it can of course only be the poet's own mind which confronts us in Hamlet. I observe in a book on Shakespeare by Georg Brandes (1896) a statement that *Hamlet* was written immediately after the death of Shakespeare's father (in 1601), that is, under the immediate impact of his bereavement and, as we may well assume, while his childhood feelings about his father had been freshly revived. It is known, too, that Shakespeare's own son who died at an early age bore the name of 'Hamnet', which is identical with 'Hamlet'. Just as *Hamlet* deals with the relation of a son to his parents, so *Macbeth* (written at approximately the same period) is concerned with the subject of childlessness. But just as all neurotic symptoms, and, for that matter, dreams, are capable of being 'over-interpreted' and indeed need to be, if they are to be fully understood, so all genuinely creative writings are the product of more than a single motive and more than a single impulse in the poet's mind, and are open to more than a single interpretation. In what I have written I have only attempted to interpret the deepest layer of impulses in the mind of the creative writer.¹

¹ [Footnote added 1919:] The above indications of a psycho-analytic explanation of *Hamlet* have since been amplified by Ernest Jones and defended against the alternative views put forward in the literature of the subject. (See Jones, 1910a.) - [Added 1930:] Incidentally, I have in the meantime ceased to believe that the author of Shakespeare's works was the man from Stratford. - [Added 1919:] Further attempts at an analysis of *Macbeth* will be found in a paper of mine and in one by Jekels (1917).
It seems to me that there is a widespread and erroneous impression among my colleagues that this technique of searching for the origins of an illness and removing its manifestations by that means is an easy one which can be practised off-hand, as it were. I conclude this from the fact that not one of all the people who have shown an interest in my therapy and passed definite judgements upon it has ever asked me how I actually go about it. There can be only one reason for this: that they think there is nothing to enquire about, that the thing is perfectly self-evident. Again, I am now and then astonished to hear that in this or that department of a hospital a young assistant has received an order from his chief to undertake a 'psycho-analysis' of a hysterical patient. I am sure he would not be allowed to examine an extirpated tumour unless he had convinced his chiefs that he was conversant with histological technique. Similarly, reports reach my ears that this or that colleague has arranged appointments with a patient in order to undertake a mental treatment of the case, though I am certain he knows nothing of the technique of any such therapy. His expectation must be therefore that the patient will make him a present of his secrets, or perhaps that he is looking for salvation in some sort of confession or confidence. I should not be surprised if a patient were injured rather than benefited by being treated in such a fashion. For it is not so easy to play upon the instrument of the mind. I am reminded on such occasions of the words of a world-famous neurotic - though it is true that he was never treated by a physician but existed only in a poet's imagination - Hamlet, Prince of Denmark. The King has ordered two courtiers, Rosenkranz and Guildenstern, to follow him, to question him and drag the secret of his depression out of him. He wards them off. Then some recorders are brought on the stage and Hamlet, taking one of them, begs one of his tormentors to play upon it, telling him that it is as easy as lying. The courtier excuses himself, for he knows no touch of the instrument, and when he cannot be persuaded to try it, Hamlet finally breaks out with these words: 'Why, look you now, how unworthy a thing you make of me! You would play upon me; . . . you would pluck out the heart of my mystery; you would sound me from my lowest note to the top of my compass; and there is much music, excellent voice, in this little organ; yet you cannot make it speak. 'Sblood, do you think I am easier to be played on than a pipe? Call me what instrument you will, though you can fret me, you cannot play upon me.' (Act III, Scene 2.)

Let us consider Shakespeare's masterpiece, *Hamlet*, a play, now over three centuries old.¹ I have followed the literature of psycho-analysis closely, and I accept its claim that it was not until the material of the tragedy had been traced back by psycho-analysis to the Oedipus theme that the mystery of its effect was at last explained. But before this was done, what a mass of differing and contradictory interpretative attempts, what a variety of opinions about the hero's character and the dramatist's intentions! Does Shakespeare claim our sympathies on behalf of a sick man, or of an ineffectual weakling, or of an idealist who is merely too good for the real world? And how many of these interpretations leave us cold! - so cold that they do nothing to explain the effect of the play and rather incline us to the view that its magical appeal rests solely upon the impressive thoughts in it and the splendour of its language. And yet, do not those very endeavours speak for the fact that we feel the need of discovering in it some source of power beyond them alone?

¹[1905a, 1567]

²[1914b, 2846]
A number of suggestions came to me out of the Oedipus complex, the ubiquity of which gradually dawned on me. The poet's choice, or his invention, of such a terrible subject seemed puzzling; and so too did the overwhelming effect of its dramatic treatment, and the general nature of such tragedies of destiny. But all of this became intelligible when one realized that a universal law of mental life had here been captured in all its emotional significance. Fate and the oracle were no more than materializations of an internal necessity; and the fact of the hero's sinning without his knowledge and against his intentions was evidently a right expression of the unconscious nature of his criminal tendencies. From understanding this tragedy of destiny it was only a step further to understanding a tragedy of character - *Hamlet*, which had been admired for three hundred years without its meaning being discovered or its author's motives guessed. It could scarcely be a chance that this neurotic creation of the poet should have come to grief, like his numberless fellows in the real world, over the Oedipus complex. For *Hamlet* was faced with the task of taking vengeance on another for the two deeds which are the subject of the Oedipus desires; and before that task his arm was paralysed by his own obscure sense of guilt. Shakespeare wrote *Hamlet* very soon after his father's death.¹ The suggestions made by me for the analysis of this tragedy were fully worked out later on by Ernest Jones. And the same example was afterwards used by Otto Rank as the starting-point for his investigation of the choice of material made by dramatists. In his large volume on the incest theme (Rank, 1912) he was able to show how often imaginative writers have taken as their subject the themes of the Oedipus situation, and traced in the different literatures of the world the way in which the material has been transformed, modified, and softened.

¹ (*Footnote added 1935:) This is a construction which I should like explicitly to withdraw. I no longer believe that William Shakespeare the actor from Stratford was the author of the works which have so long been attributed to him. Since the publication of J. T. Looney's volume *Shakespeare Identified*, I am almost convinced that in fact Edward de Vere, Earl of Oxford, is concealed behind this pseudonym.

We all, who revere Goethe, put up, without too much protest, with the efforts of his biographers, who try to recreate his life from existing accounts and indications. But what can these biographies achieve for us? Even the best and fullest of them could not answer the two questions which alone seem worth knowing about. It would not throw any light on the riddle of the miraculous gift that makes an artist, and it could not help us to comprehend any better the value and the effect of his works. And yet there is no doubt that such a biography does satisfy a powerful need in us. We feel this very distinctly if the legacy of history unkindly refuses the satisfaction of this need - for example in the case of Shakespeare. It is undeniably painful to all of us that even now we do not know who was the author of the Comedies, Tragedies and Sonnets of Shakespeare; whether it was in fact the untutored son of the provincial citizen of Stratford, who attained a modest position as an actor in London, or whether it was, rather, the nobly-born and highly cultivated, passionately wayward, to some extent *déclassé* aristocrat, Edward de Vere, Seventeenth Earl of Oxford, hereditary Lord Great Chamberlain of England. But how can we justify a need of this kind to obtain knowledge of the circumstances of a man's life when his works have become so full of importance to us? People generally say that it is our desire to bring ourselves nearer to such a man in a human way as well. Let us grant this; it is, then, the need to acquire affective relations with such men, to add them to the fathers, teachers, exemplars whom we have known or whose influence we have already experienced, in the expectation that their personalities will be just as fine and admirable as those works of art of theirs which we possess.
The name 'William Shakespeare' is very probably a pseudonym behind which a great unknown lies concealed. Edward de Vere, Earl of Oxford, a man who has been thought to be identifiable with the author of Shakespeare's works, lost a beloved and admired father while he was still a boy and completely repudiated his mother, who contracted a new marriage very soon after her husband's death.

[1940a[1938], 4999]
After a firm basis for the understanding of cerebral disturbances of speech had been established by the discovery and definite localization of a motor and a sensory aphasia (Broca and Wernicke), the authorities set about tracing the more subtle symptoms of aphasia as well to factors of localization. In this way they arrived at the hypothesis of a conduction aphasia, with subcortical and transcortical, and motor and sensory forms. This critical study is directed against this view of speech disorders and it seeks to introduce for their explanation functional factors in place of the topographical ones. The forms described as subcortical and transcortical are not to be explained by a particular localization of the lesion but by conditions of reduced capacity for conduction in the apparatus of speech. In fact there are no aphasias caused by subcortical lesion. The justification for distinguishing a central aphasia from a conduction aphasia is also disputed. The speech area of the cortex is seen rather as a continuous region of the cortex inserted between the motor fields of the cortex and those of the optic and auditory nerves—a region within which all communication and association subserving speech function takes place. The so-called speech-centres revealed by the pathology of the brain correspond merely to the corners of this field of speech; they are not distinguished functionally from the interior regions; it is only on account of their position in relation to the contiguous cortical centres that they produce more obvious signs when they become disordered.

[1897b, 442]

The nature of the subject treated here called at many points for a closer investigation of the delimitation between the physiological and the psychological approach. Meynert's and Wernicke's views on the localization of ideas in nervous elements have had to be rejected and Meynert's account of a representation of the body in the cerebral cortex has required revision. Two facts of cerebral anatomy, namely (1) that the masses of fibres entering the spinal cord are constantly diminished on passing upwards, owing to the interposition of grey matter, and (2) that there are no direct paths from the periphery of the body to the cortex—these two facts lead to the conclusion that a really complete representation of the body is present only in the grey matter of the cord (as a 'projection'), whereas in the cortex the periphery of the body is only 'represented' in less detail through selected fibres arranged according to function.

[1897b, 442]

The worst thing he can do is obviously—under whatever pretext—to try to ignore it. Nothing that is necessary can be beneath my dignity as a doctor; and it is necessary to give a married couple who contemplate limiting the number of their offspring the assistance of one's medical advice if one does not want to expose one or both of them to a neurosis. It cannot be denied that in any marriage Malthusian preventive measures will become necessary at some time or other; and, from a theoretical point of view, it would be one of the greatest triumphs of humanity, one of the most tangible liberations from the constraints of nature to which mankind is subject, if we could succeed in raising the responsible act of procreating children to the level of a deliberate and intentional activity and in freeing it from its entanglement with the necessary satisfaction of a natural need.

[1897b, 469]
The fact that I have not extended my account of the literature dealing with the problems of dreams to cover the period between the first and second editions of this book stands in need of a justification. It may strike the reader as an unsatisfactory one, but for me it was none the less decisive. The motives which led me to give any account at all of the way in which earlier writers have dealt with dreams were exhausted with the completion of this introductory chapter; to continue the task would have cost me an extraordinary effort - and the result would have been of very little use or instruction. For the intervening nine years have produced nothing new or valuable either in factual material or in opinions that might throw light on the subject. In the majority of publications that have appeared during the interval my work has remained unmentioned and unconsidered. It has, of course, received least attention from those who are engaged in what is described as ‘research’ into dreams, and who have thus provided a shining example of the repugnance to learning anything new which is characteristic of men of science. In the ironical words of Anatole France, ‘les savants ne sont pas curieux’. If there were such a thing in science as a right to retaliate, I should certainly be justified in my turn in disregarding the literature that has been issued since the publication of this book. The few notices of it that have appeared in scientific periodicals show so much lack of understanding and so much misunderstanding that my only reply to the critics would be to suggest their reading the book again - or perhaps, indeed, merely to suggest their reading it.

[1900a, 598]

In conclusion let me add these words. With Hans's last phantasy the anxiety which arose from his castration complex was also overcome, and his painful expectations were given a happier turn. Yes, the Doctor (the plumber) did come, he did take away his penis, - but only to give him a bigger one in exchange for it. For the rest, our young investigator has merely come somewhat early upon the discovery that all knowledge is patchwork, and that each step forward leaves an unsolved residue behind.

[1909b, 2086]
When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

[1915b, 3068]

It is easy to see how war impinges on this dichotomy. It strips us of the later accretions of civilization, and lays bare the primal man in each of us. It compels us once more to be heroes who cannot believe in their own death; it stamps strangers as enemies, whose death is to be brought about or desired; it tells us to disregard the death of those we love. But war cannot be abolished; so long as the conditions of existence among nations are so different and their mutual repulsion so violent, there are bound to be wars. The question then arises: Is it not we who should give in, who should adapt ourselves to war? Should we not confess that in our civilized attitude towards death we are once again living psychologically beyond our means, and should we not rather turn back and recognize the truth? Would it not be better to give death the place in reality and in our thoughts which is its due, and to give a little more prominence to the unconscious attitude towards death which we have hitherto so carefully suppressed? This hardly seems an advance to higher achievement, but rather in some respects a backward step - a regression; but it has the advantage of taking the truth more into account, and of making life more tolerable for us once again. To tolerate life remains, after all, the first duty of all living beings. Illusion becomes valueless if it makes this harder for us.

[1915b, 3091]
It would be in keeping with the times to alter it: *Si vis vitam, para mortem.* If you want to endure life, prepare yourself for death.

[1915b, 3091]

I cannot neglect this opportunity of expressing for once my astonishment that human beings can go through such great and important moments of their erotic life without noticing them much, sometimes even, indeed, without having the faintest suspicion of their existence, or else, having become aware of those moments, deceive themselves so thoroughly in their judgement of them. This happens not only under neurotic conditions, where we are familiar with the phenomenon, but seems also to be common enough in ordinary life. In the present case, for example, a girl develops a sentimental adoration for women, which her parents at first find merely vexatious and hardly take seriously; she herself knows quite well that she is very much occupied with these relationships, but still she experiences few of the sensations of intense love until a particular frustration is followed by a quite excessive reaction, which shows everyone concerned that they have to do with a consuming passion of elemental strength. Nor had the girl ever perceived anything of the state of affairs which was a necessary preliminary to the outbreak of this mental storm. In other cases, too, we come across girls or women in a state of severe depression, who on being asked for a possible cause of their condition tell us that they have, it is true, had a slight feeling for a certain person, but that it was nothing deep and that they soon got over it when they had to give it up. And yet it was this renunciation, apparently so easily borne, that became the cause of serious mental disturbance. Again, we come across men who have passed through casual love-affairs and realize only from the subsequent effects that they had been passionately in love with the person whom they had apparently regarded lightly. One is also amazed at the unexpected results that may follow an artificial abortion, the killing of an unborn child, which had been decided upon without remorse and without hesitation. It must be admitted that poets are right in liking to portray people who are in love without knowing it, or uncertain whether they do love, or who think that they hate when in reality they love. It would seem that the information received by our consciousness about our erotic life is especially liable to be incomplete, full of gaps, or falsified. Needless to say, in this discussion I have not omitted to allow for the part played by subsequent forgetting.

[1920a, 3855]
In this way we brought about a slight improvement. In particular, she seemed to take quite a liking to the painful shocks produced by the high tension apparatus, and the stronger these were the more they seemed to push her own pains into the background. In the meantime my colleague was preparing the ground for psychical treatment, and when, after four weeks of my pretence treatment, I proposed the other method and gave her some account of the procedure and mode of operation, I met with quick understanding and little resistance.

[1895d, 124]

I have not always been a psychotherapist. Like other neuropathologists, I was trained to employ local diagnoses and electro-prognosis, and it still strikes me myself as strange that the case histories I write should read like short stories and that, as one might say, they lack the serious stamp of science. I must console myself with the reflection that the nature of the subject is evidently responsible for this, rather than any preference of my own. The fact is that local diagnosis and electrical reactions lead nowhere in the study of hysteria, whereas a detailed description of mental processes such as we are accustomed to find in the works of imaginative writers enables me, with the use of a few psychological formulas, to obtain at least some kind of insight into the course of that affection. Case histories of this kind are intended to be judged like psychiatric ones; they have, however, one advantage over the latter, namely an intimate connection between the story of the patient's sufferings and the symptoms of his illness - a connection for which we still search in vain in the biographies of other psychoses.

[1895d, 146]

Frau Cäcilie suffered among other things from an extremely violent facial neuralgia which appeared suddenly two or three times a year, lasted for from five to ten days, resisted any kind of treatment and then ceased abruptly. It was limited to the second and third branches of one trigeminal, and since an abnormal excretion of urates was undoubtedly present and a not quite clearly defined 'acute rheumatism' played some part in the patient's history, a diagnosis of gouty neuralgia was plausible enough. This diagnosis was confirmed by the different consultants who were called in at each attack. Treatment of the usual kind was ordered: the electric brush, alkaline water, purges; but each time the neuralgia remained unaffected until it chose to give place to another symptom. Earlier in her life - the neuralgia was fifteen years old - her teeth were accused of being responsible for it. They were condemned to extraction, and one fine day, under narcosis, the sentence was carried out on seven of the criminals. This was not such an easy matter; her teeth were so firmly attached that the roots of most of them had to be left behind. This cruel operation had no result, either temporary or permanent. At that time the neuralgia raged for months on end. Even at the time of my treatment, at each attack of neuralgia the dentist was called in. On each occasion he diagnosed the presence of diseased roots and began to get to work on them; but as a rule he was soon interrupted. For the neuralgia would suddenly cease, and at the same time the demand for the dentist's services. During the interval her teeth did not ache at all. One day, when an attack was raging once more, the patient got me to give her hypnotic treatment. I laid a very energetic prohibition on her pains, and from that moment they ceased. I began at that time to harbour doubts of the genuineness of the neuralgia.

[1895d, 159]
There is one other advantage in the use of this procedure which I must emphasize. I know of no better way of getting to understand a severe case of complicated neurosis with a greater or lesser admixture of hysteria than by submitting it to an analysis by Breuer's method. The first thing that happens is the disappearance of whatever exhibits a hysterical mechanism. In the meantime I have learnt in the course of the analysis to interpret the residual phenomena and to trace their aetiology; and in this way I have secured a firm basis for deciding which of the weapons in the therapeutic armoury against the neuroses is indicated in the case concerned. When I reflect on the difference that I usually find between my judgement on a case of neurosis before and after an analysis of this kind, I am almost inclined to regard an analysis as essential for the understanding of a neurotic illness. Moreover, I have adopted the habit of combining cathartic psychotherapy with a rest-cure which can, if need be, be extended into a complete treatment of feeding-up on Weir Mitchell lines. This gives me the advantage of being able on the one hand to avoid the very disturbing introduction of new psychical impressions during a psychotherapy, and on the other hand to remove the boredom of a rest-cure, in which the patients not infrequently fall into the habit of harmful day-dreaming. It might be expected that the often very considerable psychical work imposed on the patients during a cathartic treatment, and the excitations resulting from the reproduction of traumatic experiences, would run counter to the intentions of the Weir Mitchell rest cure and would hinder the successes which we are accustomed to see it bring about. But the opposite is in fact the case. A combination such as this between the Breuer and Weir Mitchell procedures produces all the physical improvement that we expect from the latter, as well as having a far-reaching psychical influence such as never results from a rest-cure without psychotherapy. [1895d, 236]
Thus his first impression and the resolution it led him to were decisive for the whole of his
further development. His having a great number of chronic nervous patients at his disposal
enabled him to make use of his own special gifts. He was not a reflective man, not a thinker: he
had the nature of an artist - he was, as he himself said, a 'visuel', a man who sees. Here is what
he himself told us about his method of working. He used to look again and again at the things
he did not understand, to deepen his impression of them day by day, till suddenly an
understanding of them dawned on him. In his mind's eye the apparent chaos presented by the
continual repetition of the same symptoms then gave way to order: the new nosological pictures
emerged, characterized by the constant combination of certain groups of symptoms. The
complete and extreme cases, the 'types', could be brought into prominence with the help of a
certain sort of schematic planning, and, with these types as a point of departure, the eye could
close over the long series of ill-defined cases - the 'formes frustes' - which, branching off from
one or other characteristic feature of the type, melt away into indistinctness. He called this kind
of intellectual work, in which he had no equal, 'practising nosography', and he took pride in it.
He might be heard to say that the greatest satisfaction a man could have was to see something
new - that is, to recognize it as new; and he remarked again and again on the difficulty and
value of this kind of 'seeing'. He would ask why it was that in medicine people only see what
they have already learned to see. He would say that it was wonderful how one was suddenly
able to see new things - new states of illness - which must probably be as old as the human
race; and that he had to confess to himself that he now saw a number of things which he had
overlooked for thirty years in his hospital wards. No physician needs to be told what a wealth of
forms were acquired by neuropathology through him, and what increased precision and
sureness of diagnosis were made possible by his observations. But the pupil who spent many
hours with him going round the wards of the Salpêtrière - that museum of clinical facts, the
names and peculiar characteristics of which were for the most part derived from him would be
reminded of Cuvier, whose statue, standing in front of the Jardin des Plantes, shows that great
comprehender and describer of the animal world surrounded by a multitude of animal forms; or
else he would recall the myth of Adam, who, when God brought the creatures of Paradise
before him to be distinguished and named, may have experienced to the fullest degree that
intellectual enjoyment which Charcot praised so highly.

[1893f, 276]
If anyone wants to prove to me that in these remarks I have unduly neglected the significance of the stock aetiological factors, he must confront me with observations in which my specific factor is missing - that is, with cases in which anxiety neurosis has arisen after a psychical shock although the subject has (on the whole) led a normal vita sexualis. Let us see now whether Löwenfeld's case fulfils this condition. My respected opponent has evidently not been clear about this necessity in his own mind, otherwise he would not have left us so completely in the dark about his patient's vita sexualis. I will leave on one side the fact that this case of a lady of thirty is obviously complicated by a hysteria as to the psychical origin of which I have not the least doubt; and I naturally admit without raising any objection the presence of an anxiety neurosis alongside of this hysteria. But before I turn a case to account for or against the theory of the sexual aetiology of the neuroses, I must first have studied the patient's sexual behaviour more closely than Löwenfeld has done here. I should not be content to conclude that, because the time at which the lady received her psychical shock was shortly after a confinement, coitus interruptus could not have played a part during the previous year, and that therefore sexual noxae are ruled out. I know cases of women who were made pregnant every year, and who yet had anxiety neurosis, because - incredible as it may seem - all sexual relations were stopped after the first fertilizing coition, so that in spite of having many children they suffered from sexual privation through all these years. No doctor is ignorant of the fact that women conceive from men whose potency is very slight and who are not able to give them satisfaction. Finally (and this is a consideration which should be taken into account precisely by the upholders of a hereditary aetiology), there are plenty of women who are afflicted with congenital anxiety neurosis - that is to say, who inherit, or who develop without any demonstrable disturbance from outside, a vita sexualis which is the same as the one usually acquired through coitus interruptus and similar noxae. In a number of these women we are able to discover a hysterical illness in their youth, since which their vita sexualis has been disturbed and a deflection of sexual tension from the psychical sphere has been established. Women with this kind of sexuality are incapable of obtaining real satisfaction even from normal coitus, and they develop anxiety neurosis either spontaneously or after further operative factors have supervened. Which of all these elements were present in Löwenfeld's case? I do not know. But I repeat: this case is evidence against me only if the lady who responded to a single fright with an anxiety neurosis had before then enjoyed a normal vita sexualis.

[1895f, 357]

Doctors usually take very little interest in a good many of the questions which are discussed among neuropathologists in connection with the neuroses: whether, for instance, one is justified in making a strict differentiation between hysteria and neurasthenia, whether one may distinguish hystero-neurasthenia alongside of them, whether obsessions should be classed with neurasthenia or recognized as a separate neurosis, and so on. And, indeed, such distinctions may well be a matter of indifference to a practitioner, so long as no further consequences follow from the decisions arrived at - no deeper insight and no pointers for therapeutic treatment - and so long as the patient will in every instance be sent off to a hydropathic establishment, and be told that there is nothing the matter with him. But it will be a different thing if our point of view about the causative relations between sexuality and the neuroses is adopted. Fresh interest is then aroused in the symptomatology of the different neurotic cases, and it becomes of practical importance that one should be able correctly to break down the complicated picture into its components and correctly to name them. For the morphology of the neuroses can with little difficulty be translated into aetiology and a knowledge of the latter leads on quite naturally to new indications for methods of cure.

[1897b, 458]
There was a similar case, in which, once again, the treatment had an unexpected effect which called for an explanation. This case turned out to be still more instructive, for it exhibited a puzzling alternation in the symptoms of the neurosis. A young neurotic patient had been sent by his physician to a reputable hydropathic establishment on account of a typical neurasthenia. There his condition steadily improved at first, so that there was every prospect that he would be discharged as a grateful disciple of hydrotherapy. But in the sixth week a complete change occurred; the patient 'could no longer tolerate the water', became more and more nervous, and finally left the establishment after two more weeks, uncured and dissatisfied. When he complained to me about this therapeutic fraud I asked him a few questions about the symptoms which had overtaken him in the middle of the treatment. Curiously enough, a complete change had come over them. He had entered the sanatorium with intracranial pressure, fatigue and dyspepsia; what had troubled him during the treatment were excitement, attacks of dyspnoea, vertigo in walking, and disturbances of sleep. I was now able to say to him: 'You are doing hydrotherapy an injustice. As you yourself very well knew, you fell ill as a result of long-continued masturbation. In the sanatorium you gave up this form of satisfaction, and therefore you quickly recovered. When you felt well, however, you unwisely sought to have relations with a lady - a fellow-patient, let us suppose - which could only lead to excitement without normal satisfaction. The beautiful walks in the neighbourhood of the establishment gave you ample opportunity for this. It was this relationship, not a sudden inability to tolerate hydrotherapy, which caused you to fall ill once more. Moreover, your present state of health leads me to conclude that you are continuing this relationship here in town as well.' I can assure my readers that the patient confirmed what I said, point by point. [1897b, 465]

The present treatment of neurasthenia - which is, perhaps, carried out most successfully in hydropathic establishments - has as its aim the amelioration of the nervous condition by means of two factors: shielding the patient and strengthening him. I have nothing to say against such a method of treatment, except that it takes no account of the circumstances of the patient's sexual life. According to my experience, it is highly desirable that the medical directors of such establishments should become properly aware that they are dealing, not with victims of civilization or heredity, but - sit venia verbo - with people who are crippled in sexuality. They would then, on the one hand, be more easily able to account for their successes as well as their failures; and, on the other, they would achieve new successes which, till now, have been at the mercy of chance or of the patient's unguided behaviour. If we take a neurasthenic woman, suffering from anxiety, away from her home and send her to a hydropathic establishment, and if there, freed from all duties, she is made to bathe and take exercise and eat plenty of food, we shall certainly be inclined to think that the improvement - often a brilliant one - which is achieved in a few weeks or months is due to the rest which she has enjoyed and to the invigorating effects of hydrotherapy. That may be so: but we are overlooking the fact that her removal from home also entails an interruption of marital intercourse, and that it is only the temporary elimination of this pathogenic cause which makes it possible for her to recover under favourable treatment. Neglect of this aetiological point of view brings its subsequent revenge, when what seemed such a gratifying cure turns out to be a very transitory one. Soon after the patient has returned to ordinary life the symptoms of the complaint appear once more and oblige him either to spend a part of his existence unproductively from time to time in establishments of this kind or to direct his hopes of recovery elsewhere. It is therefore clear that with neurasthenia the therapeutic problems must be attacked, not in hydropathic institutions but within the framework of the patient's life. [1897b, 466]
In other cases our aetiological theory can help the physician in charge of the institution by throwing light on the source of failures which occur in the institution itself, and can suggest to him means of avoiding them. Masturbation is far commoner among grown-up girls and mature men than is generally supposed, and it has a harmful effect not only by producing neurasthenic symptoms, but also because it keeps the patients under the weight of what they feel to be a disgraceful secret. Physicians who are not accustomed to translate neurasthenia into masturbation account for the patient's pathological state by referring it to some catchword like anaemia, undernourishment, overwork, etc., and then expect to cure him by applying a therapy devised against those conditions. To their astonishment, however, periods of improvement in him alternate with periods in which all his symptoms grow worse and are accompanied by severe depression. The outcome of such a treatment is, in general, doubtful. If physicians knew that all the while the patient was struggling against his sexual habit and that he was in despair because he had once more been obliged to give way to it, if they understood how to win his secret from him, to make it less serious in his eyes and to support him in his fight against the habit, then the success of their therapeutic efforts might in this way well be assured. [1897b, 467]

That the method is confined within these limits is to a large extent explained by the circumstances in which I had to work it out. My material does in fact consist of chronic nervous cases derived from the more educated classes. I think it very probable that supplementary methods may be devised for treating children and the public who go for assistance to hospitals. I ought also to say that up to the present I have tried my treatment exclusively on severe cases of hysteria and obsessional neurosis; I cannot tell how it would turn out with those mild cases which, to all appearance at least, are cured by some unspecific kind of treatment lasting for a few months. It will readily be understood that a new therapy which calls for many sacrifices can only reckon on obtaining patients who have already tried the generally accepted methods without success, or whose condition has justified the inference that they could expect nothing from these supposedly more convenient and shorter therapeutic procedures. Thus it happened that I was obliged to tackle the hardest tasks straightaway with an imperfect instrument. The test has proved all the more convincing. [1897b, 474]

The main difficulties which still stand in the way of the psycho-analytic method of cure. It is no more than a necessary corollary to this complete ignorance that doctors consider themselves justified in using the most unfounded assurances for the consolation of their patients or in order to induce them to adopt therapeutic measures. 'Come to my sanatorium for six weeks', they will say, 'and you will get rid of your symptoms' (travel anxiety, obsessions, and so on). Sanatoria are, it is true, indispensable for calming acute attacks that may arise in the course of a psychoneurosis by diverting the patient's attention, nursing him and taking care of him. But towards removing chronic conditions they achieve precisely nothing: and the superior sanatoria, which are supposed to be conducted on scientific lines, do no more than the ordinary hydropathic establishments. [1897b, 474]
It would be more dignified as well as more helpful to the patient - who, after all, has to come to terms with his ailments - for the doctor to tell the truth, as he knows it from his daily practice. The psychoneuroses as a genus are by no means mild illnesses. When hysteria sets in, no one can foretell when it will come to an end. We mostly comfort ourselves with the vain prophecy that 'one day it will suddenly disappear'. Recovery often enough turns out to be merely an agreement to mutual toleration between the sick part of the patient and the healthy part; or it is the result of the transformation of a symptom into a phobia. A girl's hysteria, calmed down with difficulty, revives in her as a wife after the short interruption of young married happiness. The only difference is that another person, the husband, is now driven by his own interests to keep silence about her condition. Even if an illness of this kind leads to no manifest incapacity on the patients' part to carry on their life, it nearly always prevents free unfolding of their mental powers. Obsessions recur throughout their lives; and phobias and other restrictions upon the will have hitherto been unamenable to treatment of any kind. All this is kept from the knowledge of the layman. The father of a hysterical girl is consequently horrified if, for instance, he is asked to agree to her being given a year's treatment, when she has perhaps only been ill for a few months. The layman is, as it were, deeply convinced in himself that all these psychoneuroses are unnecessary; so he has no patience with the processes of the illness and no readiness to make sacrifices for its treatment. If, in face of a case of typhus which lasts three weeks, or of a broken leg which takes six months to mend, he adopts a more understanding attitude, and if, as soon as his child shows the first signs of a curvature of the spine, he finds it reasonable that orthopaedic treatment should be carried on over several years, the difference in his behaviour is due to the better knowledge on the part of the physicians who pass on their knowledge honestly to the layman. Honesty on the part of the physician and willing acquiescence on the part of the layman will be established for the neuroses too, as soon as an insight into the nature of those affections becomes common property in the medical world. Radical treatment of these disorders will no doubt always require special training and will be incompatible with other kinds of medical activity. On the other hand, this class of physicians, which will, I believe, be a large one in the future, has the prospect of achieving noteworthy results and of obtaining a satisfying insight into the mental life of mankind.

I was alarmed at the idea that I had missed an organic illness. This, as may well be believed, is a perpetual source of anxiety to a specialist whose practice is almost limited to neurotic patients and who is in the habit of attributing to hysteria a great number of symptoms which other physicians treat as organic. On the other hand, a faint doubt crept into my mind - from where, I could not tell - that my alarm was not entirely genuine. If Irma's pains had an organic basis, once again I could not be held responsible for curing them; my treatment only set out to get rid of hysterical pains. It occurred to me, in fact, that I was actually wishing that there had been a wrong diagnosis; for, if so, the blame for my lack of success would also have been got rid of.

In spite of her dress. This was in any case only an interpolation. We naturally used to examine the children in the hospital undressed: and this would be a contrast to the manner in which adult female patients have to be examined. I remembered that it was said of a celebrated clinician that he never made a physical examination of his patients except through their clothes. Further than this I could not see. Frankly, I had no desire to penetrate more deeply at this point.
Dr. M. said: 'It's an infection, but no matter. Dysentery will supervene and the toxin will be eliminated.' At first this struck me as ridiculous. But nevertheless, like all the rest, it had to be carefully analysed. When I came to look at it more closely it seemed to have some sort of meaning all the same. What I discovered in the patient was a local diphtheritis. I remembered from the time of my daughter's illness a discussion on diphtheritis and diphtheria, the latter being the general infection that arises from the local diphtheritis. Leopold indicated the presence of a general infection of this kind from the existence of a dull area, which might thus be regarded as a metastatic focus. I seemed to think, it is true, that metastases like this do not in fact occur with diphtheria: it made me think rather of pyaemia.

Dysentery. There seemed to be some remote theoretical notion that morbid matter can be eliminated through the bowels. Could it be that I was trying to make fun of Dr. M.'s fertility in producing far-fetched explanations and making unexpected pathological connections? Something else now occurred to me in relation to dysentery. A few months earlier I had taken on the case of a young man with remarkable difficulties associated with defaecating, who had been treated by other physicians as a case of 'anaemia accompanied by malnutrition'. I had recognized it as a hysteria, but had been unwilling to try him with my psychotherapeutic treatment and had sent him on a sea voyage. Some days before, I had had a despairing letter from him from Egypt, saying that he had had a fresh attack there which a doctor had declared was dysentery. I suspected that the diagnosis was an error on the part of an ignorant practitioner who had allowed himself to be taken in by the hysteria. But I could not help reproaching myself for having put my patient in a situation in which he might have contracted some organic trouble on top of his hysterical intestinal disorder. Moreover, 'dysentery' sounds not unlike 'diphtheria' - a word of ill omen which did not occur in the dream.

Yes, I thought to myself, I must have been making fun of Dr. M. with the consoling prognosis 'Dysentery will supervene', etc.: for it came back to me that, years before, he himself had told an amusing story of a similar kind about another doctor. Dr. M. had been called in by him for consultation over a patient who was seriously ill, and had felt obliged to point out, in view of the very optimistic view taken by his colleague, that he had found albumen in the patient's urine. The other, however, was not in the least put out: 'No matter', he had said, 'the albumen will soon be eliminated!' - I could no longer feel any doubt, therefore, that this part of the dream was expressing derision at physicians who are ignorant of hysteria. And, as though to confirm this, a further idea crossed my mind: 'Does Dr. M. realize that the symptoms in his patient (Irma's friend) which give grounds for fearing tuberculosis also have a hysterical basis? Has he spotted this hysteria? or has he been taken in by it?'

Paediatricians, on the other hand, seem to lack the only line of approach which can make this whole class of phenomena intelligible, whether from the somatic or from the psychical aspect. I cannot resist quoting an amusing instance of the way in which the blinkers of medical mythology can cause an observer to miss an understanding of such cases by a narrow margin. My instance is taken from a thesis on pavor nocturnus by Debacker (1881, 66):
There is really very little difficulty in inferring: (1) that the boy had masturbated when he was younger, that he had probably denied it, and that he had been threatened with severe punishment for his bad habit (cf. his admission: 'Je ne le ferais plus', and his denial: 'Albert n'a jamais fait ça'); (2) that with the onset of puberty the temptation to masturbate had revived with the tickling in his genitals; but (3) that a struggle for repression had broken out in him, which had suppressed his libido and transformed it into anxiety, and that the anxiety had taken over the punishments with which he had been threatened earlier.

And now let us see the inferences drawn by our author (ibid., 69): 'The following conclusions can be drawn from this observation:

'(5) A predisposing influence upon the origin of the child's brain condition may perhaps be attributed to heredity and to a past syphilitic infection in his father.'

And here is the final conclusion: 'Nous avons fait entrer cette observation dans le cadre des délire apyrétiques d'inanition, car c'est à l'ischémie cérébrale que nous rattachons cet état particulier.'

¹ Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words 'suppressed' and 'repressed.' It should have been clear, however, that the latter lays more stress upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream-thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one. And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the Oneirocritica of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion.

In the first place, let me remind you that psychotherapy is in no way a modern method of treatment. On the contrary, it is the most ancient form of therapy in medicine. In Löwenfeld's instructive Lehrbuch der gesamten Psychotherapie many of the methods of primitive and ancient medical science are described. The majority of them must be classed under the head of psychotherapy; in order to effect a cure a condition of 'expectation coloured by faith' was induced in sick persons - a condition which answers a similar purpose for us to-day. Even since physicians have come upon other remedies, psychotherapeutic endeavours of one kind or another have never completely disappeared from medicine.
And, in the third place, Gentlemen, I would remind you of the well-established fact that certain diseases, in particular the psychoneuroses, are far more readily accessible to mental influences than to any other form of medication. It is not a modern dictum but an old saying of physicians that these diseases are not cured by the drug but by the physician, that is, by the personality of the physician, inasmuch as through it he exerts a mental influence. I am well aware that you favour the view which Vischer, the professor of aesthetics, expressed so well in his parody of Faust:
[1905a, 1565]

There are many ways and means of practising psychotherapy. All that lead to recovery are good. Our usual word of comfort, which we dispense so liberally to our patients - ‘You'll soon be all right again’-, corresponds to one of these psychotherapeutic methods; but now that we have deeper insight into the neuroses, we are no longer obliged to confine ourselves to the word of comfort. We have developed the technique of hypnotic suggestion, and psychotherapy by mental distraction, by exercise, and by eliciting suitable affects. I despise none of these methods and would use them all in appropriate circumstances. If I have actually come to confine myself to one form of treatment, to the method which Breuer called cathartic, but which I myself prefer to call ‘analytic’, it is because I have allowed myself to be influenced by purely subjective motives. Because of the part I have played in founding this therapy, I feel a personal obligation to devote myself to closer investigation of it and to the development of its technique. And I may say that the analytic method of psychotherapy is the one that penetrates most deeply and carries farthest, the one by means of which the most extensive transformations can be effected in patients. Putting aside for a moment the therapeutic point of view, I may also say of it that it is the most interesting method, the only one which informs us at all about the origin and inter-relation of morbid phenomena. Owing to the insight which we gain into mental illness by this method, it alone should be capable of leading us beyond its own limits and of pointing out the way to other forms of therapeutic influence.
[1905a, 1565]

‘Psyche’ is a Greek word which may be translated ‘mind’. Thus ‘psychical treatment’ means ‘mental treatment’. The term might accordingly be supposed to signify ‘treatment of the pathological phenomena of mental life’. This, however, is not its meaning. ‘Psychical treatment’ denotes, rather, treatment taking its start in the mind, treatment (whether of mental or physical disorders) by measures which operate in the first instance and immediately upon the human mind.
[1890a, 1586]
It is only comparatively recently, too, that physicians with a scientific training have learnt to appreciate the value of mental treatment. And we can easily see why this was so when we reflect on the evolution of medicine during the last half-century. After a somewhat unfruitful period during which it was dependent on what was known as ‘Natural Philosophy’, it came under the happy influence of the natural sciences and has achieved the greatest advances alike as a science and as an art: it has shown that the organism is built up from microscopically small elements (the cells), it has learnt to understand the physics and chemistry of the various vital processes (functions), it has distinguished the visible and observable modifications which are brought about in the bodily organs by different morbid processes, and has discovered, on the other hand, the signs that reveal the operation of deep-lying morbid processes in the living body; moreover it has identified a great number of the micro-organisms which cause illness and, with the help of its newly acquired knowledge, it has reduced to a quite extraordinary degree the dangers arising from severe surgical operations. All of these advances and discoveries were related to the physical side of man, and it followed, as a result of an incorrect though easily understandable trend of thought, that physicians came to restrict their interest to the physical side of things and were glad to leave the mental field to be dealt with by the philosophers whom they despised.

Modern medicine, it is true, had reason enough for studying the indisputable connection between the body and the mind; but it never ceased to represent mental events as determined by physical ones and dependent on them. Thus stress was laid on the fact that intellectual functioning was conditional upon the presence of a normally developed and sufficiently nourished brain, that any disease of that organ led to disturbances of intellectual functioning, that the introduction of toxic substances into the circulation could produce certain states of mental illness, or - to descend to more trivial matters - that dreams could be modified by stimuli brought to bear upon a sleeper for experimental purposes.

The relation between body and mind (in animals no less than in human beings) is a reciprocal one; but in earlier times the other side of this relation, the effect of the mind upon the body, found little favour in the eyes of physicians. They seemed to be afraid of granting mental life any independence, for fear of that implying an abandonment of the scientific ground on which they stood.
This one-sided attitude of medicine towards the body has undergone a gradual change in the
course of the last decade and a half, a change brought about directly by clinical experience.
There are a large number of patients, suffering from affections of greater or less severity, whose
disorders and complaints make great demands on the skill of their physicians, but in whom no
visible or observable signs of a pathological process can be discovered either during their life or
after their death, in spite of all the advances in the methods of investigation made by scientific
medicine. One group of these patients are distinguished by the copiousness and variety of their
symptoms: they are incapable of intellectual work because of headaches or inability to
concentrate their attention, their eyes ache when they read, their legs become fatigued when
they walk, develop dull pains or go to sleep, their digestion is disturbed by distressing
sensations, by eructations or gastric spasms, they cannot defaecate without aperients, they are
subject to sleeplessness, and so on. They may suffer from all these disorders simultaneously or
in succession, or from only a selection of them; but in every case the illness is evidently the
same. Moreover, its signs are often variable and replace one another. A patient who has
hitherto been incapacitated by headaches but has had a fairly good digestion may next day
enjoy a clear head but may thenceforward be unable to manage most kinds of food. Again, his
sufferings may suddenly cease if there is a marked change in the circumstances of his
existence. If he is travelling he may feel perfectly well and be able to enjoy the most varied diet
without any ill effects, but when he gets home he may once more have to restrict himself to sour
milk. In a few cases the disorder - whether it is a pain or a weakness resembling a paralysis -
may suddenly pass from one side of the body to the other: it may jump from his right side to the
corresponding part of the body on his left side. But in every instance it is to be observed that the
symptoms are very clearly influenced by excitement, emotion, worry, etc., and also that they
can disappear and give place to perfect health without leaving any traces, even if they have
persisted over a long period.
[1890a, 1587]
I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1962]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]
Furthermore, let me say in Hans's favour (and I frankly admit my partisan attitude) that he is not the only child who has been overtaken by a phobia at some time or other in his childhood. Troubles of that kind are well known to be quite extraordinarily frequent, even in children the strictness of whose upbringing has left nothing to be desired. In later life these children either become neurotic or remain healthy. Their phobias are shouted down in the nursery because they are inaccessible to treatment and are decidedly inconvenient. In the course of months or years they diminish, and the child seems to recover; but no one can tell what psychological changes are necessitated by such a recovery, or what alterations in character are involved in it. When, however, an adult neurotic patient comes to us for psycho-analytic treatment (and let us assume that his illness has only become manifest after he has reached maturity), we find regularly that his neurosis has as its point of departure an infantile anxiety such as we have been discussing, and is in fact a continuation of it; so that, as it were, a continuous and undisturbed thread of psychical activity, taking its start from the conflicts of his childhood, has been spun through his life - irrespective of whether the first symptom of those conflicts has persisted or has retreated under the pressure of circumstances. I think, therefore, that Hans's illness may perhaps have been no more serious than that of many other children who are not branded as 'degenerates'; but since he was brought up without being intimidated, and with as much consideration and as little coercion as possible, his anxiety dared to show itself more boldly. With him there was no place for such motives as a bad conscience or a fear of punishment, which with other children must no doubt contribute to making the anxiety less. It seems to me that we concentrate too much upon symptoms and concern ourselves too little with their causes. In bringing up children we aim only at being left in peace and having no difficulties, in short, at training up a model child, and we pay very little attention to whether such a course of development is for the child's good as well. I can therefore quite imagine that it may have been to Hans's advantage to have produced this phobia. For it directed his parents' attention to the unavoidable difficulties by which a child is confronted when in the course of his cultural training he is called upon to overcome the innate instinctual components of his mind; and his trouble brought his father to his assistance. It may be that Hans now enjoys an advantage over other children, in that he no longer carries within him that seed in the shape of repressed complexes which must always be of some significance for a child's later life, and which undoubtedly brings with it a certain degree of deformity of character if not a predisposition to a subsequent neurosis. I am inclined to think that this is so, but I do not know if many others will share my opinion; nor do I know whether experience will prove me right.

[1909b, 2120]
A youngish man of university education introduced himself to me with the statement that he had suffered from obsessions ever since his childhood, but with particular intensity for the last four years. The chief features of his disorder were fears that something might happen to two people of whom he was very fond - his father and a lady whom he admired. Besides this he was aware of compulsive impulses - such as an impulse, for instance, to cut his throat with a razor; and further he produced prohibitions, sometimes in connection with quite unimportant things. He had wasted years, he told me, in fighting against these ideas of his, and in this way had lost much ground in the course of his life. He had tried various treatments, but none had been of any use to him except a course of hydrotherapy at a sanatorium near ---; and this, he thought, had probably only been because he had made an acquaintance there which had led to regular sexual intercourse. Here he had no opportunities of the sort, and he seldom had intercourse and only at irregular intervals. He felt disgust at prostitutes. Altogether, he said, his sexual life had been stunted; masturbation had played only a small part in it, in his sixteenth or seventeenth year. His potency was normal; he had first had intercourse at the age of twenty-six.

So far it has been an advantage to us to accompany the doctors; but the moment of parting is at hand. For you must not suppose that a patient's prospects of medical assistance are improved in essentials by the fact that a diagnosis of hysteria has been substituted for one of severe organic disease of the brain. Medical skill is in most cases powerless against severe diseases of the brain; but neither can the doctor do anything against hysterical disorders. He must leave it to kindly Nature to decide when and how his optimistic prognosis shall be fulfilled.¹

Thus the recognition of the illness as hysteria makes little difference to the patient; but to the doctor quite the reverse. It is noticeable that his attitude towards hysterical patients is quite other than towards sufferers from organic diseases. He does not have the same sympathy for the former as for the latter: for the hysteric's ailment is in fact far less serious and yet it seems to claim to be regarded as equally so. And there is a further factor at work. Through his studies, the doctor has learnt many things that remain a sealed book to the layman: he has been able to form ideas on the causes of illness and on the changes it brings about - e.g. in the brain of a person suffering from apoplexy or from a malignant growth - ideas which must to some degree meet the case, since they allow him to understand the details of the illness. But all his knowledge - his training in anatomy, in physiology and in pathology - leaves him in the lurch when he is confronted by the details of hysterical phenomena. He cannot understand hysteria, and in the face of it he is himself a layman. This is not a pleasant situation for anyone who as a rule sets so much store by his knowledge. So it comes about that hysterical patients forfeit his sympathy. He regards them as people who are transgressing the laws of his science - like heretics in the eyes of the orthodox. He attributes every kind of wickedness to them, accuses them of exaggeration, of deliberate deceit, of malingering. And he punishes them by withdrawing his interest from them.

¹[1910a, 2201]
Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone represented psycho-analysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling-resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became accustomed to that long ago. People simply did not believe me, just as even to-day people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of all arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patient's minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses - arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psycho-analysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electro-therapy, but that does not enable such measures to get the better of neuroses. Time will show whether psycho-analytic treatment can accomplish more.

Psycho-analysis is unjustly reproached, Gentlemen, for leading to purely psychological theories of pathological problems. The emphasis which it lays on the pathogenic role of sexuality, which, after all, is certainly not an exclusively psychical factor should alone protect it from this reproach. Psycho-analysts never forget that the mental is based on the organic, although their work can only carry them as far as this basis and no beyond it. Thus psycho-analysis is ready to admit, and indeed to postulate, that not all disturbances of vision need be psychogenic, like those that are evoked by the repression of erotic scopophilia. If an organ which serves the two sorts of instinct increases its erotogenic role, it is in general to be expected that this will not occur without the excitability and innervation of the organ undergoing changes which will manifest themselves as disturbances of its function in the service of the ego. Indeed, if we find that an organ normally serving the purpose of sense-perception begins to behave like an actual genital when its erotogenic role is increased, we shall not regard it as improbable that toxic changes are also occurring in it. For lack of a better name we must retain the old unsuitable term of 'neurotic' disturbances for both classes of functional disturbances - those of physiological as well as those of toxic origin - which follow from an increase in the erotogenic factor. Generally speaking, the neurotic disturbances of vision stand in the same relation to the psychogenic ones as the 'actual neuroses' do to the psychoneuroses: psychogenic visual disturbances can no doubt hardly ever appear without neurotic ones, but the latter can appear without the former. These neurotic symptoms are unfortunately little appreciated and understood even today; for they are not directly accessible to psycho-analysis, and other methods of research have left the standpoint of sexuality out of account.
Neither I myself nor my friends and co-workers find it agreeable to claim a monopoly in this way in the use of a medical technique. But in face of the dangers to patients and to the cause of psycho-analysis which are inherent in the practice that is to be foreseen of a 'wild' psycho-analysis, we have had no other choice. In the spring of 1910 we founded an International Psycho-Analytical Association, to which its members declare their adherence by the publication of their names, in order to be able to repudiate responsibility for what is done by those who do not belong to us and yet call their medical procedure 'psycho-analysis'. For as a matter of fact 'wild' analysts of this kind do more harm to the cause of psycho-analysis than to individual patients. I have often found that a clumsy procedure like this, even if at first it produced an exacerbation of the patient's condition, led to a recovery in the end. Not always but still often. When he has abused the physician enough and feels far enough away from his influence, his symptoms give way, or he decides to take some step which leads along the path to recovery. The final improvement then comes about 'of itself', or is ascribed to some totally indifferent treatment by some other doctor to whom the patient has later turned. In the case of the lady whose complaint against her physician we have heard, I should say that, despite everything, the 'wild' psycho-analyst did more for her than some highly respected authority who might have told her she was suffering from a 'vasomotor neurosis'. He forced her attention to the real cause of her trouble, or in that direction, and in spite of all her opposition this intervention of his cannot be without some favourable results. But he has done himself harm and helped to intensify the prejudices which patients feel, owing to their natural affective resistances, against the methods of psycho-analysis. And this can be avoided.

[1910k, 2380]

Just as little can I advocate a middle course, which would recommend itself to some people as being specially ingenious. This would consist in declaring that one returns the patient's fond feelings but at the same time in avoiding any physical implementation of this fondness until one is able to guide the relationship into calmer channels and raise it to a highest level. My objection to this expedient is that psycho-analytic treatment is founded on truthfulness. In this fact lies a great part of its educative effect and its ethical value. It is dangerous to depart from this foundation. Anyone who has become saturated in the analytic technique will no longer be able to make use of the lies and pretences which a doctor normally finds unavoidable; and if, with the best intentions, he does attempt to do so, he is very likely to betray himself. Since we demand strict truthfulness from our patients, we jeopardize our whole authority if we let ourselves be caught out by them in a departure from the truth. Besides, the experiment of letting oneself go a little way in tender feelings for the patient is not altogether without danger. Our control over ourselves is not so complete that we may not suddenly one day go further than we had intended. In my opinion, therefore, we ought not to give up the neutrality towards the patient, which we have acquired through keeping the counter-transference in check.

[1915a, 2514]

There is often a tendency in medical and especially in psychiatric circles to contradict the theories of psycho-analysis without any real study or practical application of them. This is due not only to the striking novelty of these theories and the contrast they present to the views hitherto held by psychiatrists, but also to the fact that the premisses and technique of psycho-analysis are much more nearly related to the field of psychology than to that of medicine. It cannot be disputed, however, that purely medical and non-psychological teachings have hitherto done very little towards an understanding of mental life. The progress of psycho-analysis is further retarded by the dread felt by the average observer of seeing himself in his own mirror. Men of science tend to meet emotional resistances with arguments, and thus satisfy themselves to their own satisfaction! Whoever wishes not to ignore a truth will do well to distrust his antipathies, and, if he wishes to submit the theory of psycho-analysis to a critical examination, let him first analyse himself.

[1913m, 2548]
While I was living in Paris in 1885 as a pupil of Charcot, what chiefly attracted me, apart from the great man's own lectures, were the demonstrations and addresses given by Brouardel. He used to show us from post-mortem material at the morgue how much there was which deserved to be known by doctors but of which science preferred to take no notice. On one occasion he was discussing the indications which enabled one to judge the social rank, character and origin of an unidentified body, and I heard him say: 'Les genoux sales sont le signe d'une fille honnête.' He was using a girl's dirty knees as evidence of her virtue!

[1913k, 2639]

The author of this little monograph, which deals with the pathology and treatment of psychical impotence in males, is one of the small band of physicians who early recognized the importance of psycho-analysis for their special branch of medicine and who have never since ceased to perfect themselves in its theory and technique. We are aware that only a small part of neurotic ailments - which we have now come to know as the outcome of disturbances of the sexual function - are dealt with in neuropathology itself. The greater number of them find a place among the disorders of the particular organ which is the victim of a neurotic disturbance. It is therefore expedient and proper that the treatment of these symptoms or syndromes should also be the business of the specialist, who is alone capable of making a differential diagnosis between a neurotic and an organic illness, who can draw the line, in the case of mixed forms, between their organic and neurotic elements, and who can in general give us information on the way in which the two factors in the disease mutually reinforce each other. But if 'nervous' organic diseases are not to fall into neglect as being mere appendages of the material disorders of the same organ - a neglect which, from their frequency and practical importance, they are far from meriting - the specialist, whether he is concerned with the stomach, the heart or the urogenitary system, must, in addition to his general medical knowledge and his specialized attainments, also be able to make use, for his own field of work, of the lines of approach, the discoveries and the techniques of the nerve specialist.

[1913e, 2645]

A great therapeutic advance will have been made when specialists no longer dismiss a patient suffering from a nervous ailment in an organ with a pronouncement such as: 'There's nothing wrong with you; it's simply nerves', or with the not much better further advice: 'Go to a nerve specialist; he'll order you a light course of cold-water treatment.' No doubt, too, we shall require the specialist in any organ to be capable of understanding and treating nervous disorders in his field, rather than expect the nerve-specialist to be trained into being a universal specialist in every organ in which neuroses produce symptoms. And it may accordingly be anticipated that only neuroses with mainly psychical symptoms will remain in the sphere of the nerve specialist.

[1913e, 2645]

This medical significance of psycho-analysis would not, however, justify me in bringing it to the notice of a circle of savants concerned in the synthesis of the sciences. And such a plan must seem particularly premature so long as a large number of psychiatrists and neurologists are opposed to the new therapeutic method and reject both its postulates and its findings. If, nevertheless, I regard the experiment as a legitimate one, it is because psycho-analysis can also claim to be of interest to others than psychiatrists, since it touches upon various other spheres of knowledge and reveals unexpected relations between them and the pathology of mental life.

[1913], 2802]
There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are ‘parapraxes’ (slips of the tongue or pen, forgetfulness, etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (in so far as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find ‘physiological’ explanations of them, though these were invariably unsatisfactory. Psycho-analysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus on the one hand psycho-analysis has narrowed the region subject to the physiological point of view and on the other hand has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psycho-analysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

I will begin with those connected with instruction, with training in psycho-analysis. In medical training you are accustomed to see things. You see an anatomical preparation, the precipitate of a chemical reaction, the shortening of a muscle as a result of the stimulation of its nerves. Later on, patients are demonstrated before your senses - the symptoms of their illness, the products of the pathological process and even in many cases the agent of the disease in isolation. In the surgical departments you are witnesses of the active measures taken to bring help to patients, and you may yourselves attempt to put them into effect. Even in psychiatry the demonstration of patients with their altered facial expressions, their mode of speech and their behaviour, affords you plenty of observations which leave a deep impression on you. Thus a medical teacher plays in the main the part of a leader and interpreter who accompanies you through a museum, while you gain a direct contact with the objects exhibited and feel yourselves convinced of the existence of the new facts through your own perception.

Psycho-analysis is not to be blamed for a second difficulty in your relation to it; I must make you yourselves responsible for it, Ladies and Gentlemen, at least in so far as you have been students of medicine. Your earlier education has given a particular direction to your thinking, which leads far away from psycho-analysis. You have been trained to find an anatomical basis for the functions of the organism and their disorders, to explain them chemically and physically and to view them biologically. But no portion of your interest has been directed to psychical life, in which, after all, the achievement of this marvellously complex organism reaches its peak. For that reason psychological modes of thought have remained foreign to you. You have grown accustomed to regarding them with suspicion, to denying them the attribute of being scientific, and to handing them over to laymen, poets, natural philosophers and mystics. This limitation is without doubt detrimental to your medical activity, since, as is the rule in all human relationships, your patients will begin by presenting you with their mental façade, and I fear that you will be obliged as a punishment to leave a part of the therapeutic influence you are seeking to the lay practitioners, nature curers and mystics whom you so much despise.
I am not unaware of the excuse that we have to accept for this defect in your education. No philosophical auxiliary science exists which could be made of service for your medical purposes. Neither speculative philosophy, nor descriptive psychology, nor what is called experimental psychology (which is closely allied to the physiology of the sense-organs), as they are taught in the Universities, are in a position to tell you anything serviceable of the relation between body and mind or to provide you with the key to an understanding of possible disturbances of the mental functions. It is true that psychiatry, as a part of medicine, sets about describing the mental disorders it observes and collecting them into clinical entities; but at favourable moments the psychiatrists themselves have doubts of whether their purely descriptive hypotheses deserve the name of a science. Nothing is known of the origin, the mechanism or the mutual relations of the symptoms of which these clinical entities are composed; there are either no observable changes in the anatomical organ of the mind to correspond to them, or changes which throw no light upon them. These mental disorders are only accessible to therapeutic influence when they can be recognized as subsidiary effects of what is otherwise an organic illness.

[1916-1917, 3133]

I am to put before you, then, the psycho-analytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting-room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would - 'There's nothing wrong with you' - with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I fine them so-and-so many Kronen for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psycho-analysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting-room and my consulting- and treatment-room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting-room omits to shut the door behind him and almost always he leaves both doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door-handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting-room and consulting-room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient only occurs when he has been alone in the waiting-room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.

[1916-1917, 3329]
However that may be, there is no question that the problem of anxiety is a nodal point at which the most various and important questions converge, a riddle whose solution would be found to throw a flood of light on our whole mental existence. I will not assert that I can give you this complete solution; but you will certainly expect psycho-analysis to approach this subject too in quite a different way from academic medicine. Interest there seems mainly to be centred on tracing the anatomical paths along which the state of anxiety is brought about. We are told that the medulla oblongata is stimulated, and the patient learns that he is suffering from a neurosis of the vagus nerve. The medulla oblongata is a very serious and lovely object. I remember quite clearly how much time and trouble I devoted to its study many years ago. To-day, however, I must remark that I know nothing that could be of less interest to me for the psychological understanding of anxiety than knowledge of the path of the nerves along which its excitations pass.

[1916-1917, 3442]

Do not suppose that the things I have said to you here about affects are the recognized stock-in-trade of normal psychology. They are on the contrary views that have grown up on the soil of psycho-analysis and are native only to it. What you may gather about affects from psychology - the James-Lange theory, for example - is quite beyond understanding or discussion to us psycho-analysts. But we do not regard our knowledge about affects as very assured either; it is a first attempt at finding our bearings in this obscure region. I will proceed, however. We believe that in the case of the affect of anxiety we know what the early impression is which it repeats. We believe that it is in the act of birth that there comes about the combination of unpleasurable feelings, impulses of discharge and bodily sensations which has become the prototype of the effects of a mortal danger and has ever since been repeated by us as the state of anxiety. The immense increase of stimulation owing to the interruption of the renovation of the blood (internal respiration) was at the time the cause of the experience of anxiety; the first anxiety was thus a toxic one. The name 'Angst - 'augustiae', 'Enge'¹ - emphasizes the characteristic of restriction in breathing which was then present as a consequence of the real situation and is now almost invariably reinstated in the affect. We shall also recognize it as highly relevant that this first state of anxiety arose out of separation from the mother. It is, of course, our conviction that the disposition to repeat the first state of anxiety has been so thoroughly incorporated into the organism through a countless series of generations that a single individual cannot escape the affect of anxiety even if, like the legendary Macduff, he 'was from his mother's womb untimely ripped' and has therefore not himself experienced the act of birth. We cannot say what has become the prototype of the state of anxiety in the case of creatures other than mammals. And in the same way we do not know either what complex of feelings is in such creatures the equivalent to our anxiety.

[1916-1917, 3445]

Of course, the sexual abstinence now so warmly recommended by doctors only has the same importance in generating anxiety states when the libido which is prevented from finding a satisfying discharge is correspondingly strong and has not been dealt with for the greater part by sublimation. Indeed, the decision on whether the outcome is to be illness or not always lies with quantitative factors. Even where what is in question is not illness but the form assumed by a person's character, it is easy to recognize that sexual restriction goes hand in hand with some kind of anxiousness and hesitancy, while intrepidity and impudent daring bring along with them a free indulgence of sexual needs. However much these relations are altered and complicated by a variety of cultural influences, it nevertheless remains true of the average of mankind that anxiety has a close connection with sexual limitation.

[1916-1917, 3449]
We shall soon have reached the end. You are perhaps disappointed that on the topic of the psycho-analytic method of therapy I have only spoken to you about theory and not about the conditions which determine whether a treatment is to be undertaken or about the results it produces. I shall discuss neither: the former because it is not my intention to give you practical instructions on how to carry out a psycho-analysis, and the latter because several reasons deter me from it. At the beginning of our talks, I emphasized the fact that under favourable conditions we achieve successes which are second to none of the finest in the field of internal medicine; and I can now add something further - namely that they could not have been achieved by any other procedure. If I were to say more than this I should be suspected of trying to drown the loudly raised voices of depreciation by self-advertisement. The threat has repeatedly been made against psycho-analysts by our medical 'colleagues' - even at public congresses - that a collection of the failures and damaging results of analysis would be published which would open the suffering public's eyes to the worthlessness of this method of treatment. But, apart from the malicious, denunciatory character of such a measure, it would not even be calculated to make it possible to form a correct judgement of the therapeutic effectiveness of analysis. Analytic therapy, as you know, is in its youth; it has taken a long time to establish its technique, and that could only be done in the course of working and under the influence of increasing experience. In consequence of the difficulties in giving instruction, the doctor who is a beginner in psycho-analysis is thrown back to a greater extent than other specialists on his own capacity for further development, and the results of his first years will never make it possible to judge the efficacy of analytic therapy.

The fact that an organization of this kind exists is actually due to the exclusion of psycho-analysis from Universities. And it is therefore evident that these arrangements will continue to perform an effective function so long as this exclusion persists.

(2) So far as the Universities are concerned, the question depends on their deciding whether they are willing to attribute any value at all to psycho-analysis in the training of physicians and scientists. If so, the further problem remains of how it is to be incorporated into the regular educational framework.

(a) This training has been quite rightly criticized during the last few decades for the one-sided way in which it directs the student into the fields of anatomy, physics and chemistry, while failing, on the other hand, to make plain to him the significance of mental factors in the different vital functions as well as in illnesses and their treatment. This short-coming in medical education makes itself felt later as a flagrant blind spot in the physician. This will not only show itself in his lack of interest in the most absorbing problems of human life, whether healthy or diseased, but will also render him unskilful in his treatment of patients, so that even quacks and 'healers' will have a greater effect on them than he does.

This obvious deficiency led some time ago to the inclusion in the University curriculum of courses of lectures on medical psychology. But so long as these lectures were based on academic psychology or on experimental psychology (which deals only with questions of detail), they were unable to meet the requirements of the student's training; nor could they bring him any nearer to the problems of life in general or to those of his profession. For these reasons the place occupied by this kind of medical psychology in the curriculum proved insecure.
A course of lectures on psycho-analysis, on the other hand, would certainly answer these requirements. Before coming to psycho-analysis proper, an introductory course would be needed, which would deal in detail with the relations between mental and physical life - the basis of all kinds of psychotherapy - , would describe the various kinds of suggestive procedures, and would finally show how psycho-analysis constitutes the outcome and culmination of all the earlier methods of mental treatment. Psycho-analysis, in fact, more than any other system, is fitted for teaching psychology to the medical student.

This painful form of treatment introduced in the German army for therapeutic purposes could no doubt also be employed in a more moderate fashion. If it was used in the Vienna Clinics, I am personally convinced that it was never intensified to a cruel pitch by the initiative of Professor Wagner-Jauregg. I cannot vouch for other physicians whom I did not know. The psychological education of medical men is in general decidedly deficient and more than one of them may have forgotten that the patient whom he was seeking to treat as a malingerer was, after all, not one.

This therapeutic procedure, however, bore a stigma from the very first. It did not aim at the patient’s recovery, or not in the first instance; it aimed, above all, at restoring his fitness for service. Here Medicine was serving purposes foreign to its essence. The physician himself was under military command and had his own personal dangers to fear - loss of seniority or a charge of neglecting his duty - if he allowed himself to be led by considerations other than those prescribed for him. The insoluble conflict between the claims of humanity, which normally carry decisive weight for a physician, and the demands of a national war was bound to confuse his activity.

In the story of 'The Ring of Polycrates', the King of Egypt turns away in horror from his host, Polycrates, because he sees that his friend's every wish is at once fulfilled, his every care promptly removed by kindly fate. His host has become 'uncanny' to him. His own explanation, that the too fortunate man has to fear the envy of the gods, seems obscure to us; its meaning is veiled in mythological language. We will therefore turn to another example in a less grandiose setting. In the case history of an obsessional neurotic,¹ I have described how the patient once stayed in a hydrophathic establishment and benefited greatly by it. He had the good sense, however, to attribute his improvement not to the therapeutic properties of the water, but to the situation of his room, which immediately adjoined that of a very accommodating nurse. So on his second visit to the establishment he asked for the same room, but was told that it was already occupied by an old gentleman, whereupon he gave vent to his annoyance in the words: 'I wish he may be struck dead for it.' A fortnight later the old gentleman really did have a stroke. My patient thought this an 'uncanny' experience. The impression of uncanniness would have been stronger still if less time had elapsed between his words and the untoward event, or if he had been able to report innumerable similar coincidences. As a matter of fact, he had no difficulty in producing coincidences of this sort; but then not only he but every obsessional neurotic I have observed has been able to relate analogous experiences. They are never surprised at their invariably running up against someone they have just been thinking of, perhaps for the first time for a long while. If they say one day 'I haven't had any news of so-and-so for a long time', they will be sure to get a letter from him the next morning, and an accident or a death will rarely take place without having passed through their mind a little while before. They are in the habit of referring to this state of affairs in the most modest manner, saying that they have 'presentiments' which 'usually' come true.

[1919j, 3639]

[1919d, 3670]

[1919h, 3690]
Psycho-analysis was born out of medical necessity. It sprang from the need for bringing help to neurotic patients, who had found no relief through rest-cures, through the arts of hydropathy or through electricity. A most remarkable observation made by Josef Breuer had excited a hope that the more one understood of the hitherto unexplored origin of their symptoms the more extensive would be the help one could afford them. Thus it came about that psycho-analysis, being originally a purely medical technique, was from the first directed towards research, towards the discovery of causal chains at once far-reaching and recondite.

[1919g, 3703]

Psycho-analysis took hold of this new realization and began to consider the problem of the nature of the psychical processes which led to these unusual consequences. But the direction taken by this enquiry was not to the liking of the contemporary generation of physicians. They had been brought up to respect only anatomical, physical and chemical factors. They were not prepared for taking psychical ones into account and therefore met them with indifference or antipathy. They obviously had doubts whether psychical events allowed of any exact scientific treatment whatever. As an excessive reaction against an earlier phase during which medicine had been dominated by what was known as the 'philosophy of Nature', they regarded such abstractions as those with which psychology is obliged to work as nebulous, fantastic and mystical; while they simply refused to believe in remarkable phenomena which might have been the starting-point of research. The symptoms of hysterical neuroses were looked upon as shamming and the phenomena of hypnotism as a hoax. Even the psychiatrists, upon whose attention the most unusual and astonishing mental phenomena were constantly being forced, showed no inclination to examine their details or enquire into their connections. They were content to classify the variegated array of symptoms and trace them back, so far as they could manage, to somatic, anatomical or chemical aetiological disturbances. During this materialistic or, rather, mechanistic period, medicine made tremendous advances, but it also showed a short-sighted misunderstanding of the most important and most difficult among the problems of life.

[1925e, 4123]

It is easy to understand why doctors, with an attitude of this kind towards the mind, should have had no liking for psycho-analysis and should have demurred to its demand for learning many things afresh and for seeing many things in a different light. But as a compensation it might be supposed that the new theory would be all the more likely to meet with applause from philosophers. For philosophers were accustomed to putting abstract concepts (or, as unkind tongues would say, hazy words) in the forefront of their explanations of the universe, and it would be impossible that they should object to the extension of the sphere of psychology for which psycho-analysis had paved the way. But here another obstacle arose. The philosophers' idea of what is mental was not that of psycho-analysis. The overwhelming majority of philosophers regard as mental only the phenomena of consciousness. For them the world of consciousness coincides with the sphere of what is mental. Everything else that may take place in the 'mind' - an entity so hard to grasp - is relegated by them to the organic determinants of mental processes or to processes parallel to mental ones. Or, more strictly speaking, the mind has no contents other than the phenomena of consciousness, and consequently psychology, the science of the mind, has no other subject-matter. And on this point the layman's view is the same.

[1925e, 4124]
What, then, can a philosopher say to a theory which, like psycho-analysis, asserts that on the contrary what is mental is in itself unconscious and that being conscious is only a quality, which may or may not accrue to a particular mental act and the withholding of which may perhaps alter that act in no other respect? He will naturally say that anything both unconscious and mental would be an impossibility, a *contradictio in adjecto*, and he will fail to observe that in making this judgement he is merely repeating his own definition of what is mental, a definition which may perhaps be too narrow. It is easy for philosophers to feel this certainty, since they have no acquaintance with the material whose investigation has compelled analysts to believe in unconscious mental acts. Philosophers have never taken account of hypnosis, they have not concerned themselves with the interpreting of dreams - on the contrary, like doctors, they regard dreams as the meaningless products of reduced mental activity during sleep - they are scarcely aware that there are such things as obsessions and delusions and they would find themselves in a most embarrassing situation if they were asked to explain them on the basis of their own psychological premisses. Analysts, too, refuse to say what the unconscious is, but they can indicate the domain of phenomena whose observation has obliged them to assume its existence. Philosophers, who know no kind of observation other than self-observation, cannot follow them into that domain.

So it comes about that psycho-analysis derives nothing but disadvantages from its middle position between medicine and philosophy. Doctors regard it as a speculative system and refuse to believe that, like every other natural science, it is based on a patient and tireless elaboration of facts from the world of perception; philosophers, measuring it by the standard of their own artificially constructed systems, find that it starts from impossible premisses and reproach it because its most general concepts (which are only now in process of evolution) lack clarity and precision.

The fame of my diagnoses and of their *post-mortem* confirmation brought me an influx of American physicians, to whom I lectured upon the patients in my department in a sort of pidgin English. About the neuroses I understood nothing. On one occasion I introduced to my audience a neurotic suffering from a persistent headache as a case of chronic localized meningitis; they all quite rightly rose in revolt and deserted me, and my premature activities as a teacher came to an end. By way of excuse I may add that this happened at a time when greater authorities than myself in Vienna were in the habit of diagnosing neurasthenia as cerebral tumour.

Anyone who wants to make a living from the treatment of nervous patients must clearly be able to do something to help them. My therapeutic arsenal contained only two weapons, electrotherapy and hypnotism, for prescribing a visit to a hydropathic establishment after a single consultation was an inadequate source of income. My knowledge of electrotherapy was derived from W. Erb's text-book, which provided detailed instructions for the treatment of all the symptoms of nervous diseases. Unluckily I was soon driven to see that following these instructions was of no help whatever and that what I had taken for an epitome of exact observations was merely the construction of phantasy. The realization that the work of the greatest name in German neuropathology had no more relation to reality than some 'Egyptian' dream-book, such as is sold in cheap book-shops, was painful, but it helped to rid me of another shred of the innocent faith in authority from which I was not yet free. So I put my electrical apparatus aside, even before Moebius had saved the situation by explaining that the successes of electric treatment in nervous disorders (in so far as there were any) were the effect of suggestion on the part of the physician.
I was thus led into regarding the neuroses as being without exception disturbances of the sexual function, the so-called 'actual neuroses' being the direct toxic expression of such disturbances and the psychoneuroses their mental expression. My medical conscience felt pleased at my having arrived at this conclusion. I hoped that I had filled up a gap in medical science, which, in dealing with a function of such great biological importance, had failed to take into account any injuries beyond those caused by infection or by gross anatomical lesions. The medical aspect of the matter was, moreover, supported by the fact that sexuality was not something purely mental. It had a somatic side as well, and it was possible to assign special chemical processes to it and to attribute sexual excitation to the presence of some particular, though at present unknown, substances. There must also have been some good reason why the true spontaneous neuroses resembled no group of diseases more closely than the phenomena of intoxication and abstinence, which are produced by the administration or privation of certain toxic substances, or than exophthalmic goitre, which is known to depend upon the product of the thyroid gland.

[1925d, 4203]

The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the psychoses is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoic modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in dments by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholics. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psycho-analysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.

[1925d, 4235]
All these people recognize that they are ill and go to doctors, by whom people expect nervous disorders like these to be removed. The doctors, too, lay down the categories into which these complaints are divided. They diagnose them, each according to his own standpoint, under different names: neurasthenia, psychasthenia, phobias, obsessional neurosis, hysteria. They examine the organs which produce the symptoms, the heart, the stomach, the bowels, the genitals, and find them healthy. They recommend interruptions in the patient's accustomed mode of life, holidays, strengthening exercises, tonics, and by these means bring about temporary improvements - or no result at all. Eventually the patients hear that there are people who are concerned quite specially with the treatment of such complaints and start an analysis with them.

"I will interrupt you before you have even begun. You say that you intend to expound a new psychology to me; but I should have thought that psychology was no new science. There have been psychologies and psychologists enough; and I heard of great achievements in that field while I was at college."

I should not dream of disputing them. But if you look into the matter more closely you will have to class these great achievements as belonging rather to the physiology of the sense organs. The theory of mental life could not be developed, because it was inhibited by a single essential misunderstanding. What does it comprise to-day, as it is taught at college? Apart from those valuable discoveries in the physiology of the senses, a number of classifications and definitions of our mental processes which, thanks to linguistic usage, have become the common property of every educated person. That is clearly not enough to give a view of our mental life. Have you not noticed that every philosopher, every imaginative writer, every historian and every biographer makes up his own psychology for himself, brings forward his own particular hypotheses concerning the interconnections and aims of mental acts - all more or less plausible and all equally untrustworthy? There is an evident lack of any common foundation. And it is for that reason too that in the field of psychology there is, so to speak, no respect and no authority. In that field everyone can 'run wild' as he chooses. If you raise a question in physics or chemistry, anyone who knows he possesses no 'technical knowledge' will hold his tongue. But if you venture upon a psychological assertion, you must be prepared to meet judgements and contradictions from every quarter. In this field, apparently, there is no 'technical knowledge'. Everyone has a mental life, so everyone regards himself as a psychologist. But that strikes me as an inadequate legal title. The story is told of how someone who applied for a post as a children's nurse was asked if she knew how to look after babies. 'Of course,' she replied, 'why, after all, I was a baby once myself.'
The source of our findings does not seem it me to deprive them of their value. Embryology, to take an example, would not deserve to be trusted if it could not give a plain explanation of the origin of innate malformations. I have told you of people whose thoughts go their own way, so that they are obliged to worry over problems to which they are perfectly indifferent. Do you think that academic psychology could ever make the smallest contribution towards explaining an abnormality such as that? And, after all, we all of us have the experience at night-time of our thoughts going their own way and creating things which we do not understand, which puzzle us, and which are suspiciously reminiscent of pathological products. Our dreams, I mean. The common people have always firmly believed that dreams have a sense and a value - that they mean something. Academic psychology has never been able to inform us what this meaning is. It could make nothing of dreams. If it attempted to produce explanations, they were non-psychological - such as tracing them to sensory stimuli, or to an unequal depth of sleep in different portions of the brain, and so on. But it is fair to say that a psychology which cannot explain dreams is also useless for an understanding of normal mental life, that it has no claim to be called a science.

[1926e, 4335]

The discovery of infantile sexuality is one of those of which we have reason to feel ashamed. A few paediatricians have, it seems, always known about it, and a few children's nurses. Clever men, who call themselves child psychologists, have thereupon spoken in tones of reproach of a 'desecration of the innocence of childhood'. Once again, sentiment instead of argument! Events of that kind are of daily occurrence in political bodies. A member of the Opposition rises and denounces some piece of maladministration in the Civil Service, in the Army, in the Judiciary and so on. Upon this another member, preferably one of the Government, declares that such statements are an affront to the sense of honour of the body politic, of the army, of the dynasty, or even of the nation. So they are as good as untrue. Feelings such as these can tolerate no affronts.

[1926e, 4352]

The sexual life of children is of course different from that of adults. The sexual function, from its beginnings to the definitive form in which it is so familiar to us, undergoes a complicated process of development. It grows together from numerous component instincts with different aims and passes through several phases of organization till at last it comes into the service of reproduction. Not all the component instincts are equally serviceable for the final outcome; they must be diverted, remodelled and in part suppressed. Such a far-reaching course of development is not always passed through without a flaw; inhibitions in development take place, partial fixations at early stages of development. If obstacles arise later on to the exercise of the sexual function, the sexual urge - the libido, as we call it - is apt to hark back to these earlier points of fixation. The study of the sexuality of children and its transformations up to maturity has also given us the key to an understanding of what are known as the sexual perversions, which people used always to describe with all the requisite indications of disgust but whose origin they were never able to explain. The whole topic is of uncommon interest, but for the purposes of our conversation there is not much sense in telling you more about it. To find one's way about in it one of course needs anatomical and physiological knowledge, all of which is unfortunately not to be acquired in medical schools. But a familiarity with the history of civilization and with mythology is equally indispensable.

[1926e, 4353]
Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

[1926e, 4362]

The first consideration is that in his medical school a doctor receives a training which is more or less the opposite of what he would need as a preparation for psycho-analysis. His attention has been directed to objectively ascertainable facts of anatomy, physics and chemistry, on the correct appreciation and suitable influencing of which the success of medical treatment depends. The problem of life is brought into his field of vision so far as it has hitherto been explained to us by the play of forces which can also be observed in inanimate nature. His interest is not aroused in the mental side of vital phenomena; medicine is not concerned with the study of the higher intellectual functions, which lies in the sphere of another faculty. Only psychiatry is supposed to deal with the disturbances of mental functions; but we know in what manner and with what aims it does so. It looks for the somatic determinants of mental disorders and treats them like other causes of illness.

[1926e, 4372]

Psychiatry is right to do so and medical education is clearly excellent. If it is described as one-sided, one must first discover the standpoint from which one is making that characteristic into a reproach. In itself every science is one-sided. It must be so, since it restricts itself to particular subjects, points of view and methods. It is a piece of nonsense in which I would take no part to play off one science against another. After all, physics does not diminish the value of chemistry; it cannot take its place but on the other hand cannot be replaced by it. Psycho-analysis is certainly quite particularly one-sided, as being the science of the mental unconscious. We must not therefore dispute to the medical sciences their right to be one-sided.

[1926e, 4373]
We shall only find the standpoint we are in search of if we turn from scientific medicine to practical therapeutics. A sick person is a complicated organism. He may remind us that even the mental phenomena which are so hard to grasp should not be effaced from the picture of life. Neurotics, indeed, are an undesired complication, an embarrassment as much to therapeutics as to jurisprudence and to military service. But they exist and are a particular concern of medicine. Medical education, however, does nothing, literally nothing, towards their understanding and treatment. In view of the intimate connection between the things that we distinguish as physical and mental, we may look forward to a day when paths of knowledge and, let us hope, of influence will be opened up, leading from organic biology and chemistry to the field of neurotic phenomena. That day still seems a distant one, and for the present these illnesses are inaccessible to us from the direction of medicine.

[1926e, 4373]

It would be tolerable if medical education merely failed to give doctors any orientation in the field of the neuroses. But it does more: it gives them a false and detrimental attitude. Doctors whose interest has not been aroused in the psychical factors of life are all too ready to form a low estimate of them and to ridicule them as unscientific. For that reason they are unable to take anything really seriously which has to do with them and do not recognize the obligations which derive from them. They therefore fall into the layman's lack of respect for psychological research and make their own task easy for themselves. No doubt neurotics have to be treated, since they are sick people and come to the doctor; and one must always be ready to experiment with something new. But why burden oneself with a tedious preparation? We shall manage all right; who can tell if what they teach in the analytic institutes is any good? - The less such doctors understand about the matter, the more venturesome they become. Only a man who really knows is modest, for he knows how insufficient his knowledge is.

[1926e, 4373]

The starting-point for this investigation is provided by a fact without parallel, which defies all explanation or description - the fact of consciousness. Nevertheless, if anyone speaks of consciousness we know immediately and from our most personal experience what is meant by it.¹ Many people, both inside and outside science, are satisfied with the assumption that consciousness alone is psychical; in that case nothing remains for psychology but to discriminate among psychical phenomena between perceptions, feelings, thought-processes and volitions. It is generally agreed, however, that these conscious processes do not form unbroken sequences which are complete in themselves; there would thus be no alternative left to assuming that there are physical or somatic processes which are concomitant with the psychical ones and which we should necessarily have to recognize as more complete than the psychical sequences, since some of them would have conscious processes parallel to them but others would not. If so, it of course becomes plausible to lay the stress in psychology on these somatic processes, to see in them the true essence of what is psychical and to look for some other assessment of the conscious processes. The majority of philosophers, however, as well as many other people, dispute this and declare that the idea of something psychical being unconscious is self-contradictory.

[1940a [1938], 4967]

¹ One extreme line of thought, exemplified in the American doctrine of behaviourism, thinks it possible to construct a psychology which disregards this fundamental fact!

[1940a [1938], 4967]
I have not always been a psychotherapist. Like other neuropathologists, I was trained to employ local diagnoses and electro-prognosis, and it still strikes me myself as strange that the case histories I write should read like short stories and that, as one might say, they lack the serious stamp of science. I must console myself with the reflection that the nature of the subject is evidently responsible for this, rather than any preference of my own. The fact is that local diagnosis and electrical reactions lead nowhere in the study of hysteria, whereas a detailed description of mental processes such as we are accustomed to find in the works of imaginative writers enables me, with the use of a few psychological formulas, to obtain at least some kind of insight into the course of that affection. Case histories of this kind are intended to be judged like psychiatric ones; they have, however, one advantage over the latter, namely an intimate connection between the story of the patient's sufferings and the symptoms of his illness - a connection for which we still search in vain in the biographies of other psychoses.

I have no desire to depreciate the aetiological importance of these stock agents. Since they are very various, occur very frequently and are most often named by patients themselves, they become more prominent than the specific causes of the neuroses - an aetiology which is either hidden or unknown. Fairly frequently they fulfil the function of agents provocateurs which render manifest a neurosis that has previously been latent; and a practical interest attaches to them, for a consideration of these stock causes may offer lines of approach to a therapy which does not aim at a radical cure and is content with repressing the illness to its former state of latency.

We have here reached the theory of the origin of dreams which is preferred by all the medical authorities. The obscurity in which the centre of our being (the 'moi splanchnique', as Tissié calls it) is veiled from our knowledge and the obscurity surrounding the origin of dreams tally too well not to be brought into relation to each other. The line of thought which regards vegetative organic sensation as the constructor of dreams has, moreover, a particular attraction for medical men since it allows of a single aetiology for dreams and mental diseases, whose manifestations have so much in common; for coenaesthetic changes and stimuli arising from the internal organs are also held largely responsible for the origin of the psychoses. It is not surprising, therefore, that the origin of the theory of somatic stimulation may be traced back to more than one independent source.

Krauss, the psychiatrist, in an investigation carried through with remarkable consistency, traces the origin alike of dreams and of deliria and delusions to the same factor, namely to organically determined sensations. It is scarcely possible to think of any part of the organism which might not be the starting-point of a dream or of a delusion. Organically determined sensations may be divided into two classes: (1) those constituting the general mood (coenaesthesia) and (2) the specific sensations immanent in the principal systems of the vegetative organism. Of these latter five groups are to be distinguished: (a) muscular, (b) respiratory, (c) gastric, (d) sexual and (e) peripheral sensations.' Krauss supposes that the process by which dream-images arise on the basis of somatic stimuli is as follows. The sensation that has been aroused evokes a cognate image, in accordance with some law of association. It combines with the image into an organic structure, to which, however, consciousness reacts abnormally. For it pays no attention to the sensation, but directs the whole of it to the accompanying images - which explains why the true facts were for so long misunderstood. Krauss has a special term for describing this process: the 'trans-substantiation' of sensations into dream-images.
We shall find later that the enigma of the formation of dreams can be solved by the revelation of an unsuspected psychical source of stimulation. Meanwhile we shall feel no surprise at the over-estimation of the part played in forming dreams by stimuli which do not arise from mental life. Not only are they easy to discover and even open to experimental confirmation; but the somatic view of the origin of dreams is completely in line with the prevailing trend of thought in psychiatry to-day. It is true that the dominance of the brain over the organism is asserted with apparent confidence. Nevertheless, anything that might indicate that mental life is in any way independent of demonstrable organic changes or that its manifestations are in any way spontaneous alarms the modern psychiatrist, as though a recognition of such things would inevitably bring back the days of the Philosophy of Nature, and of the metaphysical view of the nature of mind. The suspicions of the psychiatrists have put the mind, as it were, under tutelage, and they now insist that none of its impulses shall be allowed to suggest that it has any means of its own. This behaviour of theirs only shows how little trust they really have in the validity of a causal connection between the somatic and the mental. Even when investigation shows that the primary exciting cause of a phenomenon is psychical, deeper research will one day trace the path further and discover an organic basis for the mental event. But if at the moment we cannot see beyond the mental, that is no reason for denying its existence.

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

You should bear in mind that the dreams which we produce at night have, on the one hand, the greatest external similarity and internal kinship with the creations of insanity, and are, on the other hand, compatible with complete health in waking life. There is nothing paradoxical in the assertion that no one who regards these 'normal' illusions, delusions and character-changes with astonishment instead of comprehension has the slightest prospect of understanding the abnormal structures of pathological mental states otherwise than as a layman. You may comfortabally count almost all psychiatrists among such laymen.
Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone represented psychoanalysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling-resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became accustomed to that long ago. People simply did not believe me, just as even to-day people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of all arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patient's minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses - arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psycho-analysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electro-therapy, but that does not enable such measures to get the better of neuroses. Time will show whether psycho-analytic treatment can accomplish more.

Neither I myself nor my friends and co-workers find it agreeable to claim a monopoly in this way in the use of a medical technique. But in face of the dangers to patients and to the cause of psycho-analysis which are inherent in the practice that is to be foreseen of a 'wild' psycho-analysis, we have had no other choice. In the spring of 1910 we founded an International Psycho-Analytical Association, to which its members declare their adherence by the publication of their names, in order to be able to repudiate responsibility for what is done by those who do not belong to us and yet call their medical procedure 'psycho-analysis'. For as a matter of fact 'wild' analysts of this kind do more harm to the cause of psycho-analysis than to individual patients. I have often found that a clumsy procedure like this, even if at first it produced an exacerbation of the patient's condition, led to a recovery in the end. Not always but still often. When he has abused the physician enough and feels far enough away from his influence, his symptoms give way, or he decides to take some step which leads along the path to recovery. The final improvement then comes about 'of itself', or is ascribed to some totally indifferent treatment by some other doctor to whom the patient has later turned. In the case of the lady whose complaint against her physician we have heard, I should say that, despite everything, the 'wild' psycho-analyst did more for her than some highly respected authority who might have told her she was suffering from a 'vasomotor neurosis'. He forced her attention to the real cause of her trouble, or in that direction, and in spite of all her opposition this intervention of his cannot be without some favourable results. But he has done himself harm and helped to intensify the prejudices which patients feel, owing to their natural affective resistances, against the methods of psycho-analysis. And this can be avoided.
The interest felt by the practical psychiatrist in such delusional formations as these is, as a rule, exhausted when once he has ascertained the character of the products of the delusion and has formed an estimate of their influence on the patient's general behaviour: in his case marvelling is not the beginning of understanding. The psycho-analyst, in the light of his knowledge of the psychoneuroses, approaches the subject with a suspicion that even thought-structures so extraordinary as these and so remote from our common modes of thinking are nevertheless derived from the most general and comprehensible impulses of the human mind; and he would be glad to discover the motives of such a transformation as well as the manner in which it has been accomplished. With this aim in view, he will wish to go more deeply into the details of the delusion and into the history of its development.

I will pause here for a moment to meet a storm of remonstrances and objections. Any one acquainted with the present state of psychiatry must be prepared to face trouble.

"Yes, but he was not in his right mind when he did it. His delusion that he was being transformed into a woman was a pathological idea." - We have not forgotten that. Indeed our only concern is with the meaning and origin of this pathological idea. We will appeal to the distinction he himself draws between the man Flechsig and the 'Flechsig soul'. We are not making reproaches of any kind against him - whether for having had homosexual impulses or for having endeavoured to suppress them. Psychiatrists should at last take a lesson from this patient, when they see him trying, in spite of his delusions, not to confuse the world of the unconscious with the world of reality.

In textbooks of psychiatry we frequently come across statements to the effect that megalomania can develop out of delusions of persecution. The process is supposed to be as follows. The patient is primarily the victim of a delusion that he is being persecuted by powers of the greatest might. He then feels a need to account to himself for this, and in that way hits on the idea that he himself is a very exalted personage and worthy of such persecution. The development of megalomania is thus attributed by the textbooks to a process which (borrowing a useful word from Ernest Jones) we may describe as 'rationalization'. But to ascribe such important affective consequences to a rationalization is, as it seems to us, an entirely unpsychological proceeding; and we would consequently draw a sharp distinction between our opinion and the one which we have quoted from the textbooks. We are making no claim, for the moment, to knowing the origin of the megalomania.
There are also diagnostic reasons for beginning the treatment with a trial period of this sort lasting for one or two weeks. Often enough, when one sees a neurosis with hysterical or obsessional symptoms, which is not excessively marked and has not been in existence for long - just the type of case, that is, that one would regard as suitable for treatment - one has to, reckon with the possibility that it may be a preliminary stage of what is known as dementia praecox ('schizophrenia', in Bleuler's terminology; 'paraphrenia', as I have proposed to call it), and that sooner or later it will show a well-marked picture of that affection. I do not agree that it is always possible to make the distinction so easily. I am aware that there are psychiatrists who hesitate less often in their differential diagnosis, but I have become convinced that just as often they make mistakes. To make a mistake, moreover, is of far greater moment for the psycho-analyst than it is for the clinical psychiatrist, as he is called. For the latter is not attempting to do anything that will be of use, whichever kind of case it may be. He merely runs the risk of making a theoretical mistake, and his diagnosis is of no more than academic interest. Where the psycho-analyst is concerned, however, if the case is unfavourable he has committed a practical error; he has been responsible for wasted expenditure and has discredited his method of treatment. He cannot fulfil his promise of cure if the patient is suffering, not from hysteria or obsessional neurosis, but from paraphrenia, and he therefore has particularly strong motives for avoiding mistakes in diagnosis. In an experimental treatment of a few weeks he will often observe suspicious signs which may determine him not to pursue the attempt any further. Unfortunately I cannot assert that an attempt of this kind always enables us to arrive at a certain decision: it is only one wise precaution the more.¹

This medical significance of psycho-analysis would not, however, justify me in bringing it to the notice of a circle of savants concerned in the synthesis of the sciences. And such a plan must seem particularly premature so long as a large number of psychiatrists and neurologists are opposed to the new therapeutic method and reject both its postulates and its findings. If, nevertheless, I regard the experiment as a legitimate one, it is because psycho-analysis can also claim to be of interest to others than psychiatrists, since it touches upon various other spheres of knowledge and reveals unexpected relations between them and the pathology of mental life.

I am not unaware of the excuse that we have to accept for this defect in your education. No philosophical auxiliary science exists which could be made of service for your medical purposes. Neither speculative philosophy, nor descriptive psychology, nor what is called experimental psychology (which is closely allied to the physiology of the sense-organs), as they are taught in the Universities, are in a position to tell you anything serviceable of the relation between body and mind or to provide you with the key to an understanding of possible disturbances of the mental functions. It is true that psychiatry, as a part of medicine, sets about describing the mental disorders it observes and collecting them into clinical entities; but at favourable moments the psychiatrists themselves have doubts of whether their purely descriptive hypotheses deserve the name of a science. Nothing is known of the origin, the mechanism or the mutual relations of the symptoms of which these clinical entities are composed; there are either no observable changes in the anatomical organ of the mind to correspond to them, or changes which throw no light upon them. These mental disorders are only accessible to therapeutic influence when they can be recognized as subsidiary effects of what is otherwise an organic illness.
This is the gap which psycho-analysis seeks to fill. It tries to give psychiatry its missing psychological foundation. It hopes to discover the common ground on the basis of which the convergence of physical and mental disorder will become intelligible. With this aim in view, psycho-analysis must keep itself free from any hypothesis that is alien to it, whether of an anatomical, chemical or physiological kind, and must operate entirely with purely psychological auxiliary ideas; and for that very reason, I fear, it will seem strange to you to begin with.

I am to put before you, then, the psycho-analytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting-room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would - 'There's nothing wrong with you' - with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I fine them so-and-so many Kronen for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psycho-analysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting-room and my consulting- and treatment-room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting-room omits to shut the door behind him and almost always he leaves both doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door-handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting-room and consulting-room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient only occurs when he has been alone in the waiting-room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.
After this first point has been established our psychiatric interest will become even livelier. If a delusion is not to be got rid of by a reference to reality, no doubt it did not originate from reality either. Where else did it originate? There are delusions of the most varied content: why in our case is the content of the delusion jealousy in particular? In what kind of people do delusions, and especially delusions of jealousy, come about? We should like to hear what the psychiatrist has to say about this; but at this point he leaves us in the lurch. He enters into only a single one of our enquiries. He will investigate the woman's family history and will perhaps give us this reply: 'Delusions come about in people in whose families similar and other psychical disorders have repeatedly occurred.' In other words, if this woman developed a delusion she was predisposed to it by hereditary transmission. No doubt that is something; but is it all we want to know? Was this the only thing that contributed to the causation of the illness? Must we be content to suppose that it is a matter of indifference or caprice or is inexplicable whether a delusion of jealousy arises rather than any other sort? And ought we to understand the assertion of the predominance of the hereditary influence in a negative sense as well - that no matter what experiences this woman's mind encountered she was destined some time or other to produce a delusion? You will want to know why it is that scientific psychiatry will give us no further information. But my reply to you is: 'he is a rogue who gives more than he has.' The psychiatrist knows no way of throwing more light on a case like this one. He must content himself with a diagnosis and a prognosis - uncertain in spite of a wealth of experience - of its future course.

I notice now, Gentlemen, that I have been talking to you about a number of things which you are not yet prepared to understand. I did so in order to carry out the comparison between psychiatry and psycho-analysis. But there is one thing that I can ask you now. Have you observed any sign of a contradiction between them? Psychiatry does not employ the technical methods of psycho-analysis; it omits to make any inferences from the content of the delusion, and, in pointing to heredity, it gives us a very general and remote aetiology instead of indicating first the more special and proximate causes. But is there a contradiction, an opposition in this? Is it not rather a case of one supplementing the other? Does the hereditary factor contradict the importance of experience? Do not the two things rather combine in the most effective manner? You will grant that there is nothing in the nature of psychiatric work which could be opposed to psycho-analytic research. What is opposed to psycho-analysis is not psychiatry but psychiatrists. Psycho-analysis is related to psychiatry approximately as histology is to anatomy: the one studies the external forms of the organs, the other studies their construction out of tissues and cells. It is not easy to imagine a contradiction between these two species of study, of which one is a continuation of the other. To-day, as you know, anatomy is regarded by us as the foundation of scientific medicine. But there was a time when it was as much forbidden to dissect the human cadaver in order to discover the internal structure of the body as it now seems to be to practise psycho-analysis in order to learn about the internal mechanism of the mind. It is to be expected that in the not too distant future it will be realized that a scientifically based psychiatry is not possible without a sound knowledge of the deeper-lying unconscious processes in mental life.
LADIES AND GENTLEMEN, - In the last lecture I explained to you that clinical psychiatry takes little notice of the outward form or content of individual symptoms, but that psycho-analysis takes matters up at precisely that point and has established in the first place the fact that symptoms have a sense and are related to the patient's experiences. The sense of neurotic symptoms was first discovered by Josef Breuer from his study and successful cure (between 1880 and 1882) of a case of hysteria which has since become famous. It is true that Pierre Janet brought forward the same evidence independently; indeed, the French worker can claim priority of publication, for it was only a decade later (in 1893 and 1895), while he was collaborating with me, that Breuer published his observation. In any case it may seem a matter of some indifference who made the discovery, for, as you know, every discovery is made more than once and none is made all at once. And, apart from this, success does not always go along with merit: America is not named after Columbus. The great psychiatrist Leuret gave it as his opinion, before Breuer and Janet, that even the delusional ideas of the insane would certainly be found to have a sense if only we understood how to translate them. I must admit that for a long time I was prepared to give Janet very great credit for throwing light on neurotic symptoms, because he regarded them as expressions of *idées inconscientes* which dominated the patients. But since then he has expressed himself with exaggerated reserve, as if he wanted to admit that the unconscious had been nothing more to him than a form of words, a make shift, *une façon de parler* - that he had meant nothing real by it. Since then I have ceased to understand Janet's writings; but I think he has unnecessarily forfeited much credit.

Perhaps you would like to know in advance, having in mind our earlier talks, what attitude contemporary psychiatry adopts towards the problems of obsessional neurosis. But it is a meagre chapter. Psychiatry gives names to the different obsessions but says nothing further about them. On the other hand it insists that those who suffer from these symptoms are 'degenerates'. This gives small satisfaction; in fact it is a judgement of value a condemnation instead of an explanation. We are supposed to think that every possible sort of eccentricity may arise in degenerates. Well, it is true that we must regard those who develop such symptoms as somewhat different in their nature from other people. But we may ask: are they more 'degenerate' than other neurotics - than hysterical patients, for instance, or those who fall ill of psychoses? Once again, the characterization is evidently too general. Indeed, we may doubt whether there is any justification for it at all, when we learn that such symptoms occur too in distinguished people of particularly high capacities, capacities important for the world at large. It is true that, thanks to their own discretion and to the untruthfulness of their biographers, we learn little that is intimate about the great men who are our models; but it may nevertheless happen that one of them, like Émile Zola, may be a fanatic for the truth, and we then learn from him of the many strange obsessional habits to which he was a life-long victim.¹

Psychiatry has found a way out by speaking of *dégénérés supérieurs*. Very nice. But we have found from psycho-analysis that it is possible to get permanently rid of these strange obsessional symptoms, just as of other complaints and just as in people who are not degenerate. I myself have succeeded repeatedly in this.

¹[1916-1917, 3341]
And we meet with what is in essence the same thing in our second patient. She had made a rule that the pillow must not touch the back of the bedstead, and she had to obey this rule though she did not know where it came from, what it meant or to what motives it owed its power. Whether she herself regarded the rule as a matter of indifference, or whether she struggled against it or raged against it or decided to transgress it - none of this made any difference to her carrying it out. It had to be obeyed, and she asked herself vainly why. We must recognize, however, that these symptoms of obsessional neurosis, these ideas and impulses which emerge one knows not whence, which prove so resistant to every influence from an otherwise normal mind, which give the patient himself the impression of being all-powerful guests from an alien world, immortal beings intruding into the turmoil of mortal life - these symptoms offer the plainest indication of there being a special region of the mind, shut off from the rest. They lead, by a path that cannot be missed, to a conviction of the existence of the unconscious in the mind; and that is precisely why clinical psychiatry, which is acquainted only with a psychology of consciousness, can deal with these symptoms in no other way than by declaring them to be signs of a special sort of degeneracy. Obsessional ideas and obsessional impulses are not, of course, themselves unconscious, any more than the performance of obsessional actions escapes conscious perception. They would not have become symptoms if they had not forced their way into consciousness. But their psychical predeterminants which we infer by means of analysis, the connections into which we insert them by interpretation, are unconscious, at least until we have made them conscious to the patient by the work of analysis. [1916-1917, 3355]

Your second observation, too, raises a justifiable question, but it is aimed in the wrong direction. It is true that a withdrawal of the object-libido into the ego is not directly pathogenic; it takes place, indeed, as we know, every time before we go to sleep, only to be reversed when we wake up. The amoeba withdraws its protrusions only to send them out again at the first opportunity. But it is quite a different thing when a particular, very energetic process forces a withdrawal of libido from objects. Here the libido that has become narcissistic cannot find its way back to objects, and this interference with the libido's mobility certainly becomes pathogenic. It seems that an accumulation of narcissistic libido beyond a certain amount is not tolerated. We may even imagine that it was for that very reason that object-cathexes originally came about, that the ego was obliged to send out its libido so as not to fall ill as a result of its being dammed up. If it lay within our plan to go more deeply into dementia praecox, I would show you that the process which detaches the libido from objects and cuts off its return to them is closely related to the process of repression and is to be looked at as its counterpart. But you would, first and foremost, find yourselves on familiar ground when you learnt that the determinants of this process are almost identical - so far as we know at present - with those of repression. The conflict seems to be the same and to be carried on between the same forces. If the outcome is so different from, for instance, that in hysteria, the reason can only depend on a difference in innate disposition. The weak spot in the libidinal development of these patients lies in a different phase; the determining fixation, which, as you will recollect, permits the irruption that leads to the formation of symptoms, lies elsewhere, probably in the stage of primitive narcissism to which dementia praecox returns in its final outcome. It is very remarkable that in the case of all the narcissistic neuroses we have to assume fixation points for the libido going back to far earlier phases of development than in hysteria or obsessional neurosis. As you heard, however, the concepts which we arrived at during our study of the transference neuroses are adequate in helping us to find our way about in the narcissistic neuroses which are so much more severe in practice. The conformities go very far; at bottom the field of phenomena is the same. And you can imagine how small a prospect anyone has of explaining these disorders (which belong within the sphere of psychiatry) who is not forearmed for his task with an analytic knowledge of the transference neuroses. [1916-1917, 3466]
There are difficulties in addition which hold up our advance. The narcissistic disorders and the psychoses related to them can only be deciphered by observers who have been trained through the analytic study of the transference neuroses. But our psychiatrists are not students of psycho-analysis and we psycho-analysts see too few psychiatric cases. A race of psychiatrists must first grow up who have passed through the school of psycho-analysis as a preparatory science. A start in that direction is now being made in America, where very many leading psychiatrists lecture to students on the theories of psycho-analysis and where the proprietors of institutions and the directors of insane asylums endeavour to observe their patients in conformity with those theories. Nevertheless we too, over here, have succeeded sometimes in casting a glance over the narcissistic wall and in what follows I shall tell you a little of what we think we have detected.

The form of disease known as paranoia, chronic systematic insanity, occupies an unsettled position in the attempts at classification made by present-day psychiatry. There is, however, no doubt of its close affinity to dementia praecox. I once ventured to suggest that paranoia and dementia praecox should be brought together under the common designation of 'paraphrenia'. The forms of paranoia are described according to their content as megalomania, persecution mania, erotomania, delusions of jealousy, and so on. We shall not expect anything much in the way of an attempt at an explanation from psychiatry. Here is an example of one, though, it is true, one that is out of date and does not carry much weight - an attempt to derive one symptom from another by means of an intellectual rationalization: it is suggested that the patient, who, owing to a primary disposition, believes that he is being persecuted, infers from his persecution that he must be someone of quite particular importance and so develops megalomania. According to our analytic view the megalomania is the direct result of a magnification of the ego due to the drawing in of the libidinal object-cathexes - a secondary narcissism which is a return of the original early infantile one. We have, however, made a few observations of persecution mania which have induced us to follow a particular track. The first thing that struck us was that in the large majority of cases the persecutor was of the same sex as the persecuted patient. This was still open to an innocent explanation; but in a few cases that were thoroughly studied it was clear that the person of the same sex whom the patient loved most had, since his illness, been turned into his persecutor. This made a further development possible: namely, the replacement of the beloved person, along the line of familiar resemblances, by someone else - for instance, a father by a schoolmaster or by some superior. Experiences of this kind in ever increasing numbers led us to conclude that paranoia persecutoria is the form of the disease in which a person is defending himself against a homosexual impulse which has become too powerful. The change over from affection to hatred, which, it is well known, may become a serious threat to the life of the loved and hated object, corresponds in such cases to the transformation of libidinal impulses into anxiety which is a regular outcome of the process of repression. Listen, for instance, to what is, once again, the most recent instance of my observations in this connection.

[1916-1917, 3467]
So much for experiences. They show us that in renouncing direct suggestion we are not giving up anything of irreplaceable value. Now let us add a few reflections to this. The practice of hypnotic therapy makes very small demands on either the patient or the doctor. It agrees most beautifully with the estimate in which neuroses are still held by the majority of doctors. The doctor says to the neurotic patient: ‘There's nothing wrong with you, it's only a question of nerves; so I can blow away your trouble in two or three minutes with just a few words.’ But our views on the laws of energy are offended by the notion of its being possible to move a great weight by a tiny application of force, attacking it directly, without the outside help of any appropriate appliances. In so far as the conditions are comparable, experience shows that this feat is not successfully accomplished in the case of the neuroses either. But I am aware that this argument is not unimpeachable. There is such a thing as a 'trigger-action'.

We shall soon have reached the end. You are perhaps disappointed that on the topic of the psycho-analytic method of therapy I have only spoken to you about theory and not about the conditions which determine whether a treatment is to be undertaken or about the results it produces. I shall discuss neither: the former because it is not my intention to give you practical instructions on how to carry out a psycho-analysis, and the latter because several reasons deter me from it. At the beginning of our talks, I emphasized the fact that under favourable conditions we achieve successes which are second to none of the finest in the field of internal medicine; and I can now add something further - namely that they could not have been achieved by any other procedure. If I were to say more than this I should be suspected of trying to drown the loudly raised voices of depreciation by self-advertisement. The threat has repeatedly been made against psycho-analysts by our medical 'colleagues' - even at public congresses - that a collection of the failures and damaging results of analysis would be published which would open the suffering public's eyes to the worthlessness of this method of treatment. But, apart from the malicious, denunciatory character of such a measure, it would not even be calculated to make it possible to form a correct judgement of the therapeutic effectiveness of analysis. Analytic therapy, as you know, is in its youth; it has taken a long time to establish its technique, and that could only be done in the course of working and under the influence of increasing experience. In consequence of the difficulties in giving instruction, the doctor who is a beginner in psycho-analysis is thrown back to a greater extent than other specialists on his own capacity for further development, and the results of his first years will never make it possible to judge the efficacy of analytic therapy.

Only this infantile neurosis will be the subject of my communication. In spite of the patient's direct request, I have abstained from writing a complete history of his illness, of his treatment, and of his recovery, because I recognized that such a task was technically impracticable and socially impermissible. This at the same time removes the possibility of demonstrating the connection between his illness in childhood and his later and permanent one. As regards the latter I can only say that on account of it the patient spent a long time in German sanatoria, and was at that period classified in the most authoritative quarters as a case of 'manic-depressive insanity'. This diagnosis was certainly applicable to the patient's father, whose life with its wealth of activity and interests, was disturbed by repeated attacks of severe depression. But in the son I was never able, during an observation which lasted several years, to detect any changes of mood which were disproportionate to the manifest psychological situation either in their intensity or in the circumstances of their appearance. I have formed the opinion that this case, like many others which clinical psychiatry has labelled with the most multifarious and shifting diagnoses, is to be regarded as a condition following on an obsessional neurosis which has come to an end spontaneously, but has left a defect behind it after recovery.
Psychology as it is taught academically gives us but very inadequate replies to questions concerning our mental life, but in no direction is its information so meagre as in this matter of the instincts.
[1917a, 3608]

Psychiatry, it is true, denies that such things mean the intrusion into the mind of evil spirits from without; beyond this, however, it can only say with a shrug: ‘Degeneracy, hereditary disposition, constitutional inferiority!’ Psycho-analysis sets out to explain these uncanny disorders; it engages in careful and laborious investigations, devises hypotheses and scientific constructions, until at length it can speak thus to the ego:-
[1917a, 3613]

In all such situations activity on the part of the physician must take the form of energetic opposition to premature substitutive satisfactions. It is easier for him, however, to prevent the second danger which jeopardizes the propelling force of the analysis, though it is not one to be under-estimated. The patient looks for his substitutive satisfactions above all in the treatment itself, in his transference-relationship with the physician; and he may even strive to compensate himself by these means for all the other privations laid upon him. Some concessions must of course be made to him, greater or less, according to the nature of the case and the patient's individuality. But it is not good to let them become too great. Any analyst who out of the fullness of his heart, perhaps, and his readiness to help, extends to the patient all that one human being may hope to receive from another, commits the same economic error as that of which our non-analytic institutions for nervous patients are guilty. Their one aim is to make everything as pleasant as possible for the patient, so that he may feel well there and be glad to take refuge there again from the trials of life. In so doing they make no attempt to give him more strength for facing life and more capacity for carrying out his actual tasks in it. In analytic treatment all such spoiling must be avoided. As far as his relations with the physician are concerned, the patient must be left with unfulfilled wishes in abundance. It is expedient to deny him precisely those satisfactions which he desires most intensely and expresses most importunately.
[1919a, 3633]

(b) Another of the functions of psycho-analysis should be to afford a preparation for the study of psychiatry. This, in its present shape, is exclusively descriptive in character; it merely teaches the student to recognize a series of pathological entities, enabling him to distinguish which are incurable and which are dangerous to the community. Its sole connection with the other branches of medical science lies in organic aetiology - that is, in its anatomical findings; but it offers not the slightest understanding of the facts observed. Such an understanding can be furnished only by a depth-psychology.
[1919], 3639]
If the sexual component which has broken loose prematurely is the sadistic one, then we may expect, on the basis of knowledge derived from other sources, that its subsequent repression will result in a disposition to an obsessional neurosis. This expectation cannot be said to be contradicted by the results of enquiry. The present short paper is based on the exhaustive study of six cases (four female and two male). Of these, two were cases of obsessional neurosis; one extremely severe and incapacitating, the other of moderate severity and quite well accessible to influence. There was also a third case which at all events exhibited clearly marked individual traits of obsessional neurosis. The fourth case, it must be admitted, was one of straightforward hysteria, with pains and inhibitions; and the fifth patient, who had come to be analysed merely on account of indecisiveness in life, would not have been classified at all by coarse clinical diagnosis, or would have been dismissed as 'psychasthenic'. There is no need for feeling disappointed over these statistics. In the first place, we know that not every disposition is necessarily developed into a disorder; in the second place, we ought to be content to explain the facts before us, and ought as a rule to avoid the additional task of making it clear why something has not taken place.
[1919e, 3646]

Apart from this, the war neuroses are only traumatic neuroses, which, as we know, occur in peace-time too after frightening experiences or severe accidents, without any reference to a conflict in the ego.
[1919d, 3667]

Psycho-analysis was born out of medical necessity. It sprang from the need for bringing help to neurotic patients, who had found no relief through rest-cures, through the arts of hydropathy or through electricity. A most remarkable observation made by Josef Breuer had excited a hope that the more one understood of the hitherto unexplored origin of their symptoms the more extensive would be the help one could afford them. Thus it came about that psycho-analysis, being originally a purely medical technique, was from the first directed towards research, towards the discovery of causal chains at once far-reaching and recondite.
[1919g, 3703]

A psychology which will not or cannot penetrate the depths of what is repressed regards affectionate emotional ties as being invariably the expression of impulses which have no sexual aim, even though they are derived from impulses which have such an aim.¹
[1921c, 3829]

Its Relation to Psychiatry. - Psychiatry is at present essentially a descriptive and classificatory science whose orientation is still towards the somatic rather than the psychological and which is without the possibility of giving explanations of the phenomena which it observes. Psycho-analysis does not, however, stand in opposition to it, as the almost unanimous behaviour of the psychiatrists might lead one to believe. On the contrary, as a depth-psychology, a psychology of those processes in mental life which are withdrawn from consciousness, it is called upon to provide psychiatry with an indispensable groundwork and to free it from its present limitations. We can foresee that the future will give birth to a scientific psychiatry, to which psycho-analysis has served as an introduction.
[1923a, 3927]
Psycho-analysis grew up in a narrowly-restricted field. At the outset, it had only a single aim - that of understanding something of the nature of what were known as the 'functional' nervous diseases, with a view to overcoming the impotence which had so far characterized their medical treatment. The neurologists of that period had been brought up to have a high respect for chemico-physical and pathologico-anatomical facts; and they were latterly under the influence of the findings of Hitzig and Fritsch, of Ferrier, Goltz and others, who seemed to have established an intimate and possibly exclusive connection between certain functions and particular parts of the brain. They did not know what to make of the psychical factor and could not understand it. They left it to the philosophers, the mystics and - the quacks; and they considered it unscientific to have anything to do with it. Accordingly they could find no approach to the secrets of the neuroses, and in particular of the enigmatic 'hysteria', which was, indeed, the prototype of the whole species. As late as in 1885, when I was studying at the Salpêtrière, I found that people were content to account for hysterical paralyses by a formula which asserted that they were founded on slight functional disturbances of the same parts of the brain which, when they were severely damaged, led to the corresponding organic paralyses.

Of course this lack of understanding affected the treatment of these pathological conditions badly as well. In general this consisted in measures designed to 'harden' the patient - in the prescription of medicines and in attempts, mostly very ill-contrived and executed in an unfriendly manner, at bringing mental influences to bear on him by threats, jeers and warnings and by exhorting him to make up his mind to 'pull himself together'. Electrical treatment was given out as being a specific cure for nervous conditions; but anyone who has endeavoured to carry out Erb's detailed instructions must marvel at the space that phantasy can occupy even in what professes to be an exact science. The decisive turn was taken in the eighties, when the phenomena of hypnotism made one more attempt to find admission to medical science - this time with more success than so often before, thanks to the work of Liébeault, Bernheim, Heidenhain and Forel. The essential thing was that the genuineness of these phenomena was recognized. Once this had been admitted, two fundamental and unforgettable lessons could not fail to be drawn from hypnotism. First, one was given convincing proof that striking somatic changes could after all be brought about solely by mental influences, which in this case one had oneself set in motion. Secondly, one received the clearest impression - especially from the behaviour of subjects after hypnosis - of the existence of mental processes that one could only describe as 'unconscious'. The 'unconscious' had, it is true, long been under discussion among philosophers as a theoretical concept; but now for the first time, in the phenomena of hypnotism, it became something actual, tangible and subject to experiment. Apart from all this, hypnotic phenomena showed an unmistakable similarity to the manifestations of some neuroses.

In this way psychiatry became the first field to which psycho-analysis was applied and it has remained so ever since. The same research workers who have done most to deepen analytic knowledge of the neuroses, such as Karl Abraham in Berlin and Sándor Ferenczi in Budapest (to name only the most prominent), have also played a leading part in throwing analytic light on the psychoses. The conviction of the unity and intimate connection of all the disorders that present themselves as neurotic and psychotic phenomena is becoming more and more firmly established despite all the efforts of the psychiatrists. People are beginning to understand - best of all, perhaps, in America - that the psycho-analytic study of the neuroses is the only preparation for an understanding of the psychoses, and that psycho-analysis is destined to make possible a scientific psychiatry of the future which will not need to content itself with describing curious clinical pictures and unintelligible sequences of events and with tracing the influence of gross anatomical and toxic traumas upon a mental apparatus which is inaccessible to our knowledge.
Psycho-analysis took hold of this new realization and began to consider the problem of the nature of the psychical processes which led to these unusual consequences. But the direction taken by this enquiry was not to the liking of the contemporary generation of physicians. They had been brought up to respect only anatomical, physical and chemical factors. They were not prepared for taking psychical ones into account and therefore met them with indifference or antipathy. They obviously had doubts whether psychical events allowed of any exact scientific treatment whatever. As an excessive reaction against an earlier phase during which medicine had been dominated by what was known as the 'philosophy of Nature', they regarded such abstractions as those with which psychology is obliged to work as nebulous, fantastic and mystical; while they simply refused to believe in remarkable phenomena which might have been the starting-point of research. The symptoms of hysterical neuroses were looked upon as shamming and the phenomena of hypnotism as a hoax. Even the psychiatrists, upon whose attention the most unusual and astonishing mental phenomena were constantly being forced, showed no inclination to examine their details or enquire into their connections. They were content to classify the variegated array of symptoms and trace them back, so far as they could manage, to somatic, anatomical or chemical aetiological disturbances. During this materialistic or, rather, mechanistic period, medicine made tremendous advances, but it also showed a short-sighted misunderstanding of the most important and most difficult among the problems of life.

[1925e, 4123]

In my own writings and in those of my followers more and more stress is laid on the necessity that the analyses of neurotics shall deal thoroughly with the remotest period of their childhood, the time of the early efflorescence of sexual life. It is only by examining the first manifestations of the patient's innate instinctual constitution and the effects of his earliest experiences that we can accurately gauge the motive forces that have led to his neurosis and can be secure against the errors into which we might be tempted by the degree to which things have become remodelled and overlaid in adult life. This requirement is not only of theoretical but also of practical importance, for it distinguishes our efforts from the work of those physicians whose interests are focused exclusively on therapeutic results and who employ analytic methods, but only up to a certain point. An analysis of early childhood such as we are considering is tedious and laborious and makes demands both upon the physician and upon the patient which cannot always be met. Moreover, it leads us into dark regions where there are as yet no sign posts. Indeed, analysts may feel reassured, I think, that there is no risk of their work becoming mechanical, and so of losing its interest, during the next few decades.

[1925j, 4146]
The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the psychoses is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoic modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in dments by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psycho-analysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.

The first consideration is that in his medical school a doctor receives a training which is more or less the opposite of what he would need as a preparation for psycho-analysis. His attention has been directed to objectively ascertainable facts of anatomy, physics and chemistry, on the correct appreciation and suitable influencing of which the success of medical treatment depends. The problem of life is brought into his field of vision so far as it has hitherto been explained to us by the play of forces which can also be observed in inanimate nature. His interest is not aroused in the mental side of vital phenomena; medicine is not concerned with the study of the higher intellectual functions, which lies in the sphere of another faculty. Only psychiatry is supposed to deal with the disturbances of mental functions; but we know in what manner and with what aims it does so. It looks for the somatic determinants of mental disorders and treats them like other causes of illness.
Psychiatry is right to do so and medical education is clearly excellent. If it is described as one-sided, one must first discover the standpoint from which one is making that characteristic into a reproach. In itself every science is one-sided. It must be so, since it restricts itself to particular subjects, points of view and methods. It is a piece of nonsense in which I would take no part to play off one science against another. After all, physics does not diminish the value of chemistry; it cannot take its place but on the other hand cannot be replaced by it. Psycho-analysis is certainly quite particularly one-sided, as being the science of the mental unconscious. We must not therefore dispute to the medical sciences their right to be one-sided.
[1926e, 4373]
An intelligible dissatisfaction with the frequent inadequacy of the help afforded by medical skill, and perhaps, too, an internal rebellion against the duress of scientific thought, which reflects the remorselessness of nature, have in all periods (and in our own once more) imposed a strange condition on the therapeutic powers alike of persons and of procedures. The necessary faith only emerges if the practitioner is not a doctor, if he can boast of having no knowledge of the scientific basis of therapeutics, if the procedure has not been subjected to accurate testing but is recommended by some popular prejudice. Hence it is that we find a swarm of 'nature cures' and 'nature healers', who compete with physicians in the exercise of their profession and of whom we can at least say with some degree of certainty that they do far more harm than good. If this gives us grounds for blaming the patients' faith, we must yet not be so ungrateful as to forget that the same force is constantly at work in support of our own medical efforts. The results of every procedure laid down by the physician and of every treatment that he undertakes are probably composed of two portions. And one of these, which is sometimes greater and sometimes less, but can never be completely disregarded, is determined by the patient's mental attitude. The faith with which he meets the immediate effect of a medical procedure depends on the one hand on the amount of his own desire to be cured, and on the other hand on his confidence that he has taken the right steps in that direction - of his general respect, that is, for medical skill - and, further, on the power which he attributes to his doctor's personality, and even on the purely human liking aroused in him by the doctor. There are some physicians who have a greater capacity than others for winning their patients' confidence; a patient will often feel better the very moment the doctor enters his room.

[1890a, 1593]
Secondly, let me draw your attention to the fact that we physicians cannot discard psychotherapy, if only because another person intimately concerned in the process of recovery - the patient - has no intention of discarding it. You will know of the increase in knowledge on this subject that we owe to the Nancy school, to Liébeault and Bernheim. A factor dependent on the psychical disposition of the patient contributes, without any intention on our part, to the effect of every therapeutic process initiated by a physician; most frequently it is favourable to recovery, but often it acts as an inhibition. We have learned to use the word 'suggestion' for this phenomenon, and Möbius has taught us that the unreliability which we deplore in so many of our therapeutic measures may be traced back to the disturbing influence of this very powerful factor. All physicians, therefore, yourselves included, are continually practising psychotherapy, even when you have no intention of doing so and are not aware of it; it is a disadvantage, however, to leave the mental factor in your treatment so completely in the patient's hands. Thus it is impossible to keep a check on it, to administer it in doses or to intensify it. Is it not then a justifiable endeavour on the part of a physician to seek to obtain command of this factor, to use it with a purpose, and to direct and strengthen it? This and nothing else is what scientific psychotherapy proposes.

[1905a, 1564]

And, in the third place, Gentlemen, I would remind you of the well-established fact that certain diseases, in particular the psychoneuroses, are far more readily accessible to mental influences than to any other form of medication. It is not a modern dictum but an old saying of physicians that these diseases are not cured by the drug but by the physician, that is, by the personality of the physician, inasmuch as through it he exerts a mental influence. I am well aware that you favour the view which Vischer, the professor of aesthetics, expressed so well in his parody of Faust:

[1905a, 1565]

Our interest is most particularly engaged by the mental state of expectation, which puts in motion a number of mental forces that have the greatest influence on the onset and cure of physical diseases. Fearful expectation is certainly not without its effect on the result. It would be of importance to know with certainty whether it has as great a bearing as is supposed on falling ill; for instance, whether it is true that during an epidemic those who are afraid of contracting the illness are in the greatest danger. The contrary state of mind, in which expectation is coloured by hope and faith, is an effective force with which we have to reckon, strictly speaking, in all our attempts at treatment and cure. We could not otherwise account for the peculiar results which we find produced by medicaments and therapeutic procedures.

[1890a, 1591]

The most noticeable effects of this kind of expectation coloured by faith are to be found in the 'miraculous' cures which are brought about even to-day under our own eyes without the help of any medical skill. Miraculous cures properly so-called take place in the case of believers under the influence of adjuncts calculated to intensify religious feelings - that is to say, in places where a miracle-working image is worshipped, or where a holy or divine personage has revealed himself to men and has promised them relief from their sufferings in return for their worship, or where the relics of a saint are preserved as a treasure. Religious faith alone does not seem to find it easy to suppress illness by means of expectation; for as a rule other contrivances as well are brought into play in the case of miraculous cures. The times and seasons at which divine mercy is sought must be specially indicated; the patient must submit to physical toil, to the trials and sacrifices of a pilgrimage, before he can become worthy of this divine mercy.

[1890a, 1591]
It would be convenient, but quite wrong, simply to refuse all credence to these miraculous cures and to seek to explain the accounts of them as a combination of pious fraud and inaccurate observation. Though an explanation of this kind may often be justified, it is not enough to enable us to dismiss entirely the fact of miraculous cures. They do really occur and have occurred at every period of history. And they concern not merely illnesses of mental origin - those, that is, which are based on 'imagination' and are therefore likely to be especially affected by the circumstances of a pilgrimage - but also illnesses with an 'organic' basis which had previously resisted all the efforts of physicians.

There is no need, however, to bring forward anything other than mental forces in order to explain miraculous cures. Even under conditions such as these, nothing happens that can be considered as beyond our understanding. Everything proceeds naturally. Indeed, the power of religious faith is reinforced in these cases by a number of eminently human motive forces. The individual's pious belief is intensified by the enthusiasm of the crowd of people in whose midst he makes his way as a rule to the sacred locality. All the mental impulses of an individual can be enormously magnified by group influence such as this. In cases in which someone proceeds to the holy place by himself, the reputation of the place and the respect in which it is held act as substitutes for the influence of the group, so that in fact the power of a group is once more in operation. And there is yet another way in which this influence makes itself felt. Since it is well known that divine mercy is always shown only to a few of the many who seek it, each of these is eager to be among the chosen few; the ambition that lies hidden in everyone comes to the help of pious faith. Where so many powerful forces converge, we need feel no surprise if the goal is sometimes really reached.

Even those who are without religious faith need not forgo miraculous cures. In their case reputation and group-influence act as a complete substitute for faith. There are always fashionable treatments and fashionable physicians, and these play an especially dominant part in high society, where the most powerful psychological motive forces are the endeavour to excel and to do what the 'best' people do. Fashionable treatments of this kind produce therapeutic results which are outside the scope of their actual power, and the same procedures effect far more in the hands of a fashionable doctor (who, for instance, may have become well-known as an attendant upon some prominent personality) than in those of another physician. Thus there are human as well as divine miracle-workers. Such men, however, who have reached eminence owing to the favour of fashion and of imitation, soon lose their power, as is to be expected from the nature of the forces which give it to them.
An intelligible dissatisfaction with the frequent inadequacy of the help afforded by medical skill, and perhaps, too, an internal rebellion against the duress of scientific thought, which reflects the remorselessness of nature, have in all periods (and in our own once more) imposed a strange condition on the therapeutic powers alike of persons and of procedures. The necessary faith only emerges if the practitioner is not a doctor, if he can boast of having no knowledge of the scientific basis of therapeutics, if the procedure has not been subjected to accurate testing but is recommended by some popular prejudice. Hence it is that we find a swarm of 'nature cures' and 'nature healers', who compete with physicians in the exercise of their profession and of whom we can at least say with some degree of certainty that they do far more harm than good. If this gives us grounds for blaming the patients' faith, we must yet not be so ungrateful as to forget that the same force is constantly at work in support of our own medical efforts. The results of every procedure laid down by the physician and of every treatment that he undertakes are probably composed of two portions. And one of these, which is sometimes greater and sometimes less, but can never be completely disregarded, is determined by the patient's mental attitude. The faith with which he meets the immediate effect of a medical procedure depends on the one hand on the amount of his own desire to be cured, and on the other hand on his confidence that he has taken the right steps in that direction - of his general respect, that is, for medical skill - and, further, on the power which he attributes to his doctor's personality, and even on the purely human liking aroused in him by the doctor. There are some physicians who have a greater capacity than others for winning their patients' confidence; a patient will often feel better the very moment the doctor enters his room.

Physicians have practised mental treatment from the beginning of time, and in early days to a far greater extent even than to-day. If by mental treatment we mean an endeavour to produce such mental states and conditions in the patient as will be the most propitious for his recovery, this kind of medical treatment is historically the oldest. Psychical treatment was almost the only sort at the disposal of the peoples of antiquity, and they invariably reinforced the effects of therapeutic potions and other therapeutic measures by intensive mental treatment. Such familiar procedures as the use of magical formulas and purificatory baths, or the elicitation of oracular dreams by sleeping in the temple precincts, can only have had a curative effect by psychical means. The physician's personality acquired a reputation derived directly from divine power, since in its beginnings the art of healing lay in the hands of priests. So that then as now the physician's personality was one of the chief instruments for bringing the patient into a state of mind favourable for his recovery.

Now, too, we begin to understand the 'magic' of words. Words are the most important media by which one man seeks to bring his influence to bear on another; words are a good method of producing mental changes in the person to whom they are addressed. So that there is no longer anything puzzling in the assertion that the magic of words can remove the symptoms of illness, and especially such as are themselves founded on mental states.
All the mental influences which have proved effective in curing illnesses have something incalculable about them. Affects, concentration of the will, distracting the attention, expectation coloured by faith - all of these forces, which occasionally remove an illness, sometimes fail to do so without there being anything in the character of the illness to account for the different result. What stands in the way of regularity in the therapeutic results achieved is evidently the autocratic nature of the personalities of the subjects, with their variety of mental differences. Since physicians came to realize clearly the important part played in recovery by the patient's state of mind, the idea naturally occurred to them of no longer leaving it to the patient to decide how much mental compliance he should show but of deliberately imposing a propitious state of mind by suitable methods. It is from this attempt that modern mental treatment has taken its start.

[1890a, 1594]

Quite a number of different methods of treatment have thus arisen, some of them simple to arrive at and others which could only be reached on the basis of complex hypotheses. It is easy to see, for instance, that the physician, who can no longer command respect as a priest or as the possessor of secret knowledge, should use his personality in such a way as to gain his patient's confidence and, to some degree, his affection. He himself may succeed in doing this with only a limited number of patients, whereas other patients, according to their inclinations and degree of education, will be attracted to other physicians. Such a distribution will serve a useful purpose; but if the right of a patient to make a free choice of his doctor were suspended, an important precondition for influencing him mentally would be abolished.

[1890a, 1595]

There are many very effective mental procedures which the physician is obliged to renounce. He either has not the power or has not the right to invoke them. This applies in particular to the provocation of strong affects - the most powerful of all the means by which the mind affects the body. The vicissitudes of life often cure illnesses through the experience of great joy, through the satisfaction of needs or the fulfilment of wishes. The physician, who is often impotent outside his profession, cannot compete along these lines. It might be more within his power to employ fear and fright for therapeutic ends; but, except in the case of children, he must have the gravest doubts about the use of such double-edged tools. On the other hand, the physician must rule out any relations with his patient that are bound up with tender feelings, owing to their implications in practical life. Thus from the first his power to bring about mental changes in his patients seems so restricted that mental treatment conducted on a deliberate plan would seem to offer no advantages over the earlier haphazard method.

[1890a, 1595]

The physician can seek to direct his patient's volition and attention, and he has good grounds for doing so in the case of various pathological conditions. He may, for instance, persistently oblige a person who believes he is paralysed to carry out the movements of which he professes himself incapable; or he may refuse to fall in with the wishes of an anxious patient who insists on being examined for an illness from which he is quite certainly not suffering. In these instances the physician will be taking the right course, but such isolated cases would scarcely justify us in setting up mental treatment as a special therapeutic procedure. There exists, nevertheless, a queer and unforeseeable method which offers the physician a possibility of exercising a profound, even though transitory, influence on the mental life of his patients and of employing that influence for therapeutic purposes.

[1890a, 1595]
It has long been known, though it has only been established beyond all doubt during the last few decades, that it is possible, by certain gentle means, to put people into a quite peculiar mental state very similar to sleep and on that account described as 'hypnosis'. The various means by which hypnosis can be brought about have at first sight little in common. It is possible to hypnotize someone by getting him to stare fixedly at a bright object for some minutes, or by holding a watch to his ear for a similar length of time, or by repeatedly passing the open hands, at a short distance away, over his face and limbs. But the same result can be brought about by describing the onset of the state of hypnosis and its characteristics quietly and firmly to the subject - that is, by 'talking him into' hypnosis. The two procedures may also be combined. We may make the subject sit down, hold a finger in front of his eyes, tell him to gaze at it fixedly and then say to him: 'You're feeling tired. Your eyes are closing; you can't hold them open. Your limbs are heavy; you can't move them any more. You're falling asleep---' and so on. It will be observed that all the procedures have in common a fixing of the attention; in those first mentioned the attention is fatigued by slight and monotonous sensory stimuli. It is not yet satisfactorily explained, however, how it comes about that mere talking produces exactly the same state as the other procedures. Experienced hypnotists assert that by these means a definite hypnotic change can be brought about in some eighty per cent of subjects. There is no way of telling beforehand, however, which subjects are hypnotizable and which are not. Illness is far from being one of the necessary preconditions of hypnosis: normal people are said to be particularly easy to hypnotize, while some neurotics can only be hypnotized with great difficulty and the insane are completely resistant. The hypnotic state exhibits a great variety of gradations. In its lightest degree the hypnotic subject is aware only of something like a slight insensibility, while the most extreme degree, which is marked by special peculiarities, is known as 'somnambulism', on account of its resemblance to the natural phenomenon of sleep-walking. But hypnosis is in no sense a sleep like our nocturnal sleep or like the sleep produced by drugs. Changes occur in it and mental functions are retained during it which are absent in normal sleep.

[1890a, 1596]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]
A singular thing. I can remember, when I first began to meddle in the conflict of scientific opinions twenty-two years ago, with what derision the older generation of neurologists and psychiatrists of those days received assertions about suggestion and its effects. Since then the situation has fundamentally changed. The former aversion has been converted into an only too ready acceptance; and this has happened not only as a consequence of the impression which the work of Liébeault and Bernheim and their pupils could not fail to create in the course of these two decades, but also because it has since been discovered how great an economy of thought can be effected by the use of the catchword 'suggestion'. Nobody knows and nobody cares what suggestion is, where it comes from, or when it arises, - it is enough that everything awkward in the region of psychology can be labelled 'suggestion'. I do not share the view which is at present fashionable that assertions made by children are invariably arbitrary and untrustworthy. The arbitrary has no existence in mental life. The untrustworthiness of the assertions of children is due to the predominance of their imagination, just as the untrustworthiness of the assertions of grown-up people is due to the predominance of their prejudices. For the rest, even children do not lie without a reason, and on the whole they are more inclined to a love of truth than are their elders. If we were to reject little Hans's statements root and branch we should certainly be doing him a grave injustice. On the contrary, we can quite clearly distinguish from one another the occasions on which he was falsifying the facts or keeping them back under the compelling force of a resistance, the occasions on which, being undecided himself, he agreed with his father (so that what he said must not be taken as evidence), and the occasions on which, freed from every pressure, he burst into a flood of information about what was really going on inside him and about things which until then no one but himself had known. Statements made by adults offer no greater certainty. It is a regrettable fact that no account of a psycho-analysis can reproduce the impressions received by the analyst as he conducts it, and that a final sense of conviction can never be obtained from reading about it but only from directly experiencing it. But this disability attaches in an equal degree to analyses of adults.

[1909b, 2088]

We may give as instances of disorders that are accessible to psycho-analytic treatment hysterical convulsions and paralyses as well as the various symptoms of obsessional neurosis (obsessive ideas and actions). All of these are conditions which are occasionally subject to spontaneous recovery and are dependent on the personal influence of the physician in a haphazard fashion which has not yet been explained. Psycho-analysis has no therapeutic effect on the severer forms of mental disorder properly so called. But - for the first time in the history of medicine - psycho-analysis has made it possible to get some insight into the origin and mechanism alike of the neuroses and psychoses.

[1913], 2802
It is well known, too, that after Breuer made his first discovery of the cathartic method he let it rest for a number of years, and only took it up again at my instigation, on my return from my studies under Charcot. He had a large consulting practice in medicine which made great claims on him; I myself had only unwillingly taken up the profession of medicine, but I had at that time a strong motive for helping people suffering from nervous affections or at least for wishing to understand something about their states. I had embarked upon physical therapy, and had felt absolutely helpless after the disappointing results from my study of Erb's *Elektrotherapie*, which put forward such a number of indications and recommendations. If I did not at the time arrive on my own account at the conclusion which Möbius established later, that the successes of electrical treatment in nervous patients are the effects of suggestion, there is no doubt that only the total absence of these promised successes was to blame. Treatment by suggestion during deep hypnosis, which I learned from Liébeault's and Bernheim's highly impressive demonstrations, then seemed to offer a satisfactory substitute for the failure of electrical treatment. But the practice of *investigating* patients in a state of hypnosis, with which Breuer made me acquainted - a practice which combined an automatic mode of operation with the satisfaction of scientific curiosity - was bound to be incomparably more attractive than the monotonous, forcible prohibitions used in treatment by suggestion, prohibitions which stood in the way of all research.

[1914d, 2879]

I can, however, assume this much - that you know that psycho-analysis is a procedure for the medical treatment of neurotic patients. And here I can at once give you an instance of how in this field a number of things take place in a different way - often, indeed, in an opposite way - from what they do elsewhere in medical practice. When elsewhere we introduce a patient to a medical technique which is new to him, we usually minimize its inconveniences and give him confident assurances of the success of the treatment. I think we are justified in this, since by doing so we are increasing the probability of success. But when we take a neurotic patient into psycho-analytic treatment, we act differently. We point out the difficulties of the method to him, its long duration, the efforts and sacrifices it calls for; and as regards its success, we tell him we cannot promise it with certainty, that it depends on his own conduct, his understanding, his adaptability and his perseverance. We have good reasons, of course, for such apparently wrong-headed behaviour, as you will perhaps come to appreciate later on.

[1916-1917, 3129]

But here I will pause, and let you have a word; for I see an objection boiling up in you so fiercely that it would make you incapable of listening if it were not put into words: 'Ah! so you've admitted it at last! You work with the help of suggestion, just like the hypnotists! That is what we've thought for a long time. But, if so, why the roundabout road by way of memories of the past, discovering the unconscious, interpreting and translating back distortions - this immense expenditure of labour, time and money - when the one effective thing is after all only suggestion? Why do you not make direct suggestion against the symptoms, as the others do - the honest hypnotists? Moreover, if you try to excuse yourself for your long detour on the ground that you have made a number of important psychological discoveries which are hidden by direct suggestion - what about the certainty of these discoveries now? Are not they a result of suggestion too, of unintentional suggestion? Is it not possible that you are forcing on the patient what you want and what seems to you correct, in this field as well?'

[1916-1917, 3488]
Direct suggestion is suggestion aimed against the manifestation of the symptoms; it is a struggle between your authority and the motives for the illness. In this you do not concern yourself with these motives; you merely request the patient to suppress their manifestation in symptoms. It makes no difference of principle whether you put the patient under hypnosis or not. Once again Bernheim, with his characteristic perspicacity, maintained that suggestion was the essential element in the phenomena of hypnotism, that hypnosis itself was already a result of suggestion, a suggested state; and he preferred to practise suggestion in a waking state, which can achieve the same effects as suggestion under hypnosis.

[1916-1917, 3490]

So much for experiences. They show us that in renouncing direct suggestion we are not giving up anything of irreplaceable value. Now let us add a few reflections to this. The practice of hypnotic therapy makes very small demands on either the patient or the doctor. It agrees most beautifully with the estimate in which neuroses are still held by the majority of doctors. The doctor says to the neurotic patient: 'There's nothing wrong with you, it's only a question of nerves; so I can blow away your trouble in two or three minutes with just a few words.' But our views on the laws of energy are offended by the notion of its being possible to move a great weight by a tiny application of force, attacking it directly, without the outside help of any appropriate appliances. In so far as the conditions are comparable, experience shows that this feat is not successfully accomplished in the case of the neuroses either. But I am aware that this argument is not unimpeachable. There is such a thing as a 'trigger-action'.

[1916-1917, 3492]

In the light of the knowledge we have gained from psycho-analysis we can describe the difference between hypnotic and psycho-analytic suggestion as follows. Hypnotic treatment seeks to cover up and gloss over something in mental life; analytic treatment seeks to expose and get rid of something. The former acts like a cosmetic, the latter like surgery. The former makes use of suggestion in order to forbid the symptoms; it strengthens the repressions, but, apart from that, leaves all the processes that have led to the formation of the symptoms unaltered. Analytic treatment makes its impact further back towards the roots, where the conflicts are which gave rise to the symptoms, and uses suggestion in order to alter the outcome of those conflicts. Hypnotic treatment leaves the patient inert and unchanged, and for that reason, too, equally unable to resist any fresh occasion for falling ill. An analytic treatment demands from both doctor and patient the accomplishment of serious work, which is employed in lifting internal resistances. Through the overcoming of these resistances the patient's mental life is permanently changed, is raised to a high level of development and remains protected against fresh possibilities of falling ill. This work of overcoming resistances is the essential function of analytic treatment; the patient has to accomplish it and the doctor makes this possible for him with the help of suggestion operating in an educative sense. For that reason psycho-analytic treatment has justly been described as a kind of after-education.

[1916-1917, 3492]
Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psycho-analytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.

Anyone who wants to make a living from the treatment of nervous patients must clearly be able to do something to help them. My therapeutic arsenal contained only two weapons, electrotherapy and hypnotism, for prescribing a visit to a hydropathic establishment after a single consultation was an inadequate source of income. My knowledge of electrotherapy was derived from W. Erb's text-book, which provided detailed instructions for the treatment of all the symptoms of nervous diseases. Unluckily I was soon driven to see that following these instructions was of no help whatever and that what I had taken for an epitome of exact observations was merely the construction of phantasy. The realization that the work of the greatest name in German neuropathology had no more relation to reality than some 'Egyptian' dream-book, such as is sold in cheap book-shops, was painful, but it helped to rid me of another shred of the innocent faith in authority from which I was not yet free. So I put my electrical apparatus aside, even before Moebius had saved the situation by explaining that the successes of electric treatment in nervous disorders (in so far as there were any) were the effect of suggestion on the part of the physician.

It is perfectly true that psycho-analysis, like other psychotherapeutic methods, employs the instrument of suggestion (or transference). But the difference is this: that in analysis it is not allowed to play the decisive part in determining the therapeutic results. It is used instead to induce the patient to perform a piece of psychical work - the overcoming of his transference resistances - which involves a permanent alteration in his mental economy. The transference is made conscious to the patient by the analyst, and it is resolved by convincing him that in his transference-attitude he is re-experiencing emotional relations which had their origin in his earliest object-attachments during the repressed period of his childhood. In this way the transference is changed from the strongest weapon of the resistance into the best instrument of the analytic treatment. Nevertheless its handling remains the most difficult as well as the most important part of the technique of analysis.
(8) The digestive activities undergo only a few disturbances in anxiety neurosis; but these are characteristic ones. Sensations such as an inclination to vomit and nausea are not rare, and the symptom of ravenous hunger may, by itself or in conjunction with other symptoms (such as congestions), give rise to a rudimentary anxiety attack. As a chronic change, analogous to anxious expectation, we find an inclination to diarrhoea, and this has been the occasion of the strangest diagnostic errors. Unless I am mistaken, it is this diarrhoea to which Möbius (1894) has drawn attention recently in a short paper. I suspect, further, that Peyer's reflex diarrhoea, which he derives from disorders of the prostate (Peyer, 1893), is nothing else than this diarrhoea of anxiety neurosis. The illusion of a reflex relationship is created because the same factors come into play in the aetiology of anxiety neurosis as are at work in the setting up of such affections of the prostate and similar disorders.

[1895b, 335]

(9) The paraesthesias which may accompany attacks of vertigo or anxiety are interesting because they, like the sensations of the hysterical aura, become associated in a definite sequence; although I find that these associations, in contrast to the hysterical ones, are atypical and changing. A further similarity to hysteria is provided by the fact that in anxiety neurosis a kind of conversion¹ takes place on to bodily sensations, which may easily be overlooked - for instance, on to rheumatic muscles. A whole number of what are known as rheumatic individuals who, moreover, can be shown to be rheumatic - are in reality suffering from anxiety neurosis. Along with this increase of sensitivity to pain, I have also observed in a number of cases of anxiety neurosis a tendency to hallucinations; and these could not be interpreted as hysterical.

[1895b, 335]

There is a great deal to be said about this. In the first place, Löwenfeld forces upon my theory an inference which it is not bound to accept. To suppose that in the storing-up of somatic sexual excitation the same thing must be happening as in the accumulation of the stimulus which leads to an epileptic convulsion, is to make a far too detailed hypothesis, and I have given no occasion for it; nor is it the only one that presents itself. I need only assume that the nervous system has the power to master a certain amount of somatic sexual excitation even where the latter is deflected from its aim, and that disturbances only occur when that quantum of excitation receives a sudden increment, and Löwenfeld's claim would be disposed of. I have not ventured to extend my theory in that direction, chiefly because I did not expect to find any solid points of support along that path. I should merely like to indicate that we ought not to think of the production of sexual tension independently of its distribution; that in normal sexual life this production, when it is stimulated by a sexual object, takes on a substantially different form from what it does in a state of psychical quiescence; and so on.

[1895f, 360]
Against Löwenfeld's further assertion - that anxiety-states only appear under certain conditions and fail to appear when those conditions are avoided, regardless of what the subject's *vita sexualis* may be - it must be pointed out that he clearly has in mind here only the anxiety of *phobias*, as, indeed, is shown by the examples attached to the passage I have quoted. He says nothing at all about the spontaneous anxiety attacks which take the form of vertigo, palpitation, dyspnoea, trembling, sweating, and so on. My theory, on the contrary, seems by no means unequal to explaining the emergence or non-emergence of these attacks of anxiety. For in a whole number of such cases of anxiety neurosis there does in fact appear to be a periodicity in the emergence of the states of anxiety, similar to what has been observed in epilepsy, except that in the latter the mechanism of the periodicity is more transparent. On closer examination we discover the presence, with great regularity, of an excitatory sexual process (that is, a process which is able to generate somatic sexual tension), and which, after the lapse of a definite and often constant interval of time, is followed by the anxiety attack. This role is played, in abstinent women, by menstrual excitation; it is played, too, by nocturnal pollutions, which also recur periodically. Above all, it is played by sexual intercourse itself (harmful from its being incomplete), which carries over its own periodicity to the effects it brings about, viz. to the anxiety attacks. If anxiety attacks occur which break through the usual periodicity, it is generally possible to trace them back to an incidental cause of rare and irregular occurrence - to a single sexual experience, something read or seen, and the like. The interval I have mentioned varies from a few hours to two days; it is the same as that which elapses in other people between the occurrence of the same causes and the onset of the well-known sexual migraine, which has well-established connections with the syndrome of anxiety neurosis.

[1895f, 361]

(a) Affections which are fairly often remote from the domain of neuropathology, and which do not necessarily depend on a disease of the nervous system, have sometimes been regarded as nervous and as showing the presence of a hereditary neuropathic tendency. This has been so with true facial neuralgias and with many headaches which were thought to be nervous but which arose rather from post-infectious pathological changes and suppuration in the pharyngo-nasal cavities. I feel convinced that the patients would benefit if we were more often to hand over the treatment of these affections to the rhinological surgeons.

[1896a, 368]

5 Making slips of the tongue was a symptom of a woman patient of mine which persisted until it was traced back to the childhood joke of replacing 'ruinieren [ruin]' by 'urinieren [urinate]'. - [Added 1924:] The temptation to employ the artifice of a slip of the tongue for enabling improper and forbidden words to be freely used forms the basis of Abraham's observations on parapraxes 'with an overcompensating purpose' (Abraham, 1922a). A woman patient was very liable to duplicate the first syllable of proper names by stammering. She changed the name 'Protagoras' to 'Protragoras', shortly after having said 'A-alexander' instead of 'Alexander'. Inquiry revealed that in childhood she had been especially fond of the vulgar joke of repeating the syllables 'a' and 'po' when they occurred at the beginnings of words, a form of amusement which quite commonly leads to stammering in children. ['A-a' and 'Popo' are the German nursery words for 'faeces' and 'buttocks'.] On approaching the name 'Protagoras' she became aware of the risk that she might omit the 'r' in the first syllable and say 'Po-potagoras'. As a protection against this danger she held firmly to this 'r', and inserted another 'r' in the second syllable. She acted in the same way on other occasions, distorting the words 'Parterre [ground floor]' and 'Kondolenz [condolence]' so as to avoid 'Pater (father)' and 'Kondom [condom]' which were closely linked to them in her associations. Another of Abraham's patients confessed to an inclination to say 'Angora' every time for 'angina' - very probably because of a fear of being tempted to replace 'angina' by 'vagina'. These slips of the tongue owed their existence therefore to the fact that a defensive trend had retained the upper hand instead of the distorting one; and Abraham justly draws attention to the analogy between this process and the formation of symptoms in obsessional neurosis.

[1901b, 1173]
ACTIVITY OF THE ANAL ZONE  Like the labial zone, the anal zone is well suited by its position to act as a medium through which sexuality may attach itself to other somatic functions. It is to be presumed that the erotogenic significance of this part of the body is very great from the first. We learn with some astonishment from psycho-analysis of the transmutations normally undergone by the sexual excitations arising from this zone and of the frequency with which it retains a considerable amount of susceptibility to genital stimulation throughout life.² The intestinal disturbances which are so common in childhood see to it that the zone shall not lack intense excitations. Intestinal catarrhs at the tenderest age make children 'nervy', as people say, and in cases of later neurotic illness they have a determining influence on the symptoms in which the neurosis is expressed, and they put at its disposal the whole range of intestinal disturbances. If we bear in mind the erotogenic significance of the outlet of the intestinal canal, which persists, at all events in a modified form, we shall not be inclined to scoff at the influence of haemorrhoids, to which old-fashioned medicine used to attach so much importance in explaining neurotic conditions.
[1905d, 1506]

The retention of the faecal mass, which is thus carried out intentionally by the child to begin with, in order to serve, as it were, as a masturbatory stimulus upon the anal zone or to be employed in his relation to the people looking after him, is also one of the roots of the constipation which is so common among neuropaths. Further, the whole significance of the anal zone is reflected in the fact that few neurotics are to be found without their special scatological practices, ceremonies, and so on, which they carefully keep secret.¹
[1905d, 1507]

The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psycho-analysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'.² But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life.³ We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats [Dukatenscheisser]'.⁴ Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = ilu manmans). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.
[1908b, 1944]
What points the way for the motor discharge of the repressed libido in a hysterical attack is the reflex mechanism of the act of coition - a mechanism which is ready to hand in everybody, including women, and which we see coming into manifest operation when an unrestrained surrender is made to sexual activity. Already in ancient times coition was described as a 'minor epilepsy'. We might alter this and say that a convulsive hysterical attack is an equivalent of coition. The analogy with an epileptic fit helps us little, since its genesis is even less understood than that of hysterical attacks.
[1909a, 1984]

² I may venture to suggest in this connection that the toxic hallucinoses, too, e.g. alcoholic delirium, are to be understood in an analogous fashion. Here the unbearable loss imposed by reality would be precisely the loss of alcohol. When the latter is supplied, the hallucinations cease.
[1917d, 3037]

Let us make a bold attempt at another step forward. It is generally considered that the union of a number of cells into a vital association - the multicellular character of organisms - has become a means of prolonging their life. One cell helps to preserve the life of another, and the community of cells can survive even if individual cells have to die. We have already heard that conjugation, too, the temporary coalescence of two unicellular organisms, has a life-preserving and rejuvenating effect on both of them. Accordingly, we might attempt to apply the libido theory which has been arrived at in psycho-analysis to the mutual relationship of cells. We might suppose that the life instincts or sexual instincts which are active in each cell take the other cells as their object, that they partly neutralize the death instincts (that is, the processes set up by them) in those cells and thus preserve their life; while the other cells do the same for them, and still others sacrifice themselves in the performance of this libidinal function. The germ-cells themselves would behave in a completely 'narcissistic' fashion - to use the phrase that we are accustomed to use in the theory of the neuroses to describe a whole individual who retains his libido in his ego and pays none of it out in object-cathexes. The germ-cells require their libido, the activity of their life instincts, for themselves, as a reserve against their later momentous constructive activity. (The cells of the malignant neoplasms which destroy the organism should also perhaps be described as narcissistic in this same sense: pathology is prepared to regard their germs as innate and to ascribe embryonic attributes to them.) In this way the libido of our sexual instincts would coincide with the Eros of the poets and philosophers which holds all living things together.
[1920g, 3751]
Psycho-Analysis as a Therapeutic Procedure. Psycho-analysis has never set itself up as a panacea and has never claimed to perform miracles. In one of the most difficult spheres of medical activity it is the only possible method of treatment for certain illnesses and for others it is the method which yields the best or the most permanent results - though never without a corresponding expenditure of time and trouble. A physician who is not wholly absorbed in the work of giving help will find his labours amply repaid by obtaining an unhoped-for insight into the complications of mental life and the interrelations between the mental and the physical. Where at present it cannot offer help but only theoretical understanding, it may perhaps be preparing the way for some later, more direct means of influencing neurotic disorders. Its province is above all the two transference neuroses, hysteria and obsessional neurosis, in which it has contributed to the discovery of their internal structure and operative mechanisms; and, beyond them, all kinds of phobias, inhibitions, deformities of character, sexual perversions and difficulties in erotic life. Some analysts (Jelliffe, Groddeck, Felix Deutsch) have reported too that the analytic treatment of gross organic diseases is not unpromising, since a mental factor not infrequently contributes to the origin and continuance of such illnesses. Since psycho-analysis demands a certain amount of psychical plasticity from its patients, some kind of age-limit must be laid down in their selection; and since it necessitates the devotion of long and intense attention to the individual patient, it would be uneconomical to squander such expenditure upon completely worthless persons who happen to be neurotic. Experience upon material in clinics can alone show what modifications may be necessary in order to make psycho-analytic treatment accessible to wider strata of the population or to adapt it to weaker intelligences. [1923a, 3926]

Once we have admitted the idea of a fusion of the two classes of instincts with each other, the possibility of a - more or less complete - 'defusion' of them forces itself upon us. The sadistic component of the sexual instinct would be a classical example of a serviceable instinctual fusion; and the sadism which has made itself independent as a perversion would be typical of a defusion, though not of one carried to extremes. From this point we obtain a view of a great domain of facts which has not before been considered in this light. We perceive that for purposes of discharge the instinct of destruction is habitually brought into the service of Eros; we suspect that the epileptic fit is a product and indication of an instinctual defusion; and we come to understand that instinctual defusion and the marked emergence of the death instinct call for particular consideration among the effects of some severe neuroses - for instance, the obsessional neuroses. Making a swift generalization, we might conjecture that the essence of a regression of libido (e. g. from the genital to the sadistic-anal phase) lies in a defusion of instincts, just as, conversely, the advance from the earlier phase to the definitive genital one would be conditioned by an accession of erotic components. The question also arises whether ordinary ambivalence, which is so often unusually strong in the constitutional disposition to neurosis, should not be regarded as the product of a defusion; ambivalence, however, is such a fundamental phenomenon that it more probably represents an instinctual fusion that has not been completed. [1923b, 3975]

The justice of both these views cannot be disputed. Moreover, they are compatible. There is room for the ontogenetic view side by side with the more far-reaching phylogenetic one. It is also true that even at birth the whole individual is destined to die, and perhaps his organic disposition may already contain the indication of what he is to die from. Nevertheless, it remains of interest to follow out how this innate programme is carried out and in what way accidental noxae exploit his disposition. [1924d, 4086]
When the (male) child's interest turns to his genitals he betrays the fact by manipulating them frequently; and he then finds that the adults do not approve of this behaviour. More or less plainly, more or less brutally, a threat is pronounced that this part of him which he values so highly will be taken away from him. Usually it is from women that the threat emanates; very often they seek to strengthen their authority by a reference to the father or the doctor, who, so they say, will carry out the punishment. In a number of cases the women will themselves mitigate the threat in a symbolic manner by telling the child that what is to be removed is not his genital, which actually plays a passive part, but his hand, which is the active culprit. It happens particularly often that the little boy is threatened with castration, not because he plays with his penis with his hand, but because he wets his bed every night and cannot be got to be clean. Those in charge of him behave as if this nocturnal incontinence was the result and the proof of his being unduly concerned with his penis, and they are probably right. In any case, long-continued bed-wetting is to be equated with the emissions of adults. It is an expression of the same excitation of the genitals which has impelled the child to masturbate at this period.
[1924d, 4086]

By way, as it were, of postscript, I must also mention that educationists, too, cannot avoid making use of the hints which they have received from the analytic exploration of the mental life of children; and further that voices have been raised among therapists (e.g. Groddeck and Jelliffe), maintaining that the psycho-analytic treatment of serious organic complaints shows promising results, since in many of these affections some part is played by a psychical factor on which it is possible to bring influence to bear.
[1924f, 4118]

How then, strictly speaking, does his neurosis show itself? Dostoevsky called himself an epileptic, and was regarded as such by other people, on account of his severe attacks, which were accompanied by loss of consciousness, muscular convulsions and subsequent depression. Now it is highly probable that this so-called epilepsy was only a symptom of his neurosis and must accordingly be classified as hystero-epilepsy - that is, as severe hysteria. We cannot be completely certain on this point for two reasons - firstly, because the anamnestic data on Dostoevsky's alleged epilepsy are defective and untrustworthy, and secondly, because our understanding of pathological states combined with epileptiform attacks is imperfect.
[1928b, 4555]
To take the second point first. It is unnecessary here to reproduce the whole pathology of epilepsy, for it would throw no decisive light on the problem. But this may be said. The old morbus sacer is still in evidence as an ostensible clinical entity, the uncanny disease with its incalculable, apparently unprovoked convulsive attacks, its changing of the character into irritability and aggressiveness, and its progressive lowering of all the mental faculties. But the outlines of this picture are quite lacking in precision. The attacks, so savage in their onset, accompanied by biting of the tongue and incontinence of urine and working up to the dangerous status epilepticus with its risk of severe self-injuries, may, nevertheless, be reduced to brief periods of absence, or rapidly passing fits of vertigo or may be replaced by short spaces of time during which the patient does something out of character, as though he were under the control of his unconscious. These attacks, though as a rule determined, in a way we do not understand, by purely physical causes, may nevertheless owe their first appearance to some purely mental cause (a fright, for instance) or may react in other respects to mental excitations. However characteristic intellectual impairment may be in the overwhelming majority of cases, at least one case is known to us (that of Helmholtz) in which the affliction did not interfere with the highest intellectual achievement. (Other cases of which the same assertion has been made are either disputable or open to the same doubts as the case of Dostoevsky himself.) People who are victims of epilepsy may give an impression of dullness and arrested development just as the disease often accompanies the most palpable idiocy and the grossest cerebral defects, even though not as a necessary component of the clinical picture. But these attacks, with all their variations, also occur in other people who display complete mental development and, if anything, an excessive and as a rule insufficiently controlled emotional life. It is no wonder in these circumstances that it has been found impossible to maintain that 'epilepsy' is a single clinical entity. The similarity that we find in the manifest symptoms seems to call for a functional view of them. It is as though a mechanism for abnormal instinctual discharge had been laid down organically, which could be made use of in quite different circumstances - both in the case of disturbances of cerebral activity due to severe histolytic or toxic affections, and also in the case of inadequate control over the mental economy and at times when the activity of the energy operating in the mind reaches crisis-pitch. Behind this dichotomy we have a glimpse of the identity of the underlying mechanism of instinctual discharge. Nor can that mechanism stand remote from the sexual processes, which are fundamentally of toxic origin: the earliest physicians described coition as a minor epilepsy, and thus recognized in the sexual act a mitigation and adaptation of the epileptic method of discharging stimuli.

The 'epileptic reaction', as this common element may be called, is also undoubtedly at the disposal of the neurosis whose essence it is to get rid by somatic means of amounts of excitation which it cannot deal with psychically. Thus the epileptic attack becomes a symptom of hysteria and is adapted and modified by it just as it is by the normal sexual process of discharge. It is therefore quite right to distinguish between an organic and an 'affective' epilepsy. The practical significance of this is that a person who suffers from the first kind has a disease of the brain, while a person who suffers from the second kind is a neurotic. In the first case his mental life is subjected to an alien disturbance from without, in the second case the disturbance is an expression of his mental life itself.
I am sorry, though I cannot alter the facts, if this exposition of the attitudes of hatred and love towards the father and their transformations under the influence of the threat of castration seems to readers unfamiliar with psycho-analysis unsavoury and incredible. I should myself expect that it is precisely the castration complex that would be bound to arouse the most general repudiation. But I can only insist that psycho-analytic experience has put these matters in particular beyond the reach of doubt and has taught us to recognize in them the key to every neurosis. This key, then, we must apply to our author's so-called epilepsy. So alien to our consciousness are the things by which our unconscious mental life is governed! [1928b, 4560]
On subsequent reflection, I cannot help thinking that these ‘neck cramps’ may have been determined organically and have been analogous to migraine. In medical practice we come across a number of conditions of this kind which have not been described. These show such a striking resemblance to the classical attack of hemicrania that we are tempted to extend the concept of the latter and to attach only secondary importance to the localization of the pain. As we know, many neuropathic women very often have hysterical attacks (spasms and deliria) along with an attack of migraine. Every time I observed a ‘neck-cramp’ in Frau Emmy it was accompanied by an attack of delirium.

Sleeplessness or disturbed sleep are also symptoms that are usually susceptible to the most precise explanation. Thus, for years on end a woman could never get to sleep till six in the morning. She had for a long time slept in the room adjoining her sick husband, who used to rise at six o’clock. After that hour she had been able to sleep in quiet; and she behaved in the same way once more many years later during a hysterical illness. Another case was that of a man. He was a hysterical patient who had slept very badly for the last twelve years. His sleeplessness, however, was of a quite special sort. In the summer he slept excellently, but in the winter very badly; and in November he slept quite particularly badly. He had no notion what this was due to. Enquiry revealed that in November twelve years earlier he had watched for many nights at the bedside of his son, who was ill with diphtheria.

General irritability. This is a common nervous symptom and as such belongs to many status nervosi. I mention it here because it invariably appears in anxiety neurosis and is important theoretically. Increased irritability always points to an accumulation of excitation or an inability to tolerate such an accumulation - that is, to an absolute or a relative accumulation of excitation. One manifestation of this increased irritability seems to me to deserve special mention; I refer to auditory hyperaesthesia, to an oversensitiveness to noise - a symptom which is undoubtedly to be explained by the innate intimate relationship between auditory impressions and fright. Auditory hyperaesthesia frequently turns out to be a cause of sleeplessness, of which more than one form belongs to anxiety neurosis.

The findings hitherto arrived at by psycho-analysis on the aetiology of the neuroses are here employed to criticize the current theories of the omnipotence of heredity in neuropathology. The part played by heredity has been overestimated in several directions. Firstly, by including among the inheritable neuropathic illnesses conditions such as headaches, neuralgias, etc., which are very probably attributable as a rule to organic affections of the cranial cavities (the nose). Secondly, by regarding every discoverable nervous ailment among relatives as evidence of hereditary taint and by thus from the first leaving no room for acquired neuropathic illnesses which can possess no similar evidential weight. Thirdly, the aetiological role of syphilis has been misunderstood and the nervous ailments deriving from it have been put down to the account of heredity. But in addition, a general objection is permissible against a form of heredity which is described as ‘dissimilar inheritance’ (or inheritance with a change in the form of the illness), and to which a far more important part is allotted than to ‘similar’ inheritance. But when the fact of hereditary taint in a family is demonstrated in its members being affected alternatively by every sort of nervous complaint - chorea, epilepsy, hysteria, apoplexy, etc. - without any more precise determinants, then either we need a knowledge of the laws according to which these complaints replace one another or else room is left for the individual aetiologies which determine precisely the choice of the neuropathic state which in fact results from them. If such particular aetiologies exist, they are the specific causes, so much sought after, of the various different clinical forms, and heredity is pushed back into the role of a requirement or precondition.
Psycho-Analysis as a Therapeutic Procedure. - Psycho-analysis has never set itself up as a panacea and has never claimed to perform miracles. In one of the most difficult spheres of medical activity it is the only possible method of treatment for certain illnesses and for others it is the method which yields the best or the most permanent results - though never without a corresponding expenditure of time and trouble. A physician who is not wholly absorbed in the work of giving help will find his labours amply repaid by obtaining an unhoped-for insight into the complications of mental life and the interrelations between the mental and the physical. Where at present it cannot offer help but only theoretical understanding, it may perhaps be preparing the way for some later, more direct means of influencing neurotic disorders. Its province is above all the two transference neuroses, hysteria and obsessional neurosis, in which it has contributed to the discovery of their internal structure and operative mechanisms; and, beyond them, all kinds of phobias, inhibitions, deformities of character, sexual perversions and difficulties in erotic life. Some analysts (Jelliffe, Groddeck, Felix Deutsch) have reported too that the analytic treatment of gross organic diseases is not unpromising, since a mental factor not infrequently contributes to the origin and continuance of such illnesses. Since psycho-analysis demands a certain amount of psychical plasticity from its patients, some kind of age-limit must be laid down in their selection; and since it necessitates the devotion of long and intense attention to the individual patient, it would be uneconomical to squander such expenditure upon completely worthless persons who happen to be neurotic. Experience upon material in clinics can alone show what modifications may be necessary in order to make psycho-analytic treatment accessible to wider strata of the population or to adapt it to weaker intelligences. [1923a, 3926]
Our patient's abulia (inhibitions of will, inability to act) admit even less than the phobias of being regarded as psychical stigmata due to a general limitation of capacity. On the contrary, the hypnotic analysis of the case made it clear that her abulia were determined by a twofold psychical mechanism which was at bottom a single one. In the first place an abulia may simply be the consequence of a phobia. This is so when the phobia is attached to an action of the subject's own instead of to an expectation - for instance, in our present case, the fear of going out or of mixing with people, as compared with the fear of someone creeping into the room. Here the inhibition of will is caused by the anxiety attendant upon the performance of the action. It would be wrong to regard abulia of this kind as symptoms distinct from the corresponding phobias, though it must be admitted that such phobias can exist (provided they are not too severe) without producing abulia. The second class of abulia depends on the presence of affectively-toned and unresolved associations which are opposed to linking up with other associations, and particularly with any that are incompatible with them. Our patient's anorexia offers a most brilliant instance of this kind of abulia. She ate so little because she did not like the taste, and she could not enjoy the taste because the act of eating had from the earliest times been connected with memories of disgust whose sum of affect had never been to any degree diminished; and it is impossible to eat with disgust and pleasure at the same time. Her old-established disgust at meal times had persisted undiminished because she was obliged constantly to suppress it, instead of getting rid of it by reaction. In her childhood she had been forced, under threat of punishment, to eat the cold meal that disgusted her, and in her later years she had been prevented out of consideration for her brothers from expressing the affects to which she was exposed during their meals together.

[1895d, 81]

One of the commonest symptoms of hysteria is a combination of anorexia and vomiting. I know of a whole number of cases in which the occurrence of this symptom is explained quite simply. Thus in one patient vomiting persisted after she had read a humiliating letter just before a meal and had been violently sick after it. In other cases disgust at food could be quite definitely related to the fact that, owing to the institution of the 'common table', a person may be compelled to eat his meal with someone he detests. The disgust is then transferred from the person to the food. The woman with the tic whom I have just mentioned was particularly interesting in this respect. She ate uncommonly little and only under pressure. I learnt from her in hypnosis that a series of psychical traumas had eventually produced this symptom of disgust at food. While she was still a child, her mother, who was very strict, insisted on her eating any meat she had left over at her midday meal two hours later, when it was cold and the fat was all congealed. She did so with great disgust and retained the memory of it; so that later on, when she was no longer subjected to this punishment, she regularly felt disgust at mealtimes. Ten years later she used to sit at table with a relative who was tubercular and kept constantly spitting across the table into the spitoon during meals. A little while later she was obliged to share her meals with a relative who, as she knew, was suffering from a contagious disease. Breuer's patient, again, behaved for some time like someone suffering from hydrophobia. During hypnosis it turned out that she had once unexpectedly seen a dog drinking out of a tumbler of water of hers.

[1893a, 292]
It is not every child who sucks in this way. It may be assumed that those children do so in whom there is a constitutional intensification of the erotogenic significance of the labial region. If that significance persists, these same children when they are grown up will become epicures in kissing, will be inclined to perverse kissing, or, if males, will have a powerful motive for drinking and smoking. If, however, repression ensues, they will feel disgust at food and will produce hysterical vomiting. The repression extends to the nutritional instinct owing to the dual purpose served by the labial zone. Many of my women patients who suffer from disturbances of eating, globus hystericus, constriction of the throat and vomiting, have indulged energetically in sucking during their childhood.
[1905d, 1503]

The therapeutic procedure remains the same, apart from insignificant modifications, for all the various clinical pictures that may be presented in hysteria, and all forms of obsessional neurosis. This does not imply, however, that it can have an unlimited application. The nature of the psycho-analytic method involves indications and contra-indications with respect to the person to be treated as well as with respect to the clinical picture. Chronic cases of psychoneuroses without any very violent or dangerous symptoms are the most favourable ones for psycho-analysis: thus in the first place every species of obsessional neurosis, obsessive thinking and acting, and cases of hysteria in which phobias and aboulias play the most important part; further, all somatic expressions of hysteria whenever they do not, as in anorexia, require the physician to attend promptly to the speedy removal of symptoms. In acute cases of hysteria it will be necessary to wait for a calmer stage; in all cases where nervous exhaustion dominates the clinical picture a treatment which in itself demands effort, brings only slow improvement and for a time cannot take the persistence of the symptoms into account, will have to be avoided.
[1904a, 1559]

(4) Psycho-analysis should not be attempted when the speedy removal of dangerous symptoms is required, as, for example, in a case of hysterical anorexia.
[1905a, 1569]
I shall now attempt to sketch out a synthetic survey of my patient's sexual development, beginning from its earliest indications. The first that we hear of it is in the disturbance of his appetite; for, taking other observations into account, I am inclined, though with due reservations, to regard that as a result of some process in the sphere of sexuality. I have been driven to regard as the earliest recognizable sexual organization the so-called 'cannibalistic' or 'oral' phase, during which the original attachment of sexual excitation to the nutritional instinct still dominates the scene. It is not to be expected that we should come upon direct manifestations of this phase, but only upon indications of it where disturbances have been set up. Impairment of the nutritional instinct (though this can of course have other causes) draws our attention to a failure on the part of the organism to master its sexual excitation. In this phase the sexual aim could only be cannibalism - devouring; it makes its appearance with our present patient through regression from a higher stage, in the form of fear of 'being eaten by the wolf'. We were, indeed, obliged to translate this into a fear of being copulated with by his father. It is well known that there is a neurosis in girls which occurs at a much later age, at the time of puberty or soon afterwards, and which expresses aversion to sexuality by means of anorexia. This neurosis will have to be brought into relation with the oral phase of sexual life. The erotic aim of the oral organization further makes its appearance at the height of a lover's paroxysm (in such phrases as 'I could eat you up with love') and in affectionate relations with children, when the grown-up person is pretending to be a child himself. I have elsewhere given voice to a suspicion that the father of our present patient used himself to indulge in 'affectionate abuse', and may have played at wolf or dog with the little boy and have threatened as a joke to gobble him up (p. 3524). The patient confirmed this suspicion by his curious behaviour in the transference. Whenever he shrank back on to the transference from the difficulties of the treatment, he used to threaten me with eating me up and later with all kinds of other ill-treatment - all of which was merely an expression of affection.
[1918b, 3583]
GENTLEMEN, - I propose to take the example of psychogenic disturbance of vision, in order to show you the modifications which have taken place in our view of the genesis of disorders of this kind under the influence of psycho-analytic methods of investigation. As you know, hysterical blindness is taken as the type of a psychogenic visual disturbance. It is generally believed, as a result of the researches of the French School (including such men as Charcot, Janet and Binet), that the genesis of these cases is understood. For we are in a position to produce blindness of this kind experimentally if we have at our disposal someone who is susceptible to somnambulism. If we put him into deep hypnosis and suggest the idea to him that he sees nothing with one of his eyes, he will in fact behave as though he had become blind in that eye, like a hysteric who has developed a visual disturbance spontaneously. We may thus construct the mechanism of spontaneous hysterical disturbances of vision on the model of suggested hypnotic ones. In a hysteric the idea of being blind arises, not from the prompting of a hypnotist, but spontaneously - by autosuggestion, as people say; and in both cases this idea is so powerful that it turns into reality, exactly like a suggested hallucination, paralysis, etc.

Appropriate experiments have shown that people who are hysterically blind do nevertheless see in some sense, though not in the full sense. Excitations of the blind eye may have certain psychical consequences (for instance, they may produce affects) even though they do not become conscious. Thus hysterically blind people are only blind as far as consciousness is concerned; in their unconscious they see. It is precisely observations such as this that compel us to distinguish between conscious and unconscious mental processes.

How does it happen that such people develop the unconscious 'autosuggestion' that they are blind, while nevertheless they see in their unconscious? The reply given by the French researches is to explain that in patients predisposed to hysteria there is an inherent tendency to dissociation - to a falling apart of the connections in their mental field - as a consequence of which some unconscious processes do not continue as far as into the conscious. Let us leave entirely on one side the value that this attempted explanation may have as regards an understanding of the phenomena in question, and let us look at the matter from another angle. As you see, Gentlemen, the identity of hysterical blindness with the blindness provoked by suggestion, on which so much stress was laid to begin with, has now been given up. The hysterical patient is blind, not as the result of an autosuggestive idea that he cannot see, but as the result of a dissociation between unconscious and conscious processes in the act of seeing; his idea that he does not see is the well-founded expression of the psychical state of affairs and not its cause.

If, Gentlemen, you complain of the obscurity of this exposition I shall not find it easy to defend. I have tried to give you a synthesis of the views of different investigators, and in doing so I have probably coupled them together too closely. I wanted to condense into a single composite whole the concepts that have been brought up to make psychogenic disturbances intelligible - their origin from excessively powerful ideas, the distinction between conscious and unconscious mental processes and the assumption of mental dissociation. And I have been no more successful in this than the French writers, at whose head stands Pierre Janet. I hope, therefore, that you will excuse not only the obscurity but the inaccuracy of my exposition, and will allow me to tell you how psycho-analysis has led us to a view of psychogenic disturbances of vision which is more self-consistent and probably closer to the facts.
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]
We have apparently digressed widely from our problem, though in doing so we have touched on the manner in which neurotic pathological conditions are related to our mental life as a whole. But let us now return to the narrower question. The sexual and ego-instincts alike have in general the same organs and systems of organs at their disposal. Sexual pleasure is not attached merely to the function of the genitals. The mouth serves for kissing as well as for eating and communication by speech; the eyes perceive not only alterations in the external world which are important for the preservation of life, but also characteristics of objects which lead to their being chosen as objects of love - their charms. The saying that it is not easy for anyone to serve two masters is thus confirmed. The closer the relation into which an organ with a dual function of this kind enters with one of the major instincts, the more it withholds itself from the other. This principle is bound to lead to pathological consequences if the two fundamental instincts are disunited and if the ego maintains a repression of the sexual component instinct concerned. It is easy to apply this to the eye and to seeing. Let us suppose that the sexual component instinct which makes use of looking - sexual pleasure in looking - has drawn upon itself defensive action by the ego-instincts in consequence of its excessive demands, so that the ideas in which its desires are expressed succumb to repression and are prevented from becoming conscious; in that case there will be a general disturbance of the relation of the eye and of the act of seeing to the ego and consciousness. The ego will have lost its dominance over the organ, which will now be wholly at the disposal of the repressed sexual instinct. It looks as though the repression had been carried too far by the ego, as though it had emptied the baby out with the bath-water: the ego refuses to see anything at all any more, now that the sexual interest in seeing has made itself so prominent. But the alternative picture seems more to the point. This attributes the active role instead to the repressed pleasure in looking. The repressed instinct takes its revenge for being held back from further psychical expansion, by becoming able to extend its dominance over the organ that is in its service. The loss of conscious dominance over the organ is the detrimental substitute for the repression which had miscarried and was only made possible at that price.

This relation of an organ with a double claim on it - its relation to the conscious ego and to repressed sexuality - is to be seen even more clearly in motor organs than in the eye: as when, for instance, a hand which has tried to carry out an act of sexual aggression, and has become paralysed hysterically, is unable, after that act has been inhibited, to do anything else as though it were obstinately insisting on carrying out a repressed innervation; or as when the fingers of people who have given up masturbation refuse to learn the delicate movements required for playing the piano or the violin. As regards the eye, we are in the habit of translating the obscure psychical processes concerned in the repression of sexual scopophilia and in the development of the psychogenic disturbance of vision as though a punishing voice was speaking from within the subject, and saying: 'Because you sought to misuse your organ of sight for evil sensual pleasures, it is fitting that you should not see anything at all any more', and as though it was in this way approving the outcome of the process. The idea of talion punishment is involved in this, and in fact our explanation of psychogenic visual disturbance coincides with what is suggested by myths and legends. The beautiful legend of Lady Godiva tells how all the town's inhabitants hid behind their shuttered windows, so as to make easier the lady's task of riding naked through the streets in broad daylight, and how the only man who peeped through the shutters at her revealed loveliness was punished by going blind. Nor is this the only example which suggests that neurotic illness holds the hidden key to mythology as well.
Psycho-analysis is unjustly reproached, Gentlemen, for leading to purely psychological theories of pathological problems. The emphasis which it lays on the pathogenic role of sexuality, which, after all, is certainly not an exclusively psychical factor should alone protect it from this reproach. Psycho-analysts never forget that the mental is based on the organic, although their work can only carry them as far as this basis and no beyond it. Thus psycho-analysis is ready to admit, and indeed to postulate, that not all disturbances of vision need be psychogenic, like those that are evoked by the repression of erotic scopophilia. If an organ which serves the two sorts of instinct increases its erotogenic role, it is in general to be expected that this will not occur without the excitability and innervation of the organ undergoing changes which will manifest themselves as disturbances of its function in the service of the ego. Indeed, if we find that an organ normally serving the purpose of sense-perception begins to behave like an actual genital when its erotogenic role is increased, we shall not regard it as improbable that toxic changes are also occurring in it. For lack of a better name we must retain the old unsuitable term of ‘neurotic’ disturbances for both classes of functional disturbances - those of physiological as well as those of toxic origin - which follow from an increase in the erotogenic factor. Generally speaking, the neurotic disturbances of vision stand in the same relation to the psychogenic ones as the ‘actual neuroses’ do to the psychoneuroses: psychogenic visual disturbances can no doubt hardly ever appear without neurotic ones, but the latter can appear without the former. These neurotic symptoms are unfortunately little appreciated and understood even today; for they are not directly accessible to psycho-analysis, and other methods of research have left the standpoint of sexuality out of account.

[1910i, 2370]
Does this exhaust the aetiology of this case of hysteria? I do not think so. For at the time of her two treatments I had not yet raised in my own mind the questions which must be answered before an exhaustive explanation of such a case is possible. I am now of the opinion that there must have been some added factor to provoke the outbreak of illness precisely in these last years, considering that operative aetiological conditions had been present for many years previously. It has also struck me that amongst all the intimate information given me by the patient there was a complete absence of the sexual element, which is, after all, more liable than any other to provide occasion for traumas. It is impossible that her excitations in this field can have left no traces whatever; what I was allowed to hear was no doubt an editio in usum delphini [a bowdlerized edition] of her life-story. The patient behaved with the greatest and to all appearances with the most unforced sense of propriety, without a trace of prudishness. When, however, I reflect on the reserve with which she told me under hypnosis about her maid's little adventure in the hotel, I cannot help suspecting that this woman who was so passionate and so capable of strong feelings had not won her victory over her sexual needs without severe struggles, and that at times her attempts at suppressing this most powerful of all instincts had exposed her to severe mental exhaustion. She once admitted to me that she had not married again because, in view of her large fortune, she could not credit the disinterestedness of her suitors and because she would have reproached herself for damaging the prospects of her two children by a new marriage.

[1895d, 93]
(5) *Waking up at night in a fright* (the *pavor nocturnus* of adults), which is usually combined with anxiety, dyspnoea, sweating and so on, is very often nothing else than a variant of the anxiety attack. This disturbance is the determinant of a second form of sleeplessness within the field of anxiety neurosis. I have become convinced, moreover, that the *pavor nocturnus* of children, too, exhibits a form which belongs to anxiety neurosis. The streak of hysteria about it, the linking of the anxiety with the reproduction of an appropriate experience or a dream, causes the *pavor nocturnus* of children to appear as something special. But the *pavor* can also emerge in a pure form, without any dream or recurring hallucination.

[1895b, 332]

This brings us to the contents of the letter in the dream. Her father was dead, and she had left home by her own choice. In connection with this letter I at once reminded Dora of the farewell letter which she had written to her parents or had at least composed for their benefit. This letter had been intended to give her father a fright, so that he should give up Frau K.; or at any rate to take revenge on him if he could not be induced to do that. We are here concerned with the subject of her death and of her father's death. (Cf. 'cemetery' later on in the dream.) Shall we be going astray if we suppose that the situation which formed the façade of the dream was a phantasy of revenge directed against her father? The feelings of pity for him which she remembered from the day before would be quite in keeping with this. According to the phantasy she had left home and gone among strangers, and her father's heart had broken with grief and with longing for her. Thus she would be revenged. She understood very clearly what it was that her father needed when he could not get to sleep without a drink of brandy.³ We will make a note of Dora's *craving for revenge* as a new element to be taken into account in any subsequent synthesis of her dream-thoughts.

[1905e, 1433]

³ There can be no doubt that sexual satisfaction is the best soporific, just as sleeplessness is almost always the consequence of lack of satisfaction. Her father could not sleep because he was debarred from sexual intercourse with the woman he loved. (Compare in this connection the phrase discussed just below: 'I get nothing out of my wife.')

[1905e, 1433]

¹ Thus we find at this early stage, what holds good all through life, that sexual satisfaction is the best soporific. Most cases of nervous insomnia can be traced back to lack of sexual satisfaction. It is well known that unscrupulous nurses put crying children to sleep by stroking their genitals.

[1905d, 1501]
A restrictive modification of this kind is, as we shall discover later, necessary in the theory of dementia praecox as well. This must be to the effect that the repressed portion of the system $Ucs.$ does not comply with the wish to sleep that comes from the ego, that it retains its cathexis in whole or in part, and that in general, in consequence of repression, it has acquired a certain measure of independence of the ego. Accordingly, too, some amount of the expenditure on repression (anticathexis) would have to be maintained throughout the night, in order to meet the instinctual danger - though the inaccessibility of all paths leading to a release of affect and to motility may considerably diminish the height of the anticathexis that is necessary. Thus we should picture the situation which leads to the formation of dreams as follows. The wish to sleep endeavours to draw in all the cathexes sent out by the ego and to establish an absolute narcissism. This can only partly succeed, for what is repressed in the system $Ucs.$ does not obey the wish to sleep. A part of the anticathexes has therefore to be maintained, and the censorship between the $Ucs.$ and the $Pcs.$ must remain, even if not at its full strength. So far as the dominance of the ego extends, all the systems are emptied of cathexes. The stronger the $Ucs.$ instinctual cathexes are, the more unstable is sleep. We are acquainted, too, with the extreme case where the ego gives up the wish to sleep, because it feels unable to inhibit the repressed impulses set free during sleep - in other words, where it renounces sleep because of its fear of its dreams.

Melancholia confronts us with yet other problems, the answer to which in part eludes us. The fact that it passes off after a certain time has elapsed without leaving traces of any gross changes is a feature it shares with mourning. We found by way of explanation that in mourning time is needed for the command of reality-testing to be carried out in detail, and that when this work has been accomplished the ego will have succeeded in freeing its libido from the lost object. We may imagine that the ego is occupied with analogous work during the course of a melancholia; in neither case have we any insight into the economics of the course of events. The sleeplessness in melancholia testifies to the rigidity of the condition, the impossibility of effecting the general drawing-in of cathexes necessary for sleep. The complex of melancholia behaves like an open wound, drawing to itself cathetic energies - which in the transference neuroses we have called 'anticathexes' - from all directions, and emptying the ego until it is totally impoverished. It can easily prove resistant to the ego's wish to sleep.

In this connection it strikes us that we are still quite ignorant of why it is that these evil, repudiated wishes become active precisely at night and disturb us during our sleep. The answer is almost bound to lie in some hypothesis going back to the nature of the state of sleep. In daytime the heavy weight of censorship rests on them and as a rule makes it impossible for them to manifest themselves in any activity. At night this censorship, like all the other interests of mental life, is probably withdrawn, or at least greatly reduced, in favour of the single wish to sleep. It is this lowering of the censorship at night that the forbidden wishes have to thank for being able to become active once more. There are some neurotic patients who are unable to sleep and who admit to us that their insomnia was originally intentional. They did not dare to sleep because they were afraid of their dreams - afraid, that is, of the results of the weakening of the censorship. You will easily see, however, that in spite of this the withdrawal of the censorship implies no gross carelessness. The state of sleep paralyses our motive powers. If our evil intentions begin to stir, they can, after all, do nothing more than precisely cause a dream, which is harmless from the practical point of view. It is this soothing consideration that is the basis of the highly sensible remark made by the sleeper-made at night, it is true, but not forming part of dream-life: 'After all it's only a dream. So let us leave it to take its course, and let us sleep on.'
When we look back at this unashamed period of childhood it seems to us a Paradise; and Paradise itself is no more than a group phantasy of the childhood of the individual. That is why mankind were naked in Paradise and were without shame in one another's presence; till a moment arrived when shame and anxiety awoke, expulsion followed, and sexual life and the tasks of cultural activity began. But we can regain this Paradise every night in our dreams. I have already expressed a suspicion that impressions of earliest childhood (that is, from the prehistoric epoch until about the end of the third year of life) strive to achieve reproduction, from their very nature and irrespectively perhaps of their actual content, and that their repetition constitutes the fulfilment of a wish. Thus dreams of being naked are dreams of exhibiting.¹

Let us first consider the relation of children to their brothers and sisters. I do not know why we presuppose that that relation must be a loving one; for instances of hostility between adult brothers and sisters force themselves upon everyone's experience and we can often establish the fact that the disunity originated in childhood or has always existed. But it is further true that a great many adults, who are on affectionate terms with their brothers and sisters and are ready to stand by them to-day, passed their childhood on almost unbroken terms of enmity with them. The elder child ill-treats the younger, maligns him and robs him of his toys; while the younger is consumed with impotent rage against the elder, envies and fears him, or meets his oppressor with the first stirrings of a love of liberty and a sense of justice. Their parents complain that the children do not get on with one another, but cannot discover why. It is easy to see that the character of even a good child is not what we should wish to find it in an adult. Children are completely egoistic; they feel their needs intensely and strive ruthlessly to satisfy them - especially as against the rivals, other children, and first and foremost as against their brothers and sisters. But we do not on that account call a child 'bad', we call him 'naughty'; he is no more answerable for his evil deeds in our judgement than in the eyes of the law. And it is right that this should be so; for we may expect that, before the end of the period which we count as childhood, altruistic impulses and morality will awaken in the little egoist and (to use Meynert's terms) a secondary ego will overlay and inhibit the primary one. It is true, no doubt, that morality does not set in simultaneously all along the line and that the length of non-moral childhood varies in different individuals. If this morality fails to develop, we like to talk of 'degeneracy', though what in fact faces us is an inhibition in development. After the primary character has already been overlaid by later development, it can still be laid bare again, at all events in part, in cases of hysterical illness. There is a really striking resemblance between what is known as the hysterical character and that of a naughty child. Obsessional neurosis, on the contrary, corresponds to a super-morality imposed as a reinforcing weight upon fresh stirrings of the primary character. [1900a, 729]

Many people, therefore, who love their brothers and sisters and would feel bereaved if they were to die, harbour evil wishes against them in their unconscious, dating from earlier times; and these are capable of being realized in dreams. [1900a, 730]
It is of quite particular interest, however, to observe the behaviour of small children up to the age of two or three or a little older towards their younger brothers and sisters. Here, for instance, was a child who had so far been the only one; and now he was told that the stork had brought a new baby. He looked the new arrival up and down and then declared decisively: 'The stork can take him away again!'¹ I am quite seriously of the opinion that a child can form a just estimate of the set-back he has to expect at the hands of the little stranger. A lady of my acquaintance, who is on very good terms to-day with a sister four years her junior, tells me that she greeted the news of her first arrival with this qualification: 'But all the same I shan't give her my red cap!' Even if a child only comes to realize the situation later on, his hostility will date from that moment. I know of a case in which a little girl of less than three tried to strangle an infant in its cradle because she felt that its continued presence boded her no good. Children at that time of life are capable of jealousy of any degree of intensity and obviousness. Again, if it should happen that the baby sister does in fact disappear after a short while, the elder child will find the whole affection of the household once more concentrated upon himself. If after that the stork should bring yet another baby, it seems only logical that the little favourite should nourish a wish that his new competitor may meet with the same fate as the earlier one, so that he himself may be as happy as he was originally and during the interval.² Normally, of course, this attitude of a child towards a younger brother or sister is a simple function of the difference between their ages. Where the gap in time is sufficiently long, an elder girl will already begin to feel the stirring of her maternal instincts towards the helpless new born baby.

[1900a, 730]

Hostile feelings towards brothers and sisters must be far more frequent in childhood than the unseeing eye of the adult observer can perceive.¹

[1900a, 731]

In the case of my own children, who followed each other in rapid succession, I neglected the opportunity of carrying out observations of this kind; but I am now making up for this neglect by observing a small nephew, whose autocratic rule was upset, after lasting for fifteen months, by the appearance of a female rival. I am told, it is true, that the young man behaves in the most chivalrous manner to his little sister, that he kisses her hand and strokes her; but I have been able to convince myself that even before the end of his second year he made use of his powers of speech for the purpose of criticizing someone whom he could not fail to regard as superfluous. Whenever the conversation touched upon her he used to intervene in it and exclaim petulantly: 'Too 'ickle! too 'ickle!' During the last few months the baby's growth has made enough progress to place her beyond this particular ground for contempt, and the little boy has found a different basis for his assertion that she does not deserve so much attention: at every suitable opportunity he draws attention to the fact that she has no teeth.² We all of us recollect how the eldest girl of another of my sisters, who was then a child of six, spent half an hour in insisting upon each of her aunts in succession agreeing with her: 'Lucie can't understand that yet, can she?' she kept asking. Lucie was her rival - two and a half years her junior.

[1900a, 731]

¹ [Footnote added 1914:] Since this was written, a large number of observations have been made and recorded in the literature of psycho-analysis upon the originally hostile attitude of children towards their brothers and sisters and one of their parents. The author and poet Spitteler has given us a particularly genuine and naïve account of this childish attitude, derived from his own childhood: 'Moreover there was a second Adolf there: a little creature who they alleged was my brother, though I could not see what use he was and still less why they made as much fuss of him as of me myself. I was sufficient so far as I was concerned; why should I want a brother? And he was not merely useless, he was positively in the way. When I pestered my grandmother, he wanted to pester her too. When I was taken out in the perambulator, he sat opposite to me and took up half the space, so that we were bound to kick each other with our feet.'

[1900a, 731]
At this point someone will perhaps interrupt: 'Granted that children have hostile impulses towards their brothers and sisters, how can a child's mind reach such a pitch of depravity as to wish for the death of his rivals or of playmates stronger than himself, as though the death penalty were the only punishment for every crime?' Anyone who talks like this has failed to bear in mind that a child's idea of being 'dead' has nothing much in common with ours apart from the word. Children know nothing of the horrors of corruption, of freezing in the ice-cold grave, of the terrors of eternal nothingness - ideas which grown-up people find it so hard to tolerate, as is proved by all the myths of a future life. The fear of death has no meaning to a child; hence it is that he will play with the dreadful word and use it as a threat against a playmate: 'If you do that again, you'll die, like Franz!' Meanwhile the poor mother gives a shudder and remembers, perhaps, that the greater half of the human race fail to survive their childhood years. It was actually possible for a child, who was over eight years old at the time, coming home from a visit to the Natural History Museum, to say to his mother: 'I'm so fond of you, Mummy: when you die I'll have you stuffed and I'll keep you in this room, so that I can see you all the time.' So little resemblance is there between a child's idea of being dead and our own!¹

To children, who, moreover, are spared the sight of the scenes of suffering which precede death, being 'dead' means approximately the same as being 'gone' - not troubling the survivors any longer. A child makes no distinction as to how this absence is brought about: whether it is due to a journey, to a dismissal, to an estrangement, or to death.¹ If, during a child's prehistoric epoch, his nurse has been dismissed, and if soon afterwards his mother has died, the two events are superimposed on each other in a single series in his memory as revealed in analysis. When people are absent, children do not miss them with any great intensity; many mothers have learnt this to their sorrow when, after being away from home for some weeks on a summer holiday, they are met on their return by the news that the children have not once asked after their mummy. If their mother does actually make the journey to that 'undiscover'd country, from whose bourn no traveller returns', children seem at first to have forgotten her, and it is only later on that they begin to call their dead mother to mind.

¹ The appearance in dreams of things of great size and in great quantities and amounts, and of exaggeration generally, may be another childish characteristic. Children have no more ardent wish than to be big and grown-up and to get as much of things as grown-up people do. They are hard to satisfy, know no such word as 'enough' and insist insatiably on a repetition of things which they have enjoyed or whose taste they liked. It is only the civilizing influence of education that teaches them moderation and how to be content or resigned. Everyone knows that neurotics are equally inclined to be extravagant and immoderate.

[1900a, 734]
Indeed, when we look into the matter more closely, we must recognize the fact that the
dream-work is doing nothing original in making substitutions of this kind. In order to gain its
ends - in this case the possibility of a representation hampered by censorship - it merely follows
the paths which it finds already laid down in the unconscious; and it gives preference to those
transformations of the repressed material which can also become conscious in the form of jokes
or allusions and of which the phantasies of neurotic patients are so full. At this point we
suddenly reach an understanding of Scherner's dream interpretations, whose essential
correctness I have defended elsewhere. The imagination's pre-occupation with the subject's
own body is by no means peculiar to dreams or characteristic only of them. My analyses have
shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is
derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the
other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted,
is a house the only circle of ideas employed for symbolizing the body; and this is equally true of
dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have
retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far
beyond the sphere of the external genitalia.) For these patients pillars and columns represent
the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices
(a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of
ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual
images.¹ In the former case the way has been well prepared by linguistic usage, itself the
precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the
seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate
details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities
in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual
symbolism can find its best hiding-place behind what is commonplace and inconspicuous.
There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or
his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics
of the natural human dread of snakes. Wherever neuroses make use of such disguises they are
following paths along which all humanity passed in the earliest periods of civilization - paths of
whose continued existence today, under the thinnest of veils, evidence is to be found in
linguistic usages, superstitions and customs.
[1900a, 815]

In the case of children's dreams there should be no difficulty in accepting this statement. The
state of sleep or the psychical modification involved in sleep, whatever that may be, is brought
about by a resolve to sleep which is either imposed upon the child or is reached on the basis of
sensations of fatigue; and it is only made possible by the withholding of stimuli which might
suggest to the psychical apparatus aims other than that of sleeping. The means by which
external stimuli can be kept off are familiar to us; but what are the means available for
controlling internal mental stimuli which set themselves against falling asleep? Let us observe a
mother putting her child to sleep. The child gives vent to an unceasing stream of desires: he
wants one more kiss, he wants to go on playing. His mother satisfies some of these desires, but
uses her authority to postpone others of them to the next day. It is clear that any wishes or
needs that may arise have an inhibiting effect upon falling asleep. We all know the amusing
story told by Balduin Groller of the bad little boy who woke up in the middle of the night and
shouted across the night nursery: 'I want the rhino!' A better behaved child, instead of shouting,
would have dreamt that he was playing with the rhino. Since a dream that shows a wish as
fulfilled is believed during sleep, it does away with the wish and makes sleep possible. It cannot
be disputed that dream-images are believed in this way, for they are clothed in the psychical
appearance of perceptions, and children have not yet acquired the later faculty of distinguishing
hallucinations or phantasies from reality.
[1901a, 1091]
In my opinion we take the fact of infantile amnesia - the loss, that is, of the memories of the first years of our life - much too easily; and we fail to look upon it as a strange riddle. We forget how high are the intellectual achievements and how complicated the emotional impulses of which a child of some four years is capable, and we ought to be positively astonished that the memory of later years has as a rule preserved so little of these mental processes, especially as we have every reason to suppose that these same forgotten childhood achievements have not, as might be thought, slipped away without leaving their mark on the subject's development, but have exercised a determining influence for the whole of his later life. And in spite of this unique efficacy they have been forgotten! This suggests that there are conditions for remembering (in the sense of conscious reproducing) of a quite special kind, which have evaded recognition by us up to now. It may very well be that the forgetting of childhood can supply us with the key to the understanding of those amnesias which lie, according to our more recent discoveries, at the basis of the formation of all neurotic symptoms.

[1901b, 1140]

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot's proposal, such people are called *auditifs* and *moteurs* in contrast to the *visuels*. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult *visuels* no longer see themselves.¹ Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.

[1901b, 1141]

¹ [Footnote added 1924:] Anyone who is interested in the mental life of these years of childhood will find it easy to guess the deeper determinant of the demand made on the big brother. The child of not yet three had understood that the little sister who had recently arrived had grown inside his mother. He was very far from approving of this addition to the family, and was full of mistrust and anxiety that his mother's inside might conceal still more children. The wardrobe or cupboard was a symbol for him of his mother's inside. So he insisted on looking into this cupboard, and turned for this to his big brother, who (as is clear from other material) had taken his father's place as the child's rival. Besides the well-founded suspicion that this brother had had the lost nurse 'boxed up', there was a further suspicion against him - namely that he had in some way introduced the recently born baby into his mother's inside. The affect of disappointment when the cupboard was found to be empty derived, therefore, from the superficial motivation for the child's demand. As regards the deeper trend of thought, the affect was in the wrong place. On the other hand, his great satisfaction over his mother's slimness on her return can only be fully understood in the light of this deeper layer.

[1901b, 1143]
Occasionally, too, I have had to tell myself that the irritating and clumsy process of dodging someone in the street, when for several seconds one steps first to one side and then to the other, but always to the same side as the other person, till finally one comes to a standstill face to face with him (or her) - this 'getting in someone's way', I have had to tell myself, is once more a repetition of an improper and provocative piece of behaviour from earlier times and, behind a mask of clumsiness, pursues sexual aims. I know from my psycho-analyses of neurotics that what is described as the naïveté of young people and children is frequently only a mask of this sort, employed so that they may be able to say or do something improper without feeling embarrassed.

[1901b, 1256]

COMPONENT INSTINCTS Moreover, the effects of seduction do not help to reveal the early history of the sexual instinct; they rather confuse our view of it by presenting children prematurely with a sexual object for which the infantile sexual instinct at first shows no need. It must, however, be admitted that infantile sexual life, in spite of the preponderating dominance of erotogenic zones, exhibits components which from the very first involve other people as sexual objects. Such are the instincts of scopophilia, exhibitionism and cruelty, which appear in a sense independently of erotogenic zones; these instincts do not enter into intimate relations with genital life until later, but are already to be observed in childhood as independent impulses, distinct in the first instance from erotogenic sexual activity. Small children are essentially without shame, and at some periods of their earliest years show an unmistakable satisfaction in exposing their bodies, with especial emphasis on the sexual parts. The counterpart of this supposedly perverse inclination, curiosity to see other people’s genitals, probably, does not become manifest until somewhat later in childhood, when the obstacle set up by a sense of shame has already reached a certain degree of development. Under the influence of seduction the scopophilic perversion can attain great importance in the sexual life of a child. But my researches into the early years of normal people, as well as of neurotic patients, force me to the conclusion that scopophilia can also appear in children as a spontaneous manifestation. Small children whose attention has once been drawn - as a rule by masturbation - to their own genitals usually take the further step without help from outside and develop a lively interest in the genitals of their playmates. Since opportunities for satisfying curiosity of this kind usually occur only in the course of satisfying the two kinds of need for excretion, children of this kind turn into voyeurs, eager spectators of the processes of micturition and defaecation. When repression of these inclinations sets in, the desire to see other people's genitals (whether of their own or the opposite sex) persists as a tormenting compulsion, which in some cases of neurosis later affords the strongest motive force for the formation of symptoms.

[1905d, 1511]
The cruel component of the sexual instinct develops in childhood even more independently of the sexual activities that are attached to erogenous zones. Cruelty in general comes easily to the childish nature, since the obstacle that brings the instinct for mastery to a halt at another person's pain - namely a capacity for pity - is developed relatively late. The fundamental psychological analysis of this instinct has, as we know, not yet been satisfactorily achieved. It may be assumed that the impulse of cruelty arises from the instinct for mastery and appears at a period of sexual life at which the genitals have not yet taken over their later role. It then dominates a phase of sexual life which we shall later describe as a pregenital organization. Children who distinguish themselves by special cruelty towards animals and playmates usually give rise to a just suspicion of an intense and precocious sexual activity arising from erogenous zones; and, though all the sexual instincts may display simultaneous precocity, erogenous sexual activity seems, nevertheless, to be the primary one. The absence of the barrier of pity brings with it a danger that the connection between the cruel and the erogenous instincts, thus established in childhood, may prove unbreakable in later life. Ever since Jean Jacques Rousseau's *Confessions*, it has been well known to all educationalists that the painful stimulation of the skin of the buttocks is one of the erogenous roots of the passive instinct of cruelty (masochism). The conclusion has rightly been drawn by them that corporal punishment, which is usually applied to this part of the body, should not be inflicted upon any children whose libido is liable to be forced into collateral channels by the later demands of cultural education.¹

[1905d, 1512]

**MECHANICAL EXCITATIONS** At this point we must also mention the production of sexual excitation by rhythmic mechanical agitation of the body. Stimuli of this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of these pleasurable sensations - and it is worth emphasizing the fact that in this connection the concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction, a circumstance which we must later endeavour to explain - the existence, then, of these pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by the fact that children are so fond of games of passive movement, such as swinging and being thrown up into the air, and insist on such games being incessantly repeated.¹ It is well known that rocking is habitually used to induce sleep in restless children. The shaking produced by driving in carriages and later by railway-travel exercises such a fascinating effect upon older children that every boy, at any rate, has at one time or other in his life wanted to be an engine driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest in things connected with railways, and, at the age at which the production of phantasies is most active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly sexual. A compulsive link of this kind between railway-travel and sexuality is clearly derived from the pleasurable character of the sensations of movement. In the event of repression, which turns so many childish preferences into their opposite, these same individuals, when they are adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will protect themselves against a repetition of the painful experience by a dread of railway-travel.¹

[1905d, 1520]
AFFECTIVE PROCESSES The further sources of sexual excitation in children are open to less
doubt. It is easy to establish, whether by contemporary observation or
by subsequent research, that all comparatively intense affective processes, including even
terrifying ones, trench upon sexuality - a fact which may incidentally help to explain the
pathogenic effect of emotions of that kind. In schoolchildren dread of going in for an
examination or tension over a difficult piece of work can be important not only in affecting the
child’s relations at school but also in bringing about an irruption of sexual manifestations. For
quite often in such circumstances a stimulus may be felt which urges the child to touch his
genitals, or something may take place akin to a nocturnal emission with all its bewildering
consequences. The behaviour of children at school, which confronts a teacher with plenty of
puzzles, deserves in general to be brought into relation with their budding sexuality. The
sexually exciting effect of many emotions which are in themselves unpleasurable, such as
feelings of apprehension, fright or horror, persists in a great number of people throughout their
adult life. There is no doubt that this is the explanation of why so many people seek
opportunities for sensations of this kind, subject to the proviso that the seriousness of the
unpleasurable feeling is damped down by certain qualifying facts, such as its occurring in an
imaginary world, in a book or in a play.

On the basis of suitable specimens of innocent jokes, in which there was no fear of our
judgement being disturbed by their content or purpose, we were driven to conclude that the
techniques of jokes are themselves sources of pleasure; and we shall now try to discover
whether it may perhaps be possible to trace that pleasure back to economy in psychical
expenditure. In one group of these jokes (play upon words) the technique consisted in focusing
our psychical attitude upon the sound of the word instead of upon its meaning - in making the
(acoustic) word presentation itself take the place of its significance as given by its relations to
thing-presentations. It may really be suspected that in doing so we are bringing about a great
relief in psychical work and that when we make serious use of words we are obliged to hold
ourselves back with a certain effort from this comfortable procedure. We can observe how
pathological states of thought-activity, in which the possibility of concentrating psychical
expenditure on a particular point is probably restricted, do in fact give this sort of sound-
presentation of the word greater prominence than its meaning, and that sufferers in such states
proceed in their speech on the lines (as the formula runs) of the ‘external’ instead of the
‘internal’ associations of the word-presentation. We notice, too, that children, who, as we know,
are in the habit of still treating words as things, tend to expect words that are the same or similar
to have the same meaning behind them - which is a source of many mistakes that are laughed
at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being
transported by the use of the same or a similar word from one circle of ideas to another, remote
one (in the ‘Home-Roulard’, for instance, from the kitchen to politics), this enjoyment is no doubt
correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising
from a ‘short-circuit’ like this seems to be the greater the more alien the two circles of ideas that
are brought together by the same word - the further apart they are, and thus the greater the
economy which the joke’s technical method provides in the train of thought. We may notice, too,
that here jokes are making use of a method of linking things up which is rejected and studiously
avoided by serious thought.¹

Pleasure in nonsense', as we may call it for short, is concealed in serious life to a vanishing
point. In order to demonstrate it we must investigate two cases - one in which it is still visible
and one in which it becomes visible again: the behaviour of a child in learning, and that of an
adult in a toxically altered state of mind.

¹ Pleasure in nonsense', as we may call it for short, is concealed in serious life to a vanishing
point. In order to demonstrate it we must investigate two cases - one in which it is still visible
and one in which it becomes visible again: the behaviour of a child in learning, and that of an
adult in a toxically altered state of mind.
During the period in which a child is learning how to handle the vocabulary of his mother-tongue, it gives him obvious pleasure to 'experiment with it in play', to use Groos's words. And he puts words together without regard to the condition that they should make sense, in order to obtain from them the pleasurable effect of rhythm or rhyme. Little by little he is forbidden this enjoyment, till all that remains permitted to him are significant combinations of words. But when he is older attempts still emerge at disregarding the restrictions that have been learnt on the use of words. Words are disfigured by particular little additions being made to them, their forms are altered by certain manipulations (e.g. by reduplications or 'Zittersprache'), or a private language may even be constructed for use among playmates. These attempts are found again among certain categories of mental patients.

Whatever the motive may have been which led the child to begin these games, I believe that in his later development he gives himself up to them with the consciousness that they are nonsensical, and that he finds enjoyment in the attraction of what is forbidden by reason. He now uses games in order to withdraw from the pressure of critical reason. But there is far more potency in the restrictions which must establish themselves in the course of a child's education in logical thinking and in distinguishing between what is true and false in reality; and for this reason the rebellion against the compulsion of logic and reality is deep-going and long-lasting. Even the phenomena of imaginative activity must be included in this category. The power of criticism has increased so greatly in the later part of childhood and in the period of learning which extends over puberty that the pleasure in 'liberated nonsense' only seldom dares to show itself directly. One does not venture to say anything absurd. But the characteristic tendency of boys to do absurd or silly things seems to me to be directly derived from the pleasure in nonsense. In pathological cases we often see this tendency so far intensified that once more it dominates the schoolboy's talk and answers. I have been able to convince myself in the case of a few boys of secondary school age who had developed neuroses that the unconscious workings of their pleasure in the nonsense they produced played no less a part in their inefficiency than did their real ignorance.

We found relatively great difficulties in understanding the comic of mimicry so long as we left the infantile factor out of account. But mimicry is the child's best art and the driving motive of most of his games. A child's ambition aims far less at excelling among his equals than at mimicking the grown-ups. The relation of children to adults is also the basis of the comic of degradation, which corresponds to the condescension shown by adults in their attitude to the life of children. There is little that gives children greater pleasure than when a grown-up lets himself down to their level, renounces his oppressive superiority and plays with them as an equal. This relief, which gives the child pure pleasure, becomes in adults, in the form of degradation, a means of making things comic and a source of comic pleasure. As regards unmasking, we know that it goes back to degradation.
We are now at the end of our task, having reduced the mechanism of humorous pleasure to a formula analogous to those for comic pleasure and for jokes. The pleasure in jokes has seemed to us to arise from an economy in expenditure upon inhibition, the pleasure in the comic from an economy in expenditure upon ideation (upon cathexis) and the pleasure in humour from an economy in expenditure upon feeling. In all three modes of working of our mental apparatus the pleasure is derived from an economy. All three are agreed in representing methods of regaining from mental activity a pleasure which has in fact been lost through the development of that activity. For the euphoria which we endeavour to reach by these means is nothing other than the mood of a period of life in which we were accustomed to deal with our psychical work in general with a small expenditure of energy - the mood of our childhood, when we were ignorant of the comic, when we were incapable of jokes and when we had no need of humour to make us feel happy in our life.

[1905c, 1809]

I should also like to point out that your test may possibly be subject to a complication which does not, by its very nature, arise in psycho-analysis. In your examination you may be led astray by a neurotic who, although he is innocent, reacts as if he were guilty, because a lurking sense of guilt that already exists in him seizes upon the accusation made in the particular instance. You must not regard this possibility as an idle fiction; you have only to think of life in the nursery, where such events can often enough be observed. It sometimes happens that a child who has been accused of a misdeed strongly denies the charge but at the same time weeps like a detected sinner. You may perhaps think that the child is lying when he asserts his innocence; but this is not necessarily so. It can be that he has in fact not committed the particular crime with which you have charged him but that he has committed one of which you know nothing and of which you are not accusing him. He therefore quite truthfully denies being guilty of the one misdeed, while at the same time betraying his sense of guilt on account of the other. In this respect - as in so many others - the adult neurotic behaves just like a child. Many people are like this, and it is still open to question whether your technique will succeed in distinguishing self-accusing individuals of this kind from those who are really guilty. Finally, one more point. You know that, according to the rules governing criminal proceedings, you may not subject the accused to any procedure which takes him by surprise. He will therefore have been made aware that in this experiment it is a matter for him of not betraying himself. It must then be asked whether one can expect the same reactions when the subject's attention is directed towards the complex as when it is directed away from it, and how far the intention to conceal something may affect modes of reaction in different people.

[1906c, 1897]
If we could divest ourselves of our corporeal existence, and could view the things of this earth with a fresh eye as purely thinking beings, from another planet for instance, nothing perhaps would strike our attention more forcibly than the fact of the existence of two sexes among human beings, who, though so much alike in other respects, yet mark the difference between them with such obvious external signs. But it does not seem that children choose this fundamental fact in the same way as the starting-point of their researches into sexual problems. Since they have known a father and mother as far back as they can remember in life, they accept their existence as a reality which needs no further enquiry, and a boy has the same attitude towards a little sister from whom he is separated by only a slight difference of age of one or two years. A child's desire for knowledge on this point does not in fact awaken spontaneously, prompted perhaps by some inborn need for established causes; it is aroused under the goad of the self-seeking instincts that dominate him, when - perhaps after the end of his second year - he is confronted with the arrival of a new baby. And a child whose own nursery has received no such addition is able, from observations made in other homes, to put himself in the same situation. The loss of his parents' care, which he actually experiences or justly fears, and the presentiment that from now on he must for evermore share all his possessions with the newcomer, have the effect of awakening his emotions and sharpening his capacities for thought. The elder child expresses unconcealed hostility towards his rival, which finds vent in unfriendly criticisms of it, in wishes that 'the stork should take it away again' and occasionally even in small attacks upon the creature lying helpless in the cradle. A wider difference in age usually softens the expression of this primary hostility. In the same way, at a rather later age, if no small brother or sister has appeared, the child's wish for a playmate, such as he has seen in other families, may gain the upper hand.

[1908c, 1968]
At the instigation of these feelings and worries, the child now comes to be occupied with the first, grand problem of life and asks himself the question: ‘Where do babies come from?’ - a question which, there can be no doubt, first ran: ‘Where did this particular, intruding baby come from?’ We seem to hear the echoes of this first riddle in innumerable riddles of myth and legend. The question itself is, like all research, the product of a vital exigency, as though thinking were entrusted with the task of preventing the recurrence of such dreaded events. Let us assume, however, that the child's thinking soon becomes independent of this instigation, and henceforward goes on operating as a self-sustained instinct for research. Where a child is not already too much intimidated, he sooner or later adopts the direct method of demanding an answer from his parents or those in charge of him, who are in his eyes the source of all knowledge. This method, however, fails. The child receives either evasive answers or a rebuke for his curiosity, or he is dismissed with the mythologically significant piece of information which, in German countries, runs: ‘The stork brings the babies; it fetches them out of the water.’ I have reason to believe that far more children than their parents suspect are dissatisfied with this solution and meet it with energetic doubts, which, however, they do not always openly admit. I know of a three-year-old boy who, after receiving this piece of enlightenment, disappeared - to the terror of his nurse. He was found at the edge of the big pond adjoining the country house, to which he had hurried in order to see the babies in the water. I also know of another boy who could only allow his disbelief to find expression in a hesitant remark that he knew better, that it was not a stork that brought babies but a heron. It seems to me to follow from a great deal of information I have received that children refuse to believe the stork theory and that from the time of this first deception and rebuff they nourish a distrust of adults and have a suspicion of there being something forbidden which is being withheld from them by the 'grown-ups', and that they consequently hide their further researches under a cloak of secrecy. With this, however, the child also experiences the first occasion for a ‘psychical conflict’, in that views for which he feels an instinctual kind of preference, but which are not ‘right’ in the eyes of the grown-ups, come into opposition with other views, which are supported by the authority of the grown-ups without being acceptable to him himself. Such a psychical conflict may soon turn into a ‘psychical dissociation’. The set of views which are bound up with being 'good', but also with a cessation of reflection, become the dominant and conscious views; while the other set, for which the child's work of research has meanwhile obtained fresh evidence, but which are not supposed to count, become the suppressed and 'unconscious' ones. The nuclear complex of a neurosis is in this way brought into being.

[1908c, 1969]
For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least feels he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from him than from her. In this respect the imagination of girls is apt to show itself much weaker.

These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

[1909c, 1987]

If anyone is inclined to turn away in horror from this depravity of the childish heart or feels tempted, indeed, to dispute the possibility of such things, he should observe that these works of fiction, which seem so full of hostility, are none of them really so badly intended, and that they still preserve, under a slight disguise, the child's original affection for his parents. The faithlessness and ingratitude are only apparent. If we examine in detail the commonest of these imaginative romances, the replacement of both parents or of the father alone by grander people, we find that these new and aristocratic parents are equipped with attributes that are derived entirely from real recollections of the actual and humble ones; so that in fact the child is not getting rid of his father but exalting him. Indeed the whole effort at replacing the real father by a superior one is only an expression of the child's longing for the happy, vanished days when his father seemed to him the noblest and strongest of men and his mother the dearest and loveliest of women. He is turning away from the father whom he knows to-day to the father in whom he believed in the earlier years of his childhood; and his phantasy is no more than the expression of a regret that those happy days have gone. Thus in these phantasies the overvaluation that characterizes a child's earliest years comes into its own again. An interesting contribution to this subject is afforded by the study of dreams. We learn from their interpretation that even in later years, if the Emperor and Empress appear in dreams, those exalted personages stand for the dreamer's father and mother.¹ So that the child's overvaluation of his parents survives as well in the dreams of normal adults.

[1909c, 1990]
I may explain that Hans was not maintaining that he had got the nonsense at that time but in that connection. Indeed, it must have been so, for theoretical considerations require that what is to-day the object of a phobia must at one time in the past have been the source of a high degree of pleasure. I may at the same time complete what the child was unable to express, and add that the little word 'wegen' ['because of, 'cos of'] was the means of enabling the phobia to extend from horses on to 'Wagen' ['vehicles'] or, as Hans was accustomed to pronounce the word and hear it pronounced, 'Wägen' [pronounced exactly like 'wegen']. It must never be forgotten how much more concretely children treat words than grown-up people do, and consequently how much more significant for them are similarities of sound in words.

[1909b, 2047]

I shall now proceed to examine this observation of the development and resolution of a phobia in a boy under five years of age, and I shall have to do so from three points of view. In the first place I shall consider how far it supports the assertions which I put forward in my *Three Essays on the Theory of Sexuality* (1905d). Secondly, I shall consider to what extent it can contribute towards our understanding of this very frequent form of disorder. And thirdly, I shall consider whether it can be made to shed any light upon the mental life of children or to afford any criticism of our educational aims.

[1909b, 2087]

A singular thing. I can remember, when I first began to meddle in the conflict of scientific opinions twenty-two years ago, with what derision the older generation of neurologists and psychiatrists of those days received assertions about suggestion and its effects. Since then the situation has fundamentally changed. The former aversion has been converted into an only too ready acceptance; and this has happened not only as a consequence of the impression which the work of Liébeault and Bernheim and their pupils could not fail to create in the course of these two decades, but also because it has since been discovered how great an economy of thought can be effected by the use of the catchword 'suggestion'. Nobody knows and nobody cares what suggestion is, where it comes from, or when it arises, - it is enough that everything awkward in the region of psychology can be labelled 'suggestion'. I do not share the view which is at present fashionable that assertions made by children are invariably arbitrary and untrustworthy. The arbitrary has no existence in mental life. The untrustworthiness of the assertions of children is due to the predominance of their imagination, just as the untrustworthiness of the assertions of grown-up people is due to the predominance of their prejudices. For the rest, even children do not lie without a reason, and on the whole they are more inclined to a love of truth than are their elders. If we were to reject little Hans's statements root and branch we should certainly be doing him a grave injustice. On the contrary, we can quite clearly distinguish from one another the occasions on which he was falsifying the facts or keeping them back under the compelling force of a resistance, the occasions on which, being undecided himself, he agreed with his father (so that what he said must not be taken as evidence), and the occasions on which, freed from every pressure, he burst into a flood of information about what was really going on inside him and about things which until then no one but himself had known. Statements made by adults offer no greater certainty. It is a regrettable fact that no account of a psycho-analysis can reproduce the impressions received by the analyst as he conducts it, and that a final sense of conviction can never be obtained from reading about it but only from directly experiencing it. But this disability attaches in an equal degree to analyses of adults.

[1909b, 2088]
But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:¹ but it was suppressed sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

This is how, basing my conclusions upon the findings of the analysis, I am obliged to reconstruct the unconscious complexes and wishes, the repression and reawakening of which produced little Hans's phobia. I am aware that in so doing I am attributing a great deal to the mental capacity of a child between four and five years of age; but I have let myself be guided by what we have recently learned, and I do not consider myself bound by the prejudices of our ignorance. It might perhaps have been possible to make use of Hans's fear of the 'making a row with the legs' for filling up a few more gaps in our adjudication upon the evidence. Hans, it is true, declared that it reminded him of his kicking about with his legs when he was compelled to leave off playing so as to do lumf; so that this element of the neurosis becomes connected with the problem whether his mother liked having children or was compelled to have them. But I have an impression that this is not the whole explanation of the 'making a row with the legs'. Hans's father was unable to confirm my suspicion that there was some recollection stirring in the child's mind of having observed a scene of sexual intercourse between his parents in their bedroom. So let us be content with what we have discovered.

I shall now proceed to what I hope will be a brief discussion of how far little Hans's phobia offers any contribution of general importance to our views upon the life and upbringing of children. But before doing so I must return to the objection which has so long been held over, and according to which Hans was a neurotic, a 'degenerate' with a bad heredity, and not a normal child, knowledge about whom could be applied to other children. I have for some time been thinking with pain of the way in which the adherents of 'the normal person' will fall upon poor little Hans as soon as they are told that he can in fact be shown to have had a hereditary taint. His beautiful mother fell ill with a neurosis as a result of a conflict during her girlhood. I was able to be of assistance to her at the time, and this had in fact been the beginning of my connection with Hans's parents. It is only with the greatest diffidence that I venture to bring forward one or two considerations in his favour.

[1909b, 2097]

[1909b, 2115]

[1909b, 2119]
But why do so many people dream of being able to fly? The answer that psycho-analysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual activity is 'vögeln' ['to bird': 'Vogel' is the German for 'bird']; that the male organ is actually called 'l'uccello' ['the bird'] in Italian - all of these are only small fragments from a whole mass of connected ideas, from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.² This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier they would probably tell a different story. It seems that childhood is not the blissful idyll into which we distort it in retrospect, and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which they are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.

Abel tries to explain the phenomenon of reversal of sound as a doubling or reduplication of the root. Here we should find some difficulty in following the philologist. We remember in this connection how fond children are of playing at reversing the sound of words and how frequently the dream-work makes use of a reversal of the representational material for various purposes. (Here it is no longer letters but images whose order is reversed.) We should therefore be more inclined to derive reversal of sound from a factor of deeper origin.¹

If we are to understand the love-objects chosen by our type as being above all mother-surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psycho-analysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they have one single question to ask, but it never crosses their lips. It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.
This taboo upon names will seem less puzzling if we bear in mind the fact that savages regard a name as an essential part of a man's personality and as an important possession: they treat words in every sense as things. As I have pointed out elsewhere, our own children do the same. They are never ready to accept a similarity between two words as having no meaning; they consistently assume that if two things are called by similar-sounding names this must imply the existence of some deep-lying point of agreement between them. Even a civilized adult may be able to infer from certain peculiarities in his own behaviour that he is not so far removed as he may have thought from attributing importance to proper names, and that his own name has become to a very remarkable extent bound up with his personality. So, too, psycho-analytic practice comes upon frequent confirmations of this in the evidence it finds of the importance of names in unconscious mental activities.¹

¹ I will only briefly allude here to the fact that the original narcissism of children has a decisive influence upon our view of the development of their character and excludes the possibility of their having any primary sense of inferiority.

I am under no illusion that in putting forward these attempted explanations I am laying myself open to the charge of endowing modern savages with a subtlety in their mental activities which exceeds all probability. It seems to me quite possible, however, that the same may be true of our attitude towards the psychology of those races that have remained at the animistic level as is true of our attitude towards the mental life of children, which we adults no longer understand and whose fullness and delicacy of feeling we have in consequence so greatly underestimated.²

² In the first place, those who collect the observations are not the same as those who examine and discuss them. The former are travellers and missionaries while the latter are students who may never have set eyes on the objects of their researches. Again, communication with savages is not an easy matter. The observers are not always acquainted with the native language but may be obliged to rely on the help of interpreters or to conduct their inquiries through the medium of pidgin-English. Savages are not communicative on the subject of the most intimate details of their cultural life and they talk openly only to those foreigners who have lived among them for many years. They often give false or misleading information for a great variety of motives. (Cf. Frazer, 1910, 1, 150 f.) It should not be forgotten that primitive races are not young races but are in fact as old as civilized races. There is no reason to suppose that, for the benefit of our information, they have retained their original ideas and institutions undeveloped and undistorted. On the contrary, it is certain that there have been profound changes in every direction among primitive races, so that it is never possible to decide without hesitation how far their present-day conditions and opinions preserve the primaeval past in a petrified form and how far they are distortions and modifications of it. Hence arise the all-too-frequent disputes among the authorities as to which characteristics of a primitive civilization are to be regarded as primary and as to which are later and secondary developments. The determination of the original state of things thus invariably remains a matter of construction. Finally, it is not easy to feel one's way into primitive modes of thinking. We misunderstand primitive men just as easily as we do children, and we are always apt to interpret their actions and feelings according to our own mental constellations.
Andrew Lang regards it as initially a matter of indifference how clans obtained their animal names. It is only necessary to assume that they awoke one day to the consciousness that they bore such names and could give no account of how this had come about. *The origin of the names had been forgotten*. They would then attempt to arrive at an explanation by speculating on the subject; and, in view of their belief in the importance of names, they were bound to reach all the ideas contained in the totemic system. Primitive races (as well as modern savages and even our own children) do not, like us, regard names as something indifferent and conventional, but as significant and essential. A man's name is a principal component of his personality, perhaps even a portion of his soul. The fact of a primitive man bearing the same name as an animal must lead him to assume the existence of a mysterious and significant bond between himself and that particular species of animal. What other bond could it be than one of blood relationship? Once the similarity of names had led to this conclusion, the blood taboo would immediately involve all the totemic ordinances, including exogamy. 'No more than these three things - a group animal name of unknown origin; belief in a transcendental connection between all bearers, human and bestial, of the same name; and belief in the blood superstitions - was needed to give rise to all the totemic creeds and practices, including exogamy.' (Lang, 1905, 125 f.)

There is a great deal of resemblance between the relations of children and of primitive men towards animals. Children show no trace of the arrogance which urges adult civilized men to draw a hard-and-fast line between their own nature and that of all other animals. Children have no scruples over allowing animals to rank as their full equals. Uninhibited as they are in the avowal of their bodily needs, they no doubt feel themselves more akin to animals than to their elders, who may well be a puzzle to them.

The overmastering interest which must be felt in psycho-analysis by the theory of education is based upon a fact which has become evident. Only someone who can feel his way into the minds of children can be capable of educating them; and we grown-up people cannot understand children because we no longer understand our own childhood. Our infantile amnesia proves that we have grown estranged from our childhood. Psycho-analysis has brought to light the wishes, the thought structures and the developmental processes of childhood. All earlier attempts in this direction have been in the highest degree incomplete and misleading because they have entirely overlooked the inestimably important factor of sexuality in its physical and mental manifestations. The incredulous astonishment which meets the most certainly established findings of psycho-analysis on the subject of childhood - the Oedipus complex, self-love (or 'narcissism'), the disposition to perversions, anal erotism, sexual curiosity - is a measure of the gulf which separates our mental life, our judgements of value and, indeed, our processes of thought from those of even normal children.
This extension of the libido theory - in my opinion, a legitimate one - receives reinforcement from a third quarter, namely, from our observations and views on the mental life of children and primitive peoples. In the latter we find characteristics which, if they occurred singly, might be put down to megalomania: an over-estimation of the power of their wishes and mental acts, the 'omnipotence of thoughts', a belief in the thaumaturgic force of words, and a technique for dealing with the external world - 'magic' - which appears to be a logical application of these grandiose premisses.¹ In the children of to-day, whose development is much more obscure to us, we expect to find an exactly analogous attitude towards the external world.² Thus we form the idea of there being an original libidinal cathexis of the ego, from which some is later given off to objects, but which fundamentally persists and is related to the object-cathexes much as the body of an amoeba is related to the pseudopodia which it puts out. In our researches, taking, as they did, neurotic symptoms for their starting-point, this part of the allocation of libido necessarily remained hidden from us at the outset. All that we noticed were the emanations of this libido - the object-cathexes, which can be sent out and drawn back again. We see also, broadly speaking, an antithesis between ego-libido and object-libido. The more of the one is employed, the more the other becomes depleted. The highest phase of development of which object-libido is capable is seen in the state of being in love, when the subject seems to give up his own personality in favour of an object-cathexis; while we have the opposite condition in the paranoid's phantasy (or self-perception) of the 'end of the world'.³ Finally, as regards the differentiation of psychical energies, we are led to the conclusion that to begin with, during the state of narcissism, they exist together and that our analysis is too coarse to distinguish between them; not until there is object-cathexis is it possible to discriminate a sexual energy - the libido - from an energy of the ego-instincts.

[1914c, 2933]

When it comes to someone else's death, the civilized man will carefully avoid speaking of such a possibility in the hearing of the person under sentence. Children alone disregard this restriction; they unashamedly threaten one another with the possibility of dying, and even go so far as to do the same thing to someone whom they love, as, for instance: 'Dear Mummy, when you're dead I'll do this or that.' The civilized adult can hardly even entertain the thought of another person's death without seeming to himself hard-hearted or wicked; unless, of course, as a doctor or lawyer or something of the kind, he has to deal with death professionally. Least of all will he allow himself to think of the other person's death if some gain to himself in freedom, property or position is bound up with it. This sensitiveness of ours does not, of course, prevent the occurrence of deaths; when one does happen, we are always deeply affected, and it is as though we were badly shaken in our expectations. Our habit is to lay stress on the fortuitous causation of the death - accident, disease, infection, advanced age; in this way we betray an effort to reduce death from a necessity to a chance event. A number of simultaneous deaths strikes us as something extremely terrible. Towards the actual person who has died we adopt a special attitude - something almost like admiration for someone who has accomplished a very difficult task. We suspend criticism of him, overlook his possible misdeeds, declare that 'de mortuis nil nisi bonum', and think it justifiable to set out all that is most favourable to his memory in the funeral oration and upon the tombstone. Consideration for the dead, who, after all, no longer need it, is more important to us than the truth, and certainly, for most of us, than consideration for the living.

[1915b, 3082]
In order to answer the second question we must go beyond the scope of psycho-analytic work. With children it is easy to observe that they are often 'naughty' on purpose to provoke punishment, and are quiet and contented after they have been punished. Later analytic investigation can often put us on the track of the guilty feeling which induced them to seek punishment. Among adult criminals we must no doubt except those who commit crimes without any sense of guilt, who have either developed no moral inhibitions or who, in their conflict with society, consider themselves justified in their action. But as regards the majority of other criminals, those for whom punitive measures are really designed, such a motivation for crime might very well be taken into consideration; it might throw light on some obscure points in the psychology of the criminal, and furnish punishment with a new psychological basis.

[1916d, 3119]

We will keep to wishes forgetting rid of someone, which may for the most part be attributed to the dreamer's unrestricted egoism. A wish of this kind can very often be pointed to as the constructor of a dream. Whenever anyone in the course of one's life gets in one's way - and how often this must happen in view of the complication of one's relationships in life! - a dream is promptly ready to kill that person, even if it be father or mother, brother or sister, husband or wife. This wickedness of human nature came as a great surprise to us and we were decidedly disinclined to accept this outcome of dream-interpretation without question. But as soon as we were led to look for the origin of these wishes in the past, we discovered the period of the individual's past in which there was no longer anything strange in such egoism and such wishful impulses, directed even against his closest relatives. It is children, and precisely in those earliest years which are later veiled by amnesia, who often exhibit this egoism to an extremely marked degree and who invariably show clear rudiments or, more correctly speaking, residues of it. Children love themselves first, and it is only later that they learn to love others and to sacrifice something of their own ego to others. Even those people whom a child seems to love from the beginning are loved by him at first because he needs them and cannot do without them - once again from egoistic motives. Not until later does the impulse to love make itself independent of egoism. It is literally true that his egoism has taught him to love.

[1916-1917, 3292]
First and foremost, it is an untenable error to deny that children have a sexual life and to suppose that sexuality only begins at puberty with the maturation of the genitals. On the contrary, from the very first children have a copious sexual life, which differs at many points from what is later regarded as normal. What in adult life is described as ‘perverse’ differs from the normal in these respects: first, by disregarding the barrier of species (the gulf between men and animals), secondly, by overstepping the barrier against disgust, thirdly that against incest (the prohibition against seeking sexual satisfaction from near blood-relations), fourthly that against members of one’s own sex and fifthly the transferring of the part played by the genitals to other organs and areas of the body. None of these barriers existed from the beginning; they were only gradually erected in the course of development and education. Small children are free from them. They recognize no frightful gulf between human beings and animals; the arrogance with which men separate themselves from animals does not emerge until later. To begin with, children exhibit no disgust at excreta but acquire this slowly under the pressure of education; they attach no special importance to the distinction between the sexes, but attribute the same conformation of the genitals to both; they direct their first sexual lusts and their curiosity to those who are nearest and for other reasons dearest to them - parents, brothers and sisters, or nurses; and finally, they show (what later on breaks through once again at the climax of a love-relation) that they expect to derive pleasure not only from their sexual organs, but that many other parts of the body lay claim to the same sensitivity, afford them analogous feelings of pleasure and can accordingly play the part of genitals. Children may thus be described as ‘polymorphously perverse’, and if these impulses only show traces of activity, that is because on the one hand they are of less intensity compared with those in later life and on the other hand all a child’s sexual manifestations are at once energetically suppressed by education. This suppression is, as it were, extended into theory; for adults endeavour to overlook one portion of the sexual manifestations of children and to disguise another portion by misinterpreting its sexual nature, so that they can then disavow the whole of them. It is often the very same people who in the nursery are furious with any sexual naughtinesses of children and afterwards at their writing-tables defend the sexual purity of the same children. When children are left to themselves, or under the influence of seduction, they often bring about quite considerable achievements in the way of perverse sexual activity. Adults are of course right not to take this too seriously and to regard it as ‘childishness’, or ‘playfulness’, for children are not to be condemned as fully capable or fully responsible either before the judgement-seat of morals or before the law; but nonetheless these things exist. They have their importance both as indications of a child’s innate constitution and as causes and encouragements of later developments in him; they give us information on the sexual life of children and so on human sexual life in general. If, therefore, we once more find all these perverse wishful impulses behind our distorted dreams, that only means that in this field too dreams have taken a step backwards into the state of infancy.

Let us now bring together what our researches into child psychology have contributed to our understanding of dreams. We have not only found that the material of the forgotten experiences of childhood is accessible to dreams, but we have also seen that the mental life of children with all its characteristics, its egoism, its incestuous choice of love-objects, and so on, still persists in dreams - that is, in the unconscious, and that dreams carry us back every night to this infantile level. The fact is thus confirmed that what is unconscious in mental life is also what is infantile. The strange impression of there being so much evil in people begins to diminish. This frightful evil is simply the initial, primitive, infantile part of mental life, which we can find in actual operation in children, but which, in part, we overlook in them on account of their small size, and which in part we do not take seriously since we do not expect any high ethical standard from children. Since dreams regress to this level, they give the appearance of having brought to light the evil in us. But this is a deceptive appearance, by which we have allowed ourselves to be scared. We are not so evil as we were inclined to suppose from the interpretation of dreams.
What, then, can be gathered about the Oedipus complex from the direct observation of children at the time of their making their choice of an object before the latency period? Well, it is easy to see that the little man wants to have his mother all to himself, that he feels the presence of his father as a nuisance, that he is resentful if his father indulges in any signs of affection towards his mother and that he shows satisfaction when his father has gone on a journey or is absent. He will often express his feelings directly in words and promise his mother to marry her. It will be thought that this amounts to little compared to the deeds of Oedipus; but in fact it is enough, it is the same thing at root. Observation is often obscured by the circumstance that on other occasions the same child will simultaneously give evidence of great affection for his father. But contrary - or, as it is better to say, 'ambivalent' - emotional attitudes, which in adults would lead to a conflict, remain compatible with each other for a long time in children, just as later they find a permanent place beside each other in the unconscious. It will also be objected that the little boy's conduct arises from egoistic motives and gives no grounds for postulating an erotic complex: the child's mother attends to all his needs, so that he has an interest in preventing her from looking after anyone else. This also is true; but it will soon become clear that in this situation as in similar ones the egoistic interest is merely affording a point of support to which the erotic trend is attached. The little boy may show the most undisguised sexual curiosity about his mother, he may insist upon sleeping beside her at night, he may force his presence on her while she is dressing or may even make actual attempts at seducing her, as his mother will often notice and report with amusement - all of which puts beyond doubt the erotic nature of his tie with his mother. Nor must it be forgotten that the mother devotes the same attention to a little daughter without producing the same result and that the father often competes with her in looking after the boy and yet fails to gain the same significance as she does. In short, the factor of sexual preference cannot be eliminated from the situation by any criticism. From the standpoint of egoistic interest it would be simply foolish of the little man not to prefer to put up with having two people in his service rather than only one of them. [1916-1917, 3399]

In children the first phobias relating to situations are those of darkness and solitude. The former of these often persists throughout life; both are involved when a child feels the absence of some loved person who looks after it - its mother, that is to say. While I was in the next room, I heard a child who was afraid of the dark call out: 'Do speak to me, Auntie! I'm frightened!' 'Why, what good would that do? You can't see me.' To this the child replied: 'If someone speaks, it gets lighter.' Thus a longing felt in the dark is transformed into a fear of the dark. Far from its being the case that neurotic anxiety is only secondary and a special case of realistic anxiety, we see on the contrary that in a small child something that behaves like realistic anxiety shares its essential feature - origin from unemployed libido - with neurotic anxiety. Innately, children seem to have little true realistic anxiety. In all the situations which can later become determinants of phobias (on heights, on narrow bridges over water, on railway journeys, on ships) children exhibit no anxiety; and, to be sure, the greater their ignorance the less their anxiety. It would have been a very good thing if they had inherited more of such life-preserving instincts, for that would have greatly facilitated the task of watching over them to prevent their running into one danger after another. The fact is that children, to begin with, over-estimate their strength and behave fearlessly because they are ignorant of dangers. They will run along the brink of the water, climb on to the window-sill, play with sharp objects and with fire - in short, do everything that is bound to damage them and to worry those in charge of them. When in the end realistic anxiety is awakened in them, that is wholly the result of education; for they cannot be allowed to make the instructive experiences themselves. [1916-1917, 3454]
In any case it may be maintained that analysis of children's neuroses can claim to possess a specially high theoretical interest. They afford us, roughly speaking, as much help towards a proper understanding of the neuroses of adults as do children's dreams in respect to the dreams of adults. Not, indeed, that they are more perspicuous or poorer in elements; in fact, the difficulty of feeling one's way into the mental life of a child makes them set the physician a particularly difficult task. But nevertheless, so many of the later deposits are wanting in them that the essence of the neurosis springs to the eyes with unmistakable distinctness. In the present phase of the battle which is raging round psycho-analysis the resistance to its findings has, as we know, taken on a new form. People were content formerly to dispute the reality of the facts which are asserted by analysis; and for this purpose the best technique seemed to be to avoid examining them. That procedure appears to be slowly exhausting itself; and people are now adopting another plan of recognizing the facts, but of eliminating, by means of twisted interpretations, the consequences that follow from them, so that the critics can still ward off the objectionable novelties as efficiently as ever. The study of children's neuroses exposes the complete inadequacy of these shallow or high-handed attempts at re-interpretation. It shows the predominant part that is played in the formation of neuroses by those libidinal motive forces which are so eagerly disavowed, and reveals the absence of any aspirations towards remote cultural aims, of which the child still knows nothing, and which cannot therefore be of any significance for him.

[1918b, 3505]

The boy's masochistic trends lead on to another point, which I have so far avoided mentioning, because it can only be confirmed by means of the analysis of the subsequent phase of his development. I have already mentioned that after his refusal by his Nanya his libidinal expectation detached itself from her and began to contemplate another person as a sexual object. This person was his father, at that time away from home. He was no doubt led to this choice by a number of convergent factors, including such fortuitous ones as the recollection of the snake being cut to pieces; but above all he was in this way able to renew his first and most primitive object-choice, which, in conformity with a small child's narcissism, had taken place along the path of identification. We have heard already that his father had been his admired model, and that when he was asked what he wanted to be he used to reply: a gentleman like his father. This object of identification of his active current became the sexual object of a passive current in his present anal-sadistic phase. It looks as though his seduction by his sister had forced him into a passive role, and had given him a passive sexual aim. Under the persisting influence of this experience he pursued a path from his sister via his Nanya to his father - from a passive attitude towards women to the same attitude towards men - and had, nevertheless, by this means found a link with his earlier and spontaneous phase of development. His father was now his object once more; in conformity with his higher stage of development, identification was replaced by object-choice; while the transformation of his active attitude into a passive one was the consequence and the record of the seduction which had occurred meanwhile. It would naturally not have been so easy to achieve an active attitude in the sadistic phase towards his all-powerful father. When his father came home in the late summer or autumn the patient's fits of rage and scenes of fury were put to a new use. They had served for active sadistic ends in relation to his Nanya; in relation to his father their purpose was masochistic. By bringing his naughtiness forward he was trying to force punishments and beatings out of his father, and in that way to obtain from him the masochistic sexual satisfaction that he desired. His screaming fits were therefore simply attempts at seduction. In accordance, moreover, with the motives which underlie masochism, this beating would also have satisfied his sense of guilt. He had preserved a memory of how, during one of these scenes of naughtiness, he had redoubled his screams as soon as his father came towards him. His father did not beat him, however, but tried to pacify him by playing ball in front of him with the pillows of his cot.

[1918b, 3518]
I do not know how often parents and educators, faced with inexplicable naughtiness on the part of a child, might not have occasion to bear this typical state of affairs in mind. A child who behaves in this unmanageable way is making a confession and trying to provoke punishment. He hopes for a beating as a simultaneous means of setting his sense of guilt at rest and of satisfying his masochistic sexual trend.
[1918b, 3519]

We have been led unawares into a consideration of the symptoms of the later years of the obsessional neurosis; and we shall therefore pass over the occurrences of the intervening period and shall proceed to describe its termination. We already know that, apart from its permanent strength, it underwent occasional intensifications: once - though the episode must for the present remain obscure to us - at the time of the death of a boy living in the same street, with whom he was able to identify himself. When he was ten years old he had a German tutor, who very soon obtained a great influence over him. It is most instructive to observe that the whole of his strict piety dwindled away, never to be revived, after he had noticed and had learnt from enlightening conversations with his tutor that this father surrogate attached no importance to piety and set no store by the truth of religion. His piety sank away along with his dependence upon his father, who was now replaced by a new and more sociable father. This did not take place, however, without one last flicker of the obsessional neurosis; and from this he particularly remembered the obsession of having to think of the Holy Trinity whenever he saw three heaps of dung lying together in the road. In fact he never gave way to fresh ideas without making one last attempt at clinging to what had lost its values for him. When his tutor discouraged him from his cruelties to small animals he did indeed put an end to those misdeeds, but not until he had again cut up caterpillars for a last time to his thorough satisfaction. He still behaved in just the same way during the analytic treatment, for he showed a habit of producing transitory 'negative reactions'; every time something had been conclusively cleared up, he attempted to contradict the effect for a short while by an aggravation of the symptom which had been cleared up. It is quite the rule, as we know, for children to treat prohibitions in the same kind of way. When they have been rebuked for something (for instance, because they are making an unbearable din), they repeat it once more after the prohibition before stopping it. In this way they gain the point of apparently stopping of their own accord and of disobeying the prohibition.
[1918b, 3551]
When his Christmas dream, with its excitement and expectancy, conjured up before him the picture of the sexual intercourse of his parents as it had once been observed (or construed) by him, there can be no doubt that the first view of it to come up was the old one, according to which the part of the female body which received the male organ was the anus. And, indeed, what else could he have supposed when at the age of one and a half he was a spectator of the scene?¹ But now came the new event that occurred when he was four years old. What he had learnt in the meantime, the allusions which he had heard to castration, awoke and cast a doubt on the ‘cloacal theory’; they brought to his notice the difference between the sexes and the sexual part played by women. In this contingency he behaved as children in general behave when they are given an unwished for piece of information - whether sexual or of any other kind. He rejected what was new (in our case from motives connected with his fear of castration) and clung fast to what was old. He decided in favour of the intestine and against the vagina, just as, for similar motives, he later on took his father’s side against God. He rejected the new information and clung to the old theory. The latter must have provided the material for his identification with women, which made its appearance later as a dread of death in connection with the bowels, and for his first religious scruples, about whether Christ had had a behind, and so on. It is not that his new insight remained without any effect; quite the reverse. It developed an extraordinarily powerful effect, for it became a motive for keeping the whole process of the dream under repression and for excluding it from being worked over later in consciousness. But with that its effect was exhausted; it had no influence in deciding the sexual problem. That it should have been possible from that time onwards for a fear of castration to exist side by side with an identification with women by means of the bowel admittedly involved a contradiction. But it was only a logical contradiction - which is not saying much. On the contrary, the whole process is characteristic of the way in which the unconscious works. A repression is something very different from a condemning judgement.

¹[1918b, 3561]

Room must also be found in the interval between the primal scene and the seduction (from the age of one and a half to the age of three and a quarter) for the dumb water-carrier. He served the patient as a father-surrogate just as Grusha served him as a mother-surrogate. I do not think there is any justification for regarding this as an example of the intention to debase, even though it is true that both parents have come to be represented by servants. A child pays no regard to social distinctions, which have little meaning for him as yet; and he classes people of inferior rank with his parents if such people love him as his parents do. Nor is the intention to debase any more responsible for the substitution of animals for a child’s parents, for children are very far indeed from taking a disparaging view of animals. Uncles and aunts are used as parent-surrogates without any regard to the question of debasing, and this was in fact done by our present patient, as many of his recollections showed.

¹[1918b, 3578]

All this would be very nice, if only the unlucky wretch had not had a dream when he was no more than four years old, which signalized the beginning of his neurosis, which was instigated by his grandfather’s story of the tailor and the wolf, and the interpretation of which necessitates the assumption of this primal scene. All the alleviations which the theories of Jung and Adler seek to afford us come to grief, alas, upon such paltry but unimpeachable facts as these. As things stand, it seems to me more probable that the phantasy of re-birth was a derivative of the primal scene than that, conversely, the primal scene was a reflection of the phantasy of re-birth. And we may perhaps suppose, too, that the patient, at a time only four years after his birth, may after all have been too young to be already wishing to be born again. But no, I must take this last argument back; for my own observations show that we have rated the powers of children too low and that there is no knowing what they cannot be given credit for.
I admit that this is the most delicate question in the whole domain of psycho-analysis. I did not require the contributions of Adler or Jung to induce me to consider the matter with a critical eye, and to bear in mind the possibility that what analysis puts forward as being forgotten experiences of childhood (and of an improbably early childhood) may on the contrary be based upon phantasies created on occasions occurring late in life. According to this view, wherever we seemed in analyses to see traces of the after-effects of an infantile impression of the kind in question, we should rather have to assume that we were faced by the manifestation of some constitutional factor or of some disposition that had been phylogenetically maintained. On the contrary, no doubt has troubled me more; no other uncertainty has been more decisive in holding me back from publishing my conclusions. I was the first - a point to which none of my opponents have referred - to recognize both the part played by phantasies in symptom-formation and also the ‘retrospective phantasying’ of late impressions into childhood and their sexualization after the event. (See my Interpretation of Dreams (1900a), First Edition, p. 559, and ‘Notes upon a Case of Obsessional Neurosis’, (1909d).) If, in spite of this, I have held to the more difficult and more improbable view, it has been as a result of arguments such as are forced upon the investigator by the case described in these pages or by any other infantile neurosis - arguments which I once again lay before my readers for their decision.

The case itself was not a particularly favourable one. The advantage of having a wealth of information about the patient's childhood (an advantage which was made possible by the fact that the child could be studied through the medium of the adult) had to be purchased at the expense of the analysis being most terribly disjointed and of the exposition showing corresponding gaps. Personal peculiarities in the patient and a national character that was foreign to ours made the task of feeling one's way into his mind a laborious one. The contrast between the patient's agreeable and affable personality, his acute intelligence and his nicemindedness on the one hand, and his completely unbridled instinctual life on the other, necessitated an excessively long process of preparatory education, and this made a general perspective more difficult. But the patient himself has no responsibility for that feature of the case which put the severest obstacles in the way of any description of it. In the psychology of adults we have fortunately reached the point of being able to divide mental processes into conscious and unconscious and of being able to give a clearly-worded description of both. With children this distinction leaves us almost completely in the lurch. It is often embarrassing to decide what one would choose to call conscious and what unconscious. Processes which have become the dominant ones, and which from their subsequent behaviour must be equated with conscious ones, have nevertheless not been conscious in the child. It is easy to understand why. In children the conscious has not yet acquired all its characteristics; it is still in process of development, and it does not as yet fully possess the capacity for transposing itself into verbal images. We are constantly guilty of making a confusion between the phenomenon of emergence as a perception in consciousness and the fact of belonging to a hypothetical psychical system to which we ought to assign some conventional name, but which we in fact also call 'consciousness’ (the system Cs.). This confusion does no harm when we are giving a psychological description of an adult, but it is misleading when we are dealing with that of a young child. Nor should we be much assisted here if we introduced the 'preconscious'; for a child's preconscious may, in just the same way, fail to coincide with an adult's. We must be content, therefore, with having clearly recognized the obscurity.

What I have been trying to describe in this outline is the libido theory of the neuroses, upon which are founded all our conceptions of the nature of these morbid states, together with our therapeutic measures for relieving them. We naturally regard the premises of the libido theory as valid for normal behaviour as well. We speak of the narcissism of small children, and it is to the excessive narcissism of primitive man that we ascribe his belief in the omnipotence of his thoughts and his consequent attempts to influence the course of events in the external world by the technique of magic.
(b) In the course of the development of civilization man acquired a dominating position over his fellow-creatures in the animal kingdom. Not content with this supremacy, however, he began to place a gulf between his nature and theirs. He denied the possession of reason to them, and to himself he attributed an immortal soul, and made claims to a divine descent which permitted him to break the bond of community between him and the animal kingdom. Curiously enough, this piece of arrogance is still foreign to children, just as it is to primitive and primaeval man. It is the result of a later, more pretentious stage of development. At the level of totemism primitive man had no repugnance to tracing his descent from an animal ancestor. In myths, which contain the precipitate of this ancient attitude of mind, the gods take animal shapes, and in the art of earliest times they are portrayed with animals' heads. A child can see no difference between his own nature and that of animals. He is not astonished at animals thinking and talking in fairy-tales; he will transfer an emotion of fear which he feels for his human father onto a dog or a horse, without intending any derogation of his father by it. Not until he is grown up does he become so far estranged from animals as to use their names in vilification of human beings.

[1917a, 3611]

We shall venture, therefore, to refer the uncanny effect of the Sand-Man to the anxiety belonging to the castration complex of childhood. But having reached the idea that we can make an infantile factor such as this responsible for feelings of uncanniness, we are encouraged to see whether we can apply it to other instances of the uncanny. We find in the story of the Sand-Man the other theme on which Jentsch lays stress, of a doll which appears to be alive. Jentsch believes that a particularly favourable condition for awakening uncanny feelings is created when there is intellectual uncertainty whether an object is alive or not, and when an inanimate object becomes too much like an animate one. Now, dolls are of course rather closely connected with childhood life. We remember that in their early games children do not distinguish at all sharply between living and inanimate objects, and that they are especially fond of treating their dolls like live people. In fact, I have occasionally heard a woman patient declare that even at the age of eight she had still been convinced that her dolls would be certain to come to life if she were to look at them in a particular, extremely concentrated, way. So that here, too, it is not difficult to discover a factor from childhood. But, curiously enough, while the Sand-Man story deals with the arousing of an early childhood fear, the idea of a 'living doll' excites no fear at all; children have no fear of their dolls coming to life, they may even desire it. The source of uncanny feelings would not, therefore, be an infantile fear in this case, but rather an infantile wish or even merely an infantile belief. There seems to be a contradiction here; but perhaps it is only a complication, which may be helpful to us later on.

[1919h, 3685]

The theme of the 'double' has been very thoroughly treated by Otto Rank (1914). He has gone into the connections which the 'double' has with reflections in mirrors, with shadows, with guardian spirits, with the belief in the soul and with the fear of death; but he also lets in a flood of light on the surprising evolution of the idea. For the 'double' was originally an insurance against the destruction of the ego, an 'energetic denial of the power of death', as Rank says; and probably the 'immortal' soul was the first 'double' of the body. This invention of doubling as a preservation against extinction has its counterpart in the language of dreams, which is fond of representing castration by a doubling or multiplication of a genital symbol. The same desire led the Ancient Egyptians to develop the art of making images of the dead in lasting materials. Such ideas, however, have sprung from the soil of unbounded self-love, from the primary narcissism which dominates the mind of the child and of primitive man. But when this stage has been surmounted, the 'double' reverses its aspect. From having been an assurance of immortality, it becomes the uncanny harbinger of death.

[1919h, 3687]
The same extreme and unmeasured intensification of every emotion is also a feature of the affective life of children, and it is present as well in dream life. Thanks to the isolation of the single emotions in the unconscious, a slight annoyance during the day will express itself in a dream as a wish for the offending person's death, or a breath of temptation may give the impetus to the portrayal in the dream of a criminal action. Hanns Sachs has made an appropriate remark on this point: 'If we look in our consciousness at something that has been told us by a dream about a contemporary (real) situation, we ought not to be surprised to find that the monster which we saw under the magnifying glass of analysis turns out to be a tiny infusorian.'

Some other features in Le Bon's description show in a clear light how well justified is the identification of the group mind with the mind of primitive people. In groups the most contradictory ideas can exist side by side and tolerate each other, without any conflict arising from the logical contradiction between them. But this is also the case in the unconscious mental life of individuals, of children and of neurotics, as psycho-analysis has long pointed out.

In young children, for instance, ambivalent emotional attitudes towards those who are nearest to them exist side by side for a long time, without either of them interfering with the expression of the other and opposite one. If eventually a conflict breaks out between the two, it is often settled by the child making a change of object and displacing one of the ambivalent emotions on to a substitute. The history of the development of a neurosis in an adult will also show that a suppressed emotion may frequently persist for a long time in unconscious or even in conscious phantasies, the content of which naturally runs directly counter to some predominant tendency, and yet that this opposition does not result in any proceedings on the part of the ego against what it has repudiated. The phantasy is tolerated for quite a long time, until suddenly one day, usually as a result of an increase in the affective cathexis of the phantasy, a conflict breaks out between it and the ego with all the usual consequences. In the process of a child's development into a mature adult there is a more and more extensive integration of his personality, a co-ordination of the separate instinctual impulses and purposive trends which have grown up in him independently of one another. The analogous process in the domain of sexual life has long been known to us as the co-ordination of all the sexual instincts into a definitive genital organization. (Three Essays on the Theory of Sexuality, 1905d.) Moreover, that the unification of the ego is liable to the same interferences as that of the libido is shown by numerous familiar instances, such as that of men of science who have preserved their faith in the Bible, and other similar cases. - The various possible ways in which the ego can later disintegrate form a special chapter in psychopathology.

It is true that it is by no means easy to demonstrate the traces of this satanic view of the father in the mental life of the individual. When a boy draws grotesque faces and caricatures, we may no doubt be able to show that he is jeering at his father in them; and when a person of either sex is afraid of robbers and burglars at night, it is not hard to recognize these as split off portions of the father.¹ The animals, too, which appear in children's animal phobias are most often father-substitutes, as were the totem animals of primaeval times. But that the Devil is a duplicate of the father and can act as a substitute for him has not been shown so clearly elsewhere as in the demonological neurosis of this seventeenth-century painter. That is why, at the beginning of this paper, I foretold that a demonological case history of this kind would yield in the form of pure metal material which, in the neuroses of a later epoch (no longer superstitious but hypochondriacal instead) has to be laboriously extracted by analytic work from the ore of free associations and symptoms.² A deeper penetration into the analysis of our painter's illness will probably bring stronger conviction. It is no unusual thing for a man to acquire a melancholic depression and an inhibition in his work as a result of his father's death. When this happens, we conclude that the man had been attached to his father with an especially strong love, and we remember how often a severe melancholia appears as a neurotic form of mourning.
Among the observations made by psycho-analysis of the mental life of children there is scarcely one which sounds so repugnant and unbelievable to a normal adult as that of a boy’s feminine attitude to his father and the phantasy of pregnancy that arises from it. It is only since Senatspräsident Daniel Paul Schreber, a judge presiding over a division of the Appeal Court of Saxony, published the history of his psychotic illness and his extensive recovery from it,¹ that we can discuss the subject without trepidation or apology. We learn from this invaluable book that, somewhere about the age of fifty, the Senatspräsident became firmly convinced that God - who, incidentally, exhibited distinct traits of his father, the worthy physician, Dr. Schreber - had decided to emasculate him, to use him as a woman, and to beget from him 'a new race of men born from the spirit of Schreber'. (His own marriage was childless.) In his revolt against this intention of God's, which seemed to him highly unjust and 'contrary to the Order of Things', he fell ill with symptoms of paranoia, which, however, underwent a process of involution in the course of years, leaving only a small residue behind. The gifted author of his own case history could not have guessed that in it he had uncovered a typical pathogenic factor.

[1923d, 4015]

Here what has been named the masculinity complex of women branches off. It may put great difficulties in the way of their regular development towards femininity, if it cannot be got over soon enough. The hope of some day obtaining a penis in spite of everything and so of becoming like a man may persist to an incredibly late age and may become a motive for strange and otherwise unaccountable actions. Or again, a process may set in which I should like to call a 'disavowal', a process which in the mental life of children seems neither uncommon nor very dangerous but which in an adult would mean the beginning of a psychosis. Thus a girl may refuse to accept the fact of being castrated, may harden herself in the conviction that she does possess a penis, and may subsequently be compelled to behave as though she were a man.

[1925j, 4151]

We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

[1925d, 4221]
So far there seem to be no connecting links between 'Little Hans’s' repressed instinctual impulse and the substitute for it which we suspect is to be seen in his phobia of horses. Let us simplify his psychical situation by setting on one side the infantile factor and the ambivalence. Let us imagine that he is a young servant who is in love with the mistress of the house and has received some tokens of her favour. He hates his master, who is more powerful than he is, and he would like to have him out of the way. It would then be eminently natural for him to dread his master's vengeance and to develop a fear of him - just as 'Little Hans' developed a phobia of horses. We cannot, therefore, describe the fear belonging to this phobia as a symptom. If 'Little Hans', being in love with his mother, had shown fear of his father, we should have no right to say that he had a neurosis or a phobia. His emotional reaction would have been entirely comprehensible. What made it a neurosis was one thing alone: the replacement of his father by a horse. It is this displacement, then, which has a claim to be called a symptom, and which, incidentally, constitutes the alternative mechanism which enables a conflict due to ambivalence to be resolved without the aid of a reaction-formation. Such a displacement is made possible or facilitated at 'Little Hans’s' early age because the inborn traces of totemic thought can still be easily revived. Children do not as yet recognize or, at any rate, lay such exaggerated stress upon the gulf that separates human beings from the animal world. In their eyes the grown man, the object of their fear and admiration, still belongs to the same category as the big animal who has so many enviable attributes but against whom they have been warned because he may become dangerous. As we see, the conflict due to ambivalence is not dealt with in relation to one and the same person: it is circumvented, as it were, by one of the pair of conflicting impulses being directed to another person as a substitutive object.

[1926d, 4263]

The idea of being devoured by the father is typical age-old childhood material. It has familiar parallels in mythology (e.g. the myth of Kronos) and in the animal kingdom. Yet in spite of this confirmation the idea is so strange to us that we can hardly credit its existence in a child. Nor do we know whether it really means what it seems to say, and we cannot understand how it can have become the subject of a phobia. Analytic observation supplies the requisite information. It shows that the idea of being devoured by the father gives expression, in a form that has undergone regressive degradation, to a passive, tender impulse to be loved by him in a genital-erotic sense. Further investigation of the case history leaves no doubt of the correctness of this explanation. The genital impulse, it is true, betrays no sign of its tender purpose when it is expressed in the language belonging to the superseded transitional phase between the oral and sadistic organizations of the libido. Is it, moreover, a question merely of the replacement of the representative by a regressive form of expression or is it a question of a genuine regressive degradation of the genitally-directed impulse in the id? It is not at all easy to make certain. The case history of the Russian 'Wolf Man' gives very definite support to the second, more serious, view; for, from the time of the decisive dream onward, the boy became naughty, tormenting and sadistic, and soon afterwards developed a regular obsessional neurosis. At any rate, we can see that repression is not the only means which the ego can employ for the purpose of defence against an unwelcome instinctual impulse. If it succeeds in making an instinct regress, it will actually have done it more injury than it could have by repressing it. Sometimes, indeed, after forcing an instinct to regress in this way, it goes on to repress it.

[1926d, 4265]
The progress which the child makes in its development - its growing independence, the sharper division of its mental apparatus into several agencies, the advent of new needs - cannot fail to exert an influence upon the content of the danger situation. We have already traced the change of that content from loss of the mother as an object to castration. The next change is caused by the power of the super-ego. With the depersonalization of the parental agency from which castration was feared, the danger becomes less defined. Castration anxiety develops into moral anxiety - social anxiety - and it is not so easy now to know what the anxiety is about. The formula, 'separation and expulsion from the horde', only applies to that later portion of the super-ego which has been formed on the basis of social prototypes, not to the nucleus of the super-ego, which corresponds to the introjected parental agency. Putting it more generally, what the ego regards as the danger and responds to with an anxiety-signal is that the super-ego should be angry with it or punish it or cease to love it. The final transformation which the fear of the super-ego undergoes is, it seems to me, the fear of death (or fear for life) which is a fear of the super-ego projected on to the powers of destiny.

Why this should be so calls for a rather long reply. First of all, we must sift the facts. In a great number of cases the old determinants of anxiety do really lapse, after having produced neurotic reactions. The phobias of very young children, fears of being alone or in the dark or with strangers - phobias which can almost be called normal - usually pass off later on; the child 'grows out of them', as we say about some other disturbances of childhood. Animal phobias, which are of such frequent occurrence, undergo the same fate and many conversion hysterias of early years find no continuation in later life. Ceremonial actions appear extremely often in the latency period, but only a very small percentage of them develop later into a full obsessional neurosis. In general, so far as we can tell from our observations of town children belonging to the white races and living according to fairly high cultural standards, the neuroses of childhood are in the nature of regular episodes in a child's development, although too little attention is still being paid to them. Signs of childhood neuroses can be detected in all adult neurotics without exception; but by no means all children who show those signs become neurotic in later life. It must be, therefore, that certain determinants of anxiety are relinquished and certain danger-situations lose their significance as the individual becomes more mature. Moreover, some of these danger-situations manage to survive into later times by modifying their determinants of anxiety so as to bring them up to date. Thus, for instance, a man may retain his fear of castration in the guise of a syphilidophobia, after he has come to know that it is no longer customary to castrate people for indulging their sexual lusts, but that, on the other hand, severe diseases may overtake anyone who thus gives way to his instincts. Other determinants of anxiety, such as fear of the super-ego, are destined not to disappear at all but to accompany people throughout their lives. In that case the neurotic will differ from the normal person in that his reactions to the dangers in question will be unduly strong. Finally, being grown-up affords no absolute protection against a return of the original traumatic anxiety-situation. Each individual has in all probability a limit beyond which his mental apparatus fails in its function of mastering the quantities of excitation which require to be disposed of.

[1926d, 4302]
Taking this sequence, anxiety - danger - helplessness (trauma), we can now summarize what has been said. A danger-situation is a recognized, remembered, expected situation of helplessness. Anxiety is the original reaction to helplessness in the trauma and is reproduced later on in the danger-situation as a signal for help. The ego, which experienced the trauma passively, now repeats it actively in a weakened version, in the hope of being able itself to direct its course. It is certain that children behave in this fashion towards every distressing impression they receive, by reproducing it in their play. In thus changing from passivity to activity they attempt to master their experiences psychically. If this is what is meant by 'abreacting a trauma' we can no longer have anything to urge against the phrase. But what is of decisive importance is the first displacement of the anxiety-reaction from its origin in the situation of helplessness to an expectation of that situation - that is, to the danger-situation. After that come the later displacements, from the danger to the determinant of the danger - loss of the object and the modifications of that loss with which we are already acquainted.

[1926d, 4319]

The undesirable result of 'spoiling' a small child is to magnify the importance of the danger of losing the object (the object being a protection against every situation of helplessness) in comparison with every other danger. It therefore encourages the individual to remain in the state of childhood, the period of life which is characterized by motor and psychical helplessness.

[1926d, 4319]

On the other hand, the external (real) danger must also have managed to become internalized if it is to be significant for the ego. It must have been recognized as related to some situation of helplessness that has been experienced.¹ Man seems not to have been endowed, or to have been endowed to only a very small degree, with an instinctive recognition of the dangers that threaten him from without. Small children are constantly doing things which endanger their lives, and that is precisely why they cannot afford to be without a protecting object. In relation to the traumatic situation, in which the subject is helpless, external and internal dangers, real dangers and instinctual demands converge. Whether the ego is suffering from a pain which will not stop or experiencing an accumulation of instinctual needs which cannot obtain satisfaction, the economic situation is the same, and the motor helplessness of the ego finds expression in psychical helplessness.

[1926d, 4320]

You will be no less surprised to hear that male children suffer from a fear of being robbed of their sexual organ by their father, so that this fear of being castrated has a most powerful influence on the development of their character and in deciding the direction to be followed by their sexuality. And here again mythology may give you the courage to believe psycho-analysis. The same Kronos who swallowed his children also emasculated his father Uranus, and was afterwards himself emasculated in revenge by his son Zeus, who had been rescued though his mother's cunning. If you have felt inclined to suppose that all that psycho-analysis reports about the early sexuality of children is derived from the disordered imagination of the analysts, you must at least admit that their imagination has created the same product as the imaginative activities of primitive man, of which myths and fairy tales are the precipitate. The alternative friendlier, and probably also the more pertinent view would be that in the mental life of children to-day we can still detect the same archaic factors which were once dominant generally in the primaeval days of human civilization. In his mental development the child would be repeating the history of his race in an abbreviated form, just as embryology long since recognized was the case with somatic development.

[1926e, 4354]
It is also characteristic of children that their two excretory needs are cathetered with sexual interest. Later on, education draws a sharp distinction here, which is once more obliterated in the practice of joking. It may seem to us an unsavoury fact, but it takes quite a long time for children to develop feelings of disgust. This is not disputed even by people who insist otherwise on the seraphic purity of the child's mind. [1926e, 4355]

It can be done very well. It is hardly to be believed what goes on in a child of four or five years old. Children are very active-minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupider. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreprouachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians to-day, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition. [1926e, 4357]

It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances. [1926e, 4366]
A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the instinctual impulses of the early sexual period - under this burden, then, our ego takes refuge in repression and lays itself open to a childhood neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate. If life becomes too hard, if the gulf between instinctual claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the instincts tear themselves away from the ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic.

Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.
But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they must be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeble-mindedness' - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

[1927c, 4455]
No doubt you will expect me to give you more than a mere illustration when I inform you that we have found out all kinds of things about the formation of the super-ego - that is to say, about the origin of conscience. Following a well-known pronouncement of Kant's which couples the conscience within us with the starry Heavens, a pious man might well be tempted to honour these two things as the masterpieces of creation. The stars are indeed magnificent, but as regards conscience God has done an uneven and careless piece of work, for a large majority of men have brought along with them only a modest amount of it or scarcely enough to be worth mentioning. We are far from overlooking the portion of psychological truth that is contained in the assertion that conscience is of divine origin; but the thesis needs interpretation. Even if conscience is something 'within us', yet it is not so from the first. In this it is a real contrast to sexual life, which is in fact there from the beginning of life and not only a later addition. But, as is well known, young children are amoral and possess no internal inhibitions against their impulses striving for pleasure. The part which is later taken on by the super-ego is played to begin with by an external power, by parental authority. Parental influence governs the child by offering proofs of love and by threatening punishments which are signs to the child of loss of love and are bound to be feared on their own account. This realistic anxiety is the precursor of the later moral anxiety. So long as it is dominant there is no need to talk of a super-ego and of a conscience. It is only subsequently that the secondary situation develops (which we are all too ready to regard as the normal one), where the external restraint is internalized and the super-ego takes the place of the parental agency and observes, directs and threatens the ego in exactly the same way as earlier the parents did with the child.

If only because the inferiority complex has become so popular, I will venture to entertain you here with a short digression. A historical personality of our own days, who is still alive though at the moment he has retired into the background, suffers from a defect in one of his limbs owing to an injury at the time of his birth. A very well-known contemporary writer who is particularly fond of compiling the biographies of celebrities has dealt, among others, with the life of the man I am speaking of. Now in writing a biography it may well be difficult to suppress a need to plumb the psychological depths. For this reason our author has ventured on an attempt to erect the whole of the development of his hero's character on the sense of inferiority which must have been called up by his physical defect. In doing so, he has overlooked one small but not insignificant fact. It is usual for mothers whom Fate has presented with a child who is sickly or otherwise at a disadvantage to try to compensate him for his unfair handicap by a superabundance of love. In the instance before us, the proud mother behaved otherwise; she withdrew her love from the child on account of his infirmity. When he had grown up into a man of great power, he proved unambiguously by his actions that he had never forgiven his mother. When you consider the importance of a mother's love for the mental life of a child, you will no doubt make a tacit correction of the biographer's inferiority theory.

[1933a, 4670]
The next accusation against the child's mother flares up when the next baby appears in the nursery. If possible the connection with oral frustration is preserved: the mother could not or would not give the child any more milk because she needed the nourishment for the new arrival. In cases in which the two children are so close in age that lactation is prejudiced by the second pregnancy, this reproach acquires a real basis, and it is a remarkable fact that a child, even with an age difference of only 11 months, is not too young to take notice of what is happening. But what the child grudges the unwanted intruder and rival is not only the suckling but all the other signs of maternal care. It feels that it has been dethroned, despoiled, prejudiced in its rights; it casts a jealous hatred upon the new baby and develops a grievance against the faithless mother which often finds expression in a disagreeable change in its behaviour. It becomes 'naughty', perhaps, irritable and disobedient and goes back on the advances it has made towards controlling its excretions. All of this has been very long familiar and is accepted as self-evident; but we rarely form a correct idea of the strength of these jealous impulses, of the tenacity with which they persist and of the magnitude of their influence on later development. Especially as this jealousy is constantly receiving fresh nourishment in the later years of childhood and the whole shock is repeated with the birth of each new brother or sister. Nor does it make much difference if the child happens to remain the mother's preferred favourite. A child's demands for love are immoderate, they make exclusive claims and tolerate no sharing. [1933a, 4725]

We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no super-ego, the method of free association does not carry far with him, transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis - and even the analysis itself - is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child-analysis. It has automatically happened that child-analysis has become the domain of women analysts, and no doubt this will remain true. [1933a, 4748]
Rank's researches have made us acquainted with the source and purpose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent-child relationship is represented in countless dreams by pulling out of the water or rescuing from the water. When a people's imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his father. A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth - the aristocratic one and the humble one - are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

[1939a, 4843]

The first decisive step towards a change in this sort of 'social' organization seems to have been that the expelled brothers, living in a community, united to overpower their father and, as was the custom in those days, devoured him raw. There is no need to balk at this cannibalism; it continued far into later times. The essential point, however, is that we attribute the same emotional attitudes to these primitive men that we are able to establish by analytic investigation in the primitives of the present day - in our children. We suppose, that is, that they not only hated and feared their father but also honoured him as a model, and that each of them wished to take his place in reality. We can, if so, understand the cannibalistic act as an attempt to ensure identification with him by incorporating a piece of him.

[1939a, 4905]
It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of primaeval history purely imaginary would be gravely under-estimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten primaeval age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son's relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations.
This may not seem obvious at first sight, and before it can carry conviction we must recall other processes of the same character in the development of human civilization. The earliest of these and perhaps the most important is merged in the obscurity of primaeval ages. Its astonishing effects compel us to assert its occurrence. In our children, in adults who are neurotic, as well as in primitive peoples, we meet with the mental phenomenon which we describe as a belief in the 'omnipotence of thoughts'. In our judgement this lies in an overestimation of the influence which our mental (in this case, intellectual) acts can exercise in altering the external world. At bottom, all magic, the precursor of our technology, rests on this premise. All the magic of words, too, has its place here, and the conviction of the power which is bound up with the knowledge and pronouncing of a name. The 'omnipotence of thoughts' was, we suppose, an expression of the pride of mankind in the development of speech, which resulted in such an extraordinary advancement of intellectual activities. The new realm of intellectuality was opened up, in which ideas, memories and inferences became decisive in contrast to the lower psychical activity which had direct perceptions by the sense-organs as its content. This was unquestionably one of the most important stages on the path to hominization.

The first effect of meeting the being who had so long been missed and longed for was overwhelming and was like the traditional description of the law-giving from Mount Sinai. Admiration, awe and thankfulness for having found grace in his eyes - the religion of Moses knew none but these positive feelings towards the father-god. The conviction of his irresistibility, the submission to his will, could not have been more unquestioning in the helpless and intimidated son of the father of the horde - indeed those feelings only become fully intelligible when they are transposed into the primitive and infantile setting. A child's emotional impulses are intensely and inexhaustibly deep to a degree quite other than those of an adult; only religious ecstasy can bring them back. A rapture of devotion to God was thus the first reaction to the return of the great father.

So long as the ego works in full harmony with the super-ego it is not easy to distinguish between their manifestations; but tensions and estrangements between them make themselves very plainly visible. The torments caused by the reproaches of conscience correspond precisely to a child's fear of loss of love, a fear the place of which has been taken by the moral agency. On the other hand, if the ego has successfully resisted a temptation to do something which would be objectionable to the super-ego, it feels raised in its self-esteem and strengthened in its pride, as though it had made some precious acquisition. In this way the super-ego continues to play the part of an external world for the ego, although it has become a portion of the internal world. Throughout later life it represents the influence of a person's childhood, of the care and education given him by his parents and of his dependence on them - a childhood which is prolonged so greatly in human beings by a family life in common. And in all this it is not only the personal qualities of these parents that is making itself felt, but also everything that had a determining effect on them themselves, the tastes and standards of the social class in which they lived and the innate dispositions and traditions of the race from which they sprang. Those who have a liking for generalizations and sharp distinctions may say that the external world, in which the individual finds himself exposed after being detached from his parents, represents the power of the present; that his id, with its inherited trends, represents the organic past; and that the super-ego, which comes to join them later, represents more than anything the cultural past, which a child has, as it were, to repeat as an after-experience during the few years of his early life. It is unlikely that such generalizations can be universally correct. Some portion of the cultural acquisitions have undoubtedly left a precipitate behind them in the id; much of what is contributed by the super-ego will awaken an echo in the id; not a few of the child's new experiences will be intensified because they are repetitions of some primaeval phylogenetic experience.
These examples will perhaps be enough to show that dreams which can only be understood as fulfilments of wishes and which bear their meaning upon their faces without disguise are to be found under the most frequent and various conditions. They are mostly short and simple dreams, which afford a pleasant contrast to the confused and exuberant compositions that have in the main attracted the attention of the authorities. Nevertheless, it will repay us to pause for a moment over these simple dreams. We may expect to find the very simplest forms of dreams in children, since there can be no doubt that their psychical productions are less complicated than those of adults. Child psychology, in my opinion, is destined to perform the same useful services for adult psychology that the investigation of the structure or development of the lower animals has performed for research into the structure of the higher classes of animals. Few deliberate efforts have hitherto been made to make use of child psychology for this purpose. [1900a, 625]

Moreover, an examination of these dreams offers advantages from another standpoint. For children's dreams are of that kind - significant and not puzzling. Here, incidentally, we have a further argument against tracing the origin of dreams to dissociated cerebral activity during sleep. For why should a reduction in psychical functioning of this kind be a characteristic of the state of sleep in the case of adults but not in that of children? On the other hand, we shall be fully justified in expecting that an explanation of psychical processes in children, in whom they may well be greatly simplified, may turn out to be an indispensable prelude to the investigation of the psychology of adults. [1901a, 1061]

In any case it may be maintained that analysis of children's neuroses can claim to possess a specially high theoretical interest. They afford us, roughly speaking, as much help towards a proper understanding of the neuroses of adults as do children's dreams in respect to the dreams of adults. Not, indeed, that they are more perspicuous or poorer in elements; in fact, the difficulty of feeling one's way into the mental life of a child makes them set the physician a particularly difficult task. But nevertheless, so many of the later deposits are wanting in them that the essence of the neurosis springs to the eyes with unmistakable distinctness. In the present phase of the battle which is raging round psycho-analysis the resistance to its findings has, as we know, taken on a new form. People were content formerly to dispute the reality of the facts which are asserted by analysis; and for this purpose the best technique seemed to be to avoid examining them. That procedure appears to be slowly exhausting itself; and people are now adopting another plan of recognizing the facts, but of eliminating, by means of twisted interpretations, the consequences that follow from them, so that the critics can still ward off the objectionable novelties as efficiently as ever. The study of children's neuroses exposes the complete inadequacy of these shallow or high-handed attempts at re-interpretation. It shows the predominant part that is played in the formation of neuroses by those libidinal motive forces which are so eagerly disavowed, and reveals the absence of any aspirations towards remote cultural aims, of which the child still knows nothing, and which cannot therefore be of any significance for him. [1918b, 3505]
In the case of children's dreams there should be no difficulty in accepting this statement. The state of sleep or the psychical modification involved in sleep, whatever that may be, is brought about by a resolve to sleep which is either imposed upon the child or is reached on the basis of sensations of fatigue; and it is only made possible by the withholding of stimuli which might suggest to the psychical apparatus aims other than that of sleeping. The means by which external stimuli can be kept off are familiar to us; but what are the means available for controlling internal mental stimuli which set themselves against falling asleep? Let us observe a mother putting her child to sleep. The child gives vent to an unceasing stream of desires: he wants one more kiss, he wants to go on playing. His mother satisfies some of these desires, but uses her authority to postpone others of them to the next day. It is clear that any wishes or needs that may arise have an inhibiting effect upon falling asleep. We all know the amusing story told by Balduin Groller of the bad little boy who woke up in the middle of the night and shouted across the night nursery: 'I want the rhino!' A better behaved child, instead of shouting, would have dreamt that he was playing with the rhino. Since a dream that shows a wish as fulfilled is believed during sleep, it does away with the wish and makes sleep possible. It cannot be disputed that dream-images are believed in this way, for they are clothed in the psychical appearance of perceptions, and children have not yet acquired the later faculty of distinguishing hallucinations or phantasies from reality.
[1901a, 1091]

Adults have learnt to make this distinction; they have also grasped the uselessness of wishing, and after lengthy practice know how to postpone their desires until they can find satisfaction by the long and roundabout path of altering the external world. In their case, accordingly, wish-fulfilments along the short psychical path are rare in sleep too; it is even possible, indeed, that they never occur at all, and that anything that may seem to us to be constructed on the pattern of a child's dream in fact requires a far more complicated solution. On the other hand, in the case of adults - and this no doubt applies without exception to everyone in full possession of his senses - a differentiation has occurred in the psychical material, which was not present in children. A psychical agency has come into being, which, taught by experience of life, exercises a dominating and inhibiting influence upon mental impulses and maintains that influence with jealous severity, and which, owing to its relation to consciousness and to voluntary movement, is armed with the strongest instruments of psychical power. A portion of the impulses of childhood has been suppressed by this agency as being useless to life, and any thought-material derived from those impulses is in a state of repression.
[1901a, 1092]
Children are in an analogous psychical situation, though their motor efficiency is still undeveloped. I have elsewhere (1911b) put forward the hypothesis that, to begin with, they satisfy their wishes in a hallucinatory manner, that is, they create a satisfying situation by means of centrifugal excitations of their sense organs. An adult primitive man has an alternative method open to him. His wishes are accompanied by a motor impulse, the will, which is later destined to alter the whole face of the earth in order to satisfy his wishes. This motor impulse is at first employed to give a representation of the satisfying situation in such a way that it becomes possible to experience the satisfaction by means of what might be described as motor hallucinations. This kind of representation of a satisfied wish is quite comparable to children's play, which succeeds their earlier purely sensory technique of satisfaction. If children and primitive men find play and imitative representation enough for them, that is not a sign of their being unassuming in our sense or of their resignedly accepting their actual impotence. It is the easily understandable result of the paramount virtue they ascribe to their wishes, of the will that is associated with those wishes and of the methods by which those wishes operate. As time goes on, the psychological accent shifts from the motives for the magical act on to the measures by which it is carried out - that is, on to the act itself. (It would perhaps be more correct to say that it is only these measures that reveal to the subject the excessive valuation which he attaches to his psychical acts.) It thus comes to appear as though it is the magical act itself which, owing to its similarity with the desired result, alone determines the occurrence of that result. There is no opportunity, at the stage of animistic thinking, for showing any objective evidence of the true state of affairs. But a possibility of doing so does arrive at a later time. When, though all of these procedures are still being carried out, the psychical phenomenon of doubt has begun to emerge as an expression of a tendency to repression. At that point, men will be ready to admit that conjuring up spirits has no result unless it is accompanied by faith, and that the magical power of prayer fails if there is no piety at work behind it.¹

[1912-1913, 2727]
Adults have learnt to make this distinction; they have also grasped the uselessness of wishing, and after lengthy practice know how to postpone their desires until they can find satisfaction by the long and roundabout path of altering the external world. In their case, accordingly, wish-fulfilments along the short psychical path are rare in sleep too; it is even possible, indeed, that they never occur at all, and that anything that may seem to us to be constructed on the pattern of a child's dream in fact requires a far more complicated solution. On the other hand, in the case of adults - and this no doubt applies without exception to everyone in full possession of his senses - a differentiation has occurred in the psychical material, which was not present in children. A psychical agency has come into being, which, taught by experience of life, exercises a dominating and inhibiting influence upon mental impulses and maintains that influence with jealous severity, and which, owing to its relation to consciousness and to voluntary movement, is armed with the strongest instruments of psychical power. A portion of the impulses of childhood has been suppressed by this agency as being useless to life, and any thought-material derived from those impulses is in a state of repression. [1901a, 1092]
Here is the material relating to the two childhood scenes which I have promised my readers. I had bought a new trunk for the journey, of a brownish violet colour. This colour appears more than once in the dream: the violet-brown violets made of a stiffish material and beside them a thing known as a ‘Mädchenfänger’ ['girl-catcher'] - and the furniture in the ministerial apartments. It is commonly believed by children that people are struck by anything new. The following scene from my childhood has been described to me, and my memory of the description has taken the place of my memory of the scene itself. It appears that when I was two years old I still occasionally wetted the bed, and when I was reproached for this I consoled my father by promising to buy him a nice new red bed in N., the nearest town of any size. This was the origin of the parenthetical phrase in the dream to the effect that we bought or had to buy the urinal in town: one must keep one's promises. (Notice, too, the juxtaposition in symbolism of the male urinal and the female trunk or box.) This promise of mine exhibited all the megalomania of childhood. We have already come across the significant part played in dreams by children's difficulties in connection with micturition (cf. the dream reported on p. 685). We have also learned from the psycho-analysis of neurotic subjects the intimate connection between bed-wetting and the character trait of ambition.

Let us take one of the dreams I have already recorded - for instance, the one in which my friend Otto appeared with the signs of Graves' disease. (See p. 746 ff.) I had been worried during the previous day by Otto's looks; and, like everything else concerned with him, this worry affected me closely. And it pursued me, as I may assume, into my sleep. I was probably anxious to discover what could be wrong with him. This worry found expression during the night in the dream I have described, the content of which was in the first place nonsensical and in the second place was in no respect the fulfilment of a wish. I then began to investigate the origin of this inappropriate expression of the worry I had felt during the day, and by means of analysis I found a connection through the fact of my having identified my friend with a certain Baron L. and myself with Professor R. There was only one explanation of my having been obliged to choose this particular substitute for my daytime thought. I must have been prepared at all times in my Ucs. to identify myself with Professor R., since by means of that identification one of the immortal wishes of childhood - the megalomaniac wish - was fulfilled. Ugly thoughts hostile to my friend, which were certain to be repudiated during the day, had seized the opportunity of slipping through with the wish and getting themselves represented in the dream; but my daytime worry had also found some sort of expression in the content of the dream by means of a substitute. The daytime thought, which was not in itself a wish but on the contrary a worry, was obliged to find a connection in some way or other with an infantile wish which was now unconscious and suppressed, and which would enable it - suitably decocted, it is true - to 'originate' in consciousness. The more dominating was the worry, the more far-fetched a link could be established; there was no necessity for there being any connection whatever between the content of the wish and that of the worry, and in fact no such connection existed in our example.

¹ I will only briefly allude here to the fact that the original narcissism of children has a decisive influence upon our view of the development of their character and excludes the possibility of their having any primary sense of inferiority.

[1900a, 697]

[1900a, 988]

[1912-1913, 2733]
We will keep to wishes forgetting rid of someone, which may for the most part be attributed to the dreamer's unrestricted egoism. A wish of this kind can very often be pointed to as the constructor of a dream. Whenever anyone in the course of one's life gets in one's way - and how often this must happen in view of the complication of one's relationships in life! - a dream is promptly ready to kill that person, even if it be father or mother, brother or sister, husband or wife. This wickedness of human nature came as a great surprise to us and we were decidedly disinclined to accept this outcome of dream-interpretation without question. But as soon as we were led to look for the origin of these wishes in the past, we discovered the period of the individual's past in which there was no longer anything strange in such egoism and such wishful impulses, directed even against his closest relatives. It is children, and precisely in those earliest years which are later veiled by amnesia, who often exhibit this egoism to an extremely marked degree and who invariably show clear rudiments or, more correctly speaking, residues of it. Children love themselves first, and it is only later that they learn to love others and to sacrifice something of their own ego to others. Even those people whom a child seems to love from the beginning are loved by him at first because he needs them and cannot do without them - once again from egoistic motives. Not until later does the impulse to love make itself independent of egoism. It is literally true that his egoism has taught him to love. [1916-1917, 3292]
In the case of our dream we are in a position to indicate the material upon which the misinterpretation is based. The impostor is the dream and the Emperor is the dreamer himself; the moralizing purpose of the dream reveals an obscure knowledge of the fact that the latent dream-content is concerned with forbidden wishes that have fallen victim to repression. For the context in which dreams of this sort appear during my analyses of neurotics leaves no doubt that they are based upon memories from earliest childhood. It is only in our childhood that we are seen in inadequate clothing both by members of our family and by strangers - nurses, maidservants, and visitors; and it is only then that we feel no shame at our nakedness.¹ We can observe how undressing has an almost intoxicating effect on many children even in their later years, instead of making them feel ashamed. They laugh and jump about and slap themselves, while their mother, or whoever else may be there, reproves them and says: 'Ugh! Shocking! You mustn't ever do that!' Children frequently manifest a desire to exhibit. One can scarcely pass through a country village in our part of the world without meeting some child of two or three who lifts up his little shirt in front of one - in one's honour, perhaps. One of my patients has a conscious memory of a scene in his eighth year, when at bed-time he wanted to dance into the next room where his little sister slept, dressed in his night-shirt, but was prevented by his nurse. In the early history of neurotics an important part is played by exposure to children of the opposite sex; in paranoia delusions of being observed while dressing and undressing are to be traced back to experiences of this kind; while among persons who have remained at the stage of perversion there is one class in which this infantile impulse has reached the pitch of a symptom - the class of 'exhibitionists'.

[1900a, 723]
The interpretation of dreams of fire justifies the nursery law which forbids a child to 'play with fire' - so that he shall not wet his bed at night. For in their case, too, there is an underlying recollection of the enuresis of childhood. In my 'Fragment of an Analysis of a Case of Hysteria', I have given a complete analysis and synthesis of a fire dream of this kind in connection with the dreamer's case history, and I have shown what impulses of adult years this infantile material can be used to represent.

[1900a, 852]

Because, as the analysis showed, the most agreeable and satisfying thoughts contributed to bringing the dream about. What at once occurred to me in the analysis were the Augean stables which were cleansed by Hercules. This Hercules was I. The hill and bushes came from Aussee, where my children were stopping at the time. I had discovered the infantile aetiology of the neuroses and had thus saved my own children from falling ill. The seat (except, of course, for the hole) was an exact copy of a piece of furniture which had been given to me as a present by a grateful woman patient. It thus reminded me of how much my patients honoured me. Indeed, even the museum of human excrement could be given an interpretation to rejoice my heart. However much I might be disgusted by it in reality, in the dream it was a reminiscence of the fair land of Italy where, as we all know, the W.C.s in the small towns are furnished in precisely this way. The stream of urine which washed everything clean was an unmistakable sign of greatness. It was in that way that Gulliver extinguished the great fire in Lilliput though incidentally this brought him into disfavour with its tiny queen. But Gargantu, too, Rabelais' superman, revenged himself in the same way on the Parisians by sitting astride on Notre Dame and turning his stream of urine upon the city. It was only on the previous evening before going to sleep that I had been turning over Garnier's illustrations to Rabelais. And, strangely enough, here was another piece of evidence that I was the superman. The platform of Notre Dame was my favourite resort in Paris; every free afternoon I used to clamber about there on the towers of the church between the monsters and the devils. The fact that all the faeces disappeared so quickly under the stream recalled the motto: 'Afflavit et dissipati sunt', which I intended one day to put at the head of a chapter upon the therapy of hysteria.

[1900a, 912]

Finding fault with one's wife, a friendship which has turned into its opposite, a doctor's error in diagnosis, a rebuff by some one with similar interests, borrowing someone else's ideas - it can hardly be accidental that a collection of instances of forgetting, gathered at random, should require me to enter into such distressing subjects in explaining them. On the contrary, I suspect that everyone who is willing to enquire into the motives behind his lapses of memory will be able to record a similar sample list of objectionable subjects. The tendency to forget what is disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless developed with different degrees of strength in different people. It is probable that many instances of disowning which we encounter in our medical work are to be traced to forgetting.¹ It is true that our view of such forgetting limits the distinction between the two forms of behaviour to purely psychological factors and allows us to see in both modes of reaction the expression of the same motive. Of all the numerous examples of the disavowal of unpleasant memories which I have observed on the part of relatives of patients, one remains in my recollection as especially singular. A mother was giving me information about the childhood of her neurotic son, now in his puberty, in the course of which she said that, like his brothers and sisters, he had been a bed-wetter till late on - a fact which is certainly of some significance in the case history of a neurotic patient. A few weeks later, when she was wanting to find out about the progress of the treatment, I had occasion to draw her attention to the signs of a constitutional disposition to illness on the young man's part, and in doing so I referred to the bed-wetting which she had brought out in the anamnesis. To my astonishment she contested this fact in regard both to him and to the other children, and asked me how I could know it. Finally I told her that she herself had informed me a short time before. She must therefore have forgotten it.²

[1901b, 1228]
She knew nothing about it. - "Very well, then; the fear is that if they do they will wet their bed. The antithesis of "water" and "fire" must be at the bottom of this. Perhaps it is believed that they will dream of fire and then try and put it out with water. I cannot say exactly. But I notice that the antithesis of water and fire has been extremely useful to you in the dream. Your mother wanted to save the jewel-case so that it should not be \textit{burnt}; while in the dream-thoughts it is a question of the "jewel-case" not being \textit{wetted}. But fire is not only used as the contrary of water, it also serves directly to represent love (as in the phrase "to be \textit{consumed} with love"). So that from "fire" one set of rails runs by way of this symbolic meaning to thoughts of love; while the other set runs by way of the contrary "water", and, after sending off a branch line which provides another connection with "love" (for love also makes things wet), leads in a different direction. And what direction can that be? Think of the expressions you used: that an \textit{accident might happen in the night}, and that \textit{it might be necessary to leave the room}. Surely the allusion must be to a physical need? And if you transpose the accident into childhood what can it be but bed-wetting? But what is usually done to prevent children from wetting their bed? Are they not woken up in the night out of their sleep, \textit{exactly as your father woke you up in the dream}? This, then, must be the actual occurrence which enabled you to substitute your father for Herr K., who really, woke you up out of your sleep. I am accordingly driven to conclude that you were addicted to bed-wetting up to a later age than is usual with children. The same must also have been true of your brother; for your father said: "I refuse to let my two children go to their destruction..." Your brother has no other sort of connection with the real situation at the K.'s; he had not gone with you to L--. And now, what have your recollections to say to this?"

[1905e, 1409]

The significance of enuresis in the early history of neurotics is worth going into thoroughly. For the sake of clearness I will confine myself to remarking that Dora's case of bed-wetting was not the usual one. The disorder was not simply that the habit had persisted beyond what is considered the normal period, but, according to her explicit account, it had begun by disappearing and had then returned at a relatively late age - after her sixth year. Bed-wetting of this kind has, to the best of my knowledge, no more likely cause than masturbation, a habit whose importance in the aetiology of bed-wetting in general is still insufficiently appreciated. In my experience, the children concerned have themselves at one time been very well aware of this connection, and all its psychological consequences follow from it as though they had never forgotten it. Now, at the time when Dora reported the dream, we were engaged upon a line of enquiry which led straight towards an admission that she had masturbated in childhood. A short while before, she had raised the question of why it was that precisely she had fallen ill, and, before I could answer, had put the blame on her father. The justification for this was forthcoming not out of her unconscious thoughts but from her conscious knowledge. It turned out, to my astonishment, that the girl knew what the nature of her father's illness had been. After his return from consulting me she had overheard a conversation in which the name of the disease had been mentioned. At a still earlier period - at the time of the detached retina - an oculist who was called in must have hinted at a luetic aetiology; for the inquisitive and anxious girl overheard an old aunt of hers saying to her mother: 'He was ill before his marriage, you know', and adding something which she could not understand, but which she subsequently connected in her mind with improper subjects.

[1905e, 1411]
The proof of infantile masturbation in other cases is established in a precisely similar way. The evidence for it is mostly of a similar nature: indications of the presence of leucorrhoea, bed-wetting, hand-ceremonials (obsessional washing), and such things. It is always possible to discover with certainty from the nature of the symptoms of the case whether the habit was discovered by the person in charge of the child or not, or whether this sexual activity was brought to an end by long efforts on the child's part to break itself of the habit, or by a sudden change. In Dora's case the masturbation had remained undiscovered, and had come to an end at a single blow (cf. her secret, her fear of doctors, and the replacement by dyspnoea). The patients, it is true, invariably dispute the conclusiveness of circumstantial evidence such as this, and they do so even when they have retained a conscious recollection of the catarrh or of their mother's warning (e.g. 'That makes people stupid; it's dangerous'). But some time later the memory, which has been so long repressed, of this piece of infantile sexual life emerges with certainty, and it does so in every instance. I am reminded of the case of a patient of mine suffering from obsessions, her peculiarities, such as self-prohibitions and self-punishments, the feeling that if she had done this she must not do that, the idea that she must not be interrupted, the introduction of pauses between one procedure (with her hands) and the next, her hand-washing, etc, - all of these turned out to be unaltered fragments of her nurse's efforts to break her of the habit. The only thing which had remained permanently in her memory were the words of warning: "Ugh! That's dangerous!" Compare also in this connection my Three Essays on the Theory of Sexuality, 1905d. [1905e, 1416]

RETURN OF EARLY INFANTILE MASTURBATION

During the years of childhood with which I am now dealing, the sexual excitation of early infancy returns, either as a centrally determined tickling stimulus which seeks satisfaction in masturbation, or as a process in the nature of a nocturnal emission which, like the nocturnal emissions of adult years, achieves satisfaction without the help of any action by the subject. The latter case is the more frequent with girls and in the second half of childhood; its determinants are not entirely intelligible and often, though not invariably, it seems to be conditioned by a period of earlier active masturbation. The symptoms of these sexual manifestations are scanty; they are mostly displayed on behalf of the still undeveloped sexual apparatus by the urinary apparatus, which thus acts, as it were, as the former's trustee. Most of the so-called bladder disorders of this period are sexual disturbances: nocturnal enuresis, unless it represents an epileptic fit, corresponds to a nocturnal emission.

[1905d, 1510]

When the (male) child's interest turns to his genitals he betrays the fact by manipulating them frequently; and he then finds that the adults do not approve of this behaviour. More or less plainly, more or less brutally, a threat is pronounced that this part of him which he values so highly will be taken away from him. Usually it is from women that the threat emanates; very often they seek to strengthen their authority by a reference to the father or the doctor, who, so they say, will carry out the punishment. In a number of cases the women will themselves mitigate the threat in a symbolic manner by telling the child that what is to be removed is not his genital, which actually plays a passive part, but his hand, which is the active culprit. It happens particularly often that the little boy is threatened with castration, not because he plays with his penis with his hand, but because he wets his bed every night and cannot be got to be clean. Those in charge of him behave as if this nocturnal incontinence was the result and the proof of his being unduly concerned with his penis, and they are probably right. In any case, long-continued bed-wetting is to be equated with the emissions of adults. It is an expression of the same excitation of the genitals which has impelled the child to masturbate at this period.

[1924d, 4086]
¹ Psycho-analytic material, incomplete as it is and not susceptible to clear interpretation, nevertheless admits of a conjecture - a fantastic sounding one - about the origin of this human feat. It is as though primal man had the habit, when he came in contact with fire, or satisfying an infantile desire connected with it, by putting it out with a stream of his urine. The legends that we possess leave no doubt about the originally phallic view taken of tongues of flame as they shoot upwards. Putting out fire by micturating - a theme to which modern giants, Gulliver in Lilliput and Rabelais’ Gargantua, still hark back - was therefore a kind of sexual act with a male, an enjoyment of sexual potency in a homosexual competition. The first person to renounce this desire and spare the fire was able to carry it off with him and subdue it to his own use. By damping down the fire of his own sexual excitation, he had tamed the natural force of fire. This great cultural conquest was thus the reward for his renunciation of instinct. Further, it is as though woman had been appointed guardian of the fire which was held captive on the domestic hearth, because her anatomy made it impossible for her to yield to the temptation of this desire. It is remarkable, too, how regularly analytic experience testifies to the connection between ambition, fire and urethral erotism. [1930a, 4488]
She knew nothing about it. - 'Very well, then; the fear is that if they do they will wet their bed. The antithesis of "water" and "fire" must be at the bottom of this. Perhaps it is believed that they will dream of fire and then try and put it out with water. I cannot say exactly. But I notice that the antithesis of water and fire has been extremely useful to you in the dream. Your mother wanted to save the jewel-case so that it should not be burnt; while in the dream-thoughts it is a question of the "jewel-case" not being wetted. But fire is not only used as the contrary of water, it also serves directly to represent love (as in the phrase "to be consumed with love"). So that from "fire" one set of rails runs by way of this symbolic meaning to thoughts of love; while the other set runs by way of the contrary "water", and, after sending off a branch line which provides another connection with "love" (for love also makes things wet), leads in a different direction. And what direction can that be? Think of the expressions you used: that an accident might happen in the night, and that it might be necessary to leave the room. Surely the allusion must be to a physical need? And if you transpose the accident into childhood what can it be but bed-wetting? But what is usually done to prevent children from wetting their bed? Your brother has no other sort of connection with the real situation at the K.'s; he had not gone with you to L--. And now, what have your recollections to say to this?'

[1905e, 1409]

¹ It is very remarkable that the reaction of shame should be so intimately connected with involuntary emptying of the bladder (whether in the day-time or at night) and not equally so, as one would have expected, with incontinence of the bowels. Experience leaves no room for doubt upon the point. The regular relation that is found to exist between incontinence of the bladder and fire also provides matter for reflection. It is possible that these reactions and relations represent precipitates from the history of human civilization derived from a lower stratum than anything that is preserved for us in the traces surviving in myths or folklore.
[1918b, 3574]

¹ Psycho-analytic material, incomplete as it is and not susceptible to clear interpretation, nevertheless admits of a conjecture - a fantastic sounding one - about the origin of this human feat. It is as though primal man had the habit, when he came in contact with fire, or satisfying an infantile desire connected with it, by putting it out with a stream of his urine. The legends that we possess leave no doubt about the originally phallic view taken of tongues of flame as they shoot upwards. Putting out fire by micturating - a theme to which modern giants, Gulliver in Lilliput and Rabelais' Gargantua, still hark back - was therefore a kind of sexual act with a male, an enjoyment of sexual potency in a homosexual competition. The first person to renounce this desire and spare the fire was able to carry it off with him and subdue it to his own use. By damping down the fire of his own sexual excitation, he had tamed the natural force of fire. This great cultural conquest was thus the reward for his renunciation of instinct. Further, it is as though woman had been appointed guardian of the fire which was held captive on the domestic hearth, because her anatomy made it impossible for her to yield to the temptation of this desire. It is remarkable, too, how regularly analytic experience testifies to the connection between ambition, fire and urethral erotism.
[1930a, 4488]
The myth tells us that Prometheus the Titan, a culture-hero who was still a god¹ and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of quenching fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material.

Secondly, the acquisition of fire was a crime; it was accomplished by robbery or theft. This is a constant feature in all the legends about the acquiring of control over fire. It is found among the most different and widely separated peoples and not merely in the Greek myth of Prometheus the Bringer of Fire. Here, then, must be the essential content of mankind's distorted recollection. But why is the acquisition of fire inseparably connected with the idea of a crime? Who is it that was injured or defrauded by it? The Promethean myth in Hesiod gives us a straight answer; for, in another story, not itself directly connected with fire, Prometheus so arranged the sacrifices to the gods as to give men the advantage over Zeus. It is the gods, then, who were defrauded. We know that in myths the gods are granted the satisfaction of all the desires which human creatures have to renounce, as we have learnt from the case of incest. Speaking in analytic terms, we should say that instinctual life - the id - is the god who is defrauded when the quenching of fire is renounced: in the legend, a human desire is transformed into a divine privilege. But in the legend the deity possesses nothing of the characteristics of a super-ego, he is still the representative of the paramount life of the instincts.

[1932a, 4782]
I should have no hesitation in giving the same explanation of the attacks of night terrors accompanied by hallucinations (pavor nocturnus) which are so frequent in children. In this case too it can only be a question of sexual impulses which have not been understood and which have been repudiated. Investigation would probably show a periodicity in the occurrence of the attacks, since an increase in sexual libido can be brought about not only by accidental exciting impressions but also by successive waves of spontaneous developmental processes.

[1900a, 1013]

Paediatricians, on the other hand, seem to lack the only line of approach which can make this whole class of phenomena intelligible, whether from the somatic or from the psychical aspect. I cannot resist quoting an amusing instance of the way in which the blinkers of medical mythology can cause an observer to miss an understanding of such cases by a narrow margin. My instance is taken from a thesis on pavor nocturnus by Debacker (1881, 66):

A thirteen-year-old boy in delicate health began to be apprehensive and dreamy. His sleep became disturbed and was interrupted almost once a week by severe attacks of anxiety accompanied by hallucinations. He always retained a very clear recollection of these dreams. He said that the Devil had shouted at him: 'Now we've got you, now we've got you!' There was then a smell of pitch and brimstone and his skin was burnt by flames. He woke up from the dream in terror, and at first could not cry out. When he had found his voice he was clearly heard to say: 'No, no, not me; I've not done anything!' or 'Please not! I won't do it again!' or sometimes: 'Albert never did that!' Later, he refused to undress 'because the flames only caught him when he was undressed.' While he was still having these devil-dreams, which were a threat to his health, he was sent into the country. There he recovered in the course of eighteen months, and once, when he was fifteen, he confessed: 'Je n'osais pas l'avouer, mais j'éprouvais continuellement des picotements et des surexcitations aux parties; à la fin, cela m'énervait tant que plusieurs fois j'ai pensé me jeter par la fenêtre du dortoir.'³

[1900a, 1013]

There is really very little difficulty in inferring: (1) that the boy had masturbated when he was younger, that he had probably denied it, and that he had been threatened with severe punishment for his bad habit (cf. his admission: 'Je ne le ferais plus', and his denial: 'Albert n'a jamais fait ça'); (2) that with the onset of puberty the temptation to masturbate had revived with the tickling in his genitals; but (3) that a struggle for repression had broken out in him, which had suppressed his libido and transformed it into anxiety, and that the anxiety had taken over the punishments with which he had been threatened earlier.

[1900a, 1014]
¹ [Footnote added 1914:] Is this the only function that can be assigned to dreams? I know of no other. It is true that Maeder has attempted to show that dreams have other, 'secondary', functions. He started out from the correct observation that some dreams contain attempts at solving conflicts, attempts which are later carried out in reality and which thus behave as though they were trial practices for waking actions. He therefore drew a parallel between dreams and the play of animals and children, which may be regarded as practice in the operation of innate instincts and as preparation for serious activity later on, and put forward the hypothesis that dreams have a 'fonction ludique' ['play function']. Shortly before Maeder, Alfred Adler, too, had insisted that dreams possessed a function of 'thinking ahead.' (In an analysis which I published in 1905, a dream, which could only be regarded as expressing an intention, was repeated every night until it was carried out.) [1900a, 1007]

If, as has been assumed since the time of Aristotle, the purpose of drama is to arouse 'terror and pity' and so 'to purge the emotions', we can describe that purpose in rather more detail by saying that it is a question of opening up sources of pleasure or enjoyment in our emotional life, just as, in the case of intellectual activity, joking or fun open up similar sources, many of which that activity had made inaccessible. In this connection the prime factor is unquestionably the process of getting rid of one's own emotions by 'blowing off steam'; and the consequent enjoyment corresponds on the one hand to the relief produced by a thorough discharge and on the other hand, no doubt, to an accompanying sexual excitation; for the latter, as we may suppose, appears as a by-product whenever an affect is aroused, and gives people the sense, which they so much desire, of a raising of the potential of their psychical state. Being present as an interested spectator at a spectacle or play does for adults what play does for children, whose hesitant hopes of being able to do what grown-up people do are in that way gratified. The spectator is a person who experiences too little, who feels that he is a 'poor wretch to whom nothing of importance can happen', who has long been obliged to damp down, or rather displace, his ambition to stand in his own person at the hub of world affairs; he longs to feel and to act and to arrange things according to his desires - in short, to be a hero. And the playwright and actor enable him to do this by allowing him to identify himself with a hero. They spare him something, too. For the spectator knows quite well that actual heroic conduct such as this would be impossible for him without pains and sufferings and acute fears, which would almost cancel out the enjoyment. He knows, moreover, that he has only one life and that he might perhaps perish even in a single such struggle against adversity. Accordingly, his enjoyment is based on an illusion; that is to say, his suffering is mitigated by the certainty that, firstly, it is someone other than himself who is acting and suffering on the stage, and, secondly, that after all it is only a game, which can threaten no damage to his personal security. In these circumstances he can allow himself to enjoy being a 'great man', to give way without a qualm to such suppressed impulses as a craving for freedom in religious, political, social and sexual matters, and to 'blow off steam' in every direction in the various grand scenes that form part of the life represented on the stage. [1942a [1905], 1607]

Groos goes on to discuss games whose characteristic lies in the fact that they intensify the joy in recognition by putting obstacles in its way - that is to say, by creating a 'psychical damming up', which is got rid of by the act of recognition. His attempt at an explanation, however, abandons the hypothesis that recognition is pleasurable in itself, since, by referring to these games, he is tracing back the enjoyment of recognition to a joy in power, a joy in the overcoming of a difficulty. I regard the latter factor as secondary, and I see no reason to depart from the simpler view that recognition is pleasurable in itself i.e., through relieving psychical expenditure - and that the games founded on this pleasure make use of the mechanism of damming up only in order to increase the amount of such pleasure. [1905c, 1713]
Whatever the motive may have been which led the child to begin these games, I believe that in his later development he gives himself up to them with the consciousness that they are nonsensical, and that he finds enjoyment in the attraction of what is forbidden by reason. He now uses games in order to withdraw from the pressure of critical reason. But there is far more potency in the restrictions which must establish themselves in the course of a child's education in logical thinking and in distinguishing between what is true and false in reality; and for this reason the rebellion against the compulsion of logic and reality is deep-going and long-lasting. Even the phenomena of imaginative activity must be included in this category. The power of criticism has increased so greatly in the later part of childhood and in the period of learning which extends over puberty that the pleasure in 'liberated nonsense' only seldom dares to show itself directly. One does not venture to say anything absurd. But the characteristic tendency of boys to do absurd or silly things seems to me to be directly derived from the pleasure in nonsense. In pathological cases we often see this tendency so far intensified that once more it dominates the schoolboy's talk and answers. I have been able to convince myself in the case of a few boys of secondary school age who had developed neuroses that the unconscious workings of their pleasure in the nonsense they produced played no less a part in their inefficiency than did their real ignorance.

Play - let us keep to that name - appears in children while they are learning to make use of words and to put thoughts together. This play probably obeys one of the instincts which compel children to practise their capacities (Groos). In doing so they come across pleasurable effects, which arise from a repetition of what is similar, a rediscovery of what is familiar, similarity of sound, etc., and which are to be explained as unsuspected economies in psychical expenditure. It is not to be wondered at that these pleasurable effects encourage children in the pursuit of play and cause them to continue it without regard for the meaning of words or the coherence of sentences. Play with words and thoughts, motivated by certain pleasurable effects of economy, would thus be the first stage of jokes.

This play is brought to an end by the strengthening of a factor that deserves to be described as the critical faculty or reasonableness. The play is now rejected as being meaningless or actually absurd; as a result of criticism it becomes impossible. Now, too, there is no longer any question of deriving pleasure, except accidentally, from the sources of rediscovery of what is familiar, etc., unless it happens that the growing individual is overtaken by a pleasurable mood which, like the child's cheerfulness, lifts the critical inhibition. Only in such a case does the old game of getting pleasure become possible once more; but the individual does not want to wait for this to happen nor to renounce the pleasure that is familiar to him. He thus looks about for means of making himself independent of the pleasurable mood, and the further development towards jokes is governed by the two endeavours: to avoid criticism and to find a substitute for the mood.

We found relatively great difficulties in understanding the comic of mimicry so long as we left the infantile factor out of account. But mimicry is the child's best art and the driving motive of most of his games. A child's ambition aims far less at excelling among his equals than at mimicking the grown-ups. The relation of children to adults is also the basis of the comic of degradation, which corresponds to the condescension shown by adults in their attitude to the life of children. There is little that gives children greater pleasure than when a grown-up lets himself down to their level, renounces his oppressive superiority and plays with them as an equal. This relief, which gives the child pure pleasure, becomes in adults, in the form of degradation, a means of making things comic and a source of comic pleasure. As regards unmasking, we know that it goes back to degradation.
Should we not look for the first traces of imaginative activity as early as in childhood? The child's best-loved and most intense occupation is with his play or games. Might we not say that every child at play behaves like a creative writer, in that he creates a world of his own, or, rather, re-arranges the things of his world in a new way which pleases him? It would be wrong to think he does not take that world seriously; on the contrary, he takes his play very seriously and he expends large amounts of emotion on it. The opposite of play is not what is serious but what is real. In spite of all the emotion with which he cathects his world of play, the child distinguishes it quite well from reality; and he likes to link his imagined objects and situations to the tangible and visible things of the real world. This linking is all that differentiates the child's 'play' from 'phantasying'.

[1908e, 1921]

People's phantasies are less easy to observe than the play of children. The child, it is true, plays by himself or forms a closed psychical system with other children for the purposes of a game; but even though he may not play his game in front of the grown-ups, he does not, on the other hand, conceal it from them. The adult, on the contrary, is ashamed of his phantasies and hides them from other people. He cherishes his phantasies as his most intimate possessions, and as a rule he would rather confess his misdeeds than tell anyone his phantasies. It may come about that for that reason he believes he is the only person who invents such phantasies and has no idea that creations of this kind are widespread among other people. This difference in the behaviour of a person who plays and a person who phantasies is accounted for by the motives of these two activities, which are nevertheless adjuncts to each other.

[1908e, 1923]

A child's play is determined by wishes: in point of fact by a single wish-one that helps in his upbringing - the wish to be big and grown up. He is always playing at being 'grown up', and in his games he imitates what he knows about the lives of his elders. He has no reason to conceal this wish. With the adult, the case is different. On the one hand, he knows that he is expected not to go on playing or phantasying any longer, but to act in the real world; on the other hand, some of the wishes which give rise to his phantasies are of a kind which it is essential to conceal. Thus he is ashamed of his phantasies as being childish and as being unpermissible.

[1908e, 1924]

Childhood opinions about the nature of marriage, which are not seldom retained by conscious memory, have great significance for the symptomatology of later neurotic illness. At first they find expression in children's games in which each child does with another whatever it is that in his view constitutes being married; and then, later on, the wish to be married may choose the infantile form of expression and so make its appearance in a phobia which is at first sight unrecognizable, or in some corresponding symptom.¹

[1908c, 1976]

¹ The games that are most significant for subsequent neuroses are playing at 'doctor' and at 'father and mother'.

[1908c, 1976]
The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly marked imaginative activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar day-dreaming¹ which persists far beyond puberty. If these day-dreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of replacing them by others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or less effort to obtain verisimilitude. This state is reached at a time at which the child is still in ignorance of the sexual determinants of procreation.

[1909c, 1988]

But why do so many people dream of being able to fly? The answer that psycho-analysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual activity is 'vögeln' ['to bird'; 'Vogel' is the German for 'bird']; that the male organ is actually called 'l'uccello' ['the bird'] in Italian - all of these are only small fragments from a whole mass of connected ideas, from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.² This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier they would probably tell a different story. It seems that childhood is not the blissful idyll into which we distort it in retrospect, and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which they are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.

[1910c, 2296]

At this point I propose to leave the dark and dismal subject of the traumatic neurosis and pass on to examine the method of working employed by the mental apparatus in one of its earliest normal activities - I mean in children's play.

[1920g, 3720]
The different theories of children's play have only recently been summarized and discussed from the psycho-analytic point of view by Pfeifer (1919), to whose paper I would refer my readers. These theories attempt to discover the motives which lead children to play, but they fail to bring into the foreground the economic motive, the consideration of the yield of pleasure involved. Without wishing to include the whole field covered by these phenomena, I have been able, through a chance opportunity which presented itself, to throw some light upon the first game played by a little boy of one and a half and invented by himself. It was more than a mere fleeting observation, for I lived under the same roof as the child and his parents for some weeks, and it was some time before I discovered the meaning of the puzzling activity which he constantly repeated [1920g, 3720]

Nor shall we be helped in our hesitation between these two views by further considering children's play. It is clear that in their play children repeat everything that has made a great impression on them in real life, and that in doing so they abreact the strength of the impression and, as one might put it, make themselves master of the situation. But on the other hand it is obvious that all their play is influenced by a wish that dominates them the whole time - the wish to be grown-up and to be able to do what grown-up people do. It can also be observed that the unpleasurable nature of an experience does not always unsuit it for play. If the doctor looks down a child's throat or carries out some small operation on him, we may be quite sure that these frightening experiences will be the subject of the next game; but we must not in that connection overlook the fact that there is a yield of pleasure from another source. As the child passes over from the passivity of the experience to the activity of the game, he hands on the disagreeable experience to one of his playmates and in this way revenges himself on a substitute. [1920g, 3722]

Nevertheless, it emerges from this discussion that there is no need to assume the existence of a special imitative instinct in order to provide a motive for play. Finally, a reminder may be added that the artistic play and artistic imitation carried out by adults, which, unlike children's, are aimed at an audience, do not spare the spectators (for instance, in tragedy) the most painful experiences and can yet be felt by them as highly enjoyable. This is convincing proof that, even under the dominance of the pleasure principle, there are ways and means enough of making what is in itself unpleasurable into a subject to be recollected and worked over in the mind. The consideration of these cases and situations, which have a yield of pleasure as their final outcome, should be undertaken by some system of aesthetics with an economic approach to its subject-matter. They are of no use for our purposes, since they presuppose the existence and dominance of the pleasure principle; they give no evidence of the operation of tendencies beyond the pleasure principle, that is, of tendencies more primitive than it and independent of it. [1920g, 3722]

If we take into account observations such as these, based upon behaviour in the transference and upon the life-histories of men and women, we shall find courage to assume that there really does exist in the mind a compulsion to repeat which overrides the pleasure principle. Now too we shall be inclined to relate to this compulsion the dreams which occur in traumatic neuroses and the impulse which leads children to play. [1920g, 3726]
But it is to be noted that only in rare instances can we observe the pure effects of the compulsion to repeat, unsupported by other motives. In the case of children's play we have already laid stress on the other ways in which the emergence of the compulsion may be interpreted; the compulsion to repeat and instinctual satisfaction which is immediately pleasurable seem to converge here into an intimate partnership. The phenomena of transference are obviously exploited by the resistance which the ego maintains in its pertinacious insistence upon repression; the compulsion to repeat, which the treatment tries to bring into its service is, as it were, drawn over by the ego to its side (clinging as the ego does to the pleasure principle). A great deal of what might be described as the compulsion of destiny seems intelligible on a rational basis; so that we are under no necessity to call in a new and mysterious motive force to explain it.

[1920g, 3727]

The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their pleasurable experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primaeval experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power.

[1920g, 3738]
It can hardly be doubted that the world of phantasy plays the same part in psychosis and that there, too, it is the storehouse from which the materials or the pattern for building the new reality are derived. But whereas the new, imaginary external world of a psychosis attempts to put itself in the place of external reality, that of a neurosis, on the contrary, is apt, like the play of children, to attach itself to a piece of reality - a different piece from the one against which it has to defend itself - and to lend that piece a special importance and a secret meaning which we (not always quite appropriately) call a symbolic one. Thus we see that both in neurosis and psychosis there comes into consideration the question not only of a loss of reality but also of a substitute for reality.

[1924e, 4098]

Taking this sequence, anxiety - danger - helplessness (trauma), we can now summarize what has been said. A danger-situation is a recognized, remembered, expected situation of helplessness. Anxiety is the original reaction to helplessness in the trauma and is reproduced later on in the danger-situation as a signal for help. The ego, which experienced the trauma passively, now repeats it actively in a weakened version, in the hope of being able itself to direct its course. It is certain that children behave in this fashion towards every distressing impression they receive, by reproducing it in their play. In thus changing from passivity to activity they attempt to master their experiences psychically. If this is what is meant by 'abreacting a trauma' we can no longer have anything to urge against the phrase. But what is of decisive importance is the first displacement of the anxiety-reaction from its origin in the situation of helplessness to an expectation of that situation - that is, to the danger-situation. After that come the later displacements, from the danger to the determinant of the danger - loss of the object and the modifications of that loss with which we are already acquainted.

[1926d, 4319]

Our starting-point will again be the one situation which we believe we understand - the situation of the infant when it is presented with a stranger instead of its mother. It will exhibit the anxiety which we have attributed to the danger of loss of object. But its anxiety is undoubtedly more complicated than this and merits a more thorough discussion. That it does have anxiety there can be no doubt; but the expression of its face and its reaction of crying indicate that it is feeling pain as well. Certain things seem to be joined together in it which will later on be separated out. It cannot as yet distinguish between temporary absence and permanent loss. As soon as it loses sight of its mother it behaves as if it were never going to see her again; and repeated consoling experiences to the contrary are necessary before it learns that her disappearance is usually followed by her re-appearance. Its mother encourages this piece of knowledge which is so vital to it by playing the familiar game of hiding her face from it with her hands and then, to its joy, uncovering it again. In these circumstances it can, as it were, feel longing unaccompanied by despair.

[1926d, 4321]
A further question arises: 'What does the little girl require of her mother? What is the nature of her sexual aims during the time of exclusive attachment to her mother?' The answer we obtain from the analytic material is just what we should expect. The girl's sexual aims in regard to her mother are active as well as passive and are determined by the libidinal phases though which the child passes. Here the relation of activity to passivity is especially interesting. It can easily be observed that in every field of mental experience, not merely that of sexuality, when a child receives a passive impression it has a tendency to produce an active reaction. It tries to do itself what has just been done to it. This is part of the work imposed on it of mastering the external world and can even lead to its endeavouring to repeat an impression which it would have reason to avoid on account of its distressing content. Children's play, too, is made to serve this purpose of supplementing a passive experience with an active piece of behaviour and of thus, as it were, annulling it. When a doctor has opened a child's mouth, in spite of his resistance, to look down his throat, the same child, after the doctor has gone, will play at being the doctor himself, and will repeat the assault upon some small brother or sister who is as helpless in his hands as he was in the doctor's. Here we have an unmistakable revolt against passivity and a preference for the active role. This swing-over from passivity to activity does not take place with the same regularity or vigour in all children; in some it may not occur at all. A child's behaviour in this respect may enable us to draw conclusions as to the relative strength of the masculinity and femininity that it will exhibit in its sexuality.

[1931b, 4600]

The first sexual and sexually coloured experiences which a child has in relation to its mother are naturally of a passive character. It is suckled, fed, cleaned, and dressed by her, and taught to perform all its functions. A part of its libido goes on clinging to those experiences and enjoys the satisfactions bound up with them; but another part strives to turn them into activity. In the first place, being suckled at the breast gives place to active sucking. As regards the other experiences the child contents itself either with becoming self-sufficient - that is, with itself successfully carrying out what had hitherto been done for it - or with repeating its passive experiences in an active form in play; or else it actually makes its mother into the object and behaves as the active subject towards her. For a long time I was unable to credit this last behaviour, which takes place in the field of real action, until my observations removed all doubts on the matter.

[1931b, 4600]

We seldom hear of a little girl's wanting to wash or dress her mother, or tell her to perform her excretory functions. Sometimes, it is true, she says: 'Now let's play that I'm the mother and you're the child'; but generally she fulfils these active wishes in an indirect way, in her play with her doll, in which she represents the mother and the doll the child. The fondness girls have for playing with dolls, in contrast to boys, is commonly regarded as a sign of early awakened femininity. Not unjustly so; but we must not overlook the fact that what finds expression here is the active side of femininity, and that the little girl's preference for dolls is probably evidence of the exclusiveness of her attachment to her mother, with complete neglect of her father-object.

[1931b, 4601]
Along with the abandonment of clitoridal masturbation a certain amount of activity is renounced. Passivity now has the upper hand, and the girl's turning to her father is accomplished principally with the help of passive instinctual impulses. You can see that a wave of development like this, which clears the phallic activity out of the way, smoothes the ground for femininity. If too much is not lost in the course of it through repression, this femininity may turn out to be normal. The wish with which the girl turns to her father is no doubt originally the wish for the penis which her mother has refused her and which she now expects from her father. The feminine situation is only established, however, if the wish for a penis is replaced by one for a baby, if, that is, a baby takes the place of a penis in accordance with an ancient symbolic equivalence. It has not escaped us that the girl has wished for a baby earlier, in the undisturbed phallic phase: that, of course, was the meaning of her playing with dolls. But that play was not in fact an expression of her femininity; it served as an identification with her mother with the intention of substituting activity for passivity. She was playing the part of her mother and the doll was herself: now she could do with the baby everything that her mother used to do with her. Not until the emergence of the wish for a penis does the doll-baby become a baby from the girl's father, and thereafter the aim of the most powerful feminine wish. Her happiness is great if later on this wish for a baby finds fulfilment in reality, and quite especially so if the baby is a little boy who brings the longed-for penis with him. Often enough in her combined picture of 'a baby from her father' the emphasis is laid on the baby and her father left unstressed. In this way the ancient masculine wish for the possession of a penis is still faintly visible through the femininity now achieved. But perhaps we ought rather to recognize this wish for a penis as being *par excellence* a feminine one.

[1933a, 4730]
A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot. This is a good example of a very common sort of anxiety-dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often noticed blood in his mother's bed.

[1900a, 1012]

It is, I may say, a matter of daily experience that sexual intercourse between adults strikes any children who may observe it as something uncanny and that it arouses anxiety in them. I have explained this anxiety by arguing that what we are dealing with is a sexual excitation with which their understanding is unable to cope and which they also, no doubt, repudiate because their parents are involved in it, and which is therefore transformed into anxiety. At a still earlier period of life sexual excitations directed towards a parent of the opposite sex have not yet met with repression and, as we have seen, are freely expressed. (See p. 735 ff.)

[1900a, 1013]
What sprang into activity that night out of the chaos of the dreamer’s unconscious memory-traces was the picture of copulation between his parents, copulation in circumstances which were not entirely usual and were especially favourable for observation. It gradually became possible to find satisfactory answers to all the questions that arose in connection with this scene; for in the course of the treatment the first dream returned in innumerable variations and new editions, in connection with which the analysis produced the information that was required. Thus in the first place the child’s age at the date of the observation was established as being about one and a half years.¹ He was suffering at the time from malaria, an attack of which used to come on every day at a particular hour.² From his tenth year onwards he was from time to time subject to moods of depression, which used to come on in the afternoon and reached their height at about five o’clock. This symptom still existed at the time of the analytic treatment. The recurring fits of depression took the place of the earlier attacks of fever or languor; five o’clock was either the time of the highest fever or of the observation of the intercourse, unless the two times coincided.³ Probably for the very reason of this illness, he was in his parents’ bedroom. The illness, the occurrence of which is also corroborated by direct tradition, makes it reasonable to refer the event to the summer, and, since the child was born on Christmas Day, to assume that his age was \( n + 1 \frac{1}{2} \) years. He had been sleeping in his cot, then, in his parents’ bedroom, and woke up, perhaps because of his rising fever, in the afternoon, possibly at five o’clock, the hour which was later marked out by depression. It harmonizes with our assumption that it was a hot summer’s day, if we suppose that his parents had retired, half undressed,⁴ for an afternoon siesta. When he woke up, he witnessed a coitus a tergo [from behind], three times repeated;⁵ he was able to see his mother’s genitals as well as his father’s organ; and he understood the process as well as its significance.⁶ Lastly he interrupted his parents’ intercourse in a manner which will be discussed later.

There is at bottom nothing extraordinary, nothing to give the impression of being the product of an extravagant imagination, in the fact that a young couple who had only been married a few years should have ended a siesta on a hot summer’s afternoon with a love-scene, and should have disregarded the presence of their little boy of one and a half, asleep in his cot. On the contrary, such an event would, I think, be something entirely commonplace and banal; and even the position in which we have inferred that the coitus took place cannot in the least alter this judgement - especially as the evidence does not require that the intercourse should have been performed from behind each time. A single time would have been enough to give the spectator an opportunity for making observations which would have been rendered difficult or impossible by any other attitude of the lovers. The content of the scene cannot therefore in itself be an argument against its credibility. Doubts as to its probability will turn upon three other points: whether a child at the tender age of one and a half could be in a position to take in the perceptions of such a complicated process and to preserve them so accurately in his unconscious; secondly, whether it is possible at the age of four for a deferred revision of the impressions so received to penetrate the understanding; and finally, whether any procedure could succeed in bringing into consciousness coherently and convincingly the details of a scene of this kind which had been experienced and understood in such circumstances.¹

¹ The first of these difficulties cannot be reduced by assuming that the child at the time of his observation was after all probably a year older, that is to say two and a half, an age at which he may perhaps have been perfectly capable of talking. All the minor details of my patient’s case almost excluded the possibility of shifting the date in this way. Moreover, the fact should be taken into account that these scenes of observing parental intercourse are by no means rarely brought to light in analysis. The condition of their occurrence, however, is precisely that it should be in the earliest period of childhood. The older the child is, the more carefully, with parents above a certain social level, will the child be deprived of the opportunity for this kind of observation.

[1918b, 3528]
Later on I shall carefully examine these and other doubts; but I can assure the reader that I am no less critically inclined than he towards an acceptance of this observation of the child's, and I will only ask him to join me in adopting a provisional belief in the reality of the scene. We will first proceed with the study of the relations between this ‘primal scene’ and the patient's dream, his symptoms, and the history of his life; and we will trace separately the effects that followed from the essential content of the scene and from one of its visual impressions.

By the latter I mean the postures which he saw his parents adopt - the man upright, and the woman bent down like an animal. We have already heard that during his anxiety period his sister used to terrify him with a picture from the fairy-book, in which the wolf was shown standing upright, with one foot forward, with its claws stretched out and its ears pricked. He devoted himself with tireless perseverance during the treatment to the task of hunting in the second-hand book shops till he had found the illustrated fairy-book of his childhood, and had recognized his bogy in an illustration to the story of 'The Wolf and the Seven Little Goats'. He thought that the posture of the wolf in this picture might have reminded him of that of his father during the constructed primal scene. At all events the picture became the point of departure for further manifestations of anxiety. Once when he was in his seventh or eighth year he was informed that next day a new tutor was coming for him. That night he dreamt of this tutor in the shape of a lion that came towards his bed roaring loudly and in the posture of the wolf in the picture; and once again he awoke in a state of anxiety. The wolf phobia had been overcome by that time, so he was free to choose himself a new anxiety-animal, and in this late dream he was recognizing the tutor as a father-surrogate. In the later years of his childhood each of his tutors and masters played the part of his father, and was endowed with his father's influence both for good and for evil.

After what has already been said I need only deal shortly with the pathogenic effect of the primal scene and the alteration which its revival produced in his sexual development. We will only trace that one of its effects to which the dream gave expression. Later on we shall have to make it clear that it was not only a single sexual current that started from the primal scene but a whole set of them, that his sexual life was positively splintered up by it. We shall further bear in mind that the activation of this scene (I purposely avoid the word 'recollection') had the same effect as though it were a recent experience. The effects of the scene were deferred, but meanwhile it had lost none of its freshness in the interval between the ages of one and a half and four years. We shall perhaps find in what follows reason to suppose that it produced certain effects even at the time of its perception, that is, from the age of one and a half onwards.

When the patient entered more deeply into the situation of the primal scene, he brought to light the following pieces of self-observation. He assumed to begin with, he said, that the event of which he was a witness was an act of violence, but the expression of enjoyment which he saw on his mother's face did not fit in with this; he was obliged to recognize that the experience was one of gratification.¹ What was essentially new for him in his observation of his parents' intercourse was the conviction of the reality of castration - a possibility with which his thoughts had already been occupied previously. (The sight of the two girls micturating, his Nanya's threat, the governess' interpretation of the sugar-sticks, the recollection of his father having beaten a snake to pieces.) For now he saw with his own eyes the wound of which his Nanya had spoken, and understood that its presence was a necessary condition of intercourse with his father. He could no longer confuse it with the bottom, as he had in his observation of the little girls.²
We might perhaps best do justice to this statement of the patient's by supposing that the object of his observation was in the first instance a coitus in the normal position, which cannot fail to produce the impression of being a sadistic act, and that only after this was the position altered, so that he had an opportunity for making other observations and judgements. This hypothesis, however, was not confirmed with certainty, and moreover does not seem to me indispensable. We must not forget the actual situation which lies behind the abbreviated description given in the text: the patient under analysis, at an age of over twenty-five years, was putting the impressions and impulses of his fourth year into words which he would never have found at that time. If we fail to notice this, it may easily seem comic and incredible that a child of four should be capable of such technical judgements and learned notions. This is simply another instance of deferred action. At the age of one and a half the child receives an impression to which he is unable to react adequately; he is only able to understand it and to be moved by it when the impression is revived in him at the age of four; and only twenty years later, during the analysis, is he able to grasp with his conscious mental processes what was then going on in him. The patient justifiably disregards the three periods of time, and puts his present ego into the situation which is so long past. And in this we follow him, since with correct self-observation and interpretation the effect must be the same as though the distance between the second and third periods of time could be neglected. Moreover, we have no other means of describing the events of the second period.

We must here break off the discussion of his sexual development until new light is thrown from the later stages of his history upon these earlier ones. For the proper appreciation of the wolf phobia we will only add that both his father and mother became wolves. His mother took the part of the castrated wolf, which let the others climb upon it; his father took the part of the wolf that climbed. But his fear, as we have heard him assure us, related only to the standing wolf, that is, to his father. It must further strike us that the fear with which the dream ended had a model in his grandfather's story. For in this the castrated wolf, which had let the others climb upon it, was seized with fear as soon as it was reminded of the fact of its taillessness. It seems, therefore, as though he had identified himself with his castrated mother during the dream, and was now fighting against that fact. 'If you want to be sexually satisfied by Father', we may perhaps represent him as saying to himself, 'you must allow yourself to be castrated like Mother; but I won't have that.' In short, a clear protest on the part of his masculinity! Let us, however, plainly understand that the sexual development of the case that we are now examining has a great disadvantage from the point of view of research, for it was by no means undisturbed. It was first decisively influenced by the seduction, and was then diverted by the scene of observation of the coitus, which in its deferred action operated like a second seduction.

I have remarked above (see p. 3528) that it will certainly be considered improbable, firstly, that 'a child at the tender age of one and a half could be in a position to take in the perceptions of such a complicated process and to preserve them so accurately in his unconscious; secondly, that it is possible at the age of four for a deferred revision of this material to penetrate the understanding; and finally, that any procedure could succeed in bringing into consciousness coherently and convincingly the details of a scene of this kind which had been experienced and understood in such circumstances'.
In the present case the content of the primal scene is a picture of sexual intercourse between the boy's parents in a posture especially favourable for certain observations. Now it would be no evidence whatever of the reality of such a scene if we were to find it in a patient whose symptoms (the effects of the scene, that is) had appeared at some time or other in the later part of his life. A person such as this might have acquired the impressions, the ideas, and the knowledge on a great number of different occasions in the course of the long interval; he might then have transformed them into an imaginary picture, have projected them back into his childhood, and have attached them to his parents. If, however, the effects of a scene of this sort appear in the child's fourth or fifth year, then he must have witnessed the scene at an age even earlier than that. But in that case we are still faced with all the disconcerting consequences which have arisen from the analysis of this infantile neurosis. The only way out would be to assume that the patient not only unconsciously imagined the primal scene, but also concocted the alteration in his character, his fear of the wolf, and his religious obsession; but such an expedient would be contradicted by his otherwise sober nature and by the direct tradition in his family. It must therefore be left at this (I can see no other possibility): either the analysis based on the neurosis in his childhood is all a piece of nonsense from start to finish, or everything took place just as I have described it above.

At an earlier stage in the discussion we were brought up against an ambiguity in regard to the patient's predilection for female nates and for sexual intercourse in the posture in which they are especially prominent. It seemed necessary to trace this predilection back to the intercourse which he had observed between his parents, while at the same time a preference of this kind is a general characteristic of archaic constitutions which are predisposed to an obsessional neurosis. But the contradiction is easily resolved if we regard it as a case of overdetermination. The person who was the subject of his observation of this posture during intercourse was, after all, his father in the flesh, and it may also have been from him that he had inherited this constitutional predilection. Neither his father's subsequent illness nor his family history contradicts this; as has been mentioned already, a brother of his father's died in a condition which must be regarded as the outcome of a severe obsessional disorder.

This other view which I have in mind is that the state of affairs can be explained in the following manner. It is true that we cannot dispense with the assumption that the child observed a copulation, the sight of which gave him a conviction that castration might be more than an empty threat. Moreover, the significance which he subsequently came to attach to the postures of men and women, in connection with the development of anxiety on the one hand, and as a condition upon which his falling in love depended on the other hand, leaves us no choice but to conclude that it must have been a coitus a tergo, more ferarum. But there is another factor which is not so irreplaceable and which may be dropped. Perhaps what the child observed was not copulation between his parents but copulation between animals, which he then displaced on to his parents, as though he had inferred that his parents did things in the same way.
Colour is lent to this view above all by the fact that the wolves in the dream were actually sheep-dogs and, moreover, appear as such in the drawing. Shortly before the dream the boy was repeatedly taken to visit the flocks of sheep, and there he might see just such large white dogs and probably also observe them copulating. I should also like to bring into this connection the number three, which the dreamer introduced without adducing any further motive, and I would suggest that he had kept in his memory the fact that he had made three such observations with the sheep-dogs. What supervened during the expectant excitement of the night of his dream was the transference on to his parents of his recently acquired memory-picture, with all its details, and it was only thus that the powerful emotional effects which followed were made possible. He now arrived at a deferred understanding of the impressions which he may have received a few weeks or months earlier - a process such as all of us perhaps have been through in our own experiences. The transference from the copulating dogs on to his parents was accomplished not by means of his making an inference accompanied by words but by his searching out in his memory a real scene in which his parents had been together and which could be coalesced with the situation of the copulation. All the details of the scene which were established in the analysis of the dream may have been accurately reproduced. It was really on a summer's afternoon while the child was suffering from malaria, the parents were both present, dressed in white, when the child woke up from his sleep, but - the scene was innocent. The rest had been added by the inquisitive child's subsequent wish, based on his experiences with the dogs, to witness his parents too in their love-making; and the scene which was thus imagined now produced all the effects that we have catalogued, just as though it had been entirely real and not fused together out of two components, the one earlier and indifferent, the other later and profoundly impressive.

[1918b, 3544]

It is at once obvious how greatly the demands on our credulity are reduced. We need no longer suppose that the parents copulated in the presence of their child (a very young one, it is true) - which was a disagreeable idea for many of us. The period of time during which the effects were deferred is very greatly diminished; it now covers only a few months of the child's fourth year and does not stretch back at all into the first dark years of childhood. There remains scarcely anything strange in the child's conduct in making the transference from the dogs on to his parents and in being afraid of the wolf instead of his father. He was in that phase of the development of his attitude towards the world which I have described in Totem and Taboo as the return of totemism. The theory which endeavours to explain the primal scenes found in neuroses as retrospective phantasies of a later date seems to obtain powerful support from the present observation, in spite of our patient being of the tender age of four years. Young though he was, he was yet able to succeed in replacing an impression of his fourth year by an imaginary trauma at the age of one and a half. This regression, however, seems neither mysterious nor tendentious. The scene which was to be made up had to fulfil certain conditions which, in consequence of the circumstances of the dreamer's life, could only be found in precisely this early period; such, for instance, was the condition that he should be in bed in his parents' bedroom.

[1918b, 3544]
But something that I am able to adduce from the analytic findings in other cases will seem to most readers to be the decisive factor in favour of the correctness of the view here proposed. Scenes of observing sexual intercourse between parents at a very early age (whether they be real memories or phantasies) are as a matter of fact by no means rarities in the analyses of neurotic mortals. Possibly they are no less frequent among those who are not neurotics. Possibly they are part of the regular store in the - conscious or unconscious - treasury of their memories. But as often as I have been able by means of analysis to bring out a scene of this sort, it has shown the same peculiarity which startled us with our present patient too: it has related to coitus a tergo, which alone offers the spectator a possibility of inspecting the genitals. There is surely no need any longer to doubt that what we are dealing with is only a phantasy, which is invariably aroused, perhaps, by an observation of the sexual intercourse of animals. And yet more: I have hinted that my description of the 'primal scene' has remained incomplete because I have reserved for a later moment my account of the way in which the child interrupted his parents' intercourse. I must now add that this method of interruption is also the same in every case.

I can well believe that I have now laid myself open to grave aspersions on the part of the readers of this case history. If these arguments in favour of such a view of the 'primal scene' were at my disposal, how could I possibly have taken it on myself to begin by advocating one which seemed so absurd? Or have I made these new observations, which have obliged me to alter my original view, in the interval between the first draft of the case history and this addition, and am I for some reason or other unwilling to admit the fact? I will admit something else instead: I intend on this occasion to close the discussion of the reality of the primal scene with a non liquet. This case history is not yet at an end; in its further course a factor will emerge which will shake the certainty which we seem at present to enjoy. Nothing, I think, will then be left but to refer my readers to the passages in my Introductory Lectures in which I have treated the problem of primal phantasies or primal scenes.

The action of the two-and-a-half-year-old boy in the scene with Grusha is the earliest effect of the primal scene which has come to our knowledge. It represents him as copying his father, and shows us a tendency towards development in a direction which would later deserve the name of masculine. His seduction drove him into passivity - for which, in any case, the way was prepared by his behaviour when he was a witness of his parents' intercourse.

On these issues I can venture upon no decision. I must confess, however, that I regard it as greatly to the credit of psycho-analysis that it should even have reached the stage of raising such questions as these. Nevertheless, I cannot deny that the scene with Grusha, the part it played in the analysis, and the effects that followed from it in the patient's life can be most naturally and completely explained if we consider that the primal scene, which may in other cases be a phantasy, was a reality in the present one. After all, there is nothing impossible about it; and the hypothesis of its reality is entirely compatible with the inciting action of the observations upon animals which are indicated by the sheep-dogs in the dream-picture.
I will now turn from this unsatisfactory conclusion to a consideration of the problem which I have attempted in my *Introductory Lectures on Psycho-Analysis*. I should myself be glad to know whether the primal scene in my present patient's case was a phantasy or a real experience; but, taking other similar cases into account, I must admit that the answer to this question is not in fact a matter of very great importance. These scenes of observing parental intercourse, of being seduced in childhood, and of being threatened with castration are unquestionably an inherited endowment, a phylogenetic heritage, but they may just as easily be acquired by personal experience. With my patient, his seduction by his elder sister was an indisputable reality; why should not the same have been true of his observation of his parents' intercourse? [1918b, 3577]

If we look into the matter more closely we cannot help remarking that in this condition which he laid down for his recovery the patient was simply repeating the state of affairs at the time of the 'primal scene'. At that moment he had wanted to substitute himself for his mother; and, as we assumed long ago, it was he himself who, in the scene in question, had produced the excrement-baby. He still remained fixated, as though by a spell, to the scene which had such a decisive effect on his sexual life, and the return of which during the night of the dream brought the onset of his illness. The tearing of the veil was analogous to the opening of his eyes and to the opening of the window. The primal scene had become transformed into the necessary condition for his recovery. [1918b, 3580]

It appears, moreover, that there is an anxiety belonging to this phase (only, of course, where some disturbance has arisen) which manifests itself as a fear of death and may be attached to anything that is pointed out to the child as being suitable for the purpose. With our patient it was employed to induce him to overcome his loss of appetite and indeed to overcompensate for it. A possible origin of this disturbance of his appetite will be found, if we bear in mind (basing ourselves on the hypothesis that we have so often discussed) that his observation of copulation at the age of one and a half, which produced so many deferred effects, certainly occurred before the time of these difficulties in his eating. So we may perhaps suppose that it accelerated the processes of sexual maturing and consequently did in fact also produce *immediate* effects, though these were insignificant in appearance. [1918b, 3583]

His seduction continued to make its influence felt, by maintaining the passivity of his sexual aim. It transformed his sadism to a great extent into the masochism which was its passive counterpart. But it is questionable whether the seduction can be made entirely responsible for this characteristic of passivity, for the child's reaction to his observation of intercourse at the age of one and a half was already preponderantly a passive one. His sympathetic sexual excitement expressed itself by his passing a stool, though it is true that in this behaviour an active element is also to be distinguished. Side by side with the masochism which dominated his sexual impulses and also found expression in phantasies, his sadism, too, persisted and was directed against small animals. His sexual researches had set in from the time of the seduction and had been concerned, in essence, with two problems: the origin of children and the possibility of losing the genitals. These researches wove themselves into the manifestations of his instinctual impulses, and directed his sadistic propensities on to small animals as being representatives of small children. [1918b, 3585]
We have now carried our account down to about the time of the boy's fourth birthday, and it was at that point that the dream brought into deferred operation his observation of intercourse at the age of one and a half. It is not possible for us completely to grasp or adequately to describe what now ensued. The activation of the picture, which, thanks to the advance in his intellectual development, he was now able to understand, operated not only like a fresh event, but like a new trauma, like an interference from outside analogous to the seduction. The genital organization which had been broken off was re-established at a single blow; but the advance that was achieved in the dream could not be maintained. On the contrary, there came about, by means of a process that can only be equated with a repression, a repudiation of the new element and its replacement by a phobia.

As regards the prehistory of the Oedipus complex in boys we are far from complete clarity. We know that that period includes an identification of an affectionate sort with the boy's father, an identification which is still free from any sense of rivalry in regard to his mother. Another element of that stage is invariably, I believe, a masturbatory activity in connection with the genitals, the masturbation of early childhood, the more or less violent suppression of which by those in charge of the child sets the castration complex in action. It is to be assumed that this masturbation is attached to the Oedipus complex and serves as a discharge for the sexual excitation belonging to it. It is, however, uncertain whether the masturbation has this character from the first, or whether on the contrary it makes its first appearance spontaneously as an activity of a bodily organ and is only brought into relation with the Oedipus complex at some later date; this second possibility is by far the more probable. Another doubtful question is the part played by bed-wetting and by the breaking of that habit through the intervention of training measures. We are inclined to make the simple connection that continued bed-wetting is a result of masturbation and that its suppression is regarded by boys as an inhibition of their genital activity - that is, as having the meaning of a threat of castration; but whether we are always right in supposing this remains to be seen. Finally, analysis shows us in a shadowy way how the fact of a child at a very early age listening to his parents copulating may set up his first sexual excitation, and how that event may, owing to its after-effects, act as a starting-point for the child's whole sexual development. Masturbation, as well as the two attitudes in the Oedipus complex, later on become attached to this early experience, the child having subsequently interpreted its meaning. It is impossible, however, to suppose that these observations of coitus are of universal occurrence, so that at this point we are faced with the problem of 'primal phantasies'. Thus the prehistory of the Oedipus complex, even in boys, raises all of these questions for sifting and explanation; and there is the further problem of whether we are to suppose that the process invariably follows the same course, or whether a great variety of different preliminary stages may not converge upon the same terminal situation.

Various sorts. In the first place, impressions capable of permanently influencing the child's budding sexual life - such as observations of sexual activities between adults, or sexual experiences of his own with an adult or another child (no rare events); or, again, overhearing conversations, understood either at the time or retrospectively, from which the child thought it could draw conclusions about mysterious or uncanny matters; or again, remarks or actions by the child himself which give evidence of significant attitudes of affection or enmity towards other people. It is of special importance in an analysis to induce a memory of the patient's own forgotten sexual activity as a child and also of the intervention by the adults which brought it to an end.
Fenichel (1930) rightly emphasizes the difficulty of recognizing in the material produced in analysis what parts of it represent the unchanged content of the pre-Oedipus phase and what parts have been distorted by regression (or in other ways). He does not accept Jeanne Lampl-de Groot's assertion of the little girl's active attitude in the phallic phase. He also rejects the 'displacement backwards' of the Oedipus complex proposed by Melanie Klein (1928), who places its beginnings as early as the commencement of the second year of life. This dating of it, which would also necessarily imply a modification of our view of all the rest of the child's development, does not in fact correspond to what we learn from the analyses of adults, and it is especially incompatible with my findings as to the long duration of the girl's pre-Oedipus attachment to her mother. A means of softening this contradiction is afforded by the reflection that we are not as yet able to distinguish in this field between what is rigidly fixed by biological laws and what is open to movement and change under the influence of accidental experience. The effect of seduction has long been familiar to us and in just the same way other factors - such as the date at which the child's brothers and sisters are born or the time when it discovers the difference between the sexes, or again its direct observations of sexual intercourse or its parents' behaviour in encouraging or repelling it - may hasten the child's sexual development and bring it to maturity.

[1931b, 4606]

Analytic experience has convinced us of the complete truth of the assertion so often to be heard that the child is psychologically father to the adult and that the events of his first years are of paramount importance for his whole later life. It will thus be of special interest to us if there is something that may be described as the central experience of this period of childhood. Our attention is first attracted by the effects of certain influences which do not apply to all children, though they are common enough - such as the sexual abuse of children by adults, their seduction by other children (brothers or sisters) slightly their seniors, and, what we should not expect, their being deeply stirred by seeing or hearing at first hand sexual behaviour between adults (their parents) mostly at a time at which one would not have thought they could either be interested in or understand any such impressions, or be capable of remembering them later. It is easy to confirm the extent to which such experiences arouse a child's susceptibility and force his own sexual urges into certain channels from which they cannot afterwards depart. Since these impressions are subjected to repression either at once or as soon as they seek to return as memories, they constitute the determinant for the neurotic compulsion which will subsequently make it impossible for the ego to control the sexual function and will probably cause it to turn away from that function permanently. If this latter reaction occurs, the result will be a neurosis; if it is absent, a variety of perversions will develop, or the function, which is of immense importance not only for reproduction but also for the entire shaping of life, will become totally unmanageable.

[1940a [1938], 4995]
I was left with the same feeling of satisfaction when I woke from the absurd dream of my father having played a political part among the Magyars after his death; and the reason I gave myself for this feeling was that it was a continuation of the feeling that accompanied the last piece of the dream. I remembered how like Garibaldi he had looked on his death-bed and felt glad that it had come true. . . . (There was a continuation which I had forgotten). The analysis enabled me to fill in this gap in the dream. It was a mention of my second son, to who I had given the first name of a great historical figure who had powerfully attracted me in my boyhood, especially since my visit to England. During the year before the child's birth I had made up my mind to use this name if it were a son and I greeted the new-born baby with it with a feeling of high satisfaction. (It is easy to see how the suppressed megalomania of fathers is transferred in their thoughts on to their children, and it seems quite probable that this is one of the ways in which the suppression of that feeling, which becomes necessary in actual life, is carried out.) The little boy's right to appear in the context of this dream was derived from the fact that he had just had the same misadventure - easily forgivable both in a child and in a dying man - of soiling his bed-clothes. Compare in this connection Stuhlrichter ['presiding judge', literally 'chair-' or 'stool-judge'] and the wish expressed in the dream to stand before one's children's eyes great and unsullied.

But we are able to bring forward other motives than these, thanks to the knowledge of concealed mental impulses which we have acquired from the psycho-analytic examination of individual human beings. A woman whose psychosexual needs should find satisfaction in her marriage and her family life is often threatened with the danger of being left unsatisfied, because her marriage relation has come to a premature end and because of the uneventfulness of her emotional life. A mother, as she grows older, saves herself from this by putting herself in her children's place, by identifying herself with them; and this she does by making their emotional experiences her own. Parents are said to stay young with their children, and that is indeed one of the most precious psychological gains that parents derive from their children. Where a marriage is childless, the wife has lost one of the things which might be of most help to her in tolerating the resignation that her own marriage demands from her. A mother's sympathetic identification with her daughter can easily go so far that she herself falls in love with the man her daughter loves; and in glaring instances this may lead to severe forms of neurotic illness as a result of her violent mental struggles against this emotional situation. In any case, it very frequently happens that a mother-in-law is subject to an impulse to fall in love in this way, and this impulse itself or an opposing trend are added to the tumult of conflicting forces in her mind. And very often the unkind, sadistic components of her love are directed on to her son-in-law in order that the forbidden, affectionate ones may be the more severely suppressed.

Aim-inhibited Sexual Impulses. - The social instincts belong to a class of instinctual impulses which need not be described as sublimated, though they are closely related to these. They have not abandoned their directly sexual aims, but they are held back by internal resistances from attaining them; they rest content with certain approximations to satisfaction and for that very reason lead to especially firm and permanent attachments between human beings. To this class belong in particular the affectionate relations between parents and children, which were originally fully sexual, feelings of friendship, and the emotional ties in marriage which had their origin in sexual attraction.
The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him.

[1933a, 4735]
I informed Dora of the conclusions I had reached. The impression made upon her must have been forcible, for there immediately appeared a piece of the dream which had been forgotten: *she went calmly to her room, and began reading a big book that lay on her writing table.*¹ The emphasis here was upon the two details 'calmly' and 'big' in connection with 'book'. I asked whether the book was in *encyclopedia format,* and she said it was. Now children never read about forbidden subjects in an *encyclopedia calmly.* They do it in fear and trembling, with an uneasy look over their shoulder to see if some one may not be coming. Parents are very much in the way while reading of this kind is going on. But this uncomfortable situation had been radically improved, thanks to the dream's power of fulfilling wishes. Dora's father was dead, and the others had already gone to the cemetery. She might calmly read whatever she chose. Did not this mean that one of her motives for revenge was a revolt against her parents' constraint? If her father was dead she could read or love as she pleased.

For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least feels he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from *him* than from *her.* In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object-love, and in the formation of that complex which deserves to be called the *nuclear complex of the neuroses.* It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened - usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about.
I do not know how often parents and educators, faced with inexplicable naughtiness on the part of a child, might not have occasion to bear this typical state of affairs in mind. A child who behaves in this unmanageable way is making a confession and trying to provoke punishment. He hopes for a beating as a simultaneous means of setting his sense of guilt at rest and of satisfying his masochistic sexual trend.

Aim-inhibited Sexual Impulses. - The social instincts belong to a class of instinctual impulses which need not be described as sublimated, though they are closely related to these. They have not abandoned their directly sexual aims, but they are held back by internal resistances from attaining them; they rest content with certain approximations to satisfaction and for that very reason lead to especially firm and permanent attachments between human beings. To this class belong in particular the affectionate relations between parents and children, which were originally fully sexual, feelings of friendship, and the emotional ties in marriage which had their origin in sexual attraction.

We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these dé tours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.
Actually we have already come across a convincing example of an absurd dream with this kind of meaning: the dream - I interpreted it without any analysis - of the performance of a Wagner opera which lasted till a quarter to eight in the morning and in which the orchestra was conducted from a tower, and so on (see p. 811 f.). It evidently meant to say: 'This is a topsy-turvy world and a crazy society; the person who deserves something doesn't get it, and the person who doesn't care about something does get it' - and there the dreamer was comparing her fate with her cousin's. - Nor is it by any means a matter of chance that our first examples of absurdity in dreams related to a dead father. In such cases, the conditions for creating absurd dreams are found together in characteristic fashion. The authority wielded by a father provokes criticism from his children at an early age, and the severity of the demands he makes upon them leads them, for their own relief, to keep their eyes open to any weakness of their father's; but the filial piety called up by the figure of a father, particularly after his death, tightens the censorship which prohibits any such criticism from being consciously expressed. [1900a, 883]

There are other slips of the tongue where we may assume that the true disturbing factor is some similarity in sound to obscene words and meanings. Deliberate distortion and deformation of words and expressions, which is so dear to vulgar minds, has the sole purpose of exploiting innocent occasions for hinting at forbidden topics; and this playing with words is so frequent that there would be nothing remarkable in its occurring even when not intended and against one's wishes. To this category no doubt belong such examples as *Eischeissweibchen* (for *Eiweissscheibchen*),¹ *Apos Fritz* (for *à propos*),² *Lokuskapitäl* (for *Lotuskapitäl*),³ etc.; and perhaps also the *Alabüsterbachse* (Alabasterbüchse)⁴ of St. Mary Magdalen.⁵ - 'Ich fordere Sie auf, auf das Wohl unseres Chefs auf zustossen' can hardly be anything other than an unintentional parody which is a perseveration of an intended one. If I were the Principal who was being honoured at the ceremony to which the speaker contributed this slip, I should probably reflect on the cleverness of the Romans in permitting the soldiers of a general who was enjoying a Triumph openly to express in the form of satirical songs their inner criticisms of the man who was being honoured. - Meringer relates that he himself once said to someone, who by reason of being the eldest member of the company was addressed familiarly by the honorific title of 'Senexl' or 'altes Senexl': 'Prost, Senex altesl!' He was himself shocked at this mistake (Meringer and Mayer, 1895, 50). We can perhaps interpret his emotion if we reflect how close 'Altesl' comes to the insulting phrase 'alter Esel'. There are powerful internal punishments for any breach of the respect due to age (that is, reduced to childhood terms, of the respect due to the father). [1901b, 1173]

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object-love, and in the formation of that complex which deserves to be called the *nuclear complex of the neuroses*. It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened - usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about. [1909d, 2162]
It does indeed sound strange that the Devil should be chosen as a substitute for a loved father. But this is only so at first sight, for we know a good many things which lessen our surprise. To begin with, we know that God is a father-substitute; or, more correctly, that he is an exalted father; or, yet again, that he is a copy of a father as he is seen and experienced in childhood - by individuals in their own childhood and by mankind in its prehistory as the father of the primitive and primal horde. Later on in life the individual sees his father as something different and lesser. But the ideational image belonging to his childhood is preserved and becomes merged with the inherited memory-traces of the primal father to form the individual's idea of God. We also know, from the secret life of the individual which analysis uncovers, that his relation to his father was perhaps ambivalent from the outset, or, at any rate, soon became so. That is to say, it contained two sets of emotional impulses that were opposed to each other: it contained not only impulses of an affectionate and submissive nature, but also hostile and defiant ones. It is our view that the same ambivalence governs the relations of mankind to its Deity. The unresolved conflict between, on the one hand, a longing for the father and, on the other, a fear of him and a son's defiance of him, has furnished us with an explanation of important characteristics of religion and decisive vicissitudes in it.²

We have here an example of the process, with which we are familiar, by which an idea that has a contradictory - an ambivalent - content becomes divided into two sharply contrasted opposites. The contradictions in the original nature of God are, however, a reflection of the ambivalence which governs the relation of the individual to his personal father. If the benevolent and righteous God is a substitute for his father, it is not to be wondered at that his hostile attitude to his father, too, which is one of hating and fearing him and of making complaints against him, should have come to expression in the creation of Satan. Thus the father, it seems, is the individual prototype of both God and the Devil. But we should expect religions to bear ineffaceable marks of the fact that the primitive primal father was a being of unlimited evil - a being less like God than the Devil.

[1923d, 4009]

[1923d, 4010]
Thus we find at this early stage, what holds good all through life, that sexual satisfaction is the best soporific. Most cases of nervous insomnia can be traced back to lack of sexual satisfaction. It is well known that unscrupulous nurses put crying children to sleep by stroking their genitals.

POLYMORPHOUSLY PERVERSE DISPOSITION It is an instructive fact that under the influence to seduction children can become polymorphously perverse, and can be led into all possible kinds of sexual irregularities. This shows that an aptitude for them is innately present in their disposition. There is consequently little resistance towards carrying them out, since the mental dams against sexual excesses - shame, disgust and morality - have either not yet been constructed at all or are only in course of construction, according to the age of the child. In this respect children behave in the same kind of way as an average uncultivated woman in whom the same polymorphously perverse disposition persists. Under ordinary conditions she may remain normal sexually, but if she is led on by a clever seducer she will find every sort of perversion to her taste, and will retain them as part of her own sexual activities. Prostitutes exploit the same polymorphous, that is, infantile, disposition for the purposes of their profession; and, considering the immense number of women who are prostitutes or who must be supposed to have an aptitude for prostitution without becoming engaged in it, it becomes impossible not to recognize that this same disposition to perversions of every kind is a general and fundamental human characteristic.

It was not possible to say what amount of sexual activity can occur in childhood without being described as abnormal or detrimental to further development. The nature of these sexual manifestations was found to be predominantly masturbatory. Experience further showed that the external influences of seduction are capable of provoking interruptions of the latency period or even its cessation, and that in this connection the sexual instinct of children proves in fact to be polymorphously perverse; it seems, moreover, that any such premature sexual activity diminishes a child's educability.

Meaning his penis. It is one of the commonest things - psycho-analyses are full of such incidents - for children's genitals to be caressed, not only in word but in deed, by fond relatives, including even parents themselves.

² Meaning his penis. It is one of the commonest things - psycho-analyses are full of such incidents - for children's genitals to be caressed, not only in word but in deed, by fond relatives, including even parents themselves.
Among the occurrences which recur again and again in the youthful history of neurotics - which are scarcely ever absent - there are a few of particular importance, which also deserve, on that account, I think, to be brought into greater prominence than the rest. As specimens of this class I will enumerate these: observation of parental intercourse, seduction by an adult and threat of being castrated. It would be a mistake to suppose that they are never characterized by material reality; on the contrary, this is often established incontestably through enquiries from older members of the patient's family. It is by no means a rare thing, for instance, for a little boy, who is beginning to play with his penis in a naughty way and is not yet aware that one must conceal such activities, to be threatened by a parent or nurse with having his penis or his sinful hand cut off. Parents will often admit this when they are asked, since they think they have done something useful in making such a threat; a number of people have a correct conscious memory of such a threat, especially if it was made at a somewhat later period. If the threat is delivered by the mother or some other female she usually shifts its performance on to the father or the doctor. In *Struwwelpeter*, the famous work of the Frankfurt paediatrician Hoffmann (which owes its popularity precisely to an understanding of the sexual and other complexes of childhood), you will find castration softened into a cutting-off of the thumbs as a punishment for obstinate sucking. But it is highly improbable that children are threatened with castration as often as it appears in the analyses of neurotics. We shall be satisfied by realizing that the child puts a threat of this kind together in his imagination on the basis of hints, helped out by a knowledge that auto-erotic satisfaction is forbidden and under the impression of his discovery of the female genitals. Nor is it only in proletarian families that it is perfectly possible for a child, while he is not yet credited with possessing an understanding or a memory, to be a witness of the sexual act between his parents or other grown-up people; and the possibility cannot be rejected that he will be able to understand and react to the impression in retrospect. If, however, the intercourse is described with the most minute details, which would be difficult to observe, or if, as happens most frequently, it turns out to have been intercourse from behind *more ferarum* [in the manner of animals], there can be no remaining doubt that the phantasy is based on an observation of intercourse between animals (such as dogs) and that its motive was the child's unsatisfied scopophilia during puberty. The extreme achievement on these lines is a phantasy of observing parental intercourse while one is still an unborn baby in the womb. Phantasies of being seduced are of particular interest, because so often they are not phantasies but real memories. Fortunately, however, they are nevertheless not real as often as seemed at first to be shown by the findings of analysis. Seduction by an older child or by one of the same age is even more frequent than by an adult; and if in the case of girls who produce such an event in the story of their childhood their father figures fairly regularly as the seducer, there can be no doubt either of the imaginary nature of the accusation or of the motive that has led to it. A phantasy of being seduced when no seduction has occurred is usually employed by a child to screen the auto-erotic period of his sexual activity. He spares himself shame about masturbation by retrospectively phantasying a desired object into these earliest times. You must not suppose, however, that sexual abuse of a child by its nearest male relatives belongs entirely to the realm of phantasy. Most analysts will have treated cases in which such events were real and could be unimpeachably established; but even so they related to the later years of childhood and had been transposed into earlier times. [1916-1917, 3426]
The explanation came at a single blow, when the patient suddenly called to mind the fact that, when he was still very small, 'on the first estate', his sister had seduced him into sexual practices. First came a recollection that in the lavatory, which the children used frequently to visit together, she had made this proposal: 'Let's show our bottoms', and had proceeded from words to deeds. Subsequently the more essential part of the seduction came to light, with full particulars as to time and place. It was in spring, at a time when his father was away; the children were in one room playing on the floor, while their mother was working in the next. His sister had taken hold of his penis and played with it, at the same time telling him incomprehensible stories about his Nanya, as though by way of explanation. His Nanya, she said, used to do the same thing with all kinds of people - for instance, with the gardener: she used to stand him on his head, and then take hold of his genitals.

[1918b, 3513]

But his seduction by his sister was certainly not a phantasy. Its credibility was increased by some information which had never been forgotten and which dated from a later part of his life, when he was grown up. A cousin who was more than ten years his elder told him in a conversation about his sister that he very well remembered what a forward and sensual little thing she had been: once, when she was a child of four or five, she had sat on his lap and opened his trousers to take hold of his penis.

[1918b, 3513]

Various sorts. In the first place, impressions capable of permanently influencing the child's budding sexual life - such as observations of sexual activities between adults, or sexual experiences of his own with an adult or another child (no rare events); or, again, overhearing conversations, understood either at the time or retrospectively, from which the child thought it could draw conclusions about mysterious or uncanny matters; or again, remarks or actions by the child himself which give evidence of significant attitudes of affection or enmity towards other people. It is of special importance in an analysis to induce a memory of the patient's own forgotten sexual activity as a child and also of the intervention by the adults which brought it to an end.

[1926e, 4358]

Analytic experience has convinced us of the complete truth of the assertion so often to be heard that the child is psychologically father to the adult and that the events of his first years are of paramount importance for his whole later life. It will thus be of special interest to us if there is something that may be described as the central experience of this period of childhood. Our attention is first attracted by the effects of certain influences which do not apply to all children, though they are common enough - such as the sexual abuse of children by adults, their seduction by other children (brothers or sisters) slightly their seniors, and, what we should not expect, their being deeply stirred by seeing or hearing at first hand sexual behaviour between adults (their parents) mostly at a time at which one would not have thought they could either be interested in or understand any such impressions, or be capable of remembering them later. It is easy to confirm the extent to which such experiences arouse a child's susceptibility and force his own sexual urges into certain channels from which they cannot afterwards depart. Since these impressions are subjected to repression either at once or as soon as they seek to return as memories, they constitute the determinant for the neurotic compulsion which will subsequently make it impossible for the ego to control the sexual function and will probably cause it to turn away from that function permanently. If this latter reaction occurs, the result will be a neurosis; if it is absent, a variety of perversions will develop, or the function, which is of immense importance not only for reproduction but also for the entire shaping of life, will become totally unmanageable.

[1940a [1938], 4995]
It was not possible to say what amount of sexual activity can occur in childhood without being described as abnormal or detrimental to further development. The nature of these sexual manifestations was found to be predominantly masturbatory. Experience further showed that the external influences of seduction are capable of provoking interruptions of the latency period or even its cessation, and that in this connection the sexual instinct of children proves in fact to be polymorphously perverse; it seems, moreover, that any such premature sexual activity diminishes a child's educability.

At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction - but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What does awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so you are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education. For society must undertake as one of its most important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical with the bidding of society. It is also concerned to postpone the full development of the instinct till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct, educability is for practical purposes at an end. Otherwise, the instinct would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, by the eternal, primaevail exigencies of life, which are with us to this day.

Experience must no doubt have taught the educators that the task of making the sexual will of the new generation tractable could only be carried out if they began to exercise their influence very early, if they did not wait for the storm of puberty but intervened already in the sexual life of children which is preparatory to it. For this reason almost all infantile sexual activities were forbidden to children and frowned upon; an ideal was set up of making the life of children asexual, and in course of time things came to the point at which people really believed they were asexual and thereafter science pronounced this as its doctrine. To avoid contradicting their belief and their intentions, people since then overlook the sexual activities of children (no mean achievement) or are content in science to take a different view of them. Children are pure and innocent, and anyone who describes them otherwise can be charged with being an infamous blasphemer against the tender and sacred feelings of mankind.
Now it is a very noteworthy fact that the sexual instincts and the self-preservative instincts do not behave in the same way towards real necessity. The self-preservative instincts, and everything to do with them, are much easier to educate: they learn early to comply with necessity and to arrange their developments in accordance with the instructions of reality. This is intelligible, since they could not obtain the objects they need in any other way; and without those objects the individual would inevitably perish. The sexual instincts are harder to educate, for at first they have no need of an object. Since they are attached like parasites, as it were, to the other bodily functions, and find their satisfaction auto-erotically on the subject's own body, they are to begin with withdrawn from the educative influence of real necessity, and they retain this characteristic of being self-willed and inaccessible to influence (what we describe as being 'unreasonable') in most people in some respect all through their lives. Moreover, as a rule the educability of a youthful individual is at an end when his sexual needs arise in their full strength. Educators are aware of this and act accordingly; but the findings of psycho-analysis may perhaps also induce them to shift the main impact of education on to the earliest years of childhood, from infancy onwards. The little creature is often completed by the fourth or fifth year of life, and after that merely brings gradually to light what is already within him. [1916-1917, 3415]
(1) One summer holiday my wife made me greatly annoyed though the cause was innocent enough. We were sitting at table d'hôte opposite a gentleman from Vienna whom I knew and who no doubt remembered me too. However, I had reasons of my own for not renewing the acquaintance. My wife, who had heard no more than his distinguished name, revealed too plainly that she was listening to his conversation with his neighbours, for from time to time she turned to me with questions that took up the thread of their discussion. I became impatient and finally irritated. Some weeks later I was complaining to a relative about this behaviour on my wife's part but was unable to recall a single word of the gentleman's conversation. As I am normally rather apt to harbour grievances and can forget no detail of an incident that has annoyed me, my amnesia in the present case was probably motivated by consideration for my wife. A short time ago I had a similar experience. I wished to have a good laugh with an intimate friend over a remark made by my wife only a few hours before, but was prevented from doing so by the singular fact that I had utterly forgotten what she had said. I had first to ask my wife to remind me what it was. It is easy to understand my forgetfulness here as being analogous to the typical disturbance of judgement to which we are subject where those nearest to us are concerned.

[1901b, 1220]
Any inaccuracies in my own account of this phantasy could, I assured myself, easily be corrected at home when I had the book in front of me. But when I finally looked through *Le Nabab* to check this passage in my manuscript, which was ready to go to press, I found, to my very great shame and consternation, no mention of any such reverie on the part of Monsieur Jocelyn; in fact the poor book-keeper did not have this name at all but was called Monsieur Joyeuse. This second error quickly gave me the key to the solution of the first one - the paramnesia. ‘Joyeux’, of which ‘Joyeuse’ is the feminine form, is the only possible way in which I could translate my own name, Freud, into French. Where then could the phantasy, which I had remembered wrongly and ascribed to Daudet, have come from? It could only be a product of my own, a day-dream which I had formed myself and which had not become conscious or which had once been conscious and had since been totally forgotten. Perhaps I invented it myself in Paris where I frequently walked about the streets, lonely and full of longings, greatly in need of a helper and protector, until the great Charcot took me into his circle. Later I more than once met the author of *Le Nabab* in Charcot’s house.¹

¹ [Footnote added 1924:] Some time ago one of my readers sent me a small volume from Franz Hoffmann’s *Jugendbibliothek* in which a rescue scene like the one in my phantasy in Paris is recounted in detail. The agreement between the two extends even to certain not quite ordinary expressions that occur in both. It is not easy to avoid suspecting that I had in fact read this children’s book while I was myself a boy. The library at my secondary school contained Hoffmann’s series and was always ready to offer these books to pupils in place of any other mental pabulum. The phantasy which, at the age of 43, I thought I remembered as having been produced by someone else, and which I was subsequently forced to recognize as a creation of my own at the age of 28, may therefore easily have been an exact reproduction of an impression which I had received somewhere between the ages of 11 and 13. After all, the rescue phantasy which I attributed to the unemployed book-keeper in *Le Nabab* was merely meant to prepare the way for the phantasy of my own rescue, to make my longing for a patron and protector tolerable to my pride. This being so, it will not surprise anyone with an understanding of the mind to hear that in my conscious life I myself was highly resistant to the idea of being dependent on a protector’s favour, and that I found it hard to tolerate the few real situations in which something of that nature occurred. Abraham (1922b) has brought to light the deeper meaning of phantasies with such a content and has provided an almost exhaustive explanation of their special features.

[1901b, 1231]
Another paramnesia, which it was possible to explain satisfactorily, is reminiscent fausse reconnaissance, a subject that will be discussed later. I had told one of my patients, an ambitious and capable man, that a young student had recently gained admittance to the circle of my followers on the strength of an interesting work, 'Der Künstler, Versuch einer Sexualpsychologie'. When this work appeared in print a year and a quarter later, my patient maintained that he could remember with certainty having read an announcement of this book somewhere (perhaps in a bookseller's prospectus) even before - a month or six months before - I had first mentioned it to him. This announcement, he said, had come into his mind at the time; and he further remarked that the author had changed the title: it no longer read 'Versuch' but 'Ansätze zu einer Sexualpsychologie. Careful enquiry of the author and a comparison of all the dates nevertheless showed that my patient was claiming to recall something impossible. No announcement of this work had appeared anywhere before publication, and certainly none a year and a quarter before it went to press. When I omitted to interpret this paramnesia, my patient produced a repetition of it of the same kind. He believed he had recently seen a work on agoraphobia in a bookshop window and was now looking through all the publishers' catalogues in order to get a copy. I was then able to explain to him why his efforts were bound to be fruitless. The work on agoraphobia existed only in his phantasy, as an unconscious intention: he meant to write it himself. His ambition to emulate the young man and become one of my followers on the strength of a similar scientific work was responsible for the first paramnesia and then for its repetition. Whereupon he recalled that the bookseller's announcement which had led him to make this false recognition dealt with a work entitled 'Genesis, das Gesetz der Zeugung'. However, it was I who was responsible for the change in the title mentioned by him, for I could remember having myself been guilty of that inaccuracy - 'Versuch' instead of 'Ansätze' - in repeating the title.

[1901b, 1232]

We must also include in the category of the miraculous and the 'uncanny' the peculiar feeling we have, in certain moments and situations, of having had exactly the same experience once before or of having once before been in the same place, though our efforts never succeed in clearly remembering the previous occasion that announces itself in this way. I am aware that I am merely following loose linguistic usage when I call what arises in a person at such moments a 'feeling'. What is no doubt in question is a judgement, and, more precisely, a perceptual judgement; but these cases have nevertheless a character quite of their own, and we must not leave out of account the fact that what is looked for is never remembered. I do not know whether this phenomenon of 'déjà vu' has ever been seriously offered in proof of an individual's previous psychical existence; but psychologists have certainly turned their attention to it and have endeavoured to solve the problem in a whole variety of speculative ways. None of the attempted explanations which they have brought forward seems to me to be correct, because none of them takes into consideration anything other than the concomitant manifestations and the conditions which favour the phenomenon. Those psychical processes which according to my observations are alone responsible for the explanation of 'déjà vu' - namely, unconscious phantasies - are still generally neglected by psychologists even to-day.

[1901b, 1335]

It is in my view wrong to call the feeling of having experienced something before an illusion. It is rather that at such moments something is really touched on which we have already experienced once before, only we cannot consciously remember it because it has never been conscious. To put it briefly, the feeling of 'déjà vu' corresponds to the recollection of an unconscious phantasy. There exist unconscious phantasies (or day-dreams) just as there exist conscious creations of the same kind which everybody knows from his own experience.

[1901b, 1335]
I know that the subject would merit the most exhaustive treatment; but I shall here do no more
than give the analysis of a single case of 'déjà vu' where the feeling was characterized by
especial intensity and persistence. A lady who is now thirty-seven claimed to have a most
distinct memory of having at the age of twelve and a half paid her first visit to some school
friends in the country. When she entered the garden, she had an immediate feeling of having
been there before. This feeling was repeated when she went into the reception rooms, so that
she felt she knew in advance what room would be the next one, what view there would be from
it, and so on. But the possibility that this feeling of familiarity could have owed its origin to an
earlier visit to the house and garden, perhaps one in her earliest childhood, was absolutely ruled
out and was disproved as a result of her questioning her parents. The lady who reported this
was not in search of any psychological explanation, but saw the occurrence of this feeling as a
prophetic indication of the significance for her emotional life which these same school friends
later acquired. However, a consideration of the circumstances in which the phenomenon
occurred in her shows us the way to another view of the matter. At the time when she paid the
visit she knew that these girls had an only brother, who was seriously ill. During the visit she
actually set eyes on him, though he looked very ill and she said to herself that he would die
soon. Now, her own only brother had been dangerously ill with diphtheria a few months earlier;
during his illness she had spent several weeks away from her parents' house, staying with a
relative. She believed that her brother had been with her on this visit to the country; she even
thought it had been his first considerable journey after his illness; but her memory was
remarkably uncertain on these points while of all the other details, and in particular of the dress
she was wearing that day, she had an ultra-clear picture. Anyone who is well-informed will find
no difficulty in concluding from these hints that the expectation that her brother would die had at
that time played an important part in the girl's thoughts and either had never become conscious
or, after the favourable termination of the illness, had succumbed to energetic repression. If
things had turned out otherwise, she would have had to wear a different dress - mourning. She
found an analogous situation in the home of her friends, whose only brother was in danger of
dying soon, as in fact he did shortly after. She ought to have remembered consciously that she
herself had lived through this situation a few months before: instead of remembering it - which
was prevented by repression - she transferred her feeling of remembering something to her
surroundings, the garden and the house, and fell a victim to the 'fausse reconnaissance' of
having seen all this exactly the same once before. From the fact that repression occurred we
may conclude that her former expectation of her brother's death had not been far removed from
a wishful phantasy. She would then have been the only child. In her later neurosis she suffered
most severely from a fear of losing her parents, behind which, as usual, analysis was able to
reveal the unconscious wish with the same content.
[1901b, 1336]
MECHANICAL EXCITATIONS   At this point we must also mention the production of sexual
excitation by rhythmic mechanical agitation of the body. Stimuli of
this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on
the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of
these pleasurable sensations - and it is worth emphasizing the fact that in this connection the
concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction,
a circumstance which we must later endeavour to explain - the existence, then, of these
pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by
the fact that children are so fond of games of passive movement, such as swinging and being
thrown up into the air, and insist on such games being incessantly repeated.¹ It is well known
that rocking is habitually used to induce sleep in restless children. The shaking produced by
driving in carriages and later by railway-travel exercises such a fascinating effect upon older
children that every boy, at any rate, has at one time or other in his life wanted to be an engine
driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest
in things connected with railways, and, at the age at which the production of phantasies is most
active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly
sexual. A compulsive link of this kind between railway-travel and sexuality is clearly derived
from the pleasurable character of the sensations of movement. In the event of repression, which
turns so many childish preferences into their opposite, these same individuals, when they are
adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly
exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will
protect themselves against a repetition of the painful experience by a dread of railway-travel.
[1905d, 1520]

It is in the world of ideas, however, that the choice of an object is accomplished at first; and
the sexual life of maturing youth is almost entirely restricted to indulging in phantasies, that is, in
ideas that are not destined to be carried into effect.¹ In these phantasies the infantile tendencies
invariably emerge once more, but this time with intensified pressure from somatic sources.
Among these tendencies the first place is taken with uniform frequency by the child's sexual
impulses towards his parents, which are as a rule already differentiated owing to the attraction
of the opposite sex - the son being drawn towards his mother and the daughter towards her
father.² At the same time as these plainly incestuous phantasies are overcome and repudiated,
one of the most significant, but also one of the most painful, psychical achievements of the
pubertal period is completed: detachment from parental authority, a process that alone makes
possible the opposition, which is so important for the progress of civilization, between the new
generation and the old. At every stage in the course of development through which all human
beings ought by rights to pass, a certain number are held back; so there are some who have
never got over their parents' authority and have withdrawn their affection from them either very
incompletely or not at all. They are mostly girls, who, to the delight of their parents, have
persisted in all their childish love far beyond puberty. It is most instructive to find that it is
precisely these girls who, in their later marriage lack the capacity to give their husbands what is
due to them; they make cold wives and remain sexually anaesthetic. We learn from this that
sexual love and what appears to be non-sexual love for parents are fed from the same sources;
the latter, that is to say, merely corresponds to an infantile fixation of the libido.
[1905d, 1539]
The interest taken by the hero of the story in this relief is the basic psychological fact in the narrative. It was not immediately explicable. 'Dr. Norbert Hanold, Lecturer in Archaeology, did not in fact find in the relief anything calling for special notice from the point of view of his branch of science.' (3.)¹ 'He could not explain to himself what there was in it that had provoked his attention. He only knew that he had been attracted by something and that the effect had continued unchanged ever since.' But his imagination was occupied with the sculpture without ceasing. He found something 'of to-day' about it, as though the artist had had a glimpse in the street and captured it 'from the life'. He gave the girl thus pictured as she stepped along the name of 'Gradiva' - 'the girl who steps along'. He made up a story that she was no doubt the daughter of an aristocratic family, perhaps 'of a patrician aedile, who carried out his office in the service of Ceres', and that she was on her way to the goddess's temple. Then he found it hard to fit her quiet, calm nature into the busy life of a capital city. He convinced himself, rather, that she must be transported to Pompeii, and that somewhere there she was stepping across the curious stepping-stones which have been dug up and which made it possible to cross dry-foot from one side of the street to the other in rainy weather, though allowing carriage-wheels to pass between them as well. Her features struck him as having a Greek look and he had no doubt that she was of Hellenic origin. Little by little he brought the whole of his archaeological learning into the service of these and other phantasies relating to the original who had been the model for the relief.

[1907a, 1816]

Should we not look for the first traces of imaginative activity as early as in childhood? The child's best-loved and most intense occupation is with his play or games. Might we not say that every child at play behaves like a creative writer, in that he creates a world of his own, or, rather, re-arranges the things of his world in a new way which pleases him? It would be wrong to think he does not take that world seriously; on the contrary, he takes his play very seriously and he expends large amounts of emotion on it. The opposite of play is not what is serious but what is real. In spite of all the emotion with which he cathects his world of play, the child distinguishes it quite well from reality; and he likes to link his imagined objects and situations to the tangible and visible things of the real world. This linking is all that differentiates the child's 'play' from 'phantasying'.

[1908e, 1921]

The creative writer does the same as the child at play. He creates a world of phantasy which he takes very seriously - that is, which he invests with large amounts of emotion while separating it sharply from reality. Language has preserved this relationship between children's play and poetic creation. It gives [in German] the name of 'Spielf' ['play'] to those forms of imaginative writing which require to be linked to tangible objects and which are capable of representation. It speaks of a 'Lustspiel' or 'Trauerspiel' ['comedy' or 'tragedy': literally, 'pleasure play' or 'mourning play'] and describes those who carry out the representation as 'Schauspieler' ['players': literally 'show-players']. The unreality of the writer's imaginative world, however, has very important consequences for the technique of his art; for many things which, if they were real, could give no enjoyment, can do so in the play of phantasy, and many excitements which, in themselves, are actually distressing, can become a source of pleasure for the hearers and spectators at the performance of a writer's work.

[1908e, 1922]
There is another consideration for the sake of which we will dwell a moment longer on this contrast between reality and play. When the child has grown up and has ceased to play, and after he has been labouring for decades to envisage the realities of life with proper seriousness, he may one day find himself in a mental situation which once more undoes the contrast between play and reality. As an adult he can look back on the intense seriousness with which he once carried on his games in childhood; and, by equating his ostensibly serious occupations of to-day with his childhood games, he can throw off the too heavy burden imposed on him by life and win the high yield of pleasure afforded by humour.

[1908e, 1922]

As people grow up, then, they cease to play, and they seem to give up the yield of pleasure which they gained from playing. But whoever understands the human mind knows that hardly anything is harder for a man than to give up a pleasure which he has once experienced. Actually, we can never give anything up; we only exchange one thing for another. What appears to be a renunciation is really the formation of a substitute or surrogate. In the same way, the growing child, when he stops playing, gives up nothing but the link with real objects; instead playing, he now phantasies. He builds castles in the air and creates what are called daydreams. I believe that most people construct phantasies at times in their lives. This is a fact which has long been overlooked and whose importance has therefore not been sufficiently appreciated.

[1908e, 1923]

People's phantasies are less easy to observe than the play of children. The child, it is true, plays by himself or forms a closed psychical system with other children for the purposes of a game; but even though he may not play his game in front of the grown-ups, he does not, on the other hand, conceal it from them. The adult, on the contrary, is ashamed of his phantasies and hides them from other people. He cherishes his phantasies as his most intimate possessions, and as a rule he would rather confess his misdeeds than tell anyone his phantasies. It may come about that for that reason he believes he is the only person who invents such phantasies and has no idea that creations of this kind are widespread among other people. This difference in the behaviour of a person who plays and a person who phantasies is accounted for by the motives of these two activities, which are nevertheless adjuncts to each other.

[1908e, 1923]

A child's play is determined by wishes: in point of fact by a single wish-one that helps in his upbringing - the wish to be big and grown up. He is always playing at being 'grown up', and in his games he imitates what he knows about the lives of his elders. He has no reason to conceal this wish. With the adult, the case is different. On the one hand, he knows that he is expected not to go on playing or phantasying any longer, but to act in the real world; on the other hand, some of the wishes which give rise to his phantasies are of a kind which it is essential to conceal. Thus he is ashamed of his phantasies as being childish and as being unpermissible.

[1908e, 1924]

But, you will ask, if people make such a mystery of their phantasying, how is it that we know such a lot about it? Well, there is a class of human beings upon whom, not a god, indeed, but a stern goddess - Necessity - has allotted the task of telling what they suffer and what things give them happiness. These are the victims of nervous illness, who are obliged to tell their phantasies, among other things, to the doctor by whom they expect to be cured by mental treatment. This is our best source of knowledge, and we have since found good reason to suppose that our patients tell us nothing that we might not also hear from healthy people.

[1908e, 1924]
Let us now make ourselves acquainted with a few of the characteristics of phantasying. We may lay it down that a happy person never phantasies, only an unsatisfied one. The motive forces of phantasies are unsatisfied wishes, and every single phantasy is the fulfilment of a wish, a correction of unsatisfying reality. These motivating wishes vary according to the sex, character and circumstances of the person who is having the phantasy; but they fall naturally into two main groups. They are either ambitious wishes, which serve to elevate the subject's personality; or they are erotic ones. In young women the erotic wishes predominate almost exclusively, for their ambition is as a rule absorbed by erotic trends. In young men egoistic and ambitious wishes come to the fore clearly enough alongside of erotic ones. But we will not lay stress on the opposition between the two trends; we would rather emphasize the fact that they are often united. Just as, in many altar-pieces, the portrait of the donor is to be seen in a corner of the picture, so, in the majority of ambitious phantasies, we can discover in some corner or other the lady for whom the creator of the phantasy performs all his heroic deeds and at whose feet all his triumphs are laid. Here, as you see, there are strong enough motives for concealment; the well-brought-up young woman is only allowed a minimum of erotic desire, and the young man has to learn to suppress the excess of self-regard which he brings with him from the spoilt days of his childhood, so that he may find his place in a society which is full of other individuals making equally strong demands.

We must not suppose that the products of this imaginative activity - the various phantasies, castles in the air and day-dreams - are stereotyped or unalterable. On the contrary, they fit themselves in to the subject's shifting impressions of life, change with every change in his situation, and receive from every fresh active impression what might be called a 'date-mark'. The relation of a phantasy to time is in general very important. We may say that it hovers, as it were, between three times - the three moments of time which our ideation involves. Mental work is linked to some current impression, some provoking occasion in the present which has been able to arouse one of the subject's major wishes. From there it harks back to a memory of an earlier experience (usually an infantile one) in which this wish was fulfilled; and it now creates a situation relating to the future which represents a fulfilment of the wish. What it thus creates is a day-dream or phantasy, which carries about it traces of its origin from the occasion which provoked it and from the memory. Thus past, present and future are strung together, as it were, on the thread of the wish that runs through them.

A very ordinary example may serve to make what I have said clear. Let us take the case of a poor orphan boy to whom you have given the address of some employer where he may perhaps find a job. On his way there he may indulge in a day-dream appropriate to the situation from which it arises. The content of his phantasy will perhaps be something like this. He is given a job, finds favour with his new employer, makes himself indispensable in the business, is taken into his employer's family, marries the charming young daughter of the house, and then himself becomes a director of the business, first as his employer's partner and then as his successor. In this phantasy, the dreamer has regained what he possessed in his happy childhood - the protecting house, the loving parents and the first objects of his affectionate feelings. You will see from this example the way in which the wish makes use of an occasion in the present to construct, on the pattern of the past, a picture of the future.

There is a great deal more that could be said about phantasies; but I will only allude as briefly as possible to certain points. If phantasies become over-luxuriant and over-powerful, the conditions are laid for an onset of neurosis or psychosis. Phantasies, moreover, are the immediate mental precursors of the distressing symptoms complained of by our patients. Here a broad by-path branches off into pathology.
I cannot pass over the relation of phantasies to dreams. Our dreams at night are nothing else than phantasies like these, as we can demonstrate from the interpretation of dreams.¹ Language, in its unrivalled wisdom, long ago decided the question of the essential nature of dreams by giving the name of 'day-dreams' to the airy creations of phantasy. If the meaning of our dreams usually remains obscure to us in spite of this pointer, it is because of the circumstance that at night there also arise in us wishes of which we are ashamed; these we must conceal from ourselves, and they have consequently been repressed, pushed into the unconscious. Repressed wishes of this sort and their derivatives are only allowed to come to expression in a very distorted form. When scientific work had succeeded in elucidating this factor of dream-distortion, it was no longer difficult to recognize that night-dreams are wish-fulfilments in just the same way as day-dreams - the phantasies which we all know so well. [1908e, 1925]

So much for phantasies. And now for the creative writer. May we really attempt to compare the imaginative writer with the 'dreamer in broad daylight', and his creations with day-dreams? Here we must begin by making an initial distinction. We must separate writers who, like the ancient authors of epics and tragedies, take over their material ready-made, from writers who seem to originate their own material. We will keep to the latter kind, and, for the purposes of our comparison, we will choose not the writers most highly esteemed by the critics, but the less pretentious authors of novels, romances and short stories, who nevertheless have the widest and most eager circle of readers of both sexes. One feature above all cannot fail to strike us about the creations of these story-writers: each of them has a hero who is the centre of interest, for whom the writer tries to win our sympathy by every possible means and whom he seems to place under the protection of a special Providence. If, at the end of one chapter of my story, I leave the hero unconscious and bleeding from severe wounds, I am sure to find him at the beginning of the next being carefully nursed and on the way to recovery; and if the first volume closes with the ship he is in going down in a storm at sea, I am certain, at the opening of the second volume, to read of his miraculous rescue - a rescue without which the story could not proceed. The feeling of security with which I follow the hero through his perilous adventures is the same as the feeling with which a hero in real life throws himself into the water to save a drowning man or exposes himself to the enemy's fire in order to storm a battery. It is the true heroic feeling, which one of our best writers has expressed in an inimitable phrase: 'Nothing can happen to me!' It seems to me, however, that through this revealing characteristic of invulnerability we can immediately recognize His Majesty the Ego, the hero alike of every day-dream and of every story. [1908e, 1926]

Other typical features of these egocentric stories point to the same kinship. The fact that all the women in the novel invariably fall in love with the hero can hardly be looked on as a portrayal of reality, but it is easily understood as a necessary constituent of a day-dream. The same is true of the fact that the other characters in the story are sharply divided into good and bad, in defiance of the variety of human characters that are to be observed in real life. The 'good' ones are the helpers, while the 'bad' ones are the enemies and rivals, of the ego which has become the hero of the story. [1908e, 1927]
We are perfectly aware that very many imaginative writings are far removed from the model of the naïve day-dream; and yet I cannot suppress the suspicion that even the most extreme deviations from that model could be linked with it through an uninterrupted series of transitional cases. It has struck me that in many of what are known as 'psychological' novels only one person - once again the hero - is described from within. The author sits inside his mind, as it were, and looks at the other characters from outside. The psychological novel in general no doubt owes its special nature to the inclination of the modern writer to split up his ego, by self-observation, into many part-egos, and, in consequence, to personify the conflicting currents of his own mental life in several heroes. Certain novels, which might be described as 'eccentric', seem to stand in quite special contrast to the type of the day-dream. In these, the person who is introduced as the hero plays only a very small active part; he sees the actions and sufferings of other people pass before him like a spectator. Many of Zola's later works belong to this category. But I must point out that the psychological analysis of individuals who are not creative writers, and who diverge in some respects from the so-called norm, has shown us analogous variations of the day-dream, in which the ego contents itself with the role of spectator.

If our comparison of the imaginative writer with the day-dreamer, and of poetical creation with the day-dream, is to be of any value, it must, above all, show itself in some way or other fruitful. Let us, for instance, try to apply to these authors' works the thesis we laid down earlier concerning the relation between phantasy and the three periods of time and the wish which runs through them; and, with its help, let us try to study the connections that exist between the life of the writer and his works. No one has known, as a rule, what expectations to frame in approaching this problem; and often the connection has been thought of in much too simple terms. In the light of the insight we have gained from phantasies, we ought to expect the following state of affairs. A strong experience in the present awakens in the creative writer a memory of an earlier experience (usually belonging to his childhood) from which there now proceeds a wish which finds its fulfilment in the creative work. The work itself exhibits elements of the recent provoking occasion as well as of the old memory.

Do not be alarmed at the complexity of this formula. I suspect that in fact it will prove to be too exiguous a pattern. Nevertheless, it may contain a first approach to the true state of affairs; and, from some experiments I have made, I am inclined to think that this way of looking at creative writings may turn out not unfruitful. You will not forget that the stress it lays on childhood memories in the writer's life - a stress which may perhaps seem puzzling - is ultimately derived from the assumption that a piece of creative writing, like a day-dream, is a continuation of, and a substitute for, what was once the play of childhood.

You will say that, although I have put the creative writer first in the title of my paper, I have told you far less about him than about phantasies. I am aware of that, and I must try to excuse it by pointing to the present state of our knowledge. All I have been able to do is to throw out some encouragements and suggestions which, starting from the study of phantasies, lead on to the problem of the writer's choice of his literary material. As for the other problem - by what means the creative writer achieves the emotional effects in us that are aroused by his creations - we have as yet not touched on it at all. But I should like at least to point out to you the path that leads from our discussion of phantasies to the problems of poetical effects.
You will remember how I have said that the day-dreamer carefully conceals his phantasies from other people because he feels he has reasons for being ashamed of them. I should now add that even if he were to communicate them to us he could give us no pleasure by his disclosures. Such phantasies, when we learn them, repel us or at least leave us cold. But when a creative writer presents his plays to us or tells us what we are inclined to take to be his personal day dreams, we experience a great pleasure, and one which probably arises from the confluence of many sources. How the writer accomplishes this is his innermost secret; the essential *ars poetica* lies in the technique of overcoming the feeling of repulsion in us which is undoubtedly connected with the barriers that rise between each single ego and the others. We can guess two of the methods used by this technique. The writer softens the character of his egoistic day-dreams by altering and disguising it, and he bribes us by the purely formal - that is, aesthetic - yield of pleasure which he offers us in the presentation of his phantasies. We give the name of an *incentive bonus*, or a *fore-pleasure*, to a yield of pleasure such as this, which is offered to us so as to make possible the release of still greater pleasure arising from deeper psychical sources. In my opinion, all the aesthetic pleasure which a creative writer affords us has the character of a fore-pleasure of this kind, and our actual enjoyment of an imaginative work proceeds from a liberation of tensions in our minds. It may even be that not a little of this effect is due to the writer's enabling us thenceforward to enjoy our own day-dreams without self-reproach or shame. This brings us to the threshold of new, interesting and complicated enquiries; but also, at least for the moment, to the end of our discussion.

[1908e, 1929]

A common source and normal prototype of all these creations of phantasy is to be found in what are called the day-dreams of youth. These have already received some, though as yet insufficient, notice in the literature of the subject.¹ They occur with perhaps equal frequency in both sexes, though it seems that while in girls and women they are invariably of an erotic nature, in men they may be either erotic or ambitious. Nevertheless the importance of the erotic factor in men, too, should not be given a secondary rating; a closer investigation of a man's day-dreams generally shows that all his heroic exploits are carried out and all his successes achieved only in order to please a woman and to be preferred by her to other men.² These phantasies are satisfactions of wishes proceeding from deprivation and longing. They are justly called 'day-dreams', for they give us the key to an understanding of night-dreams - in which the nucleus of the dream-formation consists of nothing else than complicated day-time phantasies of this kind that have been distorted and are misunderstood by the conscious psychical agency.³

[1908a, 1932]
These day-dreams are cathexed with a large amount of interest; they are carefully cherished by the subject and usually concealed with a great deal of sensitivity, as though they were among the most intimate possessions of his personality. It is easy to recognize a person who is absorbed in day-dreaming in the street, however, by his sudden, as it were absent-minded, smile, his way of talking to himself, or by the hastening of his steps which marks the climax of the imagined situation. Every hysterical attack which I have been able to investigate up to the present has proved to be an involuntary irruption of day-dreams of this kind. For our observations no longer leave any room for doubt that such phantasies may be unconscious just as well as conscious; and as soon as the latter have become unconscious they may also become pathogenic - that is, they may express themselves in symptoms and attacks. In favourable circumstances, the subject can still capture an unconscious phantasy of this sort in consciousness. After I had drawn the attention of one of my patients to her phantasies, she told me that on one occasion she had suddenly found herself in tears in the street and that, rapidly considering what it was she was actually crying about, she had got hold of a phantasy to the following effect. In her imagination she had formed a tender attachment to a pianist who was well known in the town (though she was not personally acquainted with him); she had had a child by him (she was in fact childless); and he had then deserted her and her child and left them in poverty. It was at this point in her romance that she had burst into tears.

[1908a, 1933]

In considering the question of abstinence, the distinction is not nearly strictly enough made between two forms of it - namely abstention from any sexual activity whatever and abstention from sexual intercourse with the opposite sex. Many people who boast of succeeding in being abstinent have only been able to do so with the help of masturbation and similar satisfactions which are linked with the auto-erotic sexual activities of early childhood. But precisely because of this connection such substitutive means of sexual satisfaction are by no means harmless; they predispose to the numerous varieties of neuroses and psychoses which are conditional on an involution of sexual life to its infantile forms. Masturbation, moreover, is far from meeting the ideal demands of civilized sexual morality, and consequently drives young people into the same conflicts with the ideals of education which they hoped to escape by abstinence. Furthermore, it vitiates the character through indulgence, and this in more than one way. In the first place, it teaches people to achieve important aims without taking trouble and by easy paths instead of through an energetic exertion of force - that is, it follows the principle that sexuality lays down the pattern of behaviour; secondly, in the phantasies that accompany satisfaction the sexual object is raised to a degree of excellence which is not easily found again in reality. A witty writer (Karl Kraus in the Vienna paper Die Fackel) once expressed this truth in reverse by cynically remarking: 'Copulation is no more than an unsatisfying substitute for masturbation.'

[1908d, 1960]
When one carries out the psycho-analysis of a hysterical woman patient whose complaint is
manifested in attacks, one soon becomes convinced that these attacks are nothing else but
phantasies translated into the motor sphere, projected on to motility and portrayed in
pantomime. It is true that the phantasies are unconscious; but apart from this they are of the
same nature as the phantasies which can be observed directly in day-dreams or which can be
elicted by interpretation from dreams at night. Often a dream takes the place of an attack, and
still more often it explains it, since the same phantasy finds a different expression in a dream
and in an attack. We might expect then that by observing an attack we should be able to get to
know the phantasy represented in it; but this is seldom possible. As a rule, owing to the
influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions
which are completely analogous to the hallucinatory distortions of a dream, so that both of them
have, in the first resort, become unintelligible to the subject's own consciousness as well as to
the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same
interpretative revision as we employ for night-dreams. But not only are the forces from which the
distortion proceeds and the purpose of the distortion the same as those we have come to know
through the interpretation of dreams; the technique employed in the distortion is the same too.
[1909a, 1981]

The later stage in the development of the neurotic's estrangement from his parents, begun in
this manner, might be described as 'the neurotic's family romance'. It is seldom remembered
consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly
marked imaginative activity is one of the essential characteristics of neurotics and also of all
comparatively highly gifted people. This activity emerges first in children's play, and then,
starting roughly from the period before puberty, takes over the topic of family relations. A
characteristic example of this peculiar imaginative activity is to be seen in the familiar day-
dreaming¹ which persists far beyond puberty. If these day-dreams are carefully examined, they
are found to serve as the fulfilment of wishes and as a correction of actual life. They have two
principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed
behind the latter too. At about the period I have mentioned, then, the child's imagination
becomes engaged in the task of getting free from the parents of whom he now has a low
opinion and of replacing them by others, who, as a rule, are of higher social standing. He will
make use in this connection of any opportune coincidences from his actual experience, such as
his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the
country or with some member of the aristocracy if he lives in town. Chance occurrences of this
kind arouse the child's envy, which finds expression in a phantasy in which both his parents are
replaced by others of better birth. The technique used in developing phantasies like this (which
are, of course, conscious at this period) depends upon the ingenuity and the material which the
child has at his disposal. There is also the question of whether the phantasies are worked out
with greater or less effort to obtain verisimilitude. This state is reached at a time at which the
child is still in ignorance of the sexual determinants of procreation.
[1909c, 1988]

Moreover the motive of revenge and retaliation, which was in the foreground at the earlier
state, is also to be found at the later one. It is, as a rule, precisely these neurotic children who
were punished by their parents for sexual naughtiness and who now revenge themselves on
their parents by means of phantasies of this kind.
[1909c, 1989]
A younger child is very specially inclined to use imaginative stories such as these in order to rob those born before him of their prerogatives - in a way which reminds one of historical intrigues; and he often has no hesitation in attributing to his mother as many fictitious love-affairs as he himself has competitors. An interesting variant of the family romance may then appear, in which the hero and author returns to legitimacy himself while his brothers and sisters are eliminated by being bastardized. So too if there are any other particular interests at work they can direct the course to be taken by the family romance; for its many-sidedness and its great range of applicability enable it to meet every sort of requirement. In this way, for instance, the young phantasy-builder can get rid of his forbidden degree of kinship with one of his sisters if he finds himself sexually attracted by her.

[1909c, 1990]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]

¹ In psycho-analyses we frequently come across occurrences of this kind, dating back to the earliest years of the patient's childhood, in which his infantile sexual activity appears to reach its climax and often comes to a catastrophic end owing to some misfortune or punishment. Such occurrences are apt to appear in a shadowy way in dreams. Often they will become so clear that the analyst thinks he has a firm hold of them, and will nevertheless evade any final elucidation; and unless he proceeds with the greatest skill and caution he may be compelled to leave it undecided whether the scene in question actually took place or not. It will help to put us upon the right track in interpreting it, if we recognize that more than one version of the scene (each often differing greatly from the other) may be detected in the patient's unconscious phantasies. If we do not wish to go astray in our judgement of their historical reality, we must above all bear in mind that people's 'childhood memories' are only consolidated at a later period, usually at the age of puberty; and that this involves a complicated process of remodelling, analogous in every way to the process by which a nation constructs legends about its early history. It at once becomes evident that in his phantasies about his infancy the individual as he grows up endeavours to efface the recollection of his auto-erotic activities; and this he does by exalting their memory-traces to the level of object-love, just as a real historian will view the past in the light of the present. This explains why these phantasies abound in seductions and assaults, where the facts will have been confined to auto-erotic activities and the caresses or punishments that stimulated them. Furthermore, it becomes clear that in constructing phantasies about his childhood the individual sexualizes his memories; that is, he brings commonplace experiences into relation with his sexual activity, and extends his sexual interest to them - though in doing this he is probably following upon the traces of a really existing connection. No one who remembers my 'Analysis of a Phobia in a Five-Year-Old Boy' will need to be told that it is not my intention in these remarks to detract from the importance which I have hitherto attached to infantile sexuality by reducing it to nothing more than sexual interest at the age of puberty. I merely wish to give some technical advice that may help to clear up a class of phantasy which is calculated to falsify the picture of infantile sexual activity.

[1909d, 2162]
It is seldom that we are in the fortunate position of being able, as in the present instance, to establish the facts upon which these tales of the individual's prehistoric past are based, by recourse to the unimpeachable testimony of a grown-up person. Even so, the statement made by our patient's mother leaves the way open to various possibilities. That she did not proclaim the sexual character of the offence for which the child was punished may have been due to the activity of her own censorship; for with all parents it is precisely this sexual element in their children's past that their own censorship is most anxious to eliminate. But it is just as possible that the child was reproved by his nurse or by his mother herself for some commonplace piece of naughtiness of a non-sexual nature, and that his reaction was so violent that he was castigated by his father. In phantasies of this kind nurses and servants are regularly replaced by the superior figure of the mother. A deeper interpretation of the patient's dreams in relation to this episode revealed the clearest traces of the presence in his mind of an imaginative production of a positively epic character. In this his sexual desires for his mother and sister and his sister's premature death were linked up with the young hero's chastisement at his father's hand. It was impossible to unravel this tissue of phantasy thread by thread; the therapeutic success of the treatment was precisely what stood in the way of this. The patient recovered, and his ordinary life began to assert its claims: there were many tasks before him, which he had already neglected far too long, and which were incompatible with a continuation of the treatment. I am not to be blamed, therefore, for this gap in the analysis. The scientific results of psycho-analysis are at present only a by-product of its therapeutic aims, and for that reason it is often just in those cases where treatment fails that most discoveries are made.

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object-love, and in the formation of that complex which deserves to be called the *nuclear complex of the neuroses*. It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened - usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about.

The deeper you penetrate into the pathogenesis of nervous illness, the more you will find revealed the connection between the neuroses and other productions of the human mind, including the most valuable. You will be taught that we humans, with the high standards of our civilization and under the pressure of our internal repressions, find reality unsatisfying quite generally, and for that reason entertain a life of phantasy in which we like to make up for the insufficiencies of reality by the production of wish-fulfilments. These phantasies include a great deal of the true constitutional essence of the subject's personality as well as of those of his impulses which are repressed where reality is concerned. The energetic and successful man is one who succeeds by his efforts in turning his wishful phantasies into reality. Where this fails, as a result of the resistances of the external world and of the subject's own weakness, he begins to turn away from reality and withdraws into his more satisfying world of phantasy, the content of which is transformed into symptoms should he fall ill. In certain favourable circumstances, it still remains possible for him to find another path leading from these phantasies to reality, instead of becoming permanently estranged from it by regressing to infancy. If a person who is at loggerheads with reality possesses an *artistic gift* (a thing that is still a psychological mystery to us), he can transform his phantasies into artistic creations instead of into symptoms. In this manner he can escape the doom of neurosis and by this roundabout path regain his contact with reality. (Cf. Rank, 1907.) If there is persistent rebellion against the real world and if this precious gift is absent or insufficient, it is almost inevitable that the libido, keeping to the sources of the phantasies, will follow the path of regression, and will revive infantile wishes and end in neurosis. To-day neurosis takes the place of the monasteries which used to be the refuge of all whom life had disappointed or who felt too weak to face it.
I hope the reader will restrain himself and not allow a surge of indignation to prevent his following psycho-analysis any further because it leads to an unpardonable aspersion on the memory of a great and pure man the very first time it is applied to his case. Such indignation, it is clear, will never be able to tell us the significance of Leonardo's childhood phantasy; at the same time Leonardo has acknowledged the phantasy in the most unambiguous fashion, and we cannot abandon our expectation - or, if it sounds better, our prejudice - that a phantasy of this kind must have some meaning, in the same way as any other psychical creation: a dream, a vision or a delirium. Let us rather therefore give a fair hearing for a while to the work of analysis, which indeed has not yet spoken its last word.

[1910c, 2262]

To these phantasies which have succeeded in dominating the man's love in real life, the urge to rescue the loved one seems to bear merely a loose and superficial relation, and one that is fully accounted for by conscious reasons. By her propensity to be fickle and unfaithful the loved one brings herself into dangerous situations, and thus it is understandable that the lover should be at pains to protect her from these dangers by watching over her virtue and counteracting her bad inclinations. However, the study of people's screen-memories, phantasies and nocturnal dreams shows that we have here a particularly felicitous 'rationalization' of an unconscious motive, a process which may be compared to a successful secondary revision of a dream. In actual fact the 'rescue-motif' has a meaning and history of its own, and is an independent derivative of the mother-complex, or more accurately, of the parental complex. When a child hears that he owes his life to his parents, or that his mother gave him life, his feelings of tenderness unite with impulses which strive at power and independence, and they generate the wish to return this gift to the parents and to repay them with one of equal value. It is as though the boy's defiance were to make him say: 'I want nothing from my father; I will give him back all I have cost him.' He then forms the phantasy of rescuing his father from danger and saving his life; in this way he puts his account square with him. This phantasy is commonly enough displaced on to the emperor, king or some other great man; after being thus distorted it becomes admissible to consciousness, and may even be made use of by creative writers. In its application to a boy's father it is the defiant meaning in the idea of rescuing which is by far the most important; where his mother is concerned it is usually its tender meaning. The mother gave the child life, and it is not easy to find a substitute, of equal value for this unique gift. With a slight change of meaning, such as is easily effected in the unconscious and is comparable to the way in which in consciousness concepts shade into one another, rescuing his mother takes on the significance of giving her a child or making a child for her - needless to say, one like himself. This is not too remote from the original sense of rescuing, and the change in meaning is not an arbitrary one. His mother gave him a life - his own life - and in exchange he gives her another life, that of a child which has the greatest resemblance to himself. The son shows his gratitude by wishing to have by his mother a son who is like himself: in other words, in the rescue-phantasy he is completely identifying himself with his father. All his instincts, those of tenderness, gratitude, lustfulness, defiance and independence, find satisfaction in the single wish to be his own father. Even the element of danger has not been lost in the change of meaning; for the act of birth itself is the danger from which he was saved by his mother's efforts. Birth is both the first of all dangers to life and the prototype of all the later ones that cause us to feel anxiety, and the experience of birth has probably left behind in us the expression of affect which we call anxiety. Macduff of the Scottish legend, who was not born of his mother but ripped from her womb, was for that reason unacquainted with anxiety.

[1910h, 2333]

We can now understand the motives behind the boy's phantasies mentioned in the first of these 'Contributions' (above, p. 2331), which degrade the mother to the level of a prostitute. They are efforts to bridge the gulf between the two currents in love, at any rate in phantasy, and by debasing the mother to acquire her as an object of sensuality.

[1912d, 2340]
The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as 'phantasy'. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call 'reality-testing'. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfilments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. 'We cannot do without auxiliary constructions', as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of 'reservations' or 'nature reserves' in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

The importance of the part played by phantasy in the formation of symptoms will be made clear to you by what I have to tell you. I have explained how in the case of frustration the libido cathects regressively the positions which it has given up but to which some quotas of it have remained adhering. I shall not withdraw this or correct it, but I have to insert a connecting link. How does the libido find its way to these points of fixation? All the objects and trends which the libido has given up have not yet been given up in every sense. They or their derivatives are still retained with a certain intensity in phantasies. Thus the libido need only withdraw on to phantasies in order to find the path open to every repressed fixation. These phantasies have enjoyed a certain amount of toleration: they have not come into conflict with the ego, however sharp the contrasts between them may have been, so long as a particular condition is observed. This condition is of a quantitative nature and it is now upset by the backward flow of libido on to the phantasies. As a result of this surplus, the energetic cathexis of the phantasies is so much increased that they begin to raise claims, that they develop a pressure in the direction of becoming realized. But this makes a conflict between them and the ego inevitable. Whether they were previously preconscious or conscious, they are now subjected to repression from the direction of the ego and are at the mercy of attraction from the direction of the unconscious. From what are now unconscious phantasies the libido travels back to their origins in the unconscious - to its own points of fixation.
Before I let you go to-day, however, I should like to direct your attention a little longer to a side of the life of phantasy which deserves the most general interest. For there is a path that leads back from phantasy to reality - the path, that is, of art. An artist is once more in rudiments an introvert, not far removed from neurosis. He is oppressed by excessively powerful instinctual needs. He desires to win honour, power, wealth, fame and the love of women; but he lacks the means for achieving these satisfactions. Consequently, like any other unsatisfied man, he turns away from reality and transfers all his interest, and his libido too, to the wishful constructions of his life of phantasy, whence the path might lead to neurosis. There must be, no doubt, a convergence of all kinds of things if this is not to be the complete outcome of his development; it is well known, indeed, how often artists in particular suffer from a partial inhibition of their efficiency owing to neurosis. Their constitution probably includes a strong capacity for sublimation and a certain degree of laxity in the repressions which are decisive for a conflict. An artist, however, finds a path back to reality in the following manner. To be sure, he is not the only one who leads a life of phantasy. Access to the half-way region of phantasy is permitted by the universal assent of mankind, and everyone suffering from privation expects to derive alleviation and consolation from it. But for those who are not artists the yield of pleasure to be derived from the sources of phantasy is very limited. The ruthlessness of their repressions force them to be content with such meagre day-dreams as are allowed to become conscious. A man who is a true artist has more at his disposal. In the first place, he understands how to work over his day-dreams in such a way as to make them lose what is too personal about them and repels strangers, and to make it possible for others to share in the enjoyment of them. He understands, too, how to tone them down so that they do not easily betray their origin from proscribed sources. Furthermore, he possesses the mysterious power of shaping some particular material until it has become a faithful image of his phantasy; and he knows, moreover, how to link so large a yield of pleasure to this representation of his unconscious phantasy that, for the time being at least, repressions are outweighed and lifted by it. If he is able to accomplish all this, he makes it possible for other people once more to derive consolation and alleviation from their own sources of pleasure in their unconscious which have become inaccessible to them; he earns their gratitude and admiration and he has thus achieved through his phantasy what originally he had achieved only in his phantasy - honour, power and the love of women. [1916-1917, 3430]

Dismembered limbs, a severed head, a hand cut off at the wrist, as in a fairy tale of Hauff's, feet which dance by themselves, as in the book by Schaeffer which I mentioned above - all these have something peculiarly uncanny about them, especially when, as in the last instance, they prove capable of independent activity in addition. As we already know, this kind of uncanniness springs from its proximity to the castration complex. To some people the idea of being buried alive by mistake is the most uncanny thing of all. And yet psycho-analysis has taught us that this terrifying phantasy is only a transformation of another phantasy which had originally nothing terrifying about it at all, but was qualified by a certain lasciviousness - the phantasy, I mean, of intra-uterine existence. [1919h, 3694]
It seems to me that we have here an important discovery - namely, that the qualitative factor, the presence of certain neurotic formations, has less practical significance than the quantitative factor, the degree of attention or, more correctly, the amount of cathexis that these structures are able to attract to themselves. Our consideration of the first case, the jealous paranoia, led to a similar estimate of the importance of the quantitative factor, by showing that there also the abnormality essentially consisted in the hypercathexis of the interpretations of someone else's unconscious. We have long known of an analogous fact in the analysis of hystera. The pathogenic phantasies, derivatives of repressed instinctual impulses, are for a long time tolerated alongside the normal life of the mind, and have no pathogenic effect until by a revolution in the libidinal economy they receive a hypercathexis; not till then does the conflict which leads to the formation of symptoms break out. Thus as our knowledge grows we are increasingly impelled to bring the economic point of view into the foreground. I should also like to throw out the question whether this quantitative factor that I am now dwelling on does not suffice to cover the phenomena which Bleuler and others have lately proposed to name 'switching'. One need only assume that an increase in resistance in the course taken by the psychical current in one direction results in a hypercathexis of another path and thus causes the flow to be switched into that path.

[1922b, 3905]

In some analyses, or in some periods of an analysis, a divorce may become apparent between dream-life and waking life, like the divorce between the activity of phantasy and waking life which is found in the 'continued story' (a novel in day-dreams). In that case one dream leads off from another, taking as its central point some element which was lightly touched upon in its predecessor, and so on. But we find far more frequently that dreams are not attached to one another but are interpolated into a successive series of portions of waking thought.

[1923c, 4032]

A neurosis usually contents itself with avoiding the piece of reality in question and protecting itself against coming into contact with it. The sharp distinction between neurosis and psychosis, however, is weakened by the circumstance that in neurosis, too, there is no lack of attempts to replace a disagreeable reality by one which is more in keeping with the subject's wishes. This is made possible by the existence of a world of phantasy, of a domain which became separated from the real external world at the time of the introduction of the reality principle. This domain has since been kept free from the demands of the exigencies of life, like a kind of 'reservation'; it is not inaccessible to the ego, but is only loosely attached to it. It is from this world of phantasy that the neurosis draws the material for its new wishful constructions, and it usually finds that material along the path of regression to a more satisfying real past.

[1924e, 4097]
It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

¹ [1925d, 4238]

[1930a, 4480]
Fear of castration is not, of course, the only motive for repression: indeed, it finds no place in women, for though they have a castration complex they cannot have a fear of being castrated. Its place is taken in their sex by a fear of loss of love, which is evidently a later prolongation of the infant's anxiety if it finds its mother absent. You will realize how real a situation of danger is indicated by this anxiety. If a mother is absent or has withdrawn her love from her child, it is no longer sure of the satisfaction of its needs and is perhaps exposed to the most distressing feelings of tension. Do not reject the idea that these determinants of anxiety may at bottom repeat the situation of the original anxiety at birth, which, to be sure, also represented a separation from the mother. Indeed, if you follow a train of thought suggested by Ferenczi, you may add the fear of castration to this series, for a loss of the male organ results in an inability to unite once more with the mother (or a substitute for her) in the sexual act. I may mention to you incidentally that the very frequent phantasy of returning into the mother's womb is a substitute for this wish to copulate. There would be many interesting things and surprising connections to tell you at this point, but I cannot go outside the framework of an introduction to psycho-analysis. I will only draw your attention to the fact that here psychological researches trench upon the facts of biology.

[1933a, 4694]

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is ‘taken on lease’ from the rectum: in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.

[1933a, 4706]
(1) I emphasized as a point essential to an understanding of anxiety neurosis that the anxiety appearing in it does not admit of a psychical derivation - that is to say that the preparedness for anxiety, which constitutes the nucleus of the neurosis, cannot be acquired by a single or repeated affect of psychically justified fright. Fright, I maintained, might result in hysteria or a traumatic neurosis, but not in an anxiety neurosis. This denial, it is easy to see, is nothing else than the counterpart to my contention, on the positive side, that the anxiety appearing in my neurosis corresponds to a somatic sexual tension which has been deflected from the psychical field - a tension which would otherwise have made itself felt as libido.

[1895f, 354]

¹ [Footnote added 1920:] The phantasies of the pubertal period have as their starting-point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'Family Romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909).

[1905d, 1539]

The liberation of an individual, as he grows up, from the authority of his parents is one of the most necessary though one of the most painful results brought about by the course of his development. It is quite essential that that liberation should occur and it may be presumed that it has been to some extent achieved by everyone who his reached a normal state. Indeed, the whole progress of society rests upon the opposition between successive generations. On the other hand, there is a class of neurotics whose condition is recognizably determined by their having failed in this task.

[1909c, 1987]
For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least feels he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from him than from her. In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

[1909c, 1987]

The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly marked imaginative activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar day-dreaming¹ which persists far beyond puberty. If these day-dreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of replacing them by others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or less effort to obtain verisimilitude. This state is reached at a time at which the child is still in ignorance of the sexual determinants of procreation.

[1909c, 1988]
When presently the child comes to know the difference in the parts played by fathers and mothers in their sexual relations, and realizes that "pater semper incertus est", while the mother is 'certissima',¹ the family romance undergoes a curious curtailment: it contents itself with exalting the child's father, but no longer casts any doubts on his maternal origin, which is regarded as something unalterable. This second (sexual) stage of the family romance is actuated by another motive as well, which is absent in the first (asexual) stage. The child, having learnt about sexual processes, tends to picture to himself erotic situations and relations, the motive force behind this being his desire to bring his mother (who is the subject of the most intense sexual curiosity) into situations of secret infidelity and into secret love-affairs. In this way the child's phantasies, which started by being, as it were, asexual, are brought up to the level of his later knowledge.
[1909c, 1989]

Moreover the motive of revenge and retaliation, which was in the foreground at the earlier state, is also to be found at the later one. It is, as a rule, precisely these neurotic children who were punished by their parents for sexual naughtiness and who now revenge themselves on their parents by means of phantasies of this kind.
[1909c, 1989]

A younger child is very specially inclined to use imaginative stories such as these in order to rob those born before him of their prerogatives - in a way which reminds one of historical intrigues; and he often has no hesitation in attributing to his mother as many fictitious love-affairs as he himself has competitors. An interesting variant of the family romance may then appear, in which the hero and author returns to legitimacy himself while his brothers and sisters are eliminated by being bastardized. So too if there are any other particular interests at work they can direct the course to be taken by the family romance; for its many-sidedness and its great range of applicability enable it to meet every sort of requirement. In this way, for instance, the young phantasy-builder can get rid of his forbidden degree of kinship with one of his sisters if he finds himself sexually attracted by her.
[1909c, 1990]

If anyone is inclined to turn away in horror from this depravity of the childish heart or feels tempted, indeed, to dispute the possibility of such things, he should observe that these works of fiction, which seem so full of hostility, are none of them really so badly intended, and that they still preserve, under a slight disguise, the child's original affection for his parents. The faithlessness and ingratitude are only apparent. If we examine in detail the commonest of these imaginative romances, the replacement of both parents or of the father alone by grander people, we find that these new and aristocratic parents are equipped with attributes that are derived entirely from real recollections of the actual and humble ones; so that in fact the child is not getting rid of his father but exalting him. Indeed the whole effort at replacing the real father by a superior one is only an expression of the child's longing for the happy, vanished days when his father seemed to him the noblest and strongest of men and his mother the dearest and loveliest of women. He is turning away from the father whom he knows to-day to the father in whom he believed in the earlier years of his childhood; and his phantasy is no more than the expression of a regret that those happy days have gone. Thus in these phantasies the overvaluation that characterizes a child's earliest years comes into its own again. An interesting contribution to this subject is afforded by the study of dreams. We learn from their interpretation that even in later years, if the Emperor and Empress appear in dreams, those exalted personages stand for the dreamer's father and mother.¹ So that the child's overvaluation of his parents survives as well in the dreams of normal adults.
[1909c, 1990]
As an almost invariable corollary to this sexual enlightenment, the boy at the same time gains a knowledge of the existence of certain women who practise sexual intercourse as a means of livelihood, and who are for this reason held in general contempt. The boy himself is necessarily far from feeling this contempt: as soon as he learns that he too can be initiated by these unfortunates into sexual life, which till then he accepted as being reserved exclusively for 'grown-ups', he regards them only with a mixture of longing and horror. When after this he can no longer maintain the doubt which makes his parents an exception to the universal and odious norms of sexual activity, he tells himself with cynical logic that the difference between his mother and a whore is not after all so very great, since basically they do the same thing. The enlightening information he has received has in fact awakened the memory-traces of the impressions and wishes of his early infancy, and these have led to a reactivation in him of certain mental impulses. He begins to desire his mother herself in the sense with which he has recently become acquainted, and to hate his father anew as a rival who stands in the way of this wish; he comes, as we say, under the dominance of the Oedipus complex. He does not forgive his mother for having granted the favour of sexual intercourse not to himself but to his father, and he regards it as an act of unfaithfulness. If these impulses do not quickly pass, there is no outlet for them other than to run their course in phantasies which have as their subject his mother's sexual activities under the most diverse circumstances; and the consequent tension leads particularly readily to his finding relief in masturbation. As a result of the constant combined operation of the two driving forces, desire and thirst for revenge, phantasies of his mother's unfaithfulness are by far the most preferred; the lover with whom she commits her act of infidelity almost always exhibits the features of the boy's own ego, or more accurately, of his own idealized personality, grown up and so raised to a level with his father. What I have elsewhere¹ described as the 'family romance' comprises the manifold ramifications of this imaginative activity and the way in which they are interwoven with various egoistic interests of this period of life.

¹[1910h, 2332]

Rank's researches have made us acquainted with the source and purpose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent-child relationship is represented in countless dreams by pulling out of the water or rescuing from the water. When a people's imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his father. A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth - the aristocratic one and the humble one - are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

[1939a, 4843]
A 'large party' meant, as we already know, a secret. His brother was simply the representative (introduced into the childhood scene by a 'retrospective phantasy') of all his later rivals for a woman's affection. The episode of the gentleman who abused the King of Italy related once again, via the medium of a recent and in itself indifferent experience, to people of lower rank pushing their way into higher society. It was just as though the child at the breast was being given a warning parallel to the one which Daudet had given to young men.¹

But let us now turn from the direct observation of children to the analytic examination of adults who have become neurotic. What help does analysis give towards a further knowledge of the Oedipus complex? That can be answered in a word. Analysis confirms all that the legend describes. It shows that each of these neurotics has himself been an Oedipus or, what comes to the same thing, has, as a reaction to the complex, become a Hamlet. The analytic account of the Oedipus complex is, of course, a magnification and coarsening of the infantile sketch. The hatred of the father, the death-wishes against him, are no longer hinted at timidly, the affection for the mother admits that its aim is to possess her as a woman. Should we really attribute such blatant and extreme emotional impulses to the tender years of childhood, or is analysis deceiving us by an admixture of some new factor? It is not hard to find one. Whenever someone gives an account of a past event, even if he is a historian, we must take into account what he unintentionally puts back into the past from the present or from some intermediate time, thus falsifying his picture of it. In the case of a neurotic it is even a question whether this putting back is an entirely unintentional one; later on we shall have to discover reasons for this and have to do justice in general to the fact of 'retrospective phantasying'. We can easily see, too, that hatred of the father is reinforced by a number of factors arising from later times and circumstances and that the sexual desires towards the mother are cast into forms which must have been alien as yet to a child. But it would be a vain effort to seek to explain the whole Oedipus complex by retrospective phantasying and to attach it to later times. Its infantile core and more or less of its accessories remain as they were confirmed by the direct observation of children.

[1900a, 761]

[1916-1917, 3401]
Among the occurrences which recur again and again in the youthful history of neurotics - which are scarcely ever absent - there are a few of particular importance, which also deserve, on that account, I think, to be brought into greater prominence than the rest. As specimens of this class I will enumerate these: observation of parental intercourse, seduction by an adult and threat of being castrated. It would be a mistake to suppose that they are never characterized by material reality; on the contrary, this is often established incontestably through enquiries from older members of the patient's family. It is by no means a rare thing, for instance, for a little boy, who is beginning to play with his penis in a naughty way and is not yet aware that one must conceal such activities, to be threatened by a parent or nurse with having his penis or his sinful hand cut off. Parents will often admit this when they are asked, since they think they have done something useful in making such a threat; a number of people have a correct conscious memory of such a threat, especially if it was made at a somewhat later period. If the threat is delivered by the mother or some other female she usually shifts its performance on to the father or the doctor. In *Struwwelpeter*, the famous work of the Frankfurt paediatrician Hoffmann (which owes its popularity precisely to an understanding of the sexual and other complexes of childhood), you will find castration softened into a cutting-off of the thumbs as a punishment for obstinate sucking. But it is highly improbable that children are threatened with castration as often as it appears in the analyses of neurotics. We shall be satisfied by realizing that the child puts a threat of this kind together in his imagination on the basis of hints, helped out by a knowledge that auto-erotic satisfaction is forbidden and under the impression of his discovery of the female genitals. Nor is it only in proletarian families that it is perfectly possible for a child, while he is not yet credited with possessing an understanding or a memory, to be a witness of the sexual act between his parents or other grown-up people; and the possibility cannot be rejected that he will be able to understand and react to the impression in retrospect. If, however, the intercourse is described with the most minute details, which would be difficult to observe, or if, as happens most frequently, it turns out to have been intercourse from behind *more ferarum* [in the manner of animals], there can be no remaining doubt that the phantasy is based on an observation of intercourse between animals (such as dogs) and that its motive was the child's unsatisfied scopophilia during puberty. The extreme achievement on these lines is a phantasy of observing parental intercourse while one is still an unborn baby in the womb. Phantasies of being seduced are of particular interest, because so often they are not phantasies but real memories. Fortunately, however, they are nevertheless not real as often as seemed at first to be shown by the findings of analysis. Seduction by an older child or by one of the same age is even more frequent than by an adult; and if in the case of girls who produce such an event in the story of their childhood their father figures fairly regularly as the seducer, there can be no doubt either of the imaginary nature of the accusation or of the motive that has led to it. A phantasy of being seduced when no seduction has occurred is usually employed by a child to screen the auto-erotic period of his sexual activity. He spares himself shame about masturbation by retrospectively phantasizing a desired object into these earliest times. You must not suppose, however, that sexual abuse of a child by its nearest male relatives belongs entirely to the realm of phantasy. Most analysts will have treated cases in which such events were real and could be unimpeachably established; but even so they related to the later years of childhood and had been transposed into earlier times.

[1916-1917, 3426]
It is at once obvious how greatly the demands on our credulity are reduced. We need no longer suppose that the parents copulated in the presence of their child (a very young one, it is true) - which was a disagreeable idea for many of us. The period of time during which the effects were deferred is very greatly diminished; it now covers only a few months of the child's fourth year and does not stretch back at all into the first dark years of childhood. There remains scarcely anything strange in the child's conduct in making the transference from the dogs on to his parents and in being afraid of the wolf instead of his father. He was in that phase of the development of his attitude towards the world which I have described in *Totem and Taboo* as the return of totemism. The theory which endeavours to explain the primal scenes found in neuroses as retrospective phantasies of a later date seems to obtain powerful support from the present observation, in spite of our patient being of the tender age of four years. Young though he was, he was yet able to succeed in replacing an impression of his fourth year by an imaginary trauma at the age of one and a half. This regression, however, seems neither mysterious nor tendentious. The scene which was to be made up had to fulfil certain conditions which, in consequence of the circumstances of the dreamer's life, could only be found in precisely this early period; such, for instance, was the condition that he should be in bed in his parents' bedroom.

[1918b, 3544]

¹ I admit that this is the most delicate question in the whole domain of psycho-analysis. I did not require the contributions of Adler or Jung to induce me to consider the matter with a critical eye, and to bear in mind the possibility that what analysis puts forward as being forgotten experiences of childhood (and of an improbably early childhood) may on the contrary be based upon phantasies created on occasions occurring late in life. According to this view, wherever we seemed in analyses to see traces of the after-effects of an infantile impression of the kind in question, we should rather have to assume that we were faced by the manifestation of some constitutional factor or of some disposition that had been phylogenetically maintained. On the contrary, no doubt has troubled me more; no other uncertainty has been more decisive in holding me back from publishing my conclusions. I was the first - a point to which none of my opponents have referred - to recognize both the part played by phantasies in symptom-formation and also the 'retrospective phantasying' of late impressions into childhood and their sexualization after the event. (See my *Interpretation of Dreams* (1900a), First Edition, p. 559, and 'Notes upon a Case of Obsessional Neurosis', (1909d).) If, in spite of this, I have held to the more difficult and more improbable view, it has been as a result of arguments such as are forced upon the investigator by the case described in these pages or by any other infantile neurosis - arguments which I once again lay before my readers for their decision.

[1918b, 3581]
It would be a mistake, however, to suppose that these dream-façades are nothing other than mistaken and somewhat arbitrary revisions of the dream-content by the conscious agency of our mental life. In the erection of a dream-façade use is not infrequently made of wishful phantasies which are present in the dream-thoughts in a pre-constructed form, and are of the same character as the appropriately named 'day-dreams' familiar to us in waking life. The wishful phantasies revealed by analysis in night-dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the façade of the dream directly reveals the dream's actual nucleus, distorted by an admixture of other material.

[1901a, 1081]

After a little reflection we shall easily understand what it is about this state of things that perplexes us so much. It is the low valuation of reality, the neglect of the distinction between it and phantasy. We are tempted to feel offended at the patient's having taken up our time with invented stories. Reality seems to us something worlds apart from invention, and we set a very different value on it. Moreover the patient, too, looks at things in this light in his normal thinking. When he brings up the material which leads from behind his symptoms to the wishful situations modelled on his infantile experiences, we are in doubt to begin with whether we are dealing with reality or phantasies. Later, we are enabled by certain indications to come to a decision and we are faced by the task of conveying it to the patient. This, however, invariably gives rise to difficulties. If we begin by telling him straight away that he is now engaged in bringing to light the phantasies with which he has disguised the history of his childhood (just as every nation disguises its forgotten prehistory by constructing legends), we observe that his interest in pursuing the subject further suddenly diminishes in an undesirable fashion. He too wants to experience realities and despises everything that is merely 'imaginary'. If, however, we leave him, till this piece of work is finished, in the belief that we are occupied in investigating the real events of his childhood, we run the risk of his later on accusing us of being mistaken and laughing at us for our apparent credulity. It will be a long time before he can take in our proposal that we should equate phantasy and reality and not bother to begin with whether the childhood experiences under examination are the one or the other. Yet this is clearly the only correct attitude to adopt towards these mental productions. They too possess a reality of a sort. It remains a fact that the patient has created these phantasies for himself, and this fact is of scarcely less importance for his neurosis than if he had really experienced what the phantasies contain. The phantasies possess psychical as contrasted with material reality, and we gradually learn to understand that in the world of the neuroses it is psychical reality which is the decisive kind.

[1916-1917, 3425]
As was to be expected, the patient did not, to begin with, accept my elucidation of the matter. He could not imagine, he said, that the plan of marriage could have had any such effects: it had not made the slightest impression on him at the time. But in the further course of treatment he was forcibly brought to believe in the truth of my suspicion, and in a most singular manner. With the help of a transference phantasy, he experienced, as though it were new and belonged to the present, the very episode from the past which he had forgotten, or which had only passed though his mind unconsciously. There came an obscure and difficult period in the treatment; eventually it turned out that he had once met a young girl on the stairs in my house and had on the spot promoted her into being my daughter. She had pleased him, and he pictured to himself that the only reason I was so kind and incredibly patient with him was that I wanted to have him for a son-in-law. At the same time he raised the wealth and position of my family to a level which agreed with the model he had in mind. But his undying love for his lady fought against the temptation. After we had gone though a series of the severest resistances and bitterest vituperations on his part, he could no longer remain blind to the overwhelming effect of the perfect analogy between the transference phantasy and the actual state of affairs in the past. I will repeat one of the dreams which he had at this period, so as to give an example of his manner of treating the subject. He dreamt that he saw my daughter in front of him; she had two patches of dung instead of eyes. No one who understands the language of dreams will find much difficulty in translating this one: it declared that he was marrying my daughter not for her ‘beaux yeux’ but for her money.

[1909d, 2157]
I do not wish to deny categorically that this fourth power in dream-construction - which we shall soon recognize as all old acquaintance, since in fact it is the only one of the four with which we are familiar in other connections - I do not wish to deny that this fourth factor has the capacity to create new contributions to dreams. It is certain, however, that, like the others, it exerts its influence principally by its preferences and selections from psychical material in the dream-thoughts that has already been formed. Now there is one case in which it is to a great extent spared the labour of, as it were, building up a façade for the dream - the case, namely, in which a formation of that kind already exists, available for use in the material of the dream-thoughts. I am in the habit of describing the element in the dream-thoughts which I have in mind as a 'phantasy.' I shall perhaps avoid misunderstanding if I mention the 'day-dream' as something analogous to it in waking life.¹ The part played in our mental life by these structures has not yet been fully recognized and elucidated by psychiatrists, though M. Benedikt has made what seems to me a very promising start in that direction. The importance of day-dreams has not escaped the unerring vision of imaginative writers; there is, for instance, a well-known account by Alphonse Daudet in Le Nabab of the day-dreams of one of the minor characters in that story. The study of the psychoneuroses leads to the surprising discovery that these phantasies or day-dreams are the immediate forerunners of hysterical symptoms, or at least of a whole number of them. Hysterical symptoms are not attached to actual memories, but to phantasies erected on the basis of the basis of memories. The frequent occurrence of conscious daytime phantasies brings these structures to our knowledge; but just as there are phantasies of this kind which are conscious, so, too, there are unconscious ones in great numbers, which have to remain unconscious on account of their content and of their origin from repressed material. Closer investigation of the characteristics of these day-time phantasies shows us how right it is that these formations should bear the same name as we give to the products of our thought during the night - the name, that is, of 'dreams.' They share a large number of their properties with night-dreams, and their investigation might, in fact, have served as the shortest and best approach to an understanding of night-dreams.

[1900a, 931]

It would be a mistake, however, to suppose that these dream-facades are nothing other than mistaken and somewhat arbitrary revisions of the dream-content by the conscious agency of our mental life. In the erection of a dream-façade use is not infrequently made of wishful phantasies which are present in the dream-thoughts in a pre-constructed form, and are of the same character as the appropriately named 'day-dreams' familiar to us in waking life. The wishful phantasies revealed by analysis in night-dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the façade of the dream directly reveals the dream's actual nucleus, distorted by an admixture of other material.

[1901a, 1081]

As people grow up, then, they cease to play, and they seem to give up the yield of pleasure which they gained from playing. But whoever understands the human mind knows that hardly anything is harder for a man than to give up a pleasure which he has once experienced. Actually, we can never give anything up; we only exchange one thing for another. What appears to be a renunciation is really the formation of a substitute or surrogate. In the same way, the growing child, when he stops playing, gives up nothing but the link with real objects; instead playing, he now phantasies. He builds castles in the air and creates what are called day-dreams. I believe that most people construct phantasies at times in their lives. This is a fact which has long been overlooked and whose importance has therefore not been sufficiently appreciated.

[1908e, 1923]
We must not suppose that the products of this imaginative activity - the various phantasies, castles in the air and day-dreams - are stereotyped or unalterable. On the contrary, they fit themselves in to the subject's shifting impressions of life, change with every change in his situation, and receive from every fresh active impression what might be called a 'date-mark'. The relation of a phantasy to time is in general very important. We may say that it hovers, as it were, between three times - the three moments of time which our ideation involves. Mental work is linked to some current impression, some provoking occasion in the present which has been able to arouse one of the subject's major wishes. From there it harks back to a memory of an earlier experience (usually an infantile one) in which this wish was fulfilled; and it now creates a situation relating to the future which represents a fulfilment of the wish. What it thus creates is a day-dream or phantasy, which carries about it traces of its origin from the occasion which provoked it and from the memory. Thus past, present and future are strung together, as it were, on the thread of the wish that runs through them.

I cannot pass over the relation of phantasies to dreams. Our dreams at night are nothing else than phantasies like these, as we can demonstrate from the interpretation of dreams.¹ Language, in its unrivalled wisdom, long ago decided the question of the essential nature of dreams by giving the name of 'day-dreams' to the airy creations of phantasy. If the meaning of our dreams usually remains obscure to us in spite of this pointer, it is because of the circumstance that at night there also arise in us wishes of which we are ashamed; these we must conceal from ourselves, and they have consequently been repressed, pushed into the unconscious. Repressed wishes of this sort and their derivatives are only allowed to come to expression in a very distorted form. When scientific work had succeeded in elucidating this factor of dream-distortion, it was no longer difficult to recognize that night-dreams are wish-fulfillments in just the same way as day-dreams - the phantasies which we all know so well.

So much for phantasies. And now for the creative writer. May we really attempt to compare the imaginative writer with the 'dreamer in broad daylight', and his creations with day-dreams? Here we must begin by making an initial distinction. We must separate writers who, like the ancient authors of epics and tragedies, take over their material ready-made, from writers who seem to originate their own material. We will keep to the latter kind, and, for the purposes of our comparison, we will choose not the writers most highly esteemed by the critics, but the less pretentious authors of novels, romances and short stories, who nevertheless have the widest and most eager circle of readers of both sexes. One feature above all cannot fail to strike us about the creations of these story-writers: each of them has a hero who is the centre of interest, for whom the writer tries to win our sympathy by every possible means and whom he seems to place under the protection of a special Providence. If, at the end of one chapter of my story, I leave the hero unconscious and bleeding from severe wounds, I am sure to find him at the beginning of the next being carefully nursed and on the way to recovery; and if the first volume closes with the ship he is in going down in a storm at sea, I am certain, at the opening of the second volume, to read of his miraculous rescue - a rescue without which the story could not proceed. The feeling of security with which I follow the hero through his perilous adventures is the same as the feeling with which a hero in real life throws himself into the water to save a drowning man or exposes himself to the enemy's fire in order to storm a battery. It is the true heroic feeling, which one of our best writers has expressed in an inimitable phrase: 'Nothing can happen to me!' It seems to me, however, that through this revealing characteristic of invulnerability we can immediately recognize His Majesty the Ego, the hero alike of every day-dream and of every story.

[1908e, 1926]
Other typical features of these egocentric stories point to the same kinship. The fact that all the women in the novel invariably fall in love with the hero can hardly be looked on as a portrayal of reality, but it is easily understood as a necessary constituent of a day-dream. The same is true of the fact that the other characters in the story are sharply divided into good and bad, in defiance of the variety of human characters that are to be observed in real life. The 'good' ones are the helpers, while the 'bad' ones are the enemies and rivals, of the ego which has become the hero of the story.

[1908e, 1927]

We are perfectly aware that very many imaginative writings are far removed from the model of the naïve day-dream; and yet I cannot suppress the suspicion that even the most extreme deviations from that model could be linked with it through an uninterrupted series of transitional cases. It has struck me that in many of what are known as 'psychological' novels only one person - once again the hero - is described from within. The author sits inside his mind, as it were, and looks at the other characters from outside. The psychological novel in general no doubt owes its special nature to the inclination of the modern writer to split up his ego, by self-observation, into many part-egos, and, in consequence, to personify the conflicting currents of his own mental life in several heroes. Certain novels, which might be described as 'eccentric', seem to stand in quite special contrast to the type of the day-dream. In these, the person who is introduced as the hero plays only a very small active part; he sees the actions and sufferings of other people pass before him like a spectator. Many of Zola's later works belong to this category. But I must point out that the psychological analysis of individuals who are not creative writers, and who diverge in some respects from the so-called norm, has shown us analogous variations of the day-dream, in which the ego contents itself with the role of spectator.

[1908e, 1927]

If our comparison of the imaginative writer with the day-dreamer, and of poetical creation with the day-dream, is to be of any value, it must, above all, show itself in some way or other fruitful. Let us, for instance, try to apply to these authors' works the thesis we laid down earlier concerning the relation between phantasy and the three periods of time and the wish which runs through them; and, with its help, let us try to study the connections that exist between the life of the writer and his works. No one has known, as a rule, what expectations to frame in approaching this problem; and often the connection has been thought of in much too simple terms. In the light of the insight we have gained from phantasies, we ought to expect the following state of affairs. A strong experience in the present awakens in the creative writer a memory of an earlier experience (usually belonging to his childhood) from which there now proceeds a wish which finds its fulfilment in the creative work. The work itself exhibits elements of the recent provoking occasion as well as of the old memory.

[1908e, 1928]

Do not be alarmed at the complexity of this formula. I suspect that in fact it will prove to be too exiguous a pattern. Nevertheless, it may contain a first approach to the true state of affairs; and, from some experiments I have made, I am inclined to think that this way of looking at creative writings may turn out not unfruitful. You will not forget that the stress it lays on childhood memories in the writer's life - a stress which may perhaps seem puzzling - is ultimately derived from the assumption that a piece of creative writing, like a day-dream, is a continuation of, and a substitute for, what was once the play of childhood.

[1908e, 1928]
You will remember how I have said that the day-dreamer carefully conceals his phantasies from other people because he feels he has reasons for being ashamed of them. I should now add that even if he were to communicate them to us he could give us no pleasure by his disclosures. Such phantasies, when we learn them, repel us or at least leave us cold. But when a creative writer presents his plays to us or tells us what we are inclined to take to be his personal day dreams, we experience a great pleasure, and one which probably arises from the confluence of many sources. How the writer accomplishes this is his innermost secret; the essential *ars poetica* lies in the technique of overcoming the feeling of repulsion in us which is undoubtedly connected with the barriers that rise between each single ego and the others. We can guess two of the methods used by this technique. The writer softens the character of his egoistic day-dreams by altering and disguising it, and he bribes us by the purely formal - that is, aesthetic - yield of pleasure which he offers us in the presentation of his phantasies. We give the name of an *incentive bonus*, or a *fore-pleasure*, to a yield of pleasure such as this, which is offered to us so as to make possible the release of still greater pleasure arising from deeper psychical sources. In my opinion, all the aesthetic pleasure which a creative writer affords us has the character of a fore-pleasure of this kind, and our actual enjoyment of an imaginative work proceeds from a liberation of tensions in our minds. It may even be that not a little of this effect is due to the writer's enabling us thenceforward to enjoy our own day-dreams without self-reproach or shame. This brings us to the threshold of new, interesting and complicated enquiries; but also, at least for the moment, to the end of our discussion.

[1908e, 1929]

A common source and normal prototype of all these creations of phantasy is to be found in what are called the day-dreams of youth. These have already received some, though as yet insufficient, notice in the literature of the subject.¹ They occur with perhaps equal frequency in both sexes, though it seems that while in girls and women they are invariably of an erotic nature, in men they may be either erotic or ambitious. Nevertheless the importance of the erotic factor in men, too, should not be given a secondary rating; a closer investigation of a man's day-dreams generally shows that all his heroic exploits are carried out and all his successes achieved only in order to please a woman and to be preferred by her to other men.² These phantasies are satisfactions of wishes proceeding from deprivation and longing. They are justly called 'day-dreams', for they give us the key to an understanding of night-dreams - in which the nucleus of the dream-formation consists of nothing else than complicated day-time phantasies of this kind that have been distorted and are misunderstood by the conscious psychical agency.³

[1908a, 1932]
These day-dreams are cathetcated with a large amount of interest; they are carefully cherished by the subject and usually concealed with a great deal of sensitivity, as though they were among the most intimate possessions of his personality. It is easy to recognize a person who is absorbed in day-dreaming in the street, however, by his sudden, as it were absent-minded, smile, his way of talking to himself, or by the hastening of his steps which marks the climax of the imagined situation. Every hysterical attack which I have been able to investigate up to the present has proved to be an involuntary irruption of day-dreams of this kind. For our observations no longer leave any room for doubt that such phantasies may be unconscious just as well as conscious; and as soon as the latter have become unconscious they may also become pathogenic - that is, they may express themselves in symptoms and attacks. In favourable circumstances, the subject can still capture an unconscious phantasy of this sort in consciousness. After I had drawn the attention of one of my patients to her phantasies, she told me that on one occasion she had suddenly found herself in tears in the street and that, rapidly considering what it was she was actually crying about, she had got hold of a phantasy to the following effect. In her imagination she had formed a tender attachment to a pianist who was well known in the town (though she was not personally acquainted with him); she had had a child by him (she was in fact childless); and he had then deserted her and her child and left them in poverty. It was at this point in her romance that she had burst into tears.

[1908a, 1933]

The best-known productions of phantasy are the so-called 'day-dreams', which we have already come across, imagined satisfactions of ambitious, megalomanic, erotic wishes, which flourish all the more exuberantly the more reality counsels modesty and restraint. The essence of the happiness of phantasy - making the obtaining of pleasure free once more from the assent of reality - is shown in them unmistakably. We know that such day-dreams are the nucleus and prototype of night-dreams. A night-dream is at bottom nothing other than a day-dream that has been made utilizable owing the liberation of the instinctual impulses at night, and that has been distorted by the form assumed by mental activity at night. We have already become familiar with the idea that even a day-dream is not necessarily conscious - that there are unconscious day-dreams, as well. Such unconscious day-dreams are thus the source not only of night-dreams but also of neurotic symptoms.

[1916-1917, 3428]

It is not my intention to give a review of the author's results. I will content myself with pointing to the significance of his work and will permit myself only a remark concerning the terminology which he has adopted. He includes the sort of thought-activity which he has observed in Bleuler's autistic thinking, but calls it, as a rule, fore-conscious thinking, according to the custom prevailing in psycho-analysis. However, the autistic thinking of Bleuler does not by any means correspond with the extension and the contents of the fore-conscious, neither can I admit that the name used by Bleuler has been happily chosen. The designation 'fore-conscious' thinking itself as a characteristic appears to me misleading and unsatisfactory. The point in question is that the sort of thought-activity of which the well-known day-dream is an example - complete by itself, developing a situation or an act that is being brought to a close - constitutes the best and until now the only studied example. This day-dreaming does not owe its peculiarities to the circumstances that it proceeds mostly fore-consciously, nor are the forms changed when it is accomplished consciously. From another point of view we know also that even strictly directed reflection may be achieved without the co-operation of consciousness, that is to say, fore-consciously. For that reason I think it is advisable, when establishing a distinction between the different modes of thought-activity, not to utilize the relation to consciousness in the first instance, and to designate the day-dream, as well as the chains of thought studied by Varendonck, as freely wandering or phantastic thinking, in opposition to intentionally directed reflection. At the same time it should be taken into consideration that even phantastic thinking is not invariably in want of an aim and end-representations.

[1921b, 3942]
Here we are faced by a decision which is indeed no easy one. First, however, it must be confessed that the distinction, which may seem fundamental to other people, does not in our judgement affect the heart of the matter. If wishes and impulses have the full value of facts for primitive men, it is our business to give their attitude our understanding attention instead of correcting it in accordance with our own standards. Let us, then, examine more closely the case of neurosis - comparison with which led us into our present uncertainty. It is not accurate to say that obsessional neurotics, weighed down under the burden of an excessive morality, are defending themselves only against psychical reality and are punishing themselves for impulses which were merely felt. Historical reality has a share in the matter as well. In their childhood they had these evil impulses pure and simple, and turned them into acts so far as the impotence of childhood allowed. Each of these excessively virtuous individuals passed though an evil period in his infancy - a phase of perversion which was the forerunner and precondition of the later period of excessive morality. The analogy between primitive men and neurotics will therefore be far more fully established if we suppose that in the former instance, too, psychical reality - as to the form taken by which we are in no doubt - coincided at the beginning with factual reality: that primitive men actually did what all the evidence shows that they intended to do.

[1912-1913, 2799]

In another neurotic disorder, obsessional neurosis, the patients become the victims of distressing and apparently senseless ceremonials which take the form of the rhythmical repetition of the most trivial acts (such as washing or dressing) or of carrying out meaningless injunctions or of obeying mysterious prohibitions. It was nothing less than a triumph of psychoanalytic research when it succeeded in showing that all these obsessive acts, even the most insignificant and trivial of them, have a meaning, and that they are reflections, translated into indifferent terms, of conflicts in the patients' lives, of the struggle between temptations and moral restraints - reflections of the proscribed wish itself and of the punishment and atonement which that wish incurs. In another form of the same disorder the victim suffers from tormenting ideas (obsessions) which force themselves upon him and are accompanied by affects whose character and intensity are often only quite inadequately accounted for by the terms of the obsessive ideas themselves. Analytic investigation has shown in their case that the affects are entirely justified, since they correspond to self-reproaches which are based on something that is at least psychically real. But the ideas to which these affects are attached are not the original ones, but have found their way into their present position by a process of displacement - by being substituted for something that has been repressed. If these displacements can be reversed, the way is open to the discovery of the repressed ideas, and the relation between affect and idea is found to be perfectly appropriate.

[1913], 2810]
The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as 'phantasy'. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call 'reality-testing'. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfilments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. 'We cannot do without auxiliary constructions', as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of 'reservations' or 'nature reserves' in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

[1916-1917, 3427]
Before I let you go to-day, however, I should like to direct your attention a little longer to a side of the life of phantasy which deserves the most general interest. For there is a path that leads back from phantasy to reality - the path, that is, of art. An artist is once more in rudiments an introvert, not far removed from neurosis. He is oppressed by excessively powerful instinctual needs. He desires to win honour, power, wealth, fame and the love of women; but he lacks the means for achieving these satisfactions. Consequently, like any other unsatisfied man, he turns away from reality and transfers all his interest, and his libido too, to the wishful constructions of his life of phantasy, whence the path might lead to neurosis. There must be, no doubt, a convergence of all kinds of things if this is not to be the complete outcome of his development; it is well known, indeed, how often artists in particular suffer from a partial inhibition of their efficiency owing to neurosis. Their constitution probably includes a strong capacity for sublimation and a certain degree of laxity in the repressions which are decisive for a conflict. An artist, however, finds a path back to reality in the following manner. To be sure, he is not the only one who leads a life of phantasy. Access to the half-way region of phantasy is permitted by the universal assent of mankind, and everyone suffering from privation expects to derive alleviation and consolation from it. But for those who are not artists the yield of pleasure to be derived from the sources of phantasy is very limited. The ruthlessness of their repressions force them to be content with such meagre day-dreams as are allowed to become conscious. A man who is a true artist has more at his disposal. In the first place, he understands how to work over his day-dreams in such a way as to make them lose what is too personal about them and repel strangers, and to make it possible for others to share in the enjoyment of them. He understands, too, how to tone them down so that they do not easily betray their origin from proscribed sources. Furthermore, he possesses the mysterious power of shaping some particular material until it has become a faithful image of his phantasy; and he knows, moreover, how to link so large a yield of pleasure to this representation of his unconscious phantasy that, for the time being at least, repressions are outweighed and lifted by it. If he is able to accomplish all this, he makes it possible for other people once more to derive consolation and alleviation from their own sources of pleasure in their unconscious which have become inaccessible to them; he earns their gratitude and admiration and he has thus achieved through his phantasy what originally he had achieved only in his phantasy - honour, power and the love of women.

[1916-1917, 3430]
It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

[1925d, 4238]
¹ [Footnote added 1920:] The phantasies of the pubertal period have as their starting-point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'Family Romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909).
[1905d, 1539]

We must not neglect, however, to go back to the kind of imaginative works which we have to recognize, not as original creations, but as the re-fashioning of ready-made and familiar material. Even here, the writer keeps a certain amount of independence, which can express itself in the choice of material and in changes in it which are often quite extensive. In so far as the material is already at hand, however, it is derived from the popular treasure-house of myths, legends and fairy tales. The study of constructions of folk-psychology such as these is far from being complete, but it is extremely probable that myths, for instance, are distorted vestiges of the wishful phantasies of whole nations, the secular dreams of youthful humanity.
[1908e, 1929]

¹ In psycho-analyses we frequently come across occurrences of this kind, dating back to the earliest years of the patient's childhood, in which his infantile sexual activity appears to reach its climax and often comes to a catastrophic end owing to some misfortune or punishment. Such occurrences are apt to appear in a shadowy way in dreams. Often they will become so clear that the analyst thinks he has a firm hold of them, and will nevertheless evade any final elucidation; and unless he proceeds with the greatest skill and caution he may be compelled to leave it undecided whether the scene in question actually took place or not. It will help to put us upon the right track in interpreting it, if we recognize that more than one version of the scene (each often differing greatly from the other) may be detected in the patient's unconscious phantasies. If we do not wish to go astray in our judgement of their historical reality, we must above all bear in mind that people's 'childhood memories' are only consolidated at a later period, usually at the age of puberty; and that this involves a complicated process of remodelling, analogous in every way to the process by which a nation constructs legends about its early history. It at once becomes evident that in his phantasies about his infancy the individual as he grows up endeavours to efface the recollection of his auto-erotic activities; and this he does by exalting their memory-traces to the level of object-love, just as a real historian will view the past in the light of the present. This explains why these phantasies abound in seductions and assaults, where the facts will have been confined to auto-erotic activities and the caresses or punishments that stimulated them. Furthermore, it becomes clear that in constructing phantasies about his childhood the individual sexualizes his memories; that is, he brings commonplace experiences into relation with his sexual activity, and extends his sexual interest to them - though in doing this he is probably following upon the traces of a really existing connection. No one who remembers my 'Analysis of a Phobia in a Five-Year-Old Boy' will need to be told that it is not my intention in these remarks to detract from the importance which I have hitherto attached to infantile sexuality by reducing it to nothing more than sexual interest at the age of puberty. I merely wish to give some technical advice that may help to clear up a class of phantasy which is calculated to falsify the picture of infantile sexual activity.
[1909d, 2162]
Since I published my work upon Schreber, a chance acquisition of knowledge has put me in a position to appreciate one of his delusional beliefs more adequately, and to recognize the wealth of its bearing upon mythology. I mentioned on p. 2425 the patient's peculiar relation to the sun, and I was led to explain the sun as a sublimated 'father-symbol'. The sun used to speak to him in human language and thus revealed itself to him as a living being. Schreber was in the habit of abusing it and shouting threats at it; he declares, moreover, that when he stood facing it and spoke aloud, its rays would turn pale before him. After his 'recovery' he boasts that he can gaze at it without any difficulty and without being more than slightly dazzled by it, a thing which would naturally have been impossible for him formerly.²

After a little reflection we shall easily understand what it is about this state of things that perplexes us so much. It is the low valuation of reality, the neglect of the distinction between it and phantasy. We are tempted to feel offended at the patient's having taken up our time with invented stories. Reality seems to us something worlds apart from invention, and we set a very different value on it. Moreover the patient, too, looks at things in this light in his normal thinking. When he brings up the material which leads from behind his symptoms to the wishful situations modelled on his infantile experiences, we are in doubt to begin with whether we are dealing with reality or phantasies. Later, we are enabled by certain indications to come to a decision and we are faced by the task of conveying it to the patient. This, however, invariably gives rise to difficulties. If we begin by telling him straight away that he is now engaged in bringing to light the phantasies with which he has disguised the history of his childhood (just as every nation disguises its forgotten prehistory by constructing legends), we observe that his interest in pursuing the subject further suddenly diminishes in an undesirable fashion. He too wants to experience realities and despises everything that is merely 'imaginary'. If, however, we leave him, till this piece of work is finished, in the belief that we are occupied in investigating the real events of his childhood, we run the risk of his later on accusing us of being mistaken and laughing at us for our apparent credulity. It will be a long time before he can take in our proposal that we should equate phantasy and reality and not bother to begin with whether the childhood experiences under examination are the one or the other. Yet this is clearly the only correct attitude to adopt towards these mental productions. They too possess a reality of a sort. It remains a fact that the patient has created these phantasies for himself, and this fact is of scarcely less importance for his neurosis than if he had really experienced what the phantasies contain. The phantasies possess psychical as contrasted with material reality, and we gradually learn to understand that in the world of the neuroses it is psychical reality which is the decisive kind.

[1916-1917, 3425]

Here, then, was the explanation of the phantasies whose existence we had already divined. They were meant to efface the memory of an event which later on seemed offensive to the patient's masculine self-esteem, and they reached this end by putting an imaginary and desirable converse in the place of the historical truth. According to these phantasies it was not he who had played the passive part towards his sister; but, on the contrary, he had been aggressive, had tried to see his sister undressed, had been rejected and punished, and had for that reason got into the rage which the family tradition talked of so much. It was also appropriate to weave the governess into this imaginative composition, since the chief responsibility for his fits of rage had been ascribed to her by his mother and grandmother. These phantasies, therefore, corresponded exactly to the legends by means of which a nation that has become great and proud tries to conceal the insignificance and failure of its beginnings.

[1918b, 3513]
I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.

[1925d, 4242]
Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot’s proposal, such people are called auditifs and moteurs in contrast to the visuels. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child’s shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult visuels no longer see themselves. Furthermore it contradicts all that we have learnt to suppose that in his experiences a child’s attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the ‘childhood memories’ of individuals come in general to acquire the significance of ‘screen memories’ and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.

I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. Because the superstitious person knows nothing of the motivation of his own chance actions, and because the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, is nothing but psychology projected into the external world. The obscure recognition¹ (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a supernatural reality, which is destined to be changed back once more by science into the psychology of the unconscious. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform metaphysics into metapsychology. The gap between the paranoid’s displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranotics, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours’ characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected Weltanschauung that superstition seems so very much out of place; in the Weltanschauung of pre-scientific times and peoples it was justified and consistent.

[1901b, 1141]

[1901b, 1328]
We must not neglect, however, to go back to the kind of imaginative works which we have to recognize, not as original creations, but as the re-fashioning of ready-made and familiar material. Even here, the writer keeps a certain amount of independence, which can express itself in the choice of material and in changes in it which are often quite extensive. In so far as the material is already at hand, however, it is derived from the popular treasure-house of myths, legends and fairy tales. The study of constructions of folk-psychotherapy such as these is far from being complete, but it is extremely probable that myths, for instance, are distorted vestiges of the wishful phantasies of whole nations, the secular dreams of youthful humanity.

[1908e, 1929]

In consequence of unfavourable circumstances, both of an external and an internal nature, the following observations apply chiefly to the sexual development of one sex only - that is, of males. The value of a compilation such as I am attempting here need not, however, be a purely descriptive one. A knowledge of infantile sexual theories in the shapes they assume in the thoughts of children can be of interest in various ways - even, surprisingly enough, for the elucidation of myths and fairy tales. They are indispensable, moreover, for an understanding of the neuroses themselves; for in them these childish theories are still operative and acquire a determining influence upon the form taken by the symptoms.

[1908c, 1968]

At the instigation of these feelings and worries, the child now comes to be occupied with the first, grand problem of life and asks himself the question: 'Where do babies come from?' - a question which, there can be no doubt, first ran: 'Where did this particular, intruding baby come from?' We seem to hear the echoes of this first riddle in innumerable riddles of myth and legend. The question itself is, like all research, the product of a vital exigency, as though thinking were entrusted with the task of preventing the recurrence of such dreaded events. Let us assume, however, that the child's thinking soon becomes independent of this instigation, and henceforward goes on operating as a self-sustained instinct for research. Where a child is not already too much intimidated, he sooner or later adopts the direct method of demanding an answer from his parents or those in charge of him, who are in his eyes the source of all knowledge. This method, however, fails. The child receives either evasive answers or a rebuke for his curiosity, or he is dismissed with the mythologically significant piece of information which, in German countries, runs: 'The stork brings the babies; it fetches them out of the water.' I have reason to believe that far more children than their parents suspect are dissatisfied with this solution and meet it with energetic doubts, which, however, they do not always openly admit. I know of a three-year-old boy who, after receiving this piece of enlightenment, disappeared - to the terror of his nurse. He was found at the edge of the big pond adjoining the country house, to which he had hurried in order to see the babies in the water. I also know of another boy who could only allow his disbelief to find expression in a hesitant remark that he knew better, that it was not a stork that brought babies but a heron. It seems to me to follow from a great deal of information I have received that children refuse to believe the stork theory and that from the time of this first deception and rebuff they nourish a distrust of adults and have a suspicion of there being something forbidden which is being withheld from them by the 'grown-ups', and that they consequently hide their further researches under a cloak of secrecy. With this, however, the child also experiences the first occasion for a 'psychical conflict', in that views for which he feels an instinctual kind of preference, but which are not 'right' in the eyes of the grown-ups, come into opposition with other views, which are supported by the authority of the grown-ups without being acceptable to him himself. Such a psychical conflict may soon turn into a 'psychical dissociation'. The set of views which are bound up with being 'good', but also with a cessation of reflection, become the dominant and conscious views; while the other set, for which the child's work of research has meanwhile obtained fresh evidence, but which are not supposed to count, become the suppressed and 'unconscious' ones. The nuclear complex of a neurosis is in this way brought into being.

[1908c, 1969]
If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.

Their ignorance of the vagina also makes it possible for children to believe in the second of their sexual theories. If the baby grows in the mother's body and is then removed from it, this can only happen along the one possible pathway - the anal aperture. The baby must be evacuated like a piece of excrement, like a stool. When, in later childhood, the same question is the subject of solitary reflection or of a discussion between two children, the explanations probably arrived at are that the baby emerges from the navel, which comes open, or that the abdomen is slit up and the baby taken out - which was what happened to the wolf in the story of Little Red Riding-Hood. These theories are expressed aloud and also consciously remembered later on; they no longer contain anything objectionable. These same children have by then completely forgotten that in earlier years they believed in another theory of birth, which is now obstructed by the repression of the anal sexual components that has meanwhile occurred. At that time a motion was something which could be talked about in the nursery without shame. The child was still not so distant from his constitutional coprophilic inclinations. There was nothing degraded about coming into the world like a heap of faeces, which had not yet been condemned by feelings of disgust. The cloacal theory, which, after all, is valid for so many animals, was the most natural theory, and it alone could obtrude upon the child as being a probable one.
If the cloacal theory of birth is preserved in consciousness during later years of childhood, as occasionally happens, it is accompanied too by a solution - no longer, it is true, a primary one - of the problem of the origin of babies. Here it is like being in a fairy story; one eats some particular thing and gets a child from it. This infantile theory of birth is revived in cases of insanity. A manic woman, for instance, will lead the visiting doctor to a little heap of faeces which she has deposited in a corner of her cell, and say to him with a laugh: 'That's the baby I had to-day.'

For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least feels he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from him than from her. In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

He made this reply without having any sense of guilt as yet. But this was the occasion of his acquiring the 'castration complex', the presence of which we are so often obliged to infer in analysing neurotics, though they one and all struggle violently against recognizing it. There is much of importance to be said upon the significance of this element in the life of a child. The 'castration complex' has left marked traces behind it in myths (and not only in Greek myths); in a passage in my *Interpretation of Dreams*, and elsewhere, I have touched upon the part it plays.¹

¹[1909b, 2004]
Animals owe a good deal of their importance in myths and fairy tales to the openness with which they display their genitals and their sexual functions to the inquisitive little human child. There can be no doubt about Hans's sexual curiosity; but it also roused the spirit of enquiry in him and enabled him to arrive at genuine abstract knowledge.

[1909b, 2005]

¹ The box was of course the womb. (Hans's father was trying to let him know that he understood this.) And the same is true of the caskets in which so many of the heroes of mythology were exposed, from the time of King Sargon of Agade onwards. - [Added 1923:] Cf. Rank's study, Der Mythus von der Geburt des Helden, 1909.

[1909b, 2057]

¹ In psycho-analyses we frequently come across occurrences of this kind, dating back to the earliest years of the patient's childhood, in which his infantile sexual activity appears to reach its climax and often comes to a catastrophic end owing to some misfortune or punishment. Such occurrences are apt to appear in a shadowy way in dreams. Often they will become so clear that the analyst thinks he has a firm hold of them, and will nevertheless evade any final elucidation; and unless he proceeds with the greatest skill and caution he may be compelled to leave it undecided whether the scene in question actually took place or not. It will help to put us upon the right track in interpreting it, if we recognize that more than one version of the scene (each often differing greatly from the other) may be detected in the patient's unconscious phantasies. If we do not wish to go astray in our judgement of their historical reality, we must above all bear in mind that people's 'childhood memories' are only consolidated at a later period, usually at the age of puberty; and that this involves a complicated process of remodelling, analogous in every way to the process by which a nation constructs legends about its early history. It at once becomes evident that in his phantasies about his infancy the individual as he grows up endeavours to efface the recollection of his autó-erotic activities; and this he does by exalting their memory-traces to the level of object-love, just as a real historian will view the past in the light of the present. This explains why these phantasies abound in seductions and assaults, where the facts will have been confined to auto-erotic activities and the caresses or punishments that stimulated them. Furthermore, it becomes clear that in constructing phantasies about his childhood the individual sexualizes his memories; that is, he brings commonplace experiences into relation with his sexual activity, and extends his sexual interest to them - though in doing this he is probably following upon the traces of a really existing connection. No one who remembers my 'Analysis of a Phobia in a Five-Year-Old Boy' will need to be told that it is not my intention in these remarks to detract from the importance which I have hitherto attached to infantile sexuality by reducing it to nothing more than sexual interest at the age of puberty. I merely wish to give some technical advice that may help to clear up a class of phantasy which is calculated to falsify the picture of infantile sexual activity.

[1909d, 2162]

¹ Ibsen's Rat-Wife must certainly be derived from the legendary Pied Piper of Hamelin, who first enticed away the rats into the water, and then, by the same means, lured the children out of the town, never to return. So too, Little Eyolf threw himself into the water under the spell of the Rat-Wife. In legends generally the rat appears not so much as a disgusting creature but as something uncanny - as a chthonic animal, one might almost say; and it is used to represent the souls of the dead.

[1909d, 2168]
This is often the way in which childhood memories originate. Quite unlike conscious memories from the time of maturity, they are not fixed at the moment of being experienced and afterwards repeated, but are only elicited at a later age when childhood is already past; in the process they are altered and falsified, and are put into the service of later trends, so that generally speaking they cannot be sharply distinguished from phantasies. Their nature is perhaps best illustrated by a comparison with the way in which the writing of history originated among the peoples of antiquity. As long as a nation was small and weak it gave no thought to the writing of its history. Men tilled the soil of their land, fought for their existence against their neighbours, and tried to gain territory from them and to acquire wealth. It was an age of heroes, not of historians. Then came another age, an age of reflection: men felt themselves to be rich and powerful, and now felt a need to learn where they had come from and how they had developed. Historical writing, which had begun to keep a continuous record of the present, now also cast a glance back to the past, gathered traditions and legends, interpreted the traces of antiquity that survived in customs and usages, and in this way created a history of the past. It was inevitable that this early history should have been an expression of present beliefs and wishes rather than a true picture of the past; for many things had been dropped from the nation's memory, while others were distorted, and some remains of the past were given a wrong interpretation in order to fit in with contemporary ideas. Moreover people's motive for writing history was not objective curiosity but a desire to influence their contemporaries, to encourage and inspire them, or to hold a mirror up before them. A man's conscious memory of the events of his maturity is in every way comparable to the first kind of historical writing; while the memories that he has of his childhood correspond, as far as their origins and reliability are concerned, to the history of a nation's earliest days, which was compiled later and for tendentious reasons.

If, then, Leonardo's story about the vulture that visited him in his cradle is only a phantasy from a later period, one might suppose it could hardly be worth while spending much time on it. One might be satisfied with explaining it on the basis of his inclination, of which he makes no secret, to regard his preoccupation with the flight of birds as pre-ordained by destiny. Yet in underrating this story one would be committing just as great an injustice as if one were carelessly to reject the body of legends, traditions and interpretations found in a nation's early history. In spite of all the distortions and misunderstandings, they still represent the reality of the past: they are what a people forms out of the experience of its early days and under the dominance of motives that were once powerful and still operate to-day; and if it were only possible, by a knowledge of all the forces at work, to undo these distortions, there would be no difficulty in disclosing the historical truth lying behind the legendary material. The same holds good for the childhood memories or phantasies of an individual. What someone thinks he remembers from his childhood is not a matter of indifference; as a rule the residual memories - which he himself does not understand - cloak priceless pieces of evidence about the most important features in his mental development. As we now possess in the techniques of psycho-analysis excellent methods for helping us to bring this concealed material to light, we may venture to fill in the gap in Leonardo's life story by analysing his childhood phantasy. And if in doing so we remain dissatisfied with the degree of certainty which we achieve, we shall have to console ourselves with the reflection that so many other studies of this great and enigmatic man have met with no better fate.
People will not reach a proper understanding of the activities of children's sexuality and will probably take refuge in declaring that what has been said here is incredible, so long as they cling to the attitude taken up by our civilization of depreciating the genitals and the sexual functions. To understand the mental life of children we require analogies from primitive times. Through a long series of generations the genitals have been for us the 'pudenda', objects of shame, and even (as a result of further successful sexual repression) of disgust. If one makes a broad survey of the sexual life of our time and in particular of the classes who sustain human civilization, one is tempted to declare that it is only with reluctance that the majority of those alive to-day obey the command to propagate their kind; they feel that their dignity as human beings suffers and is degraded in the process. What is to be found among us in the way of another view of sexual life is confined to the uncultivated lower strata of society; among the higher and more refined classes it is concealed, since it is considered culturally inferior, and it ventures to put itself into practice only in the face of a bad conscience. In the primaeval days of the human race it was a different story. The laborious compilations of the student of civilization provide convincing evidence that originally the genitals were the pride and hope of living beings; they were worshipped as gods and transmitted the divine nature of their functions to all newly learned human activities. As a result of the sublimation of their basic nature there arose innumerable divinities; and at the time when the connection between official religions and sexual activity was already hidden from the general consciousness, secret cults devoted themselves to keeping it alive among a number of initiates. In the course of cultural development so much of the divine and sacred was ultimately extracted from sexuality that the exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all mental traces, it is surely not surprising that even the most primitive forms of genital-worship can be shown to have existed in very recent times and that the language, customs and superstitions of mankind to-day contain survivals from every phase of this process of development.²

Impressive analogies from biology have prepared us to find that the individual's mental development repeats the course of human development in an abbreviated form; and the conclusions which psycho-analytic research into the child's mind has reached concerning the high value set on the genitals in infancy will not therefore strike us as improbable. The child's assumption that his mother has a penis is thus the common source from which are derived the androgynously-formed mother goddesses such as the Egyptian Mut and the vultures' 'coda' in Leonardo's childhood phantasy. It is in fact only due to a misunderstanding that we describe these representations of gods as hermaphrodite in the medical sense of the word. In none of them is there a combination of the true genitals of both sexes - a combination which, to the abhorrence of all beholders, is found in some cases of malformation; all that has happened is that the male organ has been added to the breasts which are the mark of a mother, just as it was present in the child's first idea of his mother's body. This form of the mother's body, the revered creation of primaeval phantasy, has been preserved for the faithful by mythology. We can now provide the following translation of the emphasis given to the vulture's tail in Leonardo's phantasy: 'That was a time when my fond curiosity was directed to my mother, and when I still believed she had a genital organ like my own.' Here is more evidence of Leonardo's early sexual researches, which in our opinion had a decisive effect on the whole of his later life. [1910c, 2272]
This relation of an organ with a double claim on it - its relation to the conscious ego and to repressed sexuality - is to be seen even more clearly in motor organs than in the eye: as when, for instance, a hand which has tried to carry out an act of sexual aggression, and has become paralysed hysterically, is unable, after that act has been inhibited, to do anything else as though it were obstinately insisting on carrying out a repressed innervation; or as when the fingers of people who have given up masturbation refuse to learn the delicate movements required for playing the piano or the violin. As regards the eye, we are in the habit of translating the obscure psychical processes concerned in the repression of sexual scopophilia and in the development of the psychogenic disturbance of vision as though a punishing voice was speaking from within the subject, and saying: 'Because you sought to misuse your organ of sight for evil sensual pleasures, it is fitting that you should not see anything at all any more', and as though it was in this way approving the outcome of the process. The idea of talion punishment is involved in this, and in fact our explanation of psychogenic visual disturbance coincides with what is suggested by myths and legends. The beautiful legend of Lady Godiva tells how all the town's inhabitants hid behind their shuttered windows, so as to make easier the lady's task of riding naked through the streets in broad daylight, and how the only man who peeped through the shutters at her revealed loveliness was punished by going blind. Nor is this the only example which suggests that neurotic illness holds the hidden key to mythology as well.

Another advantage of a wider character is presented in particular by erotic jokes, in the strict sense, just as it is by jokes in general. I have shown in my study of jokes that the revelation of what is normally the repressed unconscious element in the mind can, under certain provisions, become a source of pleasure and thus a technique for the construction of jokes. In psycho-analysis to-day we describe a congeries of ideas and its associated affect as a 'complex'; and we are prepared to assert that many of the most admired jokes are 'complexive jokes' and that they owe their exhilarating and cheerful effect to the ingenious uncovering of what are as a rule repressed complexes. It would carry me too far afield if I were to bring forward instances here in proof of this thesis, but I can assert that the outcome of such an examination of the evidence is that the jokes, both erotic and of other sorts, which are in popular circulation provide an excellent auxiliary means of investigating the unconscious human mind - in the same way as do dreams, myths and legends, with the exploitation of which psycho-analysis is already actively.

The sun, therefore, is nothing but another sublimated symbol for the father; and in pointing this out I must disclaim all responsibility for the monotony of the solutions provided by psycho-analysis. In this instance symbolism overrides grammatical gender - at least so far as German goes, for in most other languages the sun is masculine. Its counterpart in this picture of the two parents is 'Mother Earth' as she is generally called. We frequently come upon confirmations of this assertion in resolving the pathogenic phantasies of neurotics by psycho-analysis. I can make no more than the barest allusion to the relation of all this to cosmic myths. One of my patients, who had lost his father at a very early age, was always seeking to rediscover him in what was grand and sublime in Nature. Since I have known this, it has seemed to me probable that Nietzsche's hymn 'Vor Sonnenaufgang' ['Before Sunrise'] is an expression of the same longing. Another patient, who became neurotic after his father's death, was seized with his first attack of anxiety and giddiness while the sun shone upon him as he was working in the garden with a spade. He spontaneously put forward as an interpretation that he had become frightened because his father had looked at him while he was at work upon his mother with a sharp instrument. When I ventured upon a mild remonstrance, he gave an air of greater plausibility to his view by telling me that even in his father's lifetime he had compared him with the sun, though then it had been in a satirical sense. Whenever he had been asked where his father was going to spend the summer he had replied in these sonorous words from the 'Prologue in Heaven':

1910i, 2370

[1910f, 2382]

1911c, 2426
Since I published my work upon Schreber, a chance acquisition of knowledge has put me in a position to appreciate one of his delusional beliefs more adequately, and to recognize the wealth of its bearing upon mythology. I mentioned on p. 2425 the patient's peculiar relation to the sun, and I was led to explain the sun as a sublimated 'father-symbol'. The sun used to speak to him in human language and thus revealed itself to him as a living being. Schreber was in the habit of abusing it and shouting threats at it; he declares, moreover, that when he stood facing it and spoke aloud, its rays would turn pale before him. After his 'recovery' he boasts that he can gaze at it without any difficulty and without being more than slightly dazzled by it, a thing which would naturally have been impossible for him formerly.²

It is to this delusional privilege of being able to gaze at the sun without being dazzled that the mythological interest attaches. We read in Reinach³ that the natural historians of antiquity attributed this power to the eagle alone, who, as a dweller in the highest regions of the air, was brought into especially intimate relation with the heavens, with the sun, and with lightning.4 We learn from the same sources, moreover, that the eagle puts his young to a test before recognizing them as his legitimate offspring. Unless they can succeed in looking into the sun without blinking they are thrown out of the eyrie.

There can be no doubt about the meaning of this animal myth. It is certain that this is merely ascribing to animals something that is a hallowed custom among men. The procedure gone through by the eagle with his young is an ordeal, a test of lineage, such as is reported of the most various races of antiquity. Thus the Celts living on the banks of the Rhine used to entrust their new-born babies to the waters of the river, in order to ascertain whether they were truly of their own blood. The clan of Psylli, who inhabited what is now Tripoli, boasted that they were descended from snakes, and used to expose their infants to contact with them; those who were true-born children of the clan were either not bitten or recovered rapidly from the effects of the bite.¹ The assumption underlying these trials leads us deep into the totemic habits of thought of primitive peoples. The totem - an animal, or a natural force animistically conceived, to which the tribe traces back its origin - spares the members of the tribe as being its own children, just as it itself is honoured by them as being their ancestor and is spared by them. We have here arrived at the consideration of matters which, as it seems to me, may make it possible to arrive at a psycho-analytic explanation of the origins of religion.

This short postscript to my analysis of a paranoid patient may serve to show that Jung had excellent grounds for his assertion that the mythopoetic forces of mankind are not extinct, but that to this very day they give rise in the neuroses to the same psychical products as in the remotest past ages. I should like to take up a suggestion that I myself made some time ago,¹ and add that the same holds good of the forces that construct religions. And I am of opinion that the time will soon be ripe for us to make an extension of a thesis which has long been asserted by psycho-analysts, and to complete what has hitherto had only an individual and ontogenetic application by the addition of its anthropological counterpart, which is to be conceived phylogenetically. 'In dreams and in neuroses', so our thesis has run, 'we come once more upon the child and the peculiarities which characterize his modes of thought and his emotional life.' 'And we come upon the savage too,' we may now add, 'upon the primitive man, as he stands revealed to us in the light of the researches of archaeology and of ethnology.'
Recognition of the simultaneous presence of the three factors of 'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psycho-analytic theory, and marks its distinction from other views of pathological mental life. At the same time, psycho-analysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only difference is that he deals with these events with less trouble and better success. The psycho-analytic method of investigation can accordingly be applied equally to the explanation of normal psychological phenomena, and has made it possible to discover the close relationship between pathological psychological products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been carried furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psycho-analytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychological life.

It is not surprising to find that psycho-analysis confirms our recognition of the important place which folk fairy tales have acquired in the mental life of our children. In a few people a recollection of their favourite fairy tales takes the place of memories of their own childhood; they have made the fairy tales into screen memories.

Why were there six or seven wolves? There seemed to be no answer to this question, until I raised a doubt whether the picture that had frightened him could be connected with the story of 'Little Red Riding-Hood'. This fairy tale only offers an opportunity for two illustrations - Little Red Riding-Hood's meeting with the wolf in the wood, and the scene in which the wolf lies in bed in the grandmother's night-cap. There must therefore be some other fairy tale behind his recollection of the picture. He soon discovered that it could only be the story of 'The Wolf and the Seven Little Goats' Here the number seven occurs, and also the number six, for the wolf only ate up six of the little goats, while the seventh hid itself in the clock-case. The white, too, comes into this story, for the wolf had his paw made white at the baker's after the little goats had recognized him on his first visit by his grey paw. Moreover, the two fairy tales have much in common. In both there is the eating up, the cutting open of the belly, the taking out of the people who have been eaten and their replacement by heavy stones, and finally in both of them the wicked wolf perishes. Besides all this, in the story of the little goats the tree appears. The wolf lay down under a tree after his meal and snored.

I shall have, for a special reason, to deal with this dream again elsewhere, and interpret it and consider its significance in greater detail. For it is the earliest anxiety-dream that the dreamer remembered from his childhood, and its content, taken in connection with other dreams that followed it soon afterwards and with certain events in his earliest years, is of quite peculiar interest. We must confine ourselves here to the relation of the dream to the two fairy tales which have so much in common with each other, 'Little Red Riding-Hood' and 'The Wolf and the Seven Little Goats'. The effect produced by these stories was shown in the little dreamer by a regular animal phobia. This phobia was only distinguished from other similar cases by the fact that the anxiety-animal was not an object easily accessible to observation (such as a horse or a dog), but was known to him only from stories and picture-books.
If in my patient's case the wolf was merely a first father-surrogate, the question arises whether the hidden content in the fairy tales of the wolf that ate up the little goats and of 'Little Red Riding-Hood' may not simply be infantile fear of the father.¹ Moreover, my patient's father had the characteristic, shown by so many people in relation to their children, of indulging in 'affectionate abuse'; and it is possible that during the patient's earlier years his father (though he grew severe later on) may more than once, as he caressed the little boy or played with him, have threatened in fun to 'gobble him up'. One of my patients told me that her two children could never get to be fond of their grandfather, because in the course of his affectionate romping with them he used to frighten them by saying he would cut open their tummies.

¹ Compare the similarity between these two fairy tales and the myth of Kronos, which has been pointed out by Rank (1912).

Thus our little problem has led us to an astral myth! The only pity is that with this explanation we are not at the end of the matter. The question is not exhausted, for we do not share the belief of some investigators that myths were read in the heavens and brought down to earth; we are more inclined to judge with Otto Rank¹ that they were projected on to the heavens after having arisen elsewhere under purely human conditions. It is in this human content that our interest lies.

At this point I will single out the ninth story in Grimm's Fairy Tales, which bears the title 'The Twelve Brothers'. A king and a queen have twelve children, all boys. The king declares that if the thirteenth child is a girl, the boys will have to die. In expectation of her birth he has twelve coffins made. With their mother's help the twelve sons take refuge in a hidden wood, and swear death to any girl they may meet. A girl is born, grows up, and learns one day from her mother that she has had twelve brothers. She decides to seek them out, and in the wood she finds the youngest; he recognizes her, but is anxious to hide her on account of the brothers' oath. The sister says: 'I will gladly die, if by so doing I can save my twelve brothers.' The brothers welcome her affectionately, however, and she stays with them and looks after their house for them. In a little garden beside the house grow twelve lilies. The girl picks them and gives one to each brother. At that moment the brothers are changed into ravens, and disappear, together with the house and garden. (Ravens are spirit-birds; the killing of the twelve brothers by their sister is represented by the picking of the flowers, just as it is at the beginning of the story by the coffins and the disappearance of the brothers.) The girl, who is once more ready to save her brothers from death, is now told that as a condition she must be dumb for seven years, and not speak a single word. She submits to the test, which brings her herself into mortal danger. She herself, that is, dies for her brothers, as she promised to do before she met them. By remaining dumb she succeeds at last in setting the ravens free.

In the story of 'The Six Swans' the brothers who are changed into birds are set free in exactly the same way - they are restored to life by their sister's dumbness. The girl has made a firm resolve to free her brothers, 'even if it should cost her her life'; and once again (being the wife of the king) she risks her own life because she refuses to give up her dumbness in order to defend herself against evil accusations.

We will for the time being put aside the task of inserting the interpretation that we have found into our myth, and listen to what the mythologists have to teach us about the role and origin of the Fates.¹
This discovery of Nature reacted on the conception of human life. The nature-myth changed into a human myth: the weather-goddesses became goddesses of Fate. But this aspect of the Horae found expression only in the Moerae, who watch over the necessary ordering of human life as inexorably as do the Horae over the regular order of nature. The ineluctable severity of Law and its relation to death and dissolution, which had been avoided in the charming figures of the Horae, were now stamped upon the Moerae, as though men had only perceived the full seriousness of natural law when they had to submit their own selves to it.

Prehistoric man, in the various stages of his development, is known to us through the inanimate monuments and implements which he has left behind, through the information about his art, his religion and his attitude towards life which has come to us either directly or by way of tradition handed down in legends, myths and fairy tales, and through the relics of his mode of thought which survive in our own manners and customs. But apart from this, in a certain sense he is still our contemporary. There are men still living who, as we believe, stand very near to primitive man, far nearer than we do, and whom we therefore regard as his direct heirs and representatives. Such is our view of those whom we describe as savages or half-savages; and their mental life must have a peculiar interest for us if we are right in seeing in it a well-preserved picture of an early stage of our own development.

With these three stages in mind, it may be said that animism itself is not yet a religion but contains the foundations on which religions are later built. It is obvious, too, that myths are based on animistic premises, though the details of the relation between myths and animism seem to be unexplained in some essential respects.

¹ It is generally agreed that when, in mythologies, one generation of gods is overcome by another, what is denoted is the historical replacement of one religious system by a new one, whether as a result of foreign conquest or of psychological development. In the latter case myth approximates to what Silberer has described as 'functional phenomena'. The view maintained by Jung (1912) that the god who kills the animal is a libidinal symbol implies a concept of libido other than that which has hitherto been employed and seems to me questionable from every point of view.

The son's efforts to put himself in the place of the father-god became ever more obvious. The introduction of agriculture increased the son's importance in the patriarchal family. He ventured upon new demonstrations of his incestuous libido, which found symbolic satisfaction in his cultivation of Mother Earth. Divine figures such as Attis, Adonis and Tammuz emerged, spirits of vegetation and at the same time youthful divinities enjoying the favours of mother goddesses and committing incest with their mother in defiance of their father. But the sense of guilt, which was not allayed by these creations, found expression in myths which granted only short lives to these youthful favourites of the mother-goddesses and decreed their punishment by emasculation or by the wrath of the father in the form of an animal. Adonis was killed by a wild boar, the sacred animal of Aphrodite; Attis, beloved of Cybele, perished by castration.¹ The mourning for these gods and the rejoicings over their resurrection passed over into the ritual of another son-deity who was destined to lasting success.
In the first place, it seems quite possible to apply the psycho-analytic views derived from dreams to products of ethnic imagination such as myths and fairy tales.¹ The need to interpret such productions has long been felt; some 'secret meaning' has been suspected to lie behind them and it has been presumed that that meaning is concealed by changes and transformations. The study made by psycho-analysis of dreams and neuroses has given it the necessary experience to enable it to guess the technical procedures that have governed these distortions. But in a number of instances it can also reveal the hidden motives which have led to this modification in the original meaning of myths. It cannot accept as the first impulse to the construction of myths a theoretical craving for finding an explanation of natural phenomena or for accounting for cult observances and usages which have become unintelligible. It looks for that impulse in the same psychical 'complexes', in the same emotional trends, which it has discovered at the base of dreams and symptoms.

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. Pari passu with men's progressive control over the world goes a development in their Weltanschauung, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

Most of these applications of analysis naturally go back to a hint in my earliest analytic writings. The analytic examination of neurotic people and the neurotic symptoms of normal people necessitated the assumption of psychological conditions which could not possibly be limited to the field in which they had been discovered. In this way analysis not only provided us with the explanation of pathological phenomena, but revealed their connection with normal mental life and disclosed unsuspected relationships between psychiatry and the most various other sciences dealing with activities of the mind. Certain typical dreams, for instance, yielded an explanation of some myths and fairy-tales. Riklin and Abraham followed this hint and initiated the researches into myths which have found their completion, in a manner complying with even expert standards, in Rank's works on mythology. Further investigation into dream-symbolism led to the heart of the problems of mythology, folklore (Jones and Storfer) and the abstractions of religion. A deep impression was made on all hearers at one of the psycho-analytical Congresses when a follower of Jung's demonstrated the correspondence between schizophrenic phantasies and the cosmogonies of primitive times and races. Mythological material later received further elaboration (which, though open to criticism, was none the less very interesting) at the hands of Jung, in works attempting to correlate the neuroses with religious and mythical phantasies.

[1913j, 2821]

[1913j, 2822]

[1914d, 2901]
It would, of course, be a different matter if it were proved that the libido theory has already come to grief in the attempt to explain the latter disease. This has been asserted by C. G. Jung (1912) and it is on that account that I have been obliged to enter upon this last discussion, which I would gladly have been spared. I should have preferred to follow to its end the course embarked upon in the analysis of the Schreber case without any discussion of its premisses. But Jung's assertion is, to say the least of it, premature. The grounds he gives for it are scanty. In the first place, he appeals to an admission of my own that I myself have been obliged, owing to the difficulties of the Schreber analysis, to extend the concept of libido (that is, to give up its sexual content) and to identify libido with psychical interest in general. Ferenczi (1913b), in an exhaustive criticism of Jung's work, has already said all that is necessary in correction of this erroneous interpretation. I can only corroborate his criticism and repeat that I have never made any such retractation of the libido theory. Another argument of Jung's, namely, that we cannot suppose that the withdrawal of the libido is in itself enough to bring about the loss of the normal function of reality, is no argument but a dictum. It 'begs the question',¹ and saves discussion; for whether and how this is possible was precisely the point that should have been under investigation. In his next major work, Jung (1913) just misses the solution I had long since indicated: 'At the same time', he writes, 'there is this to be further taken into consideration (a point to which, incidentally, Freud refers in his work on the Schreber case) - that the introversion of the libido sexualis leads to a cathexis of the "ego", and that it may possibly be this that produces the result of a loss of reality. It is indeed a tempting possibility to explain the psychology of the loss of reality in this fashion.' But Jung does not enter much further into a discussion of this possibility. A few lines later he dismisses it with the remark that this determinant 'would result in the psychology of an ascetic anchorite, not in a dementia praecox'. How little this inapt analogy can help us to decide the question may be learnt from the consideration that an anchorite of this kind, who 'tries to eradicate every trace of sexual interest' (but only in the popular sense of the word 'sexual'), does not even necessarily display any pathogenic allocation of the libido. He may have diverted his sexual interest from human beings entirely, and yet may have sublimated it into a heightened interest in the divine, in nature, or in the animal kingdom, without his libido having undergone an introversion on to his phantasies or a return to his ego. This analogy would seem to rule out in advance the possibility of differentiating between interest emanating from erotic sources and from others. Let us remember, further, that the researches of the Swiss school, however valuable, have elucidated only two features in the picture of dementia praecox - the presence in it of complexes known to us both in healthy and neurotic subjects, and the similarity of the phantasies that occur in it to popular myths - but that they have not been able to throw any further light on the mechanism of the disease. We may repudiate Jung's assertion, then, that the libido theory has come to grief in the attempt to explain dementia praecox, and that it is therefore disposed of for the other neuroses as well.

[1914c, 2937]

Mythology will teach you that incest, which is supposed to be so much detested by humans, is unhesitatingly allowed to the gods. And you may learn from ancient history that incestuous sister marriage was a sanctified injunction upon the person of the Ruler (among the Egyptian Pharaohs and the Incas of Peru). What was in question was thus a privilege forbidden to the common herd.

[1916-1917, 3401]
After a little reflection we shall easily understand what it is about this state of things that perplexes us so much. It is the low valuation of reality, the neglect of the distinction between it and phantasy. We are tempted to feel offended at the patient's having taken up our time with invented stories. Reality seems to us something worlds apart from invention, and we set a very different value on it. Moreover the patient, too, looks at things in this light in his normal thinking. When he brings up the material which leads from behind his symptoms to the wishful situations modelled on his infantile experiences, we are in doubt to begin with whether we are dealing with reality or phantasies. Later, we are enabled by certain indications to come to a decision and we are faced by the task of conveying it to the patient. This, however, invariably gives rise to difficulties. If we begin by telling him straight away that he is now engaged in bringing to light the phantasies with which he has disguised the history of his childhood (just as every nation disguises its forgotten prehistory by constructing legends), we observe that his interest in pursuing the subject further suddenly diminishes in an undesirable fashion. He too wants to experience realities and despises everything that is merely 'imaginary'. If; however, we leave him, till this piece of work is finished, in the belief that we are occupied in investigating the real events of his childhood, we run the risk of his later on accusing us of being mistaken and laughing at us for our apparent credulity. It will be a long time before he can take in our proposal that we should equate phantasy and reality and not bother to begin with whether the childhood experiences under examination are the one or the other. Yet this is clearly the only correct attitude to adopt towards these mental productions. They too possess a reality of a sort. It remains a fact that the patient has created these phantasies for himself, and this fact is of scarcely less importance for his neurosis than if he had really experienced what the phantasies contain. The phantasies possess *psychical as contrasted with material reality*, and we gradually learn to understand that *in the world of the neuroses it is psychical reality which is the decisive kind.*

[1916-1917, 3425]

Here, then, was the explanation of the phantasies whose existence we had already divined. They were meant to efface the memory of an event which later on seemed offensive to the patient's masculine self-esteem, and they reached this end by putting an imaginary and desirable converse in the place of the historical truth. According to these phantasies it was not he who had played the passive part towards his sister; but, on the contrary, he had been aggressive, had tried to see his sister undressed, had been rejected and punished, and had for that reason got into the rage which the family tradition talked of so much. It was also appropriate to weave the governess into this imaginative composition, since the chief responsibility for his fits of rage had been ascribed to her by his mother and grandmother. These phantasies, therefore, corresponded exactly to the legends by means of which a nation that has become great and proud tries to conceal the insignificance and failure of its beginnings.

[1918b, 3513]

'If in my patient's case the wolf was merely a first father surrogate, the question arises whether the hidden content in the fairy tales of the wolf that ate up the little goats and of "Little Red Riding-Hood" may not simply be infantile fear of the father.' Moreover, my patient's father had the characteristic, shown by so many people in relation to their children, of indulging in "affectionate abuse"; and it is possible that during the patient's earlier years his father (though he grew severe later on) may have more than once, as he caressed the little boy or played with him, have threatened in fun to "gobble him up". One of my patients told me that her two children could never get to be fond of their grandfather, because in the course of his affectionate romping with them he used to frighten them by saying he would cut open their tummies.'

[1918b, 3523]
In the course of the development of civilization man acquired a dominating position over his fellow-creatures in the animal kingdom. Not content with this supremacy, however, he began to place a gulf between his nature and theirs. He denied the possession of reason to them, and to himself he attributed an immortal soul, and made claims to a divine descent which permitted him to break the bond of community between him and the animal kingdom. Curiously enough, this piece of arrogance is still foreign to children, just as it is to primitive and primaeval man. It is the result of a later, more pretentious stage of development. At the level of totemism primitive man had no repugnance to tracing his descent from an animal ancestor. In myths, which contain the precipitate of this ancient attitude of mind, the gods take animal shapes, and in the art of earliest times they are portrayed with animals' heads. A child can see no difference between his own nature and that of animals. He is not astonished at animals thinking and talking in fairy-tales; he will transfer an emotion of fear which he feels for his human father onto a dog or a horse, without intending any derogation of his father by it. Not until he is grown up does he become so far estranged from animals as to use their names in vilification of human beings.

We know from psycho-analytic experience, however, that the fear of damaging or losing one's eyes is a terrible one in children. Many adults retain their apprehensiveness in this respect, and no physical injury is so much dreaded by them as an injury to the eye. We are accustomed to say, too, that we will treasure a thing as the apple of our eye. A study of dreams, phantasies and myths has taught us that anxiety about one's eyes, the fear of going blind, is often enough a substitute for the dread of being castrated. The self-blinding of the mythical criminal, Oedipus, was simply a mitigated form of the punishment of castration - the only punishment that was adequate for him by the lex talionis. We may try on rationalistic grounds to deny that fears about the eye are derived from the fear of castration, and may argue that it is very natural that so precious an organ as the eye should be guarded by a proportionate dread. Indeed, we might go further and say that the fear of castration itself contains no other significance and no deeper secret than a justifiable dread of this rational kind. But this view does not account adequately for the substitutive relation between the eye and the male organ which is seen to exist in dreams and myths and phantasies; nor can it dispel the impression that the threat of being castrated in especial excites a peculiarly violent and obscure emotion, and that this emotion is what first gives the idea of losing other organs its intense colouring. All further doubts are removed when we learn the details of their 'castration complex' from the analysis of neurotic patients, and realize its immense importance in their mental life.
Nor shall we conceal the fact that for almost every example adduced in support of our hypothesis one may be found which rebuts it. The story of the severed hand in Hauff's fairy tale certainly has an uncanny effect, and we have traced that effect back to the castration complex; but most readers will probably agree with me in judging that no trace of uncanniness is provoked by Herodotus's story of the treasure of Rhampsinitus, in which the master-thief, whom the princess tries to hold fast by the hand, leaves his brother's severed hand behind with her instead. Again, the prompt fulfilment of the wishes of Polycrates undoubtedly affects us in the same uncanny way as it did the king of Egypt; yet our own fairy stories are crammed with instantaneous wish-fulfilments which produce no uncanny effect whatever. In the story of 'The Three Wishes', the woman is tempted by the savoury smell of a sausage to wish that she might have one too, and in an instant it lies on a plate before her. In his annoyance at her hastiness her husband wishes it may hang on her nose. And there it is, dangling from her nose. All this is very striking but not in the least uncanny. Fairy tales quite frankly adopt the animistic standpoint of the omnipotence of thoughts and wishes, and yet I cannot think of any genuine fairy story which has anything uncanny about it. We have heard that it is in the highest degree uncanny when an inanimate object - a picture or a doll - comes to life; nevertheless in Hans Andersen's stories the household utensils, furniture and tin soldiers are alive, yet nothing could well be more remote from the uncanny. And we should hardly call it uncanny when Pygmalion's beautiful statue comes to life.

The imaginative writer has this licence among many others, that he can select his world of representation so that it either coincides with the realities we are familiar with or departs from them in what particulars he pleases. We accept his ruling in every case. In fairy tales, for instance, the world of reality is left behind from the very start, and the animistic system of beliefs is frankly adopted. Wish-fulfilments, secret powers, omnipotence of thoughts, animation of inanimate objects, all the elements so common in fairy stories, can exert no uncanny influence here; for, as we have learnt, that feeling cannot arise unless there is a conflict of judgement as to whether things which have been 'surmounted' and are regarded as incredible may not, after all, be possible; and this problem is eliminated from the outset by the postulates of the world of fairy tales. Thus we see that fairy stories, which have furnished us with most of the contradictions to our hypothesis of the uncanny, confirm the first part of our proposition - that in the realm of fiction many things are not uncanny which would be so if they happened in real life. In the case of these stories there are other contributory factors, which we shall briefly touch upon later.
To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

[1919g, 3705]

The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phyllogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaenal ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1923a, 3929]
The position is just the same, I think, in the matter of the relation of dreams to the alleged facts of the occult world. But, since dreams themselves have always been mysterious things, they have been brought into intimate connection with the other unknown mysteries. No doubt, too, they have a historic claim to that position, since in primaevial ages, when our mythology was being formed, dream-images may have played a part in the origin of ideas about spirits.
[1925i, 4052]

We have seen that one part of human mental activity is directed towards obtaining control over the real external world. Psycho-analysis now tells us further that another, particularly highly-prized, part of creative mental work serves for the fulfilment of wishes - for the substitutive satisfaction of the repressed wishes which, from the days of childhood, live in the spirit of each of us, unsatisfied. Among these creations, whose connection with an incomprehensible unconscious was always suspected, are myths and works of imaginative writing and of art, and the researches of psycho-analysts have in fact thrown a flood of light on the fields of mythology, the science of literature, and the psychology of artists. It is enough to mention Otto Rank's work as an example. We have shown that myths and fairy tales can be interpreted like dreams, we have traced the convoluted paths that lead from the urge of the unconscious wish to its realization in a work of art, we have learnt to understand the emotional effect of a work of art on the observer, and in the case of the artist himself we have made clear his internal kinship with the neurotic as well as his distinction from him, and we have pointed out the connection between his innate disposition, his chance experiences and his achievements. The aesthetic appreciation of works of art and the elucidation of the artistic gift are, it is true, not among the tasks set to psycho-analysis. But it seems that psycho-analysis is in a position to speak the decisive word in all questions that touch upon the imaginative life of man.
[1924f, 4117]

I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.
[1925d, 4242]
The idea of being devoured by the father is typical age-old childhood material. It has familiar parallels in mythology (e.g. the myth of Kronos) and in the animal kingdom. Yet in spite of this confirmation the idea is so strange to us that we can hardly credit its existence in a child. Nor do we know whether it really means what it seems to say, and we cannot understand how it can have become the subject of a phobia. Analytic observation supplies the requisite information. It shows that the idea of being devoured by the father gives expression, in a form that has undergone regressive degradation, to a passive, tender impulse to be loved by him in a genital-erotic sense. Further investigation of the case history leaves no doubt of the correctness of this explanation. The genital impulse, it is true, betrays no sign of its tender purpose when it is expressed in the language belonging to the superseded transitional phase between the oral and sadistic organizations of the libido. Is it, moreover, a question merely of the replacement of the representative by a regressive form of expression or is it a question of a genuine regressive degradation of the genitally-directed impulse in the id? It is not at all easy to make certain. The case history of the Russian 'Wolf Man' gives very definite support to the second, more serious, view; for, from the time of the decisive dream onward, the boy became naughty, tormenting and sadistic, and soon afterwards developed a regular obsessional neurosis. At any rate, we can see that repression is not the only means which the ego can employ for the purpose of defence against an unwelcome instinctual impulse. If it succeeds in making an instinct regress, it will actually have done it more injury than it could have by repressing it. Sometimes, indeed, after forcing an instinct to regress in this way, it goes on to repress it.

There is much to be told, for which our expectations have not prepared us, about the contents, manifestations and achievements of this early period of sexuality. For instance, you will no doubt be surprised to hear how often little boys are afraid of being eaten up by their father. (And you may also be surprised at my including this fear among the phenomena of sexual life.) But I may remind you of the mythological tale which you may still recall from your schooldays of how the god Kronos swallowed his children. How strange this must have sounded to you when you first heard it! But I suppose none of us thought about it at the time. To-day we can also call to mind a number of fairy tales in which some ravenous animal like a wolf appears, and we shall recognize it as a disguise of the father. And this is an opportunity of assuring you that it was only through the knowledge of infantile sexuality that it became possible to understand mythology and the world of fairy tales. Here then something has been gained as a by-product of analytic studies.

You will be no less surprised to hear that male children suffer from a fear of being robbed of their sexual organ by their father, so that this fear of being castrated has a most powerful influence on the development of their character and in deciding the direction to be followed by their sexuality. And here again mythology may give you the courage to believe psycho-analysis. The same Kronos who swallowed his children also emasculated his father Uranus, and was afterwards himself emasculated in revenge by his son Zeus, who had been rescued though his mother's cunning. If you have felt inclined to suppose that all that psycho-analysis reports about the early sexuality of children is derived from the disordered imagination of the analysts, you must at least admit that their imagination has created the same product as the imaginative activities of primitive man, of which myths and fairy tales are the precipitate. The alternative friendlier, and probably also the more pertinent view would be that in the mental life of children to-day we can still detect the same archaic factors which were once dominant generally in the primaeval days of human civilization. In his mental development the child would be repeating the history of his race in an abbreviated form, just as embryology long since recognized was the case with somatic development.
But let us first summon history to our aid. When Caius Julius Caesar landed in Egypt, he found the young Queen Cleopatra (who was soon to become so important to him) married to her still younger brother Ptolemy. In an Egyptian dynasty there was nothing peculiar in this; the Ptolemies, who were of Greek origin, had merely carried on the custom which had been practised by their predecessors, the ancient Pharaohs, for a few thousand years. This, however, was merely brother-and-sister incest, which even at the present time is not judged so harshly. So let us turn to our chief witness in matters concerning primaeval times - mythology. It informs us that the myths of every people, and not only of the Greeks, are filled with examples of love-affairs between fathers and daughters and even between mothers and sons. Cosmology, no less than the genealogy of royal races, is founded upon incest. For what purpose do you suppose these legends were created? To brand gods and kings as criminals? to fasten on them the abhorrence of the human race? Rather, surely, because incestuous wishes are a primordial human heritage and have never been fully overcome, so that their fulfilment was still granted to gods and their descendants when the majority of common humans were already obliged to renounce them. It is in complete harmony with these lessons of history and mythology that we find incestuous wishes still present and operative in the childhood of the individual.

[1926e, 4356]

These things that, by his science and technology, man has brought about on this earth, on which he first appeared as a feeble animal organism and on which each individual of his species must once more make its entry ('oh inch of nature!') as a helpless suckling - these things do not only sound like a fairy tale, they are an actual fulfilment of every - or of almost every - fairy-tale wish. All these assets he may lay claim to as his cultural acquisition. Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods. To these gods he attributed everything that seemed unattainable to his wishes, or that was forbidden to him. One may say, therefore, that these gods were cultural ideals. To-day he has come very close to the attainment of this ideal, he has almost become a god himself. Only, it is true, in the fashion in which ideals are usually attained according to the general judgement of humanity. Not completely; in some respects not at all, in others only half way. Man has, as it were, become a kind of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times. Nevertheless, he is entitled to console himself with the thought that this development will not come to an end precisely with the year 1930 A.D. Future ages will bring with them new and probably unimaginably great advances in this field of civilization and will increase man's likeness to God still more. But in the interests of our investigations, we will not forget that present-day man does not feel happy in his Godlike character.

[1930a, 4489]

For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain all the features of our myth in this fashion: apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

[1932a, 4781]
Secondly, the acquisition of fire was a crime; it was accomplished by robbery or theft. This is a constant feature in all the legends about the acquiring of control over fire. It is found among the most different and widely separated peoples and not merely in the Greek myth of Prometheus the Bringer of Fire. Here, then, must be the essential content of mankind's distorted recollection. But why is the acquisition of fire inseparably connected with the idea of a crime? Who is it that was injured or defrauded by it? The Promethean myth in Hesiod gives us a straight answer; for, in another story, not itself directly connected with fire, Prometheus so arranged the sacrifices to the gods as to give men the advantage over Zeus. It is the gods, then, who were defrauded. We know that in myths the gods are granted the satisfaction of all the desires which human creatures have to renounce, as we have learnt from the case of incest. Speaking in analytic terms, we should say that instinctual life - the id - is the god who is defrauded when the quenching of fire is renounced: in the legend, a human desire is transformed into a divine privilege. But in the legend the deity possesses nothing of the characteristics of a super-ego, he is still the representative of the paramount life of the instincts.

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire-legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal driven by instinct, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced an instinct and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes an instinctual renunciation, at least it makes no secret of the resentment which the culture-hero could not fail to arouse in men driven by their instincts. And this is in accordance with what we know and expect. We know that a demand for a renunciation of instinct, and the enforcement of that demand, call out hostility and aggressiveness, which is only transformed into a sense of guilt in a later phase of psychical development.

The question may be asked whether we may attribute to the mythopoeic activity an attempt to give (in play, as it were) a disguised representation to universally familiar, though also extremely interesting, mental processes that are accompanied by physical manifestations, with no motive other than the sheer pleasure of representation. We can certainly give no decided answer to this question without having fully grasped the nature of myths; but in the two instances before us, it is easy to recognize the same content and, with it, a definite purpose. Each describes the revival of libidinal desires after they have been quenched through being sated. That is to say, each brings out the indestructibility of those desires; and this emphasis is particularly appropriate as a consolation where the historical core of the myth deals with a defeat of instinctual life, with a renunciation of instinct that has become necessary. It is, as it were, the second part of primal man's understandable reaction when he has suffered a blow in his instinctual life: after the punishment of the offender comes the assurance that after all at bottom he has done no damage.
A reversal into the opposite is unexpectedly found in another myth which in appearance has very little to do with the fire myth. The Lernaean hydra with its countless flickering serpent's heads - one of which was immortal - was, as its name tells us, a water-dragon. Heracles, the culture-hero, fought it by cutting off its heads; but they always grew again, and it was only after he had burnt up the immortal head with fire that he overcame the monster. A water-dragon subdued by fire - that surely makes no sense. But, as in so many dreams, sense emerges if we reverse the manifest content. In that case the hydra is a brand of fire and the flickering serpent's heads are the flames; and these, in proof of their libidinal nature, once more display, like Prometheus's liver, the phenomenon of re-growth, of renewal after attempted destruction. Heracles, then, extinguishes this brand of fire with - water. (The immortal head is no doubt the phallus itself, and its destruction signifies castration.) But Heracles was also the deliverer of Prometheus and slew the bird which devoured his liver. Should we not suspect a deeper connection between the two myths? It is as though the deed of the one hero was made up for by the other. Prometheus (like the Mongolian law) had forbidden the quenching of fire; Heracles permitted it in the case in which the brand of fire threatened disaster. The second myth seems to correspond to the reaction of a later epoch of civilization to the events of the acquisition of power over fire. It looks as though this line of approach might take us quite a distance into the secrets of the myth; but admittedly we should carry a feeling of certainty with us only a short way.

[1932a, 4785]

In the antithesis between fire and water, which dominates the entire field of these myths, yet a third factor can be demonstrated in addition to the historical factor and the factor of symbolic phantasy. This is a physiological fact, which the poet Heine describes in the following lines:-

[1932a, 4786]

In 1909 Otto Rank, who was at that time still under my influence, published, following a suggestion of mine, a book bearing the title Der Mythus von der Geburt des Helden.¹ It deals with the fact that 'almost all the prominent civilized nations... began at an early stage to glorify their heroes, legendary kings and princes, founders of religions, dynasties, empires or cities, in brief their national heroes, in a number of poetic tales and legends. The history of the birth and of the early life of these personalities came to be especially invested with phantastic features, which, indifferent peoples, even though widely separated by space and entirely independent of each other, present a baffling similarity and in part, indeed, a literal conformity. Many investigators have been impressed with this fact, which has long been recognized.' If, following Rank, we construct (by a technique a little like Galton's) an 'average legend' that brings into prominence the essential features of all these stories, we arrive at the following picture:

[1939a, 4841]
Rank's researches have made us acquainted with the source and purpose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent-child relationship is represented in countless dreams by pulling out of the water or rescuing from the water. When a people's imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his father. A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth - the aristocratic one and the humble one - are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

[1939a, 4843]

We may fairly say that these explanations make the widespread and uniform nature of myths of the birth of heroes fully intelligible. For that reason it is all the more deserving of interest that the legend of the birth and exposure of Moses occupies a special position and, indeed, in one essential respect contradicts the rest.

[1939a, 4843]

A moment's reflection, however, tells us that an original legend of Moses like this, one no longer deviating from the other legends, cannot have existed. For it was either of Egyptian or of Jewish origin. The first alternative is ruled out: the Egyptians had no motive for glorifying Moses, since he was no hero to them. We are to suppose, then, that the legend was created among the Jewish people - that is to say, that it was attached in its familiar form to the figure of their leader. But it was totally unsuitable for that purpose, for what would be the use to a people of a legend which made their great man into a foreigner?

[1939a, 4845]

The legend of Moses, in the form in which we have it to-day, falls notably short of its secret intention. If Moses was not of royal birth, the legend could not stamp him as a hero; if it left him as a Jewish child, it had done nothing to raise his social standing. Only one small fragment of the entire myth remains effective: the assurance that the child had survived in the face of powerful external forces. (This feature recurs in the story of the childhood of Jesus, in which King Herod takes over the role of Pharaoh.) Thus we are in fact free to suppose that some later and clumsy adapter of the material of the legend found an opportunity for introducing into the story of his hero Moses something which resembled the classical exposure legends marking out a hero, but which, on account of the special circumstances of the case, was not applicable to Moses.

[1939a, 4845]
Let us return to the two families of the myth. At the level of analytic interpretation they are, as we know, identical; whereas at the level of the myth they are differentiated into an aristocratic family and a humble one. Where, however, the figure to whom the myth is attached is a historical one, there is a third level - that of reality. One of the families is the real one, in which the person in question (the great man) was actually born and grew up; the other is fictitious, fabricated by the myth in pursuit of its own intentions. As a rule the humble family is the real one and the aristocratic family the fabricated one. The situation in the case of Moses seemed somehow different. And here the new line of approach will perhaps lead to a clarification: in every instance which it has been possible to test, the first family, the one from which the child was exposed, was the invented one, and the second one, in which he was received and grew up, was the real one. If we have the courage to recognize this assertion as universally true and as applying also to the legend of Moses, then all at once we see things clearly: Moses was an Egyptian - probably an aristocrat - whom the legend was designed to turn into a Jew. And that would be our conclusion. The exposure in the water was at its correct point in the story; but, in order to fit in with the fresh purpose, its aim had to be somewhat violently twisted. From being a way of sacrificing the child, it was turned into a means of rescuing him.

[1939a, 4845]

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.¹ We must be prepared to find that this new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction and transformation of legends are, after all, too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses - with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions - are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.

[1939a, 4846]

During the period at which, among the Jews, the return of the religion of Moses was in preparation, the Greek people found themselves in possession of an exceedingly rich store of tribal legends and hero-myths. It is believed that the ninth or eighth century B.C. saw the origin of the two Homeric epics, which drew their material from this circle of legends. With our present psychological insight we could, long before Schliemann and Evans, have raised the question of where it was that the Greeks obtained all the legendary material which was worked over by Homer and the great Attic dramatists in their masterpieces. The answer would have had to be that this people had probably experienced in their prehistory a period of external brilliance and cultural efflorescence which had perished in a historical catastrophe and of which an obscure tradition survived in these legends. The archaeological researches of our days have now confirmed this suspicion, which in the past would certainly have been pronounced too daring. These researches have uncovered the evidences of the impressive Minoan-Mycenaean civilization, which had probably already come to an end on the mainland of Greece before 1250 B.C. There is scarcely a hint at it to be found in the Greek historians of a later age: at most a remark that there was a time when the Cretans exercised command of the sea, and the name of King Minos and of his palace, the Labyrinth. That is all, and beyond it nothing has remained but the traditions which were seized on by the poets.

[1939a, 4896]
National epics of other peoples - Germans, Indians, Finns - have come to light as well. It is the business of historians of literature to investigate whether we may assume the same determinants for their origin as with the Greeks. Such an investigation would, I believe, yield a positive result. Here is the determinant which we recognize: a piece of prehistory which, immediately after it, would have been bound to appear rich in content, important, splendid, and always, perhaps, heroic, but which lies so far back, in such remote times, that only an obscure and incomplete tradition informs later generations of it. Surprise has been felt that the epic as an art-form has become extinct in later times. The explanation may be that its determining cause no longer exists. The old material was used up and for all later events historical writing took the place of tradition. The greatest heroic deeds of our days have not been able to inspire an epic, and even Alexander the Great had a right to complain that he would find no Homer.

I put forward these assertions as much as a quarter of a century ago in my Totem and Taboo (1912-13) and I need only repeat them here. My construction starts out from a statement of Darwin's and takes in a hypothesis of Atkinson's. It asserts that in primaeval times primitive man lived in small hordes, each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men - that is, to all our ancestors. The story is told in an enormously condensed form, as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property - wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

The first step away from totemism was the humanizing of the being who was worshipped. In place of the animals, human gods appear, whose derivation from the totem is not concealed. The god is still represented either in the form of an animal or at least with an animal's face, or the totem becomes the god's favourite companion, inseparable from him, or legend tells us that the god slew this precise animal, which was after all only a preliminary stage of himself. At a point in this evolution which is not easily determined great mother-goddesses appeared, probably even before the male gods, and afterwards persisted for a long time beside them. In the meantime a great social revolution had occurred. Matriarchy was succeeded by the re-establishment of a patriarchal order. The new fathers, it is true, never achieved the omnipotence of the primal father; there were many of them, who lived together in associations larger than the horde had been. They were obliged to be on good terms with one another, and remained under the limitation of social ordinances. It is likely that the mother-goddesses originated at the time of the curtailment of the matriarchy, as a compensation for the slight upon the mothers. The male deities appear first as sons beside the great mothers and only later clearly assume the features of father-figures. These male gods of polytheism reflect the conditions during the patriarchal age. They are numerous, mutually restrictive, and are occasionally subordinated to a superior high god. The next step, however, leads us to the theme with which we are here concerned - to the return of a single father-god of unlimited dominion.
It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of primaeval history purely imaginary would be gravely under-estimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten primaeval age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son’s relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations.

[1939a, 4908]

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer’s early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer’s early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer’s adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]
The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as ‘phantasy’. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call ‘reality-testing’. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfilments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. ‘We cannot do without auxiliary constructions’, as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of ‘reservations’ or ‘nature reserves’ in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

[1916-1917, 3427]
The adoption of the required attitude of mind towards ideas that seem to emerge 'of their own free will' and the abandonment of the critical function that is normally in operation against them seem to be hard of achievement for some people. The 'involuntary thoughts' are liable to release a most violent resistance, which seeks to prevent their emergence. If we may trust that great poet and philosopher Friedrich Schiller, however, poetic creation must demand an exactly similar attitude. In a passage in his correspondence with Körner - we have to thank Otto Rank for unearthing it - Schiller (writing on December 1, 1788) replies to his friend's complaint of insufficient productivity: 'The ground for your complaint seems to me to lie in the constraint imposed by your reason upon your imagination. I will make my idea more concrete by a simile. It seems a bad thing and detrimental to the creative work of the mind if Reason makes too close an examination of the ideas as they come pouring in - at the very gateway, as it were. Looked at in isolation, a thought may seem very trivial or very fantastic; but it may be made important by another thought that comes after it, and, in conjunction with other thoughts that may seem equally absurd, it may turn out to form a most effective link. Reason cannot form any opinion upon all this unless it retains the thought long enough to look at it in connection with the others. On the other hand, where there is a creative mind, Reason - so it seems to me - relaxes its watch upon the gates, and the ideas rush in pell-mell, and only then does it look them through and examine them in a mass. - You critics, or whatever else you may call yourselves, are ashamed or frightened of the momentary and transient extravagances which are to be found in all truly creative minds and whose longer or shorter duration distinguishes the thinking artist from the dreamer. You complain of your unfruitfulness because you reject too soon and discriminate too severely.'

[1900a, 605]

The deepest and eternal nature of man, upon whose evocation in his hearers the poet is accustomed to rely, lies in those impulses of the mind which have their roots in a childhood that has since become prehistoric. Suppressed and forbidden wishes from childhood break through in the dream behind the exile's unobjectionable wishes which are capable of entering consciousness; and that is why the dream which finds concrete expression in the legend of Nausicaä ends as a rule as an anxiety-dream.

[1900a, 725]

Let us consider first the relation between father and son. The sanctity which we attribute to the rules laid down in the Decalogue has, I think, blunted our powers of perceiving the real facts. We seem scarcely to venture to observe that the majority of mankind disobey the Fifth Commandment. Alike in the lowest and in the highest strata of human society filial piety is wont to give way to other interests. The obscure information which is brought to us by mythology and legend from the primaeval ages of human society gives an unpleasing picture of the father's despotic power and of the ruthlessness with which he made use of it. Kronos devoured his children, just as the wild boar devours the sow's litter; while Zeus emasculated his father² and made himself ruler in his place. The more unrestricted was the rule of the father in the ancient family, the more must the son, as his destined successor, have found himself in the position of an enemy, and the more impatient must he have been to become ruler himself though his father's death. Even in our middle-class families fathers are as a rule inclined to refuse their sons independence and the means necessary to secure it and thus to foster the growth of the germ of hostility which is inherent in their relation. A physician will often be in a position to notice how a son's grief at the loss of his father cannot suppress his satisfaction at having at length won his freedom. In our society to-day fathers are apt to cling desperately to what is left of a now sadly antiquated protestas patris familias; and an author who, like Ibsen, brings the immemorial struggle between fathers and sons into prominence in his writings may be certain of producing his effect.

[1900a, 735]
Oedipus Rex is what is known as a tragedy of destiny. Its tragic effect is said to lie in the contrast between the supreme will of the gods and the vain attempts of mankind to escape the evil that threatens them. The lesson which, it is said, the deeply moved spectator should learn from the tragedy is submission to the divine will and realization of his own impotence. Modern dramatists have accordingly tried to achieve a similar tragic effect by weaving the same contrast into a plot invented by themselves. But the spectators have looked on unmoved while a curse or an oracle was fulfilled in spite of all the efforts of some innocent man: later tragedies of destiny have failed in their effect.

[1900a, 741]
Another of the great creations of tragic poetry, Shakespeare's *Hamlet*, has its roots in the same soil as *Oedipus Rex*. But the changed treatment of the same material reveals the whole difference in the mental life of these two widely separated epochs of civilization: the secular advance of repression in the emotional life of mankind. In the *Oedipus* the child's wishful phantasy that underlies it is brought into the open and realized as it would be in a dream. In *Hamlet* it remains repressed; and - just as in the case of a neurosis - we only learn of its existence from its inhibiting consequences. Strangely enough, the overwhelming effect produced by the more modern tragedy has turned out to be compatible with the fact that people have remained completely in the dark as to the hero's character. The play is built up on Hamlet's hesitations over fulfilling the task of revenge that is assigned to him; but its text offers no reasons or motives for these hesitations and an immense variety of attempts at interpreting them have failed to produce a result. According to the view which was originated by Goethe and is still the prevailing one to-day, Hamlet represents the type of man whose power of direct action is paralysed by an excessive development of his intellect. (He is 'sicklied o'er with the pale cast of thought.') According to another view, the dramatist has tried to portray a pathologically irresolute character which might be classed as neurasthenic. The plot of the drama shows us, however, that Hamlet is far from being represented as a person incapable of taking any action. We see him doing so on two occasions: first in a sudden outburst of temper, when he runs his sword through the eavesdropper behind the arras, and secondly in a premeditated and even crafty fashion, when, with all the callousness of a Renaissance prince, he sends the two courtiers to the death that had been planned for himself. What is it, then, that inhibits him in fulfilling the task set him by his father's ghost? The answer, once again, is that it is the peculiar nature of the task. Hamlet is able to do anything - except take vengeance on the man who did away with his father and took that father's place with his mother, the man who shows him the repressed wishes of his own childhood realized. Thus the loathing which should drive him on to revenge is replaced in him by self-reproaches, by scruples of conscience, which remind him that he himself is literally no better than the sinner whom he is to punish. Here I have translated into conscious terms what was bound to remain unconscious in Hamlet's mind; and if any one is inclined to call him a hysteric, I can only accept the fact as one that is implied by my interpretation. The distaste for sexuality expressed by Hamlet in his conversation with Ophelia fits in very well with this: the same distaste which was destined to take possession of the poet's mind more and more during the years that followed, and which reached its extreme expression in *Timon of Athens*. For it can of course only be the poet's own mind which confronts us in Hamlet. I observe in a book on Shakespeare by Georg Brandes (1896) a statement that *Hamlet* was written immediately after the death of Shakespeare's father (in 1601), that is, under the immediate impact of his bereavement and, as we may well assume, while his childhood feelings about his father had been freshly revived. It is known, too, that Shakespeare's own son who died at an early age bore the name of 'Hamnet', which is identical with 'Hamlet'. Just as *Hamlet* deals with the relation of a son to his parents, so *Macbeth* (written at approximately the same period) is concerned with the subject of childlessness. But just as all neurotic symptoms, and, for that matter, dreams, are capable of being 'over-interpreted' and indeed need to be, if they are to be fully understood, so all genuinely creative writings are the product of more than a single motive and more than a single impulse in the poet's mind, and are open to more than a single interpretation. In what I have written I have only attempted to interpret the deepest layer of impulses in the mind of the creative writer.¹

[1900a, 743]
I do not wish to deny categorically that this fourth power in dream-construction - which we shall soon recognize as all old acquaintance, since in fact it is the only one of the four with which we are familiar in other connections - I do not wish to deny that this fourth factor has the capacity to create new contributions to dreams. It is certain, however, that, like the others, it exerts its influence principally by its preferences and selections from psychical material in the dream-thoughts that has already been formed. Now there is one case in which it is to a great extent spared the labour of, as it were, building up a façade for the dream - the case, namely, in which a formation of that kind already exists, available for use in the material of the dream-thoughts. I am in the habit of describing the element in the dream-thoughts which I have in mind as a 'phantasy.' I shall perhaps avoid misunderstanding if I mention the 'day-dream' as something analogous to it in waking life.¹ The part played in our mental life by these structures has not yet been fully recognized and elucidated by psychiatrists, though M. Benedikt has made what seems to me a very promising start in that direction. The importance of day-dreams has not escaped the unerring vision of imaginative writers; there is, for instance, a well-known account by Alphonse Daudet in *Le Nabab* of the day-dreams of one of the minor characters in that story. The study of the psychoneuroses leads to the surprising discovery that these phantasies or day-dreams are the immediate forerunners of hysterical symptoms, or at least of a whole number of them. Hysterical symptoms are not attached to actual memories, but to phantasies erected on the basis of the basis of memories. The frequent occurrence of conscious daytime phantasies brings these structures to our knowledge; but just as there are phantasies of this kind which are conscious, so, too, there are unconscious ones in great numbers, which have to remain unconscious on account of their content and of their origin from repressed material. Closer investigation of the characteristics of these day-time phantasies shows us how right it is that these formations should bear the same name as we give to the products of our thought during the night - the name, that is, of 'dreams.' They share a large number of their properties with night-dreams, and their investigation might, in fact, have served as the shortest and best approach to an understanding of night-dreams.

[1900a, 931]

Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini’s sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

[1900a, 1038]
The same holds true of seeing - an activity that is ultimately derived from touching. Visual impressions remain the most frequent pathway along which libidinal excitation is aroused; indeed, natural selection counts upon the accessibility of this pathway - if such a teleological form of statement is permissible - when it encourages the development of beauty in the sexual object. The progressive concealment of the body which goes along with civilization keeps sexual curiosity awake. This curiosity seeks to complete the sexual object by revealing its hidden parts. It can, however, be diverted ('sublimated') in the direction of art, if its interest can be shifted away from the genitals on to the shape of the body as a whole.¹ It is usual for most normal people to linger to some extent over the intermediate sexual aim of a looking that has a sexual tinge to it; indeed, this offers them a possibility of directing some proportion of their libido on to higher artistic aims. On the other hand, this pleasure in looking becomes a perversion (a) if it is restricted exclusively to the genitals, or (b) if it is connected with the overriding of disgust (as in the case of voyeurs or people who look on at excretory functions), or (c) if, instead of being preparatory to the normal sexual aim, it supplants it. This last is markedly true of exhibitionists, who, if I may trust the findings of several analyses, exhibit their own genitals in order to obtain a reciprocal view of the genitals of the other person.²

[1905d, 1483]

SUBLIMATION  The third alternative result of an abnormal constitutional disposition is made possible by the process of sublimation. This enables excessively strong excitations arising from particular sources of sexuality to find an outlet and use in other fields, so that a not inconsiderable increase in psychical efficiency results from a disposition which is itself perilous. Here we have one of the origins of artistic activity; and, according to the completeness or incompleteness of the sublimation, a characterological analysis of a highly gifted individual, and in particular of one with an artistic disposition, may reveal a mixture, in every proportion, of efficiency, perversion and neurosis. A sub-species of sublimation is to be found in suppression by reaction-formation, which, as we have seen, begins during a child's period of latency and continues in favourable cases throughout his whole life. What we describe as a person’s 'character' is built up to a considerable extent from the material of sexual excitations and is composed of instincts that have been fixed since childhood, of constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse impulses which have been recognized as being unutilizable.¹ The multifariously perverse sexual disposition of childhood can accordingly be regarded as the source of a number of our virtues, in so far as through reaction-formation it stimulates their development.²

[1905d, 1549]
If, as has been assumed since the time of Aristotle, the purpose of drama is to arouse 'terror and pity' and so 'to purge the emotions', we can describe that purpose in rather more detail by saying that it is a question of opening up sources of pleasure or enjoyment in our emotional life, just as, in the case of intellectual activity, joking or fun open up similar sources, many of which that activity had made inaccessible. In this connection the prime factor is unquestionably the process of getting rid of one's own emotions by 'blowing off steam'; and the consequent enjoyment corresponds on the one hand to the relief produced by a thorough discharge and on the other hand, no doubt, to an accompanying sexual excitation; for the latter, as we may suppose, appears as a by-product whenever an affect is aroused, and gives people the sense, which they so much desire, of a raising of the potential of their psychical state. Being present as an interested spectator at a spectacle or play does for adults what play does for children, whose hesitant hopes of being able to do what grown-up people do are in that way gratified. The spectator is a person who experiences too little, who feels that he is a 'poor wretch to whom nothing of importance can happen', who has long been obliged to damp down, or rather displace, his ambition to stand in his own person at the hub of world affairs; he longs to feel and to act and to arrange things according to his desires - in short, to be a hero. And the playwright and actor enable him to do this by allowing him to identify himself with a hero. They spare him something, too. For the spectator knows quite well that actual heroic conduct such as this would be impossible for him without pains and sufferings and acute fears, which would almost cancel out the enjoyment. He knows, moreover, that he has only one life and that he might perhaps perish even in a single such struggle against adversity. Accordingly, his enjoyment is based on an illusion; that is to say, his suffering is mitigated by the certainty that, firstly, it is someone other than himself who is acting and suffering on the stage, and, secondly, that after all it is only a game, which can threaten no damage to his personal security. In these circumstances he can allow himself to enjoy being a 'great man', to give way without a qualm to such suppressed impulses as a craving for freedom in religious, political, social and sexual matters, and to 'blow off steam' in every direction in the various grand scenes that form part of the life represented on the stage.

[1942a [1905], 1607]

Several other forms of creative writing, however, are equally subject to these same preconditions for enjoyment. Lyric poetry serves the purpose, more than anything, of giving vent to intense feelings of many sorts - just as was at one time the case with dancing. Epic poetry aims chiefly at making it possible to feel the enjoyment of a great heroic character in his hour of triumph. But drama seeks to explore emotional possibilities more deeply and to give an enjoyable shape even to forebodings of misfortune; for this reason it depicts the hero in his struggles, or rather (with masochistic satisfaction) in defeat. This relation to suffering and misfortune might be taken as characteristic of drama, whether, as happens in serious plays, it is only concern that is aroused, and afterwards allayed, or whether, as happens in tragedies, the suffering is actually realized. The fact that drama originated out of sacrificial rites (cf. the goat and the scapegoat) in the cult of the gods cannot be unrelated to this meaning of drama. It appeases, as it were, a rising rebellion against the divine regulation of the universe, which is responsible for the existence of suffering. Heroes are first and foremost rebels against God or against something divine; and pleasure is derived, as it seems, from the affliction of a weaker being in the face of divine might - a pleasure due to masochistic satisfaction as well as to direct enjoyment of a character whose greatness is insisted upon in spite of everything. Here we have a mood like that of Prometheus, but alloyed with a paltry readiness to let oneself be soothed for the moment by a temporary satisfaction.

[1942a [1905], 1608]
Suffering of every kind is thus the subject-matter of drama, and from this suffering it promises
to give the audience pleasure. Thus we arrive at a first precondition of this form of art: that it
should not cause suffering to the audience, that it should know how to compensate, by means
of the possible satisfactions involved, for the sympathetic suffering which is aroused. (Modern
writers have particularly often failed to obey this rule.) But the suffering represented is soon
restricted to mental suffering; for no one wants physical suffering who knows how quickly all
mental enjoyment is brought to an end by the changes in somatic feeling that physical suffering
brings about. If we are sick we have one wish only: to be well again and to be quit of our
present state. We call for the doctor and medicine, and for the removal of the inhibition on the
play of phantasy which has pampered us into deriving enjoyment even from our own sufferings.
If a spectator puts himself in the place of someone who is physically ill he finds himself without
any capacity for enjoyment or psychical activity. Consequently a person who is physically ill can
only figure on the stage as a piece of stage property and not as a hero, unless, indeed, some
peculiar physical aspects of his illness make psychical activity possible - such, for instance, as
the sick man's forlorn state in the Philoctetes or the hopelessness of the sufferers in the class of
plays that centre round consumptives.

People are acquainted with mental suffering principally in connection with the circumstances
in which it is acquired; accordingly, dramas dealing with it require some event out of which the
illness shall arise and they open with an exposition of this event. It is only an apparent exception
that some plays, such as the Ajax and the Philoctetes, introduce the mental illness as already
fully established; for in Greek tragedies, owing to the familiarity of the material, the curtain rises,
as one might say, in the middle of the play. It is easy to give an exhaustive account of the
preconditions governing an event of the kind that is here in question. It must be an event
involving conflict and it must include an effort of will together with resistance. This precondition
found its first and grandest fulfilment in a struggle against divinity. I have already said that a
tragedy of this kind is one of rebellion, in which the dramatist and the audience take the side of
the rebel. The less belief there comes to be in divinity, the more important becomes the human
regulation of affairs; and it is this which, with increasing insight, comes to be held responsible
for suffering. Thus the hero's next struggle is against human society, and here we have the
class of social tragedies. Yet another fulfilment of the necessary precondition is to be found in a
struggle between individual men. Such are tragedies of character, which exhibit all the
excitement of an 'agon', and which are best played out between outstanding characters who
have freed themselves from the bond of human institutions - which, in fact, must have two
heroes. Fusions between these two last classes, with a hero struggling against institutions
embodied in powerful characters, are of course admissible without question. Pure tragedies of
character lack the rebellious source of enjoyment, but this emerges once again no less forcibly
in social dramas (in Ibsen for instance) than it did in the historical plays of the Greek classical
tragedians.

Thus religious drama, social drama and drama of character differ essentially in the terrain on
which the action that leads to the suffering is fought out. And we can now follow the course of
drama on to yet another terrain, where it becomes psychological drama. Here the struggle that
causes the suffering is fought out in the hero's mind itself - a struggle between different
impulses, and one which must have its end in the extinction, not of the hero, but of one of his
impulses; it must end, that is to say, in a renunciation. Combinations of any kind between this
precondition and the earlier types are, of course, possible; thus institutions, for instance, can
themselves be the cause of internal conflicts. And this is where we have tragedies of love; for
the suppression of love by social culture, by human conventions, or the struggle between 'love
and duty', which is so familiar to us in opera, are the starting-point of almost endless varieties of
situations of conflict: just as endless, in fact, as the erotic day-dreams of men.
But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion from the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is not neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an enjoyment of the liberation but a resistance to it as well.

The first of these modern dramas is *Hamlet*. It has as its subject the way in which a man who has so far been normal becomes neurotic owing to the peculiar nature of the task by which he is faced, a man, that is, in whom an impulse that has hitherto been successfully suppressed endeavours to make its way into action. *Hamlet* is distinguished by three characteristics which seem important in connection with our present discussion. (1) The hero is not psychopathic, but only becomes psychopathic in the course of the action of the play. (2) The repressed impulse is one of those which are similarly repressed in all of us, and the repression of which is part and parcel of the foundations of our personal evolution. It is this repression which is shaken up by the situation in the play. As a result of these two characteristics it is easy for us to recognize ourselves in the hero: we are susceptible to the same conflict as he is, since ‘a person who does not lose his reason under certain conditions can have no reason to lose’. (3) It appears as a necessary precondition of this form of art that the impulse that is struggling into consciousness, however clearly it is recognizable, is never given a definite name; so that in the spectator too the process is carried through with his attention averted, and he is in the grip of his emotions instead of taking stock of what is happening. A certain amount of resistance is no doubt saved in this way, just as, in an analytic treatment, we find derivatives of the repressed material reaching consciousness, owing to a lower resistance, while the repressed material itself is unable to do so. After all, the conflict in *Hamlet* is so effectively concealed that it was left to me to unearth it.

It may be in consequence of disregarding these three preconditions that so many other psychopathic characters are as unserviceable on the stage as they are in real life. For the victim of a neurosis is someone into whose conflict we can gain no insight if we first meet it in a fully established state. But, *per contra*, if we recognize the conflict, we forget that he is a sick man, just as, if he himself recognizes it, he ceases to be ill. It would seem to be the dramatist's business to induce the same illness in us; and this can best be achieved if we are made to follow the development of the illness along with the sufferer. This will be especially necessary where the repression does not already exist in us but has first to be set up; and this represents a step further than *Hamlet* in the use of neurosis on the stage. If we are faced by an unfamiliar and fully established neurosis, we shall be inclined to send for the doctor (just as we do in real life) and pronounce the character inadmissible to the stage.
This last mistake seems to occur in Bahr's *Die Andere*, apart from a second one which is implicit in the problem presented in the play - namely, that it is impossible for us to put ourselves with conviction into the position of believing that one particular person has a prescriptive right to give the girl complete satisfaction. So that her case cannot become ours. Moreover, there remains a third mistake: namely that there is nothing left for us to discover and that our entire resistance is mobilized against this predetermined condition of love which is so unacceptable to us. Of the three formal preconditions that I have been discussing, the most important seems to be that of the diversion of attention.

[1942a [1905], 1612]

In general, it may perhaps be said that the neurotic instability of the public and the dramatist's skill in avoiding resistances and offering fore-pleasures can alone determine the limits set upon the employment of abnormal characters on the stage.

[1942a [1905], 1612]

Now in this dispute as to the estimation in which dreams should be held, imaginative writers seem to be on the same side as the ancients, as the superstitious public and as the author of *The Interpretation of Dreams*. For when an author makes the characters constructed by his imagination dream, he follows the everyday experience that people's thoughts and feelings are continued in sleep and he aims at nothing else than to depict his heroes' states of mind by their dreams. But creative writers are valuable allies and their evidence is to be prized highly, for they are apt to know a whole host of things between heaven and earth of which our philosophy has not yet let us dream. In their knowledge of the mind they are far in advance of us everyday people, for they draw upon sources which we have not yet opened up for science. If only this support given by writers in favour of dreams having a meaning were less ambiguous! A strictly critical eye might object that writers take their stand neither for nor against particular dreams having a psychical meaning; they are content to show how the sleeping mind twitches under the excitations which have remained active in it as off-shoots of waking life.

[1907a, 1813]

But even this sobering thought does not damp our interest in the fashion in which writers make use of dreams. Even if thus enquiry should teach us nothing new about the nature of dreams, it may perhaps enable us from this angle to gain some small insight into the nature of creative writing. Real dreams were already regarded as unrestrained and unregulated structures - and now we are confronted by unfettered imitations of these dreams! There is far less freedom and arbitrariness in mental life, however, than we are inclined to assume - there may even be none at all. What we call chance in the world outside can, as is well known, be resolved into laws. So, too, what we call arbitrariness in the mind rests upon laws, which we are only now beginning dimly to suspect. Let us, then, see what we find!

[1907a, 1814]
There are two methods that we might adopt for this inquiry. One would be to enter deeply into a particular case, into the dream-creations of one author in one of his works. The other would be to bring together and contrast all the examples that could be found of the use of dreams in the works of different authors. The second method would seem to be far the more effective and perhaps the only justifiable one, for it frees us at once from the difficulties involved in adopting the artificial concept of ‘writers’ as a class. On investigation this class falls apart into individual writers of the most various worth - among them some whom we are accustomed to honour as the deepest observers of the human mind. In spite of this, however, these pages will be devoted to an enquiry of the first sort. It happened that in the group of men among whom the notion first arose there was one who recalled that in the work of fiction that had last caught his fancy there were several dreams which had, as it were, looked at him with familiar faces and invited him to attempt to apply to them the method of The Interpretation of Dreams. He confessed that the subject-matter of the little work and the scene in which it was laid may no doubt have played the chief part in creating his enjoyment. For the story was set in the frame of Pompeii and dealt with a young archaeologist who had surrendered his interest in life in exchange for an interest in the remains of classical antiquity and who was now brought back to real life by a roundabout path which was strange but perfectly logical. During the treatment of this genuinely poetic material the reader had been stirred by all kinds of thoughts akin to it and in harmony with it. The work was a short tale by Wilhelm Jensen - Gradiva - which its author himself described as a 'Pompeian phantasy'.

Let us pause for a moment at this journey, planned for such remarkably uncogent reasons, and take a closer look at our hero's personality and behaviour. He still appears to us as incomprehensible and foolish; we have no idea how his peculiar folly will be linked to human feeling and so arouse our sympathy. It is an author's privilege to be allowed to leave us in such uncertainty. The charm of his language and the ingenuity of his ideas offer us a provisional reward for the reliance we place in him and for the still unearned sympathy which we are ready to feel for his hero. Of this hero we are further told that he was pre-ordained by family tradition to become an archaeologist, that in his later isolation and independence he was wholly absorbed in his studies and had turned completely away from life and its pleasures. Marble and bronze alone were truly alive for him; they alone expressed the purpose and value of human life. But nature, perhaps with benevolent intent, had infused into his blood a corrective of an entirely unscientific sort - an extremely lively imagination, which could show itself not only in his dreams but often in his waking life as well. This division between imagination and intellect destined him to become an artist or a neurotic; he was one of those whose kingdom is not of this world. Thus it was that it could come about that his interest was attached to a relief representing a girl stepping along in a peculiar fashion, that he wove his phantasies around her, imagined a name and origin for her, placed the figure he had created in the setting of the Pompeii that was buried more than eighteen hundred years before, and finally, after a strange anxiety-dream, magnified his phantasy of the existence and death of this girl named Gradiva into a delusion, which gained an influence over his actions. Such products of the imagination would seem to us astonishing and inexplicable if we met them in someone in real life. Since our hero, Norbert Hanold, is a fictitious person, we may perhaps put a timid question to his author, and ask whether his imagination was determined by forces other than its own arbitrary choice. [1907a, 1819]
Perhaps, too, in most people’s eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

[1907a, 1843]

And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made - a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychological conflict, and it does not regard their symptoms as compromises. Does our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years - and, until recently, more or less alone⁴ - I myself have supported all the views that I have here extracted from Jensen's Gradiva and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the individual determinant of these psychical disorders is the suppression of a part of instinctual life and the repression of the ideas by which the suppressed instinct is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.² The question whether the instincts concerned in this causation are always components of the sexual instinct or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of Gradiva; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychological conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.⁵ Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.⁴

[1907a, 1851]

When, from the year 1893 onwards, I plunged into investigations such as these of the origin of mental disturbances, it would certainly never have occurred to me to look for a confirmation of my findings in imaginative writings. I was thus more than a little surprised to find that the author of Gradiva, which was published in 1903, had taken as the basis of its creation the very thing that I believed myself to have freshly discovered from the sources of my medical experience. How was it that the author arrived at the same knowledge as the doctor - or at least behaved as though he possessed the same knowledge?

[1907a, 1851]
And now for the final question, whose answer we have already evaded more than once. Our views on repression, on the genesis of delusions and allied disorders, on the formation and solution of dreams, on the part played by erotic life, and on the method by which such disorders are cured, are far from being the common property of science, let alone the assured possession of educated people. If the insight which has enabled the author to construct his 'phantasy' in such a way that we have been able to dissect it like a real case history is in the nature of knowledge, we should be curious to learn what were the sources of that knowledge. One of our circle - the one who, as I said at the beginning, was interested in the dreams in *Gradiva* and their possible interpretation - approached the author with the direct question whether he knew anything of such scientific theories as these. The author replied, as was to be expected, in the negative, and, indeed, somewhat brusquely. His imagination, he said, had inspired *Gradiva*, and he had enjoyed it; if there was anyone whom it did not please, let him simply leave it alone. He had no suspicion of how greatly it had in fact pleased his readers.

[1907a, 1882]

It is quite possible that the author's disavowal does not stop at this. He may perhaps altogether deny any knowledge of the rules which we have shown that he has followed, and he may repudiate all the purposes we have recognized in his work. I do not regard this as improbable; but if it is so, there are only two possible explanations. It may be that we have produced a complete caricature of an interpretation by introducing into an innocent work of art purposes of which its creator had no notion, and by so doing have shown once more how easy it is to find what one is looking for and what is occupying one's own mind - a possibility of which the strangest examples are to be found in the history of literature. Let every reader now make up his mind whether he is able to accept this explanation. We ourselves, of course, hold to the other view, the remaining alternative. Our opinion is that the author need have known nothing of these rules and purposes, so that he could disavow them in good faith, but that nevertheless we have not discovered anything in his work that is not already in it. We probably draw from the same source and work upon the same object, each of us by another method. And the agreement of our results seems to guarantee that we have both worked correctly. Our procedure consists in the conscious observation of abnormal mental processes in other people so as to be able to elicit and announce their laws. The author no doubt proceeds differently. He directs his attention to the unconscious in his own mind, he listens to its possible developments and lends them artistic expression instead of suppressing them by conscious criticism. Thus he experiences from himself what we learn from others - the laws which the activities of this unconscious must obey. But he need not state these laws, nor even be clearly aware of them; as a result of the tolerance of his intelligence, they are incorporated within his creations. We discover these laws by analysing his writings just as we find them from cases of real illness; but the conclusion seems inescapable that either both of us, the writer and the doctor, have misunderstood the unconscious in the same way, or we have both understood it correctly. This conclusion is of great value to us, and it is on its account that it has been worth while to investigate by the methods of medical psycho-analysis the way in which the formation and the cure of the delusions as well as the dreams are represented in Jensen's *Gradiva*.

[1907a, 1883]
In the five years that have passed since this study was completed, psycho-analytic research has summoned up the courage to approach the creations of imaginative writers with yet another purpose in view. It no longer merely seeks in them for confirmations of the findings it has made from unpoetic, neurotic human beings; it also demands to know the material of impressions and memories from which the author has built the work, and the methods and processes by which he has converted this material into a work of art. It has turned out that these questions can be most easily answered in the case of writers who (like our Wilhelm Jensen, who died in 1911) were in the habit of giving themselves over to their imagination in a simple-minded joy in creating. Soon after the publication of my analytic examination of *Gradiva* I attempted to interest the elderly author in these new tasks of psycho-analytic research. But he refused his cooperation.

[1907a, 1885]

A friend of mine has since then drawn my attention to two other of the author's short stories, which might stand in a genetic relation to *Gradiva*, as preliminary studies or earlier attempts at a satisfactory poetical solution of the same problem in the psychology of love. The first of these stories, 'Der rote Schirm',¹ recalls *Gradiva* by the recurrence in it of a number of small *motifs*, such as white flowers of the dead, a forgotten object (*Gradiva*'s sketch-book), and a significant small animal (the butterfly and the lizard in *Gradiva*), but more especially by the repetition of the main situation - the apparition in the mid-day glare of a summer's day of a girl who had died (or was believed to have died). In 'Der rote Schirm' the scene of the apparition is a ruined castle, just as are the ruins of the excavated Pompeii in *Gradiva*. The other story, 'Im gotischen Hause',² shows no such resemblances either to *Gradiva* or to 'Der rote Schirm' in its manifest content. But the fact that it was given an external unity with the latter story by being published with it under a common title³ points unmistakably to their having a closely related latent meaning. It is easy to see that all three stories treat of the same theme: the development of a love (in 'Der rote Schirm' the inhibition of a love) as an after-effect of an intimate association in childhood of a brother-and-sister kind. I gather further from a review by Eva, Countess Baudissin (in the Vienna daily paper *Die Zeit* of February 11, 1912) that Jensen's last novel *Fremdlinge unter den Menschen*,⁴ which contains much material from the author's own childhood, describes the history of a man who 'sees a sister in the woman he loves'. In neither of the two earlier stories is there a trace of the main *motif* of *Gradiva*: the girl's peculiarly charming gait with the nearly perpendicular posture of her foot.

[1907a, 1885]

We laymen have always been intensely curious to know like the Cardinal who put a similar question to Ariosto - from what sources that strange being, the creative writer, draws his material, and how he manages to make such an impression on us with it and to arouse in us emotions of which, perhaps, we had not even thought ourselves capable. Our interest is only heightened the more by the fact that, if we ask him, the writer himself gives us no explanation, or none that is satisfactory; and it is not at all weakened by our knowledge that not even the clearest insight into the determinants of his choice of material and into the nature of the art of creating imaginative form will ever help to make creative writers of *us*.

[1908e, 1921]

If we could at least discover in ourselves or in people like ourselves an activity which was in some way akin to creative writing! An examination of it would then give us a hope of obtaining the beginnings of an explanation of the creative work of writers. And, indeed, there is some prospect of this being possible. After all, creative writers themselves like to lessen the distance between their kind and the common run of humanity; they so often assure us that every man is a poet at heart and that the last poet will not perish till the last man does.

[1908e, 1921]
Should we not look for the first traces of imaginative activity as early as in childhood? The child's best-loved and most intense occupation is with his play or games. Might we not say that every child at play behaves like a creative writer, in that he creates a world of his own, or, rather, re-arranges the things of his world in a new way which pleases him? It would be wrong to think he does not take that world seriously; on the contrary, he takes his play very seriously and he expends large amounts of emotion on it. The opposite of play is not what is serious but what is real. In spite of all the emotion with which he cathects his world of play, the child distinguishes it quite well from reality; and he likes to link his imagined objects and situations to the tangible and visible things of the real world. This linking is all that differentiates the child's 'play' from 'phantasying'.

The creative writer does the same as the child at play. He creates a world of phantasy which he takes very seriously - that is, which he invests with large amounts of emotion while separating it sharply from reality. Language has preserved this relationship between children's play and poetic creation. It gives [in German] the name of 'Spief' ['play'] to those forms of imaginative writing which require to be linked to tangible objects and which are capable of representation. It speaks of a 'Lustspiel' or 'Trauerspiel' ['comedy' or 'tragedy': literally, 'pleasure play' or 'mourning play'] and describes those who carry out the representation as 'Schauspieler' ['players': literally 'show-players']. The unreality of the writer's imaginative world, however, has very important consequences for the technique of his art; for many things which, if they were real, could give no enjoyment, can do so in the play of phantasy, and many excitements which, in themselves, are actually distressing, can become a source of pleasure for the hearers and spectators at the performance of a writer's work.

There is another consideration for the sake of which we will dwell a moment longer on this contrast between reality and play. When the child has grown up and has ceased to play, and after he has been labouring for decades to envisage the realities of life with proper seriousness, he may one day find himself in a mental situation which once more undoes the contrast between play and reality. As an adult he can look back on the intense seriousness with which he once carried on his games in childhood; and, by equating his ostensibly serious occupations of to-day with his childhood games, he can throw off the too heavy burden imposed on him by life and win the high yield of pleasure afforded by humour.

As people grow up, then, they cease to play, and they seem to give up the yield of pleasure which they gained from playing. But whoever understands the human mind knows that hardly anything is harder for a man than to give up a pleasure which he has once experienced. Actually, we can never give anything up; we only exchange one thing for another. What appears to be a renunciation is really the formation of a substitute or surrogate. In the same way, the growing child, when he stops playing, gives up nothing but the link with real objects; instead playing, he now phantasies. He builds castles in the air and creates what are called day-dreams. I believe that most people construct phantasies at times in their lives. This is a fact which has long been overlooked and whose importance has therefore not been sufficiently appreciated.
People's phantasies are less easy to observe than the play of children. The child, it is true, plays by himself or forms a closed psychical system with other children for the purposes of a game; but even though he may not play his game in front of the grown-ups, he does not, on the other hand, conceal it from them. The adult, on the contrary, is ashamed of his phantasies and hides them from other people. He cherishes his phantasies as his most intimate possessions, and as a rule he would rather confess his misdeeds than tell anyone his phantasies. It may come about that for that reason he believes he is the only person who invents such phantasies and has no idea that creations of this kind are widespread among other people. This difference in the behaviour of a person who plays and a person who phantasies is accounted for by the motives of these two activities, which are nevertheless adjuncts to each other.

So much for phantasies. And now for the creative writer. May we really attempt to compare the imaginative writer with the 'dreamer in broad daylight', and his creations with day-dreams? Here we must begin by making an initial distinction. We must separate writers who, like the ancient authors of epics and tragedies, take over their material ready-made, from writers who seem to originate their own material. We will keep to the latter kind, and, for the purposes of our comparison, we will choose not the writers most highly esteemed by the critics, but the less pretentious authors of novels, romances and short stories, who nevertheless have the widest and most eager circle of readers of both sexes. One feature above all cannot fail to strike us about the creations of these story-writers: each of them has a hero who is the centre of interest, for whom the writer tries to win our sympathy by every possible means and whom he seems to place under the protection of a special Providence. If, at the end of one chapter of my story, I leave the hero unconscious and bleeding from severe wounds, I am sure to find him at the beginning of the next being carefully nursed and on the way to recovery; and if the first volume closes with the ship he is in going down in a storm at sea, I am certain, at the opening of the second volume, to read of his miraculous rescue - a rescue without which the story could not proceed. The feeling of security with which I follow the hero through his perilous adventures is the same as the feeling with which a hero in real life throws himself into the water to save a drowning man or exposes himself to the enemy's fire in order to storm a battery. It is the true heroic feeling, which one of our best writers has expressed in an inimitable phrase: 'Nothing can happen to me!' It seems to me, however, that through this revealing characteristic of invulnerability we can immediately recognize His Majesty the Ego, the hero alike of every day-dream and of every story.

Other typical features of these egocentric stories point to the same kinship. The fact that all the women in the novel invariably fall in love with the hero can hardly be looked on as a portrayal of reality, but it is easily understood as a necessary constituent of a day-dream. The same is true of the fact that the other characters in the story are sharply divided into good and bad, in defiance of the variety of human characters that are to be observed in real life. The 'good' ones are the helpers, while the 'bad' ones are the enemies and rivals, of the ego which has become the hero of the story.
We are perfectly aware that very many imaginative writings are far removed from the model of the naive day-dream; and yet I cannot suppress the suspicion that even the most extreme deviations from that model could be linked with it through an uninterrupted series of transitional cases. It has struck me that in many of what are known as ‘psychological’ novels only one person - once again the hero - is described from within. The author sits inside his mind, as it were, and looks at the other characters from outside. The psychological novel in general no doubt owes its special nature to the inclination of the modern writer to split up his ego, by self-observation, into many part-egos, and, in consequence, to personify the conflicting currents of his own mental life in several heroes. Certain novels, which might be described as ‘eccentric’, seem to stand in quite special contrast to the type of the day-dream. In these, the person who is introduced as the hero plays only a very small active part; he sees the actions and sufferings of other people pass before him like a spectator. Many of Zola’s later works belong to this category. But I must point out that the psychological analysis of individuals who are not creative writers, and who diverge in some respects from the so-called norm, has shown us analogous variations of the day-dream, in which the ego contents itself with the role of spectator.

If our comparison of the imaginative writer with the day-dreamer, and of poetical creation with the day-dream, is to be of any value, it must, above all, show itself in some way or other fruitful. Let us, for instance, try to apply to these authors’ works the thesis we laid down earlier concerning the relation between phantasy and the three periods of time and the wish which runs through them; and, with its help, let us try to study the connections that exist between the life of the writer and his works. No one has known, as a rule, what expectations to frame in approaching this problem; and often the connection has been thought of in much too simple terms. In the light of the insight we have gained from phantasies, we ought to expect the following state of affairs. A strong experience in the present awakens in the creative writer a memory of an earlier experience (usually belonging to his childhood) from which there now proceeds a wish which finds its fulfilment in the creative work. The work itself exhibits elements of the recent provoking occasion as well as of the old memory.

Do not be alarmed at the complexity of this formula. I suspect that in fact it will prove to be too exiguous a pattern. Nevertheless, it may contain a first approach to the true state of affairs; and, from some experiments I have made, I am inclined to think that this way of looking at creative writings may turn out not unfruitful. You will not forget that the stress it lays on childhood memories in the writer's life - a stress which may perhaps seem puzzling - is ultimately derived from the assumption that a piece of creative writing, like a day-dream, is a continuation of, and a substitute for, what was once the play of childhood.

We must not neglect, however, to go back to the kind of imaginative works which we have to recognize, not as original creations, but as the re-fashioning of ready-made and familiar material. Even here, the writer keeps a certain amount of independence, which can express itself in the choice of material and in changes in it which are often quite extensive. In so far as the material is already at hand, however, it is derived from the popular treasure-house of myths, legends and fairy tales. The study of constructions of folk-psychology such as these is far from being complete, but it is extremely probable that myths, for instance, are distorted vestiges of the wishful phantasies of whole nations, the secular dreams of youthful humanity.
You will say that, although I have put the creative writer first in the title of my paper, I have told you far less about him than about phantasies. I am aware of that, and I must try to excuse it by pointing to the present state of our knowledge. All I have been able to do is to throw out some encouragements and suggestions which, starting from the study of phantasies, lead on to the problem of the writer’s choice of his literary material. As for the other problem - by what means the creative writer achieves the emotional effects in us that are aroused by his creations - we have as yet not touched on it at all. But I should like at least to point out to you the path that leads from our discussion of phantasies to the problems of poetical effects. [1908e, 1929]

You will remember how I have said that the day-dreamer carefully conceals his phantasies from other people because he feels he has reasons for being ashamed of them. I should now add that even if he were to communicate them to us he could give us no pleasure by his disclosures. Such phantasies, when we learn them, repel us or at least leave us cold. But when a creative writer presents his plays to us or tells us what we are inclined to take to be his personal day dreams, we experience a great pleasure, and one which probably arises from the confluence of many sources. How the writer accomplishes this is his innermost secret; the essential *ars poetica* lies in the technique of overcoming the feeling of repulsion in us which is undoubtedly connected with the barriers that rise between each single ego and the others. We can guess two of the methods used by this technique. The writer softens the character of his egoistic day-dreams by altering and disguising it, and he bribes us by the purely formal - that is, aesthetic - yield of pleasure which he offers us in the presentation of his phantasies. We give the name of an *incentive bonus*, or a *fore-pleasure*, to a yield of pleasure such as this, which is offered to us so as to make possible the release of still greater pleasure arising from deeper psychical sources. In my opinion, all the aesthetic pleasure which a creative writer affords us has the character of a fore-pleasure of this kind, and our actual enjoyment of an imaginative work proceeds from a liberation of tensions in our minds. It may even be that not a little of this effect is due to the writer’s enabling us thenceforward to enjoy our own day-dreams without self-reproach or shame. This brings us to the threshold of new, interesting and complicated enquiries; but also, at least for the moment, to the end of our discussion. [1908e, 1929]
The retardation of sexual development and sexual activity at which our education and civilization aim is certainly not injurious to begin with. It is seen to be a necessity, when one considers the late age at which young people of the educated classes reach independence and are able to earn a living. (This reminds one, incidentally, of the intimate interconnection between all our cultural institutions and of the difficulty of altering any part of them without regard to the whole.) But abstinence continued long after the age of twenty is no longer unobjectionable for a young man; and it leads to other damage even when it does not lead to neurosis. People say, to be sure, that the struggle against such a powerful instinct, and the strengthening of all the ethical and aesthetic forces which are necessary for this struggle, ‘steel’ the character; and this is true for a few specially favourably organized natures. It must also be admitted that the differentiation of individual character, which is so marked in our day, has only become possible with the existence of sexual restriction. But in the vast majority of cases the struggle against sexuality eats up the energy available in a character and this at the very time when a young man is in need of all his forces in order to win his share and place in society. The relationship between the amount of sublimation possible and the amount of sexual activity necessary naturally varies very much from person to person and even from one calling to another. An abstinent artist is hardly conceivable; but an abstinent young savant is certainly no rarity. The latter can, by his self-restraint, liberate forces for his studies; while the former probably finds his artistic achievements powerfully stimulated by his sexual experience. In general I have not gained the impression that sexual abstinence helps to bring about energetic and self-reliant men of action or original thinkers or bold emancipators and reformers. Far more often it goes to produce well-behaved weaklings who later become lost in the great mass of people that tends to follow, unwillingly, the leads given by strong individuals.

The deeper you penetrate into the pathogenesis of nervous illness, the more you will find revealed the connection between the neuroses and other productions of the human mind, including the most valuable. You will be taught that we humans, with the high standards of our civilization and under the pressure of our internal repressions, find reality unsatisfying quite generally, and for that reason entertain a life of phantasy in which we like to make up for the insufficiencies of reality by the production of wish-fulfilments. These phantasies include a great deal of the true constitutional essence of the subject’s personality as well as of those of his impulses which are repressed where reality is concerned. The energetic and successful man is one who succeeds by his efforts in turning his wishful phantasies into reality. Where this fails, as a result of the resistances of the external world and of the subject’s own weakness, he begins to turn away from reality and withdraws into his more satisfying world of phantasy, the content of which is transformed into symptoms should he fall ill. In certain favourable circumstances, it still remains possible for him to find another path leading from these phantasies to reality, instead of becoming permanently estranged from it by regressing to infancy. If a person who is at loggerheads with reality possesses an artistic gift (a thing that is still a psychological mystery to us), he can transform his phantasies into artistic creations instead of into symptoms. In this manner he can escape the doom of neurosis and by this roundabout path regain his contact with reality. (Cf. Rank, 1907.) If there is persistent rebellion against the real world and if this precious gift is absent or insufficient, it is almost inevitable that the libido, keeping to the sources of the phantasies, will follow the path of regression, and will revive infantile wishes and end in neurosis. To-day neurosis takes the place of the monasteries which used to be the refuge of all whom life had disappointed or who felt too weak to face it.
If a biographical study is really intended to arrive at an understanding of its hero’s mental life it must not - as happens in the majority of biographies as a result of discretion or prudishness - silently pass over its subject’s sexual activity or sexual individuality. What is known of Leonardo in this respect is little: but that little is full of significance. In an age which saw a struggle between sensuality without restraint and gloomy asceticism, Leonardo represented the cool repudiation of sexuality - a thing that would scarcely be expected of an artist and a portrayer of feminine beauty. Solmi quotes the following sentence of his which is evidence of his frigidity: 'The act of procreation and everything connected with it is so disgusting that mankind would soon die out if it were not an old-established custom and if there were not pretty faces and sensuous natures.'¹ His posthumous writings, which not only deal with the greatest scientific problems but also contain trivialities that strike us as scarcely worthy of so great a mind (an allegorical natural history, animal fables, jokes, prophecies),² are chaste - one might say even abstinent - to a degree that would cause surprise in a work of belles lettres even to-day. So resolutely do they shun everything sexual that it would seem as if Eros alone, the preserver of all living things, was not worthy material for the investigator in his pursuit of knowledge.³ It is well known how frequently great artists take pleasure in giving vent to their phantasies in erotic and even crudely obscene pictures. In Leonardo's case on the contrary we have only some anatomical sketches of the internal female genitals, the position of the embryo in the womb and so on.⁴

Kindly nature has given the artist the ability to express his most secret mental impulses, which are hidden even from himself, by means of the works that he creates; and these works have a powerful effect on others who are strangers to the artist, and who are themselves unaware of the source of their emotion. Can it be that there is nothing in Leonardo's life work to bear witness to what his memory preserved as the strongest impression of his childhood? One would certainly expect there to be something. Yet if one considers the profound transformations through which an impression in an artist's life has to pass before it is allowed to make its contribution to a work of art, one will be bound to keep any claim to certainty in one's demonstration within very modest limits; and this is especially so in Leonardo's case.⁵

There is no doubt that the creative artist feels towards his works like a father. The effect which Leonardo's identification with his father had on his paintings was a fateful one. He created them and then cared no more about them, just as his father had not cared about him. His father's later concern could change nothing in this compulsion; for the compulsion derived from the impressions of the first years of childhood, and what has been repressed and has remained unconscious cannot be corrected by later experiences.⁶
Leonardo emerges from the obscurity of his boyhood as an artist, a painter and a sculptor, owing to a specific talent which may have been reinforced by the precocious awakening in the first years of childhood of his scopophilic instinct. We should be most glad to give an account of the way in which artistic activity derives from the primal instincts of the mind if it were not just here that our capacities fail us. We must be content to emphasize the fact - which it is hardly any longer possible to doubt - that what an artist creates provides at the same time an outlet for his sexual desire; and in Leonardo's case we can point to the information which comes from Vasari, that heads of laughing women and beautiful boys - in other words, representations of his sexual objects - were notable among his first artistic endeavours. In the bloom of his youth Leonardo appears at first to have worked without inhibition. Just as he modelled himself on his father in the outward conduct of his life, so too he passed through a period of masculine creative power and artistic productiveness in Milan, where a kindly fate enabled him to find a father substitute in the duke Lodovico Moro. But soon we and confirmation of our experience that the almost total repression of a real sexual life does not provide the most favourable conditions for the exercise of sublimated sexual trends. The pattern imposed by sexual life made itself felt. His activity and his ability to form quick decisions began to fail; his tendency towards deliberation and delay was already noticeable as a disturbing element in the 'Last Supper', and by influencing his technique it had a decisive effect on the fate of that great painting. Slowly there occurred in him a process which can only be compared to the regressions in neurotics. The development that turned him into an artist at puberty was overtaken by the process which led him to be an investigator, and which had its determinants in early infancy. The second sublimation of his erotic instinct gave place to the original sublimation for which the way had been prepared on the occasion of the first repression. He became an investigator, at first still in the service of his art, but later independently of it and away from it. With the loss of his patron, the substitute for his father, and with the increasingly sombre colours which his life took on, this regressive shift assumed larger and larger proportions. He became 'impatientissimo al pennello',¹ as we are told by a correspondent of the Countess Isabella d'Este, who was extremely eager to possess a painting from his hand. His infantile past had gained control over him. But the research which now took the place of artistic creation seems to have contained some of the features which distinguish the activity of unconscious instincts - insatiability, unyielding rigidity and the lack of an ability to adapt to real circumstances. [1910c, 2301]

Instincts and their transformations are at the limit of what is discernible by psycho-analysis. From that point it gives place to biological research. We are obliged to look for the source of the tendency to repression and the capacity for sublimation in the organic foundations of character on which the mental structure is only afterwards erected. Since artistic talent and capacity are intimately connected with sublimation we must admit that the nature of the artistic function is also inaccessible to us along psycho-analytic lines. The tendency of biological research to-day is to explain the chief features in a person's organic constitution as being the result of the blending of male and female dispositions, based on substances. Leonardo's physical beauty and his left-handedness might be quoted in support of this view. We will not, however, leave the ground of purely psychological research. Our aim remains that of demonstrating the connection along the path of instinctual activity between a person's external experiences and his reactions. Even if psycho-analysis does not throw light on the fact of Leonardo's artistic power, it at least renders its manifestations and its limitations intelligible to us. It seems at any rate as if only a man who had had Leonardo's childhood experiences could have painted the Mona Lisa and the St. Anne, have secured so melancholy a fate for his works and have embarked on such an astonishing career as a natural scientist, as if the key to all his achievements and misfortunes lay hidden in the childhood phantasy of the vulture. [1910c, 2303]
Up till now we have left it to the creative writer to depict for us the ‘necessary conditions for loving’ which govern people’s choice of an object, and the way in which they bring the demands of their imagination into harmony with reality. The writer can indeed draw on certain qualities which fit him to carry out such a task: above all, on a sensitivity that enables him to perceive the hidden impulses in the minds of other people, and the courage to let his own unconscious speak. But there is one circumstance which lessens the evidential value of what he has to say. Writers are under the necessity to produce intellectual and aesthetic pleasure, as well as certain emotional effects. For this reason they cannot reproduce the stuff of reality unchanged, but must isolate portions of it, remove disturbing associations, tone down the whole and fill in what is missing. These are the privileges of what is known as ‘poetic licence’. Moreover they can show only slight interest in the origin and development of the mental states which they portray in their completed form. In consequence it becomes inevitable that science should concern herself with the same materials whose treatment by artists has given enjoyment to mankind for thousands of years, though her touch must be clumsier and the yield of pleasure less. These observations will, it may be hoped, serve to justify us in extending a strictly scientific treatment to the field of human love. Science is, after all, the most complete renunciation of the pleasure principle of which our mental activity is capable.
[1910h, 2326]
To these phantasies which have succeeded in dominating the man's love in real life, the urge to rescue the loved one seems to bear merely a loose and superficial relation, and one that is fully accounted for by conscious reasons. By her propensity to be fickle and unfaithful the loved one brings herself into dangerous situations, and thus it is understandable that the lover should be at pains to protect her from these dangers by watching over her virtue and counteracting her bad inclinations. However, the study of people's screen-memories, phantasies and nocturnal dreams shows that we have here a particularly felicitous 'rationalization' of an unconscious motive, a process which may be compared to a successful secondary revision of a dream. In actual fact the 'rescue-motif' has a meaning and history of its own, and is an independent derivative of the mother-complex, or more accurately, of the parental complex. When a child hears that he owes his life to his parents, or that his mother gave him life, his feelings of tenderness unite with impulses which strive at power and independence, and they generate the wish to return this gift to the parents and to repay them with one of equal value. It is as though the boy's defiance were to make him say: 'I want nothing from my father; I will give him back all I have cost him.' He then forms the phantasy of rescuing his father from danger and saving his life; in this way he puts his account square with him. This phantasy is commonly enough displaced on to the emperor, king or some other great man; after being thus distorted it becomes admissible to consciousness, and may even be made use of by creative writers. In its application to a boy's father it is the defiant meaning in the idea of rescuing which is by far the most important; where his mother is concerned it is usually its tender meaning. The mother gave the child life, and it is not easy to find a substitute, of equal value for this unique gift. With a slight change of meaning, such as is easily effected in the unconscious and is comparable to the way in which in consciousness concepts shade into one another, rescuing his mother takes on the significance of giving her a child or making a child for her - needless to say, one like himself. This is not too remote from the original sense of rescuing, and the change in meaning is not an arbitrary one. His mother gave him a life - his own life - and in exchange he gives her another life, that of a child which has the greatest resemblance to himself. The son shows his gratitude by wishing to have by his mother a son who is like himself: in other words, in the rescue-phantasy he is completely identifying himself with his father. All his instincts, those of tenderness, gratitude, lustfulness, defiance and independence, find satisfaction in the single wish to be his own father. Even the element of danger has not been lost in the change of meaning; for the act of birth itself is the danger from which he was saved by his mother's efforts. Birth is both the first of all dangers to life and the prototype of all the later ones that cause us to feel anxiety, and the experience of birth has probably left behind in us the expression of affect which we call anxiety. Macduff of the Scottish legend, who was not born of his mother but ripped from her womb, was for that reason unacquainted with anxiety.

Sadger (1912) has shown in a penetrating analysis how Hebbel was determined in his choice of material by his own parental complex, and how he came to take the part of the woman so regularly in the struggle between the sexes, and to feel his way into the most hidden impulses of her mind. He also quotes the motives which the poet himself gives for the alteration he has made in the material, and he rightly finds them artificial and as though intended to justify outwardly something the poet himself is unconscious of, while at bottom concealing it. I will not dispute Sadger's explanation of why Judith, who according to the Biblical narrative is a widow, has to become a virgin widow. He refers to the purpose found in childish phantasies of denying the sexual intercourse of the parents and of turning the mother into an untouched virgin. But I will add: after the poet has established his heroine’s virginity, his sensitive imagination dwells on the hostile reaction released by the violation of her maidenhood.

Sadger (1912) has shown in a penetrating analysis how Hebbel was determined in his choice of material by his own parental complex, and how he came to take the part of the woman so regularly in the struggle between the sexes, and to feel his way into the most hidden impulses of her mind. But I will add: after the poet has established his heroine’s virginity, his sensitive imagination dwells on the hostile reaction released by the violation of her maidenhood.
Researches into the sexual activity of children have led to a further conception of the sexual instinct, based not on its purposes but on its sources. The sexual instinct possesses in a high degree the capacity for being diverted from direct sexual aims and for being directed towards higher aims which are no longer sexual (‘sublimation’). The instinct is thus enabled to make most important contributions to the social and artistic achievements of humanity. [1913m, 2547]

(6) Art brings about a reconciliation between the two principles in a peculiar way. An artist is originally a man who turns away from reality because he cannot come to terms with the renunciation of instinctual satisfaction which it at first demands, and who allows his erotic and ambitious wishes full play in the life of phantasy. He finds the way back to reality, however, from this world of phantasy by making use of special gifts to mould his phantasies into truths of a new kind, which are valued by men as precious reflections of reality. Thus in a certain fashion he actually becomes the hero, the king, the creator, or the favourite he desired to be, without following the one roundabout path of making real alterations in the external world. But he can only achieve this because other men feel the same dissatisfaction as he does with the renunciation demanded by reality, and because that dissatisfaction, which results from the replacement of the pleasure principle by the reality principle, is itself a part of reality.² [1911b, 2556]

There has been little opportunity in the preceding pages for showing how new light can be thrown upon the facts of social psychology by the adoption of a psycho-analytic method of approach: for the horror of incest displayed by savages has long been recognized as such and stands in need of no further interpretation. All that I have been able to add to our understanding of it is to emphasize the fact that it is essentially an infantile feature and that it reveals a striking agreement with the mental life of neurotic patients. Psycho-analysis has taught us that a boy’s earliest choice of objects for his love is incestuous and that those objects are forbidden ones - his mother and his sister. We have learnt, too, the manner in which, as he grows up, he liberates himself from this incestuous attraction. A neurotic, on the other hand, invariably exhibits some degree of psychical infantilism. He has either failed to get free from the psychosexual conditions that prevailed in his childhood or he has returned to them - two possibilities which may be summed up as developmental inhibition and regression. Thus incestuous fixations of libido continue to play (or begin once more to play) the principal part in his unconscious mental life. We have arrived at the point of regarding a child’s relation to his parents, dominated as it is by incestuous longings, as the nuclear complex of neurosis. This revelation of the importance of incest in neurosis is naturally received with universal scepticism by adults and normal people. Similar expressions of disbelief, for instance, inevitably greet the writings of Otto Rank, which have brought more and more evidence to show the extent to which the interest of creative writers centres round the theme of incest and how the same theme, in countless variations and distortions, provides the subject-matter of poetry. We are driven to believe that this rejection is principally a product of the distaste which human beings feel for their early incestuous wishes, now over taken by repression. It is therefore of no small importance that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defence must be enforced. [1912-1913, 2665]
The neuroses exhibit on the one hand striking and far-reaching points of agreement with those great social institutions, art, religion and philosophy. But on the other hand they seem like distortions of them. It might be maintained that a case of hysteria is a caricature of a work of art, that an obsessional neurosis is a caricature of a religion and that a paranoic delusion is a caricature of a philosophical system. The divergence resolves itself ultimately into the fact that the neuroses are asocial structures; they endeavour to achieve by private means what is effected in society by collective effort. If we analyse the instincts at work in the neuroses, we find that the determining influence in them is exercised by instinctual forces of sexual origin; the corresponding cultural formations, on the other hand, are based upon social instincts, originating from the combination of egoistic and erotic elements. Sexual needs are not capable of uniting men in the same way as are the demands of self-preservation. Sexual satisfaction is essentially the private affair of each individual.

[1912-1913, 2717]

In only a single field of our civilization has the omnipotence of thoughts been retained, and that is in the field of art. Only in art does it still happen that a man who is consumed by desires performs something resembling the accomplishment of those desires and that what he does in play produces emotional effects - thanks to artistic illusion - just as though it were something real. People speak with justice of the 'magic of art' and compare artists to magicians. But the comparison is perhaps more significant than it claims to be. There can be no doubt that art did not begin as art for art's sake. It worked originally in the service of impulses which are for the most part extinct to-day. And among them we may suspect the presence of many magical purposes.

[1912-1913, 2733]

There is yet another way in which philosophy can derive a stimulus from psycho-analysis, and that is by itself becoming a subject of psycho-analytic research. Philosophical theories and systems have been the work of a small number of men of striking individuality. In no other science does the personality of the scientific worker play anything like so large a part as in philosophy. And now for the first time psycho-analysis enables us to construct a 'psychography' of a personality. (See the sociological section below, p. 2824.) It teaches us to recognize the affective units - the complexes dependent on instincts - whose presence is to be presumed in each individual, and it introduces us to the study of the transformations and end-products arising from these instinctual forces. It reveals the relations of a person's constitutional disposition and the events of his life to the achievements open to him owing to his peculiar gifts. It can conjecture with more or less certainty from an artist's work the intimate personality that lies behind it. In the same way, psycho-analysis can indicate the subjective and individual motives behind philosophical theories which have ostensibly sprung from impartial logical work, and can draw a critic's attention to the weak spots in the system. It is not the business of psycho-analysis, however, to undertake such criticism itself, for, as may be imagined, the fact that a theory is psychologically determined does not in the least invalidate its scientific truth.

[1913j, 2815]
Psycho-analysis throws a satisfactory light upon some of the problems concerning arts and artists; but others escape it entirely. In the exercising of an art it sees once again an activity intended to allay ungratified wishes - in the first place in the creative artist himself and subsequently in his audience or spectators. The motive forces of artists are the same conflicts which drive other people into neurosis and have encouraged society to construct its institutions. Whence it is that the artist derives his creative capacity is not a question for psychology. The artist's first aim is to set himself free and, by communicating his work to other people suffering from the same arrested desires, he offers them the same liberation.¹ He represents his most personal wishful phantasies as fulfilled; but they only become a work of art when they have undergone a transformation which softens what is offensive in them, conceals their personal origin and, by obeying the laws of beauty, bribes other people with a bonus of pleasure. Psycho-analysis has no difficulty in pointing out, alongside the manifest part of artistic enjoyment, another that is latent though far more potent, derived from the hidden sources of instinctual liberation. The connection between the impressions of the artist's childhood and his life-history on the one hand and his works, as reactions to those impressions, on the other is one of the most attractive subjects of analytic examination.²

For the rest, most of the problems of artistic creation and appreciation await further study, which will throw the light of analytic knowledge on them and assign them their place in the complex structure presented by the compensation for human wishes. Art is a conventionally accepted reality in which, thanks to artistic illusion, symbols and substitutes are able to provoke real emotions. Thus art constitutes a region half-way between a reality which frustrates wishes and the wish-fulfilling world of the imagination - a region in which, as it were, primitive man's strivings for omnipotence are still in full force.

This has brought me to recognize the apparently paradoxical fact that precisely some of the grandest and most overwhelming creations of art are still unsolved riddles to our understanding. We admire them, we feel overawed by them, but we are unable to say what they represent to us. I am not sufficiently well-read to know whether this fact has already been remarked upon; possibly, indeed, some writer on aesthetics has discovered that this state of intellectual bewilderment is a necessary condition when a work of art is to achieve its greatest effects. It would be only with the greatest reluctance that I could bring myself to believe in any such necessity.
I do not mean that connoisseurs and lovers of art find no words with which to praise such objects to us. They are eloquent enough, it seems to me. But usually in the presence of a great work of art each says something different from the other; and none of them says anything that solves the problem for the unpretending admirer. In my opinion, what grips us so powerfully can only be the artist's intention, in so far as he has succeeded in expressing it in his work and in getting us to understand it. I realize that this cannot be merely a matter of intellectual comprehension; what he aims at is to awaken in us the same, emotional attitude, the same mental constellation as that which in him produced the impetus to create. But why should the artist's intention not be capable of being communicated and comprehended in words, like any other fact of mental life? Perhaps where great works of art are concerned this would never be possible without the application of psycho-analysis. The product itself after all must admit of such an analysis, if it really is an effective expression of the intentions and emotional activities of the artist. To discover his intention, though, I must first find out the meaning and content of what is represented in his work; I must, in other words, be able to interpret it. It is possible, therefore, that a work of art of this kind needs interpretation, and that until I have accomplished that interpretation I cannot come to know why I have been so powerfully affected. I even venture to hope that the effect of the work will undergo no diminution after we have succeeded in thus analysing it.

[1914b, 2846]

Another path led from the investigation of dreams to the analysis of works of imagination and ultimately to the analysis of their creators - writers and artists themselves. At an early stage it was discovered that dreams invented by writers will often yield to analysis in the same way as genuine ones. (Cf. 'Gradiva'.) The conception of unconscious mental activity made it possible to form a preliminary idea of the nature of imaginative creative writing; and the realization, gained in the study of neurotics, of the part played by the instincual impulses enabled us to perceive the sources of artistic production and confronted us with two problems: how the artist reacts to this instigation and what means he employs to disguise his reactions.¹ Most analysts with general interests have contributed something to the solution of these problems, which are the most fascinating among the applications of psycho-analysis. Naturally, opposition was not lacking in this direction either on the part of people who knew nothing of analysis; it took the same form as it did in the original field of psycho-analytic research - the same misconceptions and vehement rejections. It was only to be expected from the beginning that, whatever the regions into which psycho-analysis might penetrate, it would inevitably experience the same struggles with those already in possession of the field. These attempted invasions, however, have not yet stirred up the attention in some quarters which awaits them in the future. Among the strictly scientific applications of analysis to literature, Rank's exhaustive work on the theme of incest easily takes the first place. Its subject is bound to arouse the greatest unpopularity. Up to the present, little work based on psycho-analysis has been done in the sciences of language and history. I myself ventured the first approach to the problems of the psychology of religion by drawing a parallel between religious ritual and the ceremonials of neurotics (1907b). Dr. Pfister, a pastor in Zurich, has traced back the origin of religious fanaticism to perverse eroticism in his book on the piety of Count von Zinzendorf, as well as in other contributions. In the latest works of the Zurich school, however, we find analysis permeated with religious ideas rather than the opposite outcome that had been in view.

[1914d, 2902]
Adler is right in maintaining that when a person with an active mental life recognizes an inferiority in one of his organs, it acts as a spur and calls out a higher level of performance in him through overcompensation. But it would be altogether an exaggeration if, following Adler's example, we sought to attribute every successful achievement to this factor of an original inferiority of an organ. Not all artists are handicapped with bad eyesight, nor were all orators originally stammerers. And there are plenty of instances of excellent achievements springing from superior organic endowment. In the aetiology of neuroses organic inferiority and imperfect development play an insignificant part - much the same as that played by currently active perceptual material in the formation of dreams. Neuroses make use of such inferiorities as a pretext, just as they do of every other suitable factor. We may be tempted to believe a neurotic woman patient when she tells us that it was inevitable she should fall ill, since she is ugly, deformed or lacking in charm, so that no one could love her; but the very next neurotic will teach us better - for she persists in her neurosis and in her aversion to sexuality, although she seems more desirable, and is more desired, than the average woman. The majority of hysterical women are among the attractive and even beautiful representatives of their sex, while, on the other hand, the frequency of ugliness, organic defects and infirmities in the lower classes of society does not increase the incidence of neurotic illness among them.

[1914c, 2952]

It is an inevitable result of all this that we should seek in the world of fiction, in literature and in the theatre compensation for what has been lost in life. There we still find people who know how to die - who, indeed, even manage to kill someone else. There alone too the condition can be fulfilled which makes it possible for us to reconcile ourselves with death: namely, that behind all the vicissitudes of life we should still be able to preserve a life intact. For it is really too sad that in life it should be as it is in chess, where one false move may force us to resign the game, but with the difference that we can start no second game, no return-match. In the realm of fiction we find the plurality of lives which we need. We die with the hero with whom we have identified ourselves; yet we survive him, and are ready to die again just as safely with another hero.

[1915b, 3083]

At a first glance this tirade may perhaps seem unrelated to our present theme. Richard seems to say nothing more than: 'I find these idle times tedious, and I want to enjoy myself. As I cannot play the lover on account of my deformity, I will play the villain; I will intrigue, murder and do anything else I please.' Such a frivolous motivation could not but stifle any stirring of sympathy in the audience, if it were not a screen for something much more serious. Otherwise the play would be psychologically impossible, for the writer must know how to furnish us with a secret background of sympathy for his hero, if we are to admire his boldness and adroitness without inward protest; and such sympathy can only be based on understanding or on a sense of a possible inner fellow-feeling for him.

[1916d, 3102]

It is, however, a subtle economy of art in the poet that he does not permit his hero to give open and complete expression to all his secret motives. By this means he obliges us to supplement them; he engages our intellectual activity, diverts it from critical reflection and keeps us firmly identified with his hero. A bungler in his place would give conscious expression to all that he wishes to reveal to us, and would then find himself confronted by our cool, untrammelled intelligence, which would preclude any deepening of the illusion.

[1916d, 3103]
Unexpectedly, a hint reaches us from a direction in which we have not so far looked. Linguistic usage, which is no chance thing, but the precipitate of old discoveries, though, to be sure, it must not be employed incautiously - our language, then, is acquainted with things that bear the strange name of 'day dreams'. Day-dreams are phantasies (products of the imagination); they are very general phenomena, observable, once more, in healthy as well as in sick people, and are easily accessible to study in our own mind. The most remarkable thing about these imaginative structures is that they have been given the name of 'day-dreams', for there is no trace in them of the two things that are common to dreams. Their relation to sleep is already contradicted by their name; and, as regards the second thing common to dreams, we do not experience or hallucinate anything in them but imagine something, we know that we are having a phantasy, we do not see but think. These day-dreams appear in the prepubertal period, often in the later part of childhood even; they persist until maturity is reached and are then either given up or maintained till the end of life. The content of these phantasies is dominated by a very transparent motive. They are scenes and events in which the subject's egoistic needs of ambition and power or his erotic wishes and satisfaction. In young men the ambitious phantasies are the most prominent, in women, whose ambition is directed to success in love, the erotic ones. But in men, too, erotic needs are often enough present in the background: all their heroic deeds and successes seem only to aim at courting the admiration and favour of women. In other respects these day-dreams are of many different kinds and pass through changing vicissitudes. They are either, each one of them, dropped after a short time and replaced by a fresh one, or they are retained, spun out into long stories and adapted to the changes in the circumstances of the subject's life. They go along with the times, so to speak, and receive a 'date stamp' which bears witness to the influence of the new situation. They are the raw material of poetic production, for the creative writer uses his day-dreams, with certain remodellings, disguises and omissions, to construct the situations which he introduces into his short stories, his novels or his plays. The hero of the day dreams is always the subject himself, either directly or by an obvious identification with someone else.

[1916-1917, 3198]
Before I let you go to-day, however, I should like to direct your attention a little longer to a side
of the life of phantasy which deserves the most general interest. For there is a path that leads
back from phantasy to reality - the path, that is, of art. An artist is once more in rudiments an
introvert, not far removed from neurosis. He is oppressed by excessively powerful instinctual
needs. He desires to win honour, power, wealth, fame and the love of women; but he lacks the
means for achieving these satisfactions. Consequently, like any other unsatisfied man, he turns
away from reality and transfers all his interest, and his libido too, to the wishful constructions of
his life of phantasy, whence the path might lead to neurosis. There must be, no doubt, a
convergence of all kinds of things if this is not to be the complete outcome of his development; it
is well known, indeed, how often artists in particular suffer from a partial inhibition of their
efficiency owing to neurosis. Their constitution probably includes a strong capacity for
sublimation and a certain degree of laxity in the repressions which are decisive for a conflict. An
artist, however, finds a path back to reality in the following manner. To be sure, he is not the
only one who leads a life of phantasy. Access to the half-way region of phantasy is permitted by
the universal assent of mankind, and everyone suffering from privation expects to derive
alleviation and consolation from it. But for those who are not artists the yield of pleasure to be
derived from the sources of phantasy is very limited. The ruthlessness of their repressions force
them to be content with such meagre day-dreams as are allowed to become conscious. A man
who is a true artist has more at his disposal. In the first place, he understands how to work over
his day-dreams in such a way as to make them lose what is too personal about them and repels
strangers, and to make it possible for others to share in the enjoyment of them. He understands,
too, how to tone them down so that they do not easily betray their origin from proscribed
sources. Furthermore, he possesses the mysterious power of shaping some particular material
until it has become a faithful image of his phantasy; and he knows, moreover, how to link so
large a yield of pleasure to this representation of his unconscious phantasy that, for the time
being at least, repressions are outweighed and lifted by it. If he is able to accomplish all this, he
makes it possible for other people once more to derive consolation and alleviation from their
own sources of pleasure in their unconscious which have become inaccessible to them; he
earns their gratitude and admiration and he has thus achieved through his phantasy what
originally he had achieved only in his phantasy - honour, power and the love of women.

A little reflection was bound to show that it would be impossible to restrict to the provinces of
dreams and nervous disorders a view such as this of the life of the human mind. If that view has
hit upon a truth, it must apply equally to normal mental events, and even the highest
achievements of the human spirit must bear a demonstrable relation to the factors found in
pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of
satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a
scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its
native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself
pointed persistently in the direction of this new task, for it was obvious that the forms assumed
by the different neuroses echoed the most highly admired productions of our culture. Thus
hysterics are undoubtedly imaginative artists, even if they express their phantasies mimetically
in the main and without considering their intelligibility to other people; the ceremonials and
prohibitions of obsessional neurotics drive us to suppose that they have created a private
religion of their own; and the delusions of paranoics have an unpalatable external similarity and
internal kinship to the systems of our philosophers. It is impossible to escape the conclusion
that these patients are, in an asocial fashion, making the very attempts at solving their conflicts
and appeasing their pressing needs which, when those attempts are carried out in a fashion
that is acceptable to the majority, are known as poetry, religion and philosophy.

[1916-1917, 3430]

[1919g, 3704]
In 1913 Otto Rank and Hanns Sachs, in an extremely interesting work, brought together the results which had been achieved up to that time in the application of psycho-analysis to the mental sciences. The most easily accessible branches of those sciences seem to be mythology and the history of literature and religion. No final formula has yet been found enabling us to give an appropriate place to myths in this connection. Otto Rank, in a large volume on the incest complex (1912), has produced evidence of the surprising fact that the choice of subject matter, especially for dramatic works, is principally determined by the ambit of what psycho-analysis has termed the 'Oedipus complex'. By working it over with the greatest variety of modifications, distortions and disguises, the dramatist seeks to deal with his own most personal relations to this emotional theme. It is in attempting to master the Oedipus complex - that is to say, a person's emotional attitude towards his family, or in a narrower sense towards his father and mother - that individual neurotics come to grief, and for this reason that complex habitually forms the nucleus of their neuroses. It does not owe its importance to any unintelligible conjunction; the emphasis laid upon the relation of children to their parents is an expression of the biological facts that the young of the human race pass through a long period of dependence and are slow in reaching maturity, as well as that their capacity for love undergoes a complicated course of development. Consequently, the overcoming of the Oedipus complex coincides with the most efficient way of mastering the archaic, animal heritage of humanity. It is true that that heritage comprises all the forces that are required for the subsequent cultural development of the individual, but they must first be sorted out and worked over. This archaic heirloom is not fit to be used for the purposes of civilized social life in the form in which it is inherited by the individual.

[1919g, 3704]

This hypothesis, which is founded on the observations of Robertson Smith and was developed by me in Totem and Taboo, has been taken by Theodor Reik as the basis of his studies on the problems of the psychology of religion, of which this is the first volume. In accordance with psycho-analytic technique these studies start out from hitherto unexplained details of religious life, and by means of their elucidation gain access to the fundamental postulates and ultimate aims of religions; moreover they keep steadily in view the relation between prehistoric man and contemporary primitive societies as well as the connection between the products of civilization and the substitutive structures of neurotics. In conclusion, I would draw attention to the author's own introduction and express my belief that his work will recommend itself to the notice of specialists in the branch of knowledge with which it deals.

[1919g, 3705]

A number of dreams which occur during analyses are untranslatable even though they do not actually make much show of the resistance that is there. They represent free renderings of the latent dream-thoughts behind them and are comparable to successful creative writings which have been artistically worked over and in which the basic themes are still recognizable though they have been subjected to any amount of re-arrangement and transformation. Dreams of this kind serve in the treatment as an introduction to thoughts and memories of the dreamer without their own actual content coming into account.

[1923c, 4031]
We have seen that one part of human mental activity is directed towards obtaining control over the real external world. Psycho-analysis now tells us further that another, particularly highly-prized, part of creative mental work serves for the fulfilment of wishes - for the substitutive satisfaction of the repressed wishes which, from the days of childhood, live in the spirit of each of us, unsatisfied. Among these creations, whose connection with an incomprehensible unconscious was always suspected, are myths and works of imaginative writing and of art, and the researches of psycho-analysts have in fact thrown a flood of light on the fields of mythology, the science of literature, and the psychology of artists. It is enough to mention Otto Rank's work as an example. We have shown that myths and fairy tales can be interpreted like dreams, we have traced the convoluted paths that lead from the urge of the unconscious wish to its realization in a work of art, we have learnt to understand the emotional effect of a work of art on the observer, and in the case of the artist himself we have made clear his internal kinship with the neurotic as well as his distinction from him, and we have pointed out the connection between his innate disposition, his chance experiences and his achievements. The aesthetic appreciation of works of art and the elucidation of the artistic gift are, it is true, not among the tasks set to psycho-analysis. But it seems that psycho-analysis is in a position to speak the decisive word in all questions that touch upon the imaginative life of man.

[1924f, 4117]

But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.

[1925e, 4126]

None of the applications of psycho-analysis has excited so much interest and aroused so many hopes, and none, consequently, has attracted so many capable workers, as its use in the theory and practice of education. It is easy to understand why; for children have become the main subject of psycho-analytic research and have thus replaced in importance the neurotics on whom its studies began. Analysis has shown how the child lives on, almost unchanged, in the sick man as well as in the dreamer and the artist; it has thrown light on the motive forces and trends which set its characteristic stamp upon the childish nature; and it has traced the stages through which a child grows to maturity. No wonder, therefore, if an expectation has arisen that psycho-analytic concern with children will benefit the work of education, whose aim it is to guide and assist children on their forward path and to shield them from going astray.

[1925f, 4167]
A number of suggestions came to me out of the Oedipus complex, the ubiquity of which gradually dawned on me. The poet's choice, or his invention, of such a terrible subject seemed puzzling; and so too did the overwhelming effect of its dramatic treatment, and the general nature of such tragedies of destiny. But all of this became intelligible when one realized that a universal law of mental life had here been captured in all its emotional significance. Fate and the oracle were no more than materializations of an internal necessity; and the fact of the hero's sinning without his knowledge and against his intentions was evidently a right expression of the unconscious nature of his criminal tendencies. From understanding this tragedy of destiny it was only a step further to understanding a tragedy of character - *Hamlet*, which had been admired for three hundred years without its meaning being discovered or its author's motives guessed. It could scarcely be a chance that this neurotic creation of the poet should have come to grief, like his numberless fellows in the real world, over the Oedipus complex. For *Hamlet* was faced with the task of taking vengeance on another for the two deeds which are the subject of the Oedipus desires; and before that task his arm was paralysed by his own obscure sense of guilt. Shakespeare wrote *Hamlet* very soon after his father's death.¹ The suggestions made by me for the analysis of this tragedy were fully worked out later on by Ernest Jones. And the same example was afterwards used by Otto Rank as the starting-point for his investigation of the choice of material made by dramatists. In his large volume on the incest theme (Rank, 1912) he was able to show how often imaginative writers have taken as their subject the themes of the Oedipus situation, and traced in the different literatures of the world the way in which the material has been transformed, modified, and softened.

It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

¹[1925d, 4237]

[1925d, 4238]
I was able to show from a short story by W. Jensen called *Gradiva*, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on *Jokes and their Relation to the Unconscious* was a side-issue directly derived from *The Interpretation of Dreams*. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (*fore-pleasure*).  

[1925d, 4239]

A different kind of satisfaction is afforded by art to the participants in a cultural unit, though as a rule it remains inaccessible to the masses, who are engaged in exhausting work and have not enjoyed any personal education. As we discovered long since, art offers substitutive satisfactions for the oldest and still most deeply felt cultural renunciations, and for that reason it serves as nothing else does to reconcile a man to the sacrifices he has made on behalf of civilization. On the other hand, the creations of art heighten his feelings of identification, of which every cultural unit stands in so much need, by providing an occasion for sharing highly valued emotional experiences. And when those creations picture the achievements of his particular culture and bring to his mind its ideals in an impressive manner, they also minister to his narcissistic satisfaction.  

[1927c, 4426]

This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We cannot do without auxiliary constructions', as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends *Candide* with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.  

[1930a, 4474]
Another technique for fending off suffering is the employment of the displacements of libido which our mental apparatus permits of and through which its function gains so much in flexibility. The task here is that of shifting the instinctual aims in such a way that they cannot come up against frustration from the external world. In this, sublimation of the instincts lends its assistance. One gains the most if one can sufficiently heighten the yield of pleasure from the sources of psychical and intellectual work. When that is so, fate can do little against one. A satisfaction of this kind, such as an artist's joy in creating, in giving his phantasies body, or a scientist's in solving problems or discovering truths, has a special quality which we shall certainly one day be able to characterize in metapsychological terms. At present we can only say figuratively that such satisfactions seem 'finer and higher'. But their intensity is mild as compared with that derived from the sating of crude and primary instinctual impulses; it does not convulse our physical being. And the weak point of this method is that it is not applicable generally: it is accessible to only a few people. It presupposes the possession of special dispositions and gifts which are far from being common to any practical degree. And even to the few who do possess them, this method cannot give complete protection from suffering. It creates no impenetrable armour against the arrows of fortune, and it habitually fails when the source of suffering is a person's own body.¹

[1930a, 4479]

While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

[1930a, 4480]

We may go on from here to consider the interesting case in which happiness in life is predominantly sought in the enjoyment of beauty, wherever beauty presents itself to our senses and our judgement - the beauty of human forms and gestures, of natural objects and landscapes and of artistic and even scientific creations. This aesthetic attitude to the goal of life offers little protection against the threat of suffering, but it can compensate for a great deal. The enjoyment of beauty has a peculiar, mildly intoxicating quality of feeling. Beauty has no obvious use; nor is there any clear cultural necessity for it. Yet civilization could not do without it. The science of aesthetics investigates the conditions under which things are felt as beautiful, but it has been unable to give any explanation of the nature and origin of beauty, and, as usually happens, lack of success is concealed beneath a flood of resounding and empty words. Psycho-analysis, unfortunately, has scarcely anything to say about beauty either. All that seems certain is its derivation from the field of sexual feeling. The love of beauty seems a perfect example of an impulse inhibited in its aim. 'Beauty' and 'attraction' are originally attributes of the sexual object. It is worth remarking that the genitals themselves, the sight of which is always exciting, are nevertheless hardly ever judged to be beautiful; the quality of beauty seems, instead, to attach to certain secondary sexual characters.

[1930a, 4481]
The creative artist is the least doubtful: Dostoevsky's place is not far behind Shakespeare. *The Brothers Kamarazov* is the most magnificent novel ever written; the episode of the Grand Inquisitor, one of the peaks in the literature of the world, can hardly be valued too highly. Before the problem of the creative artist analysis must, alas, lay down its arms. [1928b, 4553]

What part of a gambler's long-buried childhood is it that forces its way to repetition in his obsession for play? The answer may be divined without difficulty from a story by one of our younger writers. Stefan Zweig, who has incidentally devoted a study to Dostoevsky himself (1920), has included in his collection of three stories *Die Verwirrung der Gefühle* (1927) one which he calls 'Vierundzwanzig Stunden aus dem Leben einer Frau'. This little masterpiece ostensibly sets out only to show what an irresponsible creature woman is, and to what excesses, surprising even to herself, an unexpected experience may drive her. But the story tells far more than this. If it is subjected to an analytical interpretation, it will be found to represent (without any apologetic intent) something quite different, something universally human, or rather something masculine. And such an interpretation is so extremely obvious that it cannot be resisted. It is characteristic of the nature of artistic creation that the author, who is a personal friend of mine, was able to assure me, when I asked him, that the interpretation which I put to him had been completely strange to his knowledge and intention, although some of the details woven into the narrative seemed expressly designed to give a clue to the hidden secret. [1928b, 4567]

As you suggest, I included Dostoevsky the psychologist under the creative artist. Another objection I might have raised against him was that his insight was so much restricted to abnormal mental life. Consider his astonishing helplessness in face of the phenomena of love. All he really knew were crude, instictual desire, masochistic subjection and loving out of pity. You are right, too, in suspecting that, in spite of all my admiration for Dostoevsky's intensity and pre-eminence, I do not really like him. That is because my patience with pathological natures is exhausted in analysis. In art and life I am intolerant of them. Those are character traits personal to me and not binding on others. [1928b, 4570]

I was recalled from such narrow considerations by the astonishing honour which you do me. By evoking the figure of the great universal personality who was born in this house and who spent his childhood in these rooms, your distinction prompts one as it were to justify oneself before him and raises the question of how he would have reacted if his glance, attentive to every innovation in science, had fallen on psycho-analysis. Goethe can be compared in versatility to Leonardo da Vinci, the Renaissance master, who like him was both artist and scientific investigator. But human images can never be repeated, and profound differences between the two great men are not lacking. In Leonardo's nature the scientist did not harmonize with the artist, he interfered with him and perhaps in the end stifled him. In Goethe's life both personalities found room side by side: at different times each allowed the other to predominate. In Leonardo it is plausible to associate his disturbance with that inhibition in his development which withdrew everything erotic, and hence psychology too, from his sphere of interest. In this respect Goethe's character was able to develop more freely. [1930, 4578]
We all, who revere Goethe, put up, without too much protest, with the efforts of his biographers, who try to recreate his life from existing accounts and indications. But what can these biographies achieve for us? Even the best and fullest of them could not answer the two questions which alone seem worth knowing about. It would not throw any light on the riddle of the miraculous gift that makes an artist, and it could not help us to comprehend any better the value and the effect of his works. And yet there is no doubt that such a biography does satisfy a powerful need in us. We feel this very distinctly if the legacy of history unkindly refuses the satisfaction of this need - for example in the case of Shakespeare. It is undeniably painful to all of us that even now we do not know who was the author of the Comedies, Tragedies and Sonnets of Shakespeare; whether it was in fact the untutored son of the provincial citizen of Stratford, who attained a modest position as an actor in London, or whether it was, rather, the nobly-born and highly cultivated, passionately wayward, to some extent déclassé aristocrat, Edward de Vere, Seventeenth Earl of Oxford, hereditary Lord Great Chamberlain of England.

But how can we justify a need of this kind to obtain knowledge of the circumstances of a man's life when his works have become so full of importance to us? People generally say that it is our desire to bring ourselves nearer to such a man in a human way as well. Let us grant this; it is, then, the need to acquire affective relations with such men, to add them to the fathers, teachers, exemplars whom we have known or whose influence we have already experienced, in the expectation that their personalities will be just as fine and admirable as those works of art of theirs which we possess.

When psycho-analysis puts itself at the service of biography, it naturally has the right to be treated no more harshly than the latter itself. Psycho-analysis can supply some information which cannot be arrived at by other means, and can thus demonstrate new connecting threads in the 'weaver's masterpiece' spread between the instinctual endowments, the experiences and the works of an artist. Since it is one of the principal functions of our thinking to master the material of the external world psychically, it seems to me that thanks are due to psycho-analysis if, when it is applied to a great man, it contributes to the understanding of his great achievement. But, I admit, in the case of Goethe we have not yet succeeded very far. This is because Goethe was not only, as a poet, a great self-revealer, but also, in spite of the abundance of autobiographical records, a careful concealer. We cannot help thinking here of the words of Mephistopheles:

This does not in the least mean that these wishes are to be pushed contemptuously on one side or their value for human life under-estimated. We are ready to trace out the fulfilments of them which they have created for themselves in the products of art and in the systems of religion and philosophy; but we cannot nevertheless overlook the fact that it would be illegitimate and highly inexpedient to allow these demands to be transferred to the sphere of knowledge. For this would be to lay open the paths which lead to psychosis, whether to individual or group psychosis, and would withdraw valuable amounts of energy from endeavours which are directed towards reality in order, so far as possible, to find satisfaction in it for wishes and needs.

[1930, 4581]

[1930, 4582]

[1933a, 4758]
Of the three powers which may dispute the basic position of science, religion alone is to be taken seriously as an enemy. Art is almost always harmless and beneficent; it does not seek to be anything but an illusion. Except for a few people who are spoken of as being 'possessed' by art, it makes no attempt at invading the realm of reality. Philosophy is not opposed to science, it behaves like a science and works in part by the same methods; it departs from it, however, by clinging to the illusion of being able to present a picture of the universe which is without gaps and is coherent, though one which is bound to collapse with every fresh advance in our knowledge. It goes astray in its method by over-estimating the epistemological value of our logical operations and by accepting other sources of knowledge such as intuition. And it often seems that the poet's derisive comment is not unjustified when he says of the philosopher:

[1933a, 4759]

In this volume my friend and pupil, Marie Bonaparte, has directed the light of psycho-analysis upon the life and work of a great writer of a pathological type. Thanks to her interpretative efforts, we can now understand how much of the characteristics of his work were determined by their author's special nature; but we also learn that this was itself the precipitate of powerful emotional ties and painful experiences in his early youth. Investigations of this kind are not intended to explain an author's genius, but they show what motive forces aroused it and what material was offered to him by destiny. There is a particular fascination in studying the laws of the human mind as exemplified in outstanding individuals.

[1933d, 4834]

If all that is left of the past are the incomplete and blurred memories which we call tradition, this offers an artist a peculiar attraction, for in that case he is free to fill in the gaps in memory according to the desires of his imagination and to picture the period which he wishes to reproduce according to his intentions. One might almost say that the vaguer a tradition has become the more serviceable it becomes for a poet. We need not therefore be surprised at the importance of tradition for imaginative writing, and the analogy with the manner in which epics are determined will make us more inclined to accept the strange hypothesis that it was the tradition of Moses which, for the Jews, altered the worship of Yahweh in the direction of the old Mosaic religion. But in other respects the two cases are still too different. On the one hand the outcome is a poem and on the other a religion; and in the latter instance we have assumed that, under the spur of tradition, it was reproduced with a faithfulness for which the instance of the epic can of course offer no counterpart. Accordingly enough of our problem is left over to justify a need for more apposite analogies.

[1939a, 4897]

I might, however, console myself with the reflection that the things I am treating are in any case so new and so important, apart from how far my account of them is correct, that it can be no misfortune if the public is obliged to read the same thing about them twice over. There are things which should be said more than once and which cannot be said often enough. But the reader must decide of his own free will whether to linger over the subject or to come back to it. He must not be surreptitiously led into having the same thing put before him twice in one book. It is a piece of clumsiness for which the author must take the blame. Unluckily an author's creative power does not always obey his will: the work proceeds as it can, and often presents itself to the author as something independent or even alien.

[1939a, 4925]
¹ [Footnote added 1915:] There is to my mind no doubt that the concept of 'beautiful' has its roots in sexual excitation and that its original meaning was 'sexually stimulating'. This is related to the fact that we never regard the genitals themselves, which produce the strongest sexual excitation, as really 'beautiful'.
[1905d, 1483]

Let us begin by casting a glance at the way in which the erotogenic zones fit themselves into the new arrangement. They have to play an important part in introducing sexual excitation. The eye is perhaps the zone most remote from the sexual object, but it is the one which, in the situation of wooing an object, is liable to be the most frequently stimulated by the particular quality of excitation whose cause, when it occurs in a sexual object, we describe as beauty. (For the same reason the merits of a sexual object are described as 'attractions'.) This stimulation is on the one hand already accompanied by pleasure, while on the other hand it leads to an increase of sexual excitement or produces it if it is not yet present. If the excitation now spreads to another erotogenic zone - to the hand, for instance, through tactile sensations - the effect is the same: a feeling of pleasure on the one side, which is quickly intensified by pleasure arising from the preparatory changes, and on the other side an increase of sexual tension, which soon passes over into the most obvious displeasure if it cannot be met by a further accession of pleasure. Another instance will perhaps make this even clearer. If an erotogenic zone in a person who is not sexually excited (e.g. the skin of a woman's breast) is stimulated by touch, the contact produces a pleasurable feeling; but it is at the same time better calculated than anything to arouse a sexual excitation that demands an increase of pleasure. The problem is how it can come about that an experience of pleasure can give rise to a need for greater pleasure.
[1905d, 1526]

We may go on from here to consider the interesting case in which happiness in life is predominantly sought in the enjoyment of beauty, wherever beauty presents itself to our senses and our judgement - the beauty of human forms and gestures, of natural objects and landscapes and of artistic and even scientific creations. This aesthetic attitude to the goal of life offers little protection against the threat of suffering, but it can compensate for a great deal. The enjoyment of beauty has a peculiar, mildly intoxicating quality of feeling. Beauty has no obvious use; nor is there any clear cultural necessity for it. Yet civilization could not do without it. The science of aesthetics investigates the conditions under which things are felt as beautiful, but it has been unable to give any explanation of the nature and origin of beauty, and, as usually happens, lack of success is concealed beneath a flood of resounding and empty words. Psycho-analysis, unfortunately, has scarcely anything to say about beauty either. All that seems certain is its derivation from the field of sexual feeling. The love of beauty seems a perfect example of an impulse inhibited in its aim. 'Beauty' and 'attraction' are originally attributes of the sexual object. It is worth remarking that the genitals themselves, the sight of which is always exciting, are nevertheless hardly ever judged to be beautiful; the quality of beauty seems, instead, to attach to certain secondary sexual characters.
[1930a, 4481]
There is yet another reason for which, as I can show, the second system is obliged to correct the primary process. The primary process endeavours to bring about a discharge of excitation in order that, with the help of the amount of excitation thus accumulated, it may establish a 'perceptual identity'. The secondary process, however, has abandoned this intention and taken on another in its place - the establishment of a 'thought identity'. All thinking is no more than a circuitous path from the memory of a satisfaction (a memory which has been adopted as a purposive idea) to an identical cathexis of the same memory which it is hoped to attain once more through an intermediate stage of motor experiences. Thinking must concern itself with the connecting paths between ideas, without being led astray by the intensities of those ideas. But it is obvious that condensations of ideas, as well as intermediate and compromise structures, must obstruct the attainment of the identity aimed at. Since they substitute one idea for another, they cause a deviation from the path which would have led on from the first idea. Processes of this kind are therefore scrupulously avoided in secondary thinking. It is easy to see, too, that the unpleasure principle, which in other respects supplies the thought-process with its most important signposts, puts difficulties in its path towards establishing 'thought identity'. Accordingly, thinking must aim at freeing itself more and more from exclusive regulation by the unpleasure principle and at restricting the development of affect in thought-activity to the minimum required for acting as a signal. The achievement of this greater delicacy in functioning is aimed at by means of a further hypercathexis, brought about by consciousness. As we well know, however, that aim is seldom attained completely, even in normal mental life, and our thinking always remains exposed to falsification by interference from the unpleasure principle.

I may now venture, upon the basis of the preceding discussion, to determine the psychological characteristic, so long sought after, which lends to the products of an obsessional neurosis their 'obsessive' or compulsive quality. A thought-process is obsessive or compulsive when, in consequence of an inhibition (due to a conflict of opposing impulses) at the motor end of the psychical system, it is undertaken with an expenditure of energy which (as regards both quality and quantity) is normally reserved for actions alone; or, in other words, an obsessive or compulsive thought is one whose function it is to represent an act regressively. No one, I think, will question my assumption that processes of thought are ordinarily conducted (on grounds of economy) with smaller displacements of energy, probably at a higher level, than are acts intended to bring about discharge or to modify the external world.

If this displaceable energy is desexualized libido, it may also be described as sublimated energy; for it would still retain the main purpose of Eros - that of uniting and binding - in so far as it helps towards establishing the unity, or tendency to unity, which is particularly characteristic of the ego. If thought processes in the wider sense are to be included among these displacements, then the activity of thinking is also supplied from the sublimation of erotic motive forces.

Judging is the intellectual action which decides the choice of motor action, which puts an end to the postponement due to thought and which leads over from thinking to acting. This postponement due to thought has also been discussed by me elsewhere. It is to be regarded as an experimental action, a motor palpating, with small expenditure of discharge. Let us consider where the ego has used a similar kind of palpating before, at what place it learnt the technique which it now applies in its processes of thought. It happened at the sensory end of the mental apparatus, in connection with sense perceptions. For, on our hypothesis, perception is not a purely passive process. The ego periodically sends out small amounts of cathexis into the perceptual system, by means of which it samples the external stimuli, and then after every such tentative advance it draws back again.
I hope you have not lost the thread of what I am saying and remember that we are investigating the relations between anxiety and repression. In the course of this we have learnt two new things: first, that anxiety makes repression and not, as we used to think, the other way round, and that the instinctual situation which is feared goes back ultimately to an external situation of danger. The next question will be: how do we now picture the process of a repression under the influence of anxiety? The answer will, I think, be as follows. The ego notices that the satisfaction of an emerging instinctual demand would conjure up one of the well-remembered situations of danger. This instinctual cathexis must therefore be somehow suppressed, stopped, made powerless. We know that the ego succeeds in this task if it is strong and has drawn the instinctual impulse concerned into its organization. But what happens in the case of repression is that the instinctual impulse still belongs to the id and that the ego feels weak. The ego thereupon helps itself by a technique which is at bottom identical with normal thinking. Thinking is an experimental action carried out with small amounts of energy, in the same way as a general shifts small figures about on a map before setting his large bodies of troops in motion. Thus the ego anticipates the satisfaction of the questionable instinctual impulse and permits it to bring about the reproduction of the unpleasurable feelings at the beginning of the feared situation of danger. With this the automatism of the pleasure-unpleasure principle is brought into operation and now carries out the repression of the dangerous instinctual impulse.

[1933a, 4696]

All of this may appear to be far from simple. But when one has grown reconciled to this unusual spatial view of the mental apparatus, it can present no particular difficulties to the imagination. I will add the further comment that the psychical topography that I have developed here has nothing to do with the anatomy of the brain, and actually only touches it at one point. What is unsatisfactory in this picture - and I am aware of it as clearly as anyone - is due to our complete ignorance of the dynamic nature of the mental processes. We tell ourselves that what distinguishes a conscious idea from a preconscious one, and the latter from an unconscious one, can only be a modification, or perhaps a different distribution, of psychical energy. We talk of cathexes and hypercathexes, but beyond this we are without any knowledge on the subject or even any starting-point for a serviceable working hypothesis. Of the phenomenon of consciousness we can at least say that it was originally attached to perception. All sensations which originate from the perception of painful, tactile, auditory or visual stimuli are what are most readily conscious. Thought-processes, and whatever may be analogous to them in the id, are in themselves unconscious and obtain access to consciousness by becoming linked to the mnemonic residues of visual and auditory perceptions along the path of the function of speech. In animals, which lack speech, these conditions must be of a simpler kind.
[1939a, 4919]
Perhaps we shall come to a better understanding of the several opposites of loving if we reflect that our mental life as a whole is governed by three polarities, the antitheses

Subject (ego) - Object (external world),
Pleasure - Unpleasure, and
Active - Passive.
[1915c, 2969]

The antithesis ego - non-ego (external), i.e. subject-object, is, as we have already said, thrust upon the individual organism at an early stage, by the experience that it can silence external stimuli by means of muscular action but is defenceless against instinctual stimuli. This antithesis remains, above all, sovereign in our intellectual activity and creates for research the basic situation which no efforts can alter. The polarity of pleasure-unpleasure is attached to a scale of feelings, whose paramount importance in determining our actions (our will) has already been emphasized. The antithesis active-passive must not be confused with the antithesis ego-subject - external world-object. The relation of the ego to the external world is passive in so far as it receives stimuli from it and active when it reacts to these. It is forced by its instincts into a quite special degree of activity towards the external world, so that we might bring out the essential point if we say that the ego-subject is passive in respect of external stimuli but active through its own instincts. The antithesis active-passive coalesces later with the antithesis masculine-feminine, which, until this has taken place, has no psychological meaning. The coupling of activity with masculinity and of passivity with femininity meets us, indeed, as a biological fact; but it is by no means so invariably complete and exclusive as we are inclined to assume.
[1915c, 2970]

The three polarities of the mind are connected with one another in various highly significant ways. There is a primal psychical situation in which two of them coincide. Originally, at the very beginning of mental life, the ego is cathected with instincts and is to some extent capable of satisfying them on itself. We call this condition 'narcissism' and this way of obtaining satisfaction 'auto-erotic'.¹ At this time the external world is not cathected with interest (in a general sense) and is indifferent for purposes of satisfaction. During this period, therefore, the ego-subject coincides with what is pleasurable and the external world with what is indifferent (or possibly unpleasurable, as being a source of stimulation). If for the moment we define loving as the relation of the ego to its sources of pleasure, the situation in which the ego loves itself only and is indifferent to the external world illustrates the first of the opposites which we found to 'loving'.
[1915c, 2970]

The third antithesis of loving, the transformation of loving into being loved, corresponds to the operation of the polarity of activity and passivity, and is to be judged in the same way as the cases of scopophilia and sadism.
[1915c, 2974]

We may sum up by saying that the essential feature in the vicissitudes undergone by instincts lies in the subjection of the instinctual impulses to the influences of the three great polarities that dominate mental life. Of these three polarities we might describe that of activity-passivity as the biological, that of ego-external world as the real, and finally that of pleasure-unpleasure as the economic polarity.
[1915c, 2974]
There is yet another reason for which, as I can show, the second system is obliged to correct the primary process. The primary process endeavours to bring about a discharge of excitation in order that, with the help of the amount of excitation thus accumulated, it may establish a 'perceptual identity'. The secondary process, however, has abandoned this intention and taken on another in its place - the establishment of a 'thought identity'. All thinking is no more than a circuitous path from the memory of a satisfaction (a memory which has been adopted as a purposive idea) to an identical cathexis of the same memory which it is hoped to attain once more through an intermediate stage of motor experiences. Thinking must concern itself with the connecting paths between ideas, without being led astray by the intensities of those ideas. But it is obvious that condensations of ideas, as well as intermediate and compromise structures, must obstruct the attainment of the identity aimed at. Since they substitute one idea for another, they cause a deviation from the path which would have led on from the first idea. Processes of this kind are therefore scrupulously avoided in secondary thinking. It is easy to see, too, that the unpleasure principle, which in other respects supplies the thought-process with its most important signposts, puts difficulties in its path towards establishing 'thought identity'. Accordingly, thinking must aim at freeing itself more and more from exclusive regulation by the unpleasure principle and at restricting the development of affect in thought-activity to the minimum required for acting as a signal. The achievement of this greater delicacy in functioning is aimed at by means of a further hypercathexis, brought about by consciousness. As we well know, however, that aim is seldom attained completely, even in normal mental life, and our thinking always remains exposed to falsification by interference from the unpleasure principle.

It has not been the fate of psycho-analysis to be greeted (like other young sciences) with the sympathetic encouragement of those who are interested in the advance of knowledge. For a long time it was disregarded, and when at last it could no longer be neglected it became, for emotional reasons, the object of the most violent attacks from people who had not taken the trouble to become acquainted with it. It owed this unfriendly reception to a single circumstance: for at an early stage of its researches psycho-analysis was driven to the conclusion that nervous illnesses are an expression of a disturbance of the sexual function and it was thus led to devote its attention to an investigation of that function - one which had been far too long neglected. But anyone who respects the rule that scientific judgement should not be influenced by emotional attitudes will assign a high degree of biological interest to psycho-analysis on account of these very investigations and will regard the resistances to it as actual evidence in favour of the correctness of its assertions.
There is, however, another symptom in our fellow-citizens of the world which has perhaps
astonished and shocked us no less than the descent from their ethical heights which has given
us so much pain. What I have in mind is the want of insight shown by the best intellects, their
obduracy, their inaccessibility to the most forcible arguments and their uncritical credulity
towards the most disputable assertions. This indeed presents a lamentable picture, and I wish
to say emphatically that in this I am by no means a blind partisan who finds all the intellectual
shortcomings on one side. But this phenomenon is much easier to account for and much less
disquieting than the one we have just considered. Students of human nature and philosophers
have long taught us that we are mistaken in regarding our intelligence as an independent force
and in overlooking its dependence on emotional life. Our intellect, they teach us, can function
reliably only when it is removed from the influences of strong emotional impulses; otherwise it
behaves merely as an instrument of the will and delivers the inference which the will requires.
Thus, in their view, logical arguments are impotent against affective interests, and that is why
disputes backed by reasons, which in Falstaff's phrase are 'as plenty as blackberries', are so
unfruitful in the world of interests. Psycho-analytic experience has, if possible, further confirmed
this statement. It can show every day that the shrewdest people will all of a sudden behave
without insight, like imbeciles, as soon as the necessary insight is confronted by an emotional
resistance, but that they will completely regain their understanding once that resistance has
been overcome. The logical bedazzlement which this war has conjured up in our fellow-citizens,
many of them the best of their kind, is therefore a secondary phenomenon, a consequence of
emotional excitement, and is bound, we may hope, to disappear with it.

Having in this way once more come to understand our fellow citizens who are now alienated
from us, we shall much more easily endure the disappointment which the nations, the collective
individuals of mankind, have caused us, for the demands we make upon these should be far
more modest. Perhaps they are recapitulating the course of individual development, and to-day
still represent very primitive phases in organization and in the formation of higher unities. It is in
agreement with this that the educative factor of an external compulsion towards morality, which
we found was so effective in individuals, is as yet barely discernible in them. We had hoped,
certainly, that the extensive community of interests established by commerce and production
would constitute the germ of such a compulsion, but it would seem that nations still obey their
passions far more readily than their interests. Their interests serve them, at most, as
rationalizations for their passions; they put forward their interests in order to be able to give
reasons for satisfying their passions. It is, to be sure, a mystery why the collective individuals
should in fact despise, hate and detest one another - every nation against every other - and
even in times of peace. I cannot tell why that is so. It is just as though when it becomes a
question of a number of people, not to say millions, all individual moral acquisitions are
obliterated, and only the most primitive, the oldest, the crudest mental attitudes are left. It may
be that only later stages in development will be able to make some change in this regrettable
state of affairs. But a little more truthfulness and honesty on all sides - in the relations of men to
one another and between them and their rulers - should also smooth the way for this
transformation.

Psycho-analysis has inferred from the dreams and parapraxes of healthy people, as well as
from the symptoms of neurotics, that the primitive, savage and evil impulses of mankind have
not vanished in any of its individual members but persist, although in a repressed state, in the
unconscious (to use our technical terms), and lie wait for opportunities of becoming active once
more. It has further taught us that our intellect is a feeble and dependent thing, a plaything and
tool of our instincts and affects, and that we are all compelled to behave cleverly or stupidly
according to the commands of our attitudes and internal resistances.
Its further course led it away from the study of the somatic determinants of nervous disease to an extent that was bewildering to physicians. Instead, it was brought into contact with the mental substance of human lives - the lives not only of the sick, but of the healthy, the normal and the supernormal. It had to deal with emotions and passions, and most of all with those which the poets never tire of depicting and celebrating - the emotions of love. It learnt to recognize the power of memories, the unsuspected importance of the years of childhood in shaping the adult, and the strength of wishes, which falsify human judgements and lay down fixed lines for human endeavour.

[1919g, 3703]

But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.

[1941d [1921], 3864]

There can, indeed, be no doubt that there are such things as prophetic dreams, in the sense that their content gives some sort of picture of the future; the only question is whether these predictions coincide to any noticeable extent with what really happens subsequently. I must confess that upon this point my resolution in favour of impartiality deserts me. The notion that there is any mental power, apart from acute calculation, which can foresee future events in detail is on the one hand too much in contradiction to all the expectations and presumptions of science and on the other hand corresponds too closely to certain ancient and familiar human desires which criticism must reject as unjustifiable pretensions. I am therefore of opinion that after one has taken into account the untrustworthiness, credulity and unconvincingness of most of these reports, together with the possibility of falsifications of memory facilitated by emotional causes and the inevitability of a few lucky shots, it may be anticipated that the spectre of veridical prophetic dreams will disappear into nothing. Personally, I have never experienced anything or learnt of anything that could encourage a more favourable presumption.

[1925i, 4053]

'And here is another. On the one hand you admit that men cannot be guided through their intelligence, they are ruled by their passions and their instinctual demands. But on the other hand you propose to replace the affective basis of their obedience to civilization by a rational one. Let who can understand this. To me it seems that it must be either one thing or the other.

[1927c, 4454]
But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they must be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeble-mindedness' - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

[1927c, 4455]

But I will moderate my zeal and admit the possibility that I, too, am chasing an illusion. Perhaps the effect of the religious prohibition of thought may not be so bad as I suppose; perhaps it will turn out that human nature remains the same even if education is not abused in order to subject people to religion. I do not know and you cannot know either. It is not only the great problems of this life that seem insoluble at the present time; many lesser questions too are difficult to answer. But you must admit that here we are justified in having a hope for the future - that perhaps there is a treasure to be dug up capable of enriching civilization and that it is worth making the experiment of an irreligious education. Should the experiment prove unsatisfactory I am ready to give up the reform and to return to my earlier, purely descriptive judgement that man is a creature of weak intelligence who is ruled by his instinctual wishes.

[1927c, 4456]
That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the instincts. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken - one knows so little about other civilizations - there are even to-day peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion - the same sanctity, rigidity and intolerance, the same prohibition of thought - for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life-tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years - which is exactly what you reproach religion with doing today. Do you not observe that it is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, the making of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master the task set before it. Such, then, are the prospects for your "primacy of the intellect". [1927c, 4458]
And there are two points that I must dwell on a little longer. Firstly, the weakness of my position does not imply any strengthening of yours. I think you are defending a lost cause. We may insist as often as we like that man's intellect is powerless in comparison with his instinctual life, and we may be right in this. Nevertheless, there is something peculiar about this weakness. The voice of the intellect is a soft one, but it does not rest till it has gained a hearing. Finally, after a countless succession of rebuffs, it succeeds. This is one of the few points on which one may be optimistic about the future of mankind, but it is in itself a point of no small importance. And from it one can derive yet other hopes. The primacy of the intellect lies, it is true, in a distant, distant future, but probably not in an infinitely distant one. It will presumably set itself the same aims as those whose realization you expect from your God (of course within human limits - so far as external reality, \( \text{Avag} \), allows it), namely the love of man and the decrease of suffering. This being so, we may tell ourselves that our antagonism is only a temporary one and not irreconcilable. We desire the same things, but you are more impatient, more exacting, and - why should I not say it? - more self-seeking than I and those on my side. You would have the state of bliss begin directly after death; you expect the impossible from it and you will not surrender the claims of the individual. Our God, \( \text{Agov} \),¹ will fulfil whichever of these wishes nature outside us allows, but he will do it very gradually, only in the unforeseeable future, and for a new generation of men. He promises no compensation for us, who suffer grievously from life. On the way to this distant goal your religious doctrines will have to be discarded, no matter whether the first attempts fail, or whether the first substitutes prove to be untenable. You know why: in the long run nothing can withstand reason and experience, and the contradiction which religion offers to both is all too palpable. Even purified religious ideas cannot escape this fate, so long as they try to preserve anything of the consolation of religion. No doubt if they confine themselves to a belief in a higher spiritual being, whose qualities are indefinable and whose purposes cannot be discerned, they will be proof against the challenge of science; but then they will also lose their hold on human interest.

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

¹ [1927c, 4460]
For a wide variety of reasons, it is very far from my intention to express an opinion upon the value of human civilization. I have endeavoured to guard myself against the enthusiastic prejudice which holds that our civilization is the most precious thing that we possess or could acquire and that its path will necessarily lead to heights of unimagined perfection. I can at least listen without indignation to the critic who is of the opinion that when one surveys the aims of cultural endeavour and the means it employs, one is bound to come to the conclusion that the whole effort is not worth the trouble, and that the outcome of it can only be a state of affairs which the individual will be unable to tolerate. My impartiality is made all the easier to me by my knowing very little about all these things. One thing only do I know for certain and that is that man's judgements of value follow directly his wishes for happiness - that, accordingly, they are an attempt to support his illusions with arguments. I should find it very understandable if someone were to point out the obligatory nature of the course of human civilization and were to say, for instance, that the tendencies to a restriction of sexual life or to the institution of a humanitarian ideal at the expense of natural selection were developmental trends which cannot be averted or turned aside and to which it is best for us to yield as though they were necessities of nature. I know, too, the objection that can be made against this, to the effect that in the history of mankind, trends such as these, which were considered unsurmountable, have often been thrown aside and replaced by other trends. Thus I have not the courage to rise up before my fellow-men as a prophet, and I bow to their reproach that I can offer them no consolation: for at bottom that is what they are all demanding - the wildest revolutionaries no less passionately than the most virtuous believers.

[1930a, 4532]
There is yet another reason for which, as I can show, the second system is obliged to correct the primary process. The primary process endeavours to bring about a discharge of excitation in order that, with the help of the amount of excitation thus accumulated, it may establish a 'perceptual identity'. The secondary process, however, has abandoned this intention and taken on another in its place - the establishment of a 'thought identity'. All thinking is no more than a circuitous path from the memory of a satisfaction (a memory which has been adopted as a purposive idea) to an identical cathexis of the same memory which it is hoped to attain once more through an intermediate stage of motor experiences. Thinking must concern itself with the connecting paths between ideas, without being led astray by the intensities of those ideas. But it is obvious that condensations of ideas, as well as intermediate and compromise structures, must obstruct the attainment of the identity aimed at. Since they substitute one idea for another, they cause a deviation from the path which would have led on from the first idea. Processes of this kind are therefore scrupulously avoided in secondary thinking. It is easy to see, too, that the unpleasure principle, which in other respects supplies the thought-process with its most important signposts, puts difficulties in its path towards establishing 'thought identity'. Accordingly, thinking must aim at freeing itself more and more from exclusive regulation by the unpleasure principle and at restricting the development of affect in thought-activity to the minimum required for acting as a signal. The achievement of this greater delicacy in functioning is aimed at by means of a further hypercathexis, brought about by consciousness. As we well know, however, that aim is seldom attained completely, even in normal mental life, and our thinking always remains exposed to falsification by interference from the unpleasure principle.

[1900a, 1029]

This, however, is not the gap in the functional efficiency of our mental apparatus which makes it possible for thoughts, which represent themselves as products of the secondary thought activity, to become subject to the primary psychical process - for such is the formula in which we can now describe the activity which leads to dreams and to hysterical symptoms. Inefficiency arises from the convergence of two factors derived from our developmental history. One of these factors devolves entirely upon the mental apparatus and has had a decisive influence on the relation between the two systems, while the other makes itself felt to a variable degree and introduces instinctual forces of organic origin into mental life. Both of them originate in childhood and are a precipitate of the modifications undergone by our mental and somatic organism since our infancy.

[1900a, 1030]
In my experience antipathy to this outcome of psycho-analytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization has been created under the pressure of the exigencies of life at the cost of satisfaction of the instincts; and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of instinctual satisfaction for the benefit of the whole community. Among the instinctual forces which are put to this use the sexual impulses play an important part; in this process they are sublimated - that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement is unstable; the sexual instincts are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual instincts may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual instincts were to be liberated and returned to their original aims. For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual instincts or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psycho-analytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psycho-analysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them.

But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.

[1916-1917, 3135]

[1941d [1921], 3864]
If the analogy is not pursued too strictly, we may say that repression has the same relation to the other methods of defence as omission has to distortion of the text, and we may discover in the different forms of this falsification parallels to the variety of ways in which the ego is altered. An attempt may be made to raise the objection that the analogy goes wrong in an essential point, for the distortion of a text is the work of a tendentious censorship, no counterpart to which is to be found in the development of the ego. But this is not so; for a tendentious purpose of this kind is to a great extent represented by the compelling force of the pleasure principle. The psychical apparatus is intolerant of unpleasure; it has to fend it off at all costs, and if the perception of reality entails unpleasure, that perception - that is, the truth - must be sacrificed. Where external dangers are concerned, the individual can help himself for some time by flight and by avoiding the situation of danger, until he is strong enough later on to remove the threat by actively altering reality. But one cannot flee from oneself; flight is no help against internal dangers. And for that reason the defensive mechanisms of the ego are condemned to falsify one's internal perception and to give one only an imperfect and distorted picture of one's id. In its relations to the id, therefore, the ego is paralysed by its restrictions or blinded by its errors; and the result of this in the sphere of psychical events can only be compared to being out walking in a country one does not know and without having a good pair of legs.

[1937c, 5033]
Now that we have established the concept of repression and have brought dream-distortion into relation with repressed psychical material, we can express in general terms the principal finding to which we have been led by the analysis of dreams. In the case of dreams which are intelligible and have a meaning, we have found that they are undisguised wish-fulfilments; that is, that in their case the dream-situation represents as fulfilled a wish which is known to consciousness, which is left over from daytime life, and which is deservedly of interest. Analysis has taught us something entirely analogous in the case of obscure and confused dreams: once again the dream-situation represents a wish as fulfilled - a wish which invariably arises from the dream-thoughts, but one which is represented in an unrecognizable form and can only be explained when it has been traced back in analysis. The wish in such cases is either itself a repressed one and alien to consciousness, or it is intimately connected with repressed thoughts and is based upon them. Thus the formula for such dreams is as follows: *they are disguised fulfilments of repressed wishes*. It is interesting in this connection to observe that the popular belief that dreams always foretell the future is confirmed. Actually the future which the dream shows us is not the one which *will* occur but the one which we should *like* to occur. The popular mind is behaving here as it usually does: what it wishes, it believes.

[1901a, 1087]

Its further course led it away from the study of the somatic determinants of nervous disease to an extent that was bewildering to physicians. Instead, it was brought into contact with the mental substance of human lives - the lives not only of the sick, but of the healthy, the normal and the supernormal. It had to deal with emotions and passions, and most of all with those which the poets never tire of depicting and celebrating - the emotions of love. It learnt to recognize the power of memories, the unsuspected importance of the years of childhood in shaping the adult, and the strength of wishes, which falsify human judgements and lay down fixed lines for human endeavour.

[1919g, 3703]

But if we look closer, difficulties begin to emerge. The immense majority of occultists are not driven by a desire for knowledge or by a sense of shame that science has so long refused to take cognizance of what are indisputable problems or by a desire to conquer this new sphere of phenomena. They are, on the contrary, convinced believers who are looking for confirmation and for something that will justify them in openly confessing their faith. But the faith which they first adopt themselves and then seek to impose on other people is either the old religious faith which has been pushed into the background by science in the course of human development, or another one even closer to the superseded convictions of primitive peoples. Analysts, on the other hand, cannot repudiate their descent from exact science and their community with its representatives. Moved by an extreme distrust of the power of human wishes and of the temptations of the pleasure principle, they are ready, for the sake of attaining some fragment of objective certainty, to sacrifice everything - the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, and the mental calm brought about by the possession of extensive grounds for expedient and ethical action. In place of all these, they are content with fragmentary pieces of knowledge and with basic hypotheses lacking preciseness and ever open to revision. Instead of waiting for the moment when they will be able to escape from the constraint of the familiar laws of physics and chemistry, they hope for the emergence of more extensive and deeper-reaching natural laws, to which they are ready to submit. Analysts are at bottom incorrigible mechanists and materialists, even though they seek to avoid robbing the mind and spirit of their still unrecognized characteristics. So, too, they embark on the investigation of occult phenomena only because they expect in that way finally to exclude the wishes of mankind from material reality.

[1941d [1921], 3864]
There can, indeed, be no doubt that there are such things as prophetic dreams, in the sense that their content gives some sort of picture of the future; the only question is whether these predictions coincide to any noticeable extent with what really happens subsequently. I must confess that upon this point my resolution in favour of impartiality deserts me. The notion that there is any mental power, apart from acute calculation, which can foresee future events in detail is on the one hand too much in contradiction to all the expectations and presumptions of science and on the other hand corresponds too closely to certain ancient and familiar human desires which criticism must reject as unjustifiable pretensions. I am therefore of opinion that after one has taken into account the untrustworthiness, credulity and unconvincingness of most of these reports, together with the possibility of falsifications of memory facilitated by emotional causes and the inevitability of a few lucky shots, it may be anticipated that the spectre of veridical prophetic dreams will disappear into nothing. Personally, I have never experienced anything or learnt of anything that could encourage a more favourable presumption.

[1925i, 4053]

This objection cannot be too energetically repudiated. It is quite without a basis, since the intellect and the mind are objects for scientific research in exactly the same way as any non-human things. Psycho-analysis has a special right to speak for the scientific Weltanschauung at this point, since it cannot be reproached with having neglected what is mental in the picture of the universe. Its contribution to science lies precisely in having extended research to the mental field. And, incidentally, without such a psychology science would be very incomplete. If, however, the investigation of the intellectual and emotional functions of men (and of animals) is included in science, then it will be seen that nothing is altered in the attitude of science as a whole, that no new sources of knowledge or methods of research have come into being. Intuition and divination would be such, if they existed; but they may safely be reckoned as illusions, the fulfilments of wishful impulses. It is easy to see, too, that these demands upon a Weltanschauung are only based on emotion. Science takes notice of the fact that the human mind produces these demands and is ready to examine their sources; but it has not the slightest reason to regard them as justified. On the contrary it sees this as a warning carefully to separate from knowledge everything that is illusion and an outcome of emotional demands like these.

[1933a, 4758]

This does not in the least mean that these wishes are to be pushed contemptuously on one side or their value for human life under-estimated. We are ready to trace out the fulfilsments of them which they have created for themselves in the products of art and in the systems of religion and philosophy; but we cannot nevertheless overlook the fact that it would be illegitimate and highly inexpedient to allow these demands to be transferred to the sphere of knowledge. For this would be to lay open the paths which lead to psychosis, whether to individual or group psychosis, and would withdraw valuable amounts of energy from endeavours which are directed towards reality in order, so far as possible, to find satisfaction in it for wishes and needs.

[1933a, 4758]
Nevertheless, on closer consideration this delusion of Hanold's seems to me to lose the greater part of its improbability. The author, indeed, has made himself responsible for one part of it by basing his story on the premiss that Zoe was in every detail a duplicate of the relief. We must therefore avoid shifting the improbability of this premiss on to its consequence - that Hanold took the girl for Gradiva come to life. Greater value is given to the delusional explanation by the fact that the author has put no rational one at our disposal. Moreover the author has adduced contributory and mitigating circumstances on behalf of his hero's excesses in the shape of the glare of the campagna sunlight and the intoxicating magic of the wine grown on the slopes of Vesuvius. But the most important of all the explanatory and exculpatory factors remains the ease with which our intellect is prepared to accept something absurd provided it satisfies powerful emotional impulses. It is an astonishing fact, and one that is too generally overlooked, how readily and frequently under these psychological conditions people of even the most powerful intelligence react as though they were feeble-minded; and anyone who is not too conceited may see this happening in himself as often as he pleases. And this is far more so if some of the mental processes concerned are linked with unconscious or repressed motives. In this connection I am happy to quote the words of a philosopher, who writes to me: 'I have been noting down the instances I myself experience of striking mistakes and unthinking actions, for which one finds motives afterwards (in a most unreasonable way). It is an alarming thing, but typical, to find how much folly this brings to light.' It must be remembered, too, that the belief in spirits and ghosts and the return of the dead, which finds so much support in the religions to which we have all been attached, at least in our childhood, is far from having disappeared among educated people, and that many who are sensible in other respects find it possible to combine spiritualism with reason. A man who has grown rational and sceptical, even, may be ashamed to discover how easily he may for a moment return to a belief in spirits under the combined impact of strong emotion and perplexity. I know of a doctor who had once lost one of his women patients suffering from Graves' disease, and who could not get rid of a faint suspicion that he might perhaps have contributed to the unhappy outcome by a thoughtless prescription. One day, several years later, a girl entered his consulting-room, who, in spite of all his efforts, he could not help recognizing as the dead one. He could frame only a single thought: 'So after all it's true that the dead can come back to life.' His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves' disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold's temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities. [1907a, 1865]
A singular thing. I can remember, when I first began to meddle in the conflict of scientific opinions twenty-two years ago, with what derision the older generation of neurologists and psychiatrists of those days received assertions about suggestion and its effects. Since then the situation has fundamentally changed. The former aversion has been converted into an only too ready acceptance; and this has happened not only as a consequence of the impression which the work of Liébeault and Bernheim and their pupils could not fail to create in the course of these two decades, but also because it has since been discovered how great an economy of thought can be effected by the use of the catchword 'suggestion'. Nobody knows and nobody cares what suggestion is, where it comes from, or when it arises, - it is enough that everything awkward in the region of psychology can be labelled 'suggestion'. I do not share the view which is at present fashionable that assertions made by children are invariably arbitrary and untrustworthy. The arbitrary has no existence in mental life. The untrustworthiness of the assertions of children is due to the predominance of their imagination, just as the untrustworthiness of the assertions of grown-up people is due to the predominance of their prejudices. For the rest, even children do not lie without a reason, and on the whole they are more inclined to a love of truth than are their elders. If we were to reject little Hans's statements root and branch we should certainly be doing him a grave injustice. On the contrary, we can quite clearly distinguish from one another the occasions on which he was falsifying the facts or keeping them back under the compelling force of a resistance, the occasions on which, being undecided himself, he agreed with his father (so that what he said must not be taken as evidence), and the occasions on which, freed from every pressure, he burst into a flood of information about what was really going on inside him and about things which until then no one but himself had known. Statements made by adults offer no greater certainty. It is a regrettable fact that no account of a psycho-analysis can reproduce the impressions received by the analyst as he conducts it, and that a final sense of conviction can never be obtained from reading about it but only from directly experiencing it. But this disability attaches in an equal degree to analyses of adults.

[1909b, 2088]

We too would like to accept this solution. But we are brought up by a doubt. The pious argument rests on an optimistic and idealistic premiss. It has not been possible to demonstrate in other connections that the human intellect has a particularly fine flair for the truth or that the human mind shows any special inclination for recognizing the truth. We have rather found, on the contrary, that our intellect very easily goes astray without any warning, and that nothing is more easily believed by us than what, without reference to the truth, comes to meet our wishful illusions. We must for that reason add a reservation to our agreement. We too believe that the pious solution contains the truth - but the historical truth and not the material truth. And we assume the right to correct a certain distortion to which this truth has been subjected on its return. That is to say, we do not believe that there is a single great god to-day, but that in primaeval times there was a single person who was bound to appear huge at that time and who afterwards returned in men's memory elevated to divinity.

[1939a, 4947]
I have never managed to give a better description than this of the strange state of mind in which one knows and does not know a thing at the same time. It is clearly impossible to understand it unless one has been in such a state oneself. I myself have had a very remarkable experience of this sort, which is still clearly before me. If I try to recollect what went on in my mind at the time I can get hold of very little. What happened was that I saw something which did not fit in at all with my expectation; yet I did not allow what I saw to disturb my fixed plan in the least, though the perception should have put a stop to it. I was unconscious of any contradiction in this; nor was I aware of my feelings of repulsion, which must nevertheless undoubtedly have been responsible for the perception producing no psychical effect. I was afflicted by that blindness of the seeing eye which is so astonishing in the attitude of mothers to their daughters, husbands to their wives and rulers to their favourites.

The analysis, moreover, gave evidence that during the same period the patient was in a special psychical state. The connection of this state with her erotic feelings and her pains seems to make it possible to understand what happened on the lines of the conversion theory. It is, I think, safe to say that at that time the patient did not become clearly conscious of her feelings for her brother-in-law, powerful though they were, except on a few occasions, and then only momentarily. If it had been otherwise, she would also inevitably have become conscious of the contradiction between those feelings and her moral ideas and would have experienced mental torments like those I saw her go through after our analysis. She had no recollection of any such sufferings; she had avoided them. It followed that her feelings themselves did not become clear to her. At that time, as well as during the analysis, her love for her brother-in-law was present in her consciousness like a foreign body, without having entered into relationship with the rest of her ideational life. With regard to these feelings she was in the peculiar situation of knowing and at the same time not knowing - a situation, that is, in which a psychical group was cut off. But this and nothing else is what we mean when we say that these feelings were not clear to her. We do not mean that their consciousness was of a lower quality or of a lesser degree, but that they were cut off from any free associative connection of thought with the rest of the ideational content of her mind.

This view may seem odd, but it can be supported by observations from psycho-analytic practice. If we communicate to a patient some idea which he has at one time repressed but which we have discovered in him, our telling him makes at first no change in his mental condition. Above all, it does not remove the repression nor undo its effects, as might perhaps be expected from the fact that the previously unconscious idea has now become conscious. On the contrary, all that we shall achieve at first will be a fresh rejection of the repressed idea. But now the patient has in actual fact the same idea in two forms indifferent places in his mental apparatus: first, he has the conscious memory of the auditory trace of the idea, conveyed in what we told him; and secondly, he also has - as we know for certain - the unconscious memory of his experience as it was in its earlier form. Actually there is no lifting of the repression until the conscious idea, after the resistances have been overcome, has entered into connection with the unconscious memory-trace. It is only through the making conscious of the latter itself that success is achieved. On superficial consideration this would seem to show that conscious and unconscious ideas are distinct registrations, topographically separated, of the same content. But a moment's reflection shows that the identity of the information given to the patient with his repressed memory is only apparent. To have heard something and to have experienced something are in their psychological nature two quite different things, even though the content of both is the same.
In the first place Hans was not what one would understand, strictly speaking, by a degenerate child, condemned by his heredity to be a neurotic. On the contrary, he was well formed physically, and was a cheerful, amiable, active-minded young fellow who might give pleasure to more people than his own father. There can be no question, of course, as to his sexual precocity; but on that point there is very little material upon which a fair comparison can be based. I gather, for instance, from a piece of collective research conducted in America, that it is by no means such a rare thing to find object-choice and feelings of love in boys at a similarly early age; and the same may be learnt from studying the records of the childhood of men who have later come to be recognized as 'great'. I should therefore be inclined to believe that sexual precocity is a correlate, which is seldom absent, of intellectual precocity, and that it is therefore to be met with in gifted children more often than might be expected.

The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulsions has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual.
And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in Totem and Taboo. But I no longer feel that I have the strength to do so.

[1939a, 4881]

How is it possible for a single man to evolve such extraordinary effectiveness that he can form a people out of random individuals and families, can stamp them with their definitive character and determine their fate for thousands of years? Is not a hypothesis such as this a relapse into the mode of thought which led to myths of a creator and to the worship of heroes, into times in which the writing of history was nothing more than a report of the deeds and destinies of single individuals, of rulers or conquerors? The modern tendency is rather towards tracing back the events of human history to more concealed, general and impersonal factors, to the compelling influence of economic conditions, to alterations in food habits, to advances in the use of materials and tools, to migrations brought about by increases in population and climatic changes. Individuals have no other part to play in this than as exponents or representatives of group trends, which are bound to find expression and do so in these particular individuals largely by chance.

[1939a, 4928]
Thus we reserve a place for 'great men' in the chain, or rather the network, of causes. But it may not, perhaps, be quite useless to enquire under what conditions we confer this title of honour. We shall be surprised to find that it is never quite easy to answer this question. A first formulation - 'we do so if a man possesses to a specially high degree qualities that we value greatly' - clearly misses the mark in every respect. Beauty, for instance, and muscular strength, however enviable they may be, constitute no claim to 'greatness'. It would seem, then, that the qualities have to be mental ones - psychical and intellectual distinctions. As regards these, we are held up by the consideration that nevertheless we should not unhesitatingly describe someone as a great man simply because he was extraordinarily efficient in some particular sphere. We should certainly not do so in the case of a chess master or of a virtuoso on a musical instrument; but not very easily, either, in the case of a distinguished artist or scientist. In such cases we should naturally speak of him as a great poet, painter, mathematician or physicist, or as a pioneer in the field of this or that activity; but we refrain from pronouncing him a great man. If we unhesitatingly declare that, for instance, Goethe and Leonardo da Vinci and Beethoven were great men, we must be led to it by something other than admiration for their splendid creations. If precisely such examples as these did not stand in the way, the idea would probably occur to us that the name of a 'great man' is preferably reserved for men of action - conquerors, generals, rulers - and is in recognition of the greatness of their achievement, the force of the effects to which they gave rise. But this too is unsatisfactory and is entirely contradicted by our condemnation of so many worthless figures whose effects upon their contemporary world and upon posterity can nevertheless not be disputed. Nor shall we be able to choose success as a sign of greatness, when we reflect on the majority of great men who instead of achieving success have perished in misfortune.

[1939a, 4929]

For the moment, then, we are inclined to decide that it is not worth while to look for a connotation of the concept of a 'great man' that is unambiguously determined. It seems to be only a loosely used and somewhat arbitrarily conferred recognition of an over-large development of certain human qualities, with some approximation to the original literal sense of 'greatness'. We must recollect, too, that we are not so much interested in the essence of great men as in the question of the means by which they affect their fellow-men. We will, however, keep this enquiry as short as possible, since it threatens to lead us far away from our goal.

[1939a, 4930]

Let us, therefore, take it for granted that a great man influences his fellow-men in two ways: by his personality and by the idea which he puts forward. That idea may stress some ancient wishful image of the masses, or it may point out a new wishful aim to them, or it may cast its spell over them in some other way. Occasionally - and this is undoubtedly the more primary case - the personality works by itself and the idea plays a quite trivial part. Not for a moment are we in the dark as to why a great man ever becomes important. We know that in the mass of mankind there is a powerful need for an authority who can be admired, before whom one bows down, by whom one is ruled and perhaps even ill-treated. We have learnt from the psychology of individual men what the origin is of this need of the masses. It is a longing for the father felt by everyone from his childhood onwards, for the same father whom the hero of legend boasts he has overcome. And now it may begin to dawn on us that all the characteristics with which we equipped the great man are paternal characteristics, and that the essence of great men for which we vainly searched lies in this conformity. The decisiveness of thought, the strength of will, the energy of action are part of the picture of a father - but above all the autonomy and independence of the great man, his divine unconcern which may grow into ruthlessness. One must admire him, one may trust him, but one cannot avoid being afraid of him too. We should have been led to realize this from the word itself: who but the father can have been the 'great man' in childhood?

[1939a, 4930]
There is no doubt that it was a mighty prototype of a father which, in the person of Moses, stooped to the poor Jewish bondsmen to assure them that they were his dear children. And no less overwhelming must have been the effect upon them of the idea of an only, eternal, almighty God, to whom they were too mean for him to make a covenant with them and who promised to care for them if they remained loyal to his worship. It was probably not easy for them to distinguish the image of the man Moses from that of his God; and their feeling was right in this, for Moses may have introduced traits of his own personality into the character of his God - such as his wrathful temper and his relentlessness. And if, this being so, they killed their great man one day, they were only repeating a misdeed which in ancient times had been committed, as prescribed by law, against the Divine King and which, as we know, went back to a still more ancient prototype.¹

What help does this explanation of the satisfaction arising from instinctual renunciation give us towards understanding the processes that we want to study - the elevation of self-regard when there are advances in intellectuality? Very little, it seems. The circumstances are quite different. There is no question of any instinctual renunciation and there is no second person or agency for whose sake the sacrifice is made. We shall soon feel doubts about this last assertion. It can be said that the great man is precisely the authority for whose sake the achievement is carried out; and, since the great man himself operates by virtue of his similarity to the father, there is no need to feel surprise if in group psychology the role of the super-ego falls to him. So that this would apply too to the man Moses in relation to the Jewish people. As regards the other point, however, no proper analogy can be established. An advance in intellectuality consists in deciding against direct sense-perception in favour of what are known as the higher intellectual processes - that is, memories, reflections and inferences. It consists, for instance, in deciding that paternity is more important than maternity, although it cannot, like the latter, be established by the evidence of the senses, and that for that reason the child should bear his father's name and be his heir. Or it declares that our God is the greatest and mightiest, although he is invisible like a gale of wind or like the soul. The rejection of a sexual or aggressive instinctual demand seems to be something quite different from this. Moreover, in the case of some advances in intellectuality - for instance, in the case of the victory of patriarchy - we cannot point to the authority which lays down the standard which is to be regarded as higher. It cannot in this case be the father, since he is only elevated into being an authority by the advance itself. Thus we are faced by the phenomenon that in the course of the development of humanity sensuality is gradually overpowered by intellectuality and that men feel proud and exalted by every such advance. But we are unable to say why this should be so. It further happens later on that intellectuality itself is overpowered by the very puzzling emotional phenomenon of faith. Here we have the celebrated 'credo quia absurdum', and, once more, anyone who has succeeded in this regards it as a supreme achievement. Perhaps the common element in all these psychological situations is something else. Perhaps men simply pronounce that what is more difficult is higher, and their pride is merely their narcissism augmented by the consciousness of a difficulty overcome.

[1939a, 4931]
Indeed, when we look into the matter more closely, we must recognize the fact that the
dream-work is doing nothing original in making substitutions of this kind. In order to gain its
ends - in this case the possibility of a representation hampered by censorship - it merely follows
the paths which it finds already laid down in the unconscious; and it gives preference to those
transformations of the repressed material which can also become conscious in the form of jokes
or allusions and of which the phantasies of neurotic patients are so full. At this point we
suddenly reach an understanding of Scherner's dream interpretations, whose essential
correctness I have defended elsewhere. The imagination's pre-occupation with the subject's
own body is by no means peculiar to dreams or characteristic only of them. My analyses have
shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is
derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the
other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted,
is a house the only circle of ideas employed for symbolizing the body; and this is equally true of
dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have
retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far
beyond the sphere of the external genitalia.) For these patients pillars and columns represent
the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices
(a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of
ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual
images.¹ In the former case the way has been well prepared by linguistic usage, itself the
precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the
seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate
details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities
in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual
symbolism can find its best hiding-place behind what is commonplace and inconspicuous.
There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or
his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics
of the natural human dread of snakes. Wherever neuroses make use of such disguises they are
following paths along which all humanity passed in the earliest periods of civilization - paths of
whose continued existence today, under the thinnest of veils, evidence is to be found in
linguistic usages, superstitions and customs.
[1900a, 815]
There can be no doubt that that apparatus has only reached its present perfection after a long period of development. Let us attempt to carry it back to an earlier stage of its functioning capacity. Hypotheses, whose justification must be looked for in other directions, tell us that at first the apparatus's efforts were directed towards keeping itself so far as possible free from stimuli; consequently its first structure followed the plan of a reflex apparatus, so that any sensory excitation impinging on it could be promptly discharged along a motor path. But the exigencies of life interfere with this simple function, and it is to them, too, that the apparatus owes the impetus to further development. The exigencies of life confront it first in the form of the major somatic needs. The excitations produced by internal needs seek discharge in movement, which may be described as an 'internal change' or an 'expression of emotion.' A hungry baby screams or kicks helplessly. But the situation remains unaltered, for the excitation arising from an internal need is not due to a force producing a momentary impact but to one which is in continuous operation. A change can only come about if in some way or other (in the case of the baby, through outside help) an 'experience of satisfaction' can be achieved which puts an end to the internal stimulus. An essential component of this experience of satisfaction is a particular perception (that of nourishment, in our example) the mnemonic image of which remains associated thenceforward with the memory trace of the excitation produced by the need. As a result of the link that has thus been established, next time this need arises a psychical impulse will at once emerge which will seek to re-cathect the mnemonic image of the perception and to re- evoke the perception itself, that is to say, to re-establish the situation of the original satisfaction. An impulse of this kind is what we call a wish; the reappearance of the perception is the fulfilment of the wish; and the shortest path to the fulfilment of the wish is a path leading direct from the excitation produced by the need to a complete cathexis of the perception. Nothing prevents us from assuming that there was a primitive state of the psychical apparatus in which this path was actually traversed, that is, in which wishing ended in hallucinating. Thus the aim of this first psychical activity was to produce a 'perceptual identity' - a repetition of the perception which was linked with the satisfaction of the need.

[1900a, 995]

The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psychoanalysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'. But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life. We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats' [Dukatenscheisser]. Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = ilu manmans). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.

[1908b, 1944]
Verbal residues are derived primarily from auditory perceptions, so that the system $Pcs.$ has, as it were, a special sensory source. The visual components of word-presentations are secondary, acquired through reading, and may to begin with be left on one side; so may the motor images of words, which, except with deaf-mutes, play the part of auxiliary indications. In essence a word is after all the mnemonic residue of a word that has been heard.

[1923b, 3955]

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious Weltanschauung is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the stage of animism. At that time, too, the world was peopled with spiritual beings resembling men - we call them demons. All the objects in the external world were their habitation, or perhaps were identical with them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature - if they wished for rain, for instance - they did not direct a prayer to the weather-god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was magic, the earliest fore-runner of the technology of to-day. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the 'omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients. We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields.

[1933a, 4763]
The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised. Using This Edition

Here are some keyboard shortcuts and tips on using this edition that may not be immediately obvious.

Press **F1** for general help.
Press **F4** to hide/show the Bookmarks or Pages panel.
Press **F6** to move between the text and navigation panes.
Press **F8** to hide/show the toolbar.
Press **F9** to hide/show the menu bar.

Press **Ctrl** + **F** to find a particular word or phrase.
Press **Ctrl** + **G** to find the next match.
Press **Ctrl** + **H** to change to/from Reading Mode. Reading Mode hides the toolbar and navigation pane.
Press **Ctrl** + **L** to change to/from full screen mode.
Press **Ctrl** + **0** to fit the page to the screen.
Press **Ctrl** + **2** to fit the page to the width of the screen.
Press **Ctrl** + **3** to fit the text to the width of the screen.
Press **Ctrl** + **+** to increase the font size.
Press **Ctrl** + **–** to decrease the font size.

Press **Ctrl** + **Shift** + **F** for advanced search options.
Press **Ctrl** + **Shift** + **N** to go to a particular page.
Press **Shift** + **F10** to activate the right-click popup menu for the active pane.

Press **Down Arrow** or **PgDn** to scroll down.
Press **Up Arrow** or **PgUp** to scroll up.
Press **Ctrl** + **PgDn** (or **Forward Arrow** if the horizontal scroll bar is not visible) to go to the top of the next page.
Press **Ctrl** + **PgUp** (or **Back Arrow** if the horizontal scroll bar is not visible) to go to the top of the previous page.
Press **Home** to go to the first page.
Press **End** to go to the last page.
Press **Alt Left Arrow** to go to the previous view.
Press **Alt Right Arrow** to go to the next view.

Press **Shift** + [numeric keypad] * in the Bookmarks panel to expand all bookmarks.
Press **Shift** + [numeric keypad] / in the Bookmarks panel to collapse all bookmarks.

Right-click in the text pane to
Select the Select Tool – copying has been disabled in this edition of the text
Select the Hand Tool – allows dragging of the text with the mouse
Show the navigation pane (if hidden)
Right-click in the far-left of the navigation pane to
Hide/show the Bookmarks or Pages panel
Hide the navigation pane
Right-click in the Bookmarks panel to enable/disable the wrapping of long bookmarks.

Drag the vertical separator bar to change the relative sizes of the navigation and text panes.

The text is best viewed with the navigation pane hidden and the Fit To Width option enabled. The navigation pane and Bookmarks panel show by default at startup. You may want to hide these once you have selected the work you wish to view.

Press **Alt** and the underlined character to activate menu options.
Press **Alt Space** to activate the Windows® system menu, which you can then use to Move, Size, Minimize, Maximize, Restore or Close the window.

The above apply to Adobe® Reader Version 11 for Windows® and may differ in other versions of the software.
About This Edition

I created this work primarily for my own benefit, its intention being to facilitate the study of Freud, and perhaps make possible the writing of a comprehensive textbook of psycho-analysis. Hopefully others will find it useful too.

This text is available on the internet in the following formats:
Adobe® PDF (Freud_For_Scholars.pdf)
EPUB (Freud_For_Scholars.epub)
Amazon Kindle® / Mobipocket® MOBI (Freud_For_Scholars.mobi)
Microsoft® CHM (Freud_For_Scholars.chm)

All page references are to my electronic edition of Freud's complete works.

Freud - Complete Works is available on the internet in the following formats:
Adobe® PDF (Freud_Complete_Works.pdf)
EPUB (Freud_Complete_Works.epub)
Amazon Kindle® / Mobipocket® MOBI (Freud_Complete_Works.mobi)
Microsoft® CHM (Freud_Complete_Works.chm)

As with Freud - Complete Works, you are encouraged to distribute this file. On no account, however, may anything, other than a nominal fee for its distribution, be charged. I have no idea what form the storage and communication of knowledge will take in the future, but hopefully there will be someone out there who will preserve this work for future generations.
