UNSUITABLE SUBSTITUTES FOR THE SEXUAL OBJECT - FETISHISM  There are some cases which are quite specially remarkable - those in which the normal sexual object is replaced by another which bears some relation to it, but is entirely unsuited to serve the normal sexual aim. From the point of view of classification, we should no doubt have done better to have mentioned this highly interesting group of aberrations of the sexual instinct among the deviations in respect of the sexual object. But we have postponed their mention till we could become acquainted with the factor of sexual overvaluation, on which these phenomena, being connected with an abandonment of the sexual aim, are dependent. [1905d, 1480]

APPEARANCE OF NEW AIMS  Every external or internal factor that hinders or postpones the attainment of the normal sexual aim (such as impotence, the high price of the sexual object or the danger of the sexual act) will evidently lend support to the tendency to linger over the preparatory activities and to turn them into new sexual aims that can take the place of the normal one. Attentive examination always shows that even what seem to be the strangest of these new aims are already hinted at in the normal sexual process. [1905d, 1483]
The time has arrived for me to attempt to summarize what I have said. We started out from the aberrations of the sexual instinct in respect of its object and of its aim and we were faced by the question of whether these arise from an innate disposition or are acquired as a result of experiences in life. We arrived at an answer to this question from an understanding, derived from psycho-analytic investigation, of the workings of the sexual instinct in psychoneurotics, a numerous class of people and one not far removed from the healthy. We found that in them tendencies to every kind of perversion can be shown to exist as unconscious forces and betray their presence as factors leading to the formation of symptoms. It was thus possible to say that neurosis is, as it were, the negative of perversion. In view of what was now seen to be the wide dissemination of tendencies to perversion we were driven to the conclusion that a disposition to perversions is an original and universal disposition of the human sexual instinct and that normal sexual behaviour is developed out of it as a result of organic changes and psychical inhibitions occurring in the course of maturation; we hoped to be able to show the presence of this original disposition in childhood. Among the forces restricting the direction taken by the sexual instinct we laid emphasis upon shame, disgust, pity and the structures of morality and authority erected by society. We were thus led to regard any established aberration from normal sexuality as an instance of developmental inhibition and infantilism. Though it was necessary to place in the foreground the importance of the variations in the original disposition, a co-operative and not an opposing relation was to be assumed as existing between them and the influences of actual life. It appeared, on the other hand, that since the original disposition is necessarily a complex one, the sexual instinct itself must be something put together from various factors, and that in the perversions it falls apart, as it were, into its components. The perversions were thus seen to be on the one hand inhibitions, and on the other hand dissociations, of normal development. Both these aspects were brought together in the supposition that the sexual instinct of adults arises from a combination of a number of impulses of childhood into a unity, an impulsion with a single aim.

[1905d, 1542]

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or inverted, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

[1908d, 1953]
The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

[1908d, 1961]

This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror!

[1916-1917, 3377]
The second group is led by perverts who have made what is normally only an introductory or preparatory act into the aim of their sexual wishes. They are people whose desire it is to look at the other person or to feel him or to watch him in the performance of his intimate actions, or who expose parts of their own bodies which should be covered, in the obscure expectation that they may be rewarded by a corresponding action in return. Next come the sadists, puzzling people whose tender endeavours have no other aim than to cause pain and torment to their object, ranging from humiliation to severe physical injuries; and, as though to counterbalance them, their counterparts, the masochists, whose only pleasure it is to suffer humiliations and torments of every kind from their loved object either symbolically or in reality. There are still others in whom several of these abnormal preconditions are united and intertwined; and lastly, we must learn that each of these groups is to be found in two forms: alongside of those who seek their sexual satisfaction in reality are those who are content merely to imagine that satisfaction, who need no real object at all, but can replace it by their phantasies.

There is something else that I must add in order to complete our view of sexual perversions. However infamous they may be, however sharply they may be contrasted with normal sexual activity, quiet consideration will show that some perverse trait or other is seldom absent from the sexual life of normal people. Even a kiss can claim to be described as a perverse act, since it consists in the bringing together of two oral erotogenic zones instead of the two genitals. Yet no one rejects it as perverse; on the contrary, it is permitted in theatrical performances as a softened hint at the sexual act. But precisely kissing can easily turn into a complete perversion - if, that is to say, it becomes so intense that a genital discharge and orgasm follow upon it directly, an event that is far from rare. We can learn, too, that for one person feeling and looking at the object are indispensable preconditions of sexual enjoyment, that another person will pinch or bite at the climax of sexual excitation, that the highest pitch of excitement in lovers is not always provoked by the genitals but by some other region of the object's body, and any number of similar things besides. There is no sense in excluding people with individual traits of this kind from the class of the normal and putting them among the perverts. On the contrary, we shall recognize more and more clearly that the essence of the perversions lies not in the extension of the sexual aim, not in the replacement of the genitals, not even always in the variant choice of the object, but solely in the exclusiveness with which these deviations are carried out and as a result of which the sexual act serving the purpose of reproduction is put on one side. In so far as the perverse actions are inserted in the performance of the normal sexual act as preparatory or intensifying contributions, they are in reality not perversions at all. The gulf between normal and perverse sexuality is of course very much narrowed by facts of this kind. It is an easy conclusion that normal sexuality has emerged out of something that was in existence before it, by weeding out certain features of that material as unserviceable and collecting together the rest in order to subordinate them to a new aim, that of reproduction.

This is not very illuminating. We can only note that disturbances of the sexual function are brought about by a great variety of means. (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple); (2) the function may be less well carried out; (3) it may be hampered by having conditions attached to it, or modified by being diverted to other aims; (4) it may be prevented by security measures; (5) if it cannot be prevented from starting, it may be immediately interrupted by the appearance of anxiety; and (6), if it is nevertheless carried out, there may be a subsequent reaction of protest against it and an attempt to undo what has been done.
OVERVALUATION OF THE SEXUAL OBJECT

It is only in the rarest instances that the psychical valuation that is set on the sexual object, as being the goal of the sexual instinct, stops short at its genitals. The appreciation extends to the whole body of the sexual object and tends to involve every sensation derived from it. The same overvaluation spreads over into the psychological sphere: the subject becomes, as it were, intellectually infatuated (that is, his powers of judgement are weakened) by the mental achievements and perfections of the sexual object and he submits to the latter's judgements with credulity. Thus the credulity of love becomes in important, if not the most fundamental, source of authority.¹

This sexual overvaluation is something that cannot be easily reconciled with a restriction of the sexual aim to union of the actual genitals and it helps to turn activities connected with other parts of the body into sexual aims.²

The significance of the factor of sexual overvaluation can be best studied in men, for their erotic life alone has become accessible to research. That of women - partly owing to the stunting effect of civilized conditions and partly owing to their conventional secretiveness and insincerity - is still veiled in an impenetrable obscurity.³

² It must be pointed out, however, that sexual overvaluation is not developed in the case of every mechanism of object-choice. We shall become acquainted later on with another and more direct explanation of the sexual role assumed by the other parts of the body. The factor of 'craving for stimulation' has been put forward by Noche and Bloch as an explanation of the extension of sexual interest to parts of the body other than the genitals; but it does not seem to me to deserve such an important place. The various channels along which the libido passes are related to each other from the very first like inter-communicating pipes, and we must take the phenomenon of collateral flow into account.

SEXUAL USE OF THE MUCOUS MEMBRANE OF THE LIPS AND MOUTH

The use of the mouth as a sexual organ is regarded as a perversion if the lips (or tongue) of one person are brought into contact with the genitals of another, but not if the mucous membranes of the lips of both of them come together. This exception is the point of contact with what is normal. Those who condemn the other practices (which have no doubt been common among mankind from primaeval times) as being perversions, are giving way to an unmistakable feeling of disgust, which protects them from accepting sexual aims of the kind. The limits of such disgust are, however, often purely conventional: a man who will kiss a pretty girl's lips passionately, may perhaps be disgusted at the idea of using her tooth-brush, though there are no grounds for supposing that his own oral cavity, for which he feels no disgust, is any cleaner than the girl's. Here, then, our attention is drawn to the factor of disgust, which interferes with the libidinal overvaluation of the sexual object but can in turn be overridden by libido. Disgust seems to be one of the forces which have led to a restriction of the sexual aim. These forces do not as a rule extend to the genitals themselves. But there is no doubt that the genitals of the opposite sex can in themselves be an object of disgust and that such an attitude is one of the characteristics of all hysterics, and especially of hysterical women. The sexual instinct in its strength enjoys overriding this disgust. (See below.)
SEXUAL USE OF THE ANAL ORIFICE  Where the anus is concerned it becomes still clearer that it is disgust which stamps that sexual aim as a perversion. I hope, however, I shall not be accused of partisanship when I assert that people who try to account for this disgust by saying that the organ in question serves the function of excretion and comes in contact with excrement - a thing which is disgusting in itself - are not much more to the point than hysterical girls who account for their disgust at the male genital by saying that it serves to void urine.

[1905d, 1479]

SIGNIFICANCE OF OTHER REGIONS OF THE BODY  The extension of sexual interest to other regions of the body, with all its variations, offers us nothing that is new in principle; it adds nothing to our knowledge of the sexual instinct, which merely proclaims its intention in this way of getting possession of the sexual object in every possible direction. But these anatomical extensions inform us that, besides sexual overvaluation, there is a second factor at work which is strange to popular knowledge. Certain regions of the body, such as the mucous membrane of the mouth and anus, which are constantly appearing in these practices, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals. We shall learn later that this claim is justified by the history of the development of the sexual instinct and that it is fulfilled in the symptomatology of certain pathological states.

[1905d, 1479]
SEXUAL USE OF THE MUCOUS MEMBRANE OF THE LIPS AND MOUTH

The use of the mouth as a sexual organ is regarded as a perversion if the lips (or tongue) of one person are brought into contact with the genitals of another, but not if the mucous membranes of the lips of both of them come together. This exception is the point of contact with what is normal. Those who condemn the other practices (which have no doubt been common among mankind from primaeval times) as being perversions, are giving way to an unmistakable feeling of disgust, which protects them from accepting sexual aims of the kind. Here, then, our attention is drawn to the factor of disgust, which interferes with the libidinal overvaluation of the sexual object but can in turn be overridden by libido. Disgust seems to be one of the forces which have led to a restriction of the sexual aim. These forces do not as a rule extend to the genitals themselves. But there is no doubt that the genitals of the opposite sex can in themselves be an object of disgust and that such an attitude is one of the characteristics of all hysterics, and especially of hysterical women. The sexual instinct in its strength enjoys overriding this disgust. (See below.)

SIGNIFICANCE OF OTHER REGIONS OF THE BODY

The extension of sexual interest to other regions of the body, with all its variations, offers us nothing that is new in principle; it adds nothing to our knowledge of the sexual instinct, which merely proclaims its intention in this way of getting possession of the sexual object in every possible direction. But these anatomical extensions inform us that, besides sexual overvaluation, there is a second factor at work which is strange to popular knowledge. Certain regions of the body, such as the mucous membrane of the mouth and anus, which are constantly appearing in these practices, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals. We shall learn later that this claim is justified by the history of the development of the sexual instinct and that it is fulfilled in the symptomatology of certain pathological states.

The part played by the erotogenic zones is immediately obvious in the case of those perversions which assign a sexual significance to the oral and anal orifices. These behave in every respect like a portion of the sexual apparatus. In hysteria these parts of the body and the neighbouring tracts of mucous membrane become the seat of new sensations and of changes in innervation - indeed, of processes that can be compared to erection - in just the same way as do the actual genitalia under the excitations of the normal sexual processes.
SEXUAL USE OF THE ANAL ORIFICE Where the anus is concerned it becomes still clearer that it is disgust which stamps that sexual aim as a perversion. I hope, however, I shall not be accused of partisanship when I assert that people who try to account for this disgust by saying that the organ in question serves the function of excretion and comes in contact with excrement - a thing which is disgusting in itself - are not much more to the point than hysterical girls who account for their disgust at the male genital by saying that it serves to void urine. [1905d, 1479]

SIGNIFICANCE OF OTHER REGIONS OF THE BODY The extension of sexual interest to other regions of the body, with all its variations, offers us nothing that is new in principle; it adds nothing to our knowledge of the sexual instinct, which merely proclaims its intention in this way of getting possession of the sexual object in every possible direction. But these anatomical extensions inform us that, besides sexual overvaluation, there is a second factor at work which is strange to popular knowledge. Certain regions of the body, such as the mucous membrane of the mouth and anus, which are constantly appearing in these practices, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals. We shall learn later that this claim is justified by the history of the development of the sexual instinct and that it is fulfilled in the symptomatology of certain pathological states. [1905d, 1479]

ACTIVITY OF THE ANAL ZONE Like the labial zone, the anal zone is well suited by its position to act as a medium through which sexuality may attach itself to other somatic functions. It is to be presumed that the erotogenic significance of this part of the body is very great from the first. We learn with some astonishment from psycho-analysis of the transmutations normally undergone by the sexual excitations arising from this zone and of the frequency with which it retains a considerable amount of susceptibility to genital stimulation throughout life.² The intestinal disturbances which are so common in childhood see to it that the zone shall not lack intense excitations. Intestinal catarrhs at the tenderest age make children 'nerve', as people say, and in cases of later neurotic illness they have a determining influence on the symptoms in which the neurosis is expressed, and they put at its disposal the whole range of intestinal disturbances. If we bear in mind the erotogenic significance of the outlet of the intestinal canal, which persists, at all events in a modified form, we shall not be inclined to scoff at the influence of haemorrhoids, to which old-fashioned medicine used to attach so much importance in explaining neurotic conditions. [1905d, 1506]
OVERVALUATION OF THE SEXUAL OBJECT

It is only in the rarest instances that the psychical valuation that is set on the sexual object, as being the goal of the sexual instinct, stops short at its genitals. The appreciation extends to the whole body of the sexual object and tends to involve every sensation derived from it. The same overvaluation spreads over into the psychological sphere: the subject becomes, as it were, intellectually infatuated (that is, his powers of judgement are weakened) by the mental achievements and perfections of the sexual object and he submits to the latter's judgements with credulity. Thus the credulity of love becomes in important, if not the most fundamental, source of authority.¹

This sexual overvaluation is something that cannot be easily reconciled with a restriction of the sexual aim to union of the actual genitals and it helps to turn activities connected with other parts of the body into sexual aims.²

The significance of the factor of sexual overvaluation can be best studied in men, for their erotic life alone has become accessible to research. That of women - partly owing to the stunting effect of civilized conditions and partly owing to their conventional secretiveness and insincerity - is still veiled in an impenetrable obscurity.³

² It must be pointed out, however, that sexual overvaluation is not developed in the case of every mechanism of object-choice. We shall become acquainted later on with another and more direct explanation of the sexual role assumed by the other parts of the body. The factor of 'craving for stimulation' has been put forward by Noche and Bloch as an explanation of the extension of sexual interest to parts of the body other than the genitals; but it does not seem to me to deserve such an important place. The various channels along which the libido passes are related to each other from the very first like inter-communicating pipes, and we must take the phenomenon of collateral flow into account.

SIGNIFICANCE OF OTHER REGIONS OF THE BODY

The extension of sexual interest to other regions of the body, with all its variations, offers us nothing that is new in principle; it adds nothing to our knowledge of the sexual instinct, which merely proclaims its intention in this way of getting possession of the sexual object in every possible direction. But these anatomical extensions inform us that, besides sexual overvaluation, there is a second factor at work which is strange to popular knowledge. Certain regions of the body, such as the mucous membrane of the mouth and anus, which are constantly appearing in these practices, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals. We shall learn later that this claim is justified by the history of the development of the sexual instinct and that it is fulfilled in the symptomatology of certain pathological states.

UNSUITABLE SUBSTITUTES FOR THE SEXUAL OBJECT - FETISHISM

There are some cases which are quite specially remarkable - those in which the normal sexual object is replaced by another which bears some relation to it, but is entirely unsuited to serve the normal sexual aim. From the point of view of classification, we should no doubt have done better to have mentioned this highly interesting group of aberrations of the sexual instinct among the deviations in respect of the sexual object. But we have postponed their mention till we could become acquainted with the factor of sexual overvaluation, on which these phenomena, being connected with an abandonment of the sexual aim, are dependent.
A transition to those cases of fetishism in which the sexual aim, whether normal or perverse, is entirely abandoned is afforded by other cases in which the sexual object is required to fulfil a fetishistic condition - such as the possession of some particular hair-colouring or clothing, or even some bodily defect if the sexual aim is to be attained. No other variation of the sexual instinct that borders on the pathological can lay so much claim to our interest as this one, such is the peculiarity of the phenomena to which it gives rise. Some degree of diminution in the urge towards the normal sexual aim (an executive weakness of the sexual apparatus) seems to be a necessary precondition in every case.¹ The point of contact with the normal is provided by the psychologically essential overvaluation of the sexual object, which inevitably extends to everything that is associated with it. A certain degree of fetishism is thus habitually present in normal love, especially in those stages of it in which the normal sexual aim seems unattainable or its fulfilment prevented:

¹ [1905d, 1480]

If we are to understand how a little girl turns into a woman, we must follow the further vicissitudes of this excitability of the clitoris. Puberty, which brings about so great an accession of libido in boys, is marked in girls by a fresh wave of repression, in which it is precisely clitoridal sexuality that is affected. What is thus overtaken by repression is a piece of masculine sexuality. The intensification of the brake upon sexuality brought about by pubertal repression in women serves as a stimulus to the libido in men and causes an increase of its activity. Along with this heightening of libido there is also an increase of sexual overvaluation which only emerges in full force in relation to a woman who holds herself back and who denies her sexuality. When at last the sexual act is permitted and the clitoris itself becomes excited, it still retains a function: the task, namely, of transmitting the excitation to the adjacent female sexual parts, just as - to use a simile - pine shavings can be kindled in order to set a log of harder wood on fire. Before this transference can be effected, a certain interval of time must often elapse, during which the young woman is anaesthetic. This anaesthesia may become permanent if the clitoridal zone refuses to abandon its excitability, an event for which the way is prepared precisely by an extensive activity of that zone in childhood. Anaesthesia in women, as is well known, is often only apparent and local. They are anaesthetic at the vaginal orifice but are by no means incapable of excitement originating in the clitoris or even in other zones. Alongside these erotogenic determinants of anaesthesia must also be set the psychical determinants, which equally, arise from repression.

¹ [1905d, 1534]

These affectionate fixations of the child persist throughout childhood, and continually carry along with them erotism, which is consequently diverted from its sexual aims. Then at the age of puberty they are joined by the powerful 'sensual' current which no longer mistakes its aims. It never fails, apparently, to follow the earlier paths and to cathet the objects of the primary infantile choice with quotas of libido that are now far stronger. Here, however, it runs up against the obstacles that have been erected in the meantime by the barrier against incest; consequently it will make efforts to pass on from these objects which are unsuitable in reality, and find a way as soon as possible to other, extraneous objects with which a real sexual life may be carried on. These new objects will still be chosen on the model (imago) of the infantile ones, but in the course of time they will attract to themselves the affection that was tied to the earlier ones. A man shall leave his father and his mother - according to the biblical command - and shall cleave unto his wife; affection and sensuality are then united. The greatest intensity of sensual passion will bring with it the highest psychical valuation of the object - this being the normal overvaluation of the sexual object on the part of a man.

¹ [1912d, 2339]
The main protective measure against such a disturbance which men have recourse to in this split in their love consists in a psychical debasement of the sexual object, the overvaluation that normally attaches to the sexual object being reserved for the incestuous object and its representatives. As soon as the condition of debasement is fulfilled, sensuality can be freely expressed, and important sexual capacities and a high degree of pleasure can develop. There is a further factor which contributes to this result. People in whom there has not been a proper confluence of the affective and the sensual currents do not usually show much refinement in their modes of behaviour in love; they have retained perverse sexual aims whose non-fulfilment is felt as a serious loss of pleasure, and whose fulfilment on the other hand seems possible only with a debased and despised sexual object.

[1912d, 2340]

In our civilized world women are under the influence of a similar after-effect of their upbringing, and, in addition, of their reaction to men's behaviour. It is naturally just as unfavourable for a woman if a man approaches her without his full potency as it is if his initial overvaluation of her when he is in love gives place to undervaluation after he has possessed her. In the case of women there is little sign of a need to debase their sexual object. This is no doubt connected with the absence in them as a rule of anything similar to the sexual overvaluation found in men. But their long holding back from sexuality and the lingering of their sensuality in phantasy has another important consequence for them. They are subsequently often unable to undo the connection between sensual activity and the prohibition, and prove to be psychically impotent, that is, frigid, when such activity is at last allowed them. This is the origin of the endeavour made by many women to keep even legitimate relations secret for a while; and of the capacity of other women for normal sensation as soon as the condition of prohibition is re-established by a secret love affair: unfaithful to their husband, they are able to keep a second order of faith with their lover.

[1912d, 2343]

‘I do not love at all - I do not love any one.’ And since, after all, one's libido must go somewhere, this proposition seems to be the psychological equivalent of the proposition: 'I love only myself.' So that this kind of contradiction would give us megalomania, which we may regard as a sexual overvaluation of the ego and may thus set beside the overvaluation of the love-object with which we are already familiar.

[1911c, 2433]

We began at an early date to extend psycho-analytic observations to these other illnesses. Already in 1908 Karl Abraham, after an exchange of thoughts with me, pronounced the main characteristic of dementia praecox (which was reckoned among the psychoses) to be that in it the libidinal cathexis of objects was lacking. But the question then arose of what happened to the libido of dementia praecox patients which was turned away from objects. Abraham did not hesitate to give the answer: it is turned back on to the ego and this reflexive turning-back is the source of the megalomania in dementia praecox. Megalomania is in every way comparable to the familiar sexual overvaluation of the object in erotic life. In this way for the first time we learnt to understand a trait in a psychotic illness by relating it to normal erotic life.

[1916-1917, 3461]
This is the place for two remarks. First, how do we differentiate between the concepts of narcissism and egoism? Well, narcissism, I believe, is the libidinal complement to egoism. When we speak of egoism, we have in view only the individual's advantage; when we talk of narcissism we are also taking his libidinal satisfaction into account. As practical motives the two can be traced separately for quite a distance. It is possible to be absolutely egoistic and yet maintain powerful object-cathexes, in so far as libidinal satisfaction in relation to the object forms part of the ego's needs. In that case, egoism will see to it that striving for the object involves no damage to the ego. It is possible to be egoistic and at the same time to be excessively narcissistic - that is to say, to have very little need for an object, whether, once more, for the purpose of direct sexual satisfaction, or in connection with the higher aspirations, derived from sexual need, which we are occasionally in the habit of contrasting with 'sensuality' under the name of 'love'. In all these connections egoism is what is self-evident and constant, while narcissism is the variable element. The opposite to egoism, altruism, does not, as a concept, coincide with libidinal object-cathexis, but is distinguished from it by the absence of longings for sexual satisfaction. When someone is completely in love, however, altruism converges with libidinal object-cathexis. As a rule the sexual object attracts a portion of the ego's narcissism to itself, and this becomes noticeable as what is known as the 'sexual overvaluation' of the object. If in addition there is an altruistic transposition of egoism on to the sexual object, the object becomes supremely powerful; it has, as it were, absorbed the ego.

In connection with this question of being in love we have always been struck by the phenomenon of sexual overvaluation - the fact that the loved object enjoys a certain amount of freedom from criticism, and that all its characteristics are valued more highly than those of people who are not loved, or than its own were at a time when it itself was not loved. If the sensual impulses are more or less effectively repressed or set aside, the illusion is produced that the object has come to be sensually loved on account of its spiritual merits, whereas on the contrary these merits may really only have been lent to it by its sensual charm.

The tendency which falsifies judgement in this respect is that of idealization. But now it is easier for us to find our bearings. We see that the object is being treated in the same way as our own ego, so that when we are in love a considerable amount of narcissistic libido overflows on to the object. It is even obvious, in many forms of love-choice, that the object serves as a substitute for some unattained ego ideal of our own. We love it on account of the perfections which we have striven to reach for our own ego, and which we should now like to procure in this roundabout way as a means of satisfying our narcissism.

If the sexual overvaluation and the being in love increase even further, then the interpretation of the picture becomes still more unmistakable. The impulses whose trend is towards directly sexual satisfaction may now be pushed into the background entirely, as regularly happens, for instance, with a young man's sentimental passion; the ego becomes more and more unassuming and modest, and the object more and more sublime and precious, until at last it gets possession of the entire self-love of the ego, whose self-sacrifice thus follows as a natural consequence. The object has, so to speak, consumed the ego. Traits of humility, of the limitation of narcissism, and of self-injury occur in every case of being in love; in the extreme case they are merely intensified, and as a result of the withdrawal of the sensual claims they remain in solitary supremacy.
This happens especially easily with love that is unhappy and cannot be satisfied; for in spite of everything each sexual satisfaction always involves a reduction in sexual overvaluation. Contemporaneously with this 'devotion' of the ego to the object, which is no longer to be distinguished from a sublimated devotion to an abstract idea, the functions allotted to the ego ideal entirely cease to operate. The criticism exercised by that agency is silent; everything that the object does and asks for is right and blameless. Conscience has no application to anything that is done for the sake of the object; in the blindness of love remorselessness is carried to the pitch of crime. The whole situation can be completely summarized in a formula: The object has been put in the place of the ego ideal.

[1921c, 3805]

It is now easy to define the difference between identification and such extreme developments of being in love as may be described as 'fascination' or 'bondage'. In the former case the ego has enriched itself with the properties of the object, it has 'introjected' the object into itself, as Ferenczi expresses it. In the second case it is impoverished, it has surrendered itself to the object, it has substituted the object for its own most important constituent. Closer consideration soon makes it plain, however, that this kind of account creates an illusion of contradistinctions that have no real existence. Economically there is no question of impoverishment or enrichment; it is even possible to describe an extreme case of being in love as a state in which the ego has introjected the object into itself. Another distinction is perhaps better calculated to meet the essence of the matter. In the case of identification the object has been lost or given up; it is then set up again inside the ego, and the ego makes a partial alteration in itself after the model of the lost object. In the other case the object is retained, and there is a hypercathexis of it by the ego and at the ego's expense. But here again a difficulty presents itself. Is it quite certain that identification presupposes that object-cathexis has been given up? Can there be no identification while the object is retained? And before we embark upon a discussion of this delicate question, the perception may already be beginning to dawn on us that yet another alternative embraces the real essence of the matter, namely, whether the object is put in the place of the ego or of the ego ideal.

[1921c, 3805]
The normal sexual aim is regarded as being the union of the genitals in the act known as copulation, which leads to a release of the sexual tension and a temporary extinction of the sexual instinct - a satisfaction analogous to the sating of hunger. But even in the most normal sexual process we may detect rudiments which, if they had developed, would have led to the deviations described as 'perversions'. For there are certain intermediate relations to the sexual object, such as touching and looking at it, which lie on the road towards copulation and are recognized as being preliminary sexual aims. On the one hand these activities are themselves accompanied by pleasure, and on the other hand they intensify the excitation, which should persist until the final sexual aim is attained. Moreover, the kiss, one particular contact of this kind, between the mucous membrane of the lips of the two people concerned, is held in high sexual esteem among many nations (including the most highly civilized ones), in spite of the fact that the parts of the body involved do not form part of the sexual apparatus but constitute the entrance to the digestive tract. Here, then, are factors which provide a point of contact between the perversions and normal sexual life and which can also serve as a basis for their classification. Perversions are sexual activities which either (a) extend, in an anatomical sense, beyond the regions of the body that are designed for sexual union, or (b) linger over the intermediate relations to the sexual object which should normally be traversed rapidly on the path towards the final sexual aim.

[1905d, 1476]

APPEARANCE OF NEW AIDS   Every external or internal factor that hinders or postpones the attainment of the normal sexual aim (such as impotence, the high price of the sexual object or the danger of the sexual act) will evidently lend support to the tendency to linger over the preparatory activities and to turn them into new sexual aims that can take the place of the normal one. Attentive examination always shows that even what seem to be the strangest of these new aims are already hinted at in the normal sexual process.

[1905d, 1483]

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or inverted, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

[1908d, 1953]
TOUCHING AND LOOKING  A certain amount of touching is indispensable (at all events among human beings) before the normal sexual aim can be attained. And everyone knows what a source of pleasure on the one hand and what an influx of fresh excitation on the other is afforded by tactile sensations of the skin of the sexual object. So that lingering over the stage of touching can scarcely be counted a perversion, provided that in the long run the sexual act is carried further.

[1905d, 1483]

It can only help to clarify things if at this point we go back to fundamental facts. A desire to see the organs peculiar to each sex exposed is one of the original components of our libido. It may itself be a substitute for something earlier and go back to a hypothetical primary desire to touch the sexual parts. As so often, looking has replaced touching.¹ The libido for looking and touching is present in everyone in two forms, active and passive, male and female; and, according to the preponderance of the sexual character, one form or the other predominates. It is easy to observe the inclination to self-exposure in young children. In cases in which the germ of this inclination escapes its usual fate of being buried and suppressed, it develops in men into the familiar perversion known as exhibitionism. In women the inclination to passive exhibitionism is almost invariably buried under the imposing reactive function of sexual modesty, but not without a loophole being left for it in relation to clothes. I need only hint at the elasticity and variability in the amount of exhibitionism that women are permitted to retain in accordance with differing convention and circumstances.

[1905c, 1695]

There is something else that I must add in order to complete our view of sexual perversions. However infamous they may be, however sharply they may be contrasted with normal sexual activity, quiet consideration will show that some perverse trait or other is seldom absent from the sexual life of normal people. Even a kiss can claim to be described as a perverse act, since it consists in the bringing together of two oral erotogenic zones instead of the two genitals. Yet no one rejects it as perverse; on the contrary, it is permitted in theatrical performances as a softened hint at the sexual act. But precisely kissing can easily turn into a complete perversion - if, that is to say, it becomes so intense that a genital discharge and orgasm follow upon it directly, an event that is far from rare. We can learn, too, that for one person feeling and looking at the object are indispensable preconditions of sexual enjoyment, that another person will pinch or bite at the climax of sexual excitation, that the highest pitch of excitement in lovers is not always provoked by the genitals but by some other region of the object’s body, and any number of similar things besides. There is no sense in excluding people with individual traits of this kind from the class of the normal and putting them among the perverts. On the contrary, we shall recognize more and more clearly that the essence of the perversions lies not in the extension of the sexual aim, not in the replacement of the genitals, not even always in the variant choice of the object, but solely in the exclusiveness with which these deviations are carried out and as a result of which the sexual act serving the purpose of reproduction is put on one side. In so far as the perverse actions are inserted in the performance of the normal sexual act as preparatory or intensifying contributions, they are in reality not perversions at all. The gulf between normal and perverse sexuality is of course very much narrowed by facts of this kind. It is an easy conclusion that normal sexuality has emerged out of something that was in existence before it, by weeding out certain features of that material as unserviceable and collecting together the rest in order to subordinate them to a new aim, that of reproduction.

[1916-1917, 3391]
I shall at this point introduce two technical terms. Let us call the person from whom sexual attraction proceeds the *sexual object* and the act towards which the instinct tends the *sexual aim*. Scientifically sifted observation, then, shows that numerous deviations occur in respect of both of these - the sexual object and the sexual aim. The relation between these deviations and what is assumed to be normal requires thorough investigation.

[1905d, 1464]

People whose sexual objects belong to the normally inappropriate sex - that is, inverts - strike the observer as a collection of individuals who may be quite sound in other respects. On the other hand, cases in which sexually immature persons (children) are chosen as sexual objects are instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive sexual objects in such a case. They usually come to play that part when someone who is cowardly or has become impotent adopts them as a substitute, or when an urgent instinct (one which will not allow of postponement) cannot at the moment get possession of any more appropriate object. Nevertheless, a light is thrown on the nature of the sexual instinct by the fact that it permits of so much variation in its objects and such a cheapening of them - which hunger, with its far more energetic retention of its objects, would only permit in the most extreme instances. A similar consideration applies to sexual intercourse with animals, which is by no means rare, especially among country people, and in which sexual attraction seems to override the barriers of species.

[1905d, 1475]

One would be glad on aesthetic grounds to be able to ascribe these and other severe aberrations of the sexual instinct to insanity; but that cannot be done. Experience shows that disturbances of the sexual instinct among the insane do not differ from those that occur among the healthy and in whole races or occupations. Thus the sexual abuse of children is found with uncanny frequency among school teachers and child attendants, simply because they have the best opportunity for it. The insane merely exhibit any such aberration to an intensified degree; or, what is particularly significant, it may become exclusive and replace normal sexual satisfaction entirely.

[1905d, 1475]

**UNSUITEME SUBSTITUTES FOR THE SEXUAL OBJECT - FETISHISM** There are some cases which are quite specially remarkable - those in which the normal sexual object is replaced by another which bears some relation to it, but is entirely unsuited to serve the normal sexual aim. From the point of view of classification, we should no doubt have done better to have mentioned this highly interesting group of aberrations of the sexual instinct among the deviations in respect of the sexual object. But we have postponed their mention till we could become acquainted with the factor of sexual overvaluation, on which these phenomena, being connected with an abandonment of the sexual aim, are dependent.

[1905d, 1480]
The time has arrived for me to attempt to summarize what I have said. We started out from the aberrations of the sexual instinct in respect of its object and of its aim and we were faced by the question of whether these arise from an innate disposition or are acquired as a result of experiences in life. We arrived at an answer to this question from an understanding, derived from psycho-analytic investigation, of the workings of the sexual instinct in psychoneurotics, a numerous class of people and one not far removed from the healthy. We found that in them tendencies to every kind of perversion can be shown to exist as unconscious forces and betray their presence as factors leading to the formation of symptoms. It was thus possible to say that neurosis is, as it were, the negative of perversion. In view of what was now seen to be the wide dissemination of tendencies to perversion we were driven to the conclusion that a disposition to perversions is an original and universal disposition of the human sexual instinct and that normal sexual behaviour is developed out of it as a result of organic changes and psychical inhibitions occurring in the course of maturation; we hoped to be able to show the presence of this original disposition in childhood. Among the forces restricting the direction taken by the sexual instinct we laid emphasis upon shame, disgust, pity and the structures of morality and authority erected by society. We were thus led to regard any established aberration from normal sexuality as an instance of developmental inhibition and infantilism. Though it was necessary to place in the foreground the importance of the variations in the original disposition, a co-operative and not an opposing relation was to be assumed as existing between them and the influences of actual life. It appeared, on the other hand, that since the original disposition is necessarily a complex one, the sexual instinct itself must be something put together from various factors, and that in the perversions it falls apart, as it were, into its components. The perversions were thus seen to be on the one hand inhibitions, and on the other hand dissociations, of normal development. Both these aspects were brought together in the supposition that the sexual instinct of adults arises from a combination of a number of impulses of childhood into a unity, an impulsion with a single aim.

This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror!

[1905d, 1542]

[1916-1917, 3377]
There is something else that I must add in order to complete our view of sexual perversions. However infamous they may be, however sharply they may be contrasted with normal sexual activity, quiet consideration will show that some perverse trait or other is seldom absent from the sexual life of normal people. Even a kiss can claim to be described as a perverse act, since it consists in the bringing together of two oral erotogenic zones instead of the two genitals. Yet no one rejects it as perverse; on the contrary, it is permitted in theatrical performances as a softened hint at the sexual act. But precisely kissing can easily turn into a complete perversion - if, that is to say, it becomes so intense that a genital discharge and orgasm follow upon it directly, an event that is far from rare. We can learn, too, that for one person feeling and looking at the object are indispensable preconditions of sexual enjoyment, that another person will pinch or bite at the climax of sexual excitation, that the highest pitch of excitement in lovers is not always provoked by the genitals but by some other region of the object's body, and any number of similar things besides. There is no sense in excluding people with individual traits of this kind from the class of the normal and putting them among the perverts. On the contrary, we shall recognize more and more clearly that the essence of the perversions lies not in the extension of the sexual aim, not in the replacement of the genitals, not even always in the variant choice of the object, but solely in the exclusiveness with which these deviations are carried out and as a result of which the sexual act serving the purpose of reproduction is put on one side. In so far as the perverse actions are inserted in the performance of the normal sexual act as preparatory or intensifying contributions, they are in reality not perversions at all. The gulf between normal and perverse sexuality is of course very much narrowed by facts of this kind. It is an easy conclusion that normal sexuality has emerged out of something that was in existence before it, by weeding out certain features of that material as unserviceable and collecting together the rest in order to subordinate them to a new aim, that of reproduction. [1916-1917, 3391]

I may tell you at once that these first explanations of Abraham's have been accepted in psycho-analysis and have become the basis of our attitude to the psychoses. We thus slowly became familiar with the notion that the libido, which we find attached to objects and which is the expression of an effort to obtain satisfaction in connection with those objects, can also leave the objects and set the subject's own ego in their place; and this notion was gradually built up more and more consistently. The name for this way of allocating the libido - 'narcissism' - was borrowed by us from a perversion described by Paul Näcke in which an adult treats his own body with all the caresses that are usually devoted to an outside sexual object. [1916-1917, 3461]

Reflection will quickly suggest that if any such fixation of the libido to the subject's own body and personality, instead of to an object does occur, it cannot be an exception or a trivial event. On the contrary it is probable that this narcissism is the universal and original state of things, from which object-love is only later developed, without the narcissism necessarily disappearing on that account. Indeed we had to recall from the history of the development of object-libido that many sexual instincts begin by finding satisfaction in the subject's own body - auto-erotically, as we say - and that this capacity for auto-erotism is the basis of the lagging-behind of sexuality in the process of education in the reality principle. Auto-erotism would thus be the sexual activity of the narcissistic stage of allocation of the libido. [1916-1917, 3461]
I shall at this point introduce two technical terms. Let us call the person from whom sexual attraction proceeds the *sexual object* and the act towards which the instinct tends the *sexual aim*. Scientifically sifted observation, then, shows that numerous deviations occur in respect of both of these - the sexual object and the sexual aim. The relation between these deviations and what is assumed to be normal requires thorough investigation.

[1905d, 1464]
But the gaining of even the loveliest woman was not among the dreamer's wishes. Two other lines were more to the point:

[1900a, 843]

The popular view of the sexual instinct is beautifully reflected in the poetic fable which tells how the original human beings were cut up into two halves - man and woman - and how these are always striving to unite again in love. It comes as a great surprise therefore to learn that there are men whose sexual object is a man and not a woman, and women whose sexual object is a woman and not a man. People of this kind are described as having 'contrary sexual feelings', or better, as being 'inverts', and the fact is described as 'inversion'. The number of such people is very considerable, though there are difficulties in establishing it precisely.¹

[1905d, 1465]

Several facts go to show that in this legitimate sense of the word inverts cannot be regarded as degenerate:

(1) Inversion is found in people who exhibit no other serious deviations from the normal.
(2) It is similarly found in people whose efficiency is unimpaired, and who are indeed distinguished by specially high intellectual development and ethical culture.¹
(3) If we disregard the patients we come across in our medical practice, and cast our eyes round a wider horizon, we shall come in two directions upon facts which make it impossible to regard inversion as a sign of degeneracy:
(a) Account must be taken of the fact that inversion was a frequent phenomenon - one might almost say an institution charged with important functions - among the peoples of antiquity at the height of their civilization.
(b) It is remarkably widespread among many savage and primitive races, whereas the concept of degeneracy is usually restricted to states of high civilization (cf. Bloch); and, even amongst the civilized peoples of Europe, climate and race exercise the most powerful influence on the prevalence of inversion and upon the attitude adopted towards it.²

[1905d, 1468]

The reverse of this view is represented by the alternative one that inversion is an acquired character of the sexual instinct. This second view is based on the following considerations:

(1) In the case of many inverts, even absolute ones, it is possible to show that very early in their lives a sexual impression occurred which left a permanent after-effect in the shape of a tendency to homosexuality.
(2) In the case of many others, it is possible to point to external influences in their lives, whether of a favourable or inhibiting character, which have led sooner or later to a fixation of their inversion. (Such influences are exclusive relations with persons of their own sex, comradeship in war, detention in prison, the dangers of heterosexual intercourse, celibacy, sexual weakness, etc.)
(3) Inversion can be removed by hypnotic suggestion, which would be astonishing in an innate characteristic.

[1905d, 1469]

In view of these considerations it is even possible to doubt the very existence of such a thing as innate inversion. It can be argued (cf. Havelock Ellis) that, if the cases of allegedly innate inversion were more closely examined, some experience of their early childhood would probably come to light which had a determining effect upon the direction taken by their libido. This experience would simply have passed out of the subject's conscious recollection, but could be recalled to his memory under appropriate influence. In the opinion of these writers inversion can only be described as a frequent variation of the sexual instinct, which can be determined by a number of external circumstances in the subject's life.

[1905d, 1469]
But this expectation was disappointed. It is impossible to demonstrate so close a connection between the hypothetical psychical hermaphroditism and the established anatomical one. A general lowering of the sexual instinct and a slight anatomical atrophy of the organs is found frequently in inverts (cf. Havelock Ellis, 1915). Frequently, but by no means regularly or even usually. The truth must therefore be recognized that inversion and somatic hermaphroditism are on the whole independent of each other.

[1905d, 1471]

A great deal of importance, too, has been attached to what are called the secondary and tertiary sexual characters and to the great frequency of the occurrence of those of the opposite sex in inverts (cf. Havelock Ellis, 1915). Much of this, again, is correct; but it should never be forgotten that in general the secondary and tertiary sexual characters of one sex occur very frequently in the opposite one. They are indications of hermaphroditism, but are not attended by any change of sexual object in the direction of inversion.

[1905d, 1471]

Psychical hermaphroditism would gain substance if the inversion of the sexual object were at least accompanied by a parallel change-over of the subject's other mental qualities, instincts and character traits into those marking the opposite sex. But it is only in inverted women that character-inversion of this kind can be looked for with any regularity. In men the most complete mental masculinity can be combined with inversion. If the belief in psychical hermaphroditism is to be persisted in, it will be necessary to add that its manifestations in various spheres show only slight signs of being mutually determined. Moreover the same is true of somatic hermaphroditism: according to Halban (1903),¹ occurrences of individual atrophied organs and of secondary sexual characters are to a considerable extent independent of one another.

[1905d, 1471]

SEXUAL OBJECT OF INVERTS The theory of psychical hermaphroditism presupposes that the sexual object of an invert is the opposite of that of a normal person. An inverted man, it holds, is like a woman in being subject to the charm that proceeds from masculine attributes both physical and mental: he feels he is a woman in search of a man.

[1905d, 1473]

But however well this applies to quite a number of inverts, it is, nevertheless, far from revealing a universal characteristic of inversion. There can be no doubt that a large proportion of male inverts retain the mental quality of masculinity, that they possess relatively few of the secondary characters of the opposite sex and that what they look for in their sexual object are in fact feminine mental traits. If this were not so, how would it be possible to explain the fact that male prostitutes who offer themselves to inverts - to-day just as they did in ancient times imitate women in all the externals of their clothing and behaviour? Such imitation would otherwise inevitably clash with the ideal of the inverts. It is clear that in Greece, where the most masculine men were numbered among the inverts, what excited a man's love was not the *masculine* character of a boy, but his physical resemblance to a woman as well as his feminine mental qualities - his shyness, his modesty and his need for instruction and assistance. As soon as the boy became a man he ceased to be a sexual object for men and himself, perhaps, became a lover of boys. In this instance, therefore, as in many others, the sexual object is not someone of the same sex but someone who combines the characters of both sexes; there is as, it were, a compromise between an impulse that seeks for a man and one that seeks for a woman, while it remains a paramount condition that the object's body (i.e. genitals) shall be masculine. Thus the sexual object is a kind of reflection of the subject's own bisexual nature.¹

[1905d, 1473]
The position in the case of women is less ambiguous; for among them the active inverts exhibit masculine characteristics, both physical and mental, with peculiar frequency and look for femininity in their sexual objects - though here again a closer knowledge of the facts might reveal greater variety.
[1905d, 1473]

[Added 1915] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.
[1905d, 1473]

[Added 1920] Ferenczi (1914) has brought forward a number of interesting points on the subject of inversion. He rightly protests that, because they have in common the symptom of inversion, a large number of conditions, which are very different from one another and which are of unequal importance both in organic and psychical respects, have been thrown together under the name of 'homosexuality' (or, to follow him in giving it a better name, 'homo-erotism'). He insists that a sharp distinction should at least be made between two types: 'subject homo-erotics', who feel and behave like women, and 'object homo-erotics', who are completely masculine and who have merely exchanged a female for a male object. The first of these two types he recognizes as true 'sexual intermediates' in Hirschfeld's sense of the word; the second he describes, less happily, as obsessional neurotics. According to him, it is only in the case of object homo-erotics that there is any question of their struggling against their inclination to inversion or of the possibility of their being influenced psychologically. While granting the existence of these two types, we may add that there are many people in whom a certain quantity of subject homo-erotism is found in combination with a proportion of object homo-erotism.
[1905d, 1473]
During the last few years work carried out by biologists, notably by Steinach, has thrown a strong light on the organic determinants of homo-erotism and of sexual characters in general. By carrying out experimental castration and subsequently grafting the sex-glands of the opposite sex, it was possible in the case of various species of mammals to transform a male into a female and vice versa. The transformation affected more or less completely both the somatic sexual characters and the psychosexual attitude (that is, both subject and object erotism). It appeared that the vehicle of the force which thus acted as a sex-determinant was not the part of the sex-gland which forms the sex-cells but what is known as its interstitial tissue (the 'puberty-gland'). In one case this transformation of sex was actually effected in a man who had lost his testes owing to tuberculosis. In his sexual life he behaved in a feminine manner, as a passive homosexual, and exhibited very clearly marked feminine sexual characters of a secondary kind (e.g. in regard to growth of hair and beard and deposits of fat on the breasts and hips). After an undescended testis from another male patient had been grafted into him, he began to behave in a masculine manner and to direct his libido towards women in a normal way. Simultaneously his somatic feminine characters disappeared. (Lipschütz, 1919, 356-7.)

People whose sexual objects belong to the normally inappropriate sex - that is, inverts - strike the observer as a collection of individuals who may be quite sound in other respects. On the other hand, cases in which sexually immature persons (children) are chosen as sexual objects are instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive sexual objects in such a case. They usually come to play that part when someone who is cowardly or has become impotent adopts them as a substitute, or when an urgent instinct (one which will not allow of postponement) cannot at the moment get possession of any more appropriate object. Nevertheless, a light is thrown on the nature of the sexual instinct by the fact that it permits of so much variation in its objects and such a cheapening of them - which hunger, with its far more energetic retention of its objects, would only permit in the most extreme instances. A similar consideration applies to sexual intercourse with animals, which is by no means rare, especially among country people, and in which sexual attraction seems to override the barriers of species.

[1905d, 1475]
PREVENTION OF INVERSION One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion.

[1905d, 1541]

If there is any basis in fact for the relation posited here between anal erotism and this triad of character-traits, one may expect to find no very marked degree of 'anal character' in people who have retained the anal zone's erotogenic character in adult life, as happens, for instance, with certain homosexuals. Unless I am much mistaken, the evidence of experience tallies quite well on the whole with this inference.

[1908b, 1945]

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or invert, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

[1908d, 1953]
More pronounced forms of the perversions and of homosexuality, especially if they are exclusive, do, it is true, make those subject to them socially useless and unhappy, so that it must be recognized that the cultural requirements even of the second stage are a source of suffering for a certain proportion of mankind. The fate of these people who differ constitutionally from the rest varies, and depends on whether they have been born with a sexual instinct which by absolute standards is strong or comparatively weak. In the latter case - where the sexual instinct is in general weak - perverts succeed in totally suppressing the inclinations which bring them into conflict with the moral demands of their stage of civilization. But this, from the ideal point of view, is also the only thing they succeed in achieving; for, in order to effect this suppression of their sexual instinct, they use up the forces which they would otherwise employ in cultural activities. They are, as it were, inwardly inhibited and outwardly paralysed. What we shall be saying again later on about the abstinence demanded of men and women in the third stage of civilization applies to them too.

[1908d, 1954]

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

[1908d, 1961]

There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as ‘the girl he was fondest of’. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.¹

[1909b, 2094]
There is a dictum in general pathology, Gentlemen, which asserts that every developmental process carries with it the seed of a pathological disposition, in so far as that process may be inhibited, delayed, or may run its course incompletely. The same thing is true of the highly complicated development of the sexual function. It does not occur smoothly in every individual; and, if not, it leaves behind it either abnormalities or a predisposition to fall ill later, along the path of involution (i.e. regression). It may happen that not all the component instincts submit to the dominance of the genital zone. An instinct which remains in this way independent leads to what we describe as a perversion, and may substitute its own sexual aim for the normal one. It very often happens, as I have already said, that auto-erotism is not completely conquered, and evidence of this is given by a great variety of subsequent disturbances. The originally equal value attached to the two sexes as sexual objects may persist, and this will lead to a tendency in adult life to homosexual activity, which can in certain circumstances be intensified into exclusive homosexuality. These classes of disturbance represent direct inhibitions in the development of the sexual function; they comprise the perversions and, what is by no means rare, general infantilism in sexual life.

[1910a, 2231]

If we reflect on the concurrence in Leonardo of his over-powerful instinct for research and the atrophy of his sexual life (which was restricted to what is called ideal homosexuality) we shall be disposed to claim him as a model instance of our third type. The core of his nature, and the secret of it, would appear to be that after his curiosity had been activated in infancy in the service of sexual interests he succeeded in sublimating the greater part of his libido into an urge for research. But it is not easy, to be sure, to prove that this view is right. To do so we should need some picture of his mental development in the first years of his childhood, and it seems foolish to hope for material of that sort when the accounts of his life are so meagre and so unreliable, and when moreover it is a question of information about circumstances that escape the attention of observers even in relation to people of our own generation.

[1910c, 2257]

If we examine with the eyes of a psycho-analyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall having come across the same sort of thing in many places, for example in dreams; so that we may venture to translate the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, 'coda', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages; the situation in the phantasy, of a vulture opening the child's mouth and beating about inside it vigorously with its tail, corresponds to the idea of an act of fellatio, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).

[1910c, 2262]
Now we understand why Leonardo assigned the memory of his supposed experience with the vulture to his suckling period. What the phantasy conceals is merely a reminiscence of sucking - or being suckled - at his mother's breast, a scene of human beauty that he, like so many artists, undertook to depict with his brush, in the guise of the mother of God and her child. There is indeed another point which we do not yet understand and which we must not lose sight of: this reminiscence, which has the same importance for both sexes, has been transformed by the man Leonardo into a passive homosexual phantasy. For the time being we shall put aside the question of what there may be to connect homosexuality with sucking at the mother's breast, merely recalling that tradition does in fact represent Leonardo as a man with homosexual feelings. In this connection, it is irrelevant to our purpose whether the charge brought against the young Leonardo was justified or not. What decides whether we describe someone as an invert is not his actual behaviour, but his emotional attitude.

At this point a little reflection will remind us that we ought not to feel satisfied yet with the way the vulture's tail in Leonardo's childhood phantasy has been explained. Something more seems to be contained in it which we do not yet understand. Its most striking feature, after all, was that it changed sucking at the mother's breast into being suckled, that is, into passivity, and thus into a situation whose nature is undoubtedly homosexual. When we remember the historical probability of Leonardo having behaved in his life as one who was emotionally homosexual, the question is forced upon us whether this phantasy does not indicate the existence of a causal connection between Leonardo's relation with his mother in childhood and his later manifest, if ideal, homosexuality. We should not venture to infer a connection of this sort from Leonardo's distorted reminiscence if we did not know from the psycho-analytic study of homosexual patients that such a connection does exist and is in fact an intimate and necessary one.

Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²
On the whole, indeed, when we come to think of it, we are not quite at a loss in regard to what it is that people call sexual. Something which combines a reference to the contrast between the sexes, to the search for pleasure, to the reproductive function and to the characteristic of something that is improper and must be kept secret - some such combination will serve for all practical purposes in everyday life. But for science that is not enough. By means of careful investigations (only made possible, indeed, by disinterested self-discipline) we have come to know groups of individuals whose 'sexual life' deviates in the most striking way from the usual picture of the average. Some of these 'perverse' people have, we might say, struck the distinction between the sexes off their programme. Only members of their own sex can rouse their sexual wishes; those of the other sex, and especially their sexual parts, are not a sexual object for them at all, and in extreme cases are an object of disgust. This implies, of course, that they have abandoned any share in reproduction. We call such people homosexuals or inverteds. They are men and women who are often, though not always, irreproachably fashioned in other respects, of high intellectual and ethical development, the victims only of this one fatal deviation. Through the mouth of their scientific spokesmen they represent themselves as a special variety of the human species - a 'third sex' which has a right to stand on an equal footing beside the other two. We shall perhaps have an opportunity of examining their claims critically. Of course they are not, as they also like to assert, an 'elite' of mankind; there are at least as many inferior and useless individuals among them as there are among those of a different sexual kind. [1916-1917, 3376]

This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror! [1916-1917, 3377]
I have said that neurotic symptoms are substitutes for sexual satisfaction, and I indicated to you that the confirmation of this assertion by the analysis of symptoms would come up against a number of difficulties. For it can only be justified if under 'sexual satisfaction' we include the satisfaction of what are called perverse sexual needs, since an interpretation of symptoms of that kind is forced upon us with surprising frequency. The claim made by homosexuals or invertos to being exceptions collapses at once when we learn that homosexual impulses are invariably discovered in every single neurotic, and that a fair number of symptoms give expression to this latent inversion. Those who call themselves homosexuals are only the conscious and manifest inverts, whose number is nothing compared to that of the latent homosexuals. We are compelled, however, to regard choice of an object of one's own sex as a divergence in erotic life which is of positively habitual occurrence, and we are learning more and more to ascribe an especially high importance to it. No doubt this does not do away with the differences between manifest homosexuality and a normal attitude; their practical significance remains, but their theoretical value is greatly diminished. We have even found that a particular disease, paranoia, which is not to be counted among the transference neuroses, regularly arises from an attempt to fend off excessively strong homosexual impulses. You will perhaps recall that one of our patients (p. 3343) behaved in her obsessional action like a man, her own husband whom she had left; neurotic women very commonly produce symptoms in this way in the character of a man. Even if this is not actually to be regarded as homosexuality, it is closely related to its preconditions. [1916-1917, 3379]

Further unfavourable features in the present case were the facts that the girl was not in any way ill (she did not suffer from anything in herself, nor did she complain of her condition) and that the task to be carried out did not consist in resolving a neurotic conflict but in converting one variety of the genital organization of sexuality into the other. Such an achievement - the removal of genital inversion or homosexuality - is in my experience never an easy matter. On the contrary, I have found success possible only in specially favourable circumstances, and even then the success essentially consisted in making access to the opposite sex (which had hitherto been barred) possible to a person restricted to homosexuality, thus restoring his full bisexual functions. After that it lay with him to choose whether he wished to abandon the path that is banned by society, and in some cases he has done so. One must remember that normal sexuality too depends upon a restriction in the choice of object. In general, to undertake to convert a fully developed homosexual into a heterosexual does not offer much more prospect of success than the reverse, except that for good practical reasons the latter is never attempted. [1920a, 3841]

The number of successes achieved by psycho-analytic treatment of the various forms of homosexuality, which incidentally are manifold, is indeed not very striking. As a rule the homosexual is not able to give up the object which provides him with pleasure, and one cannot convince him that if he made the change he would rediscover in the other object the pleasure that he has renounced, and such components of the instinct of self-preservation prove themselves too weak in the struggle against the sexual impulses. One then soon discovers his secret plan, namely, to obtain from the striking failure of his attempt a feeling of satisfaction that he has done everything possible against his abnormality, to which he can now resign himself with an easy conscience. The case is somewhat different when consideration for beloved parents and relatives has been the motive for his attempt to be cured. Here there really are libidinal impulses present which may put forth energies opposed themselves to the homosexual choice of object; but their strength is rarely sufficient. It is only where the homosexual fixation has not yet become strong enough, or where there are considerable rudiments and vestiges of a heterosexual choice of object, i.e. in a still oscillating or in a definitely bisexual organization, that one may make a more favourable prognosis for psycho-analytic therapy. [1920a, 3841]
It is well known that even in a normal person it takes a certain time before the decision in regard to the sex of the love object is finally made. Homosexual enthusiasms, exaggeratedly strong friendships tinged with sensuality, are common enough in both sexes during the first years after puberty. This was also so with our patient, but in her these tendencies undoubtedly showed themselves to be stronger, and lasted longer, than with others. In addition, these presages of later homosexuality had always occupied her conscious life, while the attitude arising from the Oedipus complex had remained unconscious and had appeared only in such signs as her tender behaviour to the little boy. As a school-girl she had been for a long time in love with a strict and unapproachable mistress, obviously a substitute mother. She had taken a specially lively interest in a number of young mothers long before her brother's birth and therefore all the more certainly long before the first reprimand from her father. From very early years, therefore, her libido had flowed in two currents, the one on the surface being one that we may unhesitatingly designate as homosexual. This latter was probably a direct and unchanged continuation of an infantile fixation on her mother. Possibly the analysis described here actually revealed nothing more than the process by which, on an appropriate occasion, the deeper heterosexual current of libido, too, was deflected into the manifest homosexual one.

If the analysis had come to an earlier, still more premature end, it might have led to the view that this was a case of late acquired homosexuality, but as it is, a consideration of the material impels us to conclude that it is rather a case of congenital homosexuality which, as usual, became fixed and unmistakably manifest only in the period following puberty. Each of these classifications does justice only to one part of the state of affairs ascertainable by observation, but neglects the other. It would be best not to attach too much value to this way of stating the problem.

It is not for psycho-analysis to solve the problem of homosexuality. It must rest content with disclosing the psychical mechanisms that resulted in determining the object-choice, and with tracing back the paths from them to the instinctual dispositions. There its work ends, and it leaves the rest to biological research, which has recently brought to light, through Steinach's¹ experiments, such very important results concerning the influence exerted by the first set of characteristics mentioned above upon the second and third. Psycho-analysis has a common basis with biology, in that it presupposes an original bisexuality in human beings (as in animals). But psycho-analysis cannot elucidate the intrinsic nature of what in conventional or in biological phraseology is termed ‘masculine’ and ‘feminine’: it simply takes over the two concepts and makes them the foundation of its work. When we attempt to reduce them further, we find masculinity vanishing into activity and femininity into passivity, and that does not tell us enough. I have already tried to explain how far we may reasonably expect, or how far experience has already proved, that the work of elucidation which is part of the task of analysis furnishes us with the means of effecting a modification of inversion. When one compares the extent to which we can influence it with the remarkable transformations that Steinach has effected in some cases by his operations, it does not make a very imposing impression. But it would be premature, or a harmful exaggeration, if at this stage we were to indulge in hopes of a ‘therapy’ of inversion that could be generally applied. The cases of male homosexuality in which Steinach has been successful fulfilled the condition, which is not always present, of a very patent physical 'hermaphroditism'. Any analogous treatment of female homosexuality is at present quite obscure. If it were to consist in removing what are probably hermaphroditic ovaries, and in grafting others, which are hoped to be of a single sex, there would be little prospect of its being applied in practice. A woman who has felt herself to be a man, and has loved in masculine fashion, will hardly let herself be forced into playing the part of a woman, when she must pay for this transformation, which is not in every way advantageous, by renouncing all hope of motherhood.

[1920a, 3857]

[1920a, 3858]

[1920a, 3860]
It is well known that a good number of homosexuals are characterized by a special development of their social instinctual impulses and by their devotion to the interests of the community. It would be tempting, as a theoretical explanation of this, to say that the behaviour towards men in general of a man who sees in other men potential love-objects must be different from that of a man who looks upon other men in the first instance as rivals in regard to women. The only objection to this is that jealousy and rivalry play their part in homosexual love as well, and that the community of men also includes these potential rivals. Apart from this speculative explanation, however, the fact that homosexual object-choice not infrequently proceeds from an early overcoming of rivalry with men cannot be without a bearing on the connection between homosexuality and social feeling.

[1922b, 3909]

This symbol of horror is worn upon her dress by the virgin goddess Athene. And rightly so, for thus she becomes a woman who is unapproachable and repels all sexual desires - since she displays the terrifying genitals of the Mother. Since the Greeks were in the main strongly homosexual, it was inevitable that we should find among them a representation of woman as a being who frightens and repels because she is castrated.

[1940c [1922], 3943]

The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and though those of perverts have been recognized it has been with moral indignation and without understanding. Looked at from the psycho-analytic standpoint, even the most eccentric and repellent perversions are explicable as manifestations of component instincts of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psycho-analysis enables us to point to some trace or other of a homosexual object-choice in everyone. If I have described children as 'polymorphously perverse', I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psycho-analysis has no concern whatever with such judgements of value.

[1925d, 4213]

According to the prevailing view human sexual life consists essentially in an endeavour to bring one's own genitals into contact with those of someone of the opposite sex. With this are associated, as accessory phenomena and introductory acts, kissing this extraneous body, looking at it and touching it. This endeavour is supposed to make its appearance at puberty - that is, at the age of sexual maturity - and to serve the purposes of reproduction. Nevertheless, certain facts have always been known which do not fit into the narrow framework of this view. (1) It is a remarkable fact that there are people who are only attracted by individuals of their own sex and by their genitals. (2) It is equally remarkable that there are people whose desires behave exactly like sexual ones but who at the same time entirely disregard the sexual organs or their normal use; people of this kind are known as 'perverts'. (3) And lastly it is a striking thing that some children (who are on that account regarded as degenerate) take a very early interest in their genitals and show signs of excitation in them.

[1940a [1938], 4963]
SEXUAL AIM OF INVERTS  The important fact to bear in mind is that no one single aim can be laid down as applying in cases of inversion. Among men, intercourse per annum by no means coincides with inversion; masturbation is quite as frequently their exclusive aim, and it is even true that restrictions of sexual aim - to the point of its being limited to simple outpourings of emotion - are commoner among them than among heterosexual lovers. Among women, too, the sexual aims of inverts are various: there seems to be a special preference for contact with the mucous membrane of the mouth. [1905d, 1474]
INNATE CHARACTER  As may be supposed, innateness is only attributed to the first, most extreme, class of inverts, and the evidence for it rests upon assurances given by them that at no time in their lives has their sexual instinct shown any sign of taking another course. The very existence of the two other classes, and especially the third, is difficult to reconcile with the hypothesis of the innateness of inversion. This explains why those who support this view tend to separate out the group of absolute inverts from all the rest, thus abandoning any attempt at giving an account of inversion which shall have universal application. In the view of these authorities inversion is innate in one group of cases, while in others it may have come about in other ways.
[1905d, 1468]

The reverse of this view is represented by the alternative one that inversion is an acquired character of the sexual instinct. This second view is based on the following considerations:

(1) In the case of many inverts, even absolute ones, it is possible to show that very early in their lives a sexual impression occurred which left a permanent after-effect in the shape of a tendency to homosexuality.

(2) In the case of many others, it is possible to point to external influences in their lives, whether of a favourable or inhibiting character, which have led sooner or later to a fixation of their inversion. (Such influences are exclusive relations with persons of their own sex, comradeship in war, detention in prison, the dangers of heterosexual intercourse, celibacy, sexual weakness, etc.)

(3) Inversion can be removed by hypnotic suggestion, which would be astonishing in an innate characteristic.
[1905d, 1469]

In view of these considerations it is even possible to doubt the very existence of such a thing as innate inversion. It can be argued (cf. Havelock Ellis) that, if the cases of allegedly innate inversion were more closely examined, some experience of their early childhood would probably come to light which had a determining effect upon the direction taken by their libido. This experience would simply have passed out of the subject's conscious recollection, but could be recalled to his memory under appropriate influence. In the opinion of these writers inversion can only be described as a frequent variation of the sexual instinct, which can be determined by a number of external circumstances in the subject's life.
[1905d, 1469]

EXPLANATION OF INVERSION  The nature of inversion is explained neither by the hypothesis that it is innate nor by the alternative hypothesis that it is acquired. In the former case we must ask in what respect it is innate, unless we are to accept the crude explanation that everyone is born with his sexual instinct attached to a particular sexual object. In the latter case it may be questioned whether the various accidental influences would be sufficient to explain the acquisition of inversion without the co-operation of something in the subject himself. As we have already shown, the existence of this last factor is not to be denied.
[1905d, 1469]
Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis.

It would naturally be important to know whether the origin of infantile perversions from the Oedipus complex can be asserted as a general principle. While this cannot be decided without further investigation, it does not seem impossible. When we recall the anamneses which have been obtained in adult cases of perversion we cannot fail to notice that the decisive impression, the 'first experience', of all these perverts, fetishists, etc., is scarcely ever referred back to a time earlier than the sixth year. At this time, however, the dominance of the Oedipus complex is already over; the experience which is recalled, and which has been effective in such a puzzling way, may very well have represented the legacy of that complex. The connections between the experience and the complex which is by this time repressed are bound to remain obscure so long as analysis has not thrown any light on the time before the first 'pathogenic' impression. So it may be imagined how little value is to be attached, for instance, to an assertion that a case of homosexuality is congenital, when the ground given for this belief is that ever since his eighth or sixth year the person in question has felt inclinations only towards his own sex.

Readers unversed in psycho-analysis will long have been awaiting an answer to two other questions. Did this homosexual girl show physical characteristics plainly belonging to the opposite sex, and did the case prove to be one of congenital or acquired (later-developed) homosexuality?

The second question, whether this was a case of congenital or acquired homosexuality, will be answered by the whole history of the patient's abnormality and its development. The study of this will show how far this question is a fruitless and inapposite one.
The analysis showed, further, that the girl had brought along with her from her childhood a strongly marked 'masculinity complex'. A spirited girl, always ready for romping and fighting, she was not at all prepared to be second to her slightly older brother; after inspecting his genital organs she had developed a pronounced envy for the penis, and the thoughts derived from this envy still continued to fill her mind. She was in fact a feminist; she felt it to be unjust that girls should not enjoy the same freedom as boys, and rebelled against the lot of woman in general. At the time of the analysis the idea of pregnancy and child-birth was disagreeable to her, partly, I surmise, on account of the bodily disfigurement connected with them. Her girlish narcissism had fallen back on this defence,¹ and ceased to express itself as pride in her good looks. Various clues indicated that she must formerly have had strong exhibitionist and scopophilic tendencies. Anyone who is anxious that the claims of acquired as opposed to hereditary factors should not be under-estimated in aetiology will call attention to the fact that the girl's behaviour, as described above, was exactly what would follow from the combined effect in a person with a strong mother-fixation of the two influences of her mother's neglect and her comparison of her genital organs with her brother's. It is possible here to attribute to the impress of the operation of external influence in early life something which one would have liked to regard as a constitutional peculiarity. On the other hand, a part even of this acquired disposition (if it was really acquired) has to be ascribed to inborn constitution. So we see in practice a continual mingling and blending of what in theory we should try to separate into a pair of opposites - namely, inherited and acquired characters.

If the analysis had come to an earlier, still more premature end, it might have led to the view that this was a case of late acquired homosexuality, but as it is, a consideration of the material impels us to conclude that it is rather a case of congenital homosexuality which, as usual, became fixed and unmistakably manifest only in the period following puberty. Each of these classifications does justice only to one part of the state of affairs ascertainable by observation, but neglects the other. It would be best not to attach too much value to this way of stating the problem.

[1920a, 3858]
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.
[1922b, 3907]
Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words ‘suppressed’ and ‘repressed.’ It should have been clear, however, that the latter lays more stress upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream-thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one.

And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the *Oneirocritica* of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion.

We find, then, that certain among the impulses to perversion occur regularly as pairs of opposites; and this, taken in conjunction with material which will be brought forward later, has a high theoretical significance. It is, moreover, a suggestive fact that the existence of the pair of opposites formed by sadism and masochism cannot be attributed merely to the element of aggressiveness. We should rather be inclined to connect the simultaneous presence of these opposites with the opposing masculinity and femininity which are combined in bisexuality - a contrast which often has to be replaced in psycho-analysis by that between activity and passivity.

A second pregenital phase is that of the sadistic-anal organization. Here the opposition between two currents, which runs through all sexual life, is already developed: they cannot yet, however, be described as ‘masculine’ and ‘feminine’, but only as ‘active’ and ‘passive’. The activity is put into operation by the instinct for mastery through the agency of the somatic musculature; the organ which, more than any other, represents the passive sexual aim is the erotogenic mucous membrane of the anus. Both of these currents have objects, which, however, are not identical. Alongside these, other component instincts operate in an auto-erotic manner. In this phase, therefore, sexual polarity and an extraneous object are already observable. But organization and subordination to the reproductive function are still absent.
It is essential to understand clearly that the concepts of 'masculine' and 'feminine', whose meaning seems so unambiguous to ordinary people, are among the most confused that occur in science. It is possible to distinguish at least three uses. 'Masculine' and 'feminine' are used sometimes in the sense of activity and passivity, sometimes in a biological, and sometimes, again, in a sociological sense. The first of these three meanings is the essential one and the most serviceable in psycho-analysis. When, for instance, libido was described in the text above as being 'masculine', the word was being used in this sense, for an instinct is always active even when it has a passive aim in view. The second, or biological, meaning of 'masculine' and 'feminine' is the one whose applicability can be determined most easily. Here 'masculine' and 'feminine' are characterized by the presence of spermatozoa or ova respectively and by the functions proceeding from them. Activity and its concomitant phenomena (more powerful muscular development, aggressiveness, greater intensity of libido) are as a rule linked with biological masculinity; but they are not necessarily so, for there are animal species in which these qualities are on the contrary assigned to the female. The third, or sociological, meaning receives its connotation from the observation of actually existing masculine and feminine individuals. Such observation shows that in human beings pure masculinity or femininity is not to be found either in a psychological or a biological sense. Every individual on the contrary displays a mixture of the character-traits belonging to his own and to the opposite sex; and he shows a combination of activity and passivity whether or not these last character-traits tally with his biological ones.

If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object-choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common instinct of mastery, which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erotogenic zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal cathexes present analytic research with the most interesting problems.

In spite of all our efforts to prevent biological terminology and considerations from dominating psycho-analytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'instinct' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' - that is, to qualities determined not by the instincts themselves but by their aims. The regular association of these 'active' and 'passive' instincts in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psycho-analysis.
The antithesis ego - non-ego (external), i.e., subject-object, is, as we have already said, thrust upon the individual organism at an early stage, by the experience that it can silence external stimuli by means of muscular action but is defenceless against instinctual stimuli. This antithesis remains, above all, sovereign in our intellectual activity and creates for research the basic situation which no efforts can alter. The polarity of pleasure-unpleasure is attached to a scale of feelings, whose paramount importance in determining our actions (our will) has already been emphasized. The antithesis active-passive must not be confused with the antithesis ego-subject - external world-object. The relation of the ego to the external world is passive in so far as it receives stimuli from it and active when it reacts to these. It is forced by its instincts into a quite special degree of activity towards the external world, so that we might bring out the essential point if we say that the ego-subject is passive in respect of external stimuli but active through its own instincts. The antithesis active-passive coalesces later with the antithesis masculine-feminine, which, until this has taken place, has no psychological meaning. The coupling of activity with masculinity and of passivity with femininity meets us, indeed, as a biological fact; but it is by no means so invariably complete and exclusive as we are inclined to assume.

Accordingly, I can now describe to you the form taken by a child's sexual life before the establishment of the primacy of the genitals, preparations for which are made in the first period of infancy preceding the latency period and which is permanently organized from puberty onwards. A kind of loose organization which may be called 'pregenital' exists during this early period. During this phase what stand in the forefront are not the genital component instincts but the sadistic and anal ones. The contrast between 'masculine' and 'feminine' plays no part here as yet. Its place is taken by the contrast between 'active' and 'passive', which may be described as a precursor of the sexual polarity and which later on is soldered to that polarity. What appears to us as masculine in the activities of this phase, when we look at it from the point of view of the genital phase, turns out to be an expression of an instinct for mastery which easily passes over into cruelty. Trends with a passive aim are attached to the erotogenic zone of the anal orifice, which is very important at this period. The instincts for looking and for gaining knowledge are powerfully at work; the genitals actually play a part in sexual life only as organs for the excretion of urine. The component instincts of this phase are not without objects, but those objects do not necessarily converge into a single object. The sadistic-anal organization is the immediate forerunner of the phase of genital primacy. Detailed study shows how much of it is retained in the later definitive shape of things and shows too the way in which its component instincts are compelled to take their place in the new genital organization. Behind the sadistic-anal phase of libidinal development we get a glimpse of a still earlier and more primitive stage of organization, in which the erotogenic zone of the mouth plays the chief part. As you will guess, the sexual activity of sensual sucking belongs to it. We must admire the understanding of the Ancient Egyptians who, in their art, represented children, including the God Horus, with a finger in their mouth. Only recently Abraham has given examples of the traces which this primitive oral phase leaves behind it in later sexual life.
We now observe that at this point in our narrative we must make an alteration in our terminology. During the dream he had reached a new phase in his sexual organization. Up to then the sexual opposites had been for him active and passive. Since his seduction his sexual aim had been a passive one, of being touched on the genitals; it was then transformed, by regression to the earlier stage of the sadistic-anal organization, into the masochistic aim of being beaten or punished. It was a matter of indifference to him whether he reached this aim with a man or with a woman. He had travelled, without considering the difference of sex, from his Nanya to his father; he had longed to have his penis touched by his Nanya, and had tried to provoke a beating from his father. Here his genitals were left out of account; though the connection with them which had been concealed by the regression was still expressed in his phantasy of being beaten on the penis. The activation of the primal scene in the dream now brought him back to the genital organization. He discovered the vagina and the biological significance of masculine and feminine. He understood now that active was the same as masculine, while passive was the same as feminine. His passive sexual aim should now have been transformed into a feminine one, and have expressed itself as ‘being copulated with by his father’ instead of ‘being beaten by him on the genitals or on the bottom’. This feminine aim, however, underwent repression and was obliged to let itself be replaced by fear of the wolf.

I am aware of the importance attaching to the first of these questions. But one should not exaggerate it and allow it to overshadow the fact that sporadic secondary characteristics of the opposite sex are very often present in normal individuals, and that well-marked physical characteristics of the opposite sex may be found in persons whose choice of object has undergone no change in the direction of inversion; in other words, that in both sexes the degree of physical hermaphroditism is to a great extent independent of psychical hermaphroditism. In modification of these statements it must be added that this independence is more evident in men than women, where bodily and mental traits belonging to the opposite sex are apt to coincide. Still I am not in a position to give a satisfactory answer to the first of our questions about my patient. The psycho-analyst customarily forgoes a thorough physical examination of his patients in certain cases. Certainly there was no obvious deviation from the feminine physical type, nor any menstrual disturbance. The beautiful and well-made girl had, it is true, her father's tall figure, and her facial features were sharp rather than soft and girlish, traits which might be regarded as indicating a physical masculinity. Some of her intellectual attributes also could be connected with masculinity: for instance, her acuteness of comprehension and her lucid objectivity, in so far as she was not dominated by her passion. But these distinctions are conventional rather than scientific. What is certainly of greater importance is that in her behaviour towards her love-object she had throughout assumed the masculine part: that is to say, she displayed the humility and the sublime overvaluation of the sexual object so characteristic of the male lover, the renunciation of all narcissistic satisfaction, and the preference for being the lover rather than the beloved. She had thus not only chosen a feminine love-object, but had also developed a masculine attitude towards that object.

[1920a, 3844]
It is not for psycho-analysis to solve the problem of homosexuality. It must rest content with disclosing the psychical mechanisms that resulted in determining the object-choice, and with tracing back the paths from them to the instinctual dispositions. There its work ends, and it leaves the rest to biological research, which has recently brought to light, through Steinach's¹ experiments, such very important results concerning the influence exerted by the first set of characteristics mentioned above upon the second and third. Psycho-analysis has a common basis with biology, in that it presupposes an original bisexuality in human beings (as in animals). But psycho-analysis cannot elucidate the intrinsic nature of what in conventional or in biological phraseology is termed 'masculine' and 'feminine': it simply takes over the two concepts and makes them the foundation of its work. When we attempt to reduce them further, we find masculinity vanishing into activity and femininity into passivity, and that does not tell us enough. I have already tried to explain how far we may reasonably expect, or how far experience has already proved, that the work of elucidation which is part of the task of analysis furnishes us with the means of effecting a modification of inversion. When one compares the extent to which we can influence it with the remarkable transformations that Steinach has effected in some cases by his operations, it does not make a very imposing impression. But it would be premature, or a harmful exaggeration, if at this stage we were to indulge in hopes of a 'therapy' of inversion that could be generally applied. The cases of male homosexuality in which Steinach has been successful fulfilled the condition, which is not always present, of a very patent physical 'hermaphroditism'. Any analogous treatment of female homosexuality is at present quite obscure. If it were to consist in removing what are probably hermaphroditic ovaries, and in grafting others, which are hoped to be of a single sex, there would be little prospect of its being applied in practice. A woman who has felt herself to be a man, and has loved in masculine fashion, will hardly let herself be forced into playing the part of a woman, when she must pay for this transformation, which is not in every way advantageous, by renouncing all hope of motherhood.
[1920a, 3860]

It is not unimportant to bear in mind what transformations are undergone, during the sexual development of childhood, by the polarity of sex with which we are familiar. A first antithesis is introduced with the choice of object, which, of course, presupposes a subject and an object. At the stage of the pregenital sadistic-anal organization, there is as yet no question of male and female; the antithesis between active and passive is the dominant one.¹ At the following stage of infantile genital organization, which we now know about, maleness exists, but not femaleness. The antithesis here is between having a male genital and being castrated. It is not until development has reached its completion at puberty that the sexual polarity coincides with male and female. Maleness combines subject, activity and possession of the penis; femaleness takes over object and passivity. The vagina is now valued as a place of shelter for the penis; it enters into the heritage of the womb.
[1923e, 4062]
In girls the motive for the demolition of the Oedipus complex is lacking. Castration has already had its effect, which was to force the child into the situation of the Oedipus complex. Thus the Oedipus complex escapes the fate which it meets with in boys: it may be slowly abandoned or dealt with by repression, or its effects may persist far into women's normal mental life. I cannot evade the notion (though I hesitate to give it expression) that for women the level of what is ethically normal is different from what it is in men. Their super-ego is never so inexorable, so impersonal, so independent of its emotional origins as we require it to be in men. Character-traits which critics of every epoch have brought up against women - that they show less sense of justice than men, that they are less ready to submit to the great exigencies of life, that they are more often influenced in their judgements by feelings of affection or hostility - all these would be amply accounted for by the modification in the formation of their super-ego which we have inferred above. We must not allow ourselves to be deflected from such conclusions by the denials of the feminists, who are anxious to force us to regard the two sexes as completely equal in position and worth; but we shall, of course, willingly agree that the majority of men are also far behind the masculine ideal and that all human individuals, as a result of their bisexual disposition and of cross-inheritance, combine in themselves both masculine and feminine characteristics, so that pure masculinity and femininity remain theoretical constructions of uncertain content.

[1925j, 4155]

² The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being displays both male and female instinctual impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psycho-analysis that it has not yet found any link with the theory of the instincts. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life, we are prepared for the possibility that those demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love-object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week.

[1930a, 4499]
Some writers are inclined to reduce the importance of the child's first and most original libidinal impulses in favour of later developmental processes, so that - to put this view in its most extreme form - the only role left to the former is merely to indicate certain paths, while the intensities which flow along those paths are supplied by later regressions and reaction-formations. Thus, for instance, Karin Horney (1926) is of the opinion that we greatly overestimate the girl's primary penis-envy and that the strength of the masculine trend which she develops later is to be attributed to a secondary penis-envy which is used to fend off her feminine impulses and, in particular, her feminine attachment to her father. This does not tally with my impressions. Certain as is the occurrence of later reinforcements through regression and reaction-formation, and difficult as it is to estimate the relative strength of the confluent libidinal components, I nevertheless think that we should not overlook the fact that the first libidinal impulses have an intensity of their own which is superior to any that come later and which may indeed be termed incommensurable. It is undoubtedly true that there is an antithesis between the attachment to the father and the masculinity complex; it is the general antithesis that exists between activity and passivity, masculinity and femininity. But this gives us no right to assume that only one of them is primary and that the other owes its strength merely to the force of defence. And if the defence against femininity is so energetic, from what other source can it draw its strength than from the masculine trend which found its first expression in the child's penis-envy and therefore deserves to be named after it?

[1931b, 4607]

Nor will you have escaped worrying over this problem - those of you who are men; to those of you who are women this will not apply - you are yourselves the problem. When you meet a human being, the first distinction you make is 'male or female?' and you are accustomed to make the distinction with unhesitating certainty. Anatomical science shares your certainty at one point and not much further. The male sexual product, the spermatozoon, and its vehicle are male; the ovum and the organism that harbours it are female. In both sexes organs have been formed which serve exclusively for the sexual functions; they were probably developed from the same disposition into two different forms. Besides this, in both sexes the other organs, the bodily shapes and tissues, show the influence of the individual's sex, but this is inconstant and its amount variable; these are what are known as the secondary sexual characters. Science next tells you something that runs counter to your expectations and is probably calculated to confuse your feelings. It draws your attention to the fact that portions of the male sexual apparatus also appear in women's bodies, though in an atrophied state, and vice versa in the alternative case. It regards their occurrence as indications of bisexuality, as though an individual is not a man or a woman but always both - merely a certain amount more the one than the other. You will then be asked to make yourselves familiar with the idea that the proportion in which masculine and feminine are mixed in an individual is subject to quite considerable fluctuations. Since, however, apart from the very rarest cases, only one kind of sexual product - ova or semen - is nevertheless present in one person, you are bound to have doubts as to the decisive significance of those elements and must conclude that what constitutes masculinity or femininity is an unknown characteristic which anatomy cannot lay hold of.

[1933a, 4716]
Can psychology do so perhaps? We are accustomed to employ 'masculine' and 'feminine' as mental qualities as well, and have in the same way transferred the notion of bisexuality to mental life. Thus we speak of a person, whether male or female, as behaving in a masculine way in one connection and in a feminine way in another. But you will soon perceive that this is only giving way to anatomy or to convention. You cannot give the concepts of 'masculine' and 'feminine' any new connotation. The distinction is not a psychological one; when you say 'masculine', you usually mean 'active', and when you say 'feminine', you usually mean 'passive'.

Now it is true that a relation of the kind exists. The male sex-cell is actively mobile and searches out the female one, and the latter, the ovum, is immobile and waits passively. This behaviour of the elementary sexual organisms is indeed a model for the conduct of sexual individuals during intercourse. The male pursues the female for the purpose of sexual union, seizes hold of her and penetrates into her. But by this you have precisely reduced the characteristic of masculinity to the factor of aggressiveness so far as psychology is concerned. You may well doubt whether you have gained any real advantage from this when you reflect that in some classes of animals the females are the stronger and more aggressive and the male is active only in the single act of sexual union. This is so, for instance, with the spiders. Even the functions of rearing and caring for the young, which strike us as feminine par excellence, are not invariably attached to the female sex in animals. In quite high species we find that the sexes share the task of caring for the young between them or even that the male alone devotes himself to it. Even in the sphere of human sexual life you soon see how inadequate it is to make masculine behaviour coincide with activity and feminine with passivity. A mother is active in every sense towards her child; the act of lactation itself may equally be described as the mother suckling the baby or as her being sucked by it. The further you go from the narrow sexual sphere the more obvious will the 'error of superimposition' become. Women can display great activity in various directions, men are not able to live in company with their own kind unless they develop a large amount of passive adaptability. If you now tell me that these facts go to prove precisely that both men and women are bisexual in the psychological sense, I shall conclude that you have decided in your own minds to make 'active' coincide with 'masculine' and 'passive' with 'feminine'. But I advise you against it. It seems to me to serve no useful purpose and adds nothing to our knowledge.

One might consider characterizing femininity psychologically as giving preference to passive aims. This is not, of course, the same thing as passivity; to achieve a passive aim may call for a large amount of activity. It is perhaps the case that in a woman, on the basis of her share in the sexual function, a preference for passive behaviour and passive aims is carried over into her life to a greater or lesser extent, in proportion to the limits, restricted or far-reaching, within which her sexual life thus serves as a model. But we must beware in this of underestimating the influence of social customs, which similarly force women into passive situations. All this is still far from being cleared up. There is one particularly constant relation between femininity and instinctual life which we do not want to overlook. The suppression of women's aggressiveness which is prescribed for them constitutionally and imposed on them socially favours the development of powerful masochistic impulses, which succeed, as we know, in binding erotically the destructive trends which have been diverted inwards. Thus masochism, as people say, is truly feminine. But if, as happens so often, you meet with masochism in men, what is left to you but to say that these men exhibit very plain feminine traits?
And now you are already prepared to hear that psychology too is unable to solve the riddle of femininity. The explanation must no doubt come from elsewhere, and cannot come till we have learnt how in general the differentiation of living organisms into two sexes came about. We know nothing about it, yet the existence of two sexes is a most striking characteristic of organic life which distinguishes it sharply from inanimate nature. However, we find enough to study in those human individuals who, through the possession of female genitals, are characterized as manifestly or predominantly feminine. In conformity with its peculiar nature, psycho-analysis does not try to describe what a woman is - that would be a task it could scarcely perform - but sets about enquiring how she comes into being, how a woman develops out of a child with a bisexual disposition. In recent times we have begun to learn a little about this, thanks to the circumstance that several of our excellent women colleagues in analysis have begun to work at the question. The discussion of this has gained special attractiveness from the distinction between the sexes. For the ladies, whenever some comparison seemed to turn out unfavourable to their sex, were able to utter a suspicion that we, the male analysts, had been unable to overcome certain deeply-rooted prejudices against what was feminine, and that this was being paid for in the partiality of our researches. We, on the other hand, standing on the ground of bisexuality, had no difficulty in avoiding impoliteness. We had only to say: 'This doesn't apply to you. You're the exception; on this point you're more masculine than feminine.' [1933a, 4718]

It is not my intention to pursue the further behaviour of femininity through puberty to the period of maturity. Our knowledge, moreover, would be insufficient for the purpose. But I will bring a few features together in what follows. Taking its prehistory as a starting-point, I will only emphasize here that the development of femininity remains exposed to disturbance by the residual phenomena of the early masculine period. Regressions to the fixations of the pre-Oedipus phases very frequently occur; in the course of some women's lives there is a repeated alternation between periods in which masculinity or femininity gains the upper hand. Some portion of what we men call 'the enigma of women' may perhaps be derived from this expression of bisexuality in women's lives. But another question seems to have become ripe for judgement in the course of these researches. We have called the motive force of sexual life 'the libido'. Sexual life is dominated by the polarity of masculine-feminine; thus the notion suggests itself of considering the relation of the libido to this antithesis. It would not be surprising if it were to turn out that each sexuality had its own special libido appropriated to it, so that one sort of libido would pursue the aims of a masculine sexual life and another sort those of a feminine one. But nothing of the kind is true. There is only one libido, which serves both the masculine and the feminine sexual functions. To it itself we cannot assign any sex; if, following the conventional equation of activity and masculinity, we are inclined to describe it as masculine, we must not forget that it also covers trends with a passive aim. Nevertheless the juxtaposition 'feminine libido' is without any justification. Furthermore, it is our impression that more constraint has been applied to the libido when it is pressed into the service of the feminine function, and that - to speak teleologically - Nature takes less careful account of its demands than in the case of masculinity. And the reason for this may lie - thinking once again teleologically - in the fact that the accomplishment of the aim of biology has been entrusted to the aggressiveness of men and has been made to some extent independent of women's consent.
[1933a, 4733]
At this point we must give separate accounts of the development of boys and girls (of males and females), for it is now that the difference between the sexes finds psychological expression for the first time. We are faced here by the great enigma of the biological fact of the duality of the sexes: it is an ultimate fact for our knowledge, it defies every attempt to trace it back to something else. Psycho-analysis has contributed nothing to clearing up this problem, which clearly falls wholly within the province of biology. In mental life we only find reflections of this great antithesis; and their interpretation is made more difficult by the fact, long suspected, that no individual is limited to the modes of reaction of a single sex but always finds some room for those of the opposite one, just as his body bears, alongside of the fully developed organs of one sex, atrophied and often useless rudiments of those of the other. For distinguishing between male and female in mental life we make use of what is obviously an inadequate empirical and conventional equation: we call everything that is strong and active male, and everything that is weak and passive female. This fact of psychological bisexuality, too, embarrasses all our enquiries into the subject and makes them harder to describe.

[1940a [1938], 4996]
One of the generalizations put forward by Stekel concerns the double significance of genital symbols. 'Where', he asks, 'is there a symbol which - provided that the imagination by any means admits of it - cannot be employed both in a male and in a female sense?' In any case the clause in parenthesis removes much of the certainty from this assertion, since in fact the imagination does not always admit of it. But I think it is worth while remarking that in my experience Stekel's generalization cannot be maintained in the face of the greater complexity of the facts. In addition to symbols which can stand with equal frequency for the male and for the female genitals, there are some which designate one of the sexes predominantly or almost exclusively, and yet others which are known only with a male or a female meaning. For it is a fact that the imagination does not admit of long, stiff objects and weapons being used as symbols of the female genitals, or of hollow objects, such as chests, cases, boxes, etc., being used as symbols for the male ones. It is true that the tendency of dreams and of unconscious phantasies to employ sexual symbols bisexually betrays an archaic characteristic; for in childhood the distinction between the genitals of the two sexes is unknown and the same kind of genitals are attributed to both of them. But it is possible, too, to be misled into wrongly supposing that a sexual symbol is bisexual, if one forgets that in some dreams there is a general inversion of sex, so that what is male is represented as female and vice versa. Dreams of this kind may, for instance, express a woman's wish to be a man.

But, once again, in the present paper I have not gone fully into all that might be said to-day about 'somatic compliance', about the infantile germs of perversion, about the erotogenic zones, and about our predisposition towards bisexuality; I have merely drawn attention to the points at which the analysis comes into contact with these organic bases of the symptoms. More than this could not be done with a single case. And I had the same reasons that I have already mentioned for wishing to avoid a cursory discussion of these factors. There is a rich opportunity here for further works, based upon the study of a large number of analyses.

BISEXUALITY A fresh contradiction of popular views is involved in the considerations put forward by Lydston, Kiernan and Chevalier in an endeavour to account for the possibility of sexual inversion. It is popularly believed that a human being is either a man or a woman. Science, however, knows of cases in which the sexual characters are obscured, and in which it is consequently difficult to determine the sex. This arises in the first instance in the field of anatomy. The genitals of the individuals concerned combine male and female characteristics. (This condition is known as hermaphroditism.) In rare cases both kinds of sexual apparatus are found side by side fully developed (true hermaphroditism); but far more frequently both sets of organs are found in an atrophied condition.

The importance of these abnormalities lies in the unexpected fact that they facilitate our understanding of normal development. For it appears that a certain degree of anatomical hermaphroditism occurs normally. In every normal male or female individual, traces are found of the apparatus of the opposite sex. These either persist without function as rudimentary organs or become modified and take on other functions.

These long-familiar facts of anatomy lead us to suppose that an originally bisexual physical disposition has, in the course of evolution, become modified into a unisexual one, leaving behind only a few traces of the sex that has become atrophied.
It was tempting to extend this hypothesis to the mental sphere and to explain inversion in all its varieties as the expression of a psychical hermaphroditism. All that was required further in order to settle the question was that inversion should be regularly accompanied by the mental and somatic signs of hermaphroditism.

But this expectation was disappointed. It is impossible to demonstrate so close a connection between the hypothetical psychical hermaphroditism and the established anatomical one. A general lowering of the sexual instinct and a slight anatomical atrophy of the organs is found frequently in inverts (cf. Havelock Ellis, 1915). Frequently, but by no means regularly or even usually. The truth must therefore be recognized that inversion and somatic hermaphroditism are on the whole independent of each other.

A great deal of importance, too, has been attached to what are called the secondary and tertiary sexual characters and to the great frequency of the occurrence of those of the opposite sex in inverts (cf. Havelock Ellis, 1915). Much of this, again, is correct; but it should never be forgotten that in general the secondary and tertiary sexual characters of one sex occur very frequently in the opposite one. They are indications of hermaphroditism, but are not attended by any change of sexual object in the direction of inversion.

Psychical hermaphroditism would gain substance if the inversion of the sexual object were at least accompanied by a parallel change-over of the subject's other mental qualities, instincts and character traits into those marking the opposite sex. But it is only in inverted women that character-inversion of this kind can be looked for with any regularity. In men the most complete mental masculinity can be combined with inversion. If the belief in psychical hermaphroditism is to be persisted in, it will be necessary to add that its manifestations in various spheres show only slight signs of being mutually determined. Moreover the same is true of somatic hermaphroditism: according to Halban (1903),¹ occurrences of individual atrophied organs and of secondary sexual characters are to a considerable extent independent of one another.

The theory of bisexuality has been expressed in its crudest form by a spokesman of the male inverts: 'a feminine brain in a masculine body'. But we are ignorant of what characterizes a feminine brain. There is neither need nor justification for replacing the psychological problem by the anatomical one. Krafft-Ebing's attempted explanation seems to be more exactly framed than that of Ulrichs but does not differ from it in essentials. According to Krafft-Ebing (1895, 5), every individual's bisexual disposition endows him with masculine and feminine brain centres as well as with somatic organs of sex: these centres develop only at puberty, for the most part under the influence of the sex-gland, which is independent of them in the original disposition. But what has just been said of masculine and feminine brains applies equally to masculine and feminine 'centres'; and incidentally we have not even any grounds for assuming that certain areas of the brain ('centres') are set aside for the functions of sex, as is the case, for instance with those of speech.¹

Nevertheless, two things emerge from these discussions. In the first place, a bisexual disposition is somehow concerned in inversion, though we do not know in what that disposition consists, beyond anatomical structure. And secondly, we have to deal with disturbances that affect the sexual instinct in the course of its development.
It appears (from a bibliography given in the sixth volume of the *Jahrbuch für sexuelle Zwischenstufen*) that E. Gley was the first writer to suggest bisexuality as an explanation of inversion. As long ago as in January, 1884, he published a paper, 'Les aberrations de l'instinct sexuel', in the *Revue Philosophique*. It is, moreover, noteworthy that the majority of authors who derive inversion from bisexuality bring forward that factor not only in the case of invert, but also for all those who have grown up to be normal, and that, as a logical consequence, they regard inversion as the result of a disturbance in development. Chevalier (1893) already writes in this sense. Krafft-Ebing (1895, 10) remarks that there are a great number of observations 'which prove at least the virtual persistence of this second centre (that of the subordinated sex).'

A Dr. Arduin (1900) asserts that 'there are masculine and feminine elements in every human being (cf. Hirschfeld, 1899); but one set of these - according to the sex of the person in question - is incomparably more strongly developed than the other, so far as heterosexual individuals are concerned. . . .' Herman (1903) is convinced that 'masculine elements and characteristics are present in every woman and feminine ones in every man', etc. [Added 1910:] Fliesl (1906) subsequently claimed the idea of bisexuality (in the sense of *duality of sex*) as his own. [Added 1924:] In lay circles the hypothesis of human bisexuality is regarded as being due to O. Weininger, the philosopher, who died at an early age, and who made the idea the basis of a somewhat unbalanced book (1903). The particulars which I have enumerated above will be sufficient to show how little justification there is for the claim.

**Sexual Object of Inverts**

The theory of psychical hermaphroditism presupposes that the sexual object of an invert is the opposite of that of a normal person. An inverted man, it holds, is like a woman in being subject to the charm that proceeds from masculine attributes both physical and mental: he feels he is a woman in search of a man.

[Added 1915:] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.
It would be unjustifiable to assert that these interesting experiments put the theory of inversion on a new basis, and it would be hasty to expect them to offer a universal means of 'curing' homosexuality. Fliess has rightly insisted that these experimental findings do not invalidate the theory of the general bisexual disposition of the higher animals. On the contrary, it seems to me probable that further research of a similar kind will produce a direct confirmation of this presumption of bisexuality.

[1905d, 1473]

We find, then, that certain among the impulses to perversion occur regularly as pairs of opposites; and this, taken in conjunction with material which will be brought forward later, has a high theoretical significance. It is, moreover, a suggestive fact that the existence of the pair of opposites formed by sadism and masochism cannot be attributed merely to the element of aggressiveness. We should rather be inclined to connect the simultaneous presence of these opposites with the opposing masculinity and femininity which are combined in bisexuality - a contrast which often has to be replaced in psycho-analysis by that between activity and passivity.

[1905d, 1485]

Since I have become acquainted with the notion of bisexuality I have regarded it as the decisive factor, and without taking bisexuality into account I think it would scarcely be possible to arrive at an understanding of the sexual manifestations that are actually to be observed in men and women.

[1905d, 1533]

¹ [Footnote added 1915:] It is essential to understand clearly that the concepts of 'masculine' and 'feminine', whose meaning seems so unambiguous to ordinary people, are among the most confused that occur in science. It is possible to distinguish at least three uses. 'Masculine' and 'feminine' are used sometimes in the sense of activity and passivity, sometimes in a biological, and sometimes, again, in a sociological sense. The first of these three meanings is the essential one and the most serviceable in psycho-analysis. When, for instance, libido was described in the text above as being 'masculine', the word was being used in this sense, for an instinct is always active even when it has a passive aim in view. The second, or biological, meaning of 'masculine' and 'feminine' is the one whose applicability can be determined most easily. Here 'masculine' and 'feminine' are characterized by the presence of spermatozoa or ova respectively and by the functions proceeding from them. Activity and its concomitant phenomena (more powerful muscular development, aggressiveness, greater intensity of libido) are as a rule linked with biological masculinity; but they are not necessarily so, for there are animal species in which these qualities are on the contrary assigned to the female. The third, or sociological, meaning receives its connotation from the observation of actually existing masculine and feminine individuals. Such observation shows that in human beings pure masculinity or femininity is not to be found either in a psychological or a biological sense. Every individual on the contrary displays a mixture of the character-traits belonging to his own and to the opposite sex; and he shows a combination of activity and passivity whether or not these last character-traits tally with his biological ones.

[1905d, 1533]
Originally my theory related only to the clinical pictures comprised under the term 'neurasthenia', among which I was particularly struck by two, which occasionally appear as pure types and which I described as 'neurasthenia proper' and 'anxiety neurosis'. It had, to be sure, always been a matter of common knowledge that sexual factors may play a part in the causation of these forms of illness; but those factors were not regarded as invariably operative, nor was there any idea of giving them precedence over other aetiological influences. I was surprised to begin with at the frequency of gross disturbances in the \textit{vita sexualis} of nervous patients; the more I set about looking for such disturbances - bearing in mind the fact that everyone hides the truth in matters of sex - and the more skilful I became at pursuing my enquiries in the face of a preliminary denial, the more regularly was I able to discover pathogenic factors in sexual life, till little seemed to stand in the way of my assuming their universal occurrence. It was necessary, however, to presuppose from the start that sexual irregularities occurred with similar frequency in our ordinary society under the pressure of social conditions; and a doubt might remain as to the degree of deviation from normal sexual functioning which should be regarded as pathogenic. I was therefore obliged to attach less importance to the invariable evidence of sexual noxae than to a second discovery which seemed to me less ambiguous. It emerged that the form taken by the illness - neurasthenia or anxiety neurosis - bore a constant relation to the nature of the sexual noxa involved. In typical cases of neurasthenia a history of regular masturbation or persistent emissions was found; in anxiety neurosis factors appeared such as \textit{coitus interruptus}, 'unconsummated excitation', and other conditions - in all of which there seemed to be the common element of an insufficient discharge of the libido that had been produced. It was only after this discovery, which was easy to make and could be confirmed as often as one liked, that I had the courage to claim a preferential position for sexual influences in the aetiology of the neuroses. Furthermore, in the mixed forms of neurasthenia and anxiety neurosis which are so common it was possible to trace a combination of the aetiologies which I had assumed for the two pure forms. Moreover, this twofold form assumed by the neurosis seemed to tally with the polar (i.e. the masculine and feminine) character of sexuality.

The bisexual nature of hysterical symptoms, which can in any event be demonstrated in numerous cases, is an interesting confirmation of my view that the postulated existence of an innate bisexual disposition in man is especially clearly visible in the analysis of psychoneurotics.² An exactly analogous state of affairs occurs in the same field when a person who is masturbating tries in his conscious phantasies to have the feelings both of the man and of the woman in the situation which he is picturing. Further counterparts are to be found in certain hysterical attacks in which the patient simultaneously plays both parts in the underlying sexual phantasy. In one case which I observed, for instance, the patient pressed her dress up against her body with one hand (as the woman), while she tried to tear it off with the other (as the man). This simultaneity of contradictory actions serves to a large extent to obscure the situation, which is otherwise so plasticly portrayed in the attack, and it is thus well suited to conceal the unconscious phantasy that is at work.

¹ As my expectations led me to suppose, and as Sadger's observations have shown, all such people pass through an amphigenic phase in childhood.

² [1906a, 1575]

[1908a, 1938]

[1909b, 2093]
In spite of all our efforts to prevent biological terminology and considerations from dominating psycho-analytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'instinct' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' - that is, to qualities determined not by the instincts themselves but by their aims. The regular association of these 'active' and 'passive' instincts in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psycho-analysis.

[1913], 2818

Now let us take these two theories, which may be said to have in common a sexualization of the process of repression, and test them by applying them to the example of the beating phantasies which we have been studying. The original phantasy, 'I am being beaten by my father', corresponds, in the case of the boy, to a feminine attitude, and is therefore an expression of that part of his disposition which belongs to the opposite sex. If this part of him undergoes repression, the first theory seems shown to be correct; for this theory set it up as a rule that what belongs to the opposite sex is identical with the repressed. It scarcely answers to our expectations, it is true, when we find that the conscious phantasy, which arises after repression has been accomplished, nevertheless exhibits the feminine attitude once more, though this time directed towards the mother. But we will not go into such doubtful points, when the whole question can be so quickly decided. There can be no doubt that the original phantasy in the case of the girl, 'I am being beaten (i.e. I am loved) by my father', represents a feminine attitude, and corresponds to her dominant and manifest sex; according to the theory, therefore, it ought to escape repression, and there would be no need for its becoming unconscious. But as a matter of fact it does become unconscious, and is replaced by a conscious phantasy which disavows the girl's manifest sexual character. The theory is therefore useless as an explanation of beating-phantasies, and is contradicted by the facts. It might be objected that it is precisely in unmanly boys and unwomanly girls that these beating-phantasies appeared and went through these vicissitudes; or that it was a trait of femininity in the boy and of masculinity in the girl which must be made responsible for the production of a passive phantasy in the boy, and its repression in the girl. We should be inclined to agree with this view, but it would not be any the less impossible to defend the supposed relation between manifest sexual character and the choice of what is destined for repression. In the last resort we can only see that both in male and female individuals masculine as well as feminine instinctual impulses are found, and that each can equally well undergo repression and so become unconscious.

[1919e], 3660
The analysis revealed beyond all shadow of doubt that the lady-love was a substitute for her mother. It is true that the lady herself was not a mother, but then she was not the girl's first love. The first objects of her affection after the birth of her youngest brother were really mothers, women between thirty and thirty-five whom she had met with their children during summer holidays or in the family circle of acquaintances in town. Motherhood as a *sine qua non* in her love-object was later on given up, because that precondition was difficult to combine in real life with another one, which grew more and more important. The specially intense bond with her latest love had still another basis which the girl discovered quite easily one day. Her lady's slender figure, severe beauty, and downright manner reminded her of the brother who was a little older than herself. Her latest choice corresponded, therefore, not only to her feminine but also to her masculine ideal; it combined satisfaction of the homosexual tendency with that of the heterosexual one. It is well known that analysis of male homosexuals has in numerous cases revealed the same combination, which should warn us not to form too simple a conception of the nature and genesis of inversion, and to keep in mind the universal bisexuality of human beings.

In doing so she behaved just as many men do who after a first distressing experience turn their backs forever upon the faithless female sex and become woman-haters. It is related of one of the most attractive and unfortunate princely figures of our time that he became a homosexual because the lady he was engaged to marry betrayed him with another man. I do not know whether this is true historically, but an element of psychological truth lies behind the rumour. In all of us, throughout life, the libido normally oscillates between male and female objects; the bachelor gives up his men friends when he marries, and returns to club-life when married life has lost its savour. Naturally, when the swing-over is fundamental and final, we suspect the presence of some special factor which definitely favours one side or the other, and which perhaps has only waited for the appropriate moment in order to turn the choice of object in its direction.

It is well known that even in a normal person it takes a certain time before the decision in regard to the sex of the love object is finally made. Homosexual enthusiasms, exaggeratedly strong friendships tinged with sensuality, are common enough in both sexes during the first years after puberty. This was also so with our patient, but in her these tendencies undoubtedly showed themselves to be stronger, and lasted longer, than with others. In addition, these presages of later homosexuality had always occupied her *conscious* life, while the attitude arising from the Oedipus complex had remained *unconscious* and had appeared only in such signs as her tender behaviour to the little boy. As a school-girl she had been for a long time in love with a strict and unapproachable mistress, obviously a substitute mother. She had taken a specially lively interest in a number of young mothers long before her brother's birth and therefore all the more certainly long before the first reprimand from her father. From very early years, therefore, her libido had flowed in two currents, the one on the surface being one that we may unhesitatingly designate as homosexual. This latter was probably a direct and unchanged continuation of an infantile fixation on her mother. Possibly the analysis described here actually revealed nothing more than the process by which, on an appropriate occasion, the deeper heterosexual current of libido, too, was deflected into the manifest homosexual one.
It is not for psycho-analysis to solve the problem of homosexuality. It must rest content with disclosing the psychical mechanisms that resulted in determining the object-choice, and with tracing back the paths from them to the instinctual dispositions. There its work ends, and it leaves the rest to biological research, which has recently brought to light, through Steinach's¹ experiments, such very important results concerning the influence exerted by the first set of characteristics mentioned above upon the second and third. Psycho-analysis has a common basis with biology, in that it presupposes an original bisexuality in human beings (as in animals). But psycho-analysis cannot elucidate the intrinsic nature of what in conventional or in biological phraseology is termed 'masculine' and 'feminine': it simply takes over the two concepts and makes them the foundation of its work. When we attempt to reduce them further, we find masculinity vanishing into activity and femininity into passivity, and that does not tell us enough. I have already tried to explain how far we may reasonably expect, or how far experience has already proved, that the work of elucidation which is part of the task of analysis furnishes us with the means of effecting a modification of inversion. When one compares the extent to which we can influence it with the remarkable transformations that Steinach has effected in some cases by his operations, it does not make a very imposing impression. But it would be premature, or a harmful exaggeration, if at this stage we were to indulge in hopes of a 'therapy' of inversion that could be generally applied. The cases of male homosexuality in which Steinach has been successful fulfilled the condition, which is not always present, of a very patent physical 'hermaphroditism'. Any analogous treatment of female homosexuality is at present quite obscure. If it were to consist in removing what are probably hermaphroditic ovaries, and in grafting others, which are hoped to be of a single sex, there would be little prospect of its being applied in practice. A woman who has felt herself to be a man, and has loved in masculine fashion, will hardly let herself be forced into playing the part of a woman, when she must pay for this transformation, which is not in every way advantageous, by renouncing all hope of motherhood.

[1920a, 3860]

The whole subject, however, is so complicated that it will be necessary to go into it in greater detail. The intricacy of the problem is due to two factors: the triangular character of the Oedipus situation and the constitutional bisexuality of each individual.

[1923b, 3965]

It would appear, therefore, that in both sexes the relative strength of the masculine and feminine sexual dispositions is what determines whether the outcome of the Oedipus situation shall be an identification with the father or with the mother. This is one of the ways in which bisexuality takes a hand in the subsequent vicissitudes of the Oedipus complex. The other way is even more important. For one gets an impression that the simple Oedipus complex is by no means its commonest form, but rather represents a simplification or schematization which, to be sure, is often enough justified for practical purposes. Closer study usually discloses the more complete Oedipus complex, which is twofold, positive and negative, and is due to the bisexuality originally present in children: that is to say, a boy has not merely an ambivalent attitude towards his father and an affectionate object-choice towards his mother, but at the same time he also behaves like a girl and displays an affectionate feminine attitude to his father and a corresponding jealousy and hostility towards his mother. It is this complicating element introduced by bisexuality that makes it so difficult to obtain a clear view of the facts in connection with the earliest object-choices and identifications, and still more difficult to describe them intelligibly. It may even be that the ambivalence displayed in the relations to the parents should be attributed entirely to bisexuality and that it is not, as I have represented above, developed out of identification in consequence of rivalry.

[1923b, 3967]
In girls the motive for the demolition of the Oedipus complex is lacking. Castration has already had its effect, which was to force the child into the situation of the Oedipus complex. Thus the Oedipus complex escapes the fate which it meets with in boys: it may be slowly abandoned or dealt with by repression, or its effects may persist far into women's normal mental life. I cannot evade the notion (though I hesitate to give it expression) that for women the level of what is ethically normal is different from what it is in men. Their super-ego is never so inexorable, so impersonal, so independent of its emotional origins as we require it to be in men. Characteristics which critics of every epoch have brought up against women - that they show less sense of justice than men, that they are less ready to submit to the great exigencies of life, that they are more often influenced in their judgements by feelings of affection or hostility - all these would be amply accounted for by the modification in the formation of their super-ego which we have inferred above. We must not allow ourselves to be deflected from such conclusions by the denials of the feminists, who are anxious to force us to regard the two sexes as completely equal in position and worth; but we shall, of course, willingly agree that the majority of men are also far behind the masculine ideal and that all human individuals, as a result of their bisexual disposition and of cross-inheritance, combine in themselves both masculine and feminine characteristics, so that pure masculinity and femininity remain theoretical constructions of uncertain content.

[1925j, 4155]

The process of arriving at an object, which plays such an important part in mental life, takes place alongside of the organization of the libido. After the stage of auto-erotism, the first love-object in the case of both sexes is the mother; and it seems probable that to begin with a child does not distinguish its mother's organ of nutrition from its own body. Later, but still in the first years of infancy, the relation known as the Oedipus complex becomes established: boys concentrate their sexual wishes upon their mother and develop hostile impulses against their father as being a rival, while girls adopt an analogous attitude.¹ All of the different variations and consequences of the Oedipus complex are important; and the innately bisexual constitution of human beings makes itself felt and increases the number of simultaneously active tendencies. Children do not become clear for quite a long time about the differences between the sexes; and during this period of sexual researches they produce typical sexual theories which, being circumscribed by the incompleteness of their authors' own physical development, are a mixture of truth and error and fail to solve the problems of sexual life (the riddle of the Sphinx - that is, the question of where babies come from). We see, then, that a child's first object-choice is an incestuous one. The whole course of development that I have described is run through rapidly. For the most remarkable feature of the sexual life of man is its diphasic onset, its onset in two waves, with an interval between them. It reaches a first climax in the fourth or fifth year of a child's life. But thereafter this early efflorescence of sexuality passes off; the sexual impulses which have shown such liveliness are overcome by repression, and a period of latency follows, which lasts until puberty and during which the reaction-formations of morality, shame, and disgust are built up.² Of all living creatures man alone seems to show this diphasic onset of sexual growth, and it may perhaps be the biological determinant of his predisposition to neuroses. At puberty the impulses and object-relations of a child's early years become reanimated, and amongst them the emotional ties of its Oedipus complex. In the sexual life of puberty there is a struggle between the urges of early years and the inhibitions of the latency period. Before this, and while the child is at the highest point of its infantile sexual development, a genital organization of a sort is established; but only the male genitals play a part in it, and the female ones remain undiscovered. (I have described this as the period of phallic primacy.) At this stage the contrast between the sexes is not stated in terms of 'male' or 'female' but of 'possessing a penis' or 'castrated'. The castration complex which arises in this connection is of the profoundest importance in the formation alike of character and of neuroses.

[1925d, 4212]
The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and though those of perverts have been recognized it has been with moral indignation and without understanding. Looked at from the psycho-analytic standpoint, even the most eccentric and repellent perversions are explicable as manifestations of component instincts of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psycho-analysis enables us to point to some trace or other of a homosexual object-choice in everyone. If I have described children as 'polymorphously perverse', I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psycho-analysis has no concern whatever with such judgements of value.

[1925d, 4213]

Nothing, however, deserves more notice than the fact that children regularly direct their sexual wishes towards their nearest relatives - in the first place, therefore, towards their father and mother, and afterwards towards their brothers and sisters. The first object of a boy's love is his mother, and of a girl's her father (except in so far as an innate bisexual disposition favours the simultaneous presence of the contrary attitude). The other parent is felt as a disturbing rival and not infrequently viewed with strong hostility. You must understand me aright. What I mean to say is not that the child wants to be treated by its favourite parent merely with the kind of affection which we adults like to regard as the essence of the parent-child relation. No, analysis leaves us in no doubt that the child's wishes extend beyond such affection to all that we understand by sensual satisfaction - so far, that is, as the child's powers of imagination allow. It is easy to see that the child never guesses the actual facts of sexual intercourse; he replaces them by other notions derived from his own experience and feelings. As a rule his wishes culminate in the intention to bear, or in some in definable way, to procreate a baby. Boys, too, in their ignorance, do not exclude themselves from the wish to bear a baby. We give the whole of this mental structure the name of 'Oedipus complex', after the familiar Greek legend. With the end of the early sexual period it should normally be given up, should radically disintegrate and become transformed; and the results of this transformation are destined for important functions in later mental life. But as a rule this is not effected radically enough, in which case puberty brings about a revival of the complex, which may have serious consequences.

[1926e, 4355]
The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being displays both male and female instinctual impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psycho-analysis that it has not yet found any link with the theory of the instincts. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life, we are prepared for the possibility that those demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love-object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week. [1930a, 4499]

A further complication arises when the constitutional factor we call bisexuality is comparatively strongly developed in a child. For then, under the threat to the boy's masculinity by castration, his inclination becomes strengthened to diverge in the direction of femininity, to put himself instead in his mother's place and take over her role as object of his father's love. But the fear of castration makes this solution impossible as well. The boy understands that he must also submit to castration if he wants to be loved by his father as a woman. Thus both impulses, hatred of the father and being in love with the father, undergo repression. There is a certain psychological distinction in the fact that the hatred of the father is given up on account of fear of an external danger (castration), while the being in love with the father is treated as an internal instinctual danger, though fundamentally it goes back to the same external danger. [1928b, 4559]

What makes hatred of the father unacceptable is fear of the father; castration is terrible, whether as a punishment or as the price of love. Of the two factors which repress hatred of the father, the first, the direct fear of punishment and castration, may be called the normal one; its pathogenic intensification seems to come only with the addition of the second factor, the fear of the feminine attitude. Thus a strong innate bisexual disposition becomes one of the preconditions or reinforcements of neurosis. Such a disposition must certainly be assumed in Dostoevsky, and it shows itself in a viable form (as latent homosexuality) in the important part played by male friendships in his life, in his strangely tender attitude towards rivals in love and in his remarkable understanding of situations which are explicable only by repressed homosexuality, as many examples from his novels show. [1928b, 4560]

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic. [1931a, 4587]
First of all, there can be no doubt that the bisexuality, which is present, as we believe, in the innate disposition of human beings, comes to the fore much more clearly in women than in men. A man, after all, has only one leading sexual zone, one sexual organ, whereas a woman has two: the vagina - the female organ proper - and the clitoris, which is analogous to the male organ. We believe we are justified in assuming that for many years the vagina is virtually non-existent and possibly does not produce sensations until puberty. It is true that recently an increasing number of observers report that vaginal impulses are present even in these early years. In women, therefore, the main genital occurrences of childhood must take place in relation to the clitoris. Their sexual life is regularly divided into two phases, of which the first has a masculine character, while only the second is specifically feminine. Thus in female development there is a process of transition from the one phase to the other, to which there is nothing analogous in the male. A further complication arises from the fact that the clitoris, with its virile character, continues to function in later female sexual life in a manner which is very variable and which is certainly not yet satisfactorily understood. We do not, of course, know the biological basis of these peculiarities in women; and still less are we able to assign them any teleological purpose.

Nor will you have escaped worrying over this problem - those of you who are men; to those of you who are women this will not apply - you are yourselves the problem. When you meet a human being, the first distinction you make is 'male or female?' and you are accustomed to make the distinction with unhesitating certainty. Anatomical science shares your certainty at one point and not much further. The male sexual product, the spermatozoon, and its vehicle are male; the ovum and the organism that harbours it are female. In both sexes organs have been formed which serve exclusively for the sexual functions; they were probably developed from the same disposition into two different forms. Besides this, in both sexes the other organs, the bodily shapes and tissues, show the influence of the individual's sex, but this is inconstant and its amount variable; these are what are known as the secondary sexual characters. Science next tells you something that runs counter to your expectations and is probably calculated to confuse your feelings. It draws your attention to the fact that portions of the male sexual apparatus also appear in women's bodies, though in an atrophied state, and vice versa in the alternative case. It regards their occurrence as indications of bisexuality, as though an individual is not a man or a woman but always both - merely a certain amount more the one than the other. You will then be asked to make yourselves familiar with the idea that the proportion in which masculine and feminine are mixed in an individual is subject to quite considerable fluctuations. Since, however, apart from the very rarest cases, only one kind of sexual product - ova or semen - is nevertheless present in one person, you are bound to have doubts as to the decisive significance of those elements and must conclude that what constitutes masculinity or femininity is an unknown characteristic which anatomy cannot lay hold of.
Can psychology do so perhaps? We are accustomed to employ 'masculine' and 'feminine' as mental qualities as well, and have in the same way transferred the notion of bisexuality to mental life. Thus we speak of a person, whether male or female, as behaving in a masculine way in one connection and in a feminine way in another. But you will soon perceive that this is only giving way to anatomy or to convention. You cannot give the concepts of 'masculine' and 'feminine' any new connotation. The distinction is not a psychological one; when you say 'masculine', you usually mean 'active', and when you say 'feminine', you usually mean 'passive'. Now it is true that a relation of the kind exists. The male sex-cell is actively mobile and searches out the female one, and the latter, the ovum, is immobile and waits passively. This behaviour of the elementary sexual organisms is indeed a model for the conduct of sexual individuals during intercourse. The male pursues the female for the purpose of sexual union, seizes hold of her and penetrates into her. But by this you have precisely reduced the characteristic of masculinity to the factor of aggressiveness so far as psychology is concerned. You may well doubt whether you have gained any real advantage from this when you reflect that in some classes of animals the females are the stronger and more aggressive and the male is active only in the single act of sexual union. This is so, for instance, with the spiders. Even the functions of rearing and caring for the young, which strike us as feminine par excellence, are not invariably attached to the female sex in animals. In quite high species we find that the sexes share the task of caring for the young between them or even that the male alone devotes himself to it. Even in the sphere of human sexual life you soon see how inadequate it is to make masculine behaviour coincide with activity and feminine with passivity. A mother is active in every sense towards her child; the act of lactation itself may equally be described as the mother suckling the baby or as her being sucked by it. The further you go from the narrow sexual sphere the more obvious will the 'error of superimposition' become. Women can display great activity in various directions, men are not able to live in company with their own kind unless they develop a large amount of passive adaptability. If you now tell me that these facts go to prove precisely that both men and women are bisexual in the psychological sense, I shall conclude that you have decided in your own minds to make 'active' coincide with 'masculine' and 'passive' with 'feminine'. But I advise you against it. It seems to me to serve no useful purpose and adds nothing to our knowledge.

And now you are already prepared to hear that psychology too is unable to solve the riddle of femininity. The explanation must no doubt come from elsewhere, and cannot come till we have learnt how in general the differentiation of living organisms into two sexes came about. We know nothing about it, yet the existence of two sexes is a most striking characteristic of organic life which distinguishes it sharply from inanimate nature. However, we find enough to study in those human individuals who, through the possession of female genitals, are characterized as manifestly or predominantly feminine. In conformity with its peculiar nature, psycho-analysis does not try to describe what a woman is - that would be a task it could scarcely perform - but sets about enquiring how she comes into being, how a woman develops out of a child with a bisexual disposition. In recent times we have begun to learn a little about this, thanks to the circumstance that several of our excellent women colleagues in analysis have begun to work at the question. The discussion of this has gained special attractiveness from the distinction between the sexes. For the ladies, whenever some comparison seemed to turn out unfavourable to their sex, were able to utter a suspicion that we, the male analysts, had been unable to overcome certain deeply-rooted prejudices against what was feminine, and that this was being paid for in the partiality of our researches. We, on the other hand, standing on the ground of bisexuality, had no difficulty in avoiding impoliteness. We had only to say: 'This doesn't apply to you. You're the exception; on this point you're more masculine than feminine.'
It is not my intention to pursue the further behaviour of femininity through puberty to the period of maturity. Our knowledge, moreover, would be insufficient for the purpose. But I will bring a few features together in what follows. Taking its prehistory as a starting-point, I will only emphasize here that the development of femininity remains exposed to disturbance by the residual phenomena of the early masculine period. Regressions to the fixations of the pre-Oedipus phases very frequently occur; in the course of some women's lives there is a repeated alternation between periods in which masculinity or femininity gains the upper hand. Some portion of what we men call 'the enigma of women' may perhaps be derived from this expression of bisexuality in women's lives. But another question seems to have become ripe for judgement in the course of these researches. We have called the motive force of sexual life 'the libido'. Sexual life is dominated by the polarity of masculine-feminine; thus the notion suggests itself of considering the relation of the libido to this antithesis. It would not be surprising if it were to turn out that each sexuality had its own special libido appropriated to it, so that one sort of libido would pursue the aims of a masculine sexual life and another sort those of a feminine one. But nothing of the kind is true. There is only one libido, which serves both the masculine and the feminine sexual functions. To it itself we cannot assign any sex; if, following the conventional equation of activity and masculinity, we are inclined to describe it as masculine, we must not forget that it also covers trends with a passive aim. Nevertheless the juxtaposition 'feminine libido' is without any justification. Furthermore, it is our impression that more constraint has been applied to the libido when it is pressed into the service of the feminine function, and that - to speak teleologically - Nature takes less careful account of its demands than in the case of masculinity. And the reason for this may lie - thinking once again teleologically - in the fact that the accomplishment of the aim of biology has been entrusted to the aggressiveness of men and has been made to some extent independent of women's consent.

[1933a, 4733]

At this point we must give separate accounts of the development of boys and girls (of males and females), for it is now that the difference between the sexes finds psychological expression for the first time. We are faced here by the great enigma of the biological fact of the duality of the sexes: it is an ultimate fact for our knowledge, it defies every attempt to trace it back to something else. Psycho-analysis has contributed nothing to clearing up this problem, which clearly falls wholly within the province of biology. In mental life we only find reflections of this great antithesis; and their interpretation is made more difficult by the fact, long suspected, that no individual is limited to the modes of reaction of a single sex but always finds some room for those of the opposite one, just as his body bears, alongside of the fully developed organs of one sex, atrophied and often useless rudiments of those of the other. For distinguishing between male and female in mental life we make use of what is obviously an inadequate empirical and conventional equation: we call everything that is strong and active male, and everything that is weak and passive female. This fact of psychological bisexuality, too, embarrasses all our enquiries into the subject and makes them harder to describe.

[1940a [1938], 4996]
Here is one instance. It is well known that at all periods there have been, as there still are, people who can take as their sexual objects members of their own sex as well as of the opposite one, without the one trend interfering with the other. We call such people bisexuals, and we accept their existence without feeling much surprise about it. We have come to learn, however, that every human being is bisexual in this sense and that his libido is distributed, either in a manifest or a latent fashion, over objects of both sexes. But we are struck by the following point. Whereas in the first class of people the two trends have got on together without clashing, in the second and more numerous class they are in a state of irreconcilable conflict. A man's heterosexuality will not put up with any homosexuality, and vice versa. If the former is the stronger it succeeds in keeping the latter latent and forcing it away from satisfaction in reality. On the other hand, there is no greater danger for a man's heterosexual function than its being disturbed by his latent homosexuality. We might attempt to explain this by saying that each individual only has a certain quota of libido at his disposal, for which the two rival trends have to struggle. But it is not clear why the rivals do not always divide up the available quota of libido between them according to their relative strength, since they are able to do so in a number of cases. We are forced to the conclusion that the tendency to a conflict is something special, something which is newly added to the situation, irrespective of the quantity of libido. An independently-emerging tendency to conflict of this sort can scarcely be attributed to anything but the intervention of an element of free aggressiveness.
[1937c, 5038]
[Added 1915:] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

[1905d, 1473]

² [Footnote added 1919:] Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis.

[1910c, 2273]
The question of why this outburst of homosexual libido overtook the patient precisely at this period (that is, between the dates of his appointment and of his move to Dresden) cannot be answered in the absence of more precise knowledge of the story of his life. Generally speaking, every human being oscillates all through his life between heterosexual and homosexual feelings, and any frustration or disappointment in the one direction is apt to drive him over into the other. We know nothing of these factors in Schreber's case, but we must not omit to draw attention to a somatic factor which may very well have been relevant. At the time of this illness Dr. Schreber was fifty-one years old, and he had therefore reached an age which is of critical importance in sexual life. It is a period at which in women the sexual function, after a phase of intensified activity, enters upon a process of far-reaching involution; nor do men appear to be exempt from its influence, for men as well as women are subject to a 'climacteric' and to the susceptibilities to disease which go along with it.¹

In doing so she behaved just as many men do who after a first distressing experience turn their backs forever upon the faithless female sex and become woman-haters. It is related of one of the most attractive and unfortunate princely figures of our time that he became a homosexual because the lady he was engaged to marry betrayed him with another man. I do not know whether this is true historically, but an element of psychological truth lies behind the rumour. In all of us, throughout life, the libido normally oscillates between male and female objects; the bachelor gives up his men friends when he marries, and returns to club-life when married life has lost its savour. Naturally, when the swing-over is fundamental and final, we suspect the presence of some special factor which definitely favours one side or the other, and which perhaps has only waited for the appropriate moment in order to turn the choice of object in its direction.

The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and though those of perverts have been recognized it has been with moral indignation and without understanding. Looked at from the psycho-analytic standpoint, even the most eccentric and repellent perversions are explicable as manifestations of component instincts of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psycho-analysis enables us to point to some trace or other of a homosexual object-choice in everyone. If I have described children as 'polymorphously perverse', I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psycho-analysis has no concern whatever with such judgements of value.
I have said that neurotic symptoms are substitutes for sexual satisfaction, and I indicated to you that the confirmation of this assertion by the analysis of symptoms would come up against a number of difficulties. For it can only be justified if under 'sexual satisfaction' we include the satisfaction of what are called perverse sexual needs, since an interpretation of symptoms of that kind is forced upon us with surprising frequency. The claim made by homosexuals or inverts to being exceptions collapses at once when we learn that homosexual impulses are invariably discovered in every single neurotic, and that a fair number of symptoms give expression to this latent inversion. Those who call themselves homosexuals are only the conscious and manifest inverts, whose number is nothing compared to that of the latent homosexuals. We are compelled, however, to regard choice of an object of one's own sex as a divergence in erotic life which is of positively habitual occurrence, and we are learning more and more to ascribe an especially high importance to it. No doubt this does not do away with the differences between manifest homosexuality and a normal attitude; their practical significance remains, but their theoretical value is greatly diminished. We have even found that a particular disease, paranoia, which is not to be counted among the transference neuroses, regularly arises from an attempt to fend off excessively strong homosexual impulses. You will perhaps recall that one of our patients (p. 3343) behaved in her obsessional action like a man, her own husband whom she had left; neurotic women very commonly produce symptoms in this way in the character of a man. Even if this is not actually to be regarded as homosexuality, it is closely related to its preconditions.

[1916-1917, 3379]

which, up to a certain point, vary independently of one another, and are met with in different individuals in manifold permutations. Tendentious literature has obscured our view of this interrelationship by putting into the foreground, for practical reasons, the third feature (the kind of object-choice), which is the only one that strikes the layman, and in addition by exaggerating the closeness of the association between this and the first feature. Moreover, it blocks the way to a deeper insight into all that is uniformly designated as homosexuality, by rejecting two fundamental facts which have been revealed by psycho-analytic investigation. The first of these is that homosexual men have experienced a specially strong fixation on their mother; the second, that, in addition to their manifest heterosexuality, a very considerable measure of latent or unconscious homosexuality can be detected in all normal people. If these findings are taken into account, then, clearly, the supposition that nature in a freakish mood created a 'third sex' falls to the ground.

[1920a, 3859]
This is the first trace of homosexuality that we have come across in him, but it will not be the last. Little Hans seems to be a positive paragon of all the vices. [1909b, 2010]

In spite of his accesses of homosexuality, little Hans bore himself like a true man in the face of his mother’s challenge. [1909b, 2011]

¹ As my expectations led me to suppose, and as Sadger’s observations have shown, all such people pass through an amphigenic phase in childhood. [1909b, 2093]

There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as ‘the girl he was fondest of’. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.¹ [1909b, 2094]
Put away your doubts, then, and join me in a consideration of infantile sexuality from the earliest age.¹ A child's sexual instinct turns out to be put together out of a number of factors; it is capable of being divided up into numerous components which originate from various sources. Above all, it is still independent of the reproductive function, into the service of which it will later be brought. It serves for the acquisition of different kinds of pleasurable feeling, which, basing ourselves on analogies and connections, we bring together under the idea of sexual pleasure. The chief source of infantile sexual pleasure is the appropriate excitation of certain parts of the body that are especially susceptible to stimulus: apart from the genitals, these are the oral, anal and urethral orifices, as well as the skin and other sensory surfaces. Since at this first phase of infantile sexual life satisfaction is obtained from the subject's own body and extraneous objects are disregarded, we term this phase (from a word coined by Havelock Ellis) that of auto-erotism. We call the parts of the body that are important in the acquisition of sexual pleasure 'erotogenic zones'. Thumb-sucking (or sensual sucking) in the youngest infants is a good example of this auto-erotic satisfaction from an erotogenic zone. The first scientific observer of this phenomenon, a paediatrician in Budapest named Lindner (1879), already interpreted it correctly as sexual satisfaction and described exhaustively its transition to other and higher forms of sexual activity. Another sexual satisfaction at this period of life is the masturbatory excitation of the genitals, which retains so much importance in later life and by many people is never completely conquered. Alongside these and other auto-erotic activities, we find in children at a very early age manifestations of those instinctual components of sexual pleasure (or, as we like to say, of libido) which presuppose the taking of an extraneous person as an object. These instincts occur in pairs of opposites, active and passive. I may mention as the most important representatives of this group the desire to cause pain (sadism) with its passive counterpart (masochism) and the active and passive desire for looking, from the former of which curiosity branches off later on and from the latter the impulse to artistic and theatrical display. Others of a child's sexual activities already imply the making of an 'object-choice', where an extraneous person becomes the main feature, a person who owes his importance in the first instance to considerations arising from the self-preservative instinct. But at this early period of childhood difference in sex plays no decisive part as yet. Thus you can attribute some degree of homosexuality to every child without doing him an injustice. This widespread and copious but dissociated sexual life of children, in which each separate instinct pursues its own acquisition of pleasure independently of all the rest, is now brought together and organized in two main directions, so that by the end of puberty the individual's final sexual character is as a rule completely formed. On the one hand, the separate instincts become subordinated to the dominance of the genital zone, so that the whole sexual life enters the service of reproduction, and the satisfaction of the separate instincts retains its importance only as preparing for and encouraging the sexual act proper. On the other hand, object-choice pushes auto-erotism into the background, so that in the subject's erotic life all the components of the sexual instinct now seek satisfaction in relation to the person who is loved. Not all of the original sexual components, however, are admitted to take part in this final establishment of sexuality. Even before puberty extremely energetic repressions of certain instincts have been effected under the influence of education, and mental forces such as shame, disgust and morality have been set up, which, like watchmen, maintain these repressions. So that when at puberty the high tide of sexual demands is reached, it is met by these mental reactive or resistant structures like dams, which direct its flow into what are called normal channels and make it impossible for it to reactivate the instincts that have undergone repression. It is in particular the coprophilic impulses of childhood - that is to say, the desires attaching to the excreta - which are submitted the most rigorously to repression, and the same is true, furthermore, of fixation to the figures to which the child's original object-choice was attached.

[1910a, 2230]
I must now turn to consider a further complication to which I should certainly give no space if I were a man of letters engaged upon the creation of a mental state like this for a short story, instead of being a medical man engaged upon its dissection. The element to which I must now allude can only serve to obscure and efface the outlines of the fine poetic conflict which we have been able to ascribe to Dora. This element would rightly fall a sacrifice to the censorship of a writer, for he, after all, simplifies and abstracts when he appears in the character of a psychologist. But in the world of reality, which I am trying to depict here, a complication of motives, an accumulation and conjunction of mental activities - in a word, overdetermination - is the rule. For behind Dora's supervalent train of thought which was concerned with her father's relations with Frau K. there lay concealed a feeling of jealousy which had that lady as its object - a feeling, that is, which could only be based upon an affection on Dora's part for one of her own sex. It has long been known and often been pointed out that at the age of puberty boys and girls show clear signs, even in normal cases, of the existence of an affection for people of their own sex. A romantic and sentimental friendship with one of her school friends, accompanied by vows, kisses, promises of eternal correspondence, and all the sensibility of jealousy, is the common precursor of a girl's first serious passion for a man. Thenceforward, in favourable circumstances, the homosexual current of feeling often runs completely dry. But if a girl is not happy in her love for a man, the current is often set flowing again by the libido in later years and is increased up to a greater or lesser degree of intensity. If this much can be established without difficulty of healthy persons, and if we take into account what has already been said about the fuller development in neurotics of the normal germs of perversion, we shall expect to find in these latter too a fairly strong homosexual predisposition. It must, indeed, be so; for I have never yet come through a single psycho-analysis of a man or a woman without having to take into account a very considerable current of homosexuality. When, in a hysterical woman or girl, the sexual libido which is directed towards men has been energetically suppressed, it will regularly be found that the libido which is directed towards women has become vicariously reinforced and even to some extent conscious. [1905e, 1397]
Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.
PREVENTION OF INVERSION   One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion. [1905d, 1541]

TEMPORAL FACTORS   Other factors which, along with precocity, may be classed as temporal also deserve attention. The order in which the various instinctual impulses come into activity seems to be phylogenetically determined; so, too, does the length of time during which they are able to manifest themselves before they succumb to the effects of some freshly emerging instinctual impulse or to some typical repression. Variations, however, seem to occur both in temporal sequence and in duration, and these variations must exercise a determining influence upon the final result. It cannot be a matter of indifference whether a given current makes its appearance earlier or later than a current flowing in the opposite direction, for the effect of a repression cannot be undone. Divergences in the temporal sequence in which the components come together invariably produce a difference in the outcome. On the other hand, instinctual impulses which emerge with special intensity often run a surprisingly short course - as, for instance, the heterosexual attachment of persons who later become manifest homosexuals. There is no justification for the fear that trends which set in with the greatest violence in childhood will permanently dominate the adult character; it is just as likely that they will disappear and make way for an opposite tendency. ('Gestrenge Herren regieren nicht Lange.')¹

[1905d, 1551]
The conflicts of feeling in our patient which we have here enumerated separately were not independent of each other, but were bound together in pairs. His hatred of his lady was inevitably coupled with his attachment to his father, and inversely his hatred of his father with his attachment to his lady. But the two conflicts of feeling which result from this simplification - namely, the opposition between his relation to his father and to his lady, and the contradiction between his love and his hatred within each of these relations - had no connection whatever with each other, either in their content or in their origin. The first of these two conflicts corresponds to the normal vacillation between male and female which characterizes every one's choice of a love-object. It is first brought to the child's notice by the time-honoured question: 'Which do you love most, Daddy or Mummy?' and it accompanies him through his whole life, whatever may be the relative intensity of his feelings to the two sexes or whatever may be the sexual aim upon which he finally becomes fixed. But normally this opposition soon loses the character of a hard-and-fast contradiction, of an inexorable 'either-or'. Room is found for satisfying the unequal demands of both sides, although even in a normal person the higher estimation of one sex is always thrown into relief by a depreciation of the other.

It cannot be doubted that his father too came to play an important part in Leonardo's psychosexual development, and not only negatively by his absence during the boy's first childhood years, but also directly by his presence in the later part of Leonardo's childhood. No one who as a child desires his mother can escape wanting to put himself in his father's place, can fail to identify himself with him in his imagination, and later to make it his task in life to gain ascendancy over him. When Leonardo was received into his grandfather's house before he had reached the age of five, his young step-mother Albiera must certainly have taken his mother's place where his feelings were concerned, and he must have found himself in what may be called the normal relationship of rivalry with his father. As we know, a decision in favour of homosexuality only takes place round about the years of puberty. When this decision had been arrived at in Leonardo's case, his identification with his father lost all significance for his sexual life, but it nevertheless continued in other spheres of non-erotic activity. We hear that he was fond of magnificence and fine clothes, and kept servants and horses, although, in Vasari's words, 'he possessed almost nothing and did little work'. The responsibility for these tastes is not to be attributed solely to his feeling for beauty: we recognize in them at the same time a compulsion to copy and to outdo his father. His father had been a great gentleman to the poor peasant girl, and the son, therefore, never ceased to feel the spur to play the great gentleman as well, the urge 'to out-herod Herod',³ to show his father what a great gentleman really looks like.
I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

[1911c, 2430]
¹ Psychoneuroses are also very often associated with manifest inversion. In such cases the heterosexual current of feeling has undergone complete suppression. It is only fair to say that my attention was first drawn to the necessary universality of the tendency to inversion in psychoneurotics by Wilhelm Fliess of Berlin, after I had discussed its presence in individual cases. - [Added 1920:] This fact, which has not been sufficiently appreciated, cannot fail to have a decisive influence on any theory of homosexuality.

[1905d, 1491]

The literature of homosexuality usually fails to distinguish clearly enough between the questions of the choice of object on the one hand, and of the sexual characteristics and sexual attitude of the subject on the other, as though the answer to the former necessarily involved the answers to the latter. Experience, however, proves the contrary: a man with predominantly male characteristics and also masculine in his erotic life may still be inverted in respect to his object, loving only men instead of women. A man in whose character feminine attributes obviously predominate, who may, indeed, behave in love like a woman, might be expected, from this feminine attitude, to choose a man for his love-object; but he may nevertheless be heterosexual, and show no more inversion in respect to his object than an average normal man. The same is true of women; here also mental sexual character and object-choice do not necessarily coincide. The mystery of homosexuality is therefore by no means so simple as it is commonly depicted in popular expositions - 'a feminine mind, bound therefore to love a man, but unhappily attached to a masculine body; a masculine mind, irresistibly attracted by women, but, alas! imprisoned in a feminine body'. It is instead a question of three sets of characteristics, namely -

- **Physical sexual characters** (physical hermaphroditism)
- **Mental sexual characters** (masculine or feminine attitude)
- **Kind of object-choice**

which, up to a certain point, vary independently of one another, and are met with in different individuals in manifold permutations. Tendentious literature has obscured our view of this interrelationship by putting into the foreground, for practical reasons, the third feature (the kind of object-choice), which is the only one that strikes the layman, and in addition by exaggerating the closeness of the association between this and the first feature. Moreover, it blocks the way to a deeper insight into all that is uniformly designated as homosexuality, by rejecting two fundamental facts which have been revealed by psycho-analytic investigation. The first of these is that homosexual men have experienced a specially strong fixation on their mother; the second, that, in addition to their manifest heterosexuality, a very considerable measure of latent or unconscious homosexuality can be detected in all normal people. If these findings are taken into account, then, clearly, the supposition that nature in a freakish mood created a ‘third sex’ falls to the ground.

[1920a, 3859]
NATURE OF INVERSION The earliest assessments regarded inversion as an innate indication of nervous degeneracy. This corresponded to the fact that medical observers first came across it in persons suffering, or appearing to suffer, from nervous diseases. This characterization of inversion involves two suppositions, which must be considered separately: that it is innate and that it is degenerate.

DEGENERACY The attribution of degeneracy in this connection is open to the objections which can be raised against the indiscriminate use of the word in general. It has become the fashion to regard any symptom which is not obviously due to trauma or infection as a sign of degeneracy. Magnan's classification of degenerates is indeed of such a kind as not to exclude the possibility of the concept of degeneracy being applied to a nervous system whose general functioning is excellent. This being so, it may well be asked whether an attribution of 'degeneracy' is of any value or adds anything to our knowledge. It seems wiser only to speak of it where

1. several serious deviations from the normal are found together, and
2. the capacity for efficient functioning and survival seem to be severely impaired.¹

Several facts go to show that in this legitimate sense of the word inverts cannot be regarded as degenerate:

1. Inversion is found in people who exhibit no other serious deviations from the normal.
2. It is similarly found in people whose efficiency is unimpaired, and who are indeed distinguished by specially high intellectual development and ethical culture.¹
3. If we disregard the patients we come across in our medical practice, and cast our eyes round a wider horizon, we shall come in two directions upon facts which make it impossible to regard inversion as a sign of degeneracy:
   (a) Account must be taken of the fact that inversion was a frequent phenomenon - one might almost say an institution charged with important functions - among the peoples of antiquity at the height of their civilization.
   (b) It is remarkably widespread among many savage and primitive races, whereas the concept of degeneracy is usually restricted to states of high civilization (cf. Bloch); and, even amongst the civilized peoples of Europe, climate and race exercise the most powerful influence on the prevalence of inversion and upon the attitude adopted towards it.²

¹ It must be allowed that the spokesmen of 'Uranism' are justified in asserting that some of the most prominent men in all recorded history were inverts and perhaps even absolute inverts.²

[1905d, 1467]
INNATE CHARACTER   As may be supposed, innateness is only attributed to the first, most extreme, class of inverts, and the evidence for it rests upon assurances given by them that at no time in their lives has their sexual instinct shown any sign of taking another course. The very existence of the two other classes, and especially the third, is difficult to reconcile with the hypothesis of the innateness of inversion. This explains why those who support this view tend to separate out the group of absolute inverts from all the rest, thus abandoning any attempt at giving an account of inversion which shall have universal application. In the view of these authorities inversion is innate in one group of cases, while in others it may have come about in other ways.
[1905d, 1468]

The reverse of this view is represented by the alternative one that inversion is an acquired character of the sexual instinct. This second view is based on the following considerations:

(1) In the case of many inverts, even absolute ones, it is possible to show that very early in their lives a sexual impression occurred which left a permanent after-effect in the shape of a tendency to homosexuality.

(2) In the case of many others, it is possible to point to external influences in their lives, whether of a favourable or inhibiting character, which have led sooner or later to a fixation of their inversion. (Such influences are exclusive relations with persons of their own sex, comradeship in war, detention in prison, the dangers of heterosexual intercourse, celibacy, sexual weakness, etc.)

(3) Inversion can be removed by hypnotic suggestion, which would be astonishing in an innate characteristic.
[1905d, 1469]

In view of these considerations it is even possible to doubt the very existence of such a thing as innate inversion. It can be argued (cf. Havelock Ellis ) that, if the cases of allegedly innate inversion were more closely examined, some experience of their early childhood would probably come to light which had a determining effect upon the direction taken by their libido. This experience would simply have passed out of the subject's conscious recollection, but could be recalled to his memory under appropriate influence. In the opinion of these writers inversion can only be described as a frequent variation of the sexual instinct, which can be determined by a number of external circumstances in the subject's life.
[1905d, 1469]

EXPLANATION OF INVERSION   The nature of inversion is explained neither by the hypothesis that it is innate nor by the alternative hypothesis that it is acquired. In the former case we must ask in what respect it is innate, unless we are to accept the crude explanation that everyone is born with his sexual instinct attached to a particular sexual object. In the latter case it may be questioned whether the various accidental influences would be sufficient to explain the acquisition of inversion without the co-operation of something in the subject himself. As we have already shown, the existence of this last factor is not to be denied.
[1905d, 1469]
Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²

[1910c, 2273]
Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²

¹ [Footnote added 1919:] Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis.

² [Footnote added 1919:]
On the whole, indeed, when we come to think of it, we are not quite at a loss in regard to what it is that people call sexual. Something which combines a reference to the contrast between the sexes, to the search for pleasure, to the reproductive function and to the characteristic of something that is improper and must be kept secret - some such combination will serve for all practical purposes in everyday life. But for science that is not enough. By means of careful investigations (only made possible, indeed, by disinterested self-discipline) we have come to know groups of individuals whose 'sexual life' deviates in the most striking way from the usual picture of the average. Some of these 'perverse' people have, we might say, struck the distinction between the sexes off their programme. Only members of their own sex can rouse their sexual wishes; those of the other sex, and especially their sexual parts, are not a sexual object for them at all, and in extreme cases are an object of disgust. This implies, of course, that they have abandoned any share in reproduction. We call such people homosexuals or inverts. They are men and women who are often, though not always, irreproachably fashioned in other respects, of high intellectual and ethical development, the victims only of this one fatal deviation. Through the mouth of their scientific spokesmen they represent themselves as a special variety of the human species - a 'third sex' which has a right to stand on an equal footing beside the other two. We shall perhaps have an opportunity of examining their claims critically. Of course they are not, as they also like to assert, an 'elite' of mankind; there are at least as many inferior and useless individuals among them as there are among those of a different sexual kind. (1916-1917, 3376)

which, up to a certain point, vary independently of one another, and are met with in different individuals in manifold permutations. Tendentious literature has obscured our view of this interrelationship by putting into the foreground, for practical reasons, the third feature (the kind of object-choice), which is the only one that strikes the layman, and in addition by exaggerating the closeness of the association between this and the first feature. Moreover, it blocks the way to a deeper insight into all that is uniformly designated as homosexuality, by rejecting two fundamental facts which have been revealed by psycho-analytic investigation. The first of these is that homosexual men have experienced a specially strong fixation on their mother; the second, that, in addition to their manifest heterosexuality, a very considerable measure of latent or unconscious homosexuality can be detected in all normal people. If these findings are taken into account, then, clearly, the supposition that nature in a freakish mood created a 'third sex' falls to the ground. (1920a, 3859)
The theory of bisexuality has been expressed in its crudest form by a spokesman of the male invert: ‘a feminine brain in a masculine body’. But we are ignorant of what characterizes a feminine brain. There is neither need nor justification for replacing the psychological problem by the anatomical one. Krafft-Ebing’s attempted explanation seems to be more exactly framed than that of Ulrichs but does not differ from it in essentials. According to Krafft-Ebing (1895, 5), every individual’s bisexual disposition endows him with masculine and feminine brain centres as well as with somatic organs of sex: these centres develop only at puberty, for the most part under the influence of the sex-gland, which is independent of them in the original disposition. But what has just been said of masculine and feminine brains applies equally to masculine and feminine ‘centres’; and incidentally we have not even any grounds for assuming that certain areas of the brain (‘centres’) are set aside for the functions of sex, as is the case, for instance with those of speech.¹

The literature of homosexuality usually fails to distinguish clearly enough between the questions of the choice of object on the one hand, and of the sexual characteristics and sexual attitude of the subject on the other, as though the answer to the former necessarily involved the answers to the latter. Experience, however, proves the contrary: a man with predominantly male characteristics and also masculine in his erotic life may still be inverted in respect to his object, loving only men instead of women. A man in whose character feminine attributes obviously predominate, who may, indeed, behave in love like a woman, might be expected, from this feminine attitude, to choose a man for his love-object; but he may nevertheless be heterosexual, and show no more inversion in respect to his object than an average normal man. The same is true of women; here also mental sexual character and object-choice do not necessarily coincide. The mystery of homosexuality is therefore by no means so simple as it is commonly depicted in popular expositions - ‘a feminine mind, bound therefore to love a man, but unhappily attached to a masculine body; a masculine mind, irresistibly attracted by women, but, alas! imprisoned in a feminine body’. It is instead a question of three sets of characteristics, namely -

**Physical sexual characters**
(physical hermaphroditism)

**Mental sexual characters**
(masculine or feminine attitude)

**Kind of object-choice**

which, up to a certain point, vary independently of one another, and are met with in different individuals in manifold permutations. Tendentious literature has obscured our view of this interrelationship by putting into the foreground, for practical reasons, the third feature (the kind of object-choice), which is the only one that strikes the layman, and in addition by exaggerating the closeness of the association between this and the first feature. Moreover, it blocks the way to a deeper insight into all that is uniformly designated as homosexuality, by rejecting two fundamental facts which have been revealed by psycho-analytic investigation. The first of these is that homosexual men have experienced a specially strong fixation on their mother; the second, that, in addition to their manifest heterosexuality, a very considerable measure of latent or unconscious homosexuality can be detected in all normal people. If these findings are taken into account, then, clearly, the supposition that nature in a freakish mood created a ‘third sex’ falls to the ground.

[1920a, 3859]
There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of'. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.¹

[1909b, 2094]
BEHAVIOUR OF INVERTS  Such people vary greatly in their behaviour in several respects.

(a) They may be absolute inverts. In that case their sexual objects are exclusively of their own sex. Persons of the opposite sex are never the object of their sexual desire, but leave them cold, or even arouse sexual aversion in them. As a consequence of this aversion, they are incapable, if they are men, of carrying out the sexual act, or else they derive no enjoyment from it.

(b) They may be amphigonic inverts, that is psychosexual hermaphrodites. In that case their sexual objects may equally well be of their own or of the opposite sex. This kind of inversion thus lacks the characteristic of exclusiveness.

(c) They may be contingent inverts. In that case, under certain external conditions - of which inaccessibility of any normal sexual object and imitation are the chief - they are capable of taking as their sexual object someone of their own sex and of deriving satisfaction from sexual intercourse with him.

Again, inverts vary in their views as to the peculiarity of their sexual instinct. Some of them accept their inversion as something in the natural course of things, just as a normal person accepts the direction of his libido, and insist energetically that inversion is as legitimate as the normal attitude; others rebel against their inversion and feel it as a pathological compulsion.¹

Other variations occur which relate to questions of time. The trait of inversion may either date back to the very beginning, as far back as the subject's memory reaches, or it may not have become noticeable till some particular time before or after puberty.² It may either persist throughout life, or it may go into temporary abeyance, or again it may constitute an episode on the way to a normal development. It may even make its first appearance late in life after a long period of normal sexual activity. A periodic oscillation between a normal and an inverted sexual object has also sometimes been observed. Those cases are of particular interest in which the libido changes over to an inverted sexual object after a distressing experience with a normal one.

As a rule these different kinds of variations are found side by side independently of one another. It is, however, safe to assume that the most extreme form of inversion will have been present from a very early age and that the person concerned will feel at one with his peculiarity.

Many authorities would be unwilling to class together all the various cases which I have enumerated and would prefer to lay stress upon their differences rather than their resemblances, in accordance with their own preferred view of inversion. Nevertheless, though the distinctions cannot be disputed, it is impossible to overlook the existence of numerous intermediate examples of every type, so that we are driven to conclude that we are dealing with a connected series.

² Many writers have insisted with justice that the dates assigned by inverts themselves for the appearance of their tendency to inversion are untrustworthy, since they may have repressed the evidence of their heterosexual feelings from their memory. [Added 1910:] These suspicions have been confirmed by psycho-analysis in those cases of inversion to which it has had access; it has produced decisive alterations in their anamnesis by filling in their infantile amnesia.

SEXUAL OBJECT OF INVERTS  The theory of psychical hermaphroditism presupposes that the sexual object of an invert is the opposite of that of a normal person. An inverted man, it holds, is like a woman in being subject to the charm that proceeds from masculine attributes both physical and mental: he feels he is a woman in search of a man.
But however well this applies to quite a number of inverts, it is, nevertheless, far from revealing a universal characteristic of inversion. There can be no doubt that a large proportion of male inverts retain the mental quality of masculinity, that they possess relatively few of the secondary characters of the opposite sex and that what they look for in their sexual object are in fact feminine mental traits. If this were not so, how would it be possible to explain the fact that male prostitutes who offer themselves to inverts - to-day just as they did in ancient times imitate women in all the externals of their clothing and behaviour? Such imitation would otherwise inevitably clash with the ideal of the inverts. It is clear that in Greece, where the most masculine men were numbered among the inverts, what excited a man's love was not the masculine character of a boy, but his physical resemblance to a woman as well as his feminine mental qualities - his shyness, his modesty and his need for instruction and assistance. As soon as the boy became a man he ceased to be a sexual object for men and himself, perhaps, became a lover of boys. In this instance, therefore, as in many others, the sexual object is not someone of the same sex but someone who combines the characters of both sexes; there is as, it were, a compromise between an impulse that seeks for a man and one that seeks for a woman, while it remains a paramount condition that the object's body (i.e. genitals) shall be masculine. Thus the sexual object is a kind of reflection of the subject's own bisexual nature.¹

[Added 1920:] Ferenczi (1914) has brought forward a number of interesting points on the subject of inversion. He rightly protests that, because they have in common the symptom of inversion, a large number of conditions, which are very different from one another and which are of unequal importance both in organic and psychical respects, have been thrown together under the name of 'homosexuality' (or, to follow him in giving it a better name, 'homo-erotism'). He insists that a sharp distinction should at least be made between two types: 'subject homo-erotics', who feel and behave like women, and 'object homo-erotics', who are completely masculine and who have merely exchanged a female for a male object. The first of these two types he recognizes as true 'sexual intermediates' in Hirschfeld's sense of the word; the second he describes, less happily, as obsessional neurotics. According to him, it is only in the case of object homo-erotics that there is any question of their struggling against their inclination to inversion or of the possibility of their being influenced psychologically. While granting the existence of these two types, we may add that there are many people in whom a certain quantity of subject homo-erotism is found in combination with a proportion of object homo-erotism.

[1905d, 1473]

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

[1908d, 1961]
If we reflect on the concurrence in Leonardo of his over-powerful instinct for research and the atrophy of his sexual life (which was restricted to what is called ideal homosexuality) we shall be disposed to claim him as a model instance of our third type. The core of his nature, and the secret of it, would appear to be that after his curiosity had been activated in infancy in the service of sexual interests he succeeded in sublimating the greater part of his libido into an urge for research. But it is not easy, to be sure, to prove that this view is right. To do so we should need some picture of his mental development in the first years of his childhood, and it seems foolish to hope for material of that sort when the accounts of his life are so meagre and so unreliable, and when moreover it is a question of information about circumstances that escape the attention of observers even in relation to people of our own generation.
[1910c, 2257]

If we examine with the eyes of a psycho-analyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall having come across the same sort of thing in many places, for example in dreams; so that we may venture to translate the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, 'coda', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages; the situation in the phantasy, of a vulture opening the child's mouth and beating about inside it vigorously with its tail, corresponds to the idea of an act of fellatio, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).
[1910c, 2262]

Now we understand why Leonardo assigned the memory of his supposed experience with the vulture to his suckling period. What the phantasy conceals is merely a reminiscence of sucking - or being suckled - at his mother's breast, a scene of human beauty that he, like so many artists, undertook to depict with his brush, in the guise of the mother of God and her child. There is indeed another point which we do not yet understand and which we must not lose sight of: this reminiscence, which has the same importance for both sexes, has been transformed by the man Leonardo into a passive homosexual phantasy. For the time being we shall put aside the question of what there may be to connect homosexuality with sucking at the mother's breast, merely recalling that tradition does in fact represent Leonardo as a man with homosexual feelings. In this connection, it is irrelevant to our purpose whether the charge brought against the young Leonardo was justified or not. What decides whether we describe someone as an invert is not his actual behaviour, but his emotional attitude.
[1910c, 2263]

We are far from wishing to exaggerate the importance of these explanations of the psychical genesis of homosexuality. It is quite obvious that they are in sharp contrast to the official theories of those who speak for homosexuals, but we know that they are not sufficiently comprehensive to make a conclusive explanation of the problem possible. What is for practical reasons called homosexuality may arise from a whole variety of psychosexual inhibitory processes; the particular process we have singled out is perhaps only one among many, and is perhaps related to only one type of 'homosexuality'. We must also admit that the number of cases of our homosexual type in which it is possible to point to the determinants which we require far exceeds the number of those where the deduced effect actually, takes place; We should not have had any cause at all for entering into the psychical genesis of the form of homosexuality we have studied if there were not a strong presumption that Leonardo, whose phantasy of the vulture was our starting point, was himself a homosexual of this very type.
[1910c, 2275]
This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a *horror feminae*. [1922b, 3909]
Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

Ferenczi (1914) has brought forward a number of interesting points on the subject of inversion. He rightly protests that, because they have in common the symptom of inversion, a large number of conditions, which are very different from one another and which are of unequal importance both in organic and psychical respects, have been thrown together under the name of 'homosexuality' (or, to follow him in giving it a better name, 'homo-erotism'). He insists that a sharp distinction should at least be made between two types: 'subject homo-erotics', who feel and behave like women, and 'object homo-erotics', who are completely masculine and who have merely exchanged a female for a male object. The first of these two types he recognizes as true 'sexual intermediates' in Hirschfeld's sense of the word; the second he describes, less happily, as obsessional neurotics. According to him, it is only in the case of object homo-erotics that there is any question of their struggling against their inclination to inversion or of the possibility of their being influenced psychologically. While granting the existence of these two types, we may add that there are many people in whom a certain quantity of subject homo-erotism is found in combination with a proportion of object homo-erotism.
There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of'. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.

[1909b, 2094]

Now we understand why Leonardo assigned the memory of his supposed experience with the vulture to his suckling period. What the phantasy conceals is merely a reminiscence of sucking - or being suckled - at his mother's breast, a scene of human beauty that he, like so many artists, undertook to depict with his brush, in the guise of the mother of God and her child. There is indeed another point which we do not yet understand and which we must not lose sight of: this reminiscence, which has the same importance for both sexes, has been transformed by the man Leonardo into a passive homosexual phantasy. For the time being we shall put aside the question of what there may be to connect homosexuality with sucking at the mother's breast, merely recalling that tradition does in fact represent Leonardo as a man with homosexual feelings. In this connection, it is irrelevant to our purpose whether the charge brought against the young Leonardo was justified or not. What decides whether we describe someone as an invert is not his actual behaviour, but his emotional attitude.

[1910c, 2263]
The literature of homosexuality usually fails to distinguish clearly enough between the questions of the choice of object on the one hand, and of the sexual characteristics and sexual attitude of the subject on the other, as though the answer to the former necessarily involved the answers to the latter. Experience, however, proves the contrary: a man with predominantly male characteristics and also masculine in his erotic life may still be inverted in respect to his object, loving only men instead of women. A man in whose character feminine attributes obviously predominate, who may, indeed, behave in love like a woman, might be expected, from this feminine attitude, to choose a man for his love-object; but he may nevertheless be heterosexual, and show no more inversion in respect to his object than an average normal man. The same is true of women; here also mental sexual character and object-choice do not necessarily coincide. The mystery of homosexuality is therefore by no means so simple as it is commonly depicted in popular expositions - ‘a feminine mind, bound therefore to love a man, but unhappily attached to a masculine body; a masculine mind, irresistibly attracted by women, but, alas! imprisoned in a feminine body’. It is instead a question of three sets of characteristics, namely -

<table>

<th>Kind of object-choice</th>
</tr>
</thead>
<tbody>
<tr>
<td>(physical hermaphroditism)</td>
<td>(masculine or feminine attitude)</td>
<td></td>
</tr>
</tbody>
</table>

which, up to a certain point, vary independently of one another, and are met with in different individuals in manifold permutations. Tendentious literature has obscured our view of this interrelationship by putting into the foreground, for practical reasons, the third feature (the kind of object-choice), which is the only one that strikes the layman, and in addition by exaggerating the closeness of the association between this and the first feature. Moreover, it blocks the way to a deeper insight into all that is uniformly designated as homosexuality, by rejecting two fundamental facts which have been revealed by psycho-analytic investigation. The first of these is that homosexual men have experienced a specially strong fixation on their mother; the second, that, in addition to their manifest heterosexuality, a very considerable measure of latent or unconscious homosexuality can be detected in all normal people. If these findings are taken into account, then, clearly, the supposition that nature in a freakish mood created a 'third sex' falls to the ground.

[1920a, 3859]
It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take *themselves* as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom *they* may love as their mother loved *them*. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

[1905d, 1473]

TEMPORAL FACTORS Other factors which, along with precocity, may be classed as temporal also deserve attention. The order in which the various instinctual impulses come into activity seems to be phylogenetically determined; so, too, does the length of time during which they are able to manifest themselves before they succumb to the effects of some freshly emerging instinctual impulse or to some typical repression. Variations, however, seem to occur both in temporal sequence and in duration, and these variations must exercise a determining influence upon the final result. It cannot be a matter of indifference whether a given current makes its appearance earlier or later than a current flowing in the opposite direction, for the effect of a repression cannot be undone. Divergences in the temporal sequence in which the components come together invariably produce a difference in the outcome. On the other hand, instinctual impulses which emerge with special intensity often run a surprisingly short course - as, for instance, the heterosexual attachment of persons who later become manifest homosexuals. There is no justification for the fear that trends which set in with the greatest violence in childhood will permanently dominate the adult character; it is just as likely that they will disappear and make way for an opposite tendency. (‘Gestrenge Herren regieren nicht Lange.’)

[1905d, 1551]
Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

CONCLUSION

It will be seen that we are not in a position to base a satisfactory explanation of the origin of inversion upon the material at present before us. Nevertheless our investigation has put us in possession of a piece of knowledge which may turn out to be of greater importance to us than the solution of that problem. It has been brought to our notice that we have been in the habit of regarding the connection between the sexual instinct and the sexual object as more intimate than it in fact is. Experience of the cases that are considered abnormal has shown us that in them the sexual instinct and the sexual object are merely soldered together - a fact which we have been in danger of overlooking in consequence of the uniformity of the normal picture, where the object appears to form part and parcel of the instinct. We are thus warned to loosen the bond that exists in our thoughts between instinct and object. It seems probable that the sexual instinct is in the first instance independent of its object; nor is its origin likely to be due to its object's attractions.
PREVENTION OF INVERSION  One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child’s love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion. [1905d, 1541]

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality. [1908d, 1961]
There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of'. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.¹

¹ [Footnote added 1923:] I have subsequently (1923e) drawn attention to the fact that the period of sexual development which our little patient was passing through is universally characterized by acquaintance with only one sort of genital organ, namely, the male one. In contrast to the later period of maturity, this period is marked not by a genital primacy but by a primacy of the phallus. [1909b, 2094]

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'² play the part of people who carry out an act of castration on the female genital organ.

² [Footnote added 1919:] Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis.

[1910c, 2273]
We are far from wishing to exaggerate the importance of these explanations of the psychical genesis of homosexuality. It is quite obvious that they are in sharp contrast to the official theories of those who speak for homosexuals, but we know that they are not sufficiently comprehensive to make a conclusive explanation of the problem possible. What is for practical reasons called homosexuality may arise from a whole variety of psychosexual inhibitory processes; the particular process we have singled out is perhaps only one among many, and is perhaps related to only one type of 'homosexuality'. We must also admit that the number of cases of our homosexual type in which it is possible to point to the determinants which we require far exceeds the number of those where the deduced effect actually, takes place; We should not have had any cause at all for entering into the psychical genesis of the form of homosexuality we have studied if there were not a strong presumption that Leonardo, whose phantasy of the vulture was our starting point, was himself a homosexual of this very type. [1910c, 2275]

I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotic to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence. [1911c, 2430]

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to esprit de corps and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensuous acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts. [1911c, 2431]
Homosexual object-choice originally lies closer to narcissism than does the heterosexual kind. When it is a question, therefore, of repelling an undesirably strong homosexual impulse, the path back to narcissism is made particularly easy. Hitherto I have had very little opportunity of talking to you about the foundations of erotic life so far as we have discovered them, and it is too late now to catch up on the omission. This much, however, I can emphasize to you. Object-choice, the step forward in the development of the libido which is made after the narcissistic stage, can take place according to two different types: either according to the narcissistic type, where the subject's own ego is replaced by another one that is as similar as possible, or according to the attachment type, where people who have become precious through satisfying the other vital needs are chosen as objects by the libido as well. A strong libidinal fixation to the narcissistic type of object-choice is to be included in the predisposition to manifest homosexuality.

[1916-1917, 3470]

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is 'taken on lease' from the rectum: in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.

[1933a, 4706]

This process is not always performed faultlessly. Inhibitions in its development manifest themselves as the many sorts of disturbance in sexual life. When this is so, we find fixations of the libido to conditions in earlier phases, whose urge, which is independent of the normal sexual aim, is described as perversion. One such developmental inhibition, for instance, is homosexuality when it is manifest. Analysis shows that in every case a homosexual object-tie was present and in most cases persisted in a latent condition. The situation is complicated by the fact that as a rule the processes necessary for bringing about a normal outcome are not completely present or absent, but partially present, so that the final result remains dependent on these quantitative relations. In these circumstances the genital organization is, it is true, attained, but it lacks those portions of the libido which have not advanced with the rest and have remained fixated to pregenital objects and aims. This weakening shows itself in a tendency, if there is an absence of genital satisfaction or if there are difficulties in the real external world, for the libido to hark back to its earlier pregenital cathexes (regression).

[1940a [1938], 4966]
Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

During the last few years work carried out by biologists, notably by Steinach, has thrown a strong light on the organic determinants of homo-erotism and of sexual characters in general. By carrying out experimental castration and subsequently grafting the sex-glands of the opposite sex, it was possible in the case of various species of mammals to transform a male into a female and vice versa. The transformation affected more or less completely both the somatic sexual characters and the psychosexual attitude (that is, both subject and object erotism). It appeared that the vehicle of the force which thus acted as a sex-determinant was not the part of the sex-gland which forms the sex-cells but what is known as its interstitial tissue (the 'puberty-gland'). In one case this transformation of sex was actually effected in a man who had lost his testes owing to tuberculosis. In his sexual life he behaved in a feminine manner, as a passive homosexual, and exhibited very clearly marked feminine sexual characters of a secondary kind (e.g. in regard to growth of hair and beard and deposits of fat on the breasts and hips). After an undescended testis from another male patient had been grafted into him, he began to behave in a masculine manner and to direct his libido towards women in a normal way. Simultaneously his somatic feminine characters disappeared. (Lipschütz, 1919, 356-7.)
It would be unjustifiable to assert that these interesting experiments put the theory of inversion on a new basis, and it would be hasty to expect them to offer a universal means of 'curing' homosexuality. Fliess has rightly insisted that these experimental findings do not invalidate the theory of the general bisexual disposition of the higher animals. On the contrary, it seems to me probable that further research of a similar kind will produce a direct confirmation of this presumption of bisexuality.

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or inverts, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

More pronounced forms of the perversions and of homosexuality, especially if they are exclusive, do, it is true, make those subject to them socially useless and unhappy, so that it must be recognized that the cultural requirements even of the second stage are a source of suffering for a certain proportion of mankind. The fate of these people who differ constitutionally from the rest varies, and depends on whether they have been born with a sexual instinct which by absolute standards is strong or comparatively weak. In the latter case - where the sexual instinct is in general weak - perverts succeed in totally suppressing the inclinations which bring them into conflict with the moral demands of their stage of civilization. But this, from the ideal point of view, is also the only thing they succeed in achieving; for, in order to effect this suppression of their sexual instinct, they use up the forces which they would otherwise employ in cultural activities. They are, as it were, inwardly inhibited and outwardly paralysed. What we shall be saying again later on about the abstinence demanded of men and women in the third stage of civilization applies to them too.

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.
Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a ‘third sex’ and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis.

We are far from wishing to exaggerate the importance of these explanations of the psychical genesis of homosexuality. It is quite obvious that they are in sharp contrast to the official theories of those who speak for homosexuals, but we know that they are not sufficiently comprehensive to make a conclusive explanation of the problem possible. What is for practical reasons called homosexuality may arise from a whole variety of psychosexual inhibitory processes; the particular process we have singled out is perhaps only one among many, and is perhaps related to only one type of ‘homosexuality’. We must also admit that the number of cases of our homosexual type in which it is possible to point to the determinants which we require far exceeds the number of those where the deduced effect actually, takes place; We should not have had any cause at all for entering into the psychical genesis of the form of homosexuality we have studied if there were not a strong presumption that Leonardo, whose phantasy of the vulture was our starting point, was himself a homosexual of this very type.

(b) If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object-choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common instinct of mastery, which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erotogenic zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal cathexes present analytic research with the most interesting problems.

Readers unversed in psycho-analysis will long have been awaiting an answer to two other questions. Did this homosexual girl show physical characteristics plainly belonging to the opposite sex, and did the case prove to be one of congenital or acquired (later-developed) homosexuality?
I am aware of the importance attaching to the first of these questions. But one should not exaggerate it and allow it to overshadow the fact that sporadic secondary characteristics of the opposite sex are very often present in normal individuals, and that well-marked physical characteristics of the opposite sex may be found in persons whose choice of object has undergone no change in the direction of inversion; in other words, that in both sexes the degree of physical hermaphroditism is to a great extent independent of psychical hermaphroditism. In modification of these statements it must be added that this independence is more evident in men than women, where bodily and mental traits belonging to the opposite sex are apt to coincide. Still I am not in a position to give a satisfactory answer to the first of our questions about my patient. The psycho-analyst customarily forgoes a thorough physical examination of his patients in certain cases. Certainly there was no obvious deviation from the feminine physical type, nor any menstrual disturbance. The beautiful and well-made girl had, it is true, her father's tall figure, and her facial features were sharp rather than soft and girlish, traits which might be regarded as indicating a physical masculinity. Some of her intellectual attributes also could be connected with masculinity: for instance, her acuteness of comprehension and her lucid objectivity, in so far as she was not dominated by her passion. But these distinctions are conventional rather than scientific. What is certainly of greater importance is that in her behaviour towards her love-object she had throughout assumed the masculine part: that is to say, she displayed the humility and the sublime overvaluation of the sexual object so characteristic of the male lover, the renunciation of all narcissistic satisfaction, and the preference for being the lover rather than the beloved. She had thus not only chosen a feminine love-object, but had also developed a masculine attitude towards that object.

The analysis showed, further, that the girl had brought along with her from her childhood a strongly marked 'masculinity complex'. A spirited girl, always ready for romping and fighting, she was not at all prepared to be second to her slightly older brother; after inspecting his genital organs she had developed a pronounced envy for the penis, and the thoughts derived from this envy still continued to fill her mind. She was in fact a feminist; she felt it to be unjust that girls should not enjoy the same freedom as boys, and rebelled against the lot of woman in general. At the time of the analysis the idea of pregnancy and child-birth was disagreeable to her, partly, I surmise, on account of the bodily disfigurement connected with them. Her girlish narcissism had fallen back on this defence,¹ and ceased to express itself as pride in her good looks. Various clues indicated that she must formerly have had strong exhibitionist and scopophilic tendencies. Anyone who is anxious that the claims of acquired as opposed to hereditary factors should not be under-estimated in aetiology will call attention to the fact that the girl's behaviour, as described above, was exactly what would follow from the combined effect in a person with a strong mother-fixation of the two influences of her mother's neglect and her comparison of her genital organs with her brother's. It is possible here to attribute to the impress of the operation of external influence in early life something which one would have liked to regard as a constitutional peculiarity. On the other hand, a part even of this acquired disposition (if it was really acquired) has to be ascribed to inborn constitution. So we see in practice a continual mingling and blending of what in theory we should try to separate into a pair of opposites - namely, inherited and acquired characters.

If the analysis had come to an earlier, still more premature end, it might have led to the view that this was a case of late acquired homosexuality, but as it is, a consideration of the material impels us to conclude that it is rather a case of congenital homosexuality which, as usual, became fixed and unmistakably manifest only in the period following puberty. Each of these classifications does justice only to one part of the state of affairs ascertainable by observation, but neglects the other. It would be best not to attach too much value to this way of stating the problem.
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]
Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.
The question of why this outburst of homosexual libido overtook the patient precisely at this period (that is, between the dates of his appointment and of his move to Dresden) cannot be answered in the absence of more precise knowledge of the story of his life. Generally speaking, every human being oscillates all through his life between heterosexual and homosexual feelings, and any frustration or disappointment in the one direction is apt to drive him over into the other. We know nothing of these factors in Schreber's case, but we must not omit to draw attention to a somatic factor which may very well have been relevant. At the time of this illness Dr. Schreber was fifty-one years old, and he had therefore reached an age which is of critical importance in sexual life. It is a period at which in women the sexual function, after a phase of intensified activity, enters upon a process of far-reaching involution; nor do men appear to be exempt from its influence, for men as well as women are subject to a 'climacteric' and to the susceptibilities to disease which go along with it.¹

[1911c, 2418]

This process is not always performed faultlessly. Inhibitions in its development manifest themselves as the many sorts of disturbance in sexual life. When this is so, we find fixations of the libido to conditions in earlier phases, whose urge, which is independent of the normal sexual aim, is described as perversion. One such developmental inhibition, for instance, is homosexuality when it is manifest. Analysis shows that in every case a homosexual object-tie was present and in most cases persisted in a latent condition. The situation is complicated by the fact that as a rule the processes necessary for bringing about a normal outcome are not completely present or absent, but partially present, so that the final result remains dependent on these quantitative relations. In these circumstances the genital organization is, it is true, attained, but it lacks those portions of the libido which have not advanced with the rest and have remained fixated to pregenital objects and aims. This weakening shows itself in a tendency, if there is an absence of genital satisfaction or if there are difficulties in the real external world, for the libido to hark back to its earlier pregenital catheces (regression). [1940a [1938], 4966]
PREVENTION OF INVERSION  One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people.  

It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion.

[1905d, 1541]
It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take *themselves* as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom *they* may love as their mother loved *them*. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

PREVENTION OF INVERSION One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion.

¹ [Footnote added 1910:]
The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.
A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hysterics - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erotogenic zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons.¹ Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotogenic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two.

[1909b, 2093]

There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my Three Essays to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of'. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.¹

[1909b, 2094]

¹ [Footnote added 1923:] I have subsequently (1923e) drawn attention to the fact that the period of sexual development which our little patient was passing through is universally characterized by acquaintance with only one sort of genital organ, namely, the male one. In contrast to the later period of maturity, this period is marked not by a genital primacy but by a primacy of the phallus.

[1909b, 2094]

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

[1910c, 2271]
At this point a little reflection will remind us that we ought not to feel satisfied yet with the way the vulture's tail in Leonardo's childhood phantasy has been explained. Something more seems to be contained in it which we do not yet understand. Its most striking feature, after all, was that it changed sucking at the mother's breast into being suckled, that is, into passivity, and thus into a situation whose nature is undoubtedly homosexual. When we remember the historical probability of Leonardo having behaved in his life as one who was emotionally homosexual, the question is forced upon us whether this phantasy does not indicate the existence of a causal connection between Leonardo's relation with his mother in childhood and his later manifest, if ideal, homosexuality. We should not venture to infer a connection of this sort from Leonardo's distorted reminiscence if we did not know from the psycho-analytic study of homosexual patients that such a connection does exist and is in fact an intimate and necessary one. [1910c, 2273]

Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.² [1910c, 2273]

After this preliminary stage a transformation sets in whose mechanism is known to us but whose motive forces we do not yet understand. The child's love for his mother cannot continue to develop consciously any further; it succumbs to repression. The boy represses his love for his mother: he puts himself in her place, identifies himself with her, and takes his own person as a model in whose likeness he chooses the new objects of his love. In this way he has become a homosexual. What he has in fact done is to slip back to auto-erotism: for the boys whom he now loves as he grows up are after all only substitutive figures and revivals of himself in childhood - boys whom he loves in the way in which his mother loved him when he was a child. He finds the objects of his love along the path of narcissism, as we say; for Narcissus, according to the Greek legend, was a youth who preferred his own reflection to everything else and who was changed into the lovely flower of that name. [1910c, 2274]
Psychological considerations of a deeper kind justify the assertion that a man who has become a homosexual in this way remains unconsciously fixated to the mnemonic image of his mother. By repressing his love for his mother he preserves it in his unconscious and from now on remains faithful to her. While he seems to pursue boys and to be their lover, he is in reality running away from the other women, who might cause him to be unfaithful. In individual cases direct observation has also enabled us to show that the man who gives the appearance of being susceptible only to the charms of men is in fact attracted by women in the same way as a normal man; but on each occasion he hastens to transfer the excitation he has received from women on to a male object, and in this manner he repeats over and over again the mechanism by which he acquired his homosexuality.

It does not seem a very extravagant step to apply what we have learnt from the funeral account to the reckonings of the pupils' expenses. They would then be another instance of the scanty remnants of Leonardo's libidinal impulses finding expression in a compulsive manner and in a distorted form. On that view, his mother and his pupils, the likenesses of his own boyish beauty, had been his sexual objects - so far as the sexual repression which dominated his nature allows us so to describe them - and the compulsion to note in laborious detail the sums he spent on them betrayed in this strange way his rudimentary conflicts. From this it would appear that Leonardo's erotic life did really belong to the type of homosexuality whose psychical development we have succeeded in disclosing, and the emergence of the homosexual situation in his phantasy of the vulture would become intelligible to us: for its meaning was exactly what we have already asserted of that type. We should have to translate it thus: 'It was through this erotic relation with my mother that I became a homosexual.'¹

If Leonardo was successful in reproducing on Mona Lisa's face the double meaning which this smile contained, the promise of unbounded tenderness and at the same time sinister menace (to quote Pater's phrase), then here too he had remained true to the content of his earliest memory. For his mother's tenderness was fateful for him; it determined his destiny and the privations that were in store for him. The violence of the caresses, to which his phantasy of the vulture points, was only too natural. In her love for her child the poor forsaken mother had to give vent to all her memories of the caresses she had enjoyed as well as her longing for new ones; and she was forced to do so not only to compensate herself for having no husband, but also to compensate her child for having no father to fondle him. So, like all unsatisfied mothers, she took her little son in place of her husband, and by the too early maturing of his erotism robbed him of a part of his masculinity. A mother's love for the infant she suckles and cares for is something far more profound than her later affection for the growing child. It is in the nature of a completely satisfying love-relation, which not only fulfils every mental wish but also every physical need; and if it represents one of the forms of attainable human happiness, that is in no little measure due to the possibility it offers of satisfying, without reproach, wishful impulses which have long been repressed and which must be called perverse.¹ In the happiest young marriage the father is aware that the baby, especially if he is a baby son, has become his rival, and this is the starting-point of an antagonism towards the favourite which is deeply rooted in the unconscious.

¹ [1910c, 2248]
When, in the prime of life, Leonardo once more encountered the smile of bliss and rapture which had once played on his mother's lips as she fondled him, he had for long been under the dominance of an inhibition which forbade him ever again to desire such caresses from the lips of women. But he had become a painter, and therefore he strove to reproduce the smile with his brush, giving it to all his pictures (whether he in fact executed them himself or had them done by his pupils under his direction) - to Leda, to John the Baptist and to Bacchus. The last two are variants of the same type. 'Leonardo has turned the locust-eater of the Bible', says Muther, 'into a Bacchus, a young Apollo, who, with a mysterious smile on his lips, and with his smooth legs crossed, gazes at us with eyes that intoxicate the senses.' These pictures breathe a mystical air into whose secret one dares not penetrate; at the very most one can attempt to establish their connection with Leonardo's earlier creations. The figures are still androgynous, but no longer in the sense of the vulture-phantasy. They are beautiful youths of feminine delicacy and with effeminate forms; they do not cast their eyes down, but gaze in mysterious triumph, as if they knew of a great achievement of happiness, about which silence must be kept. The familiar smile of fascination leads one to guess that it is a secret of love. It is possible that in these figures Leonardo has denied the unhappiness of his erotic life and has triumphed over it in his art, by representing the wishes of the boy, infatuated with his mother, as fulfilled in this blissful union of the male and female natures.

A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual instinct could be sublimated into a general urge to know, and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual instinct made to Leonardo's mental life.
I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-eroticism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-eroticism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.
[1911c, 2430]

(b) If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object-choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common instinct of mastery, which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erotogenic zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal cathexes present analytic research with the most interesting problems.
[1913i, 2628]

The analysis revealed beyond all shadow of doubt that the lady-love was a substitute for - her mother. It is true that the lady herself was not a mother, but then she was not the girl's first love. The first objects of her affection after the birth of her youngest brother were really mothers, women between thirty and thirty-five whom she had met with their children during summer holidays or in the family circle of acquaintances in town. Motherhood as a sine qua non in her love-object was later on given up, because that precondition was difficult to combine in real life with another one, which grew more and more important. The specially intense bond with her latest love had still another basis which the girl discovered quite easily one day. Her lady's slender figure, severe beauty, and downright manner reminded her of the brother who was a little older than herself. Her latest choice corresponded, therefore, not only to her feminine but also to her masculine ideal; it combined satisfaction of the homosexual tendency with that of the heterosexual one. It is well known that analysis of male homosexuals has in numerous cases revealed the same combination, which should warn us not to form too simple a conception of the nature and genesis of inversion, and to keep in mind the universal bisexuality of human beings.¹
[1920a, 3846]
In doing so she behaved just as many men do who after a first distressing experience turn their backs forever upon the faithless female sex and become woman-haters. It is related of one of the most attractive and unfortunate princely figures of our time that he became a homosexual because the lady he was engaged to marry betrayed him with another man. I do not know whether this is true historically, but an element of psychological truth lies behind the rumour. In all of us, throughout life, the libido normally oscillates between male and female objects; the bachelor gives up his men friends when he marries, and returns to club-life when married life has lost its savour. Naturally, when the swing-over is fundamental and final, we suspect the presence of some special factor which definitely favours one side or the other, and which perhaps has only waited for the appropriate moment in order to turn the choice of object in its direction.

[1920a, 3847]

Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]
We have, however, never regarded this analysis of the origin of homosexuality as complete. I can now point to a new mechanism leading to homosexual object-choice, although I cannot say how large a part it plays in the formation of the extreme, manifest and exclusive type of homosexuality. Observation has directed my attention to several cases in which during early childhood impulses of jealousy, derived from the mother-complex and of very great intensity, arose against rivals, usually older brothers. This jealousy led to an exceedingly hostile and aggressive attitude towards these brothers which might sometimes reach the pitch of actual death-wishes, but which could not maintain themselves in the face of the subject's further development. Under the influences of upbringing - and certainly not uninfluenced also by their own continuing powerlessness - these impulses yielded to repression and underwent a transformation, so that the rivals of the earlier period became the first homosexual love-objects. Such an outcome of the attachment to the mother shows various interesting relations with other processes known to us. First of all it is a complete contrast to the development of persecutory paranoia, in which the person who has before been loved becomes the hated persecutor, whereas here the hated rivals are transformed into love objects. It represents, too, an exaggeration of the process which, according to my view, leads to the birth of social instincts in the individual.¹ In both processes there is first the presence of jealous and hostile impulses which cannot achieve satisfaction; and both the affectionate and the social feelings of identification arise as reactive formations against the repressed aggressive impulses. [1922b, 3908]

This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a horror feminae. [1922b, 3909]
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]
A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hysterics - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erotogenic zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons.¹ Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotogenic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two.

There is absolutely no justification for distinguishing a special homosexual instinct. What constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. Let me recall what I have said in my Three Essays to the effect that we have mistakenly imagined the bond between instinct and object in sexual life as being more intimate than it really is. A homosexual may have normal instincts, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of'. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that he was acquainted with only one kind of genital organ - a genital organ like his own.¹

Homosexual object-choice originally lies closer to narcissism than does the heterosexual kind. When it is a question, therefore, of repelling an undesirably strong homosexual impulse, the path back to narcissism is made particularly easy. Hitherto I have had very little opportunity of talking to you about the foundations of erotic life so far as we have discovered them, and it is too late now to catch up on the omission. This much, however, I can emphasize to you. Object-choice, the step forward in the development of the libido which is made after the narcissistic stage, can take place according to two different types: either according to the narcissistic type, where the subject's own ego is replaced by another one that is as similar as possible, or according to the attachment type, where people who have become precious through satisfying the other vital needs are chosen as objects by the libido as well. A strong libidinal fixation to the narcissistic type of object-choice is to be included in the predisposition to manifest homosexuality.

¹[1909b, 2093]

¹[1909b, 2094]
The genesis of male homosexuality in a large class of cases is as follows. A young man has been unusually long and intensely fixated upon his mother in the sense of the Oedipus complex. But at last, after the end of puberty, the time comes for exchanging his mother for some other sexual object. Things take a sudden turn: the young man does not abandon his mother, but identifies himself with her; he transforms himself into her, and now looks about for objects which can replace his ego for him, and on which he can bestow such love and care as he has experienced from his mother. This is a frequent process, which can be confirmed as often as one likes, and which is naturally quite independent of any hypothesis that may be made as to the organic driving force and the motives of the sudden transformation. A striking thing about this identification is its ample scale; it remoulds the ego in one of its important features - in its sexual character - upon the model of what has hitherto been the object. In this process the object itself is renounced - whether entirely or in the sense of being preserved only in the unconscious is a question outside the present discussion. Identification with an object that is renounced or lost, as a substitute for that object - introjection of it into the ego - is indeed no longer a novelty to us. A process of the kind may sometimes be directly observed in small children. A short time ago an observation of this sort was published in the *Internationale Zeitschrift für Psychoanalyse*. A child who was unhappy over the loss of a kitten declared straight out that now he himself was the kitten, and accordingly crawled about on all fours, would not eat at table, etc.¹

[1921c, 3800]

*Homosexuality.* - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]
If one is not aware of these profound connections, it is impossible to find one’s way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is 'taken on lease' from the rectum: in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.
[1933a, 4706]
It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take *themselves* as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom they may love as their mother loved *them*. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

TEMPORAL FACTORS Other factors which, along with precocity, may be classed as temporal also deserve attention. The order in which the various instinctual impulses come into activity seems to be phylogenetically determined; so, too, does the length of time during which they are able to manifest themselves before they succumb to the effects of some freshly emerging instinctual impulse or to some typical repression. Variations, however, seem to occur both in temporal sequence and in duration, and these variations must exercise a determining influence upon the final result. It cannot be a matter of indifference whether a given current makes its appearance earlier or later than a current flowing in the opposite direction, for the effect of a repression cannot be undone. Divergences in the temporal sequence in which the components come together invariably produce a difference in the outcome. On the other hand, instinctual impulses which emerge with special intensity often run a surprisingly short course - as, for instance, the heterosexual attachment of persons who later become manifest homosexuals. There is no justification for the fear that trends which set in with the greatest violence in childhood will permanently dominate the adult character; it is just as likely that they will disappear and make way for an opposite tendency. ('*Gestrenge Herren regieren nicht Lange.*')

A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hysterics - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erotogenic zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons. Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotogenic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two.
At this point a little reflection will remind us that we ought not to feel satisfied yet with the way the vulture's tail in Leonardo's childhood phantasy has been explained. Something more seems to be contained in it which we do not yet understand. Its most striking feature, after all, was that it changed sucking at the mother's breast into being suckled, that is, into passivity, and thus into a situation whose nature is undoubtedly homosexual. When we remember the historical probability of Leonardo having behaved in his life as one who was emotionally homosexual, the question is forced upon us whether this phantasy does not indicate the existence of a causal connection between Leonardo's relation with his mother in childhood and his later manifest, if ideal, homosexuality. We should not venture to infer a connection of this sort from Leonardo's distorted reminiscence if we did not know from the psycho-analytic study of homosexual patients that such a connection does exist and is in fact an intimate and necessary one. [1910c, 2273]

Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²

[1910c, 2273]

² [Footnote added 1919:] Psycho-analytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object-choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object-choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psycho-analysis. [1910c, 2273]
After this preliminary stage a transformation sets in whose mechanism is known to us but whose motive forces we do not yet understand. The child's love for his mother cannot continue to develop consciously any further; it succumbs to repression. The boy represses his love for his mother: he puts himself in her place, identifies himself with her, and takes his own person as a model in whose likeness he chooses the new objects of his love. In this way he has become a homosexual. What he has in fact done is to slip back to auto-erotism: for the boys whom he now loves as he grows up are after all only substitutive figures and revivals of himself in childhood - boys whom he loves in the way in which his mother loved him when he was a child. He finds the objects of his love along the path of narcissism, as we say; for Narcissus, according to the Greek legend, was a youth who preferred his own reflection to everything else and who was changed into the lovely flower of that name.

[1910c, 2274]

Psychological considerations of a deeper kind justify the assertion that a man who has become a homosexual in this way remains unconsciously fixated to the mnemonic image of his mother. By repressing his love for his mother he preserves it in his unconscious and from now on remains faithful to her. While he seems to pursue boys and to be their lover, he is in reality running away from the other women, who might cause him to be unfaithful. In individual cases direct observation has also enabled us to show that the man who gives the appearance of being susceptible only to the charms of men is in fact attracted by women in the same way as a normal man; but on each occasion he hastens to transfer the excitation he has received from women on to a male object, and in this manner he repeats over and over again the mechanism by which he acquired his homosexuality.

[1910c, 2274]

This interpretation by the psychological novelist cannot be put to the proof, but it can claim so much inner probability, and is so much in harmony with all that we otherwise know of Leonardo’s emotional activity, that I cannot refrain from accepting it as correct. He had succeeded in subjecting his feelings to the yoke of research and in inhibiting their free utterance; but even for him there were occasions when what had been suppressed obtained expression forcibly. The death of the mother he had once loved so dearly was one of these. What we have before us in the account of the costs of the funeral is the expression - distorted out of all recognition - of his mourning for his mother. We wonder how such distortion could come about, and indeed we cannot understand it if we treat it as a normal mental process. But similar processes are well known to us in the abnormal conditions of neurosis and especially of what is known as ‘obsessional neurosis’. There we can see how the expression of intense feelings, which have however become unconscious through repression, is displaced on to trivial and even foolish actions. The expression of these repressed feelings has been lowered by the forces opposed to them to such a degree that one would have had to form a most insignificant estimate of their intensity; but the imperative compulsiveness with which this trivial expressive act is performed betrays the real force of the impulses - a force which is rooted in the unconscious and which consciousness would like to deny. Only a comparison such as this with what happens in obsessional neurosis can explain Leonardo’s account of the expenses of his mother’s funeral. In his unconscious he was still tied to her by erotically coloured feelings, as he had been in childhood. The opposition that came from the subsequent repression of this childhood love did not allow him to set up a different and worthier memorial to her in his diary. But what emerged as a compromise from this neurotic conflict had to be carried out; and thus it was that the account was entered in the diary, and has come to the knowledge of posterity as something unintelligible.

[1910c, 2279]
It does not seem a very extravagant step to apply what we have learnt from the funeral account to the reckonings of the pupils' expenses. They would then be another instance of the scanty remnants of Leonardo's libidinal impulses finding expression in a compulsive manner and in a distorted form. On that view, his mother and his pupils, the likenesses of his own boyish beauty, had been his sexual objects - so far as the sexual repression which dominated his nature allows us so to describe them - and the compulsion to note in laborious detail the sums he spent on them betrayed in this strange way his rudimentary conflicts. From this it would appear that Leonardo's erotic life did really belong to the type of homosexuality whose psychical development we have succeeded in disclosing, and the emergence of the homosexual situation in his phantasy of the vulture would become intelligible to us: for its meaning was exactly what we have already asserted of that type. We should have to translate it thus: 'It was through this erotic relation with my mother that I became a homosexual.'¹

If Leonardo was successful in reproducing on Mona Lisa's face the double meaning which this smile contained, the promise of unbounded tenderness and at the same time sinister menace (to quote Pater's phrase), then here too he had remained true to the content of his earliest memory. For his mother's tenderness was fateful for him; it determined his destiny and the privations that were in store for him. The violence of the caresses, to which his phantasy of the vulture points, was only too natural. In her love for her child the poor forsaken mother had to give vent to all her memories of the caresses she had enjoyed as well as her longing for new ones; and she was forced to do so not only to compensate herself for having no husband, but also to compensate her child for having no father to fondle him. So, like all unsatisfied mothers, she took her little son in place of her husband, and by the too early maturing of his erotism robbed him of a part of his masculinity. A mother's love for the infant she suckles and cares for is something far more profound than her later affection for the growing child. It is in the nature of a completely satisfying love-relation, which not only fulfils every mental wish but also every physical need; and if it represents one of the forms of attainable human happiness, that is in no little measure due to the possibility it offers of satisfying, without reproach, wishful impulses which have long been repressed and which must be called perverse.¹ In the happiest young marriage the father is aware that the baby, especially if he is a baby son, has become his rival, and this is the starting-point of an antagonism towards the favourite which is deeply rooted in the unconscious.

A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual instinct could be sublimated into a general urge to know, and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual instinct made to Leonardo's mental life.
The genesis of male homosexuality in a large class of cases is as follows. A young man has been unusually long and intensely fixated upon his mother in the sense of the Oedipus complex. But at last, after the end of puberty, the time comes for exchanging his mother for some other sexual object. Things take a sudden turn: the young man does not abandon his mother, but identifies himself with her; he transforms himself into her, and now looks about for objects which can replace his ego for him, and on which he can bestow such love and care as he has experienced from his mother. This is a frequent process, which can be confirmed as often as one likes, and which is naturally quite independent of any hypothesis that may be made as to the organic driving force and the motives of the sudden transformation. A striking thing about this identification is its ample scale; it remoulds the ego in one of its important features - in its sexual character - upon the model of what has hitherto been the object. In this process the object itself is renounced - whether entirely or in the sense of being preserved only in the unconscious is a question outside the present discussion. Identification with an object that is renounced or lost, as a substitute for that object - introjection of it into the ego - is indeed no longer a novelty to us. A process of the kind may sometimes be directly observed in small children. A short time ago an observation of this sort was published in the *Internationale Zeitschrift für Psychoanalyse*. A child who was unhappy over the loss of a kitten declared straight out that now he himself was the kitten, and accordingly crawled about on all fours, would not eat at table, etc.¹

which, up to a certain point, vary independently of one another, and are met with in different individuals in manifold permutations. Tendentious literature has obscured our view of this interrelationship by putting into the foreground, for practical reasons, the third feature (the kind of object-choice), which is the only one that strikes the layman, and in addition by exaggerating the closeness of the association between this and the first feature. Moreover, it blocks the way to a deeper insight into all that is uniformly designated as homosexuality, by rejecting two fundamental facts which have been revealed by psycho-analytic investigation. The first of these is that homosexual men have experienced a specially strong fixation on their mother; the second, that, in addition to their manifest heterosexuality, a very considerable measure of latent or unconscious homosexuality can be detected in all normal people. If these findings are taken into account, then, clearly, the supposition that nature in a freakish mood created a 'third sex' falls to the ground.

[1920a, 3859]
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

We have, however, never regarded this analysis of the origin of homosexuality as complete. I can now point to a new mechanism leading to homosexual object-choice, although I cannot say how large a part it plays in the formation of the extreme, manifest and exclusive type of homosexuality. Observation has directed my attention to several cases in which during early childhood impulses of jealousy, derived from the mother-complex and of very great intensity, arose against rivals, usually older brothers. This jealousy led to an exceedingly hostile and aggressive attitude towards these brothers which might sometimes reach the pitch of actual death-wishes, but which could not maintain themselves in the face of the subject's further development. Under the influences of upbringing - and certainly not uninfluenced also by their own continuing powerlessness - these impulses yielded to repression and underwent a transformation, so that the rivals of the earlier period became the first homosexual love-objects. Such an outcome of the attachment to the mother shows various interesting relations with other processes known to us. First of all it is a complete contrast to the development of persecutory paranoia, in which the person who has before been loved becomes the hated persecutor, whereas here the hated rivals are transformed into love objects. It represents, too, an exaggeration of the process which, according to my view, leads to the birth of social instincts in the individual.¹ In both processes there is first the presence of jealous and hostile impulses which cannot achieve satisfaction; and both the affectionate and the social feelings of identification arise as reactive formations against the repressed aggressive impulses.

[1922b, 3907]
This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a horror feminae.

[1922b, 3909]
¹ [Footnote added 1910:] It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take themselves as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom they may love as their mother loved them. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.
[1905d, 1473]

After this preliminary stage a transformation sets in whose mechanism is known to us but whose motive forces we do not yet understand. The child's love for his mother cannot continue to develop consciously any further; it succumbs to repression. The boy represses his love for his mother: he puts himself in her place, identifies himself with her, and takes his own person as a model in whose likeness he chooses the new objects of his love. In this way he has become a homosexual. What he has in fact done is to slip back to auto-erotism: for the boys whom he now loves as he grows up are after all only substitutive figures and revivals of himself in childhood - boys whom he loves in the way in which his mother loved him when he was a child. He finds the objects of his love along the path of narcissism, as we say; for Narcissus, according to the Greek legend, was a youth who preferred his own reflection to everything else and who was changed into the lovely flower of that name.
[1910c, 2274]

¹ It is by no means rare for a love-relation to be broken off through a process of identification on the part of the lover with the loved object, a process equivalent to a kind of regression to narcissism. After this has been accomplished, it is easy in making a fresh choice of object to direct the libido to a member of the sex opposite to that of the earlier choice.
[1920a, 3848]
This process is not always performed faultlessly. Inhibitions in its development manifest themselves as the many sorts of disturbance in sexual life. When this is so, we find fixations of the libido to conditions in earlier phases, whose urge, which is independent of the normal sexual aim, is described as _perversion_. One such developmental inhibition, for instance, is homosexuality when it is manifest. Analysis shows that in every case a homosexual object-tie was present and in most cases persisted in a _latent_ condition. The situation is complicated by the fact that as a rule the processes necessary for bringing about a normal outcome are not completely present or absent, but _partially_ present, so that the final result remains dependent on these _quantitative_ relations. In these circumstances the genital organization is, it is true, attained, but it lacks those portions of the libido which have not advanced with the rest and have remained fixated to pregenital objects and aims. This weakening shows itself in a tendency, if there is an absence of genital satisfaction or if there are difficulties in the real external world, for the libido to hark back to its earlier pregenital cathexes (_regression_).

[1940a [1938], 4966]
It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take themselves as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom they may love as their mother loved them. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

[Added 1915:] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

[Footnote added 1910:] It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take themselves as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom they may love as their mother loved them. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

[Added 1915:] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

1 [Footnote added 1910:] Psycho-analysis informs us that there are two methods of finding an object. The first, described in the text, is the 'anaclitic' or 'attachment' one, based on attachment to early infantile prototypes. The second is the narcissistic one, which seeks for the subject's own ego and finds it again in other people. This latter method is of particularly great importance in cases where the outcome is a pathological one, but it is not relevant to the present context.
After this preliminary stage a transformation sets in whose mechanism is known to us but whose motive forces we do not yet understand. The child's love for his mother cannot continue to develop consciously any further; it succumbs to repression. The boy represses his love for his mother: he puts himself in her place, identifies himself with her, and takes his own person as a model in whose likeness he chooses the new objects of his love. In this way he has become a homosexual. What he has in fact done is to slip back to auto-erotism: for the boys whom he now loves as he grows up are after all only substitutive figures and revivals of himself in childhood - boys whom he loves in the way in which his mother loved him when he was a child. He finds the objects of his love along the path of narcissism, as we say; for Narcissus, according to the Greek legend, was a youth who preferred his own reflection to everything else and who was changed into the lovely flower of that name.

[1910c, 2274]

It does not seem a very extravagant step to apply what we have learnt from the funeral account to the reckonings of the pupils' expenses. They would then be another instance of the scanty remnants of Leonardo's libidinal impulses finding expression in a compulsive manner and in a distorted form. On that view, his mother and his pupils, the likenesses of his own boyish beauty, had been his sexual objects - so far as the sexual repression which dominated his nature allows us so to describe them - and the compulsion to note in laborious detail the sums he spent on them betrayed in this strange way his rudimentary conflicts. From this it would appear that Leonardo's erotic life did really belong to the type of homosexuality whose psychical development we have succeeded in disclosing, and the emergence of the homosexual situation in his phantasy of the vulture would become intelligible to us: for its meaning was exactly what we have already asserted of that type. We should have to translate it thus: 'It was through this erotic relation with my mother that I became a homosexual.'

[1910c, 2280]

A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual instinct could be sublimated into a general urge to know, and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual instinct made to Leonardo's mental life.

[1910c, 2301]
I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

¹ [1911c, 2430]

Psycho-analytic observers were subsequently struck by the fact that individual features of the narcissistic attitude are found in many people who suffer from other disorders - for instance, as Sadger has pointed out, in homosexuals - and finally it seemed probable that an allocation of the libido such as deserved to be described as narcissism might be present far more extensively, and that it might claim a place in the regular course of human sexual development.¹ Difficulties in psycho-analytic work upon neurotics led to the same supposition, for it seemed as though this kind of narcissistic attitude in them constituted one of the limits to their susceptibility to influence. Narcissism in this sense would not be a perversion, but the libidinal complement to the egoism of the instinct of self-preservation, a measure of which may justifiably be attributed to every living creature.

¹ [1914c, 2931]

The significance of narcissistic object-choice for homosexuality in men must be considered in another connection.

¹ [1914c, 2944]
Lying partly undressed on the sofa beside her lover, she heard a noise like a click or beat. She did not know its cause, but she arrived at an interpretation of it after meeting two men on the staircase, one of whom was carrying something that looked like a covered box. She became convinced that someone acting on instructions from her lover had watched and photographed her during their intimate *tête à tête*. I do not for a moment imagine, of course, that if the unlucky noise had not occurred the delusion would not have been formed; on the contrary, something inevitable is to be seen behind this accidental circumstance, something which was bound to assert itself compulsively in the patient, just as when she supposed that there was a liaison between her lover and the elderly superior, her mother-substitute. Among the store of unconscious phantasies of all neurotics, and probably of all human beings, there is one which is seldom absent and which can be disclosed by analysis: this is the phantasy of watching sexual intercourse between the parents. I call such phantasies - of the observation of sexual intercourse between the parents, of seduction, of castration, and others - "primal phantasies"; and I shall discuss in detail elsewhere their origin and their relation to individual experience. The accidental noise was thus merely playing the part of a provoking factor which activated the typical phantasy of overhearing which is a component of the parental complex. Indeed, it is doubtful whether we can rightly call the noise 'accidental'. As Otto Rank has remarked to me, such noises are on the contrary an indispensable part of the phantasy of listening, and they reproduce either the sounds which betray parental intercourse or those by which the listening child fears to betray itself. But now we know at once where we stand. The patient's lover was still her father, but she herself had taken her mother's place. The part of the listener had then to be allotted to a third person. We can see by what means the girl had freed herself from her homosexual dependence on her mother. It was by means of a small piece of regression: instead of choosing her mother as a love-object, she identified herself with her - she herself became her mother. The possibility of this regression points to the narcissistic origin of her homosexual object-choice and thus to the paranoic disposition in her. One might sketch a train of thought which would bring about the same result as this identification: 'If my mother does it, I may do it too; I've just as good a right as she has.'

[1915f, 3062]

Homosexual object-choice originally lies closer to narcissism than does the heterosexual kind. When it is a question, therefore, of repelling an undesirably strong homosexual impulse, the path back to narcissism is made particularly easy. Hitherto I have had very little opportunity of talking to you about the foundations of erotic life so far as we have discovered them, and it is too late now to catch up on the omission. This much, however, I can emphasize to you. Object-choice, the step forward in the development of the libido which is made after the narcissistic stage, can take place according to two different types: either according to the narcissistic type, where the subject's own ego is replaced by another one that is as similar as possible, or according to the attachment type, where people who have become precious through satisfying the other vital needs are chosen as objects by the libido as well. A strong libidinal fixation to the narcissistic type of object-choice is to be included in the predisposition to manifest homosexuality.

[1916-1917, 3470]
I will conclude my survey of the patient's sexual development by giving some brief glimpses of its later vicissitudes. During the years of puberty a markedly sensual, masculine current, with a sexual aim suitable to the genital organization, made its appearance in him; it must be regarded as normal, and its history occupied the period up to the time of his later illness. It was connected directly with the Grusha scene, from which it borrowed its characteristic feature - a compulsive falling in love that came on and passed off by sudden fits. This current had to struggle against the inhibitions that were derived from his infantile neurosis. There had been a violent revulsion in the direction of women, and he had thus won his way to complete masculinity. From that time forward he retained women as his sexual object; but he did not enjoy this possession, for a powerful, and now entirely unconscious, inclination towards men, in which were united all the forces of the earlier phases of his development, was constantly drawing him away from his female objects and compelling him in the intervals to exaggerate his dependence upon women. He kept complaining during the treatment that he could not bear having to do with women, and all our labours were directed towards disclosing to him his unconscious relation to men. The whole situation might be summarized in the shape of a formula. His childhood had been marked by a wavering between activity and passivity, his puberty by a struggle for masculinity, and the period after he had fallen ill by a fight for the object of his masculine desires. The precipitating cause of his neurosis was not one of the types of onset which I have been able to put together as special cases of 'frustration,'¹ and it thus draws attention to a gap in that classification. He broke down after an organic affection of the genitals had revived his fear of castration, shattered his narcissism, and compelled him to abandon his hope of being personally favoured by destiny. He fell ill, therefore, as the result of a narcissistic 'frustration'. This excessive strength of his narcissism was in complete harmony with the other indications of an inhibited sexual development: with the fact that so few of his psychical trends were concentrated in his heterosexual object choice, in spite of all its energy, and that his homosexual attitude, standing so much nearer to narcissism, persisted in him as an unconscious force with such very great tenacity. Naturally, where disturbances like these are present, psycho-analytic treatment cannot bring about any instantaneous revolution or put matters upon a level with a normal development: it can only get rid of the obstacles and clear the path, so that the influences of life may be able to further development along better lines.

[1918b, 3593]
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]

This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a *horror feminae*.

[1922b, 3909]
[Added 1915:] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

[1905d, 1473]

The part played by the erotogenic zones is immediately obvious in the case of those perversions which assign a sexual significance to the oral and anal orifices. These behave in every respect like a portion of the sexual apparatus. In hysteria these parts of the body and the neighbouring tracts of mucous membrane become the seat of new sensations and of changes in innervation - indeed, of processes that can be compared to erection - in just the same way as do the actual genitalia under the excitations of the normal sexual processes.

[1905d, 1493]

A second pregenital phase is that of the sadistic-anal organization. Here the opposition between two currents, which runs through all sexual life, is already developed: they cannot yet, however, be described as 'masculine' and 'feminine', but only as 'active' and 'passive'. The activity is put into operation by the instinct for mastery through the agency of the somatic musculature; the organ which, more than any other, represents the passive sexual aim is the erotogenic mucous membrane of the anus. Both of these currents have objects, which, however, are not identical. Alongside these, other component instincts operate in an auto-erotic manner. In this phase, therefore, sexual polarity and an extraneous object are already observable. But organization and subordination to the reproductive function are still absent.²

[1905d, 1516]
If there is any basis in fact for the relation posited here between anal erotism and this triad of character-traits, one may expect to find no very marked degree of ‘anal character’ in people who have retained the anal zone’s erogenous character in adult life, as happens, for instance, with certain homosexuals. Unless I am much mistaken, the evidence of experience tallies quite well on the whole with this inference.

(b) If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object-choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common instinct of mastery, which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erogenous zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal cathexes present analytic research with the most interesting problems.

I know you have been wanting for a long time to interrupt me and exclaim: ‘Enough of these atrocities! You tell us that defaecating is a source of sexual satisfaction, and already exploited in infancy! that faeces is a valuable substance and that the anus is a kind of genital! We don’t believe all that but we do understand why paediatricians and educationists have given a wide berth to psycho-analysis and its findings.’ No, Gentlemen. You have merely forgotten that I have been trying to introduce the facts of infantile sexual life to you in connection with the facts of the sexual perversions. Why should you not be aware that for a large number of adults, homosexual and heterosexual alike, the anus does really take over the role of the vagina in sexual intercourse? And that there are many people who retain a voluptuous feeling in defaecating all through their lives and describe it as being far from small? As regards interest in the act of defaecation and enjoyment in watching someone else defaecating, you can get children themselves to confirm the fact when they are a few years older and able to tell you about it. Of course, you must not have systematically intimidated them beforehand, or they will quite understand that they must be silent on the subject. And as to the other things that you are anxious not to believe, I will refer you to the findings of analysis and of the direct observation of children and will add that it calls for real ingenuity not to see all this or to see it differently. Nor do I complain if you find the kinship between infantile sexual activity and sexual perversions something very striking. But it is in fact self-evident: if a child has a sexual life at all it is bound to be of a perverse kind; for, except for a few obscure hints, children are without what makes sexuality into the reproductive function. On the other hand, the abandonment of the reproductive function is the common feature of all perversions. We actually describe a sexual activity as perverse if it has given up the aim of reproduction and pursues the attainment of pleasure as an aim independent of it. So, as you will see, the breach and turning-point in the development of sexual life lies in its becoming subordinate to the purposes of reproduction. Everything that happens before this turn of events and equally everything that disregards it and that aims solely at obtaining pleasure is given the uncomplimentary name of ‘perverse’ and as such is proscribed.

[1908b, 1945]

[1913i, 2628]

[1916-1917, 3386]
Between the impudent use he made of his incontinence when he was three and a half, and the horror with which he viewed it when he was four and a half, there lies the dream with which his anxiety period began - the dream which gave him a deferred comprehension of the scene he had experienced when he was one and a half (p. 3533), and an explanation of the part played by women in the sexual act. It is only another step to connect the change in his attitude towards defaecation with this same great revulsion. Dysentery was evidently his name for the illness which he had heard his mother lamenting about, and which it was impossible to go on living with; he did not regard his mother's disease as being abdominal but as being intestinal. Under the influence of the primal scene he came to the conclusion that his mother had been made ill by what his father had done to her;¹ and his dread of having blood in his stool, of being as ill as his mother, was his repudiation of being identified with her in this sexual scene - the same repudiation with which he awoke from the dream. But the dread was also a proof that in his later elaboration of the primal scene he had put himself in his mother's place and had envied her this relation with his father. The organ by which his identification with women, his passive homosexual attitude to men, was able to express itself was the anal zone. The disorders in the function of this zone had acquired the significance of feminine impulses of tenderness, and they retained it during the later illness as well.

When later on I come to describing the final clearing up of my patient's symptoms, the way in which the intestinal disorder had put itself at the service of the homosexual current and had given expression to his feminine attitude towards his father will once again become evident. Meanwhile we shall mention a further meaning of faeces, which will lead us on to a discussion of the castration complex.

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is 'taken on lease' from the rectum: in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.

[1918b, 3560]

[1918b, 3566]

[1933a, 4706]
If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.

[1908c, 1971]

A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hystericists - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erogenous zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons. Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erogenous importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two.

[1909b, 2093]
I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations have directed our attention to a stage in the development of the libido which it passes through on the way from auto-eroticism to object-love. This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-eroticism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

We know, too, to what a degree depreciation of women, horror of women, and a disposition to homosexuality are derived from the final conviction that women have no penis. Ferenczi (1923) has recently, with complete justice, traced back the mythological symbol of horror - Medusa's head - to the impression of the female genitals devoid of a penis.
This page intentionally left blank
If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.

[1908c, 1971]

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

[1910c, 2271]
On the whole, indeed, when we come to think of it, we are not quite at a loss in regard to what it is that people call sexual. Something which combines a reference to the contrast between the sexes, to the search for pleasure, to the reproductive function and to the characteristic of something that is improper and must be kept secret - some such combination will serve for all practical purposes in everyday life. But for science that is not enough. By means of careful investigations (only made possible, indeed, by disinterested self-discipline) we have come to know groups of individuals whose 'sexual life' deviates in the most striking way from the usual picture of the average. Some of these 'perverse' people have, we might say, struck the distinction between the sexes off their programme. Only members of their own sex can rouse their sexual wishes; those of the other sex, and especially their sexual parts, are not a sexual object for them at all, and in extreme cases are an object of disgust. This implies, of course, that they have abandoned any share in reproduction. We call such people homosexuals or inverted.

Homosexuals. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1916-1917, 3376]

[1922b, 3907]
This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a horror feminae.

[1922b, 3909]

We know, too, to what a degree depreciation of women, horror of women, and a disposition to homosexuality are derived from the final conviction that women have no penis. Ferenczi (1923) has recently, with complete justice, traced back the mythological symbol of horror - Medusa's head - to the impression of the female genitals devoid of a penis.¹

[1923e, 4061]

There is an interesting contrast between the behaviour of the two sexes. In the analogous situation, when a little boy first catches sight of a girl's genital region, he begins by showing irresolution and lack of interest; he sees nothing or disavows what he has seen, he softens it down or looks about for expedients for bringing it into line with his expectations. It is not until later, when some threat of castration has obtained a hold upon him, that the observation becomes important to him: if he then recollects or repeats it, it arouses a terrible storm of emotion in him and forces him to believe in the reality of the threat which he has hitherto laughed at. This combination of circumstances leads to two reactions, which may become fixed and will in that case, whether separately or together or in conjunction with other factors, permanently determine the boy's relations to women: horror of the mutilated creature or triumph and contempt for her. These developments, however, belong to the future, though not to a very remote one.

[1925j, 4150]
What happened, therefore, was that the boy refused to take cognizance of the fact of his having perceived that a woman does not possess a penis. No, that could not be true: for if a woman had been castrated, then his own possession of a penis was in danger; and against that there rose in rebellion the portion of his narcissism which Nature has, as a precaution, attached to that particular organ. In later life a grown man may perhaps experience a similar panic when the cry goes up that Throne and Altar are in danger, and similar illogical consequences will ensue. If I am not mistaken, Laforgue would say in this case that the boy 'scotomizes' his perception of the woman's lack of a penis.¹ A new technical term is justified when it describes a new fact or emphasizes it. This is not so here. The oldest word in our psycho-analytic terminology, 'repression', already relates to this pathological process. If we wanted to differentiate more sharply between the vicissitude of the idea as distinct from that of the affect, and reserve the word 'Verdrängung' ['repression'] for the affect, then the correct German word for the vicissitude of the idea would be 'Verleugnung' ['disavowal']. 'Scotomization' seems to me particularly unsuitable, for it suggests that the perception is entirely wiped out, so that the result is the same as when a visual impression falls on the blind spot in the retina. In the situation we are considering, on the contrary, we see that the perception has persisted, and that a very energetic action has been undertaken to maintain the disavowal. It is not true that, after the child has made his observation of the woman, he has preserved unaltered his belief that women have a phallus. He has retained that belief, but he has also given it up. In the conflict between the weight of the unwelcome perception and the force of his counter-wish, a compromise has been reached, as is only possible under the dominance of the unconscious laws of thought - the primary processes. Yes, in his mind the woman has got a penis, in spite of everything; but this penis is no longer the same as it was before. Something else has taken its place, has been appointed its substitute, as it were, and now inherits the interest which was formerly directed to its predecessor. But this interest suffers an extraordinary increase as well, because the horror of castration has set up a memorial to itself in the creation of this substitute. Furthermore, an aversion, which is never absent in any fetishist, to the real female genitals remains a stigma indelebile of the repression that has taken place. We can now see what the fetish achieves and what it is that maintains it. It remains a token of triumph over the threat of castration and a protection against it. It also saves the fetishist from becoming a homosexual, by endowing women with the characteristic which makes them tolerable as sexual objects. In later life, the fetishist feels that he enjoys yet another advantage from his substitute for a genital. The meaning of the fetish is not known to other people, so the fetish is not withheld from him: it is easily accessible and he can readily obtain the sexual satisfaction attached to it. What other men have to woo and make exertions for can be had by the fetishist with no trouble at all.  

¹[1927e, 4536]

Probably no male human being is spared the fright of castration at the sight of a female genital. Why some people become homosexual as a consequence of that impression, while others fend it off by creating a fetish, and the great majority surmount it, we are frankly not able to explain. It is possible that, among all the factors at work, we do not yet know those which are decisive for the rare pathological results. We must be content if we can explain what has happened, and may for the present leave on one side the task of explaining why something has not happened.

¹[1927e, 4537]
A further complication arises when the constitutional factor we call bisexuality is comparatively strongly developed in a child. For then, under the threat to the boy's masculinity by castration, his inclination becomes strengthened to diverge in the direction of femininity, to put himself instead in his mother's place and take over her role as object of his father's love. But the fear of castration makes this solution impossible as well. The boy understands that he must also submit to castration if he wants to be loved by his father as a woman. Thus both impulses, hatred of the father and being in love with the father, undergo repression. There is a certain psychological distinction in the fact that the hatred of the father is given up on account of fear of an external danger (castration), while the being in love with the father is treated as an internal instinctual danger, though fundamentally it goes back to the same external danger. [1928b, 4559]

One thing that is left over in men from the influence of the Oedipus complex is a certain amount of disparagement in their attitude towards women, whom they regard as being castrated. In extreme cases this gives rise to an inhibition in their choice of object, and, if it is supported by organic factors, to exclusive homosexuality. [1931b, 4593]
Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic signficance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

[1905d, 1473]
Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psycho-analysis offers the means of filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.¹ In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.²

¹ As 'retiring in favour of someone else' has not previously been mentioned among the causes of homosexuality, or in the mechanism of libidinal fixation in general, I will adduce here another analytic observation of the same kind which has a special feature of interest. I once knew two twin brothers, both of whom were endowed with strong libidinal impulses. One of them was very successful with women, and had innumerable affairs with women and girls. The other went the same way at first, but it became unpleasant for him to be trespassing on his brother's preserves, and, owing to the likeness between them, to be mistaken for him on intimate occasions; so he got out of the difficulty by becoming homosexual. He left the women to his brother, and thus retired in his favour. Another time I treated a youngish man, an artist, unmistakably bisexual in disposition, in whom the homosexual trend had come to the fore simultaneously with a disturbance in his work. He fled from both women and work together. The analysis, which was able to bring him back to both, showed that fear of his father was the most powerful psychical motive for both the disturbances, which were really renunciations. In his imagination all women belonged to his father, and he sought refuge in men out of submission, so as to retire from the conflict with his father. Such a motivation of the homosexual object-choice must be by no means uncommon; in the primaeval ages of the human race all women presumably belonged to the father and head of the primal horde.

² [1920a, 3849]
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]
These primitive impulses undergo a lengthy process of development before they are allowed to become active in the adult. They are inhibited, directed towards other aims and fields, become commingled, alter their objects, and are to some extent turned back upon their possessor. Reaction-formations against certain instincts take the deceptive form of a change in their content, as though egoism had changed into altruism, or cruelty into pity. These reaction-formations are facilitated by the circumstance that some instinctual impulses make their appearance almost from the first in pairs of opposites - a very remarkable phenomenon, and one strange to the lay public, which is termed 'ambivalence of feeling'. The most easily observed and comprehensible instance of this is the fact that intense love and intense hatred are so often to be found together in the same person. Psycho-analysis adds that the two opposed feelings not infrequently have the same person for their object.

[1915b, 3073]

The transformation of 'bad' instincts is brought about by two factors working in the same direction, an internal and an external one. The internal factor consists in the influence exercised on the bad (let us say, the egoistic) instincts by erotism - that is, by the human need for love, taken in its widest sense. By the admixture of erotic components the egoistic instincts are transformed into social ones. We learn to value being loved as an advantage for which we are willing to sacrifice other advantages. The external factor is the force exercised by upbringing, which represents the claims of our cultural environment, and this is continued later by the direct pressure of that environment. Civilization has been attained through the renunciation of instinctual satisfaction, and it demands the same renunciation from each newcomer in turn. Throughout an individual's life there is a constant replacement of external by internal compulsion. The influences of civilization cause an ever-increasing transformation of egoistic trends into altruistic and social ones by an admixture of erotic elements. In the last resort it may be assumed that every internal compulsion which makes itself felt in the development of human beings was originally - that is, in the history of mankind - only an external one. Those who are born to-day bring with them as an inherited organization some degree of tendency (disposition) towards the transformation of egoistic into social instincts, and this disposition is easily stimulated into bringing about that result. A further portion of this instinctual transformation has to be accomplished during the life of the individual himself. So the human being is subject not only to the pressure of his immediate cultural environment, but also to the influence of the cultural history of his ancestors.

[1915b, 3074]
We have, however, never regarded this analysis of the origin of homosexuality as complete. I can now point to a new mechanism leading to homosexual object-choice, although I cannot say how large a part it plays in the formation of the extreme, manifest and exclusive type of homosexuality. Observation has directed my attention to several cases in which during early childhood impulses of jealousy, derived from the mother-complex and of very great intensity, arose against rivals, usually older brothers. This jealousy led to an exceedingly hostile and aggressive attitude towards these brothers which might sometimes reach the pitch of actual death-wishes, but which could not maintain themselves in the face of the subject’s further development. Under the influences of upbringing - and certainly not uninfluenced also by their own continuing powerlessness - these impulses yielded to repression and underwent a transformation, so that the rivals of the earlier period became the first homosexual love-objects. Such an outcome of the attachment to the mother shows various interesting relations with other processes known to us. First of all it is a complete contrast to the development of persecutory paranoia, in which the person who has before been loved becomes the hated persecutor, whereas here the hated rivals are transformed into love objects. It represents, too, an exaggeration of the process which, according to my view, leads to the birth of social instincts in the individual.¹ In both processes there is first the presence of jealous and hostile impulses which cannot achieve satisfaction; and both the affectionate and the social feelings of identification arise as reactive formations against the repressed aggressive impulses.

This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a horror feminae.

It is well known that a good number of homosexuals are characterized by a special development of their social instinctual impulses and by their devotion to the interests of the community. It would be tempting, as a theoretical explanation of this, to say that the behaviour towards men in general of a man who sees in other men potential love-objects must be different from that of a man who looks upon other men in the first instance as rivals in regard to women. The only objection to this is that jealousy and rivalry play their part in homosexual love as well, and that the community of men also includes these potential rivals. Apart from this speculative explanation, however, the fact that homosexual object-choice not infrequently proceeds from an early overcoming of rivalry with men cannot be without a bearing on the connection between homosexuality and social feeling.

In the light of psycho-analysis we are accustomed to regard social feeling as a sublimation of homosexual attitudes towards objects. In the homosexuals with marked social interests, it would seem that the detachment of social feeling from object choice has not been fully carried through.
Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

[1923b, 3971]

Now the case in which someone first loves and then hates the same person (or the reverse) because that person has given him cause for doing so, has obviously nothing to do with our problem. Nor has the other case, in which feelings of love that have not yet become manifest express themselves to begin with by hostility and aggressive tendencies; for it may be that here the destructive component in the object-cathexis has hurried on ahead and is only later on joined by the erotic one. But we know of several instances in the psychology of the neuroses in which it is more plausible to suppose that a transformation does take place. In persecutory paranoia the patient fends off an excessively strong homosexual attachment to some particular person in a special way; and as a result this person whom he loved most becomes a persecutor, against whom the patient directs an often dangerous aggressiveness. Here we have a right to interpolate a previous phase which has transformed the love into hate. In the case of the origin of homosexuality, and of desexualized social feelings as well, analytic investigation has only recently taught us to recognize that violent feelings of rivalry are present which lead to aggressive inclinations, and that it is only after these have been surmounted that the formerly hated object becomes the loved one or gives rise to an identification. The question arises whether in these instances we are to assume a direct transformation of hate into love. It is clear that here the changes are purely internal and an alteration in the behaviour of the object plays no part in them.

[1923b, 3977]

Not quite the same thing but something like it happens when the hostile rivalry leading to homosexuality is overcome. The hostile attitude has no prospect of satisfaction; consequently - for economic reasons, that is - it is replaced by a loving attitude for which there is more prospect of satisfaction - that is, possibility of discharge. So we see that we are not obliged in any of these cases to assume a direct transformation of hate into love, which would be incompatible with the qualitative distinction between the two classes of instincts.

[1923b, 3978]
As 'retiring in favour of someone else' has not previously been mentioned among the causes of homosexuality, or in the mechanism of libidinal fixation in general, I will adduce here another analytic observation of the same kind which has a special feature of interest. I once knew two twin brothers, both of whom were endowed with strong libidinal impulses. One of them was very successful with women, and had innumerable affairs with women and girls. The other went the same way at first, but it became unpleasant for him to be trespassing on his brother's preserves, and, owing to the likeness between them, to be mistaken for him on intimate occasions; so he got out of the difficulty by becoming homosexual. He left the women to his brother, and thus retired in his favour. Another time I treated a youngish man, an artist, unmistakably bisexual in disposition, in whom the homosexual trend had come to the fore simultaneously with a disturbance in his work. He fled from both women and work together. The analysis, which was able to bring him back to both, showed that fear of his father was the most powerful psychical motive for both the disturbances, which were really renunciations. In his imagination all women belonged to his father, and he sought refuge in men out of submission, so as to retire from the conflict with his father. Such a motivation of the homosexual object-choice must be by no means uncommon; in the primaeval ages of the human race all women presumably belonged to the father and head of the primal horde.

Among brothers and sisters who are not twins this 'retiring' plays a great part in other spheres as well as in that of erotic choice. For example, an elder brother studies music and is admired for it; the younger, far more gifted musically, soon gives up his own musical studies, in spite of his fondness for it, and cannot be persuaded to touch an instrument again. This is only one example of a very frequent occurrence, and investigation of the motives leading to this 'retirement' rather than to open rivalry discloses very complicated conditions in the mind.

We have, however, never regarded this analysis of the origin of homosexuality as complete. I can now point to a new mechanism leading to homosexual object-choice, although I cannot say how large a part it plays in the formation of the extreme, manifest and exclusive type of homosexuality. Observation has directed my attention to several cases in which during early childhood impulses of jealousy, derived from the mother-complex and of very great intensity, arose against rivals, usually older brothers. This jealousy led to an exceedingly hostile and aggressive attitude towards these brothers which might sometimes reach the pitch of actual death-wishes, but which could not maintain themselves in the face of the subject's further development. Under the influences of upbringing - and certainly not uninfluenced also by their own continuing powerlessness - these impulses yielded to repression and underwent a transformation, so that the rivals of the earlier period became the first homosexual love-objects. Such an outcome of the attachment to the mother shows various interesting relations with other processes known to us. First of all it is a complete contrast to the development of persecutory paranoia, in which the person who has before been loved becomes the hated persecutor, whereas here the hated rivals are transformed into love objects. It represents, too, an exaggeration of the process which, according to my view, leads to the birth of social instincts in the individual. In both processes there is first the presence of jealous and hostile impulses which cannot achieve satisfaction; and both the affectionate and the social feelings of identification arise as reactive formations against the repressed aggressive impulses.
This new mechanism of homosexual object-choice - its origin in rivalry which has been overcome and in aggressive impulses which have become repressed - is sometimes combined with the typical conditions already familiar to us. In the history of homosexuals one often hears that the change in them took place after the mother had praised another boy and set him up as a model. The tendency to a narcissistic object-choice was thus stimulated, and after a short phase of keen jealousy the rival became a love-object. As a rule, however, the new mechanism is distinguished by the change taking place at a much earlier period, and the identification with the mother receding into the background. Moreover, in the cases I have observed, it led only to homosexual attitudes which did not exclude heterosexuality and did not involve a *horror feminae*.

[1922b, 3909]
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

[1922b, 3907]
PREVENTION OF INVERSION  One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion.

¹[1905d, 1541]

I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

²[1911c, 2430]
Homosexuality in women, which is certainly not less common than in men, although much less glaring, has not only been ignored by the law, but has also been neglected by psycho-analytic research. The narration of a single case, not too pronounced in type, in which it was possible to trace its origin and development in the mind with complete certainty and almost without a gap may, therefore, have a certain claim to attention. If this presentation of it furnishes only the most general outlines of the various events concerned and of the conclusions reached from a study of the case, while suppressing all the characteristic details on which the interpretation is founded, this limitation is easily to be explained by the medical discretion necessary in discussing a recent case.

[1920a, 3837]

In doing so she behaved just as many men do who after a first distressing experience turn their backs forever upon the faithless female sex and become woman-haters. It is related of one of the most attractive and unfortunate princely figures of our time that he became a homosexual because the lady he was engaged to marry betrayed him with another man. I do not know whether this is true historically, but an element of psychological truth lies behind the rumour. In all of us, throughout life, the libido normally oscillates between male and female objects; the bachelor gives up his men friends when he marries, and returns to club-life when married life has lost its savour. Naturally, when the swing-over is fundamental and final, we suspect the presence of some special factor which definitely favours one side or the other, and which perhaps has only waited for the appropriate moment in order to turn the choice of object in its direction.

[1920a, 3847]

¹ It is by no means rare for a love-relation to be broken off through a process of identification on the part of the lover with the loved object, a process equivalent to a kind of regression to narcissism. After this has been accomplished, it is easy in making a fresh choice of object to direct the libido to a member of the sex opposite to that of the earlier choice.

[1920a, 3848]

There was, in addition, a practical motive for this change, derived from her real relations with her mother, which served as a gain from her illness. The mother herself still attached great value to the attentions and the admiration of men. If, then, the girl became homosexual and left men to her mother (in other words, 'retired in favour of' her mother), she would remove something which had hitherto been partly responsible for her mother's dislike.¹

[1920a, 3849]

So far there has been no question of the Oedipus complex, nor has it up to this point played any part. But now the girl's libido slips into a new position along the line - there is no other way of putting it - of the equation 'penis-child'. She gives up her wish for a penis and puts in place of it a wish for a child: and with that purpose in view she takes her father as a love object. Her mother becomes the object of her jealousy. The girl has turned into a little woman. If I am to credit a single analytic instance, this new situation can give rise to physical sensations which would have to be regarded as a premature awakening of the female genital apparatus. When the girl's attachment to her father comes to grief later on and has to be abandoned, it may give place to an identification with him and the girl may thus return to her masculinity complex and perhaps remain fixated in it.

[1925j, 4154]
To go back a little. We mentioned as the second possible reaction to the discovery of female castration the development of a powerful masculinity complex. By this we mean that the girl refuses, as it were, to recognize the unwelcome fact and, defiantly rebellious, even exaggerates her previous masculinity, clings to her clitoridal activity and takes refuge in an identification with her phallic mother or her father. What can it be that decides in favour of this outcome? We can only suppose that it is a constitutional factor, a greater amount of activity, such as is ordinarily characteristic of a male. However that may be, the essence of this process is that at this point in development the wave of passivity is avoided which opens the way to the turn towards femininity. The extreme achievement of such a masculinity complex would appear to be the influencing of the choice of an object in the sense of manifest homosexuality. Analytic experience teaches us, to be sure, that female homosexuality is seldom or never a direct continuation of infantile masculinity. Even for a girl of this kind it seems necessary that she should take her father as an object for some time and enter the Oedipus situation. But afterwards, as a result of her inevitable disappointments from her father, she is driven to regress into her early masculinity complex. The significance of these disappointments must not be exaggerated; a girl who is destined to become feminine is not spared them, though they do not have the same effect. The predominance of the constitutional factor seems indisputable; but the two phases in the development of female homosexuality are well mirrored in the practices of homosexuals, who play the parts of mother and baby with each other as often and as clearly as those of husband and wife.
[1933a, 4732]
I am aware of the importance attaching to the first of these questions. But one should not exaggerate it and allow it to overshadow the fact that sporadic secondary characteristics of the opposite sex are very often present in normal individuals, and that well-marked physical characteristics of the opposite sex may be found in persons whose choice of object has undergone no change in the direction of inversion; in other words, that in both sexes the degree of physical hermaphroditism is to a great extent independent of psychical hermaphroditism. In modification of these statements it must be added that this independence is more evident in men than women, where bodily and mental traits belonging to the opposite sex are apt to coincide. Still I am not in a position to give a satisfactory answer to the first of our questions about my patient. The psycho-analyst customarily forgoes a thorough physical examination of his patients in certain cases. Certainly there was no obvious deviation from the feminine physical type, nor any menstrual disturbance. The beautiful and well-made girl had, it is true, her father's tall figure, and her facial features were sharp rather than soft and girlish, traits which might be regarded as indicating a physical masculinity. Some of her intellectual attributes also could be connected with masculinity: for instance, her acuteness of comprehension and her lucid objectivity, in so far as she was not dominated by her passion. But these distinctions are conventional rather than scientific. What is certainly of greater importance is that in her behaviour towards her love-object she had throughout assumed the masculine part: that is to say, she displayed the humility and the sublime overvaluation of the sexual object so characteristic of the male lover, the renunciation of all narcissistic satisfaction, and the preference for being the lover rather than the beloved. She had thus not only chosen a feminine love-object, but had also developed a masculine attitude towards that object.

[1920a, 3844]

To go back a little. We mentioned as the second possible reaction to the discovery of female castration the development of a powerful masculinity complex. By this we mean that the girl refuses, as it were, to recognize the unwelcome fact and, defiantly rebellious, even exaggerates her previous masculinity, clings to her clitoridal activity and takes refuge in an identification with her phallic mother or her father. What can it be that decides in favour of this outcome? We can only suppose that it is a constitutional factor, a greater amount of activity, such as is ordinarily characteristic of a male. However that may be, the essence of this process is that at this point in development the wave of passivity is avoided which opens the way to the turn towards femininity. The extreme achievement of such a masculinity complex would appear to be the influencing of the choice of an object in the sense of manifest homosexuality. Analytic experience teaches us, to be sure, that female homosexuality is seldom or never a direct continuation of infantile masculinity. Even for a girl of this kind it seems necessary that she should take her father as an object for some time and enter the Oedipus situation. But afterwards, as a result of her inevitable disappointments from her father, she is driven to regress into her early masculinity complex. The significance of these disappointments must not be exaggerated; a girl who is destined to become feminine is not spared them, though they do not have the same effect. The predominance of the constitutional factor seems indisputable; but the two phases in the development of female homosexuality are well mirrored in the practices of homosexuals, who play the parts of mother and baby with each other as often and as clearly as those of husband and wife.

[1933a, 4732]
I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

Psycho-analytic observers were subsequently struck by the fact that individual features of the narcissistic attitude are found in many people who suffer from other disorders - for instance, as Sadger has pointed out, in homosexuals - and finally it seemed probable that an allocation of the libido such as deserved to be described as narcissism might be present far more extensively, and that it might claim a place in the regular course of human sexual development.¹ Difficulties in psycho-analytic work upon neurotics led to the same supposition, for it seemed as though this kind of narcissistic attitude in them constituted one of the limits to their susceptibility to influence. Narcissism in this sense would not be a perversion, but the libidinal complement to the egoism of the instinct of self-preservation, a measure of which may justifiably be attributed to every living creature.

The significance of narcissistic object-choice for homosexuality in men must be considered in another connection.

Homosexual object-choice originally lies closer to narcissism than does the heterosexual kind. When it is a question, therefore, of repelling an undesirably strong homosexual impulse, the path back to narcissism is made particularly easy. Hitherto I have had very little opportunity of talking to you about the foundations of erotic life so far as we have discovered them, and it is too late now to catch up on the omission. This much, however, I can emphasize to you. Object-choice, the step forward in the development of the libido which is made after the narcissistic stage, can take place according to two different types: either according to the narcissistic type, where the subject’s own ego is replaced by another one that is as similar as possible, or according to the attachment type, where people who have become precious through satisfying the other vital needs are chosen as objects by the libido as well. A strong libidinal fixation to the narcissistic type of object-choice is to be included in the predisposition to manifest homosexuality.
I will conclude my survey of the patient's sexual development by giving some brief glimpses of its later vicissitudes. During the years of puberty a markedly sensual, masculine current, with a sexual aim suitable to the genital organization, made its appearance in him; it must be regarded as normal, and its history occupied the period up to the time of his later illness. It was connected directly with the Grusha scene, from which it borrowed its characteristic feature - a compulsive falling in love that came on and passed off by sudden fits. This current had to struggle against the inhibitions that were derived from his infantile neurosis. There had been a violent revulsion in the direction of women, and he had thus won his way to complete masculinity. From that time forward he retained women as his sexual object; but he did not enjoy this possession, for a powerful, and now entirely unconscious, inclination towards men, in which were united all the forces of the earlier phases of his development, was constantly drawing him away from his female objects and compelling him in the intervals to exaggerate his dependence upon women. He kept complaining during the treatment that he could not bear having to do with women, and all our labours were directed towards disclosing to him his unconscious relation to men. The whole situation might be summarized in the shape of a formula. His childhood had been marked by a wavering between activity and passivity, his puberty by a struggle for masculinity, and the period after he had fallen ill by a fight for the object of his masculine desires. The precipitating cause of his neurosis was not one of the types of onset which I have been able to put together as special cases of 'frustration,'¹ and it thus draws attention to a gap in that classification. He broke down after an organic affection of the genitals had revived his fear of castration, shattered his narcissism, and compelled him to abandon his hope of being personally favoured by destiny. He fell ill, therefore, as the result of a narcissistic 'frustration'. This excessive strength of his narcissism was in complete harmony with the other indications of an inhibited sexual development: with the fact that so few of his psychical trends were concentrated in his heterosexual object choice, in spite of all its energy, and that his homosexual attitude, standing so much nearer to narcissism, persisted in him as an unconscious force with such very great tenacity. Naturally, where disturbances like these are present, psycho-analytic treatment cannot bring about any instantaneous revolution or put matters upon a level with a normal development: it can only get rid of the obstacles and clear the path, so that the influences of life may be able to further development along better lines.

[1918b, 3593]
CASTRATION COMPLEX AND PENIS ENVY. This conviction is energetically maintained by boys, is obstinately defended against the contradictions which soon result from observation, and is only abandoned after severe internal struggles (the castration complex). The substitutes for this penis which they feel is missing in women play a great part in determining the form taken by many perversions. They substitute for this penis which they feel is missing in women play a great part in determining the form taken by many perversions.¹

Little girls do not resort to denial of this kind when they see that boys' genitals are formed differently from their own. They are ready to recognize them immediately and are overcome by envy for the penis - an envy culminating in the wish, which is so important in its consequences, to be boys themselves.

It is easy to observe that little girls fully share their brother's opinion of it. They develop a great interest in that part of the boy's body. But this interest promptly falls under the sway of envy. They feel themselves unfairly treated. They make attempts to micturate in the posture that is made possible for boys by their possessing a big penis; and when a girl declares that 'she would rather be a boy', we know what deficiency her wish is intended to put right.

The analysis showed, further, that the girl had brought along with her from her childhood a strongly marked 'masculinity complex'. A spirited girl, always ready for romping and fighting, she was not at all prepared to be second to her slightly older brother; after inspecting his genital organs she had developed a pronounced envy for the penis, and the thoughts derived from this envy still continued to fill her mind. She was in fact a feminist; she felt it to be unjust that girls should not enjoy the same freedom as boys, and rebelled against the lot of woman in general. At the time of the analysis the idea of pregnancy and child-birth was disagreeable to her, partly, I surmise, on account of the bodily disfigurement connected with them. Her girlish narcissism had fallen back on this defence,¹ and ceased to express itself as pride in her good looks. Various clues indicated that she must formerly have had strong exhibitionist and scopophilic tendencies. Anyone who is anxious that the claims of acquired as opposed to hereditary factors should not be under-estimated in aetiology will call attention to the fact that the girl's behaviour, as described above, was exactly what would follow from the combined effect in a person with a strong mother-fixation of the two influences of her mother's neglect and her comparison of her genital organs with her brother's. It is possible here to attribute to the impress of the operation of external influence in early life something which one would have liked to regard as a constitutional peculiarity. On the other hand, a part even of this acquired disposition (if it was really acquired) has to be ascribed to inborn constitution. So we see in practice a continual mingling and blending of what in theory we should try to separate into a pair of opposites - namely, inherited and acquired characters.

Here what has been named the masculinity complex of women branches off. It may put great difficulties in the way of their regular development towards femininity, if it cannot be got over soon enough. The hope of some day obtaining a penis in spite of everything and so of becoming like a man may persist to an incredibly late age and may become a motive for strange and otherwise unaccountable actions. Or again, a process may set in which I should like to call a 'disavowal', a process which in the mental life of children seems neither uncommon nor very dangerous but which in an adult would mean the beginning of a psychosis. Thus a girl may refuse to accept the fact of being castrated, may harden herself in the conviction that she does possess a penis, and may subsequently be compelled to behave as though she were a man.

¹ 1905d, 1514
² 1908c, 1972
³ 1920a, 3858
⁴ 1925j, 4151
The psychical consequences of envy for the penis, in so far as it does not become absorbed in the reaction-formation of the masculinity complex, are various and far-reaching. After a woman has become aware of the wound to her narcissism, she develops, like a scar, a sense of inferiority. When she has passed beyond her first attempt at explaining her lack of a penis as being a punishment personal to herself and has realized that that sexual character is a universal one, she begins to share the contempt felt by men for a sex which is the lesser in so important a respect, and, at least in holding that opinion, insists on being like a man.¹
[1925j, 4151]

Quite different are the effects of the castration complex in the female. She acknowledges the fact of her castration, and with it, too, the superiority of the male and her own inferiority; but she rebels against this unwelcome state of affairs. From this divided attitude three lines of development open up. The first leads to a general revulsion from sexuality. The little girl, frightened by the comparison with boys, grows dissatisfied with her clitoris, and gives up her phallic activity and with it her sexuality in general as well as a good part of her masculinity in other fields. The second line leads her to cling with defiant self-assertiveness to her threatened masculinity. To an incredibly late age she clings to the hope of getting a penis some time. That hope becomes her life’s aim; and the phantasy of being a man in spite of everything often persists as a formative factor over long periods. This ‘masculinity complex’ in women can also result in a manifest homosexual choice of object. Only if her development follows the third, very circuituous, path does she reach the final normal female attitude, in which she takes her father as her object and so finds her way to the feminine form of the Oedipus complex. Thus in women the Oedipus complex is the end-result of a fairly lengthy development. It is not destroyed, but created, by the influence of castration; it escapes the strongly hostile influences which, in the male, have a destructive effect on it, and indeed it is all too often not surmounted by the female at all. For this reason, too, the cultural consequences of its break-up are smaller and of less importance in her. We should probably not be wrong in saying that it is this difference in the reciprocal relation between the Oedipus and the castration complex which gives its special stamp to the character of females as social beings.¹
[1931b, 4594]

To go back a little. We mentioned as the second possible reaction to the discovery of female castration the development of a powerful masculinity complex. By this we mean that the girl refuses, as it were, to recognize the unwelcome fact and, defiantly rebellious, even exaggerates her previous masculinity, clings to her clitorial activity and takes refuge in an identification with her phallic mother or her father. What can it be that decides in favour of this outcome? We can only suppose that it is a constitutional factor, a greater amount of activity, such as is ordinarily characteristic of a male. However that may be, the essence of this process is that at this point in development the wave of passivity is avoided which opens the way to the turn towards femininity. The extreme achievement of such a masculinity complex would appear to be the influencing of the choice of an object in the sense of manifest homosexuality. Analytic experience teaches us, to be sure, that female homosexuality is seldom or never a direct continuation of infantile masculinity. Even for a girl of this kind it seems necessary that she should take her father as an object for some time and enter the Oedipus situation. But afterwards, as a result of her inevitable disappointments from her father, she is driven to regress into her early masculinity complex. The significance of these disappointments must not be exaggerated; a girl who is destined to become feminine is not spared them, though they do not have the same effect. The predominance of the constitutional factor seems indisputable; but the two phases in the development of female homosexuality are well mirrored in the practices of homosexuals, who play the parts of mother and baby with each other as often and as clearly as those of husband and wife.
[1933a, 4732]
If a little girl persists in her first wish - to grow into a boy - in extreme cases she will end as a manifest homosexual, and otherwise she will exhibit markedly masculine traits in the conduct of her later life, will choose a masculine vocation, and so on. The other path leads by way of abandoning the mother she has loved: the daughter, under the influence of her envy for the penis, cannot forgive her mother for having sent her into the world so insufficiently equipped. In her resentment over this she gives up her mother and puts someone else in her place as the object of her love - her father. If one has lost a love-object, the most obvious reaction is to identify oneself with it, to replace it from within, as it were, by identification. This mechanism now comes to the little girl's help. Identification with her mother can take the place of attachment to her mother. The little daughter puts herself in her mother's place, as she has always done in her games; she tries to take her mother's place with her father, and begins to hate the mother she used to love, and from two motives: from jealousy as well as from mortification over the penis she has been denied. Her new relation to her father may start by having as its content a wish to have his penis at her disposal, but it culminates in another wish - to have a baby from him as a gift. The wish for a baby has thus taken the place of the wish for a penis, or has at all events split off from it.

[1940a [1938], 5000]
It is well known that even in a normal person it takes a certain time before the decision in regard to the sex of the love object is finally made. Homosexual enthusiasms, exaggeratedly strong friendships tinged with sensuality, are common enough in both sexes during the first years after puberty. This was also so with our patient, but in her these tendencies undoubtedly showed themselves to be stronger, and lasted longer, than with others. In addition, these presages of later homosexuality had always occupied her conscious life, while the attitude arising from the Oedipus complex had remained unconscious and had appeared only in such signs as her tender behaviour to the little boy. As a school-girl she had been for a long time in love with a strict and unapproachable mistress, obviously a substitute mother. She had taken a specially lively interest in a number of young mothers long before her brother's birth and therefore all the more certainly long before the first reprimand from her father. From very early years, therefore, her libido had flowed in two currents, the one on the surface being one that we may unhesitatingly designate as homosexual. This latter was probably a direct and unchanged continuation of an infantile fixation on her mother. Possibly the analysis described here actually revealed nothing more than the process by which, on an appropriate occasion, the deeper heterosexual current of libido, too, was deflected into the manifest homosexual one. [1920a, 3857]

The analysis showed, further, that the girl had brought along with her from her childhood a strongly marked 'masculinity complex'. A spirited girl, always ready for romping and fighting, she was not at all prepared to be second to her slightly older brother; after inspecting his genital organs she had developed a pronounced envy for the penis, and the thoughts derived from this envy still continued to fill her mind. She was in fact a feminist; she felt it to be unjust that girls should not enjoy the same freedom as boys, and rebelled against the lot of woman in general. At the time of the analysis the idea of pregnancy and child-birth was disagreeable to her, partly, I surmise, on account of the bodily disfigurement connected with them. Her girlish narcissism had fallen back on this defence,¹ and ceased to express itself as pride in her good looks. Various clues indicated that she must formerly have had strong exhibitionist and scopophilic tendencies. Anyone who is anxious that the claims of acquired as opposed to hereditary factors should not be under-estimated in aetiology will call attention to the fact that the girl's behaviour, as described above, was exactly what would follow from the combined effect in a person with a strong mother-fixation of the two influences of her mother's neglect and her comparison of her genital organs with her brother's. It is possible here to attribute to the impress of the operation of external influence in early life something which one would have liked to regard as a constitutional peculiarity. On the other hand, a part even of this acquired disposition (if it was really acquired) has to be ascribed to inborn constitution. So we see in practice a continual mingling and blending of what in theory we should try to separate into a pair of opposites - namely, inherited and acquired characters. [1920a, 3858]
The fact of a person struggling in this way against a compulsion towards inversion may perhaps determine the possibility of his being influenced by suggestion [Added 1910:] or psycho-analysis.

[1905d, 1466]

This does not apply only to the 'negative' tendencies to perversion which appear in neuroses but equally to the 'positive,' properly so-called, perversions. Thus these latter are to be derived not merely from a fixation of infantile tendencies but also from a regression to those tendencies as a result of other channels of the sexual current being blocked. It is for this reason that the positive perversions also are accessible to psycho-analytic therapy.

[1905d, 1543]

The hereditary conditions in the case of positive perverts are less well known, for they know how to avoid investigation. Yet there are good reasons to suppose that what is true of the neuroses applies also to the perversions. For it is no rare thing to find perversions and psychoneuroses occurring in the same family, and distributed between the two sexes in such a way that the male members of the family, or one of them, are positive perverts, while the females, true to the tendency of their sex to repression, are negative perverts, that is, hysterics. This is good evidence of the essential connections which we have shown to exist between the two disorders.

[1905d, 1546]

It would naturally be important to know whether the origin of infantile perversions from the Oedipus complex can be asserted as a general principle. While this cannot be decided without further investigation, it does not seem impossible. When we recall the anamneses which have been obtained in adult cases of perversion we cannot fail to notice that the decisive impression, the 'first experience,' of all these perverts, fetishists, etc., is scarcely ever referred back to a time earlier than the sixth year. At this time, however, the dominance of the Oedipus complex is already over; the experience which is recalled, and which has been effective in such a puzzling way, may very well have represented the legacy of that complex. The connections between the experience and the complex which is by this time repressed are bound to remain obscure so long as analysis has not thrown any light on the time before the first 'pathogenic' impression. So it may be imagined how little value is to be attached, for instance, to an assertion that a case of homosexuality is congenital, when the ground given for this belief is that ever since his eighth or sixth year the person in question has felt inclinations only towards his own sex.

[1919e, 3653]

Further unfavourable features in the present case were the facts that the girl was not in any way ill (she did not suffer from anything in herself, nor did she complain of her condition) and that the task to be carried out did not consist in resolving a neurotic conflict but in converting one variety of the genital organization of sexuality into the other. Such an achievement - the removal of genital inversion or homosexuality - is in my experience never an easy matter. On the contrary, I have found success possible only in specially favourable circumstances, and even then the success essentially consisted in making access to the opposite sex (which had hitherto been barred) possible to a person restricted to homosexuality, thus restoring his full bisexual functions. After that it lay with him to choose whether he wished to abandon the path that is banned by society, and in some cases he has done so. One must remember that normal sexuality too depends upon a restriction in the choice of object. In general, to undertake to convert a fully developed homosexual into a heterosexual does not offer much more prospect of success than the reverse, except that for good practical reasons the latter is never attempted.

[1920a, 3841]
The number of successes achieved by psycho-analytic treatment of the various forms of homosexuality, which incidentally are manifold, is indeed not very striking. As a rule the homosexual is not able to give up the object which provides him with pleasure, and one cannot convince him that if he made the change he would rediscover in the other object the pleasure that he has renounced, and such components of the instinct of self-preservation prove themselves too weak in the struggle against the sexual impulsions. One then soon discovers his secret plan, namely, to obtain from the striking failure of his attempt a feeling of satisfaction that he has done everything possible against his abnormality, to which he can now resign himself with an easy conscience. The case is somewhat different when consideration for beloved parents and relatives has been the motive for his attempt to be cured. Here there really are libidinal impulsions present which may put forth energies opposed themselves to the homosexual choice of object; but their strength is rarely sufficient. It is only where the homosexual fixation has not yet become strong enough, or where there are considerable rudiments and vestiges of a heterosexual choice of object, i.e. in a still oscillating or in a definitely bisexual organization, that one may make a more favourable prognosis for psycho-analytic therapy.

[1920a, 3841]

It is not for psycho-analysis to solve the problem of homosexuality. It must rest content with disclosing the psychical mechanisms that resulted in determining the object-choice, and with tracing back the paths from them to the instinctual dispositions. There its work ends, and it leaves the rest to biological research, which has recently brought to light, through Steinach's¹ experiments, such very important results concerning the influence exerted by the first set of characteristics mentioned above upon the second and third. Psycho-analysis has a common basis with biology, in that it presupposes an original bisexuality in human beings (as in animals). But psycho-analysis cannot elucidate the intrinsic nature of what in conventional or in biological phraseology is termed 'masculine' and 'feminine': it simply takes over the two concepts and makes them the foundation of its work. When we attempt to reduce them further, we find masculinity vanishing into activity and femininity into passivity, and that does not tell us enough. I have already tried to explain how far we may reasonably expect, or how far experience has already proved, that the work of elucidation which is part of the task of analysis furnishes us with the means of effecting a modification of inversion. When one compares the extent to which we can influence it with the remarkable transformations that Steinach has effected in some cases by his operations, it does not make a very imposing impression. But it would be premature, or a harmful exaggeration, if at this stage we were to indulge in hopes of a 'therapy' of inversion that could be generally applied. The cases of male homosexuality in which Steinach has been successful fulfilled the condition, which is not always present, of a very patent physical 'hermaphroditism'. Any analogous treatment of female homosexuality is at present quite obscure. If it were to consist in removing what are probably hermaphroditic ovaries, and in grafting others, which are hoped to be of a single sex, there would be little prospect of its being applied in practice. A woman who has felt herself to be a man, and has loved in masculine fashion, will hardly let herself be forced into playing the part of a woman, when she must pay for this transformation, which is not in every way advantageous, by renouncing all hope of motherhood.

[1920a, 3860]
In the case of our dream we are in a position to indicate the material upon which the misinterpretation is based. The impostor is the dream and the Emperor is the dreamer himself; the moralizing purpose of the dream reveals an obscure knowledge of the fact that the latent dream-content is concerned with forbidden wishes that have fallen victim to repression. For the context in which dreams of this sort appear during my analyses of neurotics leaves no doubt that they are based upon memories from earliest childhood. It is only in our childhood that we are seen in inadequate clothing both by members of our family and by strangers - nurses, maidservants, and visitors; and it is only then that we feel no shame at our nakedness.¹ We can observe how undressing has an almost intoxicating effect on many children even in their later years, instead of making them feel ashamed. They laugh and jump about and slap themselves, while their mother, or whoever else may be there, reproves them and says: 'Ugh! Shocking! You mustn't ever do that!' Children frequently manifest a desire to exhibit. One can scarcely pass through a country village in our part of the world without meeting some child of two or three who lifts up his little shirt in front of one - in one's honour, perhaps. One of my patients has a conscious memory of a scene in his eighth year, when at bed-time he wanted to dance into the next room where his little sister slept, dressed in his night-shirt, but was prevented by his nurse. In the early history of neurotics an important part is played by exposure to children of the opposite sex; in paranoia delusions of being observed while dressing and undressing are to be traced back to experiences of this kind; while among persons who have remained at the stage of perversion there is one class in which this infantile impulse has reached the pitch of a symptom - the class of 'exhibitionists'.

² Psycho-analysis has cleared up one of the remaining gaps in our understanding of fetishism. It has shown the importance, as regards the choice of a fetish, of a coprophilic pleasure in smelling which has disappeared owing to repression. Both the feet and the hair are objects with a strong smell which have been exalted into fetishes after the olfactory sensation has become unpleasurable and been abandoned. Accordingly, in the perversion that corresponds to foot fetishism, it is only dirty and evil-smelling feet that become sexual objects. Another factor that helps towards explaining the fetishistic preference for the foot is to be found among the sexual theories of children (see below p. 1514): the foot represents a woman's penis, the absence of which is deeply felt. [Added 1915:] In a number of cases of foot-fetishism it has been possible to show that the scopophilic instinct, seeking to reach its object (originally the genitals) from underneath, was brought to a halt in its pathway by prohibition and repression. For that reason it became attached to a fetish in the form of a foot or shoe, the female genitals (in accordance with the expectations of childhood/children) being imagined as male ones.

TOUCHING AND LOOKING A certain amount of touching is indispensable (at all events among human beings) before the normal sexual aim can be attained. And everyone knows what a source of pleasure on the one hand and what an influx of fresh excitation on the other is afforded by tactile sensations of the skin of the sexual object. So that lingering over the stage of touching can scarcely be counted a perversion, provided that in the long run the sexual act is carried further.

¹ 1900a, 723

² 1905d, 1482
The same holds true of seeing - an activity that is ultimately derived from touching. Visual impressions remain the most frequent pathway along which libidinal excitation is aroused; indeed, natural selection counts upon the accessibility of this pathway - if such a teleological form of statement is permissible - when it encourages the development of beauty in the sexual object. The progressive concealment of the body which goes along with civilization keeps sexual curiosity awake. This curiosity seeks to complete the sexual object by revealing its hidden parts. It can, however, be diverted ('sublimated') in the direction of art, if its interest can be shifted away from the genitals on to the shape of the body as a whole.¹ It is usual for most normal people to linger to some extent over the intermediate sexual aim of a looking that has a sexual tinge to it; indeed, this offers them a possibility of directing some proportion of their libido on to higher artistic aims. On the other hand, this pleasure in looking becomes a perversion (a) if it is restricted exclusively to the genitals, or (b) if it is connected with the overriding of disgust (as in the case of voyeurs or people who look on at excretory functions), or (c) if, instead of being preparatory to the normal sexual aim, it supplants it. This last is markedly true of exhibitionists, who, if I may trust the findings of several analyses, exhibit their own genitals in order to obtain a reciprocal view of the genitals of the other person.²

² [Footnote added 1920:] Under analysis, these perversions - and indeed most others - reveal a surprising variety of motives and determinants. The compulsion to exhibit, for instance, is also closely dependent on the castration complex: it is a means of constantly insisting upon the integrity of the subject's own (male) genitals and it reiterates his infantile satisfaction at the absence of a penis in those of women.

The significance of the erotogenic zones as apparatuses subordinate to the genitals and as substitutes for them is, among all the psychoneuroses, most clearly to be seen in hysteria; but this does not imply that that significance is any the less in the other forms of illness. It is only that in them it is less recognizable, because in their case (obsessional neurosis and paranoia) the formation of the symptoms takes place in regions of the mental apparatus which are more remote from the particular centres concerned with somatic control. In obsessional neurosis what is more striking is the significance of those impulses which create new sexual aims and seem independent of erotogenic zones. Nevertheless, in scopophilia and exhibitionism the eye corresponds to an erotogenic zone; while in the case of those components of the sexual instinct which involve pain and cruelty the same role is assumed by the skin - the skin, which in particular parts of the body has become differentiated into sense organs or modified into mucous membrane, and is thus the erotogenic zone par excellence.¹

COMPONENT INSTINCTS Moreover, the effects of seduction do not help to reveal the early history of the sexual instinct; they rather confuse our view of it by presenting children prematurely with a sexual object for which the infantile sexual instinct at first shows no need. It must, however, be admitted that infantile sexual life, in spite of the preponderating dominance of erotogenic zones, exhibits components which from the very first involve other people as sexual objects. Such are the instincts of scopophilia, exhibitionism and cruelty, which appear in a sense independently of erotogenic zones; these instincts do not enter into intimate relations with genital life until later, but are already to be observed in childhood as independent impulses, distinct in the first instance from erotogenic sexual activity. Small children are essentially without shame, and at some periods of their earliest years show an unmistakable satisfaction in exposing their bodies, with especial emphasis on the sexual parts. The counterpart of this supposedly perverse inclination, curiosity to see other people’s genitals, probably, does not become manifest until somewhat later in childhood, when the obstacle set up by a sense of shame has already reached a certain degree of development. Under the influence of seduction the scopophilic perversion can attain great importance in the sexual life of a child. But my researches into the early years of normal people, as well as of neurotic patients, force me to the conclusion that scopophilia can also appear in children as a spontaneous manifestation. Small children whose attention has once been drawn - as a rule by masturbation - to their own genitals usually take the further step without help from outside and develop a lively interest in the genitals of their playmates. Since opportunities for satisfying curiosity of this kind usually occur only in the course of satisfying the two kinds of need for excretion, children of this kind turn into voyeurs, eager spectators of the processes of micturition and defaecation. When repression of these inclinations sets in, the desire to see other people’s genitals (whether of their own or the opposite sex) persists as a tormenting compulsion, which in some cases of neurosis later affords the strongest motive force for the formation of symptoms.

Smut is like an exposure of the sexually different person to whom it is directed. By the utterance of the obscene words it compels the person who is assailed to imagine the part of the body or the procedure in question and shows her that the assailant is himself imagining it. It cannot be doubted that the desire to see what is sexual exposed is the original motive of smut.

It can only help to clarify things if at this point we go back to fundamental facts. A desire to see the organs peculiar to each sex exposed is one of the original components of our libido. It may itself be a substitute for something earlier and go back to a hypothetical primary desire to touch the sexual parts. As so often, looking has replaced touching.¹ The libido for looking and touching is present in everyone in two forms, active and passive, male and female; and, according to the preponderance of the sexual character, one form or the other predominates. It is easy to observe the inclination to self-exposure in young children. In cases in which the germ of this inclination escapes its usual fate of being buried and suppressed, it develops in men into the familiar perversion known as exhibitionism. In women the inclination to passive exhibitionism is almost invariably buried under the imposing reactive function of sexual modesty, but not without a loophole being left for it in relation to clothes. I need only hint at the elasticity and variability in the amount of exhibitionism that women are permitted to retain in accordance with differing convention and circumstances.

[1905d, 1511]

[1905c, 1695]

[1905c, 1695]
In men a high degree of this trend persists as a portion of their libido, and it serves to introduce the sexual act. When this urge makes itself felt at the first approach to a woman, it must make use of words, for two reasons; firstly, to announce itself to her, and secondly, because if the idea is aroused by speech it may induce a corresponding excitement in the woman herself and may awaken an inclination in her to passive exhibitionism. A wooing speech like this is not yet smut, but it passes over into it. If the woman's readiness emerges quickly the obscene speech has a short life; it yields at once to a sexual action. It is otherwise if quick readiness on the woman's part is not to be counted on, and if in place of it defensive reactions appear. In that case the sexually exciting speech becomes an aim in itself in the shape of smut. Since the sexual aggressiveness is held up in its advance towards the act, it pauses at the evocation of the excitement and derives pleasure from the signs of it in the woman. In so doing, the aggressiveness is no doubt altering its character as well, just as any libidinal impulse will if it is met by an obstacle. It becomes positively hostile and cruel, and it thus summoned to its help against the obstacle the sadistic components of the sexual instinct.

The pleasure which a person takes in his own sexual organ may become associated with scopophilia (or sexual pleasure in looking) in its active and passive forms, in a manner which has been very aptly described by Alfred Adler (1908) as 'confluence of instincts'. So little Hans began to try to get a sight of other people's widdlers; his sexual curiosity developed, and at the same time he liked to exhibit his own widdler. One of his dreams, dating from the beginning of his period of repression, expressed a wish that one of his little girl friends should assist him in widdling, that is, that she should share the spectacle. The dream shows, therefore, that up till then this wish had subsisted unrepressed, and later information confirmed the fact that he had been in the habit of gratifying it. The active side of his sexual scopophilia soon became associated in him with a definite theme. He repeatedly expressed both to his father and his mother his regret that he had never yet seen their widdlers; and it was probably the need for making a comparison which impelled him to do this. The ego is always the standard by which one measures the external world; one learns to understand it by means of a constant comparison with oneself. Hans had observed that large animals had widdlers that were correspondingly larger than his; he consequently suspected that the same was true of his parents, and was anxious to make sure of this. His mother, he thought, must certainly have a widdler 'like a horse'. He was then prepared with the comforting reflection that his widdler would grow with him. It was as though the child's wish to be bigger had been concentrated on his genitals.

But, as we have already said, it was owing to the intervention of Hans's father that this last important discovery was made of the way in which the precipitating cause of the illness had operated. Hans himself was occupied with his lumf interests, and thither at last we must follow him. We learn that formerly Hans had been in the habit of insisting upon accompanying his mother to the W. C., and that he had revived this custom with his friend Berta at a time when she was filling his mother's place, until the fact became known and he was forbidden to do so. Pleasure taken in looking on while some one one loves performs the natural functions is once more a 'confluence of instincts', of which we have already noticed an instance in Hans. In the end his father went into the lumf symbolism, and recognized that there was an analogy between a heavily loaded cart and a body loaded with faeces, between the way in which a cart drives out through a gateway and the way in which faeces leave the body, and so on.
The events in his sixth or seventh year which the patient described in the first hour of his
treatment were not merely, as he supposed, the beginning of his illness, but were already
the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once
the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the
study of which could alone enable us to obtain a grasp of the complicated organization of his
subsequent illness. The child, as we have seen, was under the domination of a component of
the sexual instinct, the desire to look, as a result of which there was a constant recurrence in
him of a very intense wish connected with persons of the female sex who pleased him - the
wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive
idea; and if the quality of compulsion was not yet present in the wish, this was because the ego
had not yet placed itself in complete opposition to it and did not yet regard it as something
foreign to itself. Nevertheless, opposition to this wish from some source or other was already in
activity, for its occurrence was regularly accompanied by a distressing affect.¹ A conflict was
evidently in progress in the mind of this young libertine. Side by side with the obsessive wish,
and intimately associated with it, was an obsessive fear: every time he had a wish of this kind
he could not help fearing that something dreadful would happen. This something dreadful was
already clothed in a characteristic indeterminateness which was thenceforward to be an
invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover
what it is that is veiled behind an indeterminateness of this kind. If the patient can once be
induced to give a particular instance in place of the vague generalities which characterize an
obsessional neurosis, it may be confidently assumed that the instance is the original and actual
thing which has tried to hide itself behind the generalization. Our present patient's obsessive
fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to
see a woman naked, my father will be bound to die.' The distressing affect was distinctly
coloured with a tinge of uncanniness and superstition, and was already beginning to give rise to
impulses to do something to ward off the impending evil. These impulses were subsequently to
develop into the protective measures which the patient adopted.

Before I wind up these remarks on beginning analytic treatment, I must say a word about a
certain ceremonial which concerns the position in which the treatment is carried out. I hold to
the plan of getting the patient to lie on a sofa while I sit behind him out of his sight. This
arrangement has a historical basis; it is the remnant of the hypnotic method out of which
psycho-analysis was evolved. But it deserves to be maintained for many reasons. The first is a
personal motive, but one which others may share with me. I cannot put up with being stared at
by other people for eight hours a day (or more). Since, while I am listening to the patient, I, too,
give myself over to the current of my unconscious thoughts, I do not wish my expressions of
face to give the patient material for interpretations or to influence him in what he tells me. The
patient usually regards being made to adopt this position as a hardship and rebels against it,
especially if the instinct for looking (scopophilia) plays an important part in his neurosis. I insist
on this procedure, however, for its purpose and result are to prevent the transference from
mingling with the patient's associations imperceptibly, to isolate the transference and to allow it
to come forward in due course sharply defined as a resistance. I know that many analysts work
in a different way, but I do not know whether this deviation is due more to a craving for doing
things differently or to some advantage which they find they gain by it.

Examples of the first process are met with in the two pairs of opposites: sadism-masochism
and scopophilia-exhibitionism. The reversal affects only the aims of the instincts. The active aim
(to torture, to look at) is replaced by the passive aim (to be tortured, to be looked at). Reversal
of content is found in the single instance of the transformation of love into hate.
The turning round of an instinct upon the subject's own self is made plausible by the reflection that masochism is actually sadism turned round upon the subject's own ego, and that exhibitionism includes looking at his own body. Analytic observation, indeed, leaves us in no doubt that the masochist shares in the enjoyment of the assault upon himself, and that the exhibitionist shares in the enjoyment of his exposure. The essence of the process is thus the change of the *object*, while the aim remains unchanged. We cannot fail to notice, however, that in these examples the turning round upon the subject's self and the transformation from activity to passivity converge or coincide. [1915c, 2964]

Rather different and simpler findings are afforded by the investigation of another pair of opposites - the instincts whose respective aim is to look and to display oneself (scopophilia and exhibitionism, in the language of the perversions). Here again we may postulate the same stages as in the previous instance:- *(a)* Looking as an *activity* directed towards an extraneous object. *(b)* Giving up of the object and turning of the scopophilic instinct towards a part of the subject's own body; with this, transformation to passivity and setting up of a new aim - that of being looked at. *(c)* Introduction of a new subject to whom one displays oneself in order to be looked at by him. Here, too, it can hardly be doubted that the active aim appears before the passive, that looking precedes being looked at. But there is an important divergence from what happens in the case of sadism, in that we can recognize in the case of the scopophilic instinct a yet earlier stage than that described as *(a)*. For the beginning of its activity the scopophilic instinct is auto-erotic: it has indeed an object, but that object is part of the subject's own body. It is only later that the instinct is led, by a process of comparison, to exchange this object for an analogous part of someone else's body - stage *(a)*. This preliminary stage is interesting because it is the source of *both* the situations represented in the resulting pair of opposites, the one or the other according to which element in the original situation is changed. The following might serve as a diagrammatic picture of the scopophilic instinct:-

(i) Oneself looking at a sexual organ

(ii) Oneself looking at an extraneous object (active scopophilia)

---

(i) A sexual organ being looked at by oneself

(ii) An object which is oneself or part of oneself being looked at by an extraneous person (exhibitionism)

[1915c, 2966]

A preliminary stage of this kind is absent in sadism, which from the outset is directed upon an extraneous object, although it might not be altogether unreasonable to construct such a stage out of the child's efforts to gain control over his own limbs.¹ [1915c, 2967]
With regard to both the instincts which we have just taken as examples, it should be remarked that their transformation by a reversal from activity to passivity and by a turning round upon the subject never in fact involves the whole quota of the instinctual impulse. The earlier active direction of the instinct persists to some degree side by side with its later passive direction, even when the process of its transformation has been very extensive. The only correct statement to make about the scopophilic instinct would be that all the stages of its development, its auto-erotic, preliminary stage as well as its final active or passive form, co-exist alongside one another; and the truth of this becomes obvious if we base our opinion, not on the actions to which the instinct leads, but on the mechanism of its satisfaction. Perhaps, however, it is permissible to look at the matter and represent it in yet another way. We can divide the life of each instinct into a series of separate successive waves, each of which is homogeneous during whatever period of time it may last, and whose relation to one another is comparable to that of successive eruptions of lava. We can then perhaps picture the first, original eruption of the instinct as proceeding in an unchanged form and undergoing no development at all. The next wave would be modified from the outset -(being turned, for instance, from active to passive - and would then, with this new characteristic, be added to the earlier wave, and so on. If we were then to take a survey of the instinctual impulse from its beginning up to a given point, the succession of waves which we have described would inevitably present the picture of a definite development of the instinct.

[1915c, 2967]

We have become accustomed to call the early phase of the development of the ego, during which its sexual instincts find auto-erotic satisfaction, 'narcissism', without at once entering on any discussion of the relation between auto-erotism and narcissism. It follows that the preliminary stage of the scopophilic instinct, in which the subject's own body is the object of the scopophilia, must be classed under narcissism, and that we must describe it as a narcissistic formation. The active scopophilic instinct develops from this, by leaving narcissism behind. The passive scopophilic instinct, on the contrary, holds fast to the narcissistic object. Similarly, the transformation of sadism into masochism implies a return to the narcissistic object. And in both these cases the narcissistic subject is, through identification, replaced by another, extraneous ego. If we take into account our constructed preliminary narcissistic stage of sadism, we shall be approaching a more general realization - namely, that the instinctual vicissitudes which consist in the instinct's being turned round upon the subject's own ego and undergoing reversal from activity to passivity are dependent on the narcissistic organization of the ego and bear the stamp of that phase. They perhaps correspond to the attempts at defence which at higher stages of the development of the ego are effected by other means.

[1915c, 2968]

At this point we may call to mind that so far we have considered only two pairs of opposite instincts: sadism-masochism and scopophilia-exhibitionism. These are the best known sexual instincts that appear in an ambivalent manner. The other components of the later sexual function are not yet sufficiently accessible to analysis for us to be able to discuss them in a similar way. In general we can assert of them that their activities are auto-erotic; that is to say, their object is negligible in comparison with the organ which is their source, and as a rule coincides with that organ. The object of the scopophilic instinct, however, though it too is in the first instance a part of the subject's own body, is not the eye itself; and in sadism the organic source, which is probably the muscular apparatus with its capacity for action, points unequivocally at an object other than itself, even though that object is part of the subject's own body. In the auto-erotic instincts, the part played by the organic source is so decisive that, according to a plausible suggestion of Federn (1913) and Jekels (1913), the form and function of the organ determine the activity or passivity of the instinctual aim.

[1915c, 2968]
Loving admits not merely of one, but of three opposites. In addition to the antithesis 'loving-hating', there is the other one of 'loving-being loved'; and, in addition to these, loving and hating taken together are the opposite of the condition of unconcern or indifference. The second of these three antitheses, loving-being loved, corresponds exactly to the transformation from activity to passivity and may be traced to an underlying situation in the same way as in the case of the scopophilic instinct. This situation is that of loving oneself which we regard as the characteristic feature of narcissism. Then, according as the object or the subject is replaced by an extraneous one, what results is the active aim of loving or the passive one of being loved - the latter remaining near to narcissism.

[1915c, 2969]

The third antithesis of loving, the transformation of loving into being loved, corresponds to the operation of the polarity of activity and passivity, and is to be judged in the same way as the cases of scopophilia and sadism.

[1915c, 2974]

The second group is led by perverts who have made what is normally only an introductory or preparatory act into the aim of their sexual wishes. They are people whose desire it is to look at the other person or to feel him or to watch him in the performance of his intimate actions, or who expose parts of their own bodies which should be covered, in the obscure expectation that they may be rewarded by a corresponding action in return. Next come the sadists, puzzling people whose tender endeavours have no other aim than to cause pain and torment to their object, ranging from humiliation to severe physical injuries; and, as though to counterbalance them, their counterparts, the masochists, whose only pleasure it is to suffer humiliations and torments of every kind from their loved object either symbolically or in reality. There are still others in whom several of these abnormal preconditions are united and intertwined; and lastly, we must learn that each of these groups is to be found in two forms: alongside of those who seek their sexual satisfaction in reality are those who are content merely to imagine that satisfaction, who need no real object at all, but can replace it by their phantasies.

[1916-1917, 3378]
There is something else that I must add in order to complete our view of sexual perversions. However infamous they may be, however sharply they may be contrasted with normal sexual activity, quiet consideration will show that some perverse trait or other is seldom absent from the sexual life of normal people. Even a kiss can claim to be described as a perverse act, since it consists in the bringing together of two oral erotogenic zones instead of the two genitals. Yet no one rejects it as perverse; on the contrary, it is permitted in theatrical performances as a softened hint at the sexual act. But precisely kissing can easily turn into a complete perversion - if, that is to say, it becomes so intense that a genital discharge and orgasm follow upon it directly, an event that is far from rare. We can learn, too, that for one person feeling and looking at the object are indispensable preconditions of sexual enjoyment, that another person will pinch or bite at the climax of sexual excitation, that the highest pitch of excitement in lovers is not always provoked by the genitals but by some other region of the object's body, and any number of similar things besides. There is no sense in excluding people with individual traits of this kind from the class of the normal and putting them among the perverts. On the contrary, we shall recognize more and more clearly that the essence of the perversions lies not in the extension of the sexual aim, not in the replacement of the genitals, not even always in the variant choice of the object, but solely in the exclusiveness with which these deviations are carried out and as a result of which the sexual act serving the purpose of reproduction is put on one side. In so far as the perverse actions are inserted in the performance of the normal sexual act as preparatory or intensifying contributions, they are in reality not perversions at all. The gulf between normal and perverse sexuality is of course very much narrowed by facts of this kind. It is an easy conclusion that normal sexuality has emerged out of something that was in existence before it, by weeding out certain features of that material as unserviceable and collecting together the rest in order to subordinate them to a new aim, that of reproduction.

Accordingly, I can now describe to you the form taken by a child's sexual life before the establishment of the primacy of the genitals, preparations for which are made in the first period of infancy preceding the latency period and which is permanently organized from puberty onwards. A kind of loose organization which may be called 'pregenital' exists during this early period. During this phase what stand in the forefront are not the genital component instincts but the sadistic and anal ones. The contrast between 'masculine' and 'feminine' plays no part here as yet. Its place is taken by the contrast between 'active' and 'passive', which may be described as a precursor of the sexual polarity and which later on is soldered to that polarity. What appears to us as masculine in the activities of this phase, when we look at it from the point of view of the genital phase, turns out to be an expression of an instinct for mastery which easily passes over into cruelty. Trends with a passive aim are attached to the erotogenic zone of the anal orifice, which is very important at this period. The instincts for looking and for gaining knowledge are powerfully at work; the genitals actually play a part in sexual life only as organs for the excretion of urine. The component instincts of this phase are not without objects, but those objects do not necessarily converge into a single object. The sadistic-anal organization is the immediate forerunner of the phase of genital primacy. Detailed study shows how much of it is retained in the later definitive shape of things and shows too the way in which its component instincts are compelled to take their place in the new genital organization. Behind the sadistic-anal phase of libidinal development we get a glimpse of a still earlier and more primitive stage of organization, in which the erotogenic zone of the mouth plays the chief part. As you will guess, the sexual activity of sensual sucking belongs to it. We must admire the understanding of the Ancient Egyptians who, in their art, represented children, including the God Horus, with a finger in their mouth. Only recently Abraham has given examples of the traces which this primitive oral phase leaves behind it in later sexual life.
To-day we will follow yet another side of this development namely the relation of the component sexual instincts to their object. Or rather, we will make a hasty survey of this development and dwell somewhat longer on one of its rather late consequences. A few of the components of the sexual instinct, there, have an object from the first and hold fast to it - for instance, the instinct for mastery (sadism) and the scopophilic and epistemophilic instincts. Others, more definitely linked to particular erotogenic zones of the body, have one to begin with only so long as they are still attached to the non-sexual functions, and give it up when they become separated from them. Thus the first object of the oral component of the sexual instinct is the mother's breast which satisfies the infant's need for nourishment. The erotic component, which is satisfied simultaneously during the sucking, makes itself independent with the act of sensual sucking \[lutschen\]; it gives up the outside object and replaces it by an area of the subject's own body. The oral instinct becomes auto-erotic, as are the anal and other erotogenic instincts from the first. Further development, to put the matter as concisely as possible, has two aims: firstly, the abandonment of auto-erotism, the replacement of the subject's own body once more by an outside object, and secondly, the unification of the various objects of the separate instincts and their replacement by a single object. This can, of course, only be achieved if the object is again a whole body, similar to the subject's own. Nor can it be effected unless a number of the auto-erotic instinctual impulses are left behind as being unserviceable.

The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of component instincts. These are dependent upon erotogenic zones in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly auto-erotic. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the oral components, an anal-sadistic stage follows, and it is only after the third stage has at last been reached that the primacy of the genitals is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of libido to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, fixations of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as regression), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the choice of neurosis, that is, the form in which the subsequent illness makes its appearance.
SADISM AND MASOCHISM   The most common and the most significant of all the perversions - the desire to inflict pain upon the sexual object, and its reverse - received from Krafft-Ebing the names of 'sadism' and 'masochism' for its active and passive forms respectively. Other writers have preferred the narrower term 'algolagnia'. This emphasizes the pleasure in pain, the cruelty; whereas the names chosen by Krafft-Ebing bring into prominence the pleasure in any form of humiliation or subjection.

As regards active algolagnia, sadism, the roots are easy to detect in the normal. The sexuality of most male human beings contains an element of aggressiveness - a desire to subjugate; the biological significance of it seems to lie in the need for overcoming the resistance of the sexual object by means other than the process of wooing. Thus sadism would correspond to an aggressive component of the sexual instinct which has become independent and exaggerated and, by displacement, has usurped the leading position.

In ordinary speech the connotation of sadism oscillates between, on the one hand, cases merely characterized by an active or violent attitude to the sexual object, and, on the other hand, cases in which satisfaction is entirely conditional on the humiliation and maltreatment of the object. Strictly speaking, it is only this last extreme instance which deserves to be described as a perversion.

Similarly, the term masochism comprises any passive attitude towards sexual life and the sexual object, the extreme instance of which appears to be that in which satisfaction is conditional upon suffering physical or mental pain at the hands of the sexual object. Masochism, in the form of a perversion, seems to be further removed from the normal sexual aim than its counterpart; it may be doubted at first whether it can ever occur as a primary phenomenon or whether, on the contrary, it may not invariably arise from a transformation of sadism.¹ It can often be shown that masochism is nothing more than an extension of sadism turned round upon the subject's own self, which thus, to begin with, takes the place of the sexual object. Clinical analysis of extreme cases of masochistic perversion show that a great number of factors (such as the castration complex and the sense of guilt) have combined to exaggerate and fixate the original passive sexual attitude.

¹ [Footnote added 1924:] My opinion of masochism has been to a large extent altered by later reflection, based upon certain hypotheses as to the structure of the apparatus of the mind and the classes of instincts operating in it. I have been led to distinguish a primary or erotogenic masochism, out of which two later forms, feminine and moral masochism, have developed. Sadism which cannot find employment in actual life is turned round upon the subject's own self and so produces a secondary masochism, which is superadded to the primary kind. (Cf. Freud, 1924c.)

Pain, which is overridden in such cases, thus falls into line with disgust and shame as a force that stands in opposition and resistance to the libido.
The history of human civilization shows beyond any doubt that there is an intimate connection between cruelty and the sexual instinct; but nothing has been done towards explaining the connection, apart from laying emphasis on the aggressive factor in the libido. According to some authorities this aggressive element of the sexual instinct is in reality a relic of cannibalistic desires - that is, it is a contribution derived from the apparatus for obtaining mastery, which is concerned with the satisfaction of the other and, ontogenetically, the older of the great instinctual needs.¹ It has also been maintained that every pain contains in itself the possibility of a feeling of pleasure. All that need be said is that no satisfactory explanation of this perversion has been put forward and that it seems possible that a number of mental impulses are combined in it to produce a single resultant.²

But the most remarkable feature of this perversion is that its active and passive forms are habitually found to occur together in the same individual. A person who feels pleasure in producing pain in someone else in a sexual relationship is also capable of enjoying as pleasure any pain which he may himself derive from sexual relations. A sadist is always at the same time a masochist, although the active or the passive aspect of the perversion may be the more strongly developed in him and may represent his predominant sexual activity.³

We find, then, that certain among the impulses to perversion occur regularly as pairs of opposites; and this, taken in conjunction with material which will be brought forward later, has a high theoretical significance.⁴ It is, moreover, a suggestive fact that the existence of the pair of opposites formed by sadism and masochism cannot be attributed merely to the element of aggressiveness. We should rather be inclined to connect the simultaneous presence of these opposites with the opposing masculinity and femininity which are combined in bisexuality - a contrast which often has to be replaced in psycho-analysis by that between activity and passivity.⁵

² [Footnote added 1924:] The enquiry mentioned above has led me to assign a peculiar position, based upon the origin of the instincts, to the pair of opposites constituted by sadism and masochism, and to place them outside the class of the remaining 'perversions'.

³ [1905d, 1485]

⁴ [1905d, 1485]

The significance of the erotogenic zones as apparatuses subordinate to the genitals and as substitutes for them is, among all the psychoneuroses, most clearly to be seen in hysteria; but this does not imply that that significance is any the less in the other forms of illness. It is only that in them it is less recognizable, because in their case (obsessional neurosis and paranoia) the formation of the symptoms takes place in regions of the mental apparatus which are more remote from the particular centres concerned with somatic control. In obsessional neurosis what is more striking is the significance of those impulses which create new sexual aims and seem independent of erotogenic zones. Nevertheless, in scopophilia and exhibitionism the eye corresponds to an erotogenic zone; while in the case of those components of the sexual instinct which involve pain and cruelty the same role is assumed by the skin - the skin, which in particular parts of the body has become differentiated into sense organs or modified into mucous membrane, and is thus the erotogenic zone par excellence.¹
COMPONENT INSTINCTS Moreover, the effects of seduction do not help to reveal the early history of the sexual instinct; they rather confuse our view of it by presenting children prematurely with a sexual object for which the infantile sexual instinct at first shows no need. It must, however, be admitted that infantile sexual life, in spite of the preponderating dominance of erotogenic zones, exhibits components which from the very first involve other people as sexual objects. Such are the instincts of scopophilia, exhibitionism and cruelty, which appear in a sense independently of erotogenic zones; these instincts do not enter into intimate relations with genital life until later, but are already to be observed in childhood as independent impulses, distinct in the first instance from erotogenic sexual activity. Small children are essentially without shame, and at some periods of their earliest years show an unmistakable satisfaction in exposing their bodies, with especial emphasis on the sexual parts. The counterpart of this supposedly perverse inclination, curiosity to see other people's genitals, probably, does not become manifest until somewhat later in childhood, when the obstacle set up by a sense of shame has already reached a certain degree of development. Under the influence of seduction the scopophilic perversion can attain great importance in the sexual life of a child. But my researches into the early years of normal people, as well as of neurotic patients, force me to the conclusion that scopophilia can also appear in children as a spontaneous manifestation. Small children whose attention has once been drawn - as a rule by masturbation - to their own genitals usually take the further step without help from outside and develop a lively interest in the genitals of their playmates. Since opportunities for satisfying curiosity of this kind usually occur only in the course of satisfying the two kinds of need for excretion, children of this kind turn into voyeurs, eager spectators of the processes of micturition and defaecation. When repression of these inclinations sets in, the desire to see other people's genitals (whether of their own or the opposite sex) persists as a tormenting compulsion, which in some cases of neurosis later affords the strongest motive force for the formation of symptoms.

The cruel component of the sexual instinct develops in childhood even more independently of the sexual activities that are attached to erotogenic zones. Cruelty in general comes easily to the childish nature, since the obstacle that brings the instinct for mastery to a halt at another person's pain - namely a capacity for pity - is developed relatively late. The fundamental psychological analysis of this instinct has, as we know, not yet been satisfactorily achieved. It may be assumed that the impulse of cruelty arises from the instinct for mastery and appears at a period of sexual life at which the genitals have not yet taken over their later role. It then dominates a phase of sexual life which we shall later describe as a pregenital organization. Children who distinguish themselves by special cruelty towards animals and playmates usually give rise to a just suspicion of an intense and precocious sexual activity arising from erotogenic zones; and, though all the sexual instincts may display simultaneous precocity, erotogenic sexual activity seems, nevertheless, to be the primary one. The absence of the barrier of pity brings with it a danger that the connection between the cruel and the erotogenic instincts, thus established in childhood, may prove unbreakable in later life. Ever since Jean Jacques Rousseau's Confessions, it has been well known to all educationalists that the painful stimulation of the skin of the buttocks is one of the erotogenic roots of the passive instinct of cruelty (masochism). The conclusion has rightly been drawn by them that corporal punishment, which is usually applied to this part of the body, should not be inflicted upon any children whose libido is liable to be forced into collateral channels by the later demands of cultural education.¹

¹ [1905d, 1511]
SADISTIC VIEW OF SEXUAL INTERCOURSE

If children at this early age witness sexual intercourse between adults - for which an opportunity is provided by the conviction of grown-up people that small children cannot understand anything sexual - they inevitably regard the sexual act as a sort of ill-treatment or act of subjugation: they view it, that is, in a sadistic sense. Psycho-analysis also shows us that an impression of this kind in early childhood contributes a great deal towards a predisposition to a subsequent sadistic displacement of the sexual aim. Furthermore, children are much concerned with the problem of what sexual intercourse - or, as they put it, being married - consists in: and they usually seek a solution of the mystery in some common activity concerned with the function of micturition or defaecation.

[1905d, 1515]

MUSCULAR ACTIVITY

We are all familiar with the fact that children feel a need for a large amount of active muscular exercise and derive extraordinary pleasure from satisfying it. Whether this pleasure has any connection with sexuality, whether it itself comprises sexual satisfaction or whether it can become the occasion of sexual excitation - all of this is open to critical questioning, which may indeed also be directed against the view maintained in the previous paragraphs that the pleasure derived from sensations of passive movement is of a sexual nature or may produce sexual excitation. It is, however, a fact that a number of people report that they experienced the first signs of excitement in their genitals while they were romping or wrestling with playmates - a situation in which, apart from general muscular exertion, there is a large amount of contact with the skin of the opponent. An inclination to physical struggles with some one particular person, just as in later years an inclination to verbal disputes,¹ is a convincing sign that object-choice has fallen on him. One of the roots of the sadistic instinct would seem to lie in the encouragement of sexual excitation by muscular activity. In many people the infantile connection between romping and sexual excitation is among the determinants of the direction subsequently taken by their sexual instinct.²

[1905d, 1521]

If we assume that a similar erotogenic effect attaches even to intensely painful feelings, especially when the pain is toned down or kept at a distance by some accompanying condition, we should here have one of the main roots of the masochistic-sadistic instinct, into whose numerous complexities we are very gradually gaining some insight.³

[1905d, 1521]

³ [Footnote added 1924:] I am here referring to what is known as 'erotogenic' masochism.

[1905d, 1521]

In men a high degree of this trend persists as a portion of their libido, and it serves to introduce the sexual act. When this urge makes itself felt at the first approach to a woman, it must make use of words, for two reasons; firstly, to announce itself to her, and secondly, because if the idea is aroused by speech it may induce a corresponding excitement in the woman herself and may awaken an inclination in her to passive exhibitionism. A wooing speech like this is not yet smut, but it passes over into it. If the woman's readiness emerges quickly the obscene speech has a short life; it yields at once to a sexual action. It is otherwise if quick readiness on the woman's part is not to be counted on, and if in place of it defensive reactions appear. In that case the sexually exciting speech becomes an aim in itself in the shape of smut. Since the sexual aggressiveness is held up in its advance towards the act, it pauses at the evocation of the excitement and derives pleasure from the signs of it in the woman. In so doing, the aggressiveness is no doubt altering its character as well, just as any libidinal impulse will if it is met by an obstacle. It becomes positively hostile and cruel, and it thus summons to its help against the obstacle the sadistic components of the sexual instinct.

[1905c, 1695]
Put away your doubts, then, and join me in a consideration of infantile sexuality from the earliest age.¹ A child's sexual instinct turns out to be put together out of a number of factors; it is capable of being divided up into numerous components which originate from various sources. Above all, it is still independent of the reproductive function, into the service of which it will later be brought. It serves for the acquisition of different kinds of pleasurable feeling, which, basing ourselves on analogies and connections, we bring together under the idea of sexual pleasure. The chief source of infantile sexual pleasure is the appropriate excitation of certain parts of the body that are especially susceptible to stimulus: apart from the genitals, these are the oral, anal and urethral orifices, as well as the skin and other sensory surfaces. Since at this first phase of infantile sexual life satisfaction is obtained from the subject's own body and extraneous objects are disregarded, we term this phase (from a word coined by Havelock Ellis) that of auto-erotism. We call the parts of the body that are important in the acquisition of sexual pleasure 'eroticogenic zones'. Thumb-sucking (or sensual sucking) in the youngest infants is a good example of this auto-erotic satisfaction from an eroticogenic zone. The first scientific observer of this phenomenon, a paediatrician in Budapest named Lindner (1879), already interpreted it correctly as sexual satisfaction and described exhaustively its transition to other and higher forms of sexual activity. Another sexual satisfaction at this period of life is the masturbatory excitation of the genitals, which retains so much importance in later life and by many people is never completely conquered. Alongside these and other auto-erotic activities, we find in children at a very early age manifestations of those instinctual components of sexual pleasure (or, as we like to say, of libido) which presuppose the taking of an extraneous person as an object. These instincts occur in pairs of opposites, active and passive. I may mention as the most important representatives of this group the desire to cause pain (sadism) with its passive counterpart (masochism) and the active and passive desire for looking, from the former of which curiosity branches off later on and from the latter the impulsion to artistic and theatrical display. Others of a child's sexual activities already imply the making of an 'object-choice', where an extraneous person becomes the main feature, a person who owes his importance in the first instance to considerations arising from the self-preservative instinct. But at this early period of childhood difference in sex plays no decisive part as yet. Thus you can attribute some degree of homosexuality to every child without doing him an injustice. This widespread and copious but dissociated sexual life of children, in which each separate instinct pursues its own acquisition of pleasure independently of all the rest, is now brought together and organized in two main directions, so that by the end of puberty the individual's final sexual character is as a rule completely formed. On the one hand, the separate instincts become subordinated to the dominance of the genital zone, so that the whole sexual life enters the service of reproduction, and the satisfaction of the separate instincts retains its importance only as preparing for and encouraging the sexual act proper. On the other hand, object-choice pushes auto-erotism into the background, so that in the subject's erotic life all the components of the sexual instinct now seek satisfaction in relation to the person who is loved. Not all of the original sexual components, however, are admitted to take part in this final establishment of sexuality. Even before puberty extremely energetic repressions of certain instincts have been effected under the influence of education, and mental forces such as shame, disgust and morality have been set up, which, like watchmen, maintain these repressions. So that when at puberty the high tide of sexual demands is reached, it is met by these mental reactive or resistant structures like dams, which direct its flow into what are called normal channels and make it impossible for it to reactivate the instincts that have undergone repression. It is in particular the coprophilic impulses of childhood - that is to say, the desires attaching to the excreta - which are submitted the most rigorously to repression, and the same is true, furthermore, of fixation to the figures to which the child's original object-choice was attached. [1910a, 2230]
Examples of the first process are met with in the two pairs of opposites: sadism-masochism and scopophilia-exhibitionism. The reversal affects only the aims of the instincts. The active aim (to torture, to look at) is replaced by the passive aim (to be tortured, to be looked at). Reversal of content is found in the single instance of the transformation of love into hate.

The turning round of an instinct upon the subject's own self is made plausible by the reflection that masochism is actually sadism turned round upon the subject's own ego, and that exhibitionism includes looking at his own body. Analytic observation, indeed, leaves us in no doubt that the masochist shares in the enjoyment of the assault upon himself, and that the exhibitionist shares in the enjoyment of his exposure. The essence of the process is thus the change of the object, while the aim remains unchanged. We cannot fail to notice, however, that in these examples the turning round upon the subject's self and the transformation from activity to passivity converge or coincide.

In the case of the pair of opposites sadism-masochism, the process may be represented as follows:
(a) Sadism consists in the exercise of violence or power upon some other person as object.
(b) This object is given up and replaced by the subject's self. With the turning round upon the self the change from an active to a passive instinctual aim is also effected.
(c) An extraneous person is once more sought as object; this person, in consequence of the alteration which has taken place in the instinctual aim, has to take over the role of the subject.

Case (c) is what is commonly termed masochism. Here, too, satisfaction follows along the path of the original sadism, the passive ego placing itself back in phantasy in its first role, which has now in fact been taken over by the extraneous subject. Whether there is, besides this, a more direct masochistic satisfaction is highly doubtful. A primary masochism, not derived from sadism in the manner I have described, seems not to be met with.¹ That it is not superfluous to assume the existence of stage (b) is to be seen from the behaviour of the sadistic instinct in obsessional neurosis. There there is a turning round upon the subject's self without an attitude of passivity towards another person: the change has only got as far as stage (b). The desire to torture has turned into self-torture and self-punishment, not into masochism. The active voice is changed, not into the passive, but into the reflexive, middle voice.

¹ [1915c, 2964]
Our view of sadism is further prejudiced by the circumstance that this instinct, side by side with its general aim (or perhaps, rather, within it), seems to strive towards the accomplishment of a quite special aim - not only to humiliate and master, but, in addition, to inflict pains. Psychoanalysis would appear to show that the infliction of pain plays no part among the original purposive actions of the instinct. A sadistic child takes no account of whether or not he inflicts pains, nor does he intend to do so. But when once the transformation into masochism has taken place, the pains are very well fitted to provide a passive masochistic aim; for we have every reason to believe that sensations of pain, like other unpleasurable sensations, trench upon sexual excitation and produce a pleasurable condition, for the sake of which the subject will even willingly experience the unpleasure of pain. When once feeling pains has become a masochistic aim, the sadistic aim of causing pains can arise also, retrogressively; for while these pains are being inflicted on other people, they are enjoyed masochistically by the subject through his identification of himself with the suffering object. In both cases, of course, it is not the pain itself which is enjoyed, but the accompanying sexual excitation - so that this can be done especially conveniently from the sadistic position. The enjoyment of pain would thus be an aim which was originally masochistic, but which can only become an instinctual aim in someone who was originally sadistic.

¹ (Footnote added 1924:) In later works (cf. 'The Economic Problem of Masochism', 1924c) relating to problems of instinctual life I have expressed an opposite view.

A preliminary stage of this kind is absent in sadism, which from the outset is directed upon an extraneous object, although it might not be altogether unreasonable to construct such a stage out of the child's efforts to gain control over his own limbs.¹

With regard to both the instincts which we have just taken as examples, it should be remarked that their transformation by a reversal from activity to passivity and by a turning round upon the subject never in fact involves the whole quota of the instinctual impulse. The earlier active direction of the instinct persists to a degree side by side with its later passive direction, even when the process of its transformation has been very extensive. The only correct statement to make about the scopophilic instinct would be that all the stages of its development, its auto-erotic, preliminary stage as well as its final active or passive form, co-exist alongside one another; and the truth of this becomes obvious if we base our opinion, not on the actions to which the instinct leads, but on the mechanism of its satisfaction. Perhaps, however, it is permissible to look at the matter and represent it in yet another way. We can divide the life of each instinct into a series of separate successive waves, each of which is homogeneous during whatever period of time it may last, and whose relation to one another is comparable to that of successive eruptions of lava. We can then perhaps picture the first, original eruption of the instinct as proceeding in an unchanged form and undergoing no development at all. The next wave would be modified from the outset - (being turned, for instance, from active to passive) - and would then, with this new characteristic, be added to the earlier wave, and so on. If we were then to take a survey of the instinctual impulse from its beginning up to a given point, the succession of waves which we have described would inevitably present the picture of a definite development of the instinct.

¹ [1915c, 2965]

[1915c, 2967]
We have become accustomed to call the early phase of the development of the ego, during which its sexual instincts find auto-erotic satisfaction, 'narcissism', without at once entering on any discussion of the relation between auto-erotism and narcissism. It follows that the preliminary stage of the scopophilic instinct, in which the subject's own body is the object of the scopophilia, must be classed under narcissism, and that we must describe it as a narcissistic formation. The active scopophilic instinct develops from this, by leaving narcissism behind. The passive scopophilic instinct, on the contrary, holds fast to the narcissistic object. Similarly, the transformation of sadism into masochism implies a return to the narcissistic object. And in both these cases the narcissistic subject is, through identification, replaced by another, extraneous ego. If we take into account our constructed preliminary narcissistic stage of sadism, we shall be approaching a more general realization - namely, that the instinctual vicissitudes which consist in the instinct's being turned round upon the subject's own ego and undergoing reversal from activity to passivity are dependent on the narcissistic organization of the ego and bear the stamp of that phase. They perhaps correspond to the attempts at defence which at higher stages of the development of the ego are effected by other means.

[1915c, 2968]

At this point we may call to mind that so far we have considered only two pairs of opposite instincts: sadism-masochism and scopophilia-exhibitionism. These are the best known sexual instincts that appear in an ambivalent manner. The other components of the later sexual function are not yet sufficiently accessible to analysis for us to be able to discuss them in a similar way. In general we can assert of them that their activities are auto-erotic; that is to say, their object is negligible in comparison with the organ which is their source, and as a rule coincides with that organ. The object of the scopophilic instinct, however, though it too is in the first instance a part of the subject's own body, is not the eye itself; and in sadism the organic source, which is probably the muscular apparatus with its capacity for action, points unequivocally at an object other than itself, even though that object is part of the subject's own body. In the auto-erotic instincts, the part played by the organic source is so decisive that, according to a plausible suggestion of Federn (1913) and Jekels (1913), the form and function of the organ determine the activity or passivity of the instinctual aim.

[1915c, 2968]

The third antithesis of loving, the transformation of loving into being loved, corresponds to the operation of the polarity of activity and passivity, and is to be judged in the same way as the cases of scopophilia and sadism.

[1915c, 2974]
This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror!

The second group is led by perverts who have made what is normally only an introductory or preparatory act into the aim of their sexual wishes. They are people whose desire it is to look at the other person or to feel him or to watch him in the performance of his intimate actions, or who expose parts of their own bodies which should be covered, in the obscure expectation that they may be rewarded by a corresponding action in return. Next come the sadists, puzzling people whose tender endeavours have no other aim than to cause pain and torment to their object, ranging from humiliation to severe physical injuries; and, as though to counterbalance them, their counterparts, the masochists, whose only pleasure it is to suffer humiliations and torments of every kind from their loved object either symbolically or in reality. There are still others in whom several of these abnormal preconditions are united and intertwined; and lastly, we must learn that each of these groups is to be found in two forms: alongside of those who seek their sexual satisfaction in reality are those who are content merely to imagine that satisfaction, who need no real object at all, but can replace it by their phantasies.

[1916-1917, 3378]
The boy's masochistic trends lead on to another point, which I have so far avoided mentioning, because it can only be confirmed by means of the analysis of the subsequent phase of his development. I have already mentioned that after his refusal by his Nanya his libidinal expectation detached itself from her and began to contemplate another person as a sexual object. This person was his father, at that time away from home. He was no doubt led to this choice by a number of convergent factors, including such fortuitous ones as the recollection of the snake being cut to pieces; but above all he was in this way able to renew his first and most primitive object-choice, which, in conformity with a small child's narcissism, had taken place along the path of identification. We have heard already that his father had been his admired model, and that when he was asked what he wanted to be he used to reply: a gentleman like his father. This object of identification of his active current became the sexual object of a passive current in his present anal-sadistic phase. It looks as though his seduction by his sister had forced him into a passive role, and had given him a passive sexual aim. Under the persisting influence of this experience he pursued a path from his sister via his Nanya to his father - from a passive attitude towards women to the same attitude towards men - and had, nevertheless, by this means found a link with his earlier and spontaneous phase of development. His father was now his object once more; in conformity with his higher stage of development, identification was replaced by object-choice; while the transformation of his active attitude into a passive one was the consequence and the record of the seduction which had occurred meanwhile. It would naturally not have been so easy to achieve an active attitude in the sadistic phase towards his all-powerful father. When his father came home in the late summer or autumn the patient's fits of rage and scenes of fury were put to a new use. They had served for active sadistic ends in relation to his Nanya; in relation to his father their purpose was masochistic. By bringing his naughtiness forward he was trying to force punishments and beatings out of his father, and in that way to obtain from him the masochistic sexual satisfaction that he desired. His screaming fits were therefore simply attempts at seduction. In accordance, moreover, with the motives which underlie masochism, this beating would also have satisfied his sense of guilt. He had preserved a memory of how, during one of these scenes of naughtiness, he had redoubled his screams as soon as his father came towards him. His father did not beat him, however, but tried to pacify him by playing ball in front of him with the pillows of his cot.

[1918b, 3518]

His seduction continued to make its influence felt, by maintaining the passivity of his sexual aim. It transformed his sadism to a great extent into the masochism which was its passive counterpart. But it is questionable whether the seduction can be made entirely responsible for this characteristic of passivity, for the child's reaction to his observation of intercourse at the age of one and a half was already preponderantly a passive one. His sympathetic sexual excitement expressed itself by his passing a stool, though it is true that in this behaviour an active element is also to be distinguished. Side by side with the masochism which dominated his sexual impulses and also found expression in phantasies, his sadism, too, persisted and was directed against small animals. His sexual researches had set in from the time of the seduction and had been concerned, in essence, with two problems: the origin of children and the possibility of losing the genitals. These researches wove themselves into the manifestations of his instinctual impulses, and directed his sadistic propensities on to small animals as being representatives of small children.

[1918b, 3585]
The phantasy of the period of incestuous love had said: 'He (my father) loves only me, and not the other child, for he is beating it.' The sense of guilt can discover no punishment more severe than the reversal of this triumph: 'No, he does not love you, for he is beating you.' In this way the phantasy of the second phase, that of being beaten by her father, is a direct expression of the girl's sense of guilt, to which her love for her father has now succumbed. The phantasy, therefore, has become masochistic. So far as I know, this is always so; a sense of guilt is invariably the factor that transforms sadism into masochism. But this is certainly not the whole content of masochism. The sense of guilt cannot have won the field alone; a share must also fall to the love-impulse. We must remember that we are dealing with children in whom the sadistic component was able for constitutional reasons to develop prematurely and in isolation. We need not abandon this point of view. It is precisely such children who find it particularly easy to hark back to the pregenital, sadistic-anal organization of their sexual life. If the genital organization, when it has scarcely been effected, is met by repression, the result is not only that every psychical representation of the incestuous love becomes unconscious, or remains so, but there is another result as well: a regressive debasement of the genital organization itself to a lower level. 'My father loves me' was meant in a genital sense; owing to the regression it is turned into 'My father is beating me (I am being beaten by my father)'. This being beaten is now a convergence of the sense of guilt and sexual love. It is not only the punishment for the forbidden genital relation, but also the regressive substitute for that relation, and from this latter source it derives the libidinal excitation which is from this time forward attached to it, and which finds its outlet in masturbatory acts. Here for the first time we have the essence of masochism.

Little light is thrown upon the genesis of masochism by our discussion of the beating-phantasy. To begin with, there seems to be a confirmation of the view that masochism is not the manifestation of a primary instinct, but originates from sadism which has been turned round upon the self - that is to say, by means of regression from an object to the ego.¹ Instincts with a passive aim must be taken for granted as existing, especially among women. But passivity is not the whole of masochism. The characteristic of unpleasure belongs to it as well, - a bewildering accompaniment to the satisfaction of an instinct. The transformation of sadism into masochism appears to be due to the influence of the sense of guilt which takes part in the act of repression. Thus repression is operative here in three ways: it renders the consequences of the genital organization unconscious, it compels that organization itself to regress to the earlier sadistic-anal stage, and it transforms the sadism of this stage into masochism, which is passive and again in a certain sense narcissistic. The second of these three effects is made possible by the weakness of the genital organization, which must be presupposed in these cases. The third becomes necessary because the sense of guilt takes as much objection to sadism as to incestuous object-choice genitally conceived. Again, the analyses do not tell us the origin of the sense of guilt itself. It seems to be brought along by the new phase upon which the child is entering, and, if it afterwards persists, it seems to correspond to a scar-like formation which is similar to the sense of inferiority. According to our present orientation in the structure of the ego, which is as yet uncertain, we should assign it to the agency in the mind which sets itself up as a critical conscience over against the rest of the ego, which produces Silberer's functional phenomenon in dreams, and which cuts itself loose from the ego in delusions of being watched.

[1919e, 3651]
My male cases with an infantile beating-phantasy comprised only a few who did not exhibit some other gross injury to their sexual activities; again they included a fairly large number of persons who would have to be described as true masochists in the sense of being sexual perverts. They were either people who obtained their sexual satisfaction exclusively from masturbation accompanied by masochistic phantasies; or they were people who had succeeded in combining masochism with their genital activity in such a way that, along with masochistic performances and under similar conditions, they were able to bring about erection and emission or to carry out normal intercourse. In addition to this there was the rarer case in which a masochist is interfered with in his perverse activities by the appearance of obsessional ideas of unbearable intensity. Now perverts who can obtain satisfaction do not often have occasion to come for analysis. But as regards the three classes of masochists that have been mentioned there may be strong motives to induce them to go to an analyst. The masochist masturbator finds that he is absolutely impotent if after all he does attempt intercourse with a woman; and the man who has hitherto effected intercourse with the help of a masochistic idea or performance may suddenly make the discovery that the alliance which was so convenient for him has broken down, his genital organs no longer reacting to the masochistic stimulus. We are accustomed confidently to promise recovery to psychically impotent patients who come to us for treatment; but we ought to be more guarded in making this prognosis so long as the dynamics of the disturbance are unknown to us. It comes as a disagreeable surprise if the analysis reveals the cause of the 'merely psychical' impotence to be a typically masochistic attitude, perhaps deeply embedded since infancy.

[1919e, 3656]

As regards these masochistic men, however, a discovery is made at this point which warns us not to pursue the analogy between their case and that of women any further at present, but to judge each independently. For the fact emerges that in their masochistic phantasies, as well as in the performances they go through for their realization, they invariably transfer themselves into the part of a woman; that is to say, their masochistic attitude coincides with a feminine one. This can easily be demonstrated from details of the phantasies; but many patients are even aware of it themselves, and give expression to it as a subjective conviction. It makes no difference if in a fanciful embellishment of the masochistic scene they keep up the fiction that a mischievous boy, or page, or apprentice is going to be punished. On the other hand the persons who administer chastisement are always women, both in the phantasies and the performances. This is confusing enough; and the further question must be asked whether this feminine attitude already forms the basis of the masochistic element in the infantile beating-phantasy.¹

[1919e, 3657]

In the male phantasy - as I shall call it briefly, and, I hope, without any risk of being misunderstood - the being beaten also stands for being loved (in a genital sense), though this has been debased to a lower level owing to regression. So the original form of the unconscious male phantasy was not the provisional one that we have hitherto given: 'I am being beaten by my father', but rather: 'I am loved by my father'. The phantasy has been transformed by the processes with which we are familiar into the conscious phantasy: 'I am being beaten by my mother'. The boy's beating-phantasy is therefore passive from the very beginning, and is derived from a feminine attitude towards his father. It corresponds with the Oedipus complex just as the female one (that of the girl) does; only the parallel relation which we expected to find between the two must be given up in favour of a common character of another kind. In both cases the beating-phantasy has its origin in an incestuous attachment to the father.

[1919e, 3657]
It will help to make matters clearer if at this point I enumerate the other similarities and differences between beating phantasies in the two sexes. In the case of the girl the unconscious masochistic phantasy starts from the normal Oedipus attitude; in that of the boy it starts from the inverted attitude, in which the father is taken as the object of love. In the case of the girl the phantasy has a preliminary stage (the first phase), in which the beating bears no special significance and is performed upon a person who is viewed with jealous hatred. Both of these features are absent in the case of the boy, but this particular difference is one which might be removed by more fortunate observation. In her transition to the conscious phantasy which takes the place of the unconscious one, the girl retains the figure of her father, and in that way keeps unchanged the sex of the person beating; but she changes the figure and sex of the person being beaten, so that eventually a man is beating male children. The boy, on the contrary, changes the figure and sex of the person beating, by putting his mother in the place of his father; but he retains his own figure, with the result that the person beating and the person being beaten are of opposite sexes. In the case of the girl what was originally a masochistic (passive) situation is transformed into a sadistic one by means of repression, and its sexual quality is almost effaced. In the case of the boy the situation remains masochistic, and shows a greater resemblance to the original phantasy with its genital significance, since there is a difference of sex between the person beating and the person being beaten. The boy evades his homosexuality by repressing and remodelling his unconscious phantasy: and the remarkable thing about his later conscious phantasy is that it has for its content a feminine attitude without a homosexual object-choice. By the same process, on the other hand, the girl escapes from the demands of the erotic side of her life altogether. She turns herself in phantasy into a man, without herself becoming active in a masculine way, and is no longer anything but a spectator of the event which takes the place of a sexual act.

[1919e, 3658]

In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). If only we could succeed in relating these two polarities to each other and in deriving one from the other! From the very first we recognized the presence of a sadistic component in the sexual instinct.¹ As we know, it can make itself independent and can, in the form of a perversion, dominate an individual’s entire sexual activity. It also emerges as a predominant component instinct in one of the 'pregenital organizations', as I have named them. But how can the sadistic instinct, whose aim it is to injure the object, be derived from Eros, the preserver of life? Is it not plausible to suppose that this sadism is in fact a death instinct which, under the influence of the narcissistic libido, has been forced away from the ego and has consequently only emerged in relation to the object? It now enters the service of the sexual function. During the oral stage of organization of the libido, the act of obtaining erotic mastery over an object coincides with that object's destruction; later, the sadistic instinct separates off, and finally, at the stage of genital primacy, it takes on, for the purposes of reproduction, the function of overpowering the sexual object to the extent necessary for carrying out the sexual act. It might indeed be said that the sadism which has been forced out of the ego has pointed the way for the libidinal components of the sexual instinct, and that these follow after it to the object. Wherever the original sadism has undergone no mitigation or intermixture, we find the familiar ambivalence of love and hate in erotic life.

[1920g, 3755]
If such an assumption as this is permissible, then we have met the demand that we should produce an example of a death instinct - though, it is true, a displaced one. But this way of looking at things is very far from being easy to grasp and creates a positively mystical impression. It looks suspiciously as though we were trying to find a way out of a highly embarrassing situation at any price. We may recall, however, that there is nothing new in an assumption of this kind. We put one forward on an earlier occasion, before there was any question of an embarrassing situation. Clinical observations led us at that time to the view that masochism, the component instinct which is complementary to sadism, must be regarded as sadism that has been turned round upon the subject's own ego.² But there is no difference in principle between an instinct turning from an object to the ego and its turning from the ego to an object - which is the new point now under discussion. Masochism, the turning round of the instinct upon the subject's own ego, would in that case be a return to an earlier phase of the instinct's history, a regression. The account that was formerly given of masochism requires emendation as being too sweeping in one respect: there might be such a thing as primary masochism - a possibility which I had contested at that time.³

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

¹[1920g, 3755]
²[1923b, 3974]
Once we have admitted the idea of a fusion of the two classes of instincts with each other, the possibility of a - more or less complete - 'defusion' of them forces itself upon us. The sadistic component of the sexual instinct would be a classical example of a serviceable instinctual fusion; and the sadism which has made itself independent as a perversion would be typical of a defusion, though not of one carried to extremes. From this point we obtain a view of a great domain of facts which has not before been considered in this light. We perceive that for purposes of discharge the instinct of destruction is habitually brought into the service of Eros; we suspect that the epileptic fit is a product and indication of an instinctual defusion; and we come to understand that instinctual defusion and the marked emergence of the death instinct call for particular consideration among the effects of some severe neuroses - for instance, the obsessional neuroses. Making a swift generalization, we might conjecture that the essence of a regression of libido (e. g. from the genital to the sadistic-anal phase) lies in a defusion of instincts, just as, conversely, the advance from the earlier phase to the definitive genital one would be conditioned by an accession of erotic components. The question also arises whether ordinary ambivalence, which is so often unusually strong in the constitutional disposition to neurosis, should not be regarded as the product of a defusion; ambivalence, however, is such a fundamental phenomenon that it more probably represents an instinctual fusion that has not been completed.

Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.¹

Thus masochism appears to us in the light of a great danger, which is in no way true of its counterpart, sadism. We are tempted to call the pleasure principle the watchman over our life rather than merely over our mental life. But in that case we are faced with the task of investigating the relationship of the pleasure principle to the two classes of instincts which we have distinguished - the death instincts and the erotic (libidinal) life instincts; and we cannot proceed further in our consideration of the problem of masochism till we have accomplished that task.

To return to masochism. Masochism comes under our observation in three forms: as a condition imposed on sexual excitation, as an expression of the feminine nature, and as a norm of behaviour. We may, accordingly, distinguish an erotogenic, a feminine and a moral masochism. The first, the erotogenic, masochism - pleasure in pain - lies at the bottom of the other two forms as well. Its basis must be sought along biological and constitutional lines and it remains incomprehensible unless one decides to make certain assumptions about matters that are extremely obscure. The third, and in some respects the most important, form assumed by masochism has only recently been recognized by psycho-analysis as a sense of guilt which is mostly unconscious; but it can already be completely explained and fitted into the rest of our knowledge. Feminine masochism, on the other hand, is the one that is most accessible to our observation and least problematical, and it can be surveyed in all its relations. We will begin our discussion with it.

¹[1924c, 4071]

[1923b, 3975]

[1924c, 4073]
We have sufficient acquaintance with this kind of masochism in men (to whom, owing to the material at my command, I shall restrict my remarks), derived from masochistic - and therefore often impotent - subjects whose phantasies either terminate in an act of masturbation or represent a sexual satisfaction in themselves. The real-life performances of masochistic perverts tally completely with these phantasies, whether the performances are carried out as an end in themselves or serve to induce potency and to lead to the sexual act. In both cases - for the performances are, after all, only a carrying-out of the phantasies in play - the manifest content is of being gagged, bound, painfully beaten, whipped, in some way maltreated, forced into unconditional obedience, dirtied and debased. It is far more rare for mutilations to be included in the content, and then only subject to strict limitations. The obvious interpretation, and one easily arrived at, is that the masochist wants to be treated like a small and helpless child, but, particularly, like a naughty child. It is unnecessary to quote cases to illustrate this; for the material is very uniform and is accessible to any observer, even to non-analysts. But if one has an opportunity of studying cases in which the masochistic phantasies have been especially richly elaborated, one quickly discovers that they place the subject in a characteristically female situation; they signify, that is, being castrated, or copulated with, or giving birth to a baby. For this reason I have called this form of masochism, \textit{a potiori} as it were, the feminine form, although so many of its features point to infantile life. This superimposed stratification of the infantile and the feminine will find a simple explanation later on. Being castrated - or being blinded, which stands for it - often leaves a negative trace of itself in phantasies, in the condition that no injury is to occur precisely to the genitals or the eyes. (Masochistic tortures, incidentally, rarely make such a serious impression as the cruelties of sadism, whether imagined or performed.) A sense of guilt, too, finds expression in the manifest content of masochistic phantasies; the subject assumes that he has committed some crime (the nature of which is left indefinite) which is to be expiated by all these painful and tormenting procedures. This looks like a superficial rationalization of the masochistic subject-matter, but behind it there lies a connection with infantile masturbation. On the other hand, this factor of guilt provides a transition to the third, moral, form of masochism. 

This feminine masochism which we have been describing is entirely based on the primary, erotogenic masochism, on pleasure in pain. This cannot be explained without taking our discussion very far back. 

In my \textit{Three Essays on the Theory of Sexuality}, in the section on the sources of infantile sexuality, I put forward the proposition that 'in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits'. Indeed, 'it may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual instinct'. In accordance with this, the excitation of pain and unpleasure would be bound to have the same result, too. The occurrence of such a libidinal sympathetic excitation when there is tension due to pain and unpleasure would be an infantile physiological mechanism which ceases to operate later on. It would attain a varying degree of development in different sexual constitutions; but in any case it would provide the physiological foundation on which the psychical structure of erotogenic masochism would afterwards be erected. 

[1924c, 4074] 

In my \textit{Three Essays on the Theory of Sexuality}, in the section on the sources of infantile sexuality, I put forward the proposition that 'in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits'. Indeed, 'it may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual instinct'. In accordance with this, the excitation of pain and unpleasure would be bound to have the same result, too. The occurrence of such a libidinal sympathetic excitation when there is tension due to pain and unpleasure would be an infantile physiological mechanism which ceases to operate later on. It would attain a varying degree of development in different sexual constitutions; but in any case it would provide the physiological foundation on which the psychical structure of erotogenic masochism would afterwards be erected. 

[1924c, 4075]
The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

Erotogenic masochism accompanies the libido through all its developmental phases and derives from them its changing psychical coatings. The fear of being eaten up by the totem animal (the father) originates from the primitive oral organization; the wish to be beaten by the father comes from the sadistic-anal phase which follows it; castration, although it is later disavowed, enters into the content of masochistic phantasies as a precipitate of the phallic stage or organization;¹ and from the final genital organization there arise, of course, the situations of being copulated with and of giving birth, which are characteristic of femaleness. The part played in masochism by the nates, too, is easily understandable, apart from its obvious basis in reality. The nates are the part of the body which is given erotogenic preference in the sadistic-anal phase, like the breast in the oral phase and the penis in the genital phase.

[1924c, 4075]

[1924c, 4076]

[1924c, 4077]
The third form of masochism, moral masochism, is chiefly remarkable for having loosened its connection with what we recognize as sexuality. All other masochistic sufferings carry with them the condition that they shall emanate from the loved person and shall be endured at his command. This restriction has been dropped in moral masochism. The suffering itself is what matters; whether it is decreed by someone who is loved or by someone who is indifferent is of no importance. It may even be caused by impersonal powers or by circumstances; the true masochist always turns his cheek whenever he has a chance of receiving a blow. It is very tempting, in explaining this attitude, to leave the libido out of account and to confine oneself to assuming that in this case the destructive instinct has been turned inwards again and is now raging against the self; yet there must be some meaning in the fact that linguistic usage has not given up the connection between this norm of behaviour and erotism and calls these self-injurers masochists too.

The fact that moral masochism is unconscious leads us to an obvious clue. We were able to translate the expression 'unconscious sense of guilt' as meaning a need for punishment at the hands of a parental power. We now know that the wish, which so frequently appears in phantasies, to be beaten by the father stands very close to the other wish, to have a passive (feminine) sexual relation to him and is only a regressive distortion of it. If we insert this explanation into the content of moral masochism, its hidden meaning becomes clear to us. Conscience and morality have arisen through the overcoming, the desexualization, of the Oedipus complex; but through moral masochism morality becomes sexualized once more, the Oedipus complex is revived and the way is opened for a regression from morality to the Oedipus complex. This is to the advantage neither of morality nor of the person concerned. An individual may, it is true, have preserved the whole or some measure of ethical sense alongside of his masochism; but, alternatively, a large part of his conscience may have vanished into his masochism. Again, masochism creates a temptation to perform 'sinful' actions, which must then be expiated by the reproaches of the sadistic conscience (as is exemplified in so many Russian character-types) or by chastisement from the great parental power of Destiny. In order to provoke punishment from this last representative of the parents, the masochist must do what is inexpedient, must act against his own interests, must ruin the prospects which open out to him in the real world and must, perhaps, destroy his own real existence.

[1924c, 4077]

[1924c, 4081]
The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of component instincts. These are dependent upon erotogenic zones in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly auto-erotic. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the oral components, an anal-sadistic stage follows, and it is only after the third stage has at last been reached that the primacy of the genitals is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of libido to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, fixations of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as regression), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the choice of neurosis, that is, the form in which the subsequent illness makes its appearance.

[1925d, 4211]

It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.

[1926d, 4282]
It may quite often happen that although a danger-situation is correctly estimated in itself, a certain amount of instinctual anxiety is added to the realistic anxiety. In that case the instinctual demand before whose satisfaction the ego recoils is a masochistic one: the instinct of destruction directed against the subject himself. Perhaps an addition of this kind explains cases in which reactions of anxiety are exaggerated, inexpedient or paralysing. Phobias of heights (windows, towers, precipices and so on) may have some such origin. Their hidden feminine significance is closely connected with masochism.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

[1926d, 4320]

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

¹[1930a, 4510]

The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

¹[1930a, 4511]
Unfortunately what history tells us and what we ourselves have experienced does not speak in this sense but rather justifies a judgement that belief in the 'goodness' of human nature is one of those evil illusions by which mankind expect their lives to be beautified and made easier while in reality they only cause damage. We need not continue this controversy, since we have argued in favour of a special aggressive and destructive instinct in men not on account of the teachings of history or of our experience in life but on the basis of general considerations to which we were led by examining the phenomena of sadism and masochism. As you know, we call it sadism when sexual satisfaction is linked to the condition of the sexual object's suffering pain, ill-treatment and humiliation, and masochism when the need is felt of being the ill-treated object oneself. As you know too, a certain admixture of these two trends is included in normal sexual relations, and we speak of perversions when they push the other sexual aims into the background and replace them by their own aims. And you will scarcely have failed to notice that sadism has a more intimate relation with masculinity and masochism with femininity, as though there were a secret kinship present; though I must add that we have made no progress along that path. Both phenomena, sadism and masochism alike, but masochism quite especially, present a truly puzzling problem to the libido theory; and it is only proper if what was a stumbling-block for the one theory should become the cornerstone of the theory replacing it.

[1933a, 4708]

It is our opinion, then, that in sadism and in masochism we have before us two excellent examples of a mixture of the two classes of instinct, of Eros and aggressiveness; and we proceed to the hypothesis that this relation is a model one - that every instinctual impulse that we can examine consists of similar fusions or alloys of the two classes of instinct. These fusions, of course, would be in the most varied ratios. Thus the erotic instincts would introduce the multiplicity of their sexual aims into the fusion, while the others would only admit of mitigations or gradations in their monotonous trend. This hypothesis opens a prospect to us of investigations which may some day be of great importance for the understanding of pathological processes. For fusions may also come apart, and we may expect that functioning will be most gravely affected by defusions of such a kind. But these conceptions are still too new; no one has yet tried to apply them in our work.

[1933a, 4708]

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]
But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat'. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'daemonic' character to the compulsion to repeat.

One might consider characterizing femininity psychologically as giving preference to passive aims. This is not, of course, the same thing as passivity; to achieve a passive aim may call for a large amount of activity. It is perhaps the case that in a woman, on the basis of her share in the sexual function, a preference for passive behaviour and passive aims is carried over into her life to a greater or lesser extent, in proportion to the limits, restricted or far-reaching, within which her sexual life thus serves as a model. But we must beware in this of underestimating the influence of social customs, which similarly force women into passive situations. All this is still far from being cleared up. There is one particularly constant relation between femininity and instinctual life which we do not want to overlook. The suppression of women's aggressiveness which is prescribed for them constitutionally and imposed on them socially favours the development of powerful masochistic impulses, which succeed, as we know, in binding erotically the destructive trends which have been diverted inwards. Thus masochism, as people say, is truly feminine. But if, as happens so often, you meet with masochism in men, what is left to you but to say that these men exhibit very plain feminine traits?
During this oral phase sadistic impulses already occur sporadically along with the appearance of the teeth. Their extent is far greater in the second phase, which we describe as the sadistic-anal one, because satisfaction is then sought in aggression and in the excretory function. Our justification for including aggressive urges under the libido is based on the view that sadism is an instinctual fusion of purely libidinal and purely destructive urges, a fusion which thenceforward persists uninterruptedly.¹

[1940a [1938], 4965]

¹ The question arises whether the satisfaction of purely destructive instinctual impulses can be felt as pleasure, whether pure destructiveness without any libidinal admixture occurs. Satisfaction of the death instinct remaining in the ego seems not to produce feelings of pleasure, though masochism represents a fusion which is entirely analogous to sadism.

[1940a [1938], 4965]
UNSUITABLE SUBSTITUTES FOR THE SEXUAL OBJECT - FETISHISM

There are some cases which are quite specially remarkable - those in which the normal sexual object is replaced by another which bears some relation to it, but is entirely unsuited to serve the normal sexual aim. From the point of view of classification, we should no doubt have done better to have mentioned this highly interesting group of aberrations of the sexual instinct among the deviations in respect of the sexual object. But we have postponed their mention till we could become acquainted with the factor of sexual overvaluation, on which these phenomena, being connected with an abandonment of the sexual aim, are dependent.

What is substituted for the sexual object is some part of the body (such as the foot or hair) which is in general very inappropriate for sexual purposes, or some inanimate object which bears an assignable relation to the person whom it replaces and preferably to that person's sexuality (e.g. a piece of clothing or underlining). Such substitutes are with some justice likened to the fetishes in which savages believe that their gods are embodied.

A transition to those cases of fetishism in which the sexual aim, whether normal or perverse, is entirely abandoned is afforded by other cases in which the sexual object is required to fulfil a fetishistic condition - such as the possession of some particular hair-colouring or clothing, or even some bodily defect if the sexual aim is to be attained. No other variation of the sexual instinct that borders on the pathological can lay so much claim to our interest as this one, such is the peculiarity of the phenomena to which it gives rise. Some degree of diminution in the urge towards the normal sexual aim (an executive weakness of the sexual apparatus) seems to be a necessary precondition in every case.¹ The point of contact with the normal is provided by the psychologically essential overvaluation of the sexual object, which inevitably extends to everything that is associated with it. A certain degree of fetishism is thus habitually present in normal love, especially in those stages of it in which the normal sexual aim seems unattainable or its fulfilment prevented:

¹ [Footnote added 1915:] This weakness would represent the constitutional precondition. Psycho-analysis has found that the phenomenon can also be accidentally determined, by the occurrence of an early deterrence from sexual activity owing to fear, which may divert the subject from the normal sexual aim and encourage him to seek a substitute for it.

The situation only becomes pathological when the longing for the fetish passes beyond the point of being merely a necessary condition attached to the sexual object and actually takes the place of the normal aim, and, further, when the fetish becomes detached from a particular individual and becomes the sole sexual object. These are, indeed, the general conditions under which mere variations of the sexual instinct pass over into pathological aberrations.

¹ [Footnote added 1915:] This derivation is particularly obvious in cases where there is merely a fetishistic condition attached to the sexual object. We shall come across the importance of early sexual impressions again in another connection.
Footnote added 1920: Deeper-going psycho-analytic research has raised a just criticism of Binet's assertion. All the observations dealing with this point have recorded a first meeting with the fetish at which it already aroused sexual interest without there being anything in the accompanying circumstances to explain the fact. Moreover, all of these 'early' sexual impressions relate to a time after the age of five or six, whereas psycho-analysis makes it doubtful whether fresh pathological fixations can occur so late as this. The true explanation is that behind the first recollection of the fetish's appearance there lies a submerged and forgotten phase of sexual development. The fetish, like a 'screen memory', represents this phase and is thus a remnant and precipitate of it. The fact that this early infantile phase turns in the direction of fetishism, as well as the choice of the fetish itself, are constitutionally determined.

[1905d, 1481]

In other cases the replacement of the object by a fetish is determined by a symbolic connection of thought, of which the person concerned is usually not conscious. It is not always possible to trace the course of these connections with certainty (The foot, for instance, is an age-old sexual symbol which occurs even in mythology;¹ no doubt the part played by fur as a fetish owes its origin to an association with the hair of the mons Veneris.) None the less even symbolism such as this is not always unrelated to sexual experiences in childhood.²

[1905d, 1482]

¹ Footnote added 1910: The shoe or slipper is a corresponding symbol of the female genitals.
[1905d, 1482]

² Psycho-analysis has cleared up one of the remaining gaps in our understanding of fetishism. It has shown the importance, as regards the choice of a fetish, of a coprophilic pleasure in smelling which has disappeared owing to repression. Both the feet and the hair are objects with a strong smell which have been exalted into fetishes after the olfactory sensation has become unpleasurable and been abandoned. Accordingly, in the perversion that corresponds to foot fetishism, it is only dirty and evil-smelling feet that become sexual objects. Another factor that helps towards explaining the fetishistic preference for the foot is to be found among the sexual theories of children (see below p. 1514): the foot represents a woman's penis, the absence of which is deeply felt. [Added 1915:] In a number of cases of foot-fetishism it has been possible to show that the scopophilic instinct, seeking to reach its object (originally the genitals) from underneath, was brought to a halt in its pathway by prohibition and repression. For that reason it became attached to a fetish in the form of a foot or shoe, the female genitals (in accordance with the expectations of childhood/children) being imagined as male ones.
[1905d, 1482]

³ Footnote added 1920: As regards the origin of the perversions, I will add a word in anticipation of what is to come. There is reason to suppose that, just as in the case of fetishism, abortive beginnings of normal sexual development occur before the perversions become fixated. Analytic investigation has already been able to show in a few cases that perversions are a residue of development towards the Oedipus complex and that after the repression of that complex the components of the sexual instinct which are strongest in the disposition of the individual concerned emerge once more.
[1905d, 1487]

CASTRATION COMPLEX AND PENIS ENVY This conviction is energetically maintained by boys, is obstinately defended against the contradictions which soon result from observation, and is only abandoned after severe internal struggles (the castration complex). The substitutes for this penis which they feel is missing in women play a great part in determining the form taken by many perversions.¹
[1905d, 1514]
Norbert Hanold's condition is often spoken of by the author as a 'delusion', and we have no reason to reject that designation. We can state two chief characteristics of a 'delusion', which do not, it is true, describe it exhaustively, but which distinguish it recognizably from other disorders. In the first place it is one of the group of pathological states which do not produce a direct effect upon the body but are manifested only by mental indications. And secondly it is characterized by the fact that in it 'phantasies' have gained the upper hand - that is, have obtained belief and have acquired an influence on action. If we recall Hanold's journey to Pompeii in order to look for Gradiva's peculiarly formed footprints in the ashes, we shall have a fine example of an action under the dominance of a delusion. A psychiatrist would perhaps place Norbert Hanold's delusion in the great group of 'paranoia' and possibly describe it as 'fetishistic erotomania', because the most striking thing about it was his being in love with the piece of sculpture and because in the psychiatrist's view, with its tendency to coarsen everything, the young archaeologist's interest in feet and the postures of feet would be bound to suggest 'fetishism'. Nevertheless all such systems of nomenclature and classification of the different kinds of delusion according to their subject-matter have something precarious and barren about them.¹

[1907a, 1844]

In one important respect Norbert Hanold behaved quite differently from an ordinary human being. He took no interest in living women; the science of which he was the servant had taken that interest away from him and displaced it on to women of marble or bronze. This is not to be regarded as a trivial peculiarity; on the contrary, it was the basic precondition of the events to be described. For one day it came about that one particular sculpture of that kind laid claim to the whole of the interest which is ordinarily directed only to a living woman, and with that his delusion was there. We then see unrolled before our eyes the manner in which his delusion is cured through a happy turn of events, and his interest displaced back from the marble to a living woman. The author does not let us follow the influences which led our hero to turn away from women; he only informs us that his attitude was not explained by his innate disposition, which, on the contrary, included some amount of imaginative (and, we might add, erotic) needs. And, as we learn later in the story, he did not avoid other children in his childhood: he had a friendship at that age with a little girl, was her inseparable companion, shared his little meals with her, used to thump her too and let her rumple his hair. It is in attachments such as this, in combinations like this of affection and aggressiveness, that the immature erotism of childhood finds its expression; its consequences only emerge later, but then they are irresistible, and during childhood itself it is as a rule recognized as erotism only by doctors and creative writers. Our own writer shows us clearly that he too is of the same opinion; for he makes his hero suddenly develop a lively interest in women's feet and their way of placing them. This interest was bound to bring him a bad reputation both among scientists and among the women of the town he lived in, a reputation of being a foot-fetishist; but we cannot avoid tracing the interest back to the memory of his childhood playmate. For there can be no doubt that even in her childhood the girl showed the same peculiarity of a graceful gait, with her toes almost perpendicularly raised as she stepped along; and it was because it represented that same gait that an ancient marble relief acquired such great importance for Norbert Hanold. Incidentally we may add that in his derivation of the remarkable phenomenon of fetishism the author is in complete agreement with science. Ever since Binet we have in fact tried to trace fetishism back to erotic impressions in childhood.

[1907a, 1845]
The first of these theories starts out from the neglect of the differences between the sexes on which I laid stress at the beginning of this paper as being characteristic of children. It consists in attributing to everyone, including females, the possession of a penis, such as the boy knows from his own body. It is precisely in what we must regard as the 'normal' sexual constitution that already in childhood the penis is the leading erotogenic zone and the chief auto-erotic sexual object; and the boy's estimate of its value is logically reflected in his inability to imagine a person like himself who is without this essential constituent. When a small boy sees his little sister's genitals, what he says shows that his prejudice is already strong enough to falsify his perception. He does not comment on the absence of a penis, but invariably says, as though by way of consolation and to put things right: 'Her ---'s still quite small. But when she gets bigger it'll grow all right.' The idea of a woman with a penis returns in later life, in the dreams of adults: the dreamer, in a state of nocturnal sexual excitation, will throw a woman down, strip her and prepare for intercourse - and then, in place of the female genitals, he beholds a well-developed penis and breaks off the dream and the excitation. The numerous hermaphrodites of classical antiquity faithfully reproduce this idea, universally held in childhood; one may observe that to most normal people they cause no offence, while the real hermaphroditic formations of the genitals which are permitted to occur by Nature nearly always excite the greatest abhorrence.

² For instance, in certain forms of fetishism.

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

² For instance, in certain forms of fetishism.

We can lay down no general rule as to what degree of distortion and remoteness is necessary before the resistance on the part of the conscious is removed. A delicate balancing is here taking place, the play of which is hidden from us; its mode of operation, however, enables us to infer that it is a question of calling a halt when the cathexis of the unconscious reaches a certain intensity - an intensity beyond which the unconscious would break through to satisfaction. Repression acts, therefore, in a highly individual manner. Each single derivative of the repressed may have its own special vicissitude; a little more or a little less distortion alters the whole outcome. In this connection we can understand how it is that the objects to which men give most preference, their ideals, proceed from the same perceptions and experiences as the objects which they most abhor, and that they were originally only distinguished from one another through slight modifications. Indeed, as we found in tracing the origin of the fetish, it is possible for the original instinctual representative to be split in two, one part undergoing repression, while the remainder, precisely on account of this intimate connection, undergoes idealization.
This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman’s breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror!

[1916-1917, 3377]

The subject was a man who is to-day quite indifferent to the genitals and other attractions of women, but who can be plunged into irresistible sexual excitement only by a foot of a particular form wearing a shoe. He can recall an event from his sixth year which was decisive for the fixation of his libido. He was sitting on a stool beside the governess who was to give him lessons in English. The governess, who was an elderly, dried-up, plain-looking spinster, with pale-blue eyes and a snub nose, had something wrong with her foot that day, and on that account kept it, wearing a velvet slipper, stretched out on a cushion. Her leg itself was most decently concealed. A thin, scraggy foot, like the one he had then seen belonging to his governess, thereupon became (after a timid attempt at normal sexual activity at puberty) his only sexual object; and the man was irresistibly attracted if a foot of this kind was associated with other features besides which recalled the type of the English governess. This fixation of his libido, however, made him, not into a neurotic, but into a pervert - what we call a foot-fetishist. You see, then, that although an excessive, and moreover premature, fixation of the libido is indispensable for the causation of neuroses, the area of its effects extends far beyond the field of the neuroses. This determinant, too, is as little decisive in itself as is the frustration which we have already talked about.

[1916-1917, 3410]
The sexual function is liable to a great number of disturbances, most of which exhibit the characteristics of simple inhibitions. These are classed together as psychical impotence. The normal performance of the sexual function can only come about as the result of a very complicated process, and disturbances may appear at any point in it. In men the chief stages at which inhibition occurs are shown by: a turning away of the libido at the very beginning of the process (psychical unpleasure); an absence of the physical preparation for it (lack of erection); an abridgement of the sexual act (*ejaculatio praecox*), an occurrence which might equally well be regarded as a symptom; an arrest of the act before it has reached its natural conclusion (absence of ejaculation); or a non-appearance of the psychical outcome (lack of the feeling of pleasure in orgasm). Other disturbances arise from the sexual function becoming dependent on special conditions of a perverse or fetishist nature.

This is not very illuminating. We can only note that disturbances of the sexual function are brought about by a great variety of means. (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple); (2) the function may be less well carried out; (3) it may be hampered by having conditions attached to it, or modified by being diverted to other aims; (4) it may be prevented by security measures; (5) if it cannot be prevented from starting, it may be immediately interrupted by the appearance of anxiety; and (6), if it is nevertheless carried out, there may be a subsequent reaction of protest against it and an attempt to undo what has been done.

In the last few years I have had an opportunity of studying analytically a number of men whose object-choice was dominated by a fetish. There is no need to expect that these people came to analysis on account of their fetish. For though no doubt a fetish is recognized by its adherents as an abnormality, it is seldom felt by them as the symptom of an ailment accompanied by suffering. Usually they are quite satisfied with it, or even praise the way in which it eases their erotic life. As a rule, therefore, the fetish made its appearance in analysis as a subsidiary finding.

For obvious reasons the details of these cases must be withheld from publication; I cannot, therefore, show in what way accidental circumstances have contributed to the choice of a fetish. The most extraordinary case seemed to me to be one in which a young man had exalted a certain sort of 'shine on the nose' into a fetishistic precondition. The surprising explanation of this was that the patient had been brought up in an English nursery but had later come to Germany, where he forgot his mother-tongue almost completely. The fetish, which originated from his earliest childhood, had to be understood in English, not German. The 'shine on the nose' - was in reality a 'glance at the nose'. The nose was thus the fetish, which, incidentally, he endowed at will with the luminous shine which was not perceptible to others.

In every instance, the meaning and the purpose of the fetish turned out, in analysis, to be the same. It revealed itself so naturally and seemed to me so compelling that I am prepared to expect the same solution in all cases of fetishism. When now I announce that the fetish is a substitute for the penis, I shall certainly create disappointment; so I hasten to add that it is not a substitute for any chance penis, but for a particular and quite special penis that had been extremely important in early childhood but had later been lost. That is to say, it should normally have been given up, but the fetish is precisely designed to preserve it from extinction. To put it more plainly: the fetish is a substitute for the woman's (the mother's) penis that the little boy once believed in and - for reasons familiar to us - does not want to give up.¹
What happened, therefore, was that the boy refused to take cognizance of the fact of his having perceived that a woman does not possess a penis. No, that could not be true: for if a woman had been castrated, then his own possession of a penis was in danger; and against that there rose in rebellion the portion of his narcissism which Nature has, as a precaution, attached to that particular organ. In later life a grown man may perhaps experience a similar panic when the cry goes up that Throne and Altar are in danger, and similar illogical consequences will ensue. If I am not mistaken, Laforgue would say in this case that the boy 'scotomizes' his perception of the woman's lack of a penis.¹ A new technical term is justified when it describes a new fact or emphasizes it. This is not so here. The oldest word in our psycho-analytic terminology, 'repression', already relates to this pathological process. If we wanted to differentiate more sharply between the vicissitude of the idea as distinct from that of the affect, and reserve the word 'Verdrängung' ['repression'] for the affect, then the correct German word for the vicissitude of the idea would be 'Verleugnung' ['disavowal']. 'Scotomization' seems to me particularly unsuitable, for it suggests that the perception is entirely wiped out, so that the result is the same as when a visual impression falls on the blind spot in the retina. In the situation we are considering, on the contrary, we see that the perception has persisted, and that a very energetic action has been undertaken to maintain the disavowal. It is not true that, after the child has made his observation of the woman, he has preserved unaltered his belief that women have a phallus. He has retained that belief, but he has also given it up. In the conflict between the weight of the unwelcome perception and the force of his counter-wish, a compromise has been reached, as is only possible under the dominance of the unconscious laws of thought - the primary processes. Yes, in his mind the woman has got a penis, in spite of everything; but this penis is no longer the same as it was before. Something else has taken its place, has been appointed its substitute, as it were, and now inherits the interest which was formerly directed to its predecessor. But this interest suffers an extraordinary increase as well, because the horror of castration has set up a memorial to itself in the creation of this substitute. Furthermore, an aversion, which is never absent in any fetishist, to the real female genitals remains a stigma indelebile of the repression that has taken place. We can now see what the fetish achieves and what it is that maintains it. It remains a token of triumph over the threat of castration and a protection against it. It also saves the fetishist from becoming a homosexual, by endowing women with the characteristic which makes them tolerable as sexual objects. In later life, the fetishist feels that he enjoys yet another advantage from his substitute for a genital. The meaning of the fetish is not known to other people, so the fetish is not withheld from him: it is easily accessible and he can readily obtain the sexual satisfaction attached to it. What other men have to woo and make exertions for can be had by the fetishist with no trouble at all.

[1927e, 4536]

Probably no male human being is spared the fright of castration at the sight of a female genital. Why some people become homosexual as a consequence of that impression, while others fend it off by creating a fetish, and the great majority surmount it, we are frankly not able to explain. It is possible that, among all the factors at work, we do not yet know those which are decisive for the rare pathological results. We must be content if we can explain what has happened, and may for the present leave on one side the task of explaining why something has not happened.

[1927e, 4537]
One would expect that the organs or objects chosen as substitutes for the absent female phallus would be such as appear as symbols of the penis in other connections as well. This may happen often enough, but is certainly not a deciding factor. It seems rather that when the fetish is instituted some process occurs which reminds one of the stopping of memory in traumatic amnesia. As in this latter case, the subject's interest comes to a halt half-way, as it were; it is as though the last impression before the uncanny and traumatic one is retained as a fetish. Thus the foot or shoe owes its preference as a fetish - or a part of it - to the circumstance that the inquisitive boy peered at the woman's genitals from below, from her legs up; fur and velvet - as has long been suspected - are a fixation of the sight of the pubic hair, which should have been followed by the longed-for sight of the female member; pieces of underclothing, which are so often chosen as a fetish, crystallize the moment of undressing, the last moment in which the woman could still be regarded as phallic. But I do not maintain that it is invariably possible to discover with certainty how the fetish was determined.

[1927e, 4537]

An investigation of fetishism is strongly recommended to any one who still doubts the existence of the castration complex or who can still believe that fright at the sight of the female genital has some other ground - for instance, that it is derived from a supposed recollection of the trauma of birth.

[1927e, 4537]

For me, the explanation of fetishism had another point of theoretical interest as well. Recently, along quite speculative lines, I arrived at the proposition that the essential difference between neurosis and psychosis was that in the former the ego, in the service of reality, suppresses a piece of the id, whereas in a psychosis it lets itself be induced by the id to detach itself from a piece of reality. I returned to this theme once again later on.¹ But soon after this I had reason to regret that I had ventured so far. In the analysis of two young men I learned that each - one when he was two years old and the other when he was ten - had failed to take cognizance of the death of his beloved father - had 'scotomized' it - and yet neither of them had developed a psychosis. Thus a piece of reality which was undoubtedly important had been disavowed by the ego, just as the unwelcome fact of women's castration is disavowed in fetishists. I also began to suspect that similar occurrences in childhood are by no means rare, and I believed that I had been guilty of an error in my characterization of neurosis and psychosis. It is true that there was one way out of the difficulty. My formula needed only to hold good where there was a higher degree of differentiation in the psychical apparatus; things might be permissible to a child which would entail severe injury to an adult.

[1927e, 4538]

But further research led to another solution of the contradiction. It turned out that the two young men had no more 'scotomized' their father's death than a fetishist does the castration of women. It was only one current in their mental life that had not recognized their father's death; there was another current which took full account of that fact. The attitude which fitted in with the wish and the attitude which fitted in with reality existed side by side. In one of my two cases this split had formed the basis of a moderately severe obsessional neurosis. The patient oscillated in every situation in life between two assumptions: the one, that his father was still alive and was hindering his activities; the other, opposite one, that he was entitled to regard himself as his father's successor. I may thus keep to the expectation that in a psychosis the one current - that which fitted in with reality - would have in fact been absent.

[1927e, 4538]
Returning to my description of fetishism, I may say that there are many and weighty additional proofs of the divided attitude of fetishists to the question of the castration of women. In very subtle instances both the disavowal and the affirmation of the castration have found their way into the construction of the fetish itself. This was so in the case of a man whose fetish was an athletic support-belt which could also be worn as bathing drawers. This piece of clothing covered up the genitals entirely and concealed the distinction between them. Analysis showed that it signified that women were castrated and that they were not castrated; and it also allowed of the hypothesis that men were castrated, for all these possibilities could equally well be concealed under the belt - the earliest rudiment of which in his childhood had been the fig-leaf on a statue. A fetish of this sort, doubly derived from contrary ideas, is of course especially durable. In other instances the divided attitude shows itself in what the fetishist does with his fetish, whether in reality or in his imagination. To point out that he reveres his fetish is not the whole story; in many cases he treats it in a way which is obviously equivalent to a representation of castration. This happens particularly if he has developed a strong identification with his father and plays the part of the latter; for it is to him that as a child he ascribed the woman's castration. Affection and hostility in the treatment of the fetish - which run parallel with the disavowal and the acknowledgement of castration - are mixed in unequal proportions in different cases, so that the one or the other is more clearly recognizable. We seem here to approach an understanding, even if a distant one, of the behaviour of the 'coupeur de nattes'. In him the need to carry out the castration which he disavows has come to the front. His action contains in itself the two mutually incompatible assertions: 'the woman has still got a penis' and 'my father has castrated the woman'. Another variant, which is also a parallel to fetishism in social psychology, might be seen in the Chinese custom of mutilating the female foot and then revering it like a fetish after it has been mutilated. It seems as though the Chinese male wants to thank the woman for having submitted to being castrated.

[1927e, 4538]

In conclusion we may say that the normal prototype of fetishes is a man's penis, just as the normal prototype of inferior organs is a woman's real small penis, the clitoris.

[1927e, 4538]
The view which postulates that in all psychoses there is a splitting of the ego could not call for so much notice if it did not turn out to apply to other states more like the neuroses and, finally, to the neuroses themselves. I first became convinced of this in cases fetishism. This abnormality, which may be counted as one of the perversions, is, as is well known, based on the patient (who is almost always male) not recognizing the fact that females have no penis - a fact which is extremely undesirable to him since it is a proof of the possibility of his being castrated himself. He therefore disavows his own sense-perception which showed him that the female genitals lack a penis and holds fast to the contrary conviction. The disavowed perception does not, however, remain entirely without influence for, in spite of everything, he has not the courage to assert that he actually saw a penis. He takes hold of something else instead - a part of the body or some other object - and assigns it the role of the penis which he cannot do without. It is usually something that he in fact saw at the moment at which he saw the female genitals, or it is something that can suitably serve as a symbolic substitute for the penis. Now it would be incorrect to describe this process when a fetish is constructed as a splitting of the ego; it is a compromise formed with the help of displacement, such as we have been familiar with in dreams. But our observations show us still more. The creation of the fetish was due to an intention to destroy the evidence for the possibility of castration, so that fear of castration could be avoided. If females, like other living creatures, possess a penis, there is no need to tremble for the continued possession of one’s own penis. Now we come across fetishists who have developed the same fear of castration as non-fetishists and react in the same way to it. Their behaviour is therefore simultaneously expressing two contrary premisses. On the one hand they are disavowing the fact of their perception - the fact that they saw no penis in the female genitals; and on the other hand they are recognizing the fact that females have no penis and are drawing the correct conclusions from it. The two attitudes persist side by side throughout their lives without influencing each other. Here is what may rightly be called a splitting of the ego. This circumstance also enables us to understand how it is that fetishism is so often only partially developed. It does not govern the choice of object exclusively but leaves room for a greater or lesser amount of normal sexual behaviour; sometimes, indeed, it retires into playing a modest part or is limited to a mere hint. In fetishists, therefore, the detachment of the ego from the reality of the external world has never succeeded completely.

[1940a [1938], 5008]

It must not be thought that fetishism presents an exceptional case as regards a splitting of the ego; it is merely a particularly favourable subject for studying the question. Let us return to our thesis that the childish ego, under the domination of the real world, gets rid of undesirable instinctual demands by what are called repressions. We will now supplement this by further asserting that, during the same period of life, the ego often enough finds itself in the position of fending off some demand from the external world which it feels distressing and that this is effected by means of a disavowal of the perceptions which bring to knowledge this demand from reality. Disavowals of this kind occur very often and not only with fetishists; and whenever we are in a position to study them they turn out to be half-measures, incomplete attempts at detachment from reality. The disavowal is always supplemented by an acknowledgement; two contrary and independent attitudes always arise and result in the situation of there being a splitting of the ego. Once more the issue depends on which of the two can seize hold of the greater intensity.

[1940a [1938], 5009]
The usual result of the fright of castration, the result that passes as the normal one, is that, either immediately or after some considerable struggle, the boy gives way to the threat and obeys the prohibition either wholly or at least in part (that is, by no longer touching his genitals with his hand). In other words, he gives up, in whole or in part, the satisfaction of the instinct. We are prepared to hear, however, that our present patient found another way out. He created a substitute for the penis which he missed in females - that is to say, a fetish. In so doing, it is true that he had disavowed reality, but he had saved his own penis. So long as he was not obliged to acknowledge that females have lost their penis, there was no need for him to believe the threat that had been made against him: he need have no fears for his own penis, so he could proceed with his masturbation undisturbed. This behaviour on the part of our patient strikes us forcibly as being a turning away from reality - a procedure which we should prefer to reserve for psychoses. And it is in fact not very different. Yet we will suspend our judgement, for upon closer inspection we shall discover a not unimportant distinction. The boy did not simply contradict his perceptions and hallucinate a penis where there was none to be seen; he effected no more than a displacement of value - he transferred the importance of the penis to another part of the body, a procedure in which he was assisted by the mechanism of regression (in a manner which need not here be explained). This displacement, it is true, related only to the female body; as regards his own penis nothing was changed.

[1940e [1938], 5064]
People whose sexual objects belong to the normally inappropriate sex - that is, inverts - strike the observer as a collection of individuals who may be quite sound in other respects. On the other hand, cases in which sexually immature persons (children) are chosen as sexual objects are instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive sexual objects in such a case. They usually come to play that part when someone who is cowardly or has become impotent adopts them as a substitute, or when an urgent instinct (one which will not allow of postponement) cannot at the moment get possession of any more appropriate object. Nevertheless, a light is thrown on the nature of the sexual instinct by the fact that it permits of so much variation in its objects and such a cheapening of them - which hunger, with its far more energetic retention of its objects, would only permit in the most extreme instances. A similar consideration applies to sexual intercourse with animals, which is by no means rare, especially among country people, and in which sexual attraction seems to override the barriers of species.

[1905d, 1475]

One would be glad on aesthetic grounds to be able to ascribe these and other severe aberrations of the sexual instinct to insanity; but that cannot be done. Experience shows that disturbances of the sexual instinct among the insane do not differ from those that occur among the healthy and in whole races or occupations. Thus the sexual abuse of children is found with uncanny frequency among school teachers and child attendants, simply because they have the best opportunity for it. The insane merely exhibit any such aberration to an intensified degree; or, what is particularly significant, it may become exclusive and replace normal sexual satisfaction entirely.

[1905d, 1475]
If we examine with the eyes of a psycho-analyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall having come across the same sort of thing in many places, for example in dreams; so that we may venture to translate the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, 'coda', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages; the situation in the phantasy, of a vulture opening the child's mouth and beating about inside it vigorously with its tail, corresponds to the idea of an act of fellatio, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).

The inclination to take a man's sexual organ into the mouth and suck at it, which in respectable society is considered a loathsome sexual perversion, is nevertheless found with great frequency among women of to-day - and of earlier times as well, as ancient sculptures show -, and in the state of being in love it appears completely to lose its repulsive character. Phantasies derived from this inclination are found by doctors even in women who have not become aware of the possibilities of obtaining sexual satisfaction in this way by reading Krafft Ebing's Psychopathia Sexualis or from other sources of information. Women, it seems, find no difficulty in producing this kind of wishful phantasy spontaneously.¹ Further investigation in forms us that this situation, which morality condemns with such severity, may be traced to an origin of the most innocent kind. It only repeats in a different form a situation in which we all once felt comfortable - when we were still in our suckling days ('essendo io in culla')² and took our mother's (or wet-nurse's) nipple into our mouth and sucked at it. The organic impression of this experience - the first source of pleasure in our life - doubtless remains indelibly printed on us; and when at a later date the child becomes familiar with the cow's udder whose function is that of a nipple, but whose shape and position under the belly make it resemble a penis, the preliminary stage has been reached which will later enable him to form the repellent sexual phantasy.

[1910c, 2262]
This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror!

[1916-1917, 3377]

The old paediatrician Lindner once remarked that a child discovers the genital zones (the penis or the clitoris) as a source of pleasure while indulging in sensual sucking (thumb sucking).¹ I shall leave it an open question whether it is really true that the child takes the newly found source of pleasure in exchange for the recent loss of the mother's nipple - a possibility to which later phantasies (fellatio) seem to point. Be that as it may, the genital zone is discovered at some time or other, and there seems no justification for attributing any psychical content to the first activities in connection with it. But the first step in the phallic phase which begins in this way is not the linking-up of the masturbation with the object-cathexes of the Oedipus complex, but a momentous discovery which little girls are destined to make. They notice the penis of a brother or playmate, strikingly visible and of large proportions, at once recognize it as the superior counterpart of their own small and inconspicuous organ, and from that time forward fall a victim to envy for the penis.

[1925j, 4149]
People whose sexual objects belong to the normally inappropriate sex - that is, inverts - strike the observer as a collection of individuals who may be quite sound in other respects. On the other hand, cases in which sexually immature persons (children) are chosen as sexual objects are instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive sexual objects in such a case. They usually come to play that part when someone who is cowardly or has become impotent adopts them as a substitute, or when an urgent instinct (one which will not allow of postponement) cannot at the moment get possession of any more appropriate object. Nevertheless, a light is thrown on the nature of the sexual instinct by the fact that it permits of so much variation in its objects and such a cheapening of them - which hunger, with its far more energetic retention of its objects, would only permit in the most extreme instances. A similar consideration applies to sexual intercourse with animals, which is by no means rare, especially among country people, and in which sexual attraction seems to override the barriers of species.

[1905d, 1475]
Psycho-analysis has cleared up one of the remaining gaps in our understanding of fetishism. It has shown the importance, as regards the choice of a fetish, of a coprophilic pleasure in smelling which has disappeared owing to repression. Both the feet and the hair are objects with a strong smell which have been exalted into fetishes after the olfactory sensation has become unpleasurable and been abandoned. Accordingly, in the perversion that corresponds to foot fetishism, it is only dirty and evil-smelling feet that become sexual objects. Another factor that helps towards explaining the fetishistic preference for the foot is to be found among the sexual theories of children (see below p. 1514): the foot represents a woman's penis, the absence of which is deeply felt. [Added 1915:] In a number of cases of foot-fetishism it has been possible to show that the scopophilic instinct, seeking to reach its object (originally the genitals) from underneath, was brought to a halt in its pathway by prohibition and repression. For that reason it became attached to a fetish in the form of a foot or shoe, the female genitals (in accordance with the expectations of childhood/children) being imagined as male ones.

Nevertheless, in some of these perversions the quality of the new sexual aim is of a kind to demand special examination. Certain of them are so far removed from the normal in their content that we cannot avoid pronouncing them 'pathological'. This is especially so where (as, for instance, in cases of licking excrement or of intercourse with dead bodies) the sexual instinct goes to astonishing lengths in successfully overriding the resistances of shame, disgust, horror or pain. But even in such cases we should not be too ready to assume that people who act in this way will necessarily turn out to be insane or subject to grave abnormalities of other kinds. Here again we cannot escape from the fact that people whose behaviour is in other respects normal can, under the domination of the most unruly of all the instincts, put themselves in the category of sick persons in the single sphere of sexual life. On the other hand, manifest abnormality in the other relations of life can invariably be shown to have a background of abnormal sexual conduct.

I may add that in his childhood he had been subject to strong coprophilic propensities. In this connection his anal erotism has already been noticed (p. 2166).

[1905d, 1482]

¹ I may add that in his childhood he had been subject to strong coprophilic propensities. In this connection his anal erotism has already been noticed (p. 2166).

[1909d, 2193]
This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the grotesque monsters painted by Breughel for the temptation of St. Anthony or to the long procession of vanished gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual object has been changed, and others in whom the sexual aim is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act by some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object - not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire - a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it - strange or horrible - even that it must have become a defenceless corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough of this kind of horror!

[1916-1917, 3377]
Nevertheless, in some of these perversions the quality of the new sexual aim is of a kind to
demand special examination. Certain of them are so far removed from the normal in their
content that we cannot avoid pronouncing them 'pathological'. This is especially so where (as,
for instance, in cases of licking excrement or of intercourse with dead bodies) the sexual
instinct goes to astonishing lengths in successfully overriding the resistances of shame, disgust,
horror or pain. But even in such cases we should not be too ready to assume that people who
act in this way will necessarily turn out to be insane or subject to grave abnormalities of other
kinds. Here again we cannot escape from the fact that people whose behaviour is in other
respects normal can, under the domination of the most unruly of all the instincts, put themselves
in the category of sick persons in the single sphere of sexual life. On the other hand, manifest
abnormality in the other relations of life can invariably be shown to have a background of
abnormal sexual conduct.

This class of perverts at any rate behave to their sexual objects in approximately the same
way as normal people do to theirs. But we now come to a long series of abnormal people whose
sexual activity diverges more and more widely from what seems desirable to a sensible person.
In their multiplicity and strangeness they can only be compared to the grotesque monsters
painted by Breughel for the temptation of St. Anthony or to the long procession of vanished
gods and believers which Flaubert heads past, before the eyes of his pious penitent. Such a
medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly
divide them into those in whom, like the homosexuals, the sexual object has been changed, and
others in whom the sexual aim is what has primarily been altered. The first group includes those
who have renounced the union of the two genitals and who replace the genitals of one of the
couple engaged in the sexual act by some other part or region of the body; in this they disregard
the lack of suitable organic arrangements as well as any impediment offered by feelings of
disgust. (They replace the vulva, for instance, by the mouth or anus.) Others follow, who, it is
true, still retain the genitals as an object - not, however, on account of their sexual function but
of other functions in which the genital plays a part either for anatomical reasons or because of
its propinquity. We find from them that the excretory functions, which have been put aside as
improper during the upbringing of children, retain the ability to attract the whole of sexual
interest. Then come others again, who have abandoned the genital as an object altogether, and
have taken some other part of the body as the object they desire - a woman's breast, a foot or a
plait of hair. After them come others for whom parts of the body are of no importance but whose
every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing - the fetishists.
Later in the procession come people who require the whole object indeed, but make quite
definite demands of it - strange or horrible - even that it must have become a defenceless
corpse, and who, using criminal violence, make it into one so that they may enjoy it. But enough
of this kind of horror!
Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

[1910c, 2271]
To my surprise, after this suggestion of mine, she began without any transition speaking of Prince L., whose escape from an asylum was being talked about a great deal at the time. She brought out new fears about asylums - that people in them were treated with douches of ice-cold water on the head and put into an apparatus which turned them round and round till they were quiet. When, three days ago, she had first complained about her fear of asylums, I had interrupted her after her first story, that the patients were tied on to chairs. I now saw that I had gained nothing by this interruption and that I cannot evade listening to her stories in every detail to the very end. After these arrears had been made up, I took this fresh crop of fears from her as well, I appealed to her good sense and told her she really ought to believe me more than the silly girl from whom she had had the gruesome stories about the way in which asylums are run. As I noticed that she still stammered occasionally in telling me these further things, I asked her once more what the stammer came from. No reply. 'Don't you know?' 'No.' 'Why not?' 'Why not? Because I mayn't!' (She pronounced these words violently and angrily.) This declaration seemed to me to be evidence of the success of my suggestion, but she expressed a desire for me to wake her up from her hypnosis, and I did so.¹

¹ As an example of the technique which I have described above of carrying out investigations in non-somnambulistic states - that is, where there is no extension of consciousness - I will describe an instance which I happen to have analysed in the course of the last few days. I was treating a woman of thirty-eight, suffering from anxiety neurosis (agoraphobia, attacks of fear of death, etc.). Like so many such patients, she had a disinclination to admitting that she had acquired these troubles in her married life and would have liked to push them back into her early youth. Thus she told me that she was seventeen when she had had a first attack of dizziness, with anxiety and feelings of faintness, in the street in her small native town, and that these attacks had recurred from time to time, till a few years ago they had given place to her present disorder. I suspected that these first attacks of dizziness, in which the anxiety faded more and more into the background, were hysterical and I made up my mind to embark on an analysis of them. To begin with she only knew that this first attack came over her while the was out shopping in the principal street. 'What were you going to buy?' - 'Different things, I believe; they were for a ball I had been invited to.' - 'When was this ball to take place?' - 'Two days later, I think.' - 'Something must have happened to agitate you a few days before, something that made an impression on you.' - 'I can't think of anything. After all, it was twenty-one years ago.' - 'That makes no difference; you will remember all the same. I shall press on your head, and when I relax the pressure, you will think of something or see something, and you must tell me what that is.' I went through this procedure; but she remained silent. 'Well, has nothing occurred to you?' - 'I have thought of something, but it can't have any connection with this.' - 'Tell it to me anyway.' - 'I thought of a friend of mine, a girl, who is dead. But she died when I was eighteen - a year later, that is.' - 'We shall see. Let's stick to this point. What about this friend of yours?' - 'Her death was a great shock to me, as I used to see a lot of her. A few weeks earlier another girl had died, and that had made a great stir in the town. So after all, I must have been seventeen at the time.' - 'There, you see, I told you we could rely on the things that come into your head under the pressure of my hand. Now, can you remember what you were thinking about when you felt dizzy in the street?' - 'I wasn't thinking of anything; I only felt dizzy.' - 'That's not possible. States like that never happen without being accompanied by some idea. I shall press once more and the thought you had will come back to you... Well, what has occurred to you?' - 'The idea that I am the third.' - 'What does that mean?' - 'When I got the attack of dizziness I must have thought: "Now I am dying, like the other two girls."' - 'That was the idea, then. As you were having the attack you thought of your friend. So her death must have made a great impression on you.' - 'Yes, it did. I can remember now that when I heard of her death I felt it was dreadful to be going to a ball, while she was dead. But I was looking forward so much to the ball and was so busy with preparations for it; I didn't want to think of what had happened at all.' (We may observe here a deliberate repression from consciousness, which rendered the patient's memory of her friend pathogenic.)

¹ [1895d, 59]

Here I can only touch upon the theme in passing. The conclusion I drew from all these observations was that experiences which have played an important pathogenic part, and all their subsidiary concomitants, are accurately retained in the patient's memory even when they seem to be forgotten - when he is unable to call them to mind.¹

¹ [1895d, 100]
In the course of my psycho-analytic treatment of cases of hysteria, obsessional neurosis, etc., I have often had to deal with fragmentary recollections which have remained in the patient's memory from the earliest years of his childhood. As I have shown elsewhere, great pathogenic importance must be attributed to the impressions of that time of life. But the subject of childhood memories is in any case bound to be of psychological interest, for they bring into striking relief a fundamental difference between the psychical functioning of children and of adults. No one calls in question the fact that the experiences of the earliest years of our childhood leave ineradicable traces in the depths of our minds. If, however, we seek in our memories to ascertain what were the impressions that were destined to influence us to the end of our lives, the outcome is either nothing at all or a relatively small number of isolated recollections which are often of dubious or enigmatic importance. It is only from the sixth or seventh year onwards - in many cases only after the tenth year - that our lives can be reproduced in memory as a connected chain of events. From that time on, however, there is also a direct relation between the psychical significance of an experience and its retention in the memory. Whatever seems important on account of its immediate or directly subsequent effects is recollected; whatever is judged to be inessential is forgotten. If I can remember an event a long time after its occurrence, I regard the fact of having retained it in my memory as evidence of its having made a deep impression on me at the time. I feel surprised at forgetting; and I feel even more surprised, perhaps, at remembering something apparently indifferent.

It is only in certain pathological mental conditions that the relation holding in normal adults between the psychical significance of an event and its retention in memory once more ceases to apply. For instance, a hysteric habitually shows amnesia for some or all of the experiences which led to the onset of his illness and which from that very fact have become important to him and, apart from that fact, may have been important on their own account. The analogy between pathological amnesia of this kind and the normal amnesia affecting our early years seems to me to give a valuable hint at the intimate connection that exists between the psychical content of neuroses and our infantile life.

We are so much accustomed to this lack of memory of the impressions of childhood that we are apt to overlook the problem underlying it and are inclined to explain it as a self-evident consequence of the rudimentary character of the mental activities of children. Actually, however, a normally developed child of three or four already exhibits an enormous amount of highly organized mental functioning in the comparisons and inferences which he makes and in the expression of his feelings; and there is no obvious reason why amnesia should overtake these psychical acts, which carry no less weight than those of a later age.

The age to which the content of the earliest memories of childhood is usually referred back is the period between the ages of two and four. (This is the case with 88 persons in the series observed by the Henris.) There are some, however, whose memory reaches back further - even to the time before the completion of their first year; and, on the other hand, there are some whose earliest recollections go back only to their sixth, seventh, or even eighth year. There is nothing at the moment to show what else is related to these individual differences; is to be noticed, say the Henris, that a person whose earliest recollection goes back to a very tender age - to the first year of his life, perhaps - will also have at his disposal further detached memories from the following years, and that he will be able to reproduce his experiences as a continuous chain from an earlier point of time - from about his fifth year - than is possible for other people, whose first recollection dates from a later time. Thus not only the date of the appearance of the first recollection but the whole function of memory may, in the case of some people, be advanced or retarded.
Now, however, we are met by a fact that is diametrically opposed to our expectations and cannot fail to astonish us. We hear that there are some people whose earliest recollections of childhood are concerned with everyday and indifferent events which could not produce any emotional effect even in children, but which are recollected (too clearly, one is inclined to say) in every detail, while approximately contemporary events, even if, on the evidence of their parents, they moved them intensely at the time, have not been retained in their memory. Thus the Henris mention a professor of philology whose earliest memory, dating back to between the ages of three and four, showed him a table laid for a meal and on it a basin of ice. At the same period there occurred the death of his grandmother which, according to his parents, was a severe blow to the child. But the professor of philology, as he now is, has no recollection of this bereavement; all that he remembers of those days is the basin of ice. Another man reports that his earliest memory is an episode upon a walk in which he broke off a branch from a tree. He thinks he can still identify the spot where this happened. There were several other people present, and one of them helped him.

The Henris describe such cases as rare. In my experience, based for the most part, it is true, on neurotics, they are quite frequent. One of the subjects of the Henris' investigation made an attempt at explaining the occurrence of these mnemonic images, whose innocence makes them so mysterious, and his explanation seems to me very much to the point. He thinks that in such cases the relevant scene may perhaps have been only incompletely retained in the memory, and that that may be why it seems so unenlightening: the parts that have been forgotten probably contained everything that made the experience noteworthy. I am able to confirm the truth of this view, though I should prefer to speak of these elements of the experience being omitted rather than forgotten. I have often succeeded, by means of psycho-analytic treatment, in uncovering the missing portions of a childhood experience and in thus proving that when the impression, of which no more than a torso was retained in the memory, had been restored to completeness, it did in fact agree with the presumption that it is the most important things that are recollected. This, however, provides no explanation of the remarkable choice which memory has made among the elements of the experience. We must first enquire why it should be that precisely what is important is suppressed and what is indifferent retained; and we shall not find an explanation of this until we have investigated the mechanism of these processes more deeply. We shall then form a notion that two psychical forces are concerned in bringing about memories of this sort. One of these forces takes the importance of the experience as a motive for seeking to remember it, while the other - a resistance - tries to prevent any such preference from being shown. These two opposing forces do not cancel each other out, nor does one of them (whether with or without loss to itself) overpower the other. Instead, a compromise is brought about, somewhat on the analogy of the resultant in a parallelogram of forces. And the compromise is this. What is recorded as a mnemonic image is not the relevant experience itself - in this respect the resistance gets its way; what is recorded is another psychical element closely associated with the objectionable one - and in this respect the first principle shows its strength, the principle which endeavours to fix important impressions by establishing reproducible mnemonic images. The result of the conflict is therefore that, instead of the mnemonic image which would have been justified by the original event, another is produced which has been to some degree associatively displaced from the former one. And since the elements of the experience which aroused objection were precisely the important ones, the substituted memory will necessarily lack those important elements and will in consequence most probably strike us as trivial. It will seem incomprehensible to us because we are inclined to look for the reason for its retention in its own content, whereas in fact that retention is due to the relation holding between its own content and a different one which has been suppressed. There is a common saying among us about shams, that they are not made of gold themselves but have lain beside something that is made of gold. The same simile might well be applied to some of the experiences of childhood which have been retained in the memory.

[1899a, 489]
The processes of normal and pathological defence and the displacements in which they result are clearly of great importance. But to the best of my knowledge no study whatever has hitherto been made of them by psychologists; and it remains to be ascertained in what strata of psychical activity and under what conditions they come into operation. The reason for this neglect may well be that our mental life, so far as it is the object of our conscious perception, shows nothing of these processes, apart from instances which we classify as 'faulty reasoning' and some mental operations which aim at producing a comic effect. The assertion that a psychical intensity can be displaced from one presentation (which is then abandoned) on to another (which thenceforward plays the psychological part of the former one) is as bewildering to us as certain features of Greek mythology - as, for instance, when the gods are said to clothe someone with beauty as though it were with a veil, whereas we think only of a face transfigured by a change of expression.

[1899a, 491]

There is in general no guarantee of the data produced by our memory. But I am ready to agree with you that the scene is genuine. If so, you selected it from innumerable others of a similar or another kind because, on account of its content (which in itself was indifferent) it was well adapted to represent the two phantasies, which were important enough to you. A recollection of this kind, whose value lies in the fact that it represents in the memory impressions and thoughts of a later date whose content is connected with its own by symbolic or similar links, may appropriately be called a 'screen memory'. In any case you will cease to feel any surprise that this scene should so often recur to your mind. It can no longer be regarded as an innocent one since, as we have discovered, it is calculated to illustrate the most momentous turning-points in your life, the influence of the two most powerful motive forces - hunger and love.

[1899a, 496]

This analysis, which I have reproduced as accurately as possible, will, I hope, have to some extent clarified the concept of a 'screen memory' as one which owes its value as a memory not to its own content but to the relation existing between that content and some other, that has been suppressed. Different classes of screen memories can be distinguished according to the nature of that relation. We have found examples of two of these classes among what are described as the earliest memories of childhood - that is, if we include under the heading of screen memories the incomplete childhood scenes which are innocent by very reason of their incompleteness. It is to be anticipated that screen memories will also be formed from residues of memories relating to later life as well. Anyone who bears in mind their distinctive feature - namely that they are extremely well remembered but that their content is completely indifferent - will easily recall a number of examples of the sort from his own memory. Some of these screen memories dealing with events later in life owe their importance to a connection with experiences in early youth which have remained suppressed. The connection, that is, is the reverse of the one in the case which I have analysed, where a childhood memory was accounted for by later experiences. A screen memory may be described as 'retrogressive' or as having 'pushed forward' according as the one chronological relation or the other holds between the screen and the thing screened-off. From another point of view, we can distinguish positive screen memories from negative ones (or refractory memories) whose content stands in a contrary relation to the suppressed material. The whole subject deserves a more thorough examination; but I must content myself with pointing out what complicated processes - processes, incidentally, which are altogether analogous to the formation of hysterical symptoms - are involved in the building up of our store of memories.

[1899a, 501]
There is another fact that affords even more convincing evidence in favour of this second view. Out of a number of childhood memories of significant experiences, all of them of similar distinctness and clarity, there will be some scenes which, when they are tested (for instance by the recollections of adults), turn out to have been falsified. Not that they are complete inventions; they are false in the sense that the they have shifted an event to a place where it did not occur - this is the case in one of the instances quoted by the Henris - or that they have merged two people into one or substituted one for the other, or the scenes as a whole give signs of being combinations of two separate experiences. Simple inaccuracy of recollection does not play any considerable part here, in view of the high degree of sensory intensity possessed by the images the and the efficiency of the function of memory in the young; close the investigation shows rather that these falsifications of memory are tendentious - that is, that they serve the purposes of the repression and replacement of objectionable or disagreeable impressions. It follows, therefore, that these falsified memories too, must have originated at a period of life when it has become the possible for conflicts of this kind and impulsions towards repression to have made a place for themselves in mental life - far later, therefore, than the period to which their content belongs. But in these cases too the falsified memory is the first that we become aware of: the raw material of memory-traces out of which it was forged remains unknown to us in its original form.
[1899a, 503]

One of the sources from which dreams derive material for reproduction - material which is in part neither remembered nor used in the activities of waking thought - is childhood experience. I will quote only a few of the authors who have noticed and stressed this fact.
[1900a, 529]

The way in which the memory behaves in dreams is undoubtedly of the greatest importance for any theory of memory in general. It teaches us that 'nothing which we have once mentally possessed can be entirely lost' (Scholz, 1893, 59); or, as Delboeuf puts it, 'que toute impression même la plus insignifiante, laisse une trace inaltérable, indéfiniment susceptible de reparâitre au jour.' This is a conclusion to which we are also driven by many pathological phenomena of mental life. Certain theories about dreams which we shall mention later seek to account for their absurdity and incoherence by a partial forgetting of what we know during the day. When we bear in mind the extraordinary efficiency that we have just seen exhibited by memory in dreams we shall have a lively sense of the contradiction which these theories involve.
[1900a, 534]
If *Oedipus Rex* moves a modern audience no less than it did the contemporary Greek one, the explanation can only be that its effect does not lie in the contrast between destiny and human will, but is to be looked for in the particular nature of the material on which that contrast is exemplified. There must be something which makes a voice within us ready to recognize the compelling force of destiny in the *Oedipus*, while we can dismiss as merely arbitrary such dispositions as are laid down in *Die Ahnfrau* or other modern tragedies of destiny. And a factor of this kind is in fact involved in the story of King Oedipus. His destiny moves us only because it might have been ours - because the oracle laid the same curse upon us before our birth as upon him. It is the fate of all of us, perhaps, to direct our first sexual impulse towards our mother and our first hatred and our first murderous wish against our father. Our dreams convince us that that is so. King Oedipus, who slew his father Laïus and married his mother Jocasta, merely shows us the fulfilment of our own childhood wishes. But, more fortunate than he, we have meanwhile succeeded, in so far as we have not become psychoneurotics, in detaching our sexual impulses from our mothers and in forgetting our jealousy of our fathers. Here is one in whom these primal wishes of our childhood have been fulfilled, and we shrink back from him with the whole force of the repression by which those wishes have since that time been held down within us. While the poet, as he unravels the past, brings to light the guilt of Oedipus, he is at the same time compelling us to recognize our own inner minds, in which those same impulses, though suppressed, are still to be found. The contrast with which the closing Chorus leaves us confronted -

[1900a, 741]
Previous writers have had less justification in devoting so much space to the doubt with which our judgement receives accounts of dreams. For this doubt has no intellectual warrant. There is in general no guarantee of the correctness of our memory; and yet we yield to the compulsion to attach belief to its data far more often than is objectively justified. Doubt whether a dream or certain of its details have been correctly reported is once more a derivative of the dream-censorship, of resistance to the penetration of the dream-thoughts into consciousness. This resistance has not been exhausted even by the displacements and substitutions it has brought about; it persists in the form of doubt attaching to the material which has been allowed through. We are especially inclined to misunderstand this doubt since it is careful never to attack the more intense elements of a dream but only the weak and indistinct ones. As we already know, however, a complete reversal of all psychical values takes place between the dream-thoughts and the dream. Distortion is only made possible by a withdrawal of psychical value; it habitually expresses itself by that means and is occasionally content to require nothing more. If, then, an indistinct element of a dream's content is in addition attacked by doubt, we have a sure indication that we are dealing with a comparatively direct derivative of one of the proscribed dream-thoughts. The state of things is what it was after some sweeping revolution in one of the republics of antiquity or the Renaissance. The noble and powerful families which had previously dominated the scene were sent into exile and all the high offices were filled by newcomers. Only the most impoverished and powerless members of the vanquished families, or their remote dependants, were allowed to remain in the city; and even so they did not enjoy full civic rights and were viewed with distrust. The distrust in this analogy corresponds to the doubt in the case we are considering. That is why in analysing a dream I insist that the whole scale of estimates of certainty shall be abandoned and that the faintest possibility that something of this or that sort may have occurred in the dream shall be treated as complete certainty. In tracing any element of a dream it will be found that unless this attitude is firmly adopted the analysis will come to a standstill. If any doubt is thrown upon the value of the element in question, the psychical result in the patient is that none of the involuntary ideas underlying that element comes into his head. This result is not a self-evident one. It would not make nonsense if someone were to say: 'I don't know for certain whether such and such a thing came into the dream, but here is what occurs to me in connection with it.' But in fact no one ever does say this; and it is precisely the fact that doubt produces this interrupting effect upon an analysis that reveals it as a derivative and tool of psychical resistance. Psycho-analysis is justly suspicious. One of its rules is that whatever interrupts the progress of analytic work is a resistance.¹

[1900a, 951]
An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysteric, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in Studies on Hysteria of the first hysterical attack which a woman of over forty had had in her fifteenth year.¹

[1900a, 956]

It is perfectly true that unconscious wishes always remain active. They represent paths which can always be traversed, whenever a quantity of excitation makes use of them. Indeed it is a prominent feature of unconscious processes that they are indestructible. In the unconscious nothing can be brought to an end, nothing is past or forgotten. This is brought most vividly home to one in studying the neuroses, and especially hysteria. The unconscious path of thoughts, which leads to discharge in a hysterical attack, immediately becomes traversable once more, when sufficient excitation has accumulated. A humiliation that was experienced thirty years ago acts exactly like a fresh one throughout the thirty years, as soon as it has obtained access to the unconscious sources of emotion. As soon as the memory of it is touched, it springs into life again and shows itself cathected with excitation which finds a motor discharge in an attack. This is precisely the point at which psychotherapy has to intervene. Its task is to make it possible for the unconscious processes to be dealt with finally and be forgotten. For the fading of memories and the emotional weakness of impressions which are no longer recent, which we are inclined to regard as self-evident and to explain as a primary effect of time upon mental memory-traces, are in reality secondary modifications which are only brought about by laborious work. What performs this work is the preconscious, and psychotherapy can pursue no other course than to bring the Ucs. under the domination of the Pcs.

[1900a, 1007]
In a second paper, which was published in the *Monatsschrift für Psychiatrie und Neurologie* (1899a), I was in a position to demonstrate at an unexpected point the tendentious nature of the workings of our memory. I started from the striking fact that a person's earliest childhood memories seem frequently to have preserved what is indifferent and unimportant, whereas (frequently, though certainly not universally) no trace is found in an adult's memory of impressions dating from that time which are important, impressive and rich in affect. It might be assumed from this - since it is known that the memory makes a selection from among the impressions offered to it - that in childhood the selection is conducted on entirely different principles from those which apply at the time of intellectual maturity. Careful investigation nevertheless shows that such an assumption is unnecessary. The indifferent memories of childhood owe their existence to a process of displacement: they are substitutes, in reproduction, for other impressions which are really significant. The memory of these significant impressions can be developed out of the indifferent ones by means of psychical analysis, but a resistance prevents them from being directly reproduced. As the indifferent memories owe their preservation not to their own content but to an associative relation between their content and another which is repressed, they have some claim to be called 'screen memories', the name by which I have described them.

[1901b, 1137]

In the paper which I have mentioned I only touched on and in no way exhausted the multiplicity of the relations and meanings of screen memories. In the example quoted there, of which I gave a detailed analysis, I laid special stress on the peculiarity of the chronological relation between the screen memory and the content which is screened off by it. In that example the content of the screen memory belonged to one of the earliest years of childhood, while the mental experiences which were replaced by it in the memory and which had remained almost unconscious occurred in the subject's later life, I described this sort of displacement as a retroactive or retrogressive one. The opposite relation is found perhaps still more frequently: an indifferent impression of recent date establishes itself in the memory as a screen memory, although it owes that privilege merely to its connection with an earlier experience which resistances prevent from being reproduced directly. These would be screen memories that have pushed ahead or been displaced forward. Here the essential thing with which the memory is occupied precedes the screen memory in time. Finally, we find yet a third possibility, in which the screen memory is connected with the impression that it screens not only by its content but also by contiguity in time: these are contemporary or contiguous screen memories.

[1901b, 1138]

How large a part of our store of memory falls into the category of screen memories, and what role they play in various neurotic thought-processes, are problems whose significance I neither discussed in my earlier paper nor shall enter into here. My only concern is to emphasize the similarity between the forgetting of proper names accompanied by paramnesia, and the formation of screen memories.

[1901b, 1138]
At first sight the differences between the two phenomena are much more striking than any analogies that may be found. The former phenomenon relates to proper names; the latter to whole impressions, things experienced either in reality or in thought. In the former we have a manifest failure of the function of memory; in the latter, an act of memory that strikes us as strange. In the former it is a case of momentary disturbance - for the name that has just been forgotten may have been produced correctly a hundred times before, and from tomorrow may be produced once again; in the latter it is a case of a permanent and constant memory, since the indifferent childhood memories seem to have the power of staying with us through a large part of our life. The problem in these two cases appears to be quite differently focused. In the former it is the forgetting, in the latter the retention which arouses our scientific curiosity. Closer study reveals that in spite of the dissimilarity between the two phenomena in regard to their psychical material and their duration, the points at which they agree far outbalance it. Both have to do with mistakes in remembering: what the memory reproduces is not what it should correctly have reproduced, but something else as a substitute. In the case of the forgetting of names the act of memory occurs, though in the form of substitute names; the case of the formation of screen memories has as its basis a forgetting of other more important impressions. In both instances an intellectual feeling gives us information of interference by some disturbing factor; but it takes two different forms. With the forgetting of names we know that the substitute names are false: with screen memories we are surprised that we possess them at all. If, now, psychological analysis establishes that the substitutive formation has come about in the same way in both cases, by means of displacement along a superficial association, it is precisely the dissimilarities between the two phenomena, in regard to their material, their duration and their focal point, which serve to heighten our expectation that we have discovered something of importance and of general validity. This general principle would assert that when the reproducing function fails or goes astray, the occurrence points, far more frequently than we suspect, to interference by a tendentious factor - that is, by a purpose which favours one memory while striving to work against another.

The subject of childhood memories seems to me to be of such significance and interest that I should like to devote to it a few additional observations which go beyond the views that I have so far expressed.

How far back into childhood do our memories extend? I am familiar with a few investigations into this question, such as those by V. and C. Henri (1897) and by Potwin (1901). They show that great individual differences exist among the persons examined: a few assign their earliest memories to the sixth month of life, while others remember nothing of their lives up to the end of their sixth or even eighth year. But with what are these differences in retaining childhood memories connected, and what significance attaches to them? Clearly it is not sufficient to assemble the material for answering these points by means of a questionnaire; what is required in addition is that it should be worked over - a process in which the person supplying the information must participate.
In my opinion we take the fact of infantile amnesia - the loss, that is, of the memories of the first years of our life - much too easily; and we fail to look upon it as a strange riddle. We forget how high are the intellectual achievements and how complicated the emotional impulses of which a child of some four years is capable, and we ought to be positively astonished that the memory of later years has as a rule preserved so little of these mental processes, especially as we have every reason to suppose that these same forgotten childhood achievements have not, as might be thought, slipped away without leaving their mark on the subject's development, but have exercised a determining influence for the whole of his later life. And in spite of this unique efficacy they have been forgotten! This suggests that there are conditions for remembering (in the sense of conscious reproducing) of a quite special kind, which have evaded recognition by us up to now. It may very well be that the forgetting of childhood can supply us with the key to the understanding of those amnesias which lie, according to our more recent discoveries, at the basis of the formation of all neurotic symptoms. [1901b, 1140]

Of the childhood memories that have been retained a few strike us as perfectly understandable, while others seem odd or unintelligible. It is not difficult to correct certain errors regarding both sorts. If the memories that a person has retained are subjected to an analytic enquiry, it is easy to establish that there is no guarantee of their accuracy. Some of the mnemonic images are certainly falsified, incomplete or displaced in time and place. Any such statement by the subjects of the enquiry as that their first recollection comes from about their second year is clearly not to be trusted. Moreover, motives can soon be discovered which make the distortion and displacement of the experience intelligible, but which show at the same time that these mistakes in recollection cannot be caused simply by a treacherous memory. Strong forces from later life have been at work on the capacity of childhood experiences for being remembered - probably the same forces which are responsible for our having become so far removed in general from understanding our years of childhood. [1901b, 1140]

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot's proposal, such people are called auditis and moteurs in contrast to the visuels. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult visuels no longer see themselves. Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths. [1901b, 1141]
If anyone should feel inclined to over-estimate the state of our present knowledge of mental life, a reminder of the function of memory is all that would be needed to force him to be more modest. No psychological theory has yet succeeded in giving a connected account of the fundamental phenomenon of remembering and forgetting; in fact, the complete analysis of what can actually be observed has so far scarcely been begun. To-day forgetting has perhaps become more of a puzzle than remembering, ever since we have learnt from the study of dreams and pathological phenomena that even something we thought had been forgotten long ago may suddenly re-emerge in consciousness.

[1901b, 1218]

There are, it is true, a few indications already in our possession which we expect to be accepted generally. We assume that forgetting is a spontaneous process which may be regarded as requiring a certain length of time. We lay stress on the fact that forgetting involves a certain selection taking place from among the impressions presented to us, and similarly from among the details of each impression or experience. We know some of the conditions enabling what would otherwise have been forgotten to be retained in the memory and to be re-awakened. Nevertheless, on countless occasions in daily life we can observe how imperfect and unsatisfactory our understanding of these conditions is. Thus we may listen to two people who were in receipt of the same external impressions - who took a journey together, for example - exchanging recollections at some later date. What has remained firm in the memory of one of them has often been forgotten by the other, as if it had never happened; and this is true even where there is no justification for assuming that the impression was psychically of greater importance for the one than for the other. A whole quantity of factors determining the choice of what is to be remembered are obviously still beyond our ken.

[1901b, 1218]

With the aim of making a small contribution to our knowledge of the determinants of forgetting I make it my practice to submit to a psychological analysis those cases in which I myself forget something. I am as a rule only concerned with a certain group of these cases, namely those in which the forgetting surprises me because I should have expected to know the thing in question. I may add that I am not in general inclined to forget things (things I have experienced, that is, not things I have learned!), and that for a short period of my youth some unusual feats of memory were not beyond me. When I was a schoolboy I took it as a matter of course that I could repeat by heart the page I had been reading; and shortly before I entered the University I could write down almost verbatim popular lectures on scientific subjects directly after hearing them. In the period of tension before my final medical examination I must have made use once more of what remained of this faculty, for in some subjects I gave the examiners, as though it were automatically, answers which faithfully followed the words of the textbook that I had skimmed through only once in the greatest haste.

[1901b, 1219]
There are thus abundant signs to be found in healthy, non-neurotic people that the recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance.¹ But the full significance of this fact can be estimated only when the psychology of neurotic people is investigated. We are forced to regard as one of the main pillars of the mechanism supporting hysterical symptoms an elementary endeavour of this kind to fend off ideas that can arouse feelings of unpleasure - an endeavour which can only be compared with the flight-reflex in the presence of painful stimuli. The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect in every case, that in the interplay of psychical forces it may not come up against factors which, for other purposes, aim at the opposite effect and bring it about in spite of the defensive trend. It may be surmised that the architectonic principle of the mental apparatus lies in a stratification - a building up of superimposed agencies; and it is quite possible that this defensive endeavour belongs to a lower psychical agency and is inhibited by higher agencies. At all events, if we can trace back processes such as those found in our examples of forgetting to this defensive trend, that fact speaks in favour of its existence and power.(As we have seen, a number of things are forgotten on their own account; where this is not possible, the defensive trend shifts its target and causes something else related to the target at least to be forgotten, something less important which has come into associative connection with the thing that is really objectionable.

¹ [Footnote added 1910:] A. Pick (1905) has recently brought together a number of quotations from authors who appreciate the influence of affective factors on the memory and who - more or less clearly - recognize the contribution towards forgetting made by the endeavour to fend off unpleasure. But none of us has been able to portray the phenomenon and its psychological basis so exhaustively and at the same time so impressively as Nietzsche in one of his aphorisms (Jenseits von Gut und Böse, IV, 68): "I did this", says my Memory. "I cannot have done this", says my Pride and remains inexorable. In the end - Memory yields.

One is on different ground when it comes to examining forgetting in its proper sense - that is, the forgetting of past experiences. (To distinguish them from forgetting in the stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapter I and II, as 'slipping the memory', and the forgetting of intentions as 'omissions'.) The basic determinants of the normal process of forgetting are unknown.¹ We are also reminded that not everything is forgotten that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, in so far as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

¹ [Footnote added 1910:]

[1901b, 1229]
Footnote added 1907: I may perhaps put forward the following suggestions as regards the mechanism of forgetting in its proper sense. Mnemic material is subject in general to two influences, condensation and distortion. Distortion is the work of the dominant trends in mental life, and is directed above all against the memory traces which have remained affectively operative and which show considerable resistance to condensation. The traces that have grown indifferent succumb unresistingly to the process of condensation; yet it can be observed that in addition to this, the distorting trends feed on the indifferent material if they have remained unsatisfied at the place at which they sought to manifest themselves. As these processes of condensation and distortion continue for long periods, during which every fresh experience acts in the direction of transforming the mnemic content, it is generally thought that it is time which makes memory uncertain and indistinct. It is highly probable that there is no question at all of there being any direct function of time in forgetting. - In the case of repressed memory-traces it can be demonstrated that they undergo no alteration even in the course of the longest period of time. The unconscious is quite timeless. The most important as well as the strangest characteristic of psychical fixation is that all impressions are preserved, not only in the same form in which they were first received, but also in all the forms which they have adopted in their further developments. This is a state of affairs which cannot be illustrated by comparison with another sphere. Theoretically every earlier state of the mnemonic content could thus be restored to memory again, even if its elements have long ago exchanged all their original connections for more recent ones. [1901b, 1343]

In the forgetting of intentions another factor comes into the foreground. The conflict, which could only be surmised in the repression of what was distressing to remember, here becomes tangible, and in the analysis of the examples a counter-will can regularly be recognized which opposes the intention without putting an end to it. As in the parapraxes already described, two types of psychical process can be recognized here. Either the counter-will is turned directly against the intention (in cases where the latter's purpose is of some importance), or it is unrelated in its nature to the intention itself and establishes its connection with it by means of an external association (in the case of intentions that are almost indifferent). [1901b, 1344]
If I were to begin by giving a full and consistent case history, it would place the reader in a very different situation from that of the medical observer. The reports of the patient's relatives - in the present case I was given one by the eighteen-year-old girl's father - usually afford a very indistinct picture of the course of the illness. I begin the treatment, indeed, by asking the patient to give me the whole story of his life and illness, but even so the information I receive is never enough to let me see my way about the case. This first account may be compared to an unnavigable river whose stream is at one moment choked by masses of rock and at another divided and lost among shallows and sandbanks. I cannot help wondering how it is that the authorities can produce such smooth and precise histories in cases of hysteria. As a matter of fact the patients are incapable of giving such reports about themselves. They can, indeed, give the physician plenty of coherent information about this or that period of their lives; but it is sure to be followed by another period as to which their communications run dry, leaving gaps unfilled, and riddles unanswered; and then again will come yet another period which will remain totally obscure and unilluminated by even a single piece of serviceable information. The connections - even the ostensible ones - are for the most part incoherent, and the sequence of different events is uncertain. Even during the course of their story patients will repeatedly correct a particular or a date, and then perhaps, after wavering for some time, return to their first version. The patients' inability to give an ordered history of their life in so far as it coincides with the history of their illness is not merely characteristic of the neurosis.¹ It also possesses great theoretical significance. For this inability has the following grounds. In the first place, patients consciously and intentionally keep back part of what they ought to tell - things that are perfectly we known to them - because they have not got over their feelings of timidity and shame (or discretion, where what they say concerns other people); this is the share taken by conscious disingenuousness. In the second place, part of the anamnestic knowledge, which the patients have at their disposal at other times, disappears while they are actually telling their story, but without their making any deliberate reservations: the share taken by unconscious disingenuousness. In the third place, there are invariably true amnesias - gaps in the memory into which not only old recollections but even quite recent ones have fallen - and paramnesias, formed secondarily so as to fill in those gaps.² When the events themselves have been kept in mind, the purpose underlying the amnesias can be fulfilled just as surely by destroying a connection, and a connection is most surely broken by altering the chronological order of events. The latter always proves to be the most vulnerable element in the store of memory and the one which is most easily subject to repression. Again we meet with many recollections that are in what might be described as the first stage of repression, and these we find surrounded with doubts. At a later period the doubts would be replaced by a loss or a falsification of memory.³

¹ [1905e, 1358]

² Amnesias and paramnesias stand in a complementary relation to each other. When there are large gaps in the memory there will be few mistakes in it. And conversely, paramnesias can at a first glance completely conceal the presence of amnesias.

³ [1905e, 1358]
When I told Dora that I could not avoid supposing that her affection for her father must at a very early moment have amounted to her being completely in love with him, she of course gave me her usual reply: 'I don't remember that.' But she immediately went on to tell me something analogous about a seven-year-old girl who was her cousin (on her mother's side) and in whom she often thought she saw a kind of reflection of her own childhood. This little girl had (not for the first time) been the witness of a heated dispute between her parents, and, when Dora happened to come in on a visit soon afterwards, whispered in her ear: 'You can't think how I hate that person!' (pointing to her mother), 'and when she's dead I shall marry Daddy.' I am in the habit of regarding associations such as this, which bring forward something that agrees with the content of an assertion of mine, as a confirmation from the unconscious of what I have said. No other kind of 'Yes' can be extracted from the unconscious; there is no such thing at all as an unconscious 'No'.¹

INFANTILE AMNESIA The reason for this strange neglect is to be sought, I think, partly in considerations of propriety, which the authors obey as a result of their own upbringing, and partly in a psychological phenomenon which has itself hitherto eluded explanation. What I have in mind is the peculiar amnesia which, in the case of most people, though by to means all, hides the earliest beginnings of their childhood up to their sixth or eighth year. Hitherto it has not occurred to us to feel any astonishment at the fact of this amnesia, though we might have had good grounds for doing so. For we learn from other people that during these years, of which at a later date we retain nothing in our memory but a few unintelligible and fragmentary recollections, we reacted in a lively manner to impressions, that we were capable of expressing pain and joy in a human fashion, that we gave evidence of love, jealousy and other passionate feelings by which we were strongly moved at the time, and even that we gave utterance to remarks which were regarded by adults as good evidence of our possessing insight and the beginnings of a capacity for judgement. And of all this we, when we are grown up, have no knowledge of our own! Why should our memory lag so far behind the other activities of our minds? We have, on the contrary, good reason to believe that there is no period at which the capacity for receiving and reproducing impressions is greater than precisely during the years of childhood.¹

¹ I have attempted to solve one of the problems connected with the earliest memories of childhood in a paper on 'Screen Memories' (1899a). [Added 1924:] See also Chapter IV of my Psychopathology of Everyday Life (1901b).

[1905d, 1497]
Moreover, the connection between infantile and hysterical amnesia is more than a mere play upon words. Hysterical amnesia, which occurs at the bidding of repression, is only explicable by the fact that the subject is already in possession of a store of memory-traces which have been withdrawn from conscious disposal, and which are now, by an associative link, attracting to themselves the material which the forces of repression are engaged in repelling from consciousness.¹ It may be said that without infantile amnesia there would be no hysterical amnesia.
[1905d, 1498]

I believe, then, that infantile amnesia, which turns everyone's childhood into something like a prehistoric epoch and conceals from him the beginnings of his own sexual life, is responsible for the fact that in general no importance is attached to childhood in the development of sexual life. The gaps in our knowledge which have arisen in this way cannot be bridged by a single observer. As long ago as in the year 1896 I insisted on the significance of the years of childhood in the origin of certain important phenomena connected with sexual life, and since then I have never ceased to emphasize the part played in sexuality, by the infantile factor.
[1905d, 1498]

SECOND PHASE OF INFANTILE MASTURBATION    The masturbation of early infancy seems to disappear after a short time; but it may persist uninterruptedly until puberty, and this would constitute the first great deviation from the course of development laid down for civilized men. At some point of childhood after early infancy, as a rule before the fourth year, the sexual instinct belonging to the genital zone usually revives and persists again for a time until it is once more suppressed, or it may continue without interruption. This second phase of infantile sexual activity may assume a variety of different forms which can only be determined by a precise analysis of individual cases. But all its details leave behind the deepest (unconscious) impressions in the subject's memory, determine the development of his character, if he is to remain healthy, and the symptomatology of his neurosis, if he is to fall ill after puberty.¹ In the latter case we find that this sexual period has been forgotten and that the conscious memories that bear witness to it have been displaced. (I have already mentioned that I am also inclined to relate normal infantile amnesia to this infantile sexual activity.) Psychoanalytic investigation enables us to make what has been forgotten conscious and thus do away with a compulsion that arises from the unconscious psychical material.
[1905d, 1509]
Nevertheless, we feel a need to modify Spencer's notion, in part to give a more definite form to the ideas contained in it and in part to change them. We should say that laughter arises if a quota of psychical energy which has earlier been used for the cathexis of particular psychical paths has become unusable, so that it can find free discharge. We are well aware what 'evil looks' we are inviting with such a hypothesis; but we will venture to quote in our defence an opposite sentence from Lipps's book Komik und Humor (1898, 71), from which illumination is to be derived on more subjects than that of the comic and humour: 'Finally, specific psychological problems always lead fairly deep into psychology, so that at bottom no psychological problem can be treated in isolation.' The concepts of 'psychical energy' and 'discharge' and the treatment of psychical energy as a quantity have become habitual in my thoughts since I began to arrange the facts of psychopathology philosophically; and already in my Interpretation of Dreams (1900a) I tried (in the same sense as Lipps) to establish the fact that what are 'really psychically effective' are psychical processes which are unconscious in themselves, not the contents of consciousness.¹ It is only when I speak of the 'cathexis of psychical paths' that I seem to depart from the analogies commonly used by Lipps. My experiences of the displaceability of psychical energy along certain paths of association, and of the almost indestructible persistence of the traces of psychical processes, have in fact suggested to me an attempt at picturing the unknown in some such way. To avoid misunderstanding, I must add that I am making no attempt to proclaim that the cells and nerve fibres, or the systems of neurones which are taking their place to-day, are these psychical paths, even though it would have to be possible in some manner which cannot yet be indicated to represent such paths by organic elements of the nervous system.

[1905c, 1735]

¹ Apart from the dream-work and the technique of jokes, there is another kind of mental event in which I have been able to show that condensation is a regular and important process: namely the mechanism of normal (non-tendentious) forgetting. Unique impressions offer difficulties to forgetting; those that are analogous in any way are forgotten by being condensed in regard to their points of resemblance. Confusion between analogous impressions is one of the preliminary stages of forgetting.

[1905c, 1753]
With the young man, things had taken a different turn. Archaeology took hold of him and left him with an interest only in women of marble and bronze. His childhood friendship, instead of being strengthened into a passion, was dissolved, and his memories of it passed into such profound forgetfulness that he did not recognize or notice his early playmate when he met her in society. It is true that when we look further we may doubt whether 'forgetfulness' is the correct psychological description of the fate of these memories in our young archaeologist. There is a kind of forgetting which is distinguished by the difficulty with which the memory is awakened even by a powerful external summons, as though some internal resistance were struggling against its revival. A forgetting of this kind has been given the name of 'repression' in psychopathology; and the case which our author has put before us seems to be an example of this repression. Now we do not know in general whether the forgetting of an impression is linked with the dissolution of its memory-trace in the mind; but we can assert quite definitely of 'repression' that it does not coincide with the dissolution or extinction of the memory. What is repressed cannot, it is true, as a rule make its way into memory without more ado; but it retains a capacity for effective action, and, under the influence of some external event, it may one day bring about psychical consequences which can be regarded as products of a modification of the forgotten memory and as derivatives of it and which remain unintelligible unless we take this view of them. We have already seemed to recognize in Norbert Hanold's phantasies about Gradiva derivatives of his repressed memories of his childhood friendship with Zoe Bertgang. A return like this of what has been repressed is to be expected with particular regularity when a person's erotic feelings are attached to the repressed impressions - when his erotic life has been attacked by repression. In such cases the old Latin saying holds true, though it may have been coined first to apply to expulsion by external influences and not to internal conflicts: 'Naturam expelles furca, tamen usque recurret.'¹ But it does not tell us everything. It only informs us of the fact of the return of the piece of nature that has been repressed; it does not describe the highly remarkable manner of that return, which is accomplished by what seems like a piece of malicious treachery. It is precisely what was chosen as the instrument of repression - like the 'furca' of the Latin saying - that becomes the vehicle for the return: in and behind the repressing force, what is repressed proves itself victor in the end. This fact, which has been so little noticed and deserves so much consideration, is illustrated - more impressively than it could be by many examples - in a well known etching by Félicien Rops; and it is illustrated in the typical case of repression in the life of saints and penitents. An ascetic monk has fled, no doubt from the temptations of the world, to the image of the crucified Saviour. And now the cross sinks down like a shadow, and in its place, radiant, there rises instead the image of a voluptuous, naked woman, in the same crucified attitude. Other artists with less psychological insight have, in similar representations of temptation, shown Sin, insolent and triumphant, in some position alongside of the Saviour on the cross. Only Rops has placed Sin in the very place of the Saviour on the cross. He seems to have known that, when what has been repressed returns, it emerges from the repressing force itself.

[1907a, 1837]
That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.

If we apply knowledge gained elsewhere to this case of childhood neurosis, we shall not be able to avoid a suspicion that in this instance as in others (that is to say, before the child had reached his sixth year) there had been conflicts and repressions, which had themselves been overtaken by amnesia, but had left behind them as a residuum the particular content of this obsessive fear. Later on we shall learn how far it is possible for us to rediscover those forgotten experiences or to reconstruct them with some degree of certainty. In the meantime stress may be laid on the fact, which is probably more than a mere coincidence, that the patient's infantile amnesia ended precisely with his sixth year.

At the next session, which was the seventh, he took up the same subject once more. He could not believe, he said, that he had ever entertained such a wish against his father. He remembered a story of Sudermann's, he went on, that had made a deep impression upon him. In this story there was a woman who, as she sat by her sister's sick-bed, felt a wish that her sister should die so that she herself might marry her husband. The woman thereupon committed suicide, thinking she was not fit to live after being guilty of such baseness. He could understand this, he said, and it would be only right if his thoughts were the death of him, for he deserved nothing less.¹ - I remarked that it was well known to us that patients derived a certain satisfaction from their sufferings, so that in reality they all resisted their own recovery to some extent. He must never lose sight of the fact that a treatment like ours proceeded to the accompaniment of a constant resistance; I should be repeatedly reminding him of this fact.

The predilection felt by obsessional neurotics for uncertainty and doubt leads them to turn their thoughts by preference to those subjects upon which all mankind are uncertain and upon which our knowledge and judgements must necessarily remain open to doubt. The chief subjects of this kind are paternity, length of life, life after death, and memory - in the last of which we are all in the habit of believing, without having the slightest guarantee of its trustworthiness.¹
As Lichtenberg says, 'An astronomer knows whether the moon is inhabited or not with about as much certainty as he knows who was his father, but not with so much certainty as he knows who was his mother'. A great advance was made in civilization when men decided to put their inferences upon a level with the testimony of their senses and to make the step from matriarchy to patriarchy. The prehistoric figures which show a smaller person sitting upon the head of a larger one are representations of patrilineal descent; Athena had no mother, but sprang from the head of Zeus. A witness who testifies to something before a court of law is still called 'Zeuge' [literally, 'begetter'] in German, after the part played by the male in the act of procreation; so too in hieroglyphics the word for a 'witness' is written with a representation of the male organ.

In obsessional neuroses the uncertainty of memory is used to the fullest extent as a help in the formation of symptoms; and we shall learn directly the part played in the actual content of the patients' thoughts by the questions of length of life and life after death. But as an appropriate transition I will first consider one particular superstitious trait in our patient to which I have already alluded (p. 2176) and which will no doubt have puzzled more than one of my readers.

And when the obsessional patient lays his finger on the weak spot in the security of our mental life - on the untrustworthiness of our memory - the discovery enables him to extend his doubt over everything, even over actions which have already been performed and which have so far had no connection with the love-hatred complex, and over the entire past. I may recall the instance of the woman who had just bought a comb for her little daughter in a shop, and, becoming suspicious of her husband, began to doubt whether she had not as a matter of fact been in possession of the comb for a long time. Was not this woman saying point-blank: 'If I can doubt your love' (and this was only a projection of her doubt of her own love for him), 'then I can doubt this too, then I can doubt everything' - thus revealing to us the hidden meaning of neurotic doubt?

What we have here then is a childhood memory; and certainly one of the strangest sort. It is strange on account of its content and on account of the age to which it is assigned. That a person should be able to retain a memory of his suckling period is perhaps not impossible, but it cannot by any means be regarded as certain. What, however, this memory of Leonardo's asserts - namely that a vulture opened the child's mouth with its tail - sounds so improbable, so fabulous, that another view of it, which at a single stroke puts an end to both difficulties, has more to commend it to our judgement. On this view the scene with the vulture would not be a memory of Leonardo's but a phantasy, which he formed at a later date and transposed to his childhood.
In a friendly notice of this book Havelock Ellis (1910) has challenged the view put forward above. He objects that this memory of Leonardo’s may very well have had a basis of reality: since children’s memories often reach very much further back than is commonly supposed; the large bird in question need not of course have been a vulture. This is a point that I will gladly concede, and as a step towards lessening the difficulty I in turn will offer a suggestion - namely that his mother observed the large bird’s visit to her child - an event which may easily have had the significance of an omen in her eyes - and repeatedly told him about it afterwards. As a result, I suggest, he retained the memory of his mother’s story, and later, as so often happens, it became possible for him to take it for a memory of an experience of his own. However, this alteration does no damage to the force of my general account. It happens, indeed, as a general rule that the phantasies about their childhood which people construct at a late date are attached to trivial but real events of this early, and normally forgotten, period. There must thus have been some secret reason for bringing into prominence a real event of no importance and for elaborating it in the sort of way Leonardo did in his story of the bird, which he dubbed a vulture, and of its remarkable behaviour.

This is often the way in which childhood memories originate. Quite unlike conscious memories from the time of maturity, they are not fixed at the moment of being experienced and afterwards repeated, but are only elicited at a later age when childhood is already past; in the process they are altered and falsified, and are put into the service of later trends, so that generally speaking they cannot be sharply distinguished from phantasies. Their nature is perhaps best illustrated by a comparison with the way in which the writing of history originated among the peoples of antiquity. As long as a nation was small and weak it gave no thought to the writing of its history. Men tilled the soil of their land, fought for their existence against their neighbours, and tried to gain territory from them and to acquire wealth. It was an age of heroes, not of historians. Then came another age, an age of reflection: men felt themselves to be rich and powerful, and now felt a need to learn where they had come from and how they had developed. Historical writing, which had begun to keep a continuous record of the present, now also cast a glance back to the past, gathered traditions and legends, interpreted the traces of antiquity that survived in customs and usages, and in this way created a history of the past. It was inevitable that this early history should have been an expression of present beliefs and wishes rather than a true picture of the past; for many things had been dropped from the nation’s memory, while others were distorted, and some remains of the past were given a wrong interpretation in order to fit in with contemporary ideas. Moreover people’s motive for writing history was not objective curiosity but a desire to influence their contemporaries, to encourage and inspire them, or to hold a mirror up before them. A man’s conscious memory of the events of his maturity is in every way comparable to the first kind of historical writing; while the memories that he has of his childhood correspond, as far as their origins and reliability are concerned, to the history of a nation’s earliest days, which was compiled later and for tendentious reasons.
If, then, Leonardo’s story about the vulture that visited him in his cradle is only a phantasy from a later period, one might suppose it could hardly be worth while spending much time on it. One might be satisfied with explaining it on the basis of his inclination, of which he makes no secret, to regard his preoccupation with the flight of birds as pre-ordained by destiny. Yet in underrating this story one would be committing just as great an injustice as if one were carelessly to reject the body of legends, traditions and interpretations found in a nation’s early history. In spite of all the distortions and misunderstandings, they still represent the reality of the past: they are what a people forms out of the experience of its early days and under the dominance of motives that were once powerful and still operate to-day; and if it were only possible, by a knowledge of all the forces at work, to undo these distortions, there would be no difficulty in disclosing the historical truth lying behind the legendary material. The same holds good for the childhood memories or phantasies of an individual. What someone thinks he remembers from his childhood is not a matter of indifference; as a rule the residual memories - which he himself does not understand - cloak priceless pieces of evidence about the most important features in his mental development.¹ As we now possess in the techniques of psycho-analysis excellent methods for helping us to bring this concealed material to light, we may venture to fill in the gap in Leonardo's life story by analysing his childhood phantasy. And if in doing so we remain dissatisfied with the degree of certainty which we achieve, we shall have to console ourselves with the reflection that so many other studies of this great and enigmatic man have met with no better fate.

¹ [Footnote added 1919:] Since I wrote the above words I have attempted to make similar use of an unintelligible memory dating from the childhood of another man of genius. In the account of his life that Goethe wrote when he was about sixty (’Dichtung und Warheit’) there is a description in the first few pages of how, with the encouragement of his neighbours, he slung first some small and then some large pieces of crockery out of the window into the street, so that they were smashed to pieces. This is, indeed, the only scene that he reports from the earliest years of childhood. The sheer inconsequentiality of its content, the way in which it corresponded with the childhood memories of other human beings who did not become particularly great, and the absence in this passage of any mention of the young brother who was born when Goethe was three and three-quarters, and who died when he was nearly ten - all this induced me to undertake an analysis of this childhood memory. (This child is in fact mentioned at a later point in the book, where Goethe dwells on the many illnesses of childhood.) I hoped to be able as a result to replace it by something which would be more in keeping with the context of Goethe's account and whose content would make it worthy of preservation and of the place he has given it in the history of his life. The short analysis made it possible for the throwing-out of the crockery to be recognized as a magical act directed against a troublesome intruder; and at the place in the book where he describes the episode the intention is to triumph over the fact that a second son was not in the long run permitted to disturb Goethe's close relation with his mother. If the earliest memory of childhood, preserved in disguises such as these, should be concerned - in Goethe's case as well as in Leonardo's - with the mother, what would be so surprising in that? 

[1910c, 2261]
Our aim in dissecting a childhood phantasy is to separate the real memory that it contains from the later motives that modify and distort it. In Leonardo’s case we believe that we now know the real content of the phantasy: the replacement of his mother by the vulture indicates that the child was aware of his father’s absence and found himself alone with his mother. The fact of Leonardo's illegitimate birth is in harmony with his vulture phantasy; it was only on this account that he could compare himself to a vulture-child. But the next reliable fact that we possess about his youth is that by the time he was five he had been received into his father’s household. We are completely ignorant when that happened - whether it was a few months after his birth or whether it was a few weeks before the drawing-up of the land-register. It is here that the interpretation of the vulture phantasy comes in: Leonardo, it seems to tell us, spent the critical first years of his life not by the side of his father and stepmother, but with his poor, forsaken, real mother, so that he had time to feel the absence of his father. This seems a slender and yet a somewhat daring conclusion to have emerged from our psycho-analytic efforts, but its significance will increase as we continue our investigation. Its certainty is reinforced when we consider the circumstances that did in fact operate in Leonardo’s childhood. In the same year that Leonardo was born, the sources tell us, his father, Ser Piero da Vinci, married Donna Albiera, a lady of good birth; it was to the childlessness of this marriage that the boy owed his reception into his father’s (or rather his grandfather’s) house - an event which had taken place by the time he was five years old, as the document attests. Now it is not usual at the start of a marriage to put an illegitimate offspring into the care of the young bride who still expects to be blessed with children of her own. Years of disappointment must surely first have elapsed before it was decided to adopt the illegitimate child - who had probably grown up an attractive young boy - as a compensation for the absence of the legitimate children that had been hoped for. It fits in best with the interpretation of the vulture phantasy if at least three years of Leonardo’s life, and perhaps five, had elapsed before he could exchange the solitary person of his mother for a parental couple. And by then it was too late. In the first three or four years of life certain impressions become fixed and ways of reacting to the outside world are established which can never be deprived of their importance by later experiences.

If it is true that the unintelligible memories of a person's childhood and the phantasies that are built on them invariably emphasize the most important elements in his mental development, then it follows that the fact which the vulture phantasy confirms, namely that Leonardo spent the first years of his life alone with his mother, will have been of decisive influence in the formation of his inner life. An inevitable effect of this state of affairs was that the child - who was confronted in his early life with one problem more than other children - began to brood on this riddle with special intensity, and so at a tender age became a researcher, tormented as he was by the great question of where babies come from and what the father has to do with their origin. It was a vague suspicion that his researches and the history of his childhood were connected in this way which later prompted him to exclaim that he had been destined from the first to investigate the problem of the flight of birds since he had been visited by a vulture as he lay in his cradle. Later on it will not be difficult to show how his curiosity about the flight of birds was derived from the sexual researches of his childhood.
People will not reach a proper understanding of the activities of children's sexuality and will probably take refuge in declaring that what has been said here is incredible, so long as they cling to the attitude taken up by our civilization of depreciating the genitals and the sexual functions. To understand the mental life of children we require analogies from primitive times. Through a long series of generations the genitals have been for us the 'pudenda', objects of shame, and even (as a result of further successful sexual repression) of disgust. If one makes a broad survey of the sexual life of our time and in particular of the classes who sustain human civilization, one is tempted to declare that it is only with reluctance that the majority of those alive to-day obey the command to propagate their kind; they feel that their dignity as human beings suffers and is degraded in the process. What is to be found among us in the way of another view of sexual life is confined to the uncultivated lower strata of society; among the higher and more refined classes it is concealed, since it is considered culturally inferior, and it ventures to put itself into practice only in the face of a bad conscience. In the primaeval days of the human race it was a different story. The laborious compilations of the student of civilization provide convincing evidence that originally the genitals were the pride and hope of living beings; they were worshipped as gods and transmitted the divine nature of their functions to all newly learned human activities. As a result of the sublimation of their basic nature there arose innumerable divinities; and at the time when the connection between official religions and sexual activity was already hidden from the general consciousness, secret cults devoted themselves to keeping it alive among a number of initiates. In the course of cultural development so much of the divine and sacred was ultimately extracted from sexuality that the exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all mental traces, it is surely not surprising that even the most primitive forms of genital-worship can be shown to have existed in very recent times and that the language, customs and superstitions of mankind to-day contain survivals from every phase of this process of development.²

At this point a little reflection will remind us that we ought not to feel satisfied yet with the way the vulture's tail in Leonardo's childhood phantasy has been explained. Something more seems to be contained in it which we do not yet understand. Its most striking feature, after all, was that it changed sucking at the mother's breast into being suckled, that is, into passivity, and thus into a situation whose nature is undoubtedly homosexual. When we remember the historical probability of Leonardo having behaved in his life as one who was emotionally homosexual, the question is forced upon us whether this phantasy does not indicate the existence of a causal connection between Leonardo's relation with his mother in childhood and his later manifest, if ideal, homosexuality. We should not venture to infer a connection of this sort from Leonardo's distorted reminiscence if we did not know from the psycho-analytic study of homosexual patients that such a connection does exist and is in fact an intimate and necessary one. [1910c, 2273]
At this point I will interpolate a few remarks which every analyst has found confirmed in his observations. Forgetting impressions, scenes or experiences nearly always reduces itself to shutting them off. When the patient talks about these 'forgotten' things he seldom fails to add: 'As a matter of fact I've always known it; only I've never thought of it.' He often expresses disappointment at the fact that not enough things come into his head that he can call 'forgotten' - that he has never thought of since they happened. Nevertheless, even this desire is fulfilled, especially in the case of conversion hysterias. 'Forgetting' becomes still further restricted when we assess at their true value the screen memories which are so generally present. In some cases I have had an impression that the familiar childhood amnesia, which is theoretically so important to us, is completely counterbalanced by screen memories. Not only some but all of what is essential from childhood has been retained in these memories. It is simply a question of knowing how to extract it out of them by analysis. They represent the forgotten years of childhood as adequately as the manifest content of a dream represents the dream-thoughts.

The other group of psychical processes - phantasies, processes of reference, emotional impulses, thought-connections - which, as purely internal acts, can be contrasted with impressions and experiences, must, in their relation to forgetting and remembering, be considered separately. In these processes it particularly often happens that something is 'remembered' which could never have been 'forgotten' because it was never at any time noticed - was never conscious. As regards the course taken by psychical events it seems to make no difference whatever whether such a 'thought-connection' was conscious and then forgotten or whether it never managed to become conscious at all. The conviction which the patient obtains in the course of his analysis is quite independent of this kind of memory.

The increased significance of external reality heightened the importance, too, of the sense-organs that are directed towards that external world, and of the consciousness attached to them. Consciousness now learned to comprehend sensory qualities in addition to the qualities of pleasure and unpleasure which hitherto had alone been of interest to it. A special function was instituted which had periodically to search the external world, in order that its data might be familiar already if an urgent internal need should arise - the function of attention. Its activity meets the sense-impressions half way, instead of awaiting their appearance. At the same time, probably, a system of notation was introduced, whose task it was to lay down the results of this periodical activity of consciousness - a part of what we call memory.

There is another question that I might draw your attention to, which has been dealt with too little in our discussions: that of 'unconscious' masturbation. I mean masturbation during sleep, during abnormal states, or fits. You will recall the many hysterical fits in which masturbatory acts recur in a disguised or unrecognizable way, after the subject has renounced that form of satisfaction, and the many symptoms in obsessional neurosis which seek to replace and repeat this kind of sexual activity, which has formerly been forbidden. We may also speak of a therapeutic return of masturbation. A number of you will have found on occasion, as I have, that it represents a great advance if during the treatment the patient ventures to take up masturbation once more, though he may have no intention of making a permanent stop at that infantile halting-place. In this connection I may remind you that a considerable number of precisely the most severe sufferers from neurosis have avoided all recollection of masturbation during historic times, while psycho-analysis is able to prove that that species of sexual activity had by no means been strange to them during the forgotten earliest period of their lives.
In our clinical history of a case we have insisted that the imposition of the prohibition in very early childhood is the determining point; a similar importance attaches in the subsequent developments to the mechanism of repression at the same early age. As a result of the repression which has been enforced and which involves a loss of memory - an amnesia - the motives for the prohibition (which is conscious) remain unknown; and all attempts at disposing of it by intellectual processes must fail, since they cannot find any base of attack. The prohibition owes its strength and its obsessive character precisely to its unconscious opponent, the concealed and undiminished desire - that is to say, to an internal necessity inaccessible to conscious inspection. The ease with which the prohibition can be transferred and extended reflects a process which falls in with the unconscious desire and is greatly facilitated by the psychological conditions that prevail in the unconscious. The instinctual desire is constantly shifting in order to escape from the impasse and endeavours to find substitutes - substitute objects and substitute acts - in place of the prohibited ones. In consequence of this, the prohibition itself shifts about as well, and extends to any new aims which the forbidden impulse may adopt. Any fresh advance made by the repressed libido is answered by a fresh sharpening of the prohibition. The mutual inhibition of the two conflicting forces produces a need for discharge, for reducing the prevailing tension; and to this may be attributed the reason for the performance of obsessive acts. In the case of a neurosis these are clearly compromise actions: from one point of view they are evidences of remorse, efforts at expiation, and so on, while on the other hand they are at the same time substitutive acts to compensate the instinct for what has been prohibited. It is a law of neurotic illness that these obsessive acts fall more and more under the sway of the instinct and approach nearer and nearer to the activity which was originally prohibited.

[1912-1913, 2678]

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913], 2804

Psycho-analysis has been obliged to derive the mental life of adults from that of children, and has had to take seriously the old saying that the child is father to the man. It has traced the continuity between the infantile and adult mind, and has also noted the transformations and rearrangements that occur in the process. In most of us there is a gap in our memories covering the first years of our childhood, of which only a few fragmentary recollections survive. Psycho-analysis may be said to have filled in this gap and to have abolished man's infantile amnesia. (See the section on 'Educational Interest' below.)

[1913], 2819
Some notable discoveries have been made in the course of this investigation of the infantile mind. Thus it has been possible to confirm, what has often already been suspected, the extraordinarily important influence exerted by the impressions of childhood (and particularly by its earliest years) on the whole course of later development. This brings us up against a psychological paradox - which for psycho-analysts alone is no paradox - that it is precisely these most important of all impressions that are not remembered in later years. Psycho-analysis has been able to establish the decisive and indestructible character of these earliest experiences in the clearest possible way in the case of sexual life. 'On revient toujours à ses premiers amours' is sober truth. The many riddles in the sexual life of adults can only be solved if stress is laid on the infantile factors in love. Theoretical light is thrown on their influence by the consideration that an individual's first experiences in childhood do not occur only by chance but also correspond to the first activities of his innate or constitutional instinctual dispositions.

The overmastering interest which must be felt in psycho-analysis by the theory of education is based upon a fact which has become evident. Only someone who can feel his way into the minds of children can be capable of educating them; and we grown-up people cannot understand children because we no longer understand our own childhood. Our infantile amnesia proves that we have grown estranged from our childhood. Psycho-analysis has brought to light the wishes, the thought structures and the developmental processes of childhood. All earlier attempts in this direction have been in the highest degree incomplete and misleading because they have entirely overlooked the inestimably important factor of sexuality in its physical and mental manifestations. The incredulous astonishment which meets the most certainly established findings of psycho-analysis on the subject of childhood - the Oedipus complex, self-love (or 'narcissism'), the disposition to perversions, anal erotism, sexual curiosity - is a measure of the gulf which separates our mental life, our judgements of value and, indeed, our processes of thought from those of even normal children.

It not infrequently happens in the course of an analytic treatment that the patient, after reporting some fact that he has remembered, will go on to say: 'But I've told you that already' - while the analyst himself feels sure that this is the first time he has heard the story. If the patient is contradicted upon the point, he will often protest with energy that he is perfectly certain he is right, that he is ready to swear to it, and so on; while the analyst's own conviction that what he has heard is new to him will become correspondingly stronger. To try to decide the dispute by shouting the patient down or by outvying him in protestations would be a most unpsychological proceeding. It is familiar ground that a sense of conviction of the accuracy of one's memory has no objective value; and, since one of the two persons concerned must necessarily be in the wrong, it may just as well be the physician as the patient who has fallen a victim to a paramnesia. The analyst will admit as much to the patient, will break off the argument, and will postpone a settlement of the point until some later occasion.

In a minority of cases the analyst himself will then recollect that he has already heard the piece of information under dispute, and will at the same time discover the subjective, and often far-fetched, reason which led to this temporary forgetfulness. But in the great majority of cases it is the patient who turns out to have been mistaken; and he can be brought to recognize the fact. The explanation of this frequent occurrence appears to be that the patient really had an intention of giving this information, that once or even several times he actually made some remark leading up to it, but that he was then prevented by resistance from carrying out his purpose, and afterwards confused a recollection of his intention with a recollection of its performance.
The forgetting of impressions and experiences demonstrates much more clearly and exclusively than the forgetting of names the operation of the purpose of keeping disagreeable things out of memory. The whole field of this kind of forgetting does not, of course, fall within the class of parapraxes, but only such cases as, measured by the standard of our usual experience, seem to us striking and unjustified: for instance, when the forgetting affects impressions that are too fresh or important, or when the missing memory tears a gap in what is otherwise a well remembered chain of events. Why and in what way we are able to forget in general, and among other things experiences which have certainly left the deepest impression upon us, such as the events of our earliest childhood years, - that is quite another problem, in which fending off unpleasurable impulses plays a certain part but is far from being the whole explanation. It is an undoubted fact that disagreeable impressions are easily forgotten. Various psychologists have noticed it and the great Darwin was so much impressed by it that he made it 'a golden rule' to note down with especial care any observations which seemed unfavourable to his theory, since he had convinced himself that precisely they would not remain in his memory.

[1916-1917, 3181]

A person who hears for the first time of this principle of the fending off of unpleasurable memories by forgetting rarely fails to object that on the contrary it has been his experience that distressing things are particularly hard to forget but keep on returning to torment him against his will - memories, for instance, of insults and humiliations. This is also a true fact, but the objection is not to the point. It is important to begin in good time to reckon with the fact that mental life is the arena and battle-ground for mutually opposing purposes or, to put it non-dynamically, that it consists of contradictions and pairs of contraries. Proof of the existence of a particular purpose is no argument against the existence of an opposite one; there is room for both. It is only a question of the attitude of these contraries to each other, and of what effects are produced by the one and by the other.

[1916-1917, 3181]

This, however, is not the only archaic characteristic of dreams. You are all familiar, of course, from your own experience, with the remarkable amnesia of childhood. I mean the fact that the earliest years of life, up to the age of five, six or eight, have not left behind them traces in our memory like later experiences. Here and there, it is true, we come upon people who can boast of a continuous memory from the first beginnings to the present day; but the other alternative, of gaps in the memory, is by far the more frequent. There has not, in my opinion, been enough astonishment over this fact. By the time a child is two he can speak well, and soon shows that he is at home in complicated mental situations; and he makes remarks which, if they are reported to him many years later, he himself will have forgotten. Moreover, the memory is more efficient at an early age, since it is less overburdened than it is later. Nor is there any reason for regarding the function of memory as a particularly high or difficult mental activity; on the contrary, we can find a good memory in people of very low intellectual standing.

[1916-1917, 3290]
A second remarkable fact to which I must draw your attention, and which comes on top of the first one, is that out of the void of memories that covers the earliest years of childhood there stand out a few well-preserved recollections, mostly perceived in plastic form, which cannot justify their survival. Our memory deals with the material of the impressions which impinge on us in later life by making a selection among them. It retains what is of any importance and drops what is unimportant. But this is not true of the childhood memories that have been retained. They do not necessarily correspond to the important experiences of childhood years, nor even to those which must have seemed important from the child's point of view. They are often so commonplace and insignificant that we can only ask ourselves in astonishment why this particular detail has escaped oblivion. I attempted long ago, with the help of analysis, to attack the enigma of childhood amnesia and of the residual memories which interrupt it, and I arrived at the conclusion that even in the case of children it is true in spite of everything that only what is important remains in the memory. But through the processes, already familiar to you, of condensation and more especially of displacement, what is important is replaced in memory by something else which appears unimportant. For this reason I have called these childhood memories 'screen memories', and with a thorough analysis everything that has been forgotten can be extracted from them.

[1916-1917, 3290]

A disturbance of memory of this kind is enough for obsessional neurosis; but the case is different with hysteria. As a rule the latter neurosis is marked by amnesias on a really large scale. In analysing each separate hysterical symptom one is usually led to a whole chain of impressions of events, which, when they recur, are expressly described by the patient as having been till then forgotten. On the one hand, this chain reaches back to the earliest years of life, so that the hysterical amnesia can be recognized as an immediate continuation of the infantile amnesia which, for us normal people, conceals the beginnings of our mental life. On the other hand, we learn with astonishment that even the patient's most recent experiences can be subject to forgetting, and that the occasions which precipitated the outbreak of the illness or led to its intensification are in particular encroached upon, if not completely swallowed up, by amnesia. It regularly happens that important details have disappeared from the total picture of a recent recollection of this sort or that they have been replaced by falsifications of memory. Indeed it happens with almost equal regularity that certain memories of recent experiences only emerge shortly before the end of an analysis - memories which had been held back till that late moment and had left perceptible gaps in the continuity of the case.

[1916-1917, 3360]

Children are alone in not falling in with these conventions. They assert their animal rights with complete naïveté and give constant evidence that they have still to travel the road to purity. Strangely enough, the people who deny the existence of sexuality in children do not on that account become milder in their educational efforts but pursue the manifestations of what they deny exists with the utmost severity - describing them as 'childish naughtinesses'. It is also of the highest theoretical interest that the period of life which contradicts the prejudice of an asexual childhood most glaringly - the years of a child's life up to the age of five or six - is afterwards covered in most people by the veil of amnesia which is only completely torn away by an analytic enquiry, though it has been permeable earlier for the construction of a few dreams.

[1916-1917, 3383]
From about the sixth to the eighth year of life onwards, we can observe a halt and retrogression in sexual development, which, in cases where it is most propitious culturally, deserves to be called a period of latency. The latency period may also be absent: it need not bring with it any interruption of sexual activity and sexual interests along the whole line. The majority of experiences and mental impulses before the start of the latency period now fall victim to infantile amnesia - the forgetting (already discussed by us) which veils our earliest youth from us and makes us strangers to it. The task is set us in every psycho-analysis of bringing this forgotten period back into memory. It is impossible to avoid a suspicion that the beginnings of sexual life which are included in that period have provided the motive for its being forgotten - that this forgetting, in fact, is an outcome of repression.

The processes of finding an object are fairly complex and no comprehensive account has hitherto been given of them. For our purposes it may be specially pointed out that when, in the years of childhood before puberty, the process has in some respects reached a conclusion, the object that has been found turns out to be almost identical with the first object of the oral pleasure-instinct, which was reached by attachment. Though it is not actually the mother's breast, at least it is the mother. We call the mother the first love-object. For we speak of love when we bring the mental side of the sexual trends into the foreground and want to force back the underlying physical or 'sensual' instinctual demands or to forget them for a moment. At the time at which the child's mother becomes his love-object the psychical work of repression has already begun in him, which is withdrawing from his knowledge awareness of a part of his sexual aims. To his choice of his mother as a love-object the psychical work of repression has already begun in him, which is withdrawing from his knowledge awareness of a part of his sexual aims. To his choice of his mother as a love-object everything becomes attached which, under the name of the 'Oedipus complex', has attained so much importance in the psycho-analytic explanation of the neuroses and has played no less a part, perhaps, in the resistance to psycho-analysis.

I have warned you that we still have something new to learn; it is indeed something surprising and perplexing. By means of analysis, as you know, starting from the symptoms, we arrive at a knowledge of the infantile experiences to which the libido is fixated and out of which the symptoms are made. Well, the surprise lies in the fact that these scenes from infancy are not always true. Indeed, they are not true in the majority of cases, and in a few of them they are the direct opposite of the historical truth. As you will see, this discovery is calculated more than any other to discredit either analysis, which has led to this result, or the patients, on whose statements the analysis and our whole understanding of the neuroses are founded. But there is something else remarkably perplexing about it. If the infantile experiences brought to light by analysis were invariably real, we should feel that we were standing on firm ground; if they were regularly falsified and revealed as inventions, as phantasies of the patient, we should be obliged to abandon this shaky ground and look for salvation elsewhere. But neither of these things is the case: the position can be shown to be that the childhood experiences constructed or remembered in analysis are sometimes indisputably false and sometimes equally certainly correct, and in most cases compounded of truth and falsehood. Sometimes, then, symptoms represent events which really took place and to which we may attribute an influence on the fixation of the libido, and sometimes they represent phantasies of the patient's which are not, of course, suited to playing an aetiological role. It is difficult to find one's way about in this. We can make a first start, perhaps, with a similar discovery - namely, that the isolated childhood memories that people have possessed consciously from time immemorial and before there was any such thing as analysis may equally be falsified or at least may combine truth and falsehood in plenty. In their case there is seldom any difficulty in showing their incorrectness; so we at least have the reassurance of knowing that the responsibility for this unexpected disappointment lies, not with analysis, but in some way with the patients.
My description will therefore deal with an infantile neurosis which was analysed not while it actually existed, but only fifteen years after its termination. This state of things has its advantages as well as its disadvantages in comparison with the alternative. An analysis which is conducted upon a neurotic child itself must, as a matter of course, appear to be more trustworthy, but it cannot be very rich in material; too many words and thoughts have to be lent to the child, and even so the deepest strata may turn out to be impenetrable to consciousness. An analysis of a childhood disorder through the medium of recollection in an intellectually mature adult is free from these limitations; but it necessitates our taking into account the distortion and refurbishing to which a person's own past is subjected when it is looked back upon from a later period. The first alternative perhaps gives the more convincing results; the second is by far the more instructive.

I am anxious not to be misunderstood. Every analyst knows - and he has met with the experience on countless occasions - that in the course of a successful treatment the patient brings up a large number of spontaneous recollections from his childhood, for the appearance of which (a first appearance, perhaps) the physician feels himself entirely blameless, since he has not made any attempt at a construction which could have put any material of the sort into the patient's head. It does not necessarily follow that these previously unconscious recollections are always true. They may be; but they are often distorted from the truth, and interspersed with imaginary elements, just like the so-called screen memories which are preserved spontaneously. All that I mean to say is this: scenes, like this one in my present patient's case, which date from such an early period and exhibit a similar content, and which further lay claim to such an extraordinary significance for the history of the case, are as a rule not reproduced as recollections, but have to be divined - constructed - gradually and laboriously from an aggregate of indications. Moreover, it would be sufficient for the purposes of the argument if my admission that scenes of this kind do not become conscious in the shape of recollections applied only to cases of obsessional neurosis, or even if I were to limit my assertion to the case which we are studying here.

In every psycho-analytic investigation of a life-history it is always possible to explain the meaning of the earliest childhood memories along these lines. Indeed, it usually happens that the very recollection to which the patient gives precedence, which he relates first, with which he introduces the story of his life, proves to be the most important, the very one that holds the key to the secret pages of his mind. But the little childish episode related in Dichtung und Wahrheit does not rise to our expectations. The ways and means that with our patients lead to interpretation are of course not available to us here; the episode does not seem in itself to admit of any traceable connection with important impressions at a later date. A mischievous trick with damaging effects on the household economy, carried out under the spur of outside encouragement, is certainly no fitting headpiece for all that Goethe has to tell us of his richly filled life. An impression of utter innocence and irrelevance clings to this childish memory, and it might be taken as a warning not to stretch the claims of psycho-analysis too far nor to apply it in unsuitable places.
Strictly considered - and why should this question not be considered with all possible strictness? analytic work deserves to be recognized as genuine psycho-analysis only when it has succeeded in removing the amnesia which conceals from the adult his knowledge of his childhood from its beginning (that is, from about the second to the fifth year). This cannot be said among analysts too emphatically or repeated too often. The motives for disregarding this reminder are, indeed, intelligible. It would be desirable to obtain practical results in a shorter period and with less trouble. But at the present time theoretical knowledge is still far more important to all of us than therapeutic success, and anyone who neglects childhood analysis is bound to fall into the most disastrous errors. The emphasis which is laid here upon the importance of the earliest experiences does not imply any underestimation of the influence of later ones. But the later impressions of life speak loudly enough through the mouth of the patient, while it is the physician who has to raise his voice on behalf of the claims of childhood. [1919e, 3646]

There can, indeed, be no doubt that there are such things as prophetic dreams, in the sense that their content gives some sort of picture of the future; the only question is whether these predictions coincide to any noticeable extent with what really happens subsequently. I must confess that upon this point my resolution in favour of impartiality deserts me. The notion that there is any mental power, apart from acute calculation, which can foresee future events in detail is on the one hand too much in contradiction to all the expectations and presumptions of science and on the other hand corresponds too closely to certain ancient and familiar human desires which criticism must reject as unjustifiable pretensions. I am therefore of opinion that after one has taken into account the untrustworthiness, credulity and unconvincingness of most of these reports, together with the possibility of falsifications of memory facilitated by emotional causes and the inevitability of a few lucky shots, it may be anticipated that the spectre of veridical prophetic dreams will disappear into nothing. Personally, I have never experienced anything or learnt of anything that could encourage a more favourable presumption. [1925i, 4053]

By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions. [1925e, 4128]
If I distrust my memory - neurotics, as we know, do so to a remarkable extent, but normal people have every reason for doing so as well - I am able to supplement and guarantee its working by making a note in writing. In that case the surface upon which this note is preserved, the pocket-book or sheet of paper, is as it were a materialized portion of my mnemic apparatus, which I otherwise carry about with me invisible. I have only to bear in mind the place where this 'memory' has been deposited and I can then 'reproduce' it at any time I like, with the certainty that it will have remained unaltered and so have escaped the possible distortions to which it might have been subjected in my actual memory.

[1925a, 4133]

All the forms of auxiliary apparatus which we have invented for the improvement or intensification of our sensory functions are built on the same model as the sense organs themselves or portions of them: for instance, spectacles, photographic cameras, ear-trumpets. Measured by this standard, devices to aid our memory seem particularly imperfect, since our mental apparatus accomplishes precisely what they cannot: it has an unlimited receptive capacity for new perceptions and nevertheless lays down permanent - even though not unalterable - memory-traces of them. As long ago as in 1900 I gave expression in The Interpretation of Dreams to a suspicion that this unusual capacity was to be divided between two different systems (or organs of the mental apparatus). According to this view, we possess a system Pcpt.-Cs., which receives perceptions but retains no permanent trace of them, so that it can react like a clean sheet to every new perception; while the permanent traces of the excitations which have been received are preserved in 'mnemic systems' lying behind the perceptual system. Later, in Beyond the Pleasure Principle (1920g), I added a remark to the effect that the inexplicable phenomenon of consciousness arises in the perceptual system instead of the permanent traces.

[1925a, 4134]

The analogy would not be of much value if it could not be pursued further than this. If we lift the entire covering-sheet - both the celluloid and the waxed paper - off the wax slab, the writing vanishes and, as I have already remarked, does not re-appear again. The surface of the Mystic Pad is clear of writing and once more capable of receiving impressions. But it is easy to discover that the permanent trace of what was written is retained upon the wax slab itself and is legible in suitable lights. Thus the Pad provides not only a receptive surface that can be used over and over again, like a slate, but also permanent traces of what has been written, like an ordinary paper pad: it solves the problem of combining the two functions by dividing them between two separate but interrelated component parts or systems. But this is precisely the way in which, according to the hypothesis which I mentioned just now, our mental apparatus performs its perceptual function. The layer which receives the stimuli - the system Pcpt.-Cs. - forms no permanent traces; the foundations of memory come about in other, adjoining, systems.

[1925a, 4136]

We need not be disturbed by the fact that in the Mystic Pad no use is made of the permanent traces of the notes that have been received; it is enough that they are present. There must come a point at which the analogy between an auxiliary apparatus of this kind and the organ which is its prototype will cease to apply. It is true, too, that once the writing has been erased, the Mystic Pad cannot 'reproduce' it from within; it would be a mystic pad indeed if, like our memory, it could accomplish that. None the less, I do not think it is too far-fetched to compare the celluloid and waxed paper cover with the system Pcpt.-Cs. and its protective shield, the wax slab with the unconscious behind them, and the appearance and disappearance of the writing with the flickering-up and passing-away of consciousness in the process of perception.

[1925a, 4136]
But I must admit that I am inclined to press the comparison still further. On the Mystic Pad the writing vanishes every time the close contact is broken between the paper which receives the stimulus and the wax slab which preserves the impression. This agrees with a notion which I have long had about the method by which the perceptual apparatus of our mind functions, but which I have hitherto kept to myself. My theory was that cathetic innervations are sent out and withdrawn in rapid periodic impulses from within into the completely pervious system \textit{Pcpt.-Cs}. So long as that system is cathectized in this manner, it receives perceptions (which are accompanied by consciousness) and passes the excitation on to the unconscious mnemic systems; but as soon as the cathexis is withdrawn, consciousness is extinguished and the functioning of the system comes to a standstill. It is as though the unconscious stretches out feelers, through the medium of the system \textit{Pcpt.-Cs.}, towards the external world and hastily withdraws them as soon as they have sampled the excitations coming from it. Thus the interruptions, which in the case of the Mystic Pad have an external origin, were ascribed by my hypothesis to the discontinuity in the current of innervation; and the actual breaking of contact which occurs in the Mystic Pad was replaced in my theory by the periodic non-excitability of the perceptual system. I further had a suspicion that this discontinuous method of functioning of the system \textit{Pcpt.-Cs.} lies at the bottom of the origin of the concept of time.

If we imagine one hand writing upon the surface of the Mystic Writing-Pad while another periodically raises its covering-sheet from the wax slab, we shall have a concrete representation of the way in which I tried to picture the functioning of the perceptual apparatus of our mind.

The other sort of decision made by the function of judgement - as to the real existence of something of which there is a presentation (reality-testing) - is a concern of the definitive reality-ego, which develops out of the initial pleasure-ego. It is now no longer a question of whether what has been perceived (a thing) shall be taken into the ego or not, but of whether something which is in the ego as a presentation can be rediscovered in perception (reality) as well. It is, we see, once more a question of \textit{external} and \textit{internal}. What is unreal, merely a presentation and subjective, is only \textit{internal}; what is real is also there \textit{outside}. In this stage of development regard for the pleasure principle has been set aside. Experience has shown the subject that it is not only important whether a thing (an object of satisfaction for him) possesses the 'good' attribute and so deserves to be taken into his ego, but also whether it is there in the external world, so that he can get hold of it whenever he needs it. In order to understand this step forward we must recollect that all presentations originate from perceptions and are repetitions of them. Thus originally the mere existence of a presentation was a guarantee of the reality of what was presented. The antithesis between subjective and objective does not exist from the first. It only comes into being from the fact that thinking possesses the capacity to bring before the mind once more something that has once been perceived, by reproducing it as a presentation without the external object having still to be there. The first and immediate aim, therefore, of reality-testing is, not to \textit{find} an object in real perception which corresponds to the one presented, but to \textit{refind} such an object, to convince oneself that it is still there. Another capacity of the power of thinking offers a further contribution to the differentiation between what is subjective and what is objective. The reproduction of a perception as a presentation is not always a faithful one; it may be modified by omissions, or changed by the merging of various elements. In that case, reality-testing has to ascertain how far such distortions go. But it is evident that a precondition for the setting up of reality-testing is that objects shall have been lost which once brought real satisfaction.
I have already mentioned that my investigation of the precipitating and underlying causes of the neuroses led me more and more frequently to conflicts between the subject's sexual impulses and his resistances to sexuality. In my search for the pathogenic situations in which the repressions of sexuality had set in and in which the symptoms, as substitutes for what was repressed, had had their origin, I was carried further and further back into the patient's life and ended by reaching the first years of his childhood. What poets and students of human nature had always asserted turned out to be true: the impressions of that early period of life, though they were for the most part buried in amnesia, left ineradicable traces upon the individual's growth and in particular laid down the disposition to any nervous disorder that was to follow. But since these experiences of childhood were always concerned with sexual excitations and the reaction against them, I found myself faced by the fact of infantile sexuality - once again a novelty and a contradiction of one of the strongest of human prejudices. Childhood was looked upon as 'innocent' and free from the lusts of sex, and the fight with the demon of 'sensuality' was not thought to begin until the troubled age of puberty. Such occasional sexual activities as it had been impossible to overlook in children were put down as signs of degeneracy or premature depravity or as a curious freak of nature. Few of the findings of psycho-analysis have met with such universal contradiction or have aroused such an outburst of indignation as the assertion that the sexual function starts at the beginning of life and reveals its presence by important signs even in childhood. And yet no other finding of analysis can be demonstrated so easily and so completely.

[1925d, 4209]

My surprising discoveries as to the sexuality of children were made in the first instance through the analysis of adults. But later (from about 1908 onwards) it became possible to confirm them fully and in every detail by direct observations upon children. Indeed, it is so easy to convince oneself of the regular sexual activities of children that one cannot help asking in astonishment how the human race can have succeeded in overlooking the facts and in maintaining for so long the wishful legend of the asexuality of childhood. This surprising circumstance must be connected with the amnesia which, with the majority of adults, hides their own infancy.

[1925d, 4214]

We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

[1925d, 4221]
It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.
[1926e, 4348]

Then I will pursue the subject further; in any case it is not easy for me to get away from it. I will tell you, then, that the most remarkable thing about the sexual life of children seems to me that it passes through the whole of its very far-reaching development in the first five years of life. From then onwards until puberty there stretches what is known as the period of latency. During it sexuality normally advances no further; on the contrary, the sexual urges diminish in strength and many things are given up and forgotten which the child did and knew. During that period of life, after the early efflorescence of sexuality has withered, such attitudes of the ego as shame, disgust and morality arise, which are destined to stand up against the later tempest of puberty and to lay down the path of the freshly awakening sexual desires. This 'diphasic onset', as it is named, of sexual life has a great deal to do with the genesis of neurotic illnesses. It seems to occur only in human beings, and it is perhaps one of the determinants of the human privilege of becoming neurotic. The prehistory of sexual life was just as much overlooked before psychoanalysis as, in another department, the background to conscious mental life. You will rightly suspect that the two are intimately connected.
[1926e, 4353]
This brings us to the more general problem of preservation in the sphere of the mind. The subject has hardly been studied yet; but it is so attractive and important that we may be allowed to turn our attention to it for a little, even though our excuse is insufficient. Since we overcame the error of supposing that the forgetting we are familiar with signified a destruction of the memory-trace - that is, its annihilation - we have been inclined to take the opposite view, that in mental life nothing which has once been formed can perish - that everything is somehow preserved and that in suitable circumstances (when, for instance, regression goes back far enough) it can once more be brought to light. Let us try to grasp what this assumption involves by taking an analogy from another field. We will choose as an example the history of the Eternal City.¹ Historians tell us that the oldest Rome was the Roma Quadrata, a fenced settlement on the Palatine. Then followed the phase of the Septimontium, a federation of the settlements on the different hills; after that came the city bounded by the Servian wall; and later still, after all the transformations during the periods of the republic and the early Caesars, the city which the Emperor Aurelian surrounded with his walls. We will not follow the changes which the city went through any further, but we will ask ourselves how much a visitor, whom we will suppose to be equipped with the most complete historical and topographical knowledge, may still find left of these early stages in the Rome of to-day. Except for a few gaps, he will see the wall of Aurelian almost unchanged. In some places he will be able to find sections of the Servian wall where they have been excavated and brought to light. If he knows enough - more than present-day archaeology does - he may perhaps be able to trace out in the plan of the city the whole course of that wall and the outline of the Roma Quadrata. Of the buildings which once occupied this ancient area he will find nothing, or only scanty remains, for they exist no longer. The best information about Rome in the republican era would only enable him at the most to point out the sites where the temples and public buildings of that period stood. Their place is now taken by ruins, but not by ruins of themselves but of later restorations made after fires or destruction. It is hardly necessary to remark that all these remains of ancient Rome are found dovetailed into the jumble of a great metropolis which has grown up in the last few centuries since the Renaissance. There is certainly not a little that is ancient still buried in the soil of the city or beneath its modern buildings. This is the manner in which the past is preserved in historical sites like Rome.

[1930a, 4469]

Now let us, by a flight of imagination, suppose that Rome is not a human habitation but a psychical entity with a similarly long and copious past - an entity, that is to say, in which nothing that has once come into existence will have passed away and all the earlier phases of development continue to exist alongside the latest one. This would mean that in Rome the palaces of the Caesars and the Septizonium of Septimius Severus would still be rising to their old height on the Palatine and that the castle of S. Angelo would still be carrying on its battlements the beautiful statues which graced it until the siege by the Goths, and so on. But more than this. In the place occupied by the Palazzo Caffarelli would once more stand - without the Palazzo having to be removed - the Temple of Jupiter Capitolinus; and this not only in its latest shape, as the Romans of the Empire saw it, but also in its earliest one, when it still showed Etruscan forms and was ornamented with terracotta antefixes. Where the Coliseum now stands we could at the same time admire Nero's vanished Golden House. On the Piazza of the Pantheon we should find not only the Pantheon of to-day, as it was bequeathed to us by Hadrian, but, on the same site, the original edifice erected by Agrippa; indeed, the same piece of ground would be supporting the church of Santa Maria sopra Minerva and the ancient temple over which it was built. And the observer would perhaps only have to change the direction of his glance or his position in order to call up the one view or the other.

[1930a, 4470]
There is one further objection which has to be considered. The question may be raised why we chose precisely the past of a city to compare with the past of the mind. The assumption that everything past is preserved holds good even in mental life only on condition that the organ of the mind has remained intact and that its tissues have not been damaged by trauma or inflammation. But destructive influences which can be compared to causes of illness like these are never lacking in the history of a city, even if it has had a less chequered past than Rome, and even if, like London, it has hardly ever suffered from the visitations of an enemy. Demolitions and replacement of buildings occur in the course of the most peaceful development of a city. A city is thus a priori unsuited for a comparison of this sort with a mental organism. [1930a, 4471]

Perhaps we are going too far in this. Perhaps we ought to content ourselves with asserting that what is past in mental life may be preserved and is not necessarily destroyed. It is always possible that even in the mind some of what is old is effaced or absorbed - whether in the normal course of things or as an exception - to such an extent that it cannot be restored or revivified by any means; or that preservation in general is dependent on certain favourable conditions. It is possible, but we know nothing about it. We can only hold fast to the fact that it is rather the rule than the exception for the past to be preserved in mental life. [1930a, 4471]

We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psychoanalysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been repressed; but, that being so, we cannot understand how it is that they have such free access to dream-life, that they provide the pattern for so many dream-phantasies and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment. [1933a, 4641]

Long-past ages have a great and often puzzling attraction for men's imagination. Whenever they are dissatisfied with their present surroundings - and this happens often enough - they turn back to the past and hope that they will now be able to prove the truth of the unextinguishable dream of a golden age.¹ They are probably still under the spell of their childhood, which is presented to them by their not impartial memory as a time of uninterrupted bliss. [1939a, 4897]
(1) (a) All these traumas occur in early childhood up to about the fifth year. Impressions from
the time at which a child is beginning to talk stand out as being of particular interest; the periods
between the ages of two and four seem to be the most important; it cannot be determined with
certainty how long after birth this period of receptivity begins. (b) The experiences in question
are as a rule totally forgotten, they are not accessible to memory and fall within the period of
infantile amnesia, which is usually broken into by a few separate mnemic residues, what are
known as 'screen memories'. (c) They relate to impressions of a sexual and aggressive nature,
and no doubt also to early injuries to the ego (narcissistic mortifications). In this connection it
should be remarked that such young children make no sharp distinction between sexual and
aggressive acts, as they do later. (Cf. the misunderstanding of the sexual act in a sadistic
sense.) The predominance of the sexual factor is, of course, most striking and calls for
theoretical consideration.

[1939a, 4900]

These three points - the very early appearance of these experiences (during the first five
years of life), the fact of their being forgotten and their sexual-aggressive content - are closely
interconnected. The traumas are either experiences on the subject's own body or sense
perceptions, mostly of something seen and heard - that is, experiences or impressions. The
interconnection of these three points is established by a theory, a product of the work of
analysis which alone can bring about a knowledge of the forgotten experiences, or, to put it
more vividly but also more incorrectly, bring them back to memory. The theory is that, in
contrast to popular opinion, the sexual life of human beings (or what corresponds to it later on)
exhibits an early efflorescence which comes to an end at about the fifth year and is followed by
what is known as the period of latency (till puberty) in which there is no further development of
sexuality and indeed what has been attained undergoes a retrogression. This theory is
confirmed by the anatomical investigation of the growth of the internal genitalia; it leads us to
suppose that the human race is descended from a species of animal which reached sexual
maturity in five years and rouses a suspicion that the postponement of sexual life and its
diphasic onset are intimately connected with the history of hominization. Human beings appear
to be the only animal organisms with a latency period and sexual retardation of this kind.
Investigations on the primates (which, so far as I know, are not available) would be
indispensable for testing this theory. It cannot be a matter of indifference psychologically that
the period of infantile amnesia coincides with this early period of sexuality. It may be that this
state of things provides the true determinant for the possibility of neurosis, which is in a sense a
human prerogative and from this point of view appears as a vestige - a 'survival' - of primaeval
times like certain portions of our bodily anatomy.

[1939a, 4900]

In the case of the individual we believe we can see clearly. The memory-trace of his early
experience has been preserved in him, but in a special psychological condition. The individual
may be said to have known it always, just as one knows about the repressed. Here we have
formed ideas, which can be confirmed without difficulty through analysis, of how something can
be forgotten and how it can then reappear after a while. What is forgotten is not extinguished
but only 'repressed'; its memory-traces are present in all their freshness, but isolated by
'anticathexes'. They cannot enter into communication with other intellectual processes; they are
unconscious - inaccessible to consciousness. It may also be that certain portions of the
repressed, having evaded the process, remain accessible to memory and occasionally emerge
into consciousness; but even so they are isolated, like foreign bodies out of connection with the
rest. It may be so, but it need not be so; repression may also be complete, and it is with that
alternative that we shall deal in what follows.

[1939a, 4917]
The chief interest is naturally focused on the first of these assertions, the most unexpected of all. It has been found that in early childhood there are signs of bodily activity to which only an ancient prejudice could deny the name of sexual and which are linked to psychical phenomena that we come across later in adult erotic life - such as fixation to particular objects, jealousy, and so on. It is further found, however, that these phenomena which emerge in early childhood form part of an ordered course of development, that they pass through a regular process of increase, reaching a climax towards the end of the fifth year, after which there follows a lull. During this lull progress is at a standstill and much is unlearnt and there is much recession. After the end of this period of latency, as it is called, sexual life advances once more with puberty; we might say that it has a second efflorescence. And here we come upon the fact that the onset of sexual life is diphasic, that it occurs in two waves - something that is unknown except in man and evidently has an important bearing on hominization.¹ It is not a matter of indifference that the events of this early period, except for a few residues, fall a victim to infantile amnesia. Our views on the aetiology of the neuroses and our technique of analytic therapy are derived from these conceptions; and our tracing of the developmental processes in this early period has also provided evidence for yet other conclusions.
[1940a [1938], 4964]

As regards the other point - the specific instinctual factor - we come upon an interesting discrepancy between theory and experience. Theoretically there is no objection to supposing that any sort of instinctual demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component instincts of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a purely erotic nature but have arisen from alloys of the erotic instinct with portions of the destructive instinct. But it cannot be doubted that the instincts which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses - whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls a victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) - that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.
[1940a [1938], 4994]
The analyst, as we have said, works under more favourable conditions than the archaeologist since he has at his disposal material which can have no counterpart in excavations, such as the repetitions of reactions dating from infancy and all that is indicated by the transference in connection with these repetitions. But in addition to this it must be borne in mind that the excavator is dealing with destroyed objects of which large and important portions have quite certainly been lost, by mechanical violence, by fire and by plundering. No amount of effort can result in their discovery and lead to their being united with the surviving remains. The one and only course open is that of reconstruction, which for this reason can often reach only a certain degree of probability. But it is different with the psychical object whose early history the analyst is seeking to recover. Here we are regularly met by a situation which with the archaeological object occurs only in such rare circumstances as those of Pompeii or of the tomb of Tut'ankhamun. All of the essentials are preserved; even things that seem completely forgotten are present somehow and somewhere, and have merely been buried and made inaccessible to the subject. Indeed, it may, as we know, be doubted whether any psychical structure can really be the victim of total destruction. It depends only upon analytic technique whether we shall succeed in bringing what is concealed completely to light. There are only two other facts that weigh against the extraordinary advantage which is thus enjoyed by the work of analysis: namely, that psychical objects are incomparably more complicated than the excavator's material ones and that we have insufficient knowledge of what we may expect to find, since their finer structure contains so much that is still mysterious. But our comparison between the two forms of work can go no further than this; for the main difference between them lies in the fact that for the archaeologist the reconstruction is the aim and end of his endeavours while for analysis the construction is only a preliminary labour.

[1937d, 5051]
The view developed here, that distressing memories succumb especially easily to motivated forgetting, deserves to find application in many spheres where no attention, or too little, has so far been paid to it. Thus it seems to me that it has still not yet been sufficiently strongly emphasized in assessing testimony in courts of law,¹ where the process of putting a witness on oath is clearly expected to have much too great a purifying influence on the play of his psychical forces. It is universally acknowledged that where the origin of a people's traditions and legendary history are concerned, a motive of this kind, whose aim is to wipe from memory whatever is distressing to national feeling, must be taken into consideration. Closer investigation would perhaps reveal a complete analogy between the ways in which the traditions of a people and the childhood memories of the individual come to be formed. - The great Darwin laid down a 'golden rule' for the scientific worker based on his insight into the part played by unpleasure as a motive for forgetting.²

[1901b, 1230]

This is often the way in which childhood memories originate. Quite unlike conscious memories from the time of maturity, they are not fixed at the moment of being experienced and afterwards repeated, but are only elicited at a later age when childhood is already past; in the process they are altered and falsified, and are put into the service of later trends, so that generally speaking they cannot be sharply distinguished from phantasies. Their nature is perhaps best illustrated by a comparison with the way in which the writing of history originated among the peoples of antiquity. As long as a nation was small and weak it gave no thought to the writing of its history. Men tilled the soil of their land, fought for their existence against their neighbours, and tried to gain territory from them and to acquire wealth. It was an age of heroes, not of historians. Then came another age, an age of reflection: men felt themselves to be rich and powerful, and now felt a need to learn where they had come from and how they had developed. Historical writing, which had begun to keep a continuous record of the present, now also cast a glance back to the past, gathered traditions and legends, interpreted the traces of antiquity that survived in customs and usages, and in this way created a history of the past. It was inevitable that this early history should have been an expression of present beliefs and wishes rather than a true picture of the past; for many things had been dropped from the nation's memory, while others were distorted, and some remains of the past were given a wrong interpretation in order to fit in with contemporary ideas. Moreover people's motive for writing history was not objective curiosity but a desire to influence their contemporaries, to encourage and inspire them, or to hold a mirror up before them. A man's conscious memory of the events of his maturity is in every way comparable to the first kind of historical writing; while the memories that he has of his childhood correspond, as far as their origins and reliability are concerned, to the history of a nation's earliest days, which was compiled later and for tendentious reasons.

[1910c, 2260]

It will be seen, then, that my mistake was of the same kind as would be made by someone who believed that the legendary story of the early kings of Rome (as told by Livy) was historical truth instead of what it is in fact - a reaction against the memory of times and circumstances that were insignificant and occasionally, perhaps, inglorious. When the mistake had been cleared up, the path to the study of the sexual life of children lay open. It thus became possible to apply psycho-analysis to another field of science and to use its data as a means of discovering a new piece of biological knowledge.

[1925d, 4211]
There is a possible anatomical analogy to what I believe to be the course of development of
the infantile sexual function in Bayer's discovery (1902) that the internal sexual organs (i.e. the
uterus) are as a rule larger in new-born children than in older ones. It is not certain, however,
what view we should take of this involution that occurs after birth (which has been shown by
Halban to apply also to other portions of the genital apparatus). According to Halban (1904) the
process of involution comes to an end after a few weeks of extra-uterine life. [Added 1920:]
Those authorities who regard the interstitial portion of the sex-gland as the organ that
determines sex have on their side been led by anatomical researches to speak of infantile
sexuality and a period of sexual latency. I quote a passage from Lipschütz's book (1919, 168),
which I mentioned on p. 1473 n. 'We shall be doing more justice to the facts if we say that the
maturation of the sexual characters which is accomplished at puberty is only due to a great
acceleration which occurs at that time of processes which began much earlier - in my view as
early as during intra-uterine life.' 'What has hitherto been described in a summary way as
puberty is probably only a second major phase of puberty which sets in about the middle of the
second decade of life . . . Childhood, from birth until the beginning of this second major phase,
might be described as "the intermediate phase of puberty"' (ibid., 170). Attention was drawn to
this coincidence between anatomical findings and psychological observation in a review by
Ferenczi (1920). The agreement is marred only by the fact that the 'first peak' in the
development of the sexual organ occurs during the early intra-uterine period, whereas the early
efflorescence of infantile sexual life must be ascribed to the third and fourth years of life. There
is, of course, no need to expect that anatomical growth and psychical development must be
exactly simultaneous. The researches in question were made on the sex-glands of human
beings. Since a period of latency in the psychological sense does not occur in animals, it would
be very interesting to know whether the anatomical findings which have led these writers to
assume the occurrence of two peaks in sexual development are also demonstrable in the higher
animals.
[1905d, 1499]

The fact that the onset of sexual development in human beings occurs in two phases, i.e. that
the development is interrupted by the period of latency, seemed to call for particular notice. This
appears to be one of the necessary conditions of the aptitude of men for developing a higher
civilization, but also of their tendency to neurosis. So far as we know, nothing analogous is to be
found in man's animal relatives. It would seem that the origin of this peculiarity of man must be
looked for in the prehistory of the human species.
[1905d, 1545]

If, however, the derivation of perversions from the Oedipus complex can be generally
established, our estimate of its importance will have gained added strength. For in our opinion
the Oedipus complex is the actual nucleus of neuroses, and the infantile sexuality which
culminates in this complex is the true determinant of neuroses. What remains of the complex in
the unconscious represents the disposition to the later development of neuroses in the adult. In
this way the beating-phantasy and other analogous perverse fixations would also only be
precipitates of the Oedipus complex, scars, so to say, left behind after the process has ended,
just as the notorious 'sense of inferiority' corresponds to a narcissistic scar of the same sort. In
taking this view of the matter I must express my unreserved agreement with Marcinowski
(1918), who has recently put it forward most happily. As is well known, this neurotic delusion of
inferiority is only a partial one, and is completely compatible with the existence of a self-
overvaluation derived from other sources. The origin of the Oedipus complex itself, and the
destiny which compels man, probably alone among all animals, to begin his sexual life twice
over, first like all other creatures in his early childhood, and then after a long interruption once
more at the age of puberty - all the problems that are connected with man's 'archaic heritage'
have been discussed by me elsewhere, and I have no intention of going into them in this place.
[1919e, 3654]
Neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido - the twice repeated start made by the directly sexual function, with an intervening period of latency.¹ To this extent it resembles hypnosis and group formation in having the character of a regression, which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been wholly successful; and it represents a conflict between those portions of the instincts which have been received into the ego after having passed through this development and those portions of them which, springing from the repressed unconscious, strive - as do other, completely repressed, instinctual impulses - to attain direct satisfaction. Neuroses are extraordinarily rich in content, for they embrace all possible relations between the ego and the object - both those in which the object is retained and others in which it is abandoned or erected inside the ego itself - and also the conflicting relations between the ego and its ego ideal.

The Diphasic Onset of Sexual Development. - Towards the end of the fifth year this early period of sexual life normally comes to an end. It is succeeded by a period of more or less complete latency, during which ethical restraints are built up, to act as defences against the desires of the Oedipus complex. In the subsequent period of puberty, the Oedipus complex is revivified in the unconscious and embarks upon further modifications. It is only at puberty that the sexual instincts develop to their full intensity; but the direction of that development, as well as all the predispositions for it, have already been determined by the early efflorescence of sexuality during childhood which preceded it. This diphasic development of the sexual function - in two stages, interrupted by the latency period - appears to be a biological peculiarity of the human species and to contain the determining factor for the origin of neuroses.

If we consider once more the origin of the super-ego as we have described it, we shall recognize that it is the outcome of two highly important factors, one of a biological and the other of a historical nature: namely, the lengthy duration in man of his childhood helplessness and dependence, and the fact of his Oedipus complex, the repression of which we have shown to be connected with the interruption of libidinal development by the latency period and so with the diphasic onset of man's sexual life. According to one psycho-analytic hypothesis, the last-mentioned phenomenon, which seems to be peculiar to man, is a heritage of the cultural development necessitated by the glacial epoch. We see, then, that the differentiation of the super-ego from the ego is no matter of chance; it represents the most important characteristics of the development both of the individual and of the species; indeed, by giving permanent expression to the influence of the parents it perpetuates the existence of the factors to which it owes its origin.

¹[1921c, 3834]

²[1923a, 3923]

³[1923b, 3969]
Readers of my *Three Essays on the Theory of Sexuality* (1905d) will be aware that I have never undertaken any thorough remodelling of that work in its later editions, but have retained the original arrangement and have kept abreast of the advances made in our knowledge by means of interpolations and alterations in the text. In doing this, it may often have happened that what was old and what was more recent did not admit of being merged into an entirely uncontradictory whole. Originally, as we know, the accent was on a portrayal of the fundamental difference between the sexual life of children and of adults; later, the *pregenital organizations* of the libido made their way into the foreground, and also the remarkable and momentous fact of the *diphasic onset* of sexual development. Finally, our interest was engaged by the *sexual researches* of children; and from this we were able to recognize the far-reaching *approximation of the final outcome of sexuality in childhood* (in about the fifth year) to the definitive form taken by it in the adult. This is the point at which I left things in the last (1922) edition of my *Three Essays*.

[1923e, 4058]

I have described elsewhere how this turning away takes place. The object-cathexes are given up and replaced by identifications. The authority of the father or the parents is introjected into the ego, and there it forms the nucleus of the super-ego, which takes over the severity of the father and perpetuates his prohibition against incest, and so secures the ego from the return of the libidinal object-cathexis. The libidinal trends belonging to the Oedipus complex are in part desexualized and sublimated (a thing which probably happens with every transformation into an identification) and in part inhibited in their aim and changed into impulses of affection. The whole process has, on the one hand, preserved the genital organ - has averted the danger of its loss - and, on the other, has paralysed it - has removed its function. This process ushers in the latency period, which now interrupts the child's sexual development.

[1924d, 4088]

And now, as a third point, psycho-analysis has shown us, to our growing astonishment, the enormously important part played by what is known as the 'Oedipus complex' - that is, the emotional relation of a child to its two parents - in the mental life of human beings. Our astonishment diminishes when we realize that the Oedipus complex is the psychical correlate of two fundamental biological facts: the long period of the human child’s dependence, and the remarkable way in which its sexual life reaches a first climax in the third to fifth years of life, and then, after a period of inhibition, sets in again at puberty. And here, the discovery was made that a third and extremely serious part of human intellectual activity, the part which has created the great institutions of religion, law, ethics, and all forms of *civic life*, has as its fundamental aim the enabling of the individual to master his Oedipus complex and to divert his libido from its infantile attachments into the social ones that are ultimately desired. The applications of psycho-analysis to the science of religion and sociology (e. g. by the present writer, Theodor Reik and Oskar Pfister), which have led to these findings, are still young and insufficiently appreciated; but it cannot be doubted that further studies will only confirm the certainty of these important conclusions.

[1924f, 4117]
The process of arriving at an object, which plays such an important part in mental life, takes place alongside of the organization of the libido. After the stage of auto-erotism, the first love-object in the case of both sexes is the mother; and it seems probable that to begin with a child does not distinguish its mother's organ of nutrition from its own body. Later, but still in the first years of infancy, the relation known as the Oedipus complex becomes established: boys concentrate their sexual wishes upon their mother and develop hostile impulses against their father as being a rival, while girls adopt an analogous attitude.¹ All of the different variations and consequences of the Oedipus complex are important; and the innately bisexual constitution of human beings makes itself felt and increases the number of simultaneously active tendencies. Children do not become clear for quite a long time about the differences between the sexes; and during this period of sexual researches they produce typical sexual theories which, being circumscribed by the incompleteness of their authors' own physical development, are a mixture of truth and error and fail to solve the problems of sexual life (the riddle of the Sphinx - that is, the question of where babies come from). We see, then, that a child's first object-choice is an incestuous one. The whole course of development that I have described is run through rapidly. For the most remarkable feature of the sexual life of man is its diphasic onset, its onset in two waves, with an interval between them. It reaches a first climax in the fourth or fifth year of a child's life. But thereafter this early efflorescence of sexuality passes off; the sexual impulses which have shown such liveliness are overcome by repression, and a period of latency follows, which lasts until puberty and during which the reaction-formations of morality, shame, and disgust are built up.² Of all living creatures man alone seems to show this diphasic onset of sexual growth, and it may perhaps be the biological determinant of his predisposition to neuroses. At puberty the impulses and object-relations of a child's early years become re-animated, and amongst them the emotional ties of its Oedipus complex. In the sexual life of puberty there is a struggle between the urges of early years and the inhibitions of the latency period. Before this, and while the child is at the highest point of its infantile sexual development, a genital organization of a sort is established; but only the male genitals play a part in it, and the female ones remain undiscovered. (I have described this as the period of phallic primacy.) At this stage the contrast between the sexes is not stated in terms of 'male' or 'female' but of 'possessing a penis' or 'castrated'. The castration complex which arises in this connection is of the profoundest importance in the formation alike of character and of neuroses.

[1925d, 4212]

The advent of puberty opens a decisive chapter in the history of an obsessional neurosis. The genital organization which has been broken off in childhood starts again with great vigour. But, as we know, the sexual development in childhood determines what direction this new start at puberty will take. Not only will the early aggressive impulses be re-awakened; but a greater or lesser proportion of the new libidinal impulses - in bad cases the whole of them - will have to follow the course prescribed for them by regression and will emerge as aggressive and destructive tendencies. In consequence of the erotic trends being disguised in this way and owing to the powerful reaction-formations in the ego, the struggle against sexuality will henceforward be carried on under the banner of ethical principles. The ego will recoil with astonishment from promptings to cruelty and violence which enter consciousness from the id, and it has no notion that in them it is combating erotic wishes, including some to which it would not otherwise have taken exception. The overstrict super-ego insists all the more strongly on the suppression of sexuality, since this has assumed such repellent forms. Thus in obsessional neurosis the conflict is aggravated in two directions: the defensive forces become more intolerant and the forces that are to be fended off become more intolerable. Both effects are due to a single factor, namely, regression of the libido.

[1926d, 4275]
The existence of the second, phylogenetic, factor, is based only upon inference. We have been led to assume its existence by a remarkable feature in the development of the libido. We have found that the sexual life of man, unlike that of most of the animals nearly related to him, does not make a steady advance from birth to maturity, but that, after an early efflorescence up till the fifth year, it undergoes a very decided interruption; and that it then starts on its course once more at puberty, taking up again the beginnings broken off in early childhood. This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species which has left behind this interruption in the sexual development of the individual as a historical precipitate. This factor owes its pathogenic significance to the fact that the majority of the instinctual demands of this infantile sexuality are treated by the ego as dangers and fended off as such, so that the later sexual impulses of puberty, which in the natural course of things would be ego-syntonic, run the risk of succumbing to the attraction of their infantile prototypes and following them into repression. It is here that we come upon the most direct aetiology of the neuroses. It is a curious thing that early contact with the demands of sexuality should have a similar effect on the ego to that produced by premature contact with the external world.

Then I will pursue the subject further; in any case it is not easy for me to get away from it. I will tell you, then, that the most remarkable thing about the sexual life of children seems to me that it passes through the whole of its very far-reaching development in the first five years of life. From then onwards until puberty there stretches what is known as the period of latency. During it sexuality normally advances no further; on the contrary, the sexual urges diminish in strength and many things are given up and forgotten which the child did and knew. During that period of life, after the early efflorescence of sexuality has withered, such attitudes of the ego as shame, disgust and morality arise, which are destined to stand up against the later tempest of puberty and to lay down the path of the freshly awakening sexual desires. This 'diphasic onset', as it is named, of sexual life has a great deal to do with the genesis of neurotic illnesses. It seems to occur only in human beings, and it is perhaps one of the determinants of the human privilege of becoming neurotic. The prehistory of sexual life was just as much overlooked before psycho-analysis as, in another department, the background to conscious mental life. You will rightly suspect that the two are intimately connected.

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.
These three points - the very early appearance of these experiences (during the first five years of life), the fact of their being forgotten and their sexual-aggressive content - are closely interconnected. The traumas are either experiences on the subject's own body or sense perceptions, mostly of something seen and heard - that is, experiences or impressions. The interconnection of these three points is established by a theory, a product of the work of analysis which alone can bring about a knowledge of the forgotten experiences, or, to put it more vividly but also more incorrectly, bring them back to memory. The theory is that, in contrast to popular opinion, the sexual life of human beings (or what corresponds to it later on) exhibits an early efflorescence which comes to an end at about the fifth year and is followed by what is known as the period of latency (till puberty) in which there is no further development of sexuality and indeed what has been attained undergoes a retrogression. This theory is confirmed by the anatomical investigation of the growth of the internal genitals; it leads us to suppose that the human race is descended from a species of animal which reached sexual maturity in five years and rouses a suspicion that the postponement of sexual life and its diphasic onset are intimately connected with the history of hominization. Human beings appear to be the only animal organisms with a latency period and sexual retardation of this kind. Investigations on the primates (which, so far as I know, are not available) would be indispensable for testing this theory. It cannot be a matter of indifference psychologically that the period of infantile amnesia coincides with this early period of sexuality. It may be that this state of things provides the true determinant for the possibility of neurosis, which is in a sense a human prerogative and from this point of view appears as a vestige - a 'survival' - of primaeval times like certain portions of our bodily anatomy.  

[1939a, 4900]

The chief interest is naturally focused on the first of these assertions, the most unexpected of all. It has been found that in early childhood there are signs of bodily activity to which only an ancient prejudice could deny the name of sexual and which are linked to psychical phenomena that we come across later in adult erotic life - such as fixation to particular objects, jealousy, and so on. It is further found, however, that these phenomena which emerge in early childhood form part of an ordered course of development, that they pass through a regular process of increase, reaching a climax towards the end of the fifth year, after which there follows a lull. During this lull progress is at a standstill and much is unlearnt and there is much recession. After the end of this period of latency, as it is called, sexual life advances once more with puberty; we might say that it has a second efflorescence. And here we come upon the fact that the onset of sexual life is diphasic, that it occurs in two waves - something that is unknown except in man and evidently has an important bearing on hominization.¹ It is not a matter of indifference that the events of this early period, except for a few residues, fall a victim to infantile amnesia. Our views on the aetiology of the neuroses and our technique of analytic therapy are derived from these conceptions; and our tracing of the developmental processes in this early period has also provided evidence for yet other conclusions.  

[1940a [1938], 4964]

¹ Cf. the suggestion that man is descended from a mammal which reached sexual maturity at the age of five, but that some major external influence was brought to bear on the species and at that point interrupted the straight course of development of sexuality. Other transformations in the sexual life of man as compared with that of animals might be connected with this - such as the abolition of the periodicity of the libido and the exploitation of the part played by menstruation in the relation between the sexes.  

[1940a [1938], 4964]
As regards the other point - the specific instinctual factor - we come upon an interesting discrepancy between theory and experience. Theoretically there is no objection to supposing that any sort of instinctual demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component instincts of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a purely erotic nature but have arisen from alloys of the erotic instinct with portions of the destructive instinct. But it cannot be doubted that the instincts which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses - whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls a victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) - that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.

[1940a [1938], 4994]
The sexual instinct - or, more correctly, the sexual instincts, for analytic investigation teaches us that the sexual instinct is made up of many separate constituents or component instincts - is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capacity for sublimation. In contrast to this displaceability, in which its value for civilization lies, the sexual instinct may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual instinct probably varies in each individual; certainly the proportion of it which is suitable for sublimation varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual instinct it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective quality of unpleasure, must be regarded as an illness.

Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization rests upon two pillars, of which one is the control of natural forces and the other the restriction of our instincts. The ruler's throne rests upon fettered slaves. Among the instinctual components which are thus brought into service, the sexual instincts, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this - and will not allow the topic to be mentioned.
As regards the other point - the specific instinctual factor - we come upon an interesting discrepancy between theory and experience. Theoretically there is no objection to supposing that any sort of instinctual demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component instincts of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a purely erotic nature but have arisen from alloys of the erotic instinct with portions of the destructive instinct. But it cannot be doubted that the instincts which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses - whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls a victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) - that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.
[1940a [1938], 4994]
After having explained the preponderance of perverse tendencies in psychoneurotics by recognizing it as a collateral filling of subsidiary channels when the main current of the instinctual stream has been blocked by 'repression',¹ we proceeded to a consideration of sexual life in childhood. We found it a regrettable thing that the existence of the sexual instinct in childhood has been denied and that the sexual manifestations not infrequently to be observed in children have been described as irregularities. It seemed to us on the contrary that children bring germs of sexual activity with them into the world, that they already enjoy sexual satisfaction when they begin to take nourishment and that they persistently seek to repeat the experience in the familiar activity of 'thumb-sucking'. The sexual activity of children, however, does not, it appeared, develop pari passu with their other functions, but, after a short period of efflorescence from the ages of two to five, enters upon the so-called period of latency. During that period the production of sexual excitation is not by any means stopped but continues and produces a store of energy which is employed to a great extent for purposes other than sexual - namely, on the one hand in contributing the sexual components to social feelings and on the other hand (through repression and reaction-forming) in building up the subsequently developed barriers against sexuality. On this view, the forces destined to retain the sexual instinct upon certain lines are built up in childhood chiefly at the cost of perverse sexual impulses and with the assistance of education. A certain portion of the infantile sexual impulses would seem to evade these uses and succeed in expressing itself as sexual activity. We next found that sexual excitation in children springs from a multiplicity of forces. Satisfaction arises first and foremost from the appropriate sensory excitation of what we have described as erotogenic zones. It seems probable that any part of the skin and any sense-organ - probably, indeed, any organ - can function as an erotogenic zone, though there are some particularly marked erotogenic zones whose excitation would seem to be secured from the very first by certain organic contrivances. It further appears that sexual excitation arises as a by-product, as it were, of a large number of processes that occur in the organism, as soon as they reach a certain degree of intensity, and most especially of any relatively powerful emotion, even though it is of a distressing nature. The excitations from all these sources are not yet combined; but each follows its own separate aim, which is merely the attainment of a certain sort of pleasure. In childhood, therefore, the sexual instinct is not unified and is at first without an object, that is, auto-erotic.

[1905d, 1543]

We were then obliged to recognize, as one of our most surprising findings, that this early efflorescence of infantile sexual life (between the ages of two and five) already gives rise to the choice of an object, with all the wealth of mental activities which such a process involves. Thus, in spite of the lack of synthesis between the different instinctual components and the uncertainty of the sexual aim, the phase of development corresponding to that period must be regarded as an important precursor of the subsequent final sexual organization.

[1905d, 1544]
The Development of the Libido. - The sexual instinct, the dynamic manifestation of which in mental life we shall call 'libido', is made up of component instincts into which it may once more break up and which are only gradually united into well-defined organizations. The sources of these component instincts are the organs of the body and in particular certain specially marked erotogenic zones; but contributions are made to libido from every important functional process in the body. At first the individual component instincts strive for satisfaction independently of one another, but in the course of development they become more and more convergent and concentrated. The first (pregenital) stage of organization to be discerned is the oral one, in which - in conformity with the suckling's predominant interest - the oral zone plays the leading part. This is followed by the sadistic-anal organization, in which the anal zone and the component instinct of sadism are particularly prominent; at this stage the difference between the sexes is represented by the contrast between active and passive. The third and final stage of organization is that in which the majority of the component instincts converge under the primacy of the genital zones. As a rule this development is passed through swiftly and unobtrusively; but some individual portions of the instincts remain behind at the prodromal stages of the process and thus give rise to fixations of libido, which are important as constituting predispositions for subsequent irruptions of repressed impulses and which stand in a definite relation to the later development of neuroses and perversions. (See the article on 'The Libido Theory'.)  

The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of component instincts. These are dependent upon erotogenic zones in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly auto-erotic. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the oral components, an anal-sadistic stage follows, and it is only after the third stage has at last been reached that the primacy of the genitals is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of libido to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, fixations of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as regression), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the choice of neurosis, that is, the form in which the subsequent illness makes its appearance.  

[1923a, 3921]  

[1925d, 4211]
The sexual instinct - or, more correctly, the sexual instincts, for analytic investigation teaches us that the sexual instinct is made up of many separate constituents or component instincts - is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capacity for sublimation. In contrast to this displaceability, in which its value for civilization lies, the sexual instinct may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual instinct probably varies in each individual; certainly the proportion of it which is suitable for sublimation varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual instinct it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective quality of unpleasure, must be regarded as an illness.

The object [Objekt] of an instinct is the thing in regard to which or through which the instinct is able to achieve its aim. It is what is most variable about an instinct and is not originally connected with it, but becomes assigned to it only in consequence of being peculiarly fitted to make satisfaction possible. The object is not necessarily something extraneous: it may equally well be a part of the subject's own body. It may be changed any number of times in the course of the vicissitudes which the instinct undergoes during its existence; and highly important parts are played by this displacement of instinct. It may happen that the same object serves for the satisfaction of several instincts simultaneously, a phenomenon which Adler has called a 'confluence' of instincts [Triebverschränkung]. A particularly close attachment of the instinct to its object is distinguished by the term 'fixation'. This frequently occurs at very early periods of the development of an instinct and puts an end to its mobility through its intense opposition to detachment.
In further pursuing the discussion of this thesis, are we to consider the nature of the frustration or the peculiar character of those who are affected by it? It is extremely seldom, after all, that frustration is universal and absolute. In order to operate pathogenically it must no doubt affect the mode of satisfaction which alone the subject desires, of which alone he is capable. There are in general very many ways of tolerating deprivation of libidinal satisfaction without falling ill as a result. In the first place, we know people who are able to put up with a deprivation of this kind without being injured: they are not happy, they suffer from longing, but they do not fall ill. Next, we must bear in mind that the sexual instinctual impulses in particular are extraordinarily plastic, if I may so express it. One of them can take the place of another, one of them can take over another's intensity; if the satisfaction of one of them is frustrated by reality, the satisfaction of another can afford complete compensation. They are related to one another like a network of intercommunicating channels filled with a liquid; and this is so in spite of their being subject to the primacy of the genitals - a state of affairs that is not at all easily combined in a single picture. Further, the component instincts of sexuality, as well as the sexual current which is compounded from them, exhibit a large capacity for changing their object, for taking another in its place - and one, therefore, that is more easily attainable. This displaceability and readiness to accept a substitute must operate powerfully against the pathogenic effect of a frustration. Among these protective processes against falling ill owing to deprivation there is one which has gained special cultural significance. It consists in the sexual trend abandoning its aim of obtaining a component or a reproductive pleasure and taking on another which is related genetically to the abandoned one but is itself no longer sexual and must be described as social. We call this process 'sublimation', in accordance with the general estimate that places social aims higher than the sexual ones, which are at bottom self-interested. Sublimation is, incidentally, only a special case of the way in which sexual trends are attached to other, non-sexual ones. We shall have to discuss it again in another connection.

You see how many of the characteristics and vicissitudes of the instincts still escape our comprehension. A further distinction should be mentioned here which is exhibited between the sexual and self-preservative instincts and which would be of the greatest theoretical importance if it applied to the groups as a whole. The sexual instincts are noticeable to us for their plasticity, their capacity for altering their aims, their replaceability, which admits of one instinctual satisfaction being replaced by another, and their readiness for being deferred, of which we have just given a good example in the aim-inhibited instincts. We should be glad to deny these characteristics to the self-preservation instincts, and to say of them that they are inflexible, admit of no delay, are imperative in a very different sense and have a quite other relation to repression and to anxiety. But a little reflection tells us that this exceptional position applies, not to all the ego-instances, but only to hunger and thirst, and is evidently based on a peculiar character of the sources of those instincts. A good part of the confusing impression made by all this is that we have not given separate consideration to the alterations which the influence of the organized ego makes in the instinctual impulses that belonged originally to the id.

[1916-1917, 3408]

[1933a, 4703]
If the id in a human being gives rise to an instinctual demand of an erotic or aggressive nature, the simplest and most natural thing is that the ego, which has the apparatus of thought and the muscular apparatus at its disposal, should satisfy the demand by an action. This satisfaction of the instinct is felt by the ego as pleasure, just as its non-satisfaction would undoubtedly have become a source of unpleasure. Now a case may arise in which the ego abstains from satisfying the instinct in view of external obstacles - namely, if it perceives that the action in question would provoke a serious danger to the ego. An abstention from satisfaction of this kind, the renunciation of an instinct on account of an external hindrance - or, as we say, in obedience to the reality principle - is not pleasurable in any event. The renunciation of the instinct would lead to a lasting tension owing to unpleasure, if it were not possible to reduce the strength of the instinct itself by displacements of energy. Instinctual renunciation can, however, also be imposed for other reasons, which we correctly describe as internal. In the course of an individual's development a portion of the inhibiting forces in the external world are internalized and an agency is constructed in the ego which confronts the rest of the ego in an observing, criticizing and prohibiting sense. We call this new agency the super-ego. Thenceforward the ego, before putting to work the instinctual satisfactions demanded by the id, has to take into account not merely the dangers of the external world but also the objections of the super-ego, and it will have all the more grounds for abstaining from satisfying the instinct. But whereas instinctual renunciation, when it is for external reasons, is only unpleasurable, when it is for internal reasons, in obedience to the super-ego, it has a different economic effect. In addition to the inevitable unpleasurable consequences it also brings the ego a yield of pleasure - a substitutive satisfaction, as it were. The ego feels elevated; it is proud of the instinctual renunciation, as though it were a valuable achievement. We believe we can understand the mechanism of this yield of pleasure. The super-ego is the successor and representative of the individual's parents (and educators) who had supervised his actions in the first period of his life; it carries on their functions almost unchanged. It keeps the ego in a permanent state of dependence and exercises a constant pressure on it. Just as in childhood, the ego is apprehensive about risking the love of its supreme master; it feels his approval as liberation and satisfaction and his reproaches as pangs of conscience. When the ego has brought the super-ego the sacrifice of an instinctual renunciation, it expects to be rewarded by receiving more love from it. The consciousness of deserving this love is felt by it as pride. At the time when the authority had not yet been internalized as a super-ego, there could be the same relation between the threat of loss of love and the claims of instinct: there was a feeling of security and satisfaction when one had achieved an instinctual renunciation out of love for one's parents. But this happy feeling could only assume the peculiar narcissistic character of pride after the authority had itself become a portion of the ego.

[1939a, 4936]
The forces which we assume to exist behind the tensions caused by the needs of the id are called *instincts*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitancies and vacillations we have decided to assume the existence of only two basic instincts, *Eros* and the *destructive instinct*. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death instinct*. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards re-union.¹

[1940a [1938], 4959]

It would be a mistake to suppose that these three phases succeed one another in a clear-cut fashion. One may appear in addition to another; they may overlap one another, may be present alongside of one another. In the early phases the different component instincts set about their pursuit of pleasure independently of one another; in the phallic phase there are the beginnings of an organization which subordinates the other urges to the primacy of the genitals and signifies the start of a co-ordination of the general urge towards pleasure into the sexual function. The complete organization is only achieved at puberty, in a fourth, genital phase. A state of things is then established in which (1) some earlier libidinal cathexes are retained, (2) others are taken into the sexual function as preparatory, auxiliary acts, the satisfaction of which produces what is known as fore-pleasure, and (3) other urges are excluded from the organization, and are either suppressed altogether (repressed) or are employed in the ego in another way, forming character-traits or undergoing sublimation with a displacement of their aims.

[1940a [1938], 4966]
When I described one of the psychical processes occurring in the mental apparatus as the ‘primary’ one, what I had in mind was not merely considerations of relative importance and efficiency; I intended also to choose a name which would give an indication of its chronological priority. It is true that, so far as we know, no psychical apparatus exists which possesses a primary process only and that such an apparatus is to that extent a theoretical fiction. But this much is a fact: the primary processes are present in the mental apparatus from the first, while it is only during the course of life that the secondary processes unfold, and come to inhibit and overlay the primary ones; it may even be that their complete domination is not attained until the prime of life. In consequence of the belated appearance of the secondary processes, the core of our being, consisting of unconscious wishful impulses, remains inaccessible to the understanding and inhibition of the preconscious; the part played by the latter is restricted once and for all to directing along the most expedient paths the wishful impulses that arise from the unconscious. These unconscious wishes exercise a compelling force upon all later mental trends, a force which those trends are obliged to fall in with or which they may perhaps endeavour to divert and direct to higher aims. A further result of the belated appearance of the secondary process is that a wide sphere of mnemonic material is inaccessible to preconscious cathexis.

[1900a, 1030]
As regards the second kind of emotional reaction, which is not directed against me this time, but against my patient - supposing that my view of her is correct - and which regards the perverse nature of her phantasies as horrible, I should like to say emphatically that a medical man has no business to indulge in such passionate condemnation. I may also remark in passing that it seems to me superfluous for a physician who is writing upon the aberrations of the sexual instincts to seize every opportunity of inserting into the text expressions of his personal repugnance at such revolting things. We are faced by a fact; and it is to be hoped that we shall grow accustomed to it, when we have put our own tastes on one side. We must learn to speak without indignation of what we call the sexual perversions - instances in which the sexual function has extended its limits in respect either to the part of the body concerned or to the sexual object chosen. The uncertainty in regard to the boundaries of what is to be called normal sexual life, when we take different races and different epochs into account, should in itself be enough to cool the zealot's ardour. We surely ought not to forget that the perversion which is the most repellent to us, the sensual love of a man for a man, was not only tolerated by a people so far our superiors in cultivation as were the Greeks, but was actually entrusted by them with important social functions. The sexual life of each one of us extends to a slight degree - now in this direction, now in that - beyond the narrow lines imposed as the standard of normality. The perversions are neither bestial nor degenerate in the emotional sense of the word. They are a development of germs all of which are contained in the undifferentiated sexual disposition of the child, and which, by being suppressed or by being diverted to higher, asexual aims - by being 'sublimated' - are destined to provide the energy for a great number of our cultural achievements. When, therefore, any one has become a gross and manifest pervert, it would be more correct to say that he has remained one, for he exhibits a certain stage of inhibited development. All psychoneurotics are persons with strongly marked perverse tendencies, which have been repressed in the course of their development and have become unconscious. Consequently their unconscious phantasies show precisely the same content as the documentarily recorded actions of perverts - even though they have not read Krafft-Ebing's Psychopathia Sexualis, to which simple-minded people attribute such a large share of the responsibility for the production of perverse tendencies. Psychoneuroses are, so to speak, the negative of perversions. In neurotics their sexual constitution, under which the effects of heredity are included, operates in combination with any accidental influences in their life which may disturb the development of normal sexuality. A stream of water which meets with an obstacle in the river-bed is dammed up and flows back into old channels which had formerly seemed fated to run dry. The motive forces leading to the formation of hysterical symptoms draw their strength not only from repressed normal sexuality but also from unconscious perverse activities.¹

[1905e, 1387]
The same holds true of seeing - an activity that is ultimately derived from touching. Visual impressions remain the most frequent pathway along which libidinal excitation is aroused; indeed, natural selection counts upon the accessibility of this pathway - if such a teleological form of statement is permissible - when it encourages the development of beauty in the sexual object. The progressive concealment of the body which goes along with civilization keeps sexual curiosity awake. This curiosity seeks to complete the sexual object by revealing its hidden parts. It can, however, be diverted ('sublimated') in the direction of art, if its interest can be shifted away from the genitals on to the shape of the body as a whole.¹ It is usual for most normal people to linger to some extent over the intermediate sexual aim of a looking that has a sexual tinge to it; indeed, this offers them a possibility of directing some proportion of their libido on to higher artistic aims. On the other hand, this pleasure in looking becomes a perversion (a) if it is restricted exclusively to the genitals, or (b) if it is connected with the overriding of disgust (as in the case of voyeurs or people who look on at excretory functions), or (c) if, instead of being preparatory to the normal sexual aim, it supplants it. This last is markedly true of exhibitionists, who, if I may trust the findings of several analyses, exhibit their own genitals in order to obtain a reciprocal view of the genitals of the other person.²

[1905d, 1483]

REACTION-FORMATION AND SUBLIMATION  

What is it that goes to the making of these constructions which are so important for the growth of a civilized and normal individual? They probably emerge at the cost of the infantile sexual impulses themselves. Thus the activity of those impulses does not cease even during this period of latency, though their energy is diverted, wholly or in great part, from their sexual use and directed to other ends. Historians of civilization appear to be at one in assuming that powerful components are acquired for every kind of cultural achievement by this diversion of sexual instinctual forces from sexual aims and their direction to new ones - a process which deserves the name of 'sublimation'. To this we would add, accordingly, that the same process plays a part in the development of the individual and we would place its beginning in the period of sexual latency of childhood.¹

[1905d, 1500]

SUBLIMATION  

The third alternative result of an abnormal constitutional disposition is made possible by the process of sublimation. This enables excessively strong excitations arising from particular sources of sexuality to find an outlet and use in other fields, so that a not inconsiderable increase in psychical efficiency results from a disposition which is itself perilous. Here we have one of the origins of artistic activity; and, according to the completeness or incompleteness of the sublimation, a characterological analysis of a highly gifted individual, and in particular of one with an artistic disposition, may reveal a mixture, in every proportion, of efficiency, perversion and neurosis. A sub-species of sublimation is to be found in suppression by reaction-formation, which, as we have seen, begins during a child's period of latency and continues in favourable cases throughout his whole life. What we describe as a person's 'character' is built up to a considerable extent from the material of sexual excitations and is composed of instincts that have been fixed since childhood, of constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse impulses which have been recognized as being unutilizable.¹ The multifariously perverse sexual disposition of childhood can accordingly be regarded as the source of a number of our virtues, in so far as through reaction-formation it stimulates their development.²

[1905d, 1549]
Unconscious phantasies have either been unconscious all along and have been formed in the unconscious; or - as is more often the case - they were once conscious phantasies, day-dreams, and have since been purposely forgotten and have become unconscious through 'repression'. Their content may afterwards either have remained the same or have undergone alterations, so that the present unconscious phantasies are derivatives of the once conscious ones. Now an unconscious phantasy has a very important connection with the subject's sexual life; for it is identical with the phantasy which served to give him sexual satisfaction during a period of masturbation. At that time the masturbatory act (in the widest sense of the term) was compounded of two parts. One was the evocation of a phantasy and the other some active behaviour for obtaining self-gratification at the height of the phantasy. This compound, as we know, was itself merely soldered together.¹ Originally the action was a purely auto-erotic procedure for the purpose of obtaining pleasure from some particular part of the body, which could be described as erotogenic. Later, this action became merged with a wishful idea from the sphere of object-love and served as a partial realization of the situation in which the phantasy culminated. When, subsequently, the subject renounces this type of satisfaction, composed of masturbation and phantasy, the action is given up, while the phantasy, from being conscious, becomes unconscious. If no other mode of sexual satisfaction supervenes, the subject remains abstinent; and if he does not succeed in sublimating his libido - that is, in deflecting his sexual excitation to higher aims -, the condition is now fulfilled for his unconscious phantasy to be revived and to proliferate, and, at least as regards some part of its content, to put itself into effect, with the whole force of his need for love, in the form of a pathological symptom.

[1908a, 1934]

I know that no one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my Three Essays on the Theory of Sexuality in 1905. I there attempted to show that the sexual instinct of man is highly complex and is put together from contributions made by numerous constituents and component instincts. Important contributions to 'sexual excitation' are furnished by the peripheral excitations of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes, nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others - a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' - i.e. from the completion of the fifth year to the first manifestations of puberty (round about the eleventh year) - reaction-formations, or counter-forces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual instincts. Now anal erotism is one of the components of the instinct which, in the course of development and in accordance with the education demanded by our present civilization, have become unserviceable for sexual aims. It is therefore plausible to suppose that these character-traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.²

[1908b, 1943]
The sexual instinct - or, more correctly, the sexual instincts, for analytic investigation teaches us that the sexual instinct is made up of many separate constituents or component instincts - is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capacity for sublimation. In contrast to this displaceability, in which its value for civilization lies, the sexual instinct may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual instinct probably varies in each individual; certainly the proportion of it which is suitable for sublimation varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual instinct it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective quality of unpleasure, must be regarded as an illness.

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or inverts, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

¹ Hans's father even observed that simultaneously with this repression a certain amount of sublimation set in. From the time of the beginning of his anxiety Hans began to show an increased interest in music and to develop his inherited musical gift.

[1908d, 1952, 1909b, 2117]
A second outcome of the work of psycho-analysis is that it then becomes possible for the unconscious instincts revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called 'sublimation', in which the energy of the infantile wishful impulses is not cut off but remains ready for use - the unserviceable aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the sexual instinct that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed instinct impossible; when the repression is lifted, the path to sublimation becomes free once more.

Observation of men's daily lives shows us that most people succeed in directing very considerable portions of their sexual instinctual forces to their professional activity. The sexual instinct is particularly well fitted to make contributions of this kind since it is endowed with a capacity for sublimation: that is, it has the power to replace its immediate aim by other aims which may be valued more highly and which are not sexual. We accept this process as proved whenever the history of a person's childhood - that is, the history of his mental development - shows that in childhood this over-powerful instinct was in the service of sexual interests. We find further confirmation if a striking atrophy occurs in the sexual life of maturity, as though a portion of sexual activity had now been replaced by the activity of the over-powerful instinct.

In virtue of a special disposition, the third type, which is the rarest and most perfect, escapes both inhibition of thought and neurotic compulsive thinking. It is true that here too sexual repression comes about, but it does not succeed in relegating a component instinct of sexual desire to the unconscious. Instead, the libido evades the fate of repression by being sublimated from the very beginning into curiosity and by becoming attached to the powerful instinct for research as a reinforcement. Here, too, the research becomes to some extent compulsive and a substitute for sexual activity; but owing to the complete difference in the underlying psychical processes (sublimation instead of an irruption from the unconscious ) the quality of neurosis is absent; there is no attachment to the original complexes of infantile sexual research, and the instinct can operate freely in the service of intellectual interest. Sexual repression, which has made the instinct so strong through the addition to it of sublimated libido, is still taken into account by the instinct, in that it avoids any concern with sexual themes.
A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual instinct could be sublimated into a general urge to know, and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual instinct made to Leonardo's mental life.

[1910c, 2301]

But even if the historical material at our disposal were very abundant, and if the psychical mechanisms could be dealt with with the greatest assurance, there are two important points at which a psycho-analytic enquiry would not be able to make us understand how inevitable it was that the person concerned should have turned out in the way he did and in no other way. In Leonardo's case we have had to maintain the view that the accident of his illegitimate birth and the excessive tenderness of his mother had the most decisive influence on the formation of his character and on his later fortune, since the sexual repression which set in after this phase of childhood caused him to sublimate his libido into the urge to know, and established his sexual inactivity for the whole of his later life. But this repression after the first erotic satisfactions of childhood need not necessarily have taken place; in someone else it might perhaps not have taken place or might have assumed much less extensive proportions. We must recognize here a degree of freedom which cannot be resolved any further by psycho-analytic means. Equally, one has no right to claim that the consequence of this wave of repression was the only possible one. It is probable that another person would not have succeeded in withdrawing the major portion of his libido from repression by sublimating it into a craving for knowledge; under the same influences he would have sustained a permanent injury to his intellectual activity or have acquired an insurmountable disposition to obsessional neurosis. We are left, then, with these two characteristics of Leonardo which are inexplicable by the efforts of psycho-analysis: his quite special tendency towards instinctual repressions, and his extraordinary capacity for sublimating the primitive instincts.

[1910c, 2303]
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]

If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psychoanalysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]
Let us start with the latter, the **scientific** errors. The doctor's advice to the lady shows clearly in what sense he understands the expression 'sexual life' - in the popular sense, namely, in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of the sexual substances. He cannot have remained unaware, however, that psycho-analysis is commonly reproached with having extended the concept of what is sexual far beyond its usual range. The fact is undisputed; I shall not discuss here whether it may justly be used as a reproach. In psycho-analysis the concept of what is sexual comprises far more; it goes lower and also higher than its popular sense. This extension is justified genetically; we reckon as belonging to 'sexual life' all the activities of the tender feelings which have primitive sexual impulses as their source, even when those impulses have become inhibited in regard to their original sexual aim or have exchanged this aim for another which is no longer sexual. For this reason we prefer to speak of **psychosexuality**, thus laying stress on the point that the mental factor in sexual life should not be overlooked or underestimated. We use the word 'sexuality' in the same comprehensive sense as that in which the German language uses the word *lieben* ['to love']. We have long known, too, that mental absence of satisfaction with all its consequences can exist where there is no lack of normal sexual intercourse; and as therapists we always bear in mind that the unsatisfied sexual trends (whose substitutive satisfactions in the form of nervous symptoms we combat) can often find only very inadequate outlet in coitus or other sexual acts.

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to *esprit de corps* and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

Researches into the sexual activity of children have led to a further conception of the sexual instinct, based not on its purposes but on its sources. The sexual instinct possesses in a high degree the capacity for being diverted from direct sexual aims and for being directed towards higher aims which are no longer sexual ('sublimation'). The instinct is thus enabled to make most important contributions to the social and artistic achievements of humanity.
This much can be said by way of a general characterization of the sexual instincts. They are numerous, emanate from a great variety of organic sources, act in the first instance independently of one another and only achieve a more or less complete synthesis at a late stage. The aim which each of them strives for is the attainment of 'organ-pleasure'; only when synthesis is achieved do they enter the service of the reproductive function and thereupon become generally recognizable as sexual instincts. At their first appearance they are attached to the instincts of self-preservation, from which they only gradually become separated; in their choice of object, too, they follow the paths that are indicated to them by the ego-instincts. A portion of them remains associated with the ego-instincts throughout life and furnishes them with libidinal components, which in normal functioning easily escape notice and are revealed clearly only by the onset of illness. They are distinguished by possessing the capacity to act vicariously for one another to a wide extent and by being able to change their objects readily. In consequence of the latter properties they are capable of functions which are far removed from their original purposive actions - capable, that is, of 'sublimation'.

[1915c, 2963]

In further pursuing the discussion of this thesis, are we to consider the nature of the frustration or the peculiar character of those who are affected by it? It is extremely seldom, after all, that frustration is universal and absolute. In order to operate pathogenically it must no doubt affect the mode of satisfaction which alone the subject desires, of which alone he is capable. There are in general very many ways of tolerating deprivation of libidinal satisfaction without falling ill as a result. In the first place, we know people who are able to put up with a deprivation of this kind without being injured: they are not happy, they suffer from longing, but they do not fall ill. Next, we must bear in mind that the sexual instinctual impulses in particular are extraordinarily plastic, if I may so express it. One of them can take the place of another, one of them can take over another's intensity; if the satisfaction of one of them is frustrated by reality, the satisfaction of another can afford complete compensation. They are related to one another like a network of intercommunicating channels filled with a liquid; and this is so in spite of their being subject to the primacy of the genitals - a state of affairs that is not at all easily combined in a single picture. Further, the component instincts of sexuality, as well as the sexual current which is compounded from them, exhibit a large capacity for changing their object, for taking another in its place - and one, therefore, that is more easily attainable. This displaceability and readiness to accept a substitute must operate powerfully against the pathogenic effect of a frustration. Among these protective processes against falling ill owing to deprivation there is one which has gained special cultural significance. It consists in the sexual trend abandoning its aim of obtaining a component or a reproductive pleasure and taking on another which is related genetically to the abandoned one but is itself no longer sexual and must be described as social. We call this process 'sublimation', in accordance with the general estimate that places social aims higher than the sexual ones, which are at bottom self-interested. Sublimation is, incidentally, only a special case of the way in which sexual trends are attached to other, non-sexual ones. We shall have to discuss it again in another connection.

[1916-1917, 3408]
You will no doubt have observed that in these last discussions I have introduced a fresh factor into the structure of the aetiological chain - namely the quantity, the magnitude, of the energies concerned. We have still to take this factor into account everywhere. A purely qualitative analysis of the aetiological determinants is not enough. Or, to put it another way, a merely dynamic view of these mental processes is insufficient; an economic line of approach is also needed. We must tell ourselves that the conflict between two trends does not break out till certain intensities of cathexis have been reached, even though the determinants for it have long been present so far as their subject-matter is concerned. In the same way, the pathogenic significance of the constitutional factors must be weighed according to how much more of one component instinct than of another is present in the inherited disposition. It may even be supposed that the disposition of all human beings is qualitatively alike and that they differ only owing to these quantitative conditions. The quantitative factor is no less decisive as regards capacity to resist neurotic illness. It is a matter of what quota of unemployed libido a person is able to hold in suspension and of how large a fraction of his libido he is able to divert from sexual to sublimated aims. The ultimate aim of mental activity, which may be described qualitatively as an endeavour to obtain pleasure and avoid unpleasure, emerges, looked at from the economic point of view, as the task of mastering the amounts of excitation (mass of stimuli) operating in the mental apparatus and of keeping down their accumulation which creates unpleasure.

[1916-1917, 3429]

We are justified in saying that they have been diverted from these sexual aims, even though there is some difficulty in giving a description of such a diversion of aim which will conform to the requirements of metapsychology. Moreover, those instincts which are inhibited in their aims always preserve some few of their original sexual aims; even an affectionate devotee, even a friend or an admirer, desires the physical proximity and the sight of the person who is now loved only in the 'Pauline' sense. If we choose, we may recognize in this diversion of aim a beginning of the sublimation of the sexual instincts, or on the other hand we may fix the limits of sublimation at some more distant point. Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited. Since they are not capable of really complete satisfaction, they are especially adapted to create permanent ties; while those instincts which are directly sexual incur a loss of energy each time they are satisfied, and must wait to be renewed by a fresh accumulation of sexual libido, so that meanwhile the object may have been changed. The inhibited instincts are capable of any degree of admixture with the uninhibited; they can be transformed back into them, just as they arose out of them. It is well known how easily erotic wishes develop out of emotional relations of a friendly character, based upon appreciation and admiration (compare Molière's 'Kiss me for the love of Greek'), between a master and a pupil, between a performer and a delighted listener, and especially in the case of women. In fact the growth of emotional ties of this kind, with their purposeless beginnings, provides a much frequented pathway to sexual object-choice. Pfister, in his Frömmigkeit des Grafen von Zinzendorf (1910), has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement. On the other hand it is also very usual for directly sexual impulsions, short-lived in themselves, to be transformed into a lasting and purely affectionate tie; and the consolidation of a passionate love marriage rests to a large extent upon this process.

[1921c, 3830]
Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathectic to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.

[1923a, 3932]

The transformation of object-libido into narcissistic libido which thus takes place obviously implies an abandonment of sexual aims, a desexualization - a kind of sublimation, therefore. Indeed, the question arises, and deserves careful consideration, whether this is not the universal road to sublimation, whether all sublimation does not take place though the mediation of the ego, which begins by changing sexual object-libido into narcissistic libido and then, perhaps, goes on to give it another aim.¹ We shall later on have to consider whether other instinctual vicissitudes may not also result from this transformation, whether, for instance, it may not bring about a defusion of the various instincts that are fused together.

[1923b, 3964]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]
If this displaceable energy is desexualized libido, it may also be described as sublimated energy; for it would still retain the main purpose of Eros - that of uniting and binding - in so far as it helps towards establishing the unity, or tendency to unity, which is particularly characteristic of the ego. If thought processes in the wider sense are to be included among these displacements, then the activity of thinking is also supplied from the sublimation of erotic motive forces.

[1923b, 3979]

Here we arrive again at the possibility which has already been discussed that sublimation may take place regularly, through the mediation of the ego. The other case will be recollected, in which the ego deals with the first object-cathexes of the id (and certainly with later ones too) by taking over the libido from them into itself and binding it to the alteration of the ego produced by means of identification. The transformation into ego-libido of course involves an abandonment of sexual aims, a desexualization. In any case this throws light upon an important function of the ego in its relation to Eros. By thus getting hold of the libido from the object-cathexes, setting itself up as sole love-object, and desexualizing or sublimating the libido of the id, the ego is working in opposition to the purposes of Eros and placing itself at the service of the opposing instinctual impulses. It has to acquiesce in some of the other object-cathexes of the id; it has, so to speak, to participate in them. We shall come back later to another possible consequence of this activity of the ego.

[1923b, 3979]

And from the struggle against Eros! It can hardly be doubted that the pleasure principle serves the id as a compass in its struggle against the libido - the force that introduces disturbances into the process of life. If it is true that Fechner's principle of constancy governs life, which thus consists of a continuous descent towards death, it is the claims of Eros, of the sexual instincts, which, in the form of instinctual needs, hold up the falling level and introduce fresh tensions. The id, guided by the pleasure principle - that is, by the perception of unpleasure - fends off these tensions in various ways. It does so in the first place by complying as swiftly as possible with the demands of the non-desexualized libido - by striving for the satisfaction of the directly sexual trends. But it does so in a far more comprehensive fashion in relation to one particular form of satisfaction in which all component demands converge - by discharge of the sexual substances, which are saturated vehicles, so to speak, of the erotic tensions. The ejection of the sexual substances in the sexual act corresponds in a sense to the separation of soma and germ-plasm. This accounts for the likeness of the condition that follows complete sexual satisfaction to dying, and for the fact that death coincides with the act of copulation in some of the lower animals. These creatures die in the act of reproduction because, after Eros has been eliminated through the process of satisfaction, the death instinct has a free hand for accomplishing its purposes. Finally, as we have seen, the ego, by sublimating some of the libido for itself and its purposes, assists the id in its work of mastering the tensions.

[1923b, 3981]

Towards the two classes of instincts the ego's attitude is not impartial. Through its work of identification and sublimation it gives the death instincts in the id assistance in gaining control over the libido, but in so doing it runs the risk of becoming the object of the death instincts and of itself perishing. In order to be able to help in this way it has had itself to become filled with libido; it thus itself becomes the representative of Eros and henceforward desires to live and to be loved.

[1923b, 3990]
I have described elsewhere how this turning away takes place. The object-cathexes are given up and replaced by identifications. The authority of the father or the parents is introjected into the ego, and there it forms the nucleus of the super-ego, which takes over the severity of the father and perpetuates his prohibition against incest, and so secures the ego from the return of the libidinal object-cathexis. The libidinal trends belonging to the Oedipus complex are in part desexualized and sublimated (a thing which probably happens with every transformation into an identification) and in part inhibited in their aim and changed into impulses of affection. The whole process has, on the one hand, preserved the genital organ - has averted the danger of its loss - and, on the other, has paralysed it - has removed its function. This process ushers in the latency period, which now interrupts the child's sexual development.

If we leave little-known internal urges out of account, we may say that the main motive force towards the cultural development of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of instinctual impulses which could not be satisfied socially. With the further advances of civilization the demands of repression also grew. Civilization is after all built entirely on renunciation of instinct, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psycho-analysis has shown that it is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.

This state of affairs is enough to account for the reluctant and hesitant reception of analysis in scientific quarters. But it does not explain the outbursts of indignation, derision and scorn which, in disregard of every standard of logic and good taste, have characterized the controversial methods of its opponents. A reaction of such a kind suggests that resistances other than purely intellectual ones were stirred up and that powerful emotional forces were aroused. And there are indeed plenty of things to be found in the theory of psycho-analysis calculated to produce such an effect as this upon the passions of men of every kind and not of scientists alone. Above all there is the very important place in the mental life of human beings which psycho-analysis assigns to what are known as the sexual instincts. Psycho-analytic theory maintained that the symptoms of neuroses are distorted substitutive satisfactions of sexual instinctual forces, the direct satisfaction of which has been frustrated by internal resistances. Later on, when analysis had extended beyond its original field of work and began to be applied to normal mental life, it sought to show that these same sexual components, which could be diverted from their immediate aims and directed to other things, made the most important contributions to the cultural achievements of the individual and of society. These views were not entirely new. The incomparable significance of sexual life had been proclaimed by the philosopher Schopenhauer in an intensely impressive passage. Moreover, what psycho-analysis called sexuality was by no means identical with the impulsion towards a union of the two sexes or towards producing a pleasurable sensation in the genitals; it had far more resemblance to the all-inclusive and all-preserving Eros of Plato's Symposium.
The second of my alleged extensions of the concept of sexuality finds its justification in the fact revealed by psycho-analytic investigation that all of these affectionate impulses were originally of a completely sexual nature but have become inhibited in their aim or sublimated. The manner in which the sexual instincts can thus be influenced and diverted enables them to be employed for cultural activities of every kind, to which indeed they bring the most important contributions.

[1925d, 4214]

In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called narcissism or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object-cathexes are sent out and into which the libido can stream back again from the objects. Thus narcissistic libido is constantly being transformed into object-libido, and vice versa. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had only been paid to what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the instincts of self-preservation operating in the ego (the 'ego-instincts') and that it was brought to bear upon the libidinal instincts. But since the instincts of self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object-libido, the interest of self-preservation was defending itself against the demands of object-love, and therefore against the demands of sexuality in the narrower sense as well.

[1925d, 4231]

This is not very illuminating. We can only note that disturbances of the sexual function are brought about by a great variety of means. (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple); (2) the function may be less well carried out; (3) it may be hampered by having conditions attached to it, or modified by being diverted to other aims; (4) it may be prevented by security measures; (5) if it cannot be prevented from starting, it may be immediately interrupted by the appearance of anxiety; and (6), if it is nevertheless carried out, there may be a subsequent reaction of protest against it and an attempt to undo what has been done.

[1926d, 4249]

Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the 'sublimation' of instincts, the part played by symbolism, the problem of ambivalence, etc. Nor has there been space to allude to the applications of psycho-analysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Social Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psycho-analysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these other branches of mental science.

[1926f, 4406]
Another technique for fending off suffering is the employment of the displacements of libido which our mental apparatus permits of and through which its function gains so much in flexibility. The task here is that of shifting the instinctual aims in such a way that they cannot come up against frustration from the external world. In this, sublimation of the instincts lends its assistance. One gains the most if one can sufficiently heighten the yield of pleasure from the sources of psychical and intellectual work. When that is so, fate can do little against one. A satisfaction of this kind, such as an artist's joy in creating, in giving his phantasies body, or a scientist's in solving problems or discovering truths, has a special quality which we shall certainly one day be able to characterize in metapsychological terms. At present we can only say figuratively that such satisfactions seem 'finer and higher'. But their intensity is mild as compared with that derived from the sating of crude and primary instinctual impulses; it does not convulse our physical being. And the weak point of this method is that it is not applicable generally: it is accessible to only a few people. It presupposes the possession of special dispositions and gifts which are far from being common to any practical degree. And even to the few who do possess them, this method cannot give complete protection from suffering. It creates no impenetrable armour against the arrows of fortune, and it habitually fails when the source of suffering is a person's own body.¹

¹ When there is no special disposition in a person which imperatively prescribes what direction his interests in life shall take, the ordinary professional work that is open to everyone can play the part assigned to it by Voltaire's wise advice. It is not possible, within the limits of a short survey, to discuss adequately the significance of work for the economics of the libido. No other technique for the conduct of life attaches the individual so firmly to reality as laying emphasis on work; for his work at least gives him a secure place in a portion of reality, in the human community. The possibility it offers of displacing a large amount of libidinal components, whether narcissistic, aggressive or even erotic, on to professional work and on to the human relations connected with it lends it a value by no means second to what it enjoys as something indispensible to the preservation and justification of existence in society. Professional activity is a source of special satisfaction if it is a freely chosen one - if, that is to say, by means of sublimation, it makes possible the use of existing inclinations, of persisting or constitutionally reinforced instinctual impulses. And yet, as a path to happiness, work is not highly prized by men. They do not strive after it as they do after other possibilities of satisfaction. The great majority of people only work under the stress of necessity, and this natural human aversion to work raises most difficult social problems.

While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

¹ [1930a, 4479]
In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

[1930a, 4482]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹ Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

[1930a, 4494]
The conjecture which goes deepest, however, is the one which takes its start from what I have said above (p. 4495) in my footnote. It is to the effect that, with the assumption of an erect posture by man and with the depreciation of his sense of smell, it was not only his anal erotism which threatened to fall a victim to organic repression, but the whole of his sexuality; so that since this, the sexual function has been accompanied by a repugnance which cannot further be accounted for, and which prevents its complete satisfaction and forces it away from the sexual aim into sublimations and libidinal displacements. I know that Bleuler (1913) once pointed to the existence of a primary repelling attitude like this towards sexual life. All neurotics, and many others besides, take exception to the fact that ‘inter urinas et faeces nascimur’.

The genitals, too, give rise to strong sensations of smell which many people cannot tolerate and which spoil sexual intercourse for them. Thus we should find that the deepest root of the sexual repression which advances along with civilization is the organic defence of the new form of life achieved with man's erect gait against his earlier animal existence. This result of scientific research coincides in a remarkable way with commonplace prejudices that have often made themselves heard. Nevertheless, these things are at present no more than unconfirmed possibilities which have not been substantiated by science. Nor should we forget that, in spite of the undeniable depreciation of olfactory stimuli, there exist even in Europe people among whom the strong genital odours which are so repellent to us are highly prized as sexual stimulants and who refuse to give them up. (Cf. the collections of folklore obtained from Iwan Bloch's questionnaire on the sense of smell in sexual life published in different volumes of Friedrich S. Krauss's *Anthropophyteia*.)

An instinct, then, is distinguished from a stimulus by the fact that it arises from sources of stimulation within the body, that it operates as a constant force and that the subject cannot avoid it by flight, as is possible with an external stimulus. We can distinguish an instinct's source, object and aim. Its source is a state of excitation in the body, its aim is the removal of that excitation; on its path from its source to its aim the instinct becomes operative psychically. We picture it as a certain quota of energy which presses in a particular direction. It is from this pressing that it derives its name of ‘Trieb’. People speak of ‘active’ and ‘passive’ instincts, but it would be more correct to speak of instincts with active and passive aims: for an expenditure of activity is needed to achieve a passive aim as well. The aim can be achieved in the subject's own body; as a rule an external object is brought in, in regard to which the instinct achieves its external aim; its internal aim invariably remains the bodily change which is felt as satisfaction. It has not become clear to us whether the relation of the instinct to its somatic source gives it a specific quality and if so what. The evidence of analytic experience shows that it is an undoubted fact that instinctual impulses from one source attach themselves to those from other sources and share their further vicissitudes and that in general one instinctual satisfaction can be replaced by another. But it must be admitted that we do not understand this very well. The relations of an instinct to its aim and object are also open to alterations; both can be exchanged for other ones, though its relation to its object is nevertheless the more easily loosened. A certain kind of modification of the aim and change of the object, in which our social valuation is taken into account, is described by us as 'sublimation'. Besides this, we have grounds for distinguishing instincts which are 'inhibited in their aim' - instinctual impulses from sources well known to us with an unambiguous aim, but which come to a stop on their way to satisfaction, so that a lasting object-cathexis comes about and a permanent trend. Such, for instance, is the relation of tenderness, which undoubtedly originates from the sources of sexual need and invariably renounces its satisfaction.

[1930a, 4499]

[1933a, 4702]
It would be a mistake to suppose that these three phases succeed one another in a clear-cut fashion. One may appear in addition to another; they may overlap one another, may be present alongside of one another. In the early phases the different component instincts set about their pursuit of pleasure independently of one another; in the phallic phase there are the beginnings of an organization which subordinates the other urges to the primacy of the genitals and signifies the start of a co-ordination of the general urge towards pleasure into the sexual function. The complete organization is only achieved at puberty, in a fourth, genital phase. A state of things is then established in which (1) some earlier libidinal cathexes are retained, (2) others are taken into the sexual function as preparatory, auxiliary acts, the satisfaction of which produces what is known as fore-pleasure, and (3) other urges are excluded from the organization, and are either suppressed altogether (repressed) or are employed in the ego in another way, forming character-traits or undergoing sublimation with a displacement of their aims.

[1940a [1938], 4966]
Reversal of an instinct into its opposite resolves on closer examination into two different processes: a change from activity to passivity, and a reversal of its content. The two processes, being different in their nature, must be treated separately.

[1915c, 2964]

No doubt was left in the analysis that these passive trends had made their appearance at the same time as the active-sadistic ones, or very soon after them.¹ This is in accordance with the unusually clear, intense, and constant ambivalence of the patient, which was shown here for the first time in the even development of both members of the pairs of contrary component instincts. Such behaviour was also characteristic of his later life, and so was this further trait: no position of the libido which had once been established was ever completely replaced by a later one. It was rather left in existence side by side with all the others, and this allowed him to maintain an incessant vacillation which proved to be incompatible with the acquisition of a stable character.

[1918b, 3517]

Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathectic to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.

[1923a, 3932]

Even in sexual chemistry things must be rather more complicated. For psychology, however, it is a matter of indifference whether there is a single sexually exciting substance in the body or two or countless numbers of them. Psycho-analysis teaches us to manage with a single libido, which, it is true, has both active and passive aims (that is, modes of satisfaction). This antithesis and, above all, the existence of libidinal trends with passive aims, contains within itself the remainder of our problem.

[1931b, 4604]
The processes at puberty thus establish the primacy of the genital zones; and, in a man, the penis, which has now become capable of erection, presses forward insistently towards the new sexual aim - penetration into a cavity in the body which excites his genital zone. Simultaneously on the psychical side the process of finding an object, for which preparations have been made from earliest childhood, is completed. At a time at which the first beginnings of sexual satisfaction are still linked with the taking of nourishment, the sexual instinct has a sexual object outside the infant's own body in the shape of his mother's breast. It is only later that the instinct loses that object, just at the time, perhaps, when the child is able to form a total idea of the person to whom the organ that is giving him satisfaction belongs. As a rule the sexual instinct then becomes auto-erotic, and not until the period of latency has been passed through is the original relation restored. There are thus good reasons why a child sucking at his mother's breast has become the prototype of every relation of love. The finding of an object is in fact a refinding of it.¹

THE SEXUAL OBJECT DURING EARLY INFANCY  But even after sexual activity has become detached from the taking of nourishment, an important part of this first and most significant of all sexual relations is left over, which helps to prepare for the choice of an object and thus to restore the happiness that has been lost. All through the period of latency children learn to feel for other people who help them in their helplessness and satisfy their needs a love which is on the model of, and a continuation of, their relation as sucklings to their nursing mother. There may perhaps be an inclination to dispute the possibility of identifying a child's affection and esteem for those who look after him with sexual love. I think, however, that a closer psychological examination may make it possible to establish this identity beyond any doubt. A child's intercourse with anyone responsible for his care affords him an unending source of sexual excitation and satisfaction from his erogenous zones. This is especially so since the person in charge of him, who, after all, is as a rule his mother, herself regards him with feelings that are derived from her own sexual life: she strokes him, kisses him, rocks him and quite clearly treats him as a substitute for a complete sexual object.¹ A mother would probably be horrified if she were made aware that all her marks of affection were rousing her child's sexual instinct and preparing for its later intensity. She regards what she does as asexual, 'pure' love, since, after all, she carefully avoids applying more excitations to the child's genitals than are unavoidable in nursery care. As we know, however, the sexual instinct is not aroused only by direct excitation of the genital zone. What we call affection will unfailingly show its effects one day on the genital zones as well. Moreover, if the mother understood more of the high importance of the part played by instincts in mental life as a whole - in all its ethical and psychical achievements - she would spare herself any self-reproaches even after her enlightenment. She is only fulfilling her task in teaching the child to love. After all, he is meant to grow up into a strong and capable person with vigorous sexual needs and to accomplish during his life all the things that human beings are urged to do by their instincts. It is true that an excess of parental affection does harm by causing precocious sexual maturity and also because, by spoiling the child, it makes him incapable in later life of temporarily doing without love or of being content with a smaller amount of it. One of the clearest indications that a child will later become neurotic is to be seen in an insatiable demand for his parents' affection. And on the other hand neuropathic parents, who are inclined as a rule to display excessive affection, are precisely those who are most likely by their caresses to arouse the child's disposition to neurotic illness. Incidentally, this example shows that there are ways more direct than inheritance by which neurotic parents can hand their disorder on to their children.
In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child's sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

[1905d, 1545]

An enquiry which deals with the comic, however cursorily, would be seriously incomplete if it did not find room for at least a few remarks about humour. The essential kinship between the two is so little open to doubt that an attempt at explaining the comic is bound to make at least some contribution to an understanding of humour. However much that is pertinent and impressive may have been brought forward in the appreciation of humour (which, itself one of the highest psychical achievements, enjoys the particular favour of thinkers), yet we cannot evade an attempt at giving expression to its nature by an approach to the formulas for jokes and for the comic.

[1905c, 1803]

We have seen that the release of distressing affects is the greatest obstacle to the emergence of the comic. As soon as the aimless movement does damage, or the stupidity leads to mischief, or the disappointment causes pain, the possibility of a comic effect is at an end. This is true, at all events, for a person who cannot ward off such unpleasure, who is himself its victim or is obliged to have a share in it; whereas a person who is not concerned shows by his demeanour that the situation involved contains everything that is required for a comic effect. Now humour is a means of obtaining pleasure in spite of the distressing affects that interfere with it; it acts as a substitute for the generation of these affects, it puts itself in their place. The conditions for its appearance are given if there is a situation in which, according to our usual habits, we should be tempted to release a distressing affect and if motives then operate upon us which suppress that affect in statu nascendi. In the cases that have just been mentioned the person who is the victim of the injury, pain, and so on, might obtain humorous pleasure, while the unconcerned person laughs from comic pleasure. The pleasure of humour, if this is so, comes about - we cannot say otherwise - at the cost of a release of affect that does not occur: it arises from an economy in the expenditure of affect.

[1905c, 1803]
Humour is the most easily satisfied among the species of the comic. It completes its course within a single person; another person's participation adds nothing new to it. I can keep to myself the enjoyment of the humorous pleasure that has arisen in me, without feeling obliged to communicate it. It is not easy to say what happens in a person when humorous pleasure is generated; but we can obtain some insight if we examine the cases in which humour is communicated or sympathized with, cases in which, by an understanding of the humorous person, we arrive at the same pleasure as his. The crudest case of humour - what is known as Galgenthumor - may be instructive in this connection. A rogue who was being led out to execution on a Monday remarked: 'Well, this week's beginning nicely.' This is actually a joke, since the remark is quite apt in itself, but on the other hand, is misplaced in a nonsensical way, since for the man himself there would be no further events that week. But humour is concerned in the making of such a joke - that is, in disregarding what it is that distinguishes the beginning of this week from others, in denying the distinction which might give rise to motives for quite special emotions. The case was the same when the rogue on his way to execution asked for a scarf for his bare throat so as not to catch cold - an otherwise laudable precaution but one which, in view of what lay in store so shortly for the neck, was remarkably superfluous and unimportant. It must be confessed that there is something like magnanimity in this blague, in the man's tenacious hold upon his customary self and his disregard of what might overthrow that self and drive it to despair. This kind of grandeur of humour appears unmistakably in cases in which our admiration is not inhibited by the circumstances of the humorous person.
[1905c, 1804]

This is humour on the grand scale, and if when we hear it we do not laugh, that is because our admiration covers the humorous pleasure. In the case of the rogue who refuses to catch cold on the way to execution we laugh heartily. The situation that ought to drive the criminal to despair might rouse intense pity in us; but that pity is inhibited because we understand that he, who is more closely concerned, makes nothing of the situation. As a result of this understanding, the expenditure on the pity, which was already prepared, becomes unutilizable and we laugh it off. We are, as it were, infected by the rogue's indifference - though we notice that it has cost him a great expenditure of psychical work.
[1905c, 1805]
An economy of pity is one of the most frequent sources of humorous pleasure. Mark Twain's humour usually works with his mechanism. In an account of his brother's life, for instance, he tells us how he was at one time employed on a great road-making enterprise. The premature explosion of a mine blew him up into the air and he came down again far away from the place where he had been working. We are bound to have feelings of sympathy for the victim of the accident and would like to ask whether he was injured by it. But when the story goes on to say that his brother had a half-day's wages deducted for being 'absent from his place of employment' we are entirely distracted from our pity and become almost as hard-hearted as the contractor and almost as indifferent to possible damage to the brother's health. On another occasion Mark Twain presents us with his family tree, which he traces back to one of Columbus's fellow-voyagers. He then describes this ancestor's character and how his baggage consisted entirely of a number of pieces of washing each of which had a different laundry-mark - here we cannot help laughing at the cost of an economy of the feelings of piety into which we were prepared to enter at the beginning of this family history. The mechanism of the humorous pleasure is not interfered with by our knowledge that this pedigree is a fictitious one and that the fiction serves the satirical purpose of exposing the embellishments in similar accounts by other people: it is as independent of the condition that it must be real as in the case of making things comic. In yet another story, Mark Twain describes how his brother constructed a subterranean dwelling, into which he brought a bed, a table and a lamp and which he roofed over with a large piece of sailcloth with a hole in the middle. At night, however, after the hut was finished, a cow that was being driven home fell through the opening of the roof on to the table and put out the lamp. His brother patiently helped to get the beast out and put the establishment to rights again. Next night the same interruption was repeated and his brother behaved as before. And so it was every following night. Repetition makes the story comic, but Mark Twain ends it by reporting that on the forty-sixth night, when the cow fell through again, his brother finally remarked: 'The thing's beginning to get monotonous.' At this our humorous pleasure cannot be kept back, for what we had long expected to hear was that this obstinate set of misfortunes would make his brother angry. And indeed the small contributions of humour that we produce ourselves are as a rule made at the cost of anger - instead of getting angry.

[1905c, 1805]

The ingenious knight Don Quixote de la Mancha is, on the contrary, a figure who possesses no humour himself but who with his seriousness offers us a pleasure which could be called humorous, though its mechanism shows an important divergence from that of humour. Don Quixote is originally a purely comic figure, a big child; the phantasies from his books of chivalry have gone to his head. It is well known that to begin with the author intended nothing else of him and that his creation gradually grew far beyond its creator's first intentions. But after the author had equipped this ridiculous figure with the deepest wisdom and the noblest purposes and had made him into the symbolic representative of an idealism which believes in the realization of its aims and takes duties seriously and takes promises literally, this figure ceased to have a comic effect. Just as in other cases humorous pleasure arises from the prevention of an emotion, so it does here from the interference with comic pleasure. But it is clear that these examples have already carried us a long way from the simple cases of humour.

[1905c, 1805]
The species of humour are extraordinarily variegated according to the nature of the emotion which is economized in favour of the humour: pity, anger, pain, tenderness, and so on. Their number seems to remain uncompleted because the kingdom of humour is constantly being enlarged whenever an artist or writer succeeds in submitting some hitherto unconquered emotions to the control of humour, in making them, by devices like those in the examples we have given, into sources of humorous pleasure. The artists in Simplicissimus, for instance, have had astonishing results in achieving humour at the cost of horror and disgust. The forms in which humour is manifested are, moreover, determined by two peculiarities which are connected with the conditions under which it is generated. Humour may, in the first place, appear merged with a joke or some other species of the comic; in that case its task is to get rid of a possibility implicit in the situation that an affect may be generated which would interfere with the pleasurable outcome. In the second place, it may stop this generating of an affect entirely or only partially; this last is actually the commoner case since it is easier to bring about, and it produces the various forms of "broken" humour - the humour that smiles through tears. It withdraws a part of its energy from the affect and in exchange gives it a tinge of humour.

The humorous pleasure derived from sympathy originates, as can be seen from the examples above, from a peculiar technique comparable to displacement, by means of which the release of affect that is already in preparation is disappointed and the cathexis diverted on to something else, often on to something of secondary importance. But this does not help us at all to understand the process by which the displacement away from the generating of affect takes place in the humorous person himself. We can see that the receiver imitates the creator of the humour in his mental processes, but this tells us nothing of the forces which make the process possible in the latter.

We can only say that if someone succeeds, for instance, in disregarding a painful affect by reflecting on the greatness of the interests of the world as compared with his own smallness, we do not regard this as an achievement of humour but of philosophical thought, and if we put ourselves into his train of thought, we obtain no yield of pleasure. Humorous displacement is thus just as impossible under the glare of conscious attention as is comic comparison; like the latter, it is tied to the condition of remaining preconscious or automatic.

We can gain some information about humorous displacement if we look at it in the light of a defensive process. Defensive processes are the psychical correlative of the flight reflex and perform the task of preventing the generation of unpleasure from internal sources. In fulfilling this task they serve mental events as an automatic regulation, which in the end, incidentally, turns out to be detrimental and has to be subjected to conscious thinking. I have indicated one particular form of this defence, repression that has failed, as the operative mechanism for the development of psychoneuroses. Humour can be regarded as the highest of these defensive processes. It scorns to withdraw the ideational content bearing the distressing affect from conscious attention as repression does, and thus surmounts the automatism of defence. It brings this about by finding a means of withdrawing the energy from the release of unpleasure that is already in preparation and of transforming it, by discharge, into pleasure. It is even conceivable that once again it may be a connection with the infantile that puts the means for achieving this at its disposal. Only in childhood have there been distressing affects at which the adult would smile to-day - just as he laughs, as a humorist, at his present distressing affects. The exaltation of his ego, to which the humorous displacement bears witness, and of which the translation would no doubt be 'I am too big (too fine) to be distressed by these things', might well be derived from his comparing his present ego with his childish one. This view is to some extent supported by the part played by the infantile in neurotic processes of repression.
On the whole humour is closer to the comic than to jokes. It shares with the former its psychical localization in the preconscious whereas jokes, as we have had to suppose, are formed as a compromise between the unconscious and the preconscious. On the other hand humour does not participate in a peculiar characteristic common to jokes and the comic, on which we have perhaps not yet laid sufficient stress. It is a necessary condition for generating the comic that we should be obliged, simultaneously or in rapid succession, to apply to one and the same act of ideation two different ideational methods, between which the 'comparison' is then made and the comic difference emerges. Differences in expenditure of this kind arise between that belongs to someone else and to oneself, between what is as usual and what has been changed, between what is expected and what happens.¹ In the case of jokes, the difference between two simultaneous methods of viewing things, which operate with a different expenditure, applies to the process in the person who hears the joke. One of these two views, following the hints contained in the joke, passes along the path of thought through the unconscious; the other stays on the surface and views the joke like any other wording that has emerged from the preconscious and become conscious. We should perhaps be justified in representing the pleasure from a joke that is heard as being derived from the difference between these two methods of viewing it.² Here we are saying of jokes what we described as their possessing a Janus head, while the relation between jokes and the comic had still to be cleared up.³

In the case of humour the characteristic which we have just brought forward becomes effaced. It is true that we feel humorous pleasure when an emotion is avoided which we should have expected because it usually accompanies the situation, and to that extent humour too comes under the extended concept of the comic of expectation. But with humour it is no longer a question of two different methods of viewing the same subject matter. The fact that the situation is dominated by the emotion that is to be avoided, which is of an unpleasurable character, puts an end to the possibility of comparing it with the characteristics of the comic and of jokes. Humorous displacement is in fact a case of a liberated expenditure being used elsewhere - a case which has been shown to be so perilous to a comic effect.

We are now at the end of our task, having reduced the mechanism of humorous pleasure to a formula analogous to those for comic pleasure and for jokes. The pleasure in jokes has seemed to us to arise from an economy in expenditure upon inhibition, the pleasure in the comic from an economy in expenditure upon ideation (upon cathexis) and the pleasure in humour from an economy in expenditure upon feeling. In all three modes of working of our mental apparatus the pleasure is derived from an economy. All three are agreed in representing methods of regaining from mental activity a pleasure which has in fact been lost through the development of that activity. For the euphoria which we endeavour to reach by these means is nothing other than the mood of a period of life in which we were accustomed to deal with our psychical work in general with a small expenditure of energy - the mood of our childhood, when we were ignorant of the comic, when we were incapable of jokes and when we had no need of humour to make us feel happy in our life.
There is another consideration for the sake of which we will dwell a moment longer on this contrast between reality and play. When the child has grown up and has ceased to play, and after he has been labouring for decades to envisage the realities of life with proper seriousness, he may one day find himself in a mental situation which once more undoes the contrast between play and reality. As an adult he can look back on the intense seriousness with which he once carried on his games in childhood; and, by equating his ostensibly serious occupations of to-day with his childhood games, he can throw off the too heavy burden imposed on him by life and win the high yield of pleasure afforded by humour.

In his subsequent development, however, it was not to homosexuality that our young libertine proceeded, but to an energetic masculinity with traits of polygamy; he knew how to vary his behaviour, too, with his varying feminine objects - audaciously aggressive in one case, languishing and bashful in another. His affection had moved from his mother on to other objects of love, but at a time when there was a scarcity of these it returned to her, only to break down in a neurosis. It was not until this happened that it became evident to what a pitch of intensity his love for his mother had developed and through what vicissitudes it had passed. The sexual aim which he pursued with his girl playmates, of sleeping with them, had originated in relation to his mother. It was expressed in words which might be retained in maturity, though they would then bear a richer connotation.¹ The boy had found his way to object-love in the usual manner from the care he had received when he was an infant; and a new pleasure had now become the most important for him - that of sleeping beside his mother. I should like to emphasize the importance of pleasure derived from cutaneous contact as a component in this new aim of Hans's, which, according to the nomenclature (artificial to my mind) of Moll, would have to be described as satisfaction of the instinct of conrectation.

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object-love, and in the formation of that complex which deserves to be called the nuclear complex of the neuroses. It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened - usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about.
I have promised to tell you of a few more psychical peculiarities of mature femininity, as we come across them in analytic observation. We do not lay claim to more than an average validity for these assertions; nor is it always easy to distinguish what should be ascribed to the influence of the sexual function and what to social breeding. Thus, we attribute a larger amount of narcissism to femininity, which also affects women's choice of object, so that to be loved is a stronger need for them than to love. The effect of penis-envy has a share, further, in the physical vanity of women, since they are bound to value their charms more highly as a late compensation for their original sexual inferiority. Shame, which is considered to be a feminine characteristic par excellence but is far more a matter of convention than might be supposed, has as its purpose, we believe, concealment of genital deficiency. We are not forgetting that at a later time shame takes on other functions. It seems that women have made few contributions to the discoveries and inventions in the history of civilization; there is, however, one technique which they may have invented - that of plaiting and weaving. If that is so, we should be tempted to guess the unconscious motive for the achievement. Nature herself would seem to have given the model which this achievement imitates by causing the growth at maturity of the pubic hair that conceals the genitals. The step that remained to be taken lay in making the threads adhere to one another, while on the body they stick into the skin and are only matted together. If you reject this idea as fantastic and regard my belief in the influence of lack of a penis on the configuration of femininity as an idée fixe, I am of course defenceless.

[1933a, 4734]

The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him.

[1933a, 4735]
A woman's identification with her mother allows us to distinguish two strata: the pre-Oedipus one which rests on her affectionate attachment to her mother and takes her as a model, and the later one from the Oedipus complex which seeks to get rid of her mother and take her place with her father. We are no doubt justified in saying that much of both of them is left over for the future and that neither of them is adequately surmounted in the course of development. But the phase of the affectionate pre-Oedipus attachment is the decisive one for a woman's future: during it preparations are made for the acquisition of the characteristics with which she will later fulfil her role in the sexual function and perform her invaluable social tasks. It is in this identification too that she acquires her attractiveness to a man, whose Oedipus attachment to his mother it kindles into passion. How often it happens, however, that it is only his son who obtains what he himself aspired to! One gets an impression that a man's love and a woman's are a phase apart psychologically.
[1933a, 4736]
CONCLUSION   It will be seen that we are not in a position to base a satisfactory explanation of 
the origin of inversion upon the material at present before us. Nevertheless our 
investigation has put us in possession of a piece of knowledge which may turn out to be of 
greater importance to us than the solution of that problem. It has been brought to our notice that 
we have been in the habit of regarding the connection between the sexual instinct and the sexual 
object as more intimate than it in fact is. Experience of the cases that are considered abnormal 
has shown us that in them the sexual instinct and the sexual object are merely soldered together - 
a fact which we have been in danger of overlooking in consequence of the uniformity of the 
normal picture, where the object appears to form part and parcel of the instinct. We are thus 
warned to loosen the bond that exists in our thoughts between instinct and object. It seems 
probable that the sexual instinct is in the first instance independent of its object; nor is its origin 
likely to be due to its object's attractions.
[1905d, 1474]

People whose sexual objects belong to the normally inappropriate sex - that is, inverts - strike 
the observer as a collection of individuals who may be quite sound in other respects. On the other 
hand, cases in which sexually immature persons (children) are chosen as sexual objects are 
instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive 
sexual objects in such a case. They usually come to play that part when someone who is 
cowardly or has become impotent adopts them as a substitute, or when an urgent instinct (one 
which will not allow of postponement) cannot at the moment get possession of any more 
appropriate object. Nevertheless, a light is thrown on the nature of the sexual instinct by the fact 
that it permits of so much variation in its objects and such a cheapening of them - which hunger, 
with its far more energetic retention of its objects, would only permit in the most extreme 
instances. A similar consideration applies to sexual intercourse with animals, which is by no 
means rare, especially among country people, and in which sexual attraction seems to override 
the barriers of species.
[1905d, 1475]

The most general conclusion that follows from all these discussions seems, however, to be this. 
Under a great number of conditions and in surprisingly numerous individuals, the nature and 
importance of the sexual object recedes into the background. What is essential and constant in 
the sexual instinct is something else.¹
[1905d, 1475]

¹ [Footnote added 1910:] The most striking distinction between the erotic life of antiquity and our own no 
doubt lies in the fact that the ancients laid the stress upon the instinct itself, whereas we emphasize its 
object. The ancients glorified the instinct and were prepared on its account to honour even an inferior object; 
while we despise the instinctual activity in itself, and find excuses for it only in the merits of the object.
[1905d, 1475]

There is absolutely no justification for distinguishing a special homosexual instinct. What 
constitutes a homosexual is a peculiarity not in his instinctual life but in his choice of an object. 
Let me recall what I have said in my Three Essays to the effect that we have mistakenly imagined 
the bond between instinct and object in sexual life as being more intimate than it really is. A 
homosexual may have normal instincts, but he is unable to disengage them from a class of 
objects defined by a particular determinant. And in his childhood, since at that period this 
determinant is taken for granted as being of universal application, he is able to behave like little 
Hans, who showed his affection to little boys and girls indiscriminately, and once described his 
friend Fritzl as ‘the girl he was fondest of’. Hans was a homosexual (as all children may very well 
be), quite consistently with the fact, which must always be kept in mind, that he was acquainted 
with only one kind of genital organ - a genital organ like his own.¹
[1909b, 2094]
This much can be said by way of a general characterization of the sexual instincts. They are numerous, emanate from a great variety of organic sources, act in the first instance independently of one another and only achieve a more or less complete synthesis at a late stage. The aim which each of them strives for is the attainment of ‘organ-pleasure’; only when synthesis is achieved do they enter the service of the reproductive function and thereupon become generally recognizable as sexual instincts. At their first appearance they are attached to the instincts of self-preservation, from which they only gradually become separated; in their choice of object, too, they follow the paths that are indicated to them by the ego-instincts. A portion of them remains associated with the ego-instincts throughout life and furnishes them with libidinal components, which in normal functioning easily escape notice and are revealed clearly only by the onset of illness. They are distinguished by possessing the capacity to act vicariously for one another to a wide extent and by being able to change their objects readily. In consequence of the latter properties they are capable of functions which are far removed from their original purposive actions - capable, that is, of 'sublimation'.

[1915c, 2963]

The turning round of an instinct upon the subject's own self is made plausible by the reflection that masochism is actually sadism turned round upon the subject's own ego, and that exhibitionism includes looking at his own body. Analytic observation, indeed, leaves us in no doubt that the masochist shares in the enjoyment of the assault upon himself, and that the exhibitionist shares in the enjoyment of his exposure. The essence of the process is thus the change of the object, while the aim remains unchanged. We cannot fail to notice, however, that in these examples the turning round upon the subject's self and the transformation from activity to passivity converge or coincide.

[1915c, 2964]

In further pursuing the discussion of this thesis, are we to consider the nature of the frustration or the peculiar character of those who are affected by it? It is extremely seldom, after all, that frustration is universal and absolute. In order to operate pathogenically it must no doubt affect the mode of satisfaction which alone the subject desires, of which alone he is capable. There are in general very many ways of tolerating deprivation of libidinal satisfaction without falling ill as a result. In the first place, we know people who are able to put up with a deprivation of this kind without being injured: they are not happy, they suffer from longing, but they do not fall ill. Next, we must bear in mind that the sexual instinctual impulses in particular are extraordinarily plastic, if I may so express it. One of them can take the place of another, one of them can take over another's intensity; if the satisfaction of one of them is frustrated by reality, the satisfaction of another can afford complete compensation. They are related to one another like a network of intercommunicating channels filled with a liquid; and this is so in spite of their being subject to the primacy of the genitals - a state of affairs that is not at all easily combined in a single picture. Further, the component instincts of sexuality, as well as the sexual current which is compounded from them, exhibit a large capacity for changing their object, for taking another in its place - and one, therefore, that is more easily attainable. This displaceability and readiness to accept a substitute must operate powerfully against the pathogenic effect of a frustration. Among these protective processes against falling ill owing to deprivation there is one which has gained special cultural significance. It consists in the sexual trend abandoning its aim of obtaining a component or a reproductive pleasure and taking on another which is related genetically to the abandoned one but is itself no longer sexual and must be described as social. We call this process 'sublimation', in accordance with the general estimate that places social aims higher than the sexual ones, which are at bottom self-interested. Sublimation is, incidentally, only a special case of the way in which sexual trends are attached to other, non-sexual ones. We shall have to discuss it again in another connection.

[1916-1917, 3408]
I may tell you at once that these first explanations of Abraham's have been accepted in psycho-
analysis and have become the basis of our attitude to the psychoses. We thus slowly became
familiar with the notion that the libido, which we find attached to objects and which is the
expression of an effort to obtain satisfaction in connection with those objects, can also leave the
objects and set the subject's own ego in their place; and this notion was gradually built up more
and more consistently. The name for this way of allocating the libido - 'narcissism' - was borrowed
by us from a perversion described by Paul Näcke in which an adult treats his own body with all
the caresses that are usually devoted to an outside sexual object.
[1916-1917, 3461]

Two people coming together for the purpose of sexual satisfaction, in so far as they seek for
solitude, are making a demonstration against the herd instinct, the group feeling. The more they
are in love, the more completely they suffice for each other. Their rejection of the group's
influence is expressed in the shape of a sense of shame. Feelings of jealousy of the most
extreme violence are summoned up in order to protect the choice of a sexual object from being
encroached upon by a group tie. It is only when the affectionate, that is, personal, factor of a love
relation gives place entirely to the sensual one, that it is possible for two people to have sexual
intercourse in the presence of others or for there to be simultaneous sexual acts in a group, as
occurs at an orgy. But at that point a regression has taken place to an early stage in sexual
relations, at which being in love as yet played no part, and all sexual objects were judged to be of
equal value, somewhat in the sense of Bernard Shaw's malicious aphorism to the effect that
being in love means greatly exaggerating the difference between one woman and another.
[1921c, 3831]

Sublimation. - An attentive examination of the sexual trends, which alone were accessible to
psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as
the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once
more into its component instincts. Each component instinct is unalterably characterized by its
source, that is, by the region or zone of the body from which its excitation is derived. Each has
furthermore as distinguishable features an object and an aim. The aim is always discharge
accompanied by satisfaction, but it is capable of being changed from activity to passivity. The
object is less closely attached to the instinct than was at first supposed; it is easily exchanged for
another one, and, moreover, an instinct which had an external object can be turned round upon
the subject's own self. The separate instincts can either remain independent of one another or - in
what is still an inexplicable manner - can be combined and merged into one another to perform
work in common. They are also able to replace one another and to transfer their libidinal cathe
thesis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of
others. The most important vicissitude which an instinct can undergo seems to be sublimation;
here both object and aim are changed, so that what was originally a sexual instinct finds
satisfaction in some achievement which is no longer sexual but has a higher social or ethical
valuation. These different features do not as yet combine to form an integral picture.
[1923a, 3932]
Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject's own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservative instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego.

[1923a, 3933]

In the present discussion, moreover, I am only putting forward a hypothesis; I have no proof to offer. It seems a plausible view that this displaceable and neutral energy, which is no doubt active in both the ego and in the id, proceeds from the narcissistic store of libido - that it is desexualized Eros. (The erotic instincts appear to be altogether more plastic, more readily diverted and displaced than the destructive instincts.) From this we can easily go on to assume that this displaceable libido is employed in the service of the pleasure principle to obviate blockages and to facilitate discharge. In this connection it is easy to observe a certain indifference as to the path along which the discharge takes place, so long as it takes place somehow. We know this trait; it is characteristic of the cathectic processes in the id. It is found in erotic cathexes, where a peculiar indifference in regard to the object displays itself; and it is especially evident in the transferences arising in analysis, which develop inevitably, irrespective of the persons who are their object. Not long ago Rank published some good examples of the way in which neurotic acts of revenge can be directed against the wrong people. Such behaviour on the part of the unconscious reminds one of the comic story of the three village tailors, one of whom had to be hanged because the only village blacksmith had committed a capital offence. Punishment must be exacted even if it does not fall upon the guilty. It was in studying the dream-work that we first came upon this kind of looseness in the displacements brought about by the primary process. In that case it was the objects that were thus relegated to a position of no more than secondary importance, just as in the case we are now discussing it is the paths of discharge. It would be characteristic of the ego to be more particular about the choice both of an object and of a path of discharge.

[1923b, 3979]
An instinct, then, is distinguished from a stimulus by the fact that it arises from sources of stimulation within the body, that it operates as a constant force and that the subject cannot avoid it by flight, as is possible with an external stimulus. We can distinguish an instinct's source, object and aim. Its source is a state of excitation in the body, its aim is the removal of that excitation; on its path from its source to its aim the instinct becomes operative psychically. We picture it as a certain quota of energy which presses in a particular direction. It is from this pressing that it derives its name of ‘Trieb’. People speak of ‘active’ and ‘passive’ instincts, but it would be more correct to speak of instincts with active and passive aims: for an expenditure of activity is needed to achieve a passive aim as well. The aim can be achieved in the subject's own body; as a rule an external object is brought in, in regard to which the instinct achieves its external aim; its internal aim invariably remains the bodily change which is felt as satisfaction. It has not become clear to us whether the relation of the instinct to its somatic source gives it a specific quality and if so what. The evidence of analytic experience shows that it is an undoubted fact that instinctual impulses from one source attach themselves to those from other sources and share their further vicissitudes and that in general one instinctual satisfaction can be replaced by another. But it must be admitted that we do not understand this very well. The relations of an instinct to its aim and object are also open to alterations; both can be exchanged for other ones, though its relation to its object is nevertheless the more easily loosened. A certain kind of modification of the aim and change of the object, in which our social valuation is taken into account, is described by us as 'sublimation'. Besides this, we have grounds for distinguishing instincts which are 'inhibited in their aim' - instinctual impulses from sources well known to us with an unambiguous aim, but which come to a stop on their way to satisfaction, so that a lasting object-cathexis comes about and a permanent trend. Such, for instance, is the relation of tenderness, which undoubtedly originates from the sources of sexual need and invariably renounces its satisfaction.

[1933a, 4702]
Binet (1888) was the first to maintain (what has since been confirmed by a quantity of evidence) that the choice of a fetish is an after-effect of some sexual impression received as a rule in early childhood. (This may be brought into line with the proverbial durability of first loves: on revient toujours à ses premiers amours.) This derivation is particularly obvious in cases where there is merely a fetishistic condition attached to the sexual object. We shall come across the importance of early sexual impressions again in another connection.¹

AFTER-EFFECTS OF INFANTILE OBJECT-CHOICE Even a person who has been fortunate enough to avoid an incestuous fixation of his libido does not entirely escape its influence. It often happens that a young man falls in love seriously for the first time with a mature woman, or a girl with an elderly man in a position of authority; this is clearly an echo of the phase of development that we have been discussing, since these figures are able to re-animate pictures of their mother or father.¹ There can be no doubt that every object-choice whatever is based, though less closely, on these prototypes. A man, especially, looks for someone who can represent his picture of his mother, as it has dominated his mind from his earliest childhood; and accordingly, if his mother is still alive, she may well resent this new version of herself and meet her with hostility. In view of the importance of a child's relations to his parents in determining his later choice of a sexual object, it can easily be understood that any disturbance of those relations will produce the gravest effects upon his adult sexual life. Jealousy in a lover is never without an infantile root or at least an infantile reinforcement. If there are quarrels between the parents or if their marriage is unhappy, the ground will be prepared in their children for the severest predisposition to a disturbance of sexual development or to a neurotic illness.

In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child's sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.
A friend of mine has since then drawn my attention to two other of the author's short stories, which might stand in a genetic relation to Gradiva, as preliminary studies or earlier attempts at a satisfactory poetical solution of the same problem in the psychology of love. The first of these stories, 'Der rote Schirm',¹ recalls Gradiva by the recurrence in it of a number of small motifs, such as white flowers of the dead, a forgotten object (Gradiva's sketch-book), and a significant small animal (the butterfly and the lizard in Gradiva), but more especially by the repetition of the main situation - the apparition in the mid-day glare of a summer's day of a girl who had died (or was believed to have died). In 'Der rote Schirm' the scene of the apparition is a ruined castle, just as are the ruins of the excavated Pompeii in Gradiva. The other story, 'Im gotischen Hause',² shows no such resemblances either to Gradiva or to 'Der rote Schirm' in its manifest content. But the fact that it was given an external unity with the latter story by being published with it under a common title³ points unmistakably to their having a closely related latent meaning. It is easy to see that all three stories treat of the same theme: the development of a love (in 'Der rote Schirm' the inhibition of a love) as an after-effect of an intimate association in childhood of a brother-and-sister kind. I gather further from a review by Eva, Countess Baudissin (in the Vienna daily paper Die Zeit of February 11, 1912) that Jensen's last novel Fremdlinge unter den Menschen,⁴ which contains much material from the author's own childhood, describes the history of a man who 'sees a sister in the woman he loves'. In neither of the two earlier stories is there a trace of the main motif of Gradiva: the girl's peculiarly charming gait with the nearly perpendicular posture of her foot. [1907a, 1885]

It is inevitable and perfectly normal that a child should take his parents as the first objects of his love. But his libido should not remain fixated to these first objects; later on, it should merely take them as a model, and should make a gradual transition from them on to extraneous people when the time for the final choice of an object arrives. The detachment of the child from his parents is thus a task that cannot be evaded if the young individual's social fitness is not to be endangered. During the time at which repression is making its selection among the component instincts, and later, when there should be a slackening of the parents' influence, which is essentially responsible for the expenditure of energy on these repressions, the task of education meets with great problems, which at the present time are certainly not always dealt with in an understanding and unobjectionable manner. [1910a, 2233]

If we survey the different features of the picture presented here - the conditions imposed on the man that his loved one should not be unattached and should be like a prostitute, the high value he sets on her, his need for feeling jealousy, his fidelity, which is nevertheless compatible with being broken down into a long series of instances, and the urge to rescue the woman - it will seem scarcely probable that they should all be derived from a single source. Yet psycho-analytic exploration into the life-histories of men of this type has no difficulty in showing that there is such a single source. The object-choice which is so strangely conditioned, and this very singular way of behaving in love, have the same psychical origin as we find in the loves of normal people. They are derived from the infantile fixation of tender feelings on the mother, and represent one of the consequences of that fixation. In normal love only a few characteristics survive which reveal unmistakably the maternal prototype of the object-choice, as, for instance, the preference shown by young men for maturer women; the detachment of libido from the mother has been effected relatively swiftly. In our type, on the other hand, the libido has remained attached to the mother for so long, even after the onset of puberty, that the maternal characteristics remain stamped on the love-objects that are chosen later, and all these turn into easily recognizable mother-surrogates. The comparison with the way in which the skull of a newly born child is shaped springs to mind at this point: after a protracted labour it always takes the form of a cast of the narrow part of the mother's pelvis. [1910h, 2329]
We have now to show the plausibility of our assertion that the characteristic features of our type - its conditions for loving and its behaviour in love - do in fact arise from the psychical constellation connected with the mother. This would seem to be easiest where the first precondition is concerned - the condition that the woman should not be unattached, or that there should be an injured third party. It is at once clear that for the child who is growing up in the family circle the fact of the mother belonging to the father becomes an inseparable part of the mother's essence, and that the injured third party is none other than the father himself. The trait of overvaluing the loved one, and regarding her as unique and irreplaceable, can be seen to fall just as naturally into the context of the child's experience, for no one possesses more than one mother, and the relation to her is based on an event that is not open to any doubt and cannot be repeated.

If we are to understand the love-objects chosen by our type as being above all mother-surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psychoanalysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they have one single question to ask, but it never crosses their lips. It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.

On the other hand the second precondition for loving - the condition that the object chosen should be like a prostitute - seems energetically to oppose a derivation from the mother complex. The adult's conscious thought likes to regard his mother as a person of unimpeachable moral purity; and there are few ideas which he finds so offensive when they come from others, or feels as so tormenting when they spring from his own mind, as one which calls this aspect of his mother in question. This very relation of the sharpest contrast between 'mother' and 'prostitute' will however encourage us to enquire into the history of the development of these two complexes and the unconscious relation between them, since we long ago discovered that what, in the conscious, is found split into a pair of opposites often occurs in the unconscious as a unity. Investigation then leads us back to the time in a boy's life at which he first gains a more or less complete knowledge of the sexual relations between adults, somewhere about the years of pre-puberty. Brutal pieces of information, which are undisguisedly intended to arouse contempt and rebelliousness, now acquaint him with the secret of sexual life and destroy the authority of adults, which appears incompatible with the revelation of their sexual activities. The aspect of these disclosures which affects the newly initiated child most strongly is the way in which they apply to his own parents. This application is often flatly rejected by him, in some such words as these: 'Your parents and other people may do something like that with one another, but my parents can't possibly do it.'

It is on account of all these connections between the rescue-motif and the parental complex that the urge to rescue the loved one forms an important feature of the type of loving which I have been discussing.
The affectionate current is the older of the two. It springs from the earliest years of childhood; it is formed on the basis of the interests of the self-preservative instinct and is directed to the members of the family and those who look after the child. From the very beginning it carries along with it contributions from the sexual instincts - components of erotic interest - which can already be seen more or less clearly even in childhood and in any event are uncovered in neurotics by psycho-analysis later on. It corresponds to the child's primary object-choice. We learn in this way that the sexual instincts find their first objects by attaching themselves to the valuations made by the ego-instincts, precisely in the way in which the first sexual satisfactions are experienced in attachment to the bodily functions necessary for the preservation of life. The 'affection' shown by the child's parents and those who look after him, which seldom fails to betray its erotic nature ('the child is an erotic plaything'), does a very great deal to raise the contributions made by erotism to the cathexes of his ego-instincts, and to increase them to an amount which is bound to play a part in his later development, especially when certain other circumstances lend their support.

These affectionate fixations of the child persist throughout childhood, and continually carry along with them erotism, which is consequently diverted from its sexual aims. Then at the age of puberty they are joined by the powerful 'sensual' current which no longer mistakes its aims. It never fails, apparently, to follow the earlier paths and to cathect the objects of the primary infantile choice with quotas of libido that are now far stronger. Here, however, it runs up against the obstacles that have been erected in the meantime by the barrier against incest; consequently it will make efforts to pass on from these objects which are unsuitable in reality, and find a way as soon as possible to other, extraneous objects with which a real sexual life may be carried on. These new objects will still be chosen on the model (imago) of the infantile ones, but in the course of time they will attract to themselves the affection that was tied to the earlier ones. A man shall leave his father and his mother - according to the biblical command - and shall cleave unto his wife; affection and sensuality are then united. The greatest intensity of sensual passion will bring with it the highest psychical valuation of the object - this being the normal overvaluation of the sexual object on the part of a man.

Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of frustration in reality, which opposes the new object-choice and reduces its value for the person concerned. There is after all no point in embarking upon an object-choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of attraction which the infantile objects that have to be relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity (the process of introversion), strengthens the images of the first sexual objects and becomes fixated to them. The obstacle raised against incest, however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy-situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.
However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.

[1918a, 2358]

If an infant could speak, he would no doubt pronounce the act of sucking at his mother's breast by far the most important in his life. He is not far wrong in this, for in this single act he is satisfying at once the two great vital needs. We are therefore not surprised to learn from psycho-analysis how such psychical importance the act retains all through life. Sucking at the mother's breast is the starting-point of the whole of sexual life, the unmatched prototype of every later sexual satisfaction, to which phantasy often enough recurs in times of need. This sucking involves making the mother's breast the first object of the sexual instinct. I can give you no idea of the important bearing of this first object upon the choice of every later object, of the profound effects it has in its transformations and substitutions in even the remotest regions of our sexual life. But at first the infant, in his sucking activity, gives up this object and replaces it by a part of his own body. He begins to suck his thumbs or his own tongue. In this way he makes himself independent of the consent of the external world as regards gaining pleasure, and besides this he increases it by adding the excitation of a second area of his body. The erotogenic zones are not all equally generous in yielding pleasure; it is therefore an important experience when the infant, as Lindner reports, discovers, in the course of feeling around, the specially excitable regions afforded by his genitals and so finds his way from sucking to masturbation.

[1916-1917, 3385]

The processes of finding an object are fairly complex and no comprehensive account has hitherto been given of them. For our purposes it may be specially pointed out that when, in the years of childhood before puberty, the process has in some respects reached a conclusion, the object that has been found turns out to be almost identical with the first object of the oral pleasure-instinct, which was reached by attachment. Though it is not actually the mother's breast, at least it is the mother. We call the mother the first love-object. For we speak of love when we bring the mental side of the sexual trends into the foreground and want to force back the underlying physical or 'sensual' instinctual demands or to forget them for a moment. At the time at which the child's mother becomes his love-object the psychical work of repression has already begun in him, which is withdrawing from his knowledge awareness of a part of his sexual aims. To his choice of his mother as a love-object everything becomes attached which, under the name of the 'Oedipus complex', has attained so much importance in the psychoanalytic explanation of the neuroses and has played no less a part, perhaps, in the resistance to psycho-analysis.

[1916-1917, 3397]
This first configuration of the child’s love, which in typical cases takes the shape of the Oedipus complex, succumbs, as we know, from the beginning of the period of latency onwards to a wave of repression. Such of it as is left over shows itself as a purely affectionate emotional tie, relating to the same people, but no longer to be described as ‘sexual’. Psycho-analysis, which illuminates the depths of mental life, has no difficulty in showing that the sexual ties of the earliest years of childhood also persist, though repressed and unconscious. It gives us courage to assert that wherever we come across an affectionate feeling it is successor to a completely ‘sensual’ object-tie with the person in question or rather with that person’s prototype (or *imago*). It cannot indeed disclose to us without a special investigation whether in a given case this former complete sexual current still exists under repression or whether it has already been exhausted. To speak still more precisely: it is quite certain that this current is still there as a form and possibility, and can always be cathected and put into activity again by means of regression; the only question is (and it cannot always be answered) what degree of cathexis and operative force it still has at the present moment. Equal care must be taken in this connection to avoid two sources of error - the Scylla of underestimating the importance of the repressed unconscious, and the Charybdis of judging the normal entirely by the standards of the pathological.

1921c, 3829

A child’s first erotic object is the mother’s breast that nourishes it; love has its origin in attachment to the satisfied need for nourishment. There is no doubt that, to begin with, the child does not distinguish between the breast and its own body; when the breast has to be separated from the body and shifted to the ‘outside’ because the child so often finds it absent, it carries with it as an ‘object’ a part of the original narcissistic libidinal cathexis. This first object is later completed into the person of the child’s mother, who not only nourishes it but also looks after it and thus arouses in it a number of other physical sensations, pleasurable and unpleasurable. By her care of the child’s body she becomes its first seducer. In these two relations lies the root of a mother’s importance, unique, without parallel, established unalterably for a whole lifetime as the first and strongest love-object and as the prototype of all later love-relations - for both sexes. In all this the phylogenetic foundation has so much the upper hand over personal accidental experience that it makes no difference whether a child has really sucked at the breast or has been brought up on the bottle and never enjoyed the tenderness of a mother’s care. In both cases the child’s development takes the same path; it may be that in the second case its later longing grows all the greater. And for however long it is fed at its mother’s breast, it will always be left with a conviction after it has been weaned that its feeding was too short and too little.

1940a [1938], 4996
AFTER-EFFECTS OF INFANTILE OBJECT-CHOICE  Even a person who has been fortunate enough to avoid an incestuous fixation of his libido does not entirely escape its influence. It often happens that a young man falls in love seriously for the first time with a mature woman, or a girl with an elderly man in a position of authority; this is clearly an echo of the phase of development that we have been discussing, since these figures are able to re-animate pictures of their mother or father.¹ There can be no doubt that every object-choice whatever is based, though less closely, on these prototypes. A man, especially, looks for someone who can represent his picture of his mother, as it has dominated his mind from his earliest childhood; and accordingly, if his mother is still alive, she may well resent this new version of herself and meet her with hostility. In view of the importance of a child's relations to his parents in determining his later choice of a sexual object, it can easily be understood that any disturbance of those relations will produce the gravest effects upon his adult sexual life. Jealousy in a lover is never without an infantile root or at least an infantile reinforcement. If there are quarrels between the parents or if their marriage is unhappy, the ground will be prepared in their children for the severest predisposition to a disturbance of sexual development or to a neurotic illness.

[1905d, 1540]

A child's affection for his parents is no doubt the most important infantile trace which, after being revived at puberty, points the way to his choice of an object; but it is not the only one. Other starting-points with the same early origin enable a man to develop more than one sexual line, based no less upon his childhood, and to lay down very various conditions for his object-choice.²

[1905d, 1540]

In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child's sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

[1905d, 1545]
A friend of mine has since then drawn my attention to two other of the author's short stories, which might stand in a genetic relation to Gradiva, as preliminary studies or earlier attempts at a satisfactory poetical solution of the same problem in the psychology of love. The first of these stories, 'Der rote Schirm',¹ recalls Gradiva by the recurrence in it of a number of small motifs, such as white flowers of the dead, a forgotten object (Gradiva's sketch-book), and a significant small animal (the butterfly and the lizard in Gradiva), but more especially by the repetition of the main situation - the apparition in the mid-day glare of a summer's day of a girl who had died (or was believed to have died). In 'Der rote Schirm' the scene of the apparition is a ruined castle, just as are the ruins of the excavated Pompeii in Gradiva. The other story, 'Im gotischen Hause',² shows no such resemblances either to Gradiva or to 'Der rote Schirm' in its manifest content. But the fact that it was given an external unity with the latter story by being published with it under a common title³ points unmistakably to their having a closely related latent meaning. It is easy to see that all three stories treat of the same theme: the development of a love (in 'Der rote Schirm' the inhibition of a love) as an after-effect of an intimate association in childhood of a brother-and-sister kind. I gather further from a review by Eva, Countess Baudissin (in the Vienna daily paper Die Zeit of February 11, 1912) that Jensen's last novel Fremdlinge unter den Menschen,⁴ which contains much material from the author's own childhood, describes the history of a man who 'sees a sister in the woman he loves'. In neither of the two earlier stories is there a trace of the main motif of Gradiva: the girl's peculiarly charming gait with the nearly perpendicular posture of her foot.

[1907a, 1885]

These affectionate fixations of the child persist throughout childhood, and continually carry along with them erotism, which is consequently diverted from its sexual aims. Then at the age of puberty they are joined by the powerful 'sensual' current which no longer mistakes its aims. It never fails, apparently, to follow the earlier paths and to cathet the objects of the primary infantile choice with quotas of libido that are now far stronger. Here, however, it runs up against the obstacles that have been erected in the meantime by the barrier against incest; consequently it will make efforts to pass on from these objects which are unsuitable in reality, and find a way as soon as possible to other, extraneous objects with which a real sexual life may be carried on. These new objects will still be chosen on the model (imago) of the infantile ones, but in the course of time they will attract to themselves the affection that was tied to the earlier ones. A man shall leave his father and his mother - according to the biblical command - and shall cleave unto his wife; affection and sensuality are then united. The greatest intensity of sensual passion will bring with it the highest psychical valuation of the object - this being the normal overvaluation of the sexual object on the part of a man.

[1912d, 2339]
However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.

[1918a, 2358]

A woman's identification with her mother allows us to distinguish two strata: the pre-Oedipus one which rests on her affectionate attachment to her mother and takes her as a model, and the later one from the Oedipus complex which seeks to get rid of her mother and take her place with her father. We are no doubt justified in saying that much of both of them is left over for the future and that neither of them is adequately surmounted in the course of development. But the phase of the affectionate pre-Oedipus attachment is the decisive one for a woman's future; during it preparations are made for the acquisition of the characteristics with which she will later fulfil her role in the sexual function and perform her invaluable social tasks. It is in this identification too that she acquires her attractiveness to a man, whose Oedipus attachment to his mother it kindles into passion. How often it happens, however, that it is only his son who obtains what he himself aspired to! One gets an impression that a man's love and a woman's are a phase apart psychologically.

[1933a, 4736]

A child's first erotic object is the mother's breast that nourishes it; love has its origin in attachment to the satisfied need for nourishment. There is no doubt that, to begin with, the child does not distinguish between the breast and its own body; when the breast has to be separated from the body and shifted to the 'outside' because the child so often finds it absent, it carries with it as an 'object' a part of the original narcissistic libidinal cathexis. This first object is later completed into the person of the child's mother, who not only nourishes it but also looks after it and thus arouses in it a number of other physical sensations, pleasurable and unpleasurable. By her care of the child's body she becomes its first seducer. In these two relations lies the root of a mother's importance, unique, without parallel, established unalterably for a whole lifetime as the first and strongest love-object and as the prototype of all later love-relations - for both sexes. In all this the phylogenetic foundation has so much the upper hand over personal accidental experience that it makes no difference whether a child has really sucked at the breast or has been brought up on the bottle and never enjoyed the tenderness of a mother's care. In both cases the child's development takes the same path; it may be that in the second case its later longing grows all the greater. And for however long it is fed at its mother's breast, it will always be left with a conviction after it has been weaned that its feeding was too short and too little.

[1940a [1938], 4996]
A child's affection for his parents is no doubt the most important infantile trace which, after being revived at puberty, points the way to his choice of an object; but it is not the only one. Other starting-points with the same early origin enable a man to develop more than one sexual line, based no less upon his childhood, and to lay down very various conditions for his object-choice.

A friend of mine has since then drawn my attention to two other of the author's short stories, which might stand in a genetic relation to Gradiva, as preliminary studies or earlier attempts at a satisfactory poetical solution of the same problem in the psychology of love. The first of these stories, 'Der rote Schirm',¹ recalls Gradiva by the recurrence in it of a number of small motifs, such as white flowers of the dead, a forgotten object (Gradiva's sketch-book), and a significant small animal (the butterfly and the lizard in Gradiva), but more especially by the repetition of the main situation - the apparition in the mid-day glare of a summer's day of a girl who had died (or was believed to have died). In 'Der rote Schirm' the scene of the apparition is a ruined castle, just as are the ruins of the excavated Pompeii in Gradiva. The other story, 'Im gotischen Hause',² shows no such resemblances either to Gradiva or to 'Der rote Schirm' in its manifest content. But the fact that it was given an external unity with the latter story by being published with it under a common title³ points unmistakably to their having a closely related latent meaning. It is easy to see that all three stories treat of the same theme: the development of a love (in 'Der rote Schirm' the inhibition of a love) as an after-effect of an intimate association in childhood of a brother-and-sister kind. I gather further from a review by Eva, Countess Baudissin (in the Vienna daily paper Die Zeit of February 11, 1912) that Jensen's last novel Fremdlinge unter den Menschen,⁴ which contains much material from the author's own childhood, describes the history of a man who 'sees a sister in the woman he loves'. In neither of the two earlier stories is there a trace of the main motif of Gradiva: the girl's peculiarly charming gait with the nearly perpendicular posture of her foot.

The wolf that he was afraid of was undoubtedly his father; but his fear of the wolf was conditional upon the creature being in an upright posture. His recollection asserted most definitely that he had not been terrified by pictures of wolves going on all fours or, as in the story of 'Little Red Riding-Hood', lying in bed. The posture which, according to our construction of the primal scene, he had seen the woman assume, was of no less significance; though in this case the significance was limited to the sexual sphere. The most striking phenomenon of his erotic life after maturity was his liability to compulsive attacks of falling physically in love which came on and disappeared again in the most puzzling succession. These attacks released a tremendous energy in him even at times when he was otherwise inhibited, and they were quite beyond his control. I must, for a specially important reason, postpone a full consideration of this compulsive love; but I may mention here that it was subject to a definite condition, which was concealed from his consciousness and was discovered only during the treatment. It was necessary that the woman should have assumed the posture which we have ascribed to his mother in the primal scene. From his puberty he had felt large and conspicuous buttocks as the most powerful attraction in a woman; to copulate except from behind gave him scarcely any enjoyment. At this point a criticism may justly be raised: it may be objected that a sexual preference of this kind for the hind parts of the body is a general characteristic of people who are inclined to an obsessional neurosis, and that its presence does not justify us in referring it back to a special impression in childhood. It is part of the fabric of the anal-erotic disposition and is one of the archaic traits which distinguish that constitution. Indeed, copulation from behind - more ferarum [in the fashion of animals] - may, after all, be regarded as phylogenetically the older form. We shall return to this point too in a later discussion, when we have brought forward the supplementary material which showed the basis of the unconscious condition upon which his falling in love depended.
You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitorial masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

[1933a, 4729]
Binet (1888) was the first to maintain (what has since been confirmed by a quantity of evidence) that the choice of a fetish is an after-effect of some sexual impression received as a rule in early childhood. (This may be brought into line with the proverbial durability of first loves: on revient toujours à ses premiers amours.) This derivation is particularly obvious in cases where there is merely a fetishistic condition attached to the sexual object. We shall come across the importance of early sexual impressions again in another connection.¹

¹ [Footnote added 1915:] Psycho-analysis informs us that there are two methods of finding an object. The first, described in the text, is the ‘anaclitic’ or ‘attachment’ one, based on attachment to early infantile prototypes. The second is the narcissistic one, which seeks for the subject’s own ego and finds it again in other people. This latter method is of particularly great importance in cases where the outcome is a pathological one, but it is not relevant to the present context.

In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child’s sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

If we survey the different features of the picture presented here - the conditions imposed on the man that his loved one should not be unattached and should be like a prostitute, the high value he sets on her, his need for feeling jealousy, his fidelity, which is nevertheless compatible with being broken down into a long series of instances, and the urge to rescue the woman - it will seem scarcely probable that they should all be derived from a single source. Yet psycho-analytic exploration into the life-histories of men of this type has no difficulty in showing that there is such a single source. The object-choice which is so strangely conditioned, and this very singular way of behaving in love, have the same psychical origin as we find in the loves of normal people. They are derived from the infantile fixation of tender feelings on the mother, and represent one of the consequences of that fixation. In normal love only a few characteristics survive which reveal unmistakably the maternal prototype of the object-choice, as, for instance, the preference shown by young men for maturer women; the detachment of libido from the mother has been effected relatively swiftly. In our type, on the other hand, the libido has remained attached to the mother for so long, even after the onset of puberty, that the maternal characteristics remain stamped on the love-objects that are chosen later, and all these turn into easily recognizable mother-surrogates. The comparison with the way in which the skull of a newly born child is shaped springs to mind at this point: after a protracted labour it always takes the form of a cast of the narrow part of the mother’s pelvis.
We have now to show the plausibility of our assertion that the characteristic features of our type - its conditions for loving and its behaviour in love - do in fact arise from the psychical constellation connected with the mother. This would seem to be easiest where the first precondition is concerned - the condition that the woman should not be unattached, or that there should be an injured third party. It is at once clear that for the child who is growing up in the family circle the fact of the mother belonging to the father becomes an inseparable part of the mother's essence, and that the injured third party is none other than the father himself. The trait of overvaluing the loved one, and regarding her as unique and irreplaceable, can be seen to fall just as naturally into the context of the child's experience, for no one possesses more than one mother, and the relation to her is based on an event that is not open to any doubt and cannot be repeated.

If we are to understand the love-objects chosen by our type as being above all mother-surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psycho-analysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they have one single question to ask, but it never crosses their lips. It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.

On the other hand the second precondition for loving - the condition that the object chosen should be like a prostitute - seems energetically to oppose a derivation from the mother complex. The adult's conscious thought likes to regard his mother as a person of unimpeachable moral purity; and there are few ideas which he finds so offensive when they come from others, or feels as so tormenting when they spring from his own mind, as one which calls this aspect of his mother in question. This very relation of the sharpest contrast between 'mother' and 'prostitute' will however encourage us to enquire into the history of the development of these two complexes and the unconscious relation between them, since we long ago discovered that what, in the conscious, is found split into a pair of opposites often occurs in the unconscious as a unity. Investigation then leads us back to the time in a boy's life at which he first gains a more or less complete knowledge of the sexual relations between adults, somewhere about the years of pre-puberty. Brutal pieces of information, which are undisguisedly intended to arouse contempt and rebelliousness, now acquaint him with the secret of sexual life and destroy the authority of adults, which appears incompatible with the revelation of their sexual activities. The aspect of these disclosures which affects the newly initiated child most strongly is the way in which they apply to his own parents. This application is often flatly rejected by him, in some such words as these: 'Your parents and other people may do something like that with one another, but my parents can't possibly do it.

Now that we have gained an insight into this piece of mental development we can no longer regard it as contradictory and incomprehensible that the precondition of the loved one's being like a prostitute should derive directly from the mother complex. The type of male love which we have described bears the traces of this evolution and is simple to understand as a fixation on the phantasies formed by the boy in puberty - phantasies which have later after all found a way out into real life. There is no difficulty in assuming that the masturbation assiduously practised in the years of puberty has played its part in the fixation of the phantasies.
The affectionate current is the older of the two. It springs from the earliest years of childhood; it is formed on the basis of the interests of the self-preservative instinct and is directed to the members of the family and those who look after the child. From the very beginning it carries along with it contributions from the sexual instincts - components of erotic interest - which can already be seen more or less clearly even in childhood and in any event are uncovered in neurotics by psycho-analysis later on. It corresponds to the child's primary object-choice. We learn in this way that the sexual instincts find their first objects by attaching themselves to the valuations made by the ego-instincts, precisely in the way in which the first sexual satisfactions are experienced in attachment to the bodily functions necessary for the preservation of life. The 'affection' shown by the child's parents and those who look after him, which seldom fails to betray its erotic nature ('the child is an erotic plaything'), does a very great deal to raise the contributions made by erotism to the cathexes of his ego-instincts, and to increase them to an amount which is bound to play a part in his later development, especially when certain other circumstances lend their support.

These affectionate fixations of the child persist throughout childhood, and continually carry along with them erotism, which is consequently diverted from its sexual aims. Then at the age of puberty they are joined by the powerful 'sensual' current which no longer mistakes its aims. It never fails, apparently, to follow the earlier paths and to cathect the objects of the primary infantile choice with quotas of libido that are now far stronger. Here, however, it runs up against the obstacles that have been erected in the meantime by the barrier against incest; consequently it will make efforts to pass on from these objects which are unsuitable in reality, and find a way as soon as possible to other, extraneous objects with which a real sexual life may be carried on. These new objects will still be chosen on the model (imago) of the infantile ones, but in the course of time they will attract to themselves the affection that was tied to the earlier ones. A man shall leave his father and his mother - according to the biblical command - and shall cleave unto his wife; affection and sensuality are then united. The greatest intensity of sensual passion will bring with it the highest psychical valuation of the object - this being the normal overvaluation of the sexual object on the part of a man.

A third way in which we may approach the study of narcissism is by observing the erotic life of human beings, with its many kinds of differentiation in man and woman. Just as object-libido at first concealed ego-libido from our observation, so too in connection with the object-choice of infants (and of growing children) what we first noticed was that they derived their sexual objects from their experiences of satisfaction. The first auto-erotic sexual satisfactions are experienced in connection with vital functions which serve the purpose of self-preservation. The sexual instincts are at the outset attached to the satisfaction of the ego-instincts; only later do they become independent of these, and even then we have an indication of that original attachment in the fact that the persons who are concerned with a child's feeding, care, and protection become his earliest sexual objects: that is to say, in the first instance his mother or a substitute for her. Side by side, however, with this type and source of object-choice, which may be called the 'anaclitic' or 'attachment' type, psycho-analytic research has revealed a second type, which we were not prepared for finding. We have discovered, especially clearly in people whose libidinal development has suffered some disturbance, such as perverts and homosexuals, that in their later choice of love-objects they have taken as a model not their mother but their own selves. They are plainly seeking themselves as a love-object, and are exhibiting a type of object-choice which must be termed 'narcissistic'. In this observation we have the strongest of the reasons which have led us to adopt the hypothesis of narcissism.

[1912d, 2338]
[1914c, 2942]
We have, however, not concluded that human beings are divided into two sharply differentiated groups, according as their object-choice conforms to the anaclitic or to the narcissistic type; we assume rather that both kinds of object-choice are open to each individual, though he may show a preference for one or the other. We say that a human being has originally two sexual objects - himself and the woman who nurses him - and in doing so we are postulating a primary narcissism in everyone, which may in some cases manifest itself in a dominating fashion in his object-choice.

[1914c, 2943]

A comparison of the male and female sexes then shows that there are fundamental differences between them in respect of their type of object-choice, although these differences are of course not universal. Complete object-love of the attachment type is, properly speaking, characteristic of the male. It displays the marked sexual overvaluation which is doubtless derived from the child's original narcissism and thus corresponds to a transference of that narcissism to the sexual object. This sexual overvaluation is the origin of the peculiar state of being in love, a state suggestive of a neurotic compulsion, which is thus traceable to an impoverishment of the ego as regards libido in favour of the love-object. A different course is followed in the type of female most frequently met with, which is probably the purest and truest one. With the onset of puberty the maturing of the female sexual organs, which up till then have been in a condition of latency, seems to bring about an intensification of the original narcissism, and this is unfavourable to the development of a true object-choice with its accompanying sexual overvaluation. Women, especially if they grow up with good looks, develop a certain self-contentment which compensates them for the social restrictions that are imposed upon them in their choice of object. Strictly speaking, it is only themselves that such women love with an intensity comparable to that of the man's love for them. Nor does their need lie in the direction of loving, but of being loved; and the man who fulfils this condition is the one who finds favour with them. The importance of this type of woman for the erotic life of mankind is to be rated very high. Such women have the greatest fascination for men, not only for aesthetic reasons, since as a rule they are the most beautiful, but also because of a combination of interesting psychological factors. For it seems very evident that another person's narcissism has a great attraction for those who have renounced part of their own narcissism and are in search of object-love. The charm of a child lies to a great extent in his narcissism, his self-contentment and inaccessibility, just as does the charm of certain animals which seem not to concern themselves about us, such as cats and the large beasts of prey. Indeed, even great criminals and humorists, as they are represented in literature, compel our interest by the narcissistic consistency with which they manage to keep away from their ego anything that would diminish it. It is as if we envied them for maintaining a blissful state of mind - an unassailable libidinal position which we ourselves have since abandoned. The great charm of narcissistic women has, however, its reverse side; a large part of the lover's dissatisfaction, of his doubts of the woman's love, of his complaints of her enigmatic nature, has its root in this incongruity between the types of object-choice.

[1914c, 2943]

What I have so far said by way of indication may be concluded by a short summary of the paths leading to the choice of an object.
A person may love:-

(1) According to the narcissistic type:
   (a) what he himself is (i.e. himself),
   (b) what he himself was,
   (c) what he himself would like to be,
   (d) someone who was once part of himself.

(2) According to the anaclitic (attachment) type:
   (a) the woman who feeds him,
   (b) the man who protects him,

and the succession of substitutes who take their place. The inclusion of case (c) of the first type cannot be justified till a later stage of this discussion.

Applying our distinction between sexual and ego-instincts, we must recognize that self-regard has a specially intimate dependence on narcissistic libido. Here we are supported by two fundamental facts: that in paraphrenics self-regard is increased, while in the transference neuroses it is diminished; and that in love-relations not being loved lowers the self-regarding feelings, while being loved raises them. As we have indicated, the aim and the satisfaction in a narcissistic object-choice is to be loved.

Being in love consists in a flowing-over of ego-libido on to the object. It has the power to remove repressions and re-instate perversions. It exalts the sexual object into a sexual ideal. Since, with the object type (or attachment type), being in love occurs in virtue of the fulfilment of infantile conditions for loving, we may say that whatever fulfils that condition is idealized.

The sexual ideal may enter into an interesting auxiliary relation to the ego ideal. It may be used for substitutive satisfaction where narcissistic satisfaction encounters real hindrances. In that case a person will love in conformity with the narcissistic type of object-choice, will love what he once was and no longer is, or else what possesses the excellences which he never had at all (cf. (c)). The formula parallel to the one there stated runs thus: what possesses the excellence which the ego lacks for making it an ideal, is loved. This expedient is of special importance for the neurotic, who, on account of his excessive object-cathexes, is impoverished in his ego and is incapable of fulfilling his ego ideal. He then seeks a way back to narcissism from his prodigal expenditure of libido upon objects, by choosing a sexual ideal after the narcissistic type which possesses the excellences to which he cannot attain. This is the cure by love, which he generally prefers to cure by analysis. Indeed, he cannot believe in any other mechanism of cure; he usually brings expectations of this sort with him to the treatment and directs them towards the person of the physician. The patient's incapacity for love, resulting from his extensive repressions, naturally stands in the way of a therapeutic plan of this kind. An unintended result is often met with when, by means of the treatment, he has been partially freed from his repressions: he withdraws from further treatment in order to choose a love-object, leaving his cure to be continued by a life with someone he loves. We might be satisfied with this result, if it did not bring with it all the dangers of a crippling dependence upon his helper in need.
One or two things may be directly inferred with regard to the preconditions and effects of a process such as this. On the one hand, a strong fixation to the loved object must have been present; on the other hand, in contradiction to this, the object-cathexis must have had little power of resistance. As Otto Rank has aptly remarked, this contradiction seems to imply that the object-choice has been effected on a narcissistic basis, so that the object-cathexis, when obstacles come in its way, can regress to narcissism. The narcissistic identification with the object then becomes a substitute for the erotic cathexis, the result of which is that in spite of the conflict with the loved person the love-relation need not be given up. This substitution of identification for object-love is an important mechanism in the narcissistic affections; Karl Landauer (1914) has lately been able to point to it in the process of recovery in a case of schizophrenia. It represents, of course, a regression from one type of object-choice to original narcissism. We have elsewhere shown that identification is a preliminary stage of object-choice, that it is the first way - and one that is expressed in an ambivalent fashion - in which the ego picks out an object. The ego wants to incorporate this object into itself, and, in accordance with the oral or cannibalistic phase of libidinal development in which it is, it wants to do so by devouring it. Abraham is undoubtedly right in attributing to this connection the refusal of nourishment met with in severe forms of melancholia.

Homosexual object-choice originally lies closer to narcissism than does the heterosexual kind. When it is a question, therefore, of repelling an undesirably strong homosexual impulse, the path back to narcissism is made particularly easy. Hitherto I have had very little opportunity of talking to you about the foundations of erotic life so far as we have discovered them, and it is too late now to catch up on the omission. This much, however, I can emphasize to you. Object-choice, the step forward in the development of the libido which is made after the narcissistic stage, can take place according to two different types: either according to the narcissistic type, where the subject's own ego is replaced by another one that is as similar as possible, or according to the attachment type, where people who have become precious through satisfying the other vital needs are chosen as objects by the libido as well. A strong libidinal fixation to the narcissistic type of object-choice is to be included in the predisposition to manifest homosexuality.

We can say what the ultimate outcome of the infantile wish for a penis is in women in whom the determinants of a neurosis in later life are absent: it changes into the wish for a man, and thus puts up with the man as an appendage to the penis. This transformation, therefore, turns an impulse which is hostile to the female sexual function into one which is favourable to it. Such women are in this way made capable of an erotic life based on the masculine type of object-love, which can exist alongside the feminine one proper, derived from narcissism. We already know that in other cases it is only a baby that makes the transition from narcissistic self-love to object-love possible. So that in this respect too a baby can be represented by the penis.

During the work of treatment we have to consider the distribution of the patient's libido; we look for the object presentations to which it is bound and free it from them, so as to place it at the disposal of the ego. In the course of this, we have come to form a very curious picture of the original, primal distribution of libido in human beings. We have been driven to assume that at the beginning of the development of the individual all his libido (all his erotic tendencies, all his capacity for love) is tied to himself - that as we say, it cathects his own ego. It is only later that, being attached to the satisfaction of the major vital needs, the libido flows over from the ego on to external objects. Not till then are we able to recognize the libidinal instincts as such and distinguish them from the ego instincts. It is possible for the libido to become detached from these objects and withdrawn again into the ego.
Perhaps with the solitary exception of the relation of a mother to her son, which is based on narcissism, is not disturbed by subsequent rivalry, and is reinforced by a rudimentary attempt at sexual object-choice.

The tendency which falsifies judgement in this respect is that of idealization. But now it is easier for us to find our bearings. We see that the object is being treated in the same way as our own ego, so that when we are in love a considerable amount of narcissistic libido overflows on to the object. It is even obvious, in many forms of love-choice, that the object serves as a substitute for some unattained ego ideal of our own. We love it on account of the perfections which we have striven to reach for our own ego, and which we should now like to procure in this roundabout way as a means of satisfying our narcissism.

I am aware of the importance attaching to the first of these questions. But one should not exaggerate it and allow it to overshadow the fact that sporadic secondary characteristics of the opposite sex are very often present in normal individuals, and that well-marked physical characteristics of the opposite sex may be found in persons whose choice of object has undergone no change in the direction of inversion; in other words, that in both sexes the degree of physical hermaphroditism is to a great extent independent of psychical hermaphroditism. In modification of these statements it must be added that this independence is more evident in men than women, where bodily and mental traits belonging to the opposite sex are apt to coincide. Still I am not in a position to give a satisfactory answer to the first of our questions about my patient. The psycho-analyst customarily forgoes a thorough physical examination of his patients in certain cases. Certainly there was no obvious deviation from the feminine physical type, nor any menstrual disturbance. The beautiful and well-made girl had, it is true, her father's tall figure, and her facial features were sharp rather than soft and girlish, traits which might be regarded as indicating a physical masculinity. Some of her intellectual attributes also could be connected with masculinity: for instance, her acuteness of comprehension and her lucid objectivity, in so far as she was not dominated by her passion. But these distinctions are conventional rather than scientific. What is certainly of greater importance is that in her behaviour towards her love-object she had throughout assumed the masculine part: that is to say, she displayed the humility and the sublime overvaluation of the sexual object so characteristic of the male lover, the renunciation of all narcissistic satisfaction, and the preference for being the lover rather than the beloved. She had thus not only chosen a feminine love-object, but had also developed a masculine attitude towards that object.
Homosexuality. - Recognition of the organic factor in homosexuality does not relieve us of the obligation of studying the psychical processes connected with its origin. The typical process, already established in innumerable cases, is that a few years after the termination of puberty a young man, who until this time has been strongly fixated to his mother, changes his attitude; he identifies himself with his mother, and looks about for love-objects in whom he can re-discover himself, and whom he might then love as his mother loved him. The characteristic mark of this process is that for several years one of the necessary conditions for his love is usually that the male object shall be of the same age as he himself was when the change took place. We have come to know of various factors contributing to this result, probably in different degrees. First there is the fixation on the mother, which makes it difficult to pass on to another woman. Identification with the mother is an outcome of this attachment, and at the same time in a certain sense it enables the son to keep true to her, his first object. Then there is the inclination towards a narcissistic object-choice, which in general lies readier to hand and is easier to put into effect than a move towards the other sex. Behind this latter factor there lies concealed another of quite exceptional strength, or perhaps it coincides with it: the high value set upon the male organ and the inability to tolerate its absence in a love-object. Depreciation of women, and aversion to them, even horror of them, are generally derived from the early discovery that women have no penis. We subsequently discovered, as another powerful motive urging towards homosexual object-choice, regard for the father or fear of him; for the renunciation of women means that all rivalry with him (or with all men who may take his place) is avoided. The two last motives - the clinging to the condition of a penis in the object, as well as the retiring in favour of the father - may be ascribed to the castration complex. Attachment to the mother, narcissism, fear of castration - these are the factors (which incidentally have nothing specific about them) that we have hitherto found in the psychical aetiology of homosexuality; and with these must be reckoned the effect of seduction, which is responsible for a premature fixation of the libido, as well as the influence of the organic factor which favours the passive role in love.

I have promised to tell you of a few more psychical peculiarities of mature femininity, as we come across them in analytic observation. We do not lay claim to more than an average validity for these assertions; nor is it always easy to distinguish what should be ascribed to the influence of the sexual function and what to social breeding. Thus, we attribute a larger amount of narcissism to femininity, which also affects women’s choice of object, so that to be loved is a stronger need for them than to love. The effect of penis-envy has a share, further, in the physical vanity of women, since they are bound to value their charms more highly as a late compensation for their original sexual inferiority. Shame, which is considered to be a feminine characteristic par excellence but is far more a matter of convention than might be supposed, has as its purpose, we believe, concealment of genital deficiency. We are not forgetting that at a later time shame takes on other functions. It seems that women have made few contributions to the discoveries and inventions in the history of civilization; there is, however, one technique which they may have invented - that of plaiting and weaving. If that is so, we should be tempted to guess the unconscious motive for the achievement. Nature herself would seem to have given the model which this achievement imitates by causing the growth at maturity of the pubic hair that conceals the genitals. The step that remained to be taken lay in making the threads adhere to one another, while on the body they stick into the skin and are only matted together. If you reject this idea as fantastic and regard my belief in the influence of lack of a penis on the configuration of femininity as an idée fixe, I am of course defenceless.

[1922b, 3907]

[1933a, 4734]
The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him.

[1933a, 4735]
It is only too easy to explain why most people (whether medical observers or others) will hear nothing of the sexual life of children. They have forgotten their own infantile sexual activity under the pressure of their education to a civilized life, and they do not wish to be reminded of what has been repressed. They would arrive at other convictions if they were to begin their enquiry with a self-analysis, a revision and interpretation of their childhood memories.

[1910a, 2229]

By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

[1925e, 4128]

I have already mentioned that my investigation of the precipitating and underlying causes of the neuroses led me more and more frequently to conflicts between the subject's sexual impulses and his resistances to sexuality. In my search for the pathogenic situations in which the repressions of sexuality had set in and in which the symptoms, as substitutes for what was repressed, had had their origin, I was carried further and further back into the patient's life and ended by reaching the first years of his childhood. What poets and students of human nature had always asserted turned out to be true: the impressions of that early period of life, though they were for the most part buried in amnesia, left ineradicable traces upon the individual's growth and in particular laid down the disposition to any nervous disorder that was to follow. But since these experiences of childhood were always concerned with sexual excitations and the reaction against them, I found myself faced by the fact of *infantile sexuality* - once again a novelty and a contradiction of one of the strongest of human prejudices. Childhood was looked upon as 'innocent' and free from the lusts of sex, and the fight with the demon of 'sensuality' was not thought to begin until the troubled age of puberty. Such occasional sexual activities as it had been impossible to overlook in children were put down as signs of degeneracy or premature depravity or as a curious freak of nature. Few of the findings of psycho-analysis have met with such universal contradiction or have aroused such an outburst of indignation as the assertion that the sexual function starts at the beginning of life and reveals its presence by important signs even in childhood. And yet no other finding of analysis can be demonstrated so easily and so completely.

[1925d, 4209]
The discovery of infantile sexuality is one of those of which we have reason to feel ashamed. A few paediatricians have, it seems, always known about it, and a few children's nurses. Clever men, who call themselves child psychologists, have thereupon spoken in tones of reproach of a 'desecration of the innocence of childhood'. Once again, sentiment instead of argument! Events of that kind are of daily occurrence in political bodies. A member of the Opposition rises and denounces some piece of maladministration in the Civil Service, in the Army, in the Judiciary and so on. Upon this another member, preferably one of the Government, declares that such statements are an affront to the sense of honour of the body politic, of the army, of the dynasty, or even of the nation. So they are as good as untrue. Feelings such as these can tolerate no affronts.

[1926e, 4352]

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]
As regards the second kind of emotional reaction, which is not directed against me this time, but against my patient - supposing that my view of her is correct - and which regards the perverse nature of her phantasies as horrible, I should like to say emphatically that a medical man has no business to indulge in such passionate condemnation. I may also remark in passing that it seems to me superfluous for a physician who is writing upon the aberrations of the sexual instincts to seize every opportunity of inserting into the text expressions of his personal repugnance at such revolting things. We are faced by a fact; and it is to be hoped that we shall grow accustomed to it, when we have put our own tastes on one side. We must learn to speak without indignation of what we call the sexual perversions - instances in which the sexual function has extended its limits in respect either to the part of the body concerned or to the sexual object chosen. The uncertainty in regard to the boundaries of what is to be called normal sexual life, when we take different races and different epochs into account, should in itself be enough to cool the zealot's ardour. We surely ought not to forget that the perversion which is the most repellent to us, the sensual love of a man for a man, was not only tolerated by a people so far our superiors in cultivation as were the Greeks, but was actually entrusted by them with important social functions. The sexual life of each one of us extends to a slight degree - now in this direction, now in that - beyond the narrow lines imposed as the standard of normality. The perversions are neither bestial nor degenerate in the emotional sense of the word. They are a development of germs all of which are contained in the undifferentiated sexual disposition of the child, and which, by being suppressed or by being diverted to higher, asexual aims - by being 'sublimated' - are destined to provide the energy for a great number of our cultural achievements. When, therefore, any one has become a gross and manifest pervert, it would be more correct to say that he has remained one, for he exhibits a certain stage of inhibited development. All psychoneurotics are persons with strongly marked perverse tendencies, which have been repressed in the course of their development and have become unconscious. Consequently their unconscious phantasies show precisely the same content as the documentarily recorded actions of perverts - even though they have not read Krafft-Ebing's Psychopathia Sexualis, to which simple-minded people attribute such a large share of the responsibility for the production of perverse tendencies. Psychoneuroses are, so to speak, the negative of perversions. In neurotics their sexual constitution, under which the effects of heredity are included, operates in combination with any accidental influences in their life which may disturb the development of normal sexuality. A stream of water which meets with an obstacle in the river-bed is dammed up and flows back into old channels which had formerly seemed fated to run dry. The motive forces leading to the formation of hysterical symptoms draw their strength not only from repressed normal sexuality but also from unconscious perverse activities.¹

[1905e, 1387]
POLYMORPHOUSLY PERVERSE DISPOSITION  It is an instructive fact that under the influence of seduction children can become polymorphously perverse, and can be led into all possible kinds of sexual irregularities. This shows that an aptitude for them is innately present in their disposition. There is consequently little resistance towards carrying them out, since the mental dams against sexual excesses - shame, disgust and morality - have either not yet been constructed at all or are only in course of construction, according to the age of the child. In this respect children behave in the same kind of way as an average uncultivated woman in whom the same polymorphously perverse disposition persists. Under ordinary conditions she may remain normal sexually, but if she is led on by a clever seducer she will find every sort of perversion to her taste, and will retain them as part of her own sexual activities. Prostitutes exploit the same polymorphous, that is, infantile, disposition for the purposes of their profession; and, considering the immense number of women who are prostitutes or who must be supposed to have an aptitude for prostitution without becoming engaged in it, it becomes impossible not to recognize that this same disposition to perversions of every kind is a general and fundamental human characteristic. [1905d, 1510]

It was not possible to say what amount of sexual activity can occur in childhood without being described as abnormal or detrimental to further development. The nature of these sexual manifestations was found to be predominantly masturbatory. Experience further showed that the external influences of seduction are capable of provoking interruptions of the latency period or even its cessation, and that in this connection the sexual instinct of children proves in fact to be polymorphously perverse; it seems, moreover, that any such premature sexual activity diminishes a child's educability. [1905d, 1545]

SUBLIMATION  The third alternative result of an abnormal constitutional disposition is made possible by the process of sublimation. This enables excessively strong excitations arising from particular sources of sexuality to find an outlet and use in other fields, so that a not inconsiderable increase in psychical efficiency results from a disposition which is itself perilous. Here we have one of the origins of artistic activity; and, according to the completeness or incompleteness of the sublimation, a characterological analysis of a highly gifted individual, and in particular of one with an artistic disposition, may reveal a mixture, in every proportion, of efficiency, perversion and neurosis. A sub-species of sublimation is to be found in suppression by reaction-formation, which, as we have seen, begins during a child's period of latency and continues in favourable cases throughout his whole life. What we describe as a person's 'character' is built up to a considerable extent from the material of sexual excitations and is composed of instincts that have been fixed since childhood, of constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse impulses which have been recognized as being unutilizable.¹ The multifariously perverse sexual disposition of childhood can accordingly be regarded as the source of a number of our virtues, in so far as through reaction-formation it stimulates their development.² [1905d, 1549]
I could not further elucidate this part of my theory without a detailed discussion of my views on repression. It will be enough here to refer to my *Three Essays* (1905d), in which I have attempted to throw some light - if only a feeble one - on the somatic processes in which the essential nature of sexuality is to be looked for. I have there shown that the constitutional sexual disposition of children is incomparably more variegated than might have been expected, that it deserves to be described as 'polymorphously perverse' and that what is spoken of as the normal behaviour of the sexual function emerges from this disposition after certain of its components have been repressed. By pointing out the infantile elements in sexuality I was able to establish a simple correlation between health, perversions and neuroses. I showed that normality is a result of the repression of certain component instincts and constitutes of the infantile disposition and of the subordination of the remaining constituents under the primacy of the genital zones in the service of the reproductive function. I showed that perversions correspond to disturbances of this coalescence owing to the overpowering and compulsive development of certain of the component instincts, while neuroses can be traced back to an excessive repression of the libidinal trends. Since almost all the perverse instincts of the infantile disposition can be recognized as the forces concerned in the formation of symptoms in neuroses, though in a state of repression, I was able to describe neurosis as being the 'negative' of perversion. 

[1906a, 1581]

This is the first trace of homosexuality that we have come across in him, but it will not be the last. Little Hans seems to be a positive paragon of all the vices. 

[1909b, 2010]

When educators have become familiar with the findings of psycho-analysis, it will be easier for them to reconcile themselves to certain phases of infantile development and they will, among other things, not be in danger of over-estimating the importance of the socially unserviceable or perverse instinctual impulses which emerge in children. On the contrary they will refrain from any attempt at forcibly suppressing such impulses, when they learn that efforts of this kind often produce no less undesirable results than the alternative, which is so much dreaded by educators, of giving free play to children's naughtiness. The forcible suppression of strong instincts by external means never has the effect in a child of these instincts being extinguished or brought under control; it leads to repression, which establishes a predisposition to later nervous illness. Psycho-analysis has frequent opportunities of observing the part played by inopportune and undiscerning severity of upbringing in the production of neuroses, or the price, in loss of efficiency and of capacity for enjoyment, which has to be paid for the normality upon which the educator insists. And psycho-analysis can also show what precious contributions to the formation of character are made by these asocial and perverse instincts in the child, if they are not subjected to repression but are diverted from their original aims to more valuable ones by the process known as 'sublimation'. Our highest virtues have grown up, as reaction formations and sublimations, out of our worst dispositions. Education should scrupulously refrain from burying these precious springs of action and should restrict itself to encouraging the processes by which these energies are led along safe paths. Whatever we can expect in the way of prophylaxis against neurosis in the individual lies in the hands of a psycho-analytically enlightened education.¹ 

[1913], 2825}
First and foremost, it is an untenable error to deny that children have a sexual life and to suppose that sexuality only begins at puberty with the maturation of the genitals. On the contrary, from the very first children have a copious sexual life, which differs at many points from what is later regarded as normal. What in adult life is described as 'perverse' differs from the normal in these respects: first, by disregarding the barrier of species (the gulf between men and animals), secondly, by overstepping the barrier against disgust, thirdly that against incest (the prohibition against seeking sexual satisfaction from near blood-relations), fourthly that against members of one's own sex and fifthly the transferring of the part played by the genitals to other organs and areas of the body. None of these barriers existed from the beginning; they were only gradually erected in the course of development and education. Small children are free from them. They recognize no frightful gulf between human beings and animals; the arrogance with which men separate themselves from animals does not emerge until later. To begin with, children exhibit no disgust at excreta but acquire this slowly under the pressure of education; they attach no special importance to the distinction between the sexes, but attribute the same conformation of the genitals to both; they direct their first sexual lusts and their curiosity to those who are nearest and for other reasons dearest to them - parents, brothers and sisters, or nurses; and finally, they show (what later on breaks through once again at the climax of a love-relation) that they expect to derive pleasure not only from their sexual organs, but that many other parts of the body lay claim to the same sensitivity, afford them analogous feelings of pleasure and can accordingly play the part of genitals. Children may thus be described as 'polymorphously perverse', and if these impulses only show traces of activity, that is because on the one hand they are of less intensity compared with those in later life and on the other hand all a child's sexual manifestations are at once energetically suppressed by education. This suppression is, as it were, extended into theory; for adults endeavour to overlook one portion of the sexual manifestations of children and to disguise another portion by misinterpreting its sexual nature, so that they can then disavow the whole of them. It is often the very same people who in the nursery are furious with any sexual naughtinesses of children and afterwards at their writing-tables defend the sexual purity of the same children. When children are left to themselves, or under the influence of seduction, they often bring about quite considerable achievements in the way of perverse sexual activity. Adults are of course right not to take this too seriously and to regard it as 'childishness', or 'playfulness', for children are not to be condemned as fully capable or fully responsible either before the judgement-seat of morals or before the law; but nonetheless these things exist. They have their importance both as indications of a child's innate constitution and as causes and encouragements of later developments in him; they give us information on the sexual life of children and so on human sexual life in general. If, therefore, we once more find all these perverse wishful impulses behind our distorted dreams, that only means that in this field too dreams have taken a step backwards into the state of infancy.

[1916-1917, 3297]
The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and though those of perverts have been recognized it has been with moral indignation and without understanding. Looked at from the psycho-analytic standpoint, even the most eccentric and repellent perversions are explicable as manifestations of component instincts of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psycho-analysis enables us to point to some trace or other of a homosexual object-choice in everyone. If I have described children as 'polymorphously perverse', I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psycho-analysis has no concern whatever with such judgements of value.

[1925d, 4213]
The deeper interpretation of this dream was shown by another dream of the same night, in which the dreamer identified herself with her brother. She had actually been a boyish girl, and had often been told that she should have been a boy. This identification with her brother made it particularly clear that 'the little one' meant a genital organ. Her mother was threatening him (or her) with castration, which could only have been a punishment for playing with her penis; thus the identification also proved that she herself had masturbated as a child - a memory which till then she had only had as applied to her brother. The information supplied by the second dream showed that she must have come to know about the male organ at an early age and have afterwards forgotten it. Further, the second dream alluded to the infantile sexual theory according to which girls are boys who have been castrated. When I suggested to her that she had had this childish belief, she at once confirmed the fact by telling me that she had heard the anecdote of the little boy's saying to the little girl: 'Cut off?' and of the little girl's replying: 'No, always been like that.'

[1900a, 825]

There is really very little difficulty in inferring: (1) that the boy had masturbated when he was younger, that he had probably denied it, and that he had been threatened with severe punishment for his bad habit (cf. his admission: 'Je ne le ferais plus', and his denial: 'Albert n'a jamais fait ça'); (2) that with the onset of puberty the temptation to masturbate had revived with the tickling in his genitals; but (3) that a struggle for repression had broken out in him, which had suppressed his libido and transformed it into anxiety, and that the anxiety had taken over the punishments with which he had been threatened earlier.

[1900a, 1014]

The significance of enuresis in the early history of neurotics is worth going into thoroughly. For the sake of clearness I will confine myself to remarking that Dora's case of bed-wetting was not the usual one. The disorder was not simply that the habit had persisted beyond what is considered the normal period, but, according to her explicit account, it had begun by disappearing and had then returned at a relatively late age - after her sixth year. Bed-wetting of this kind has, to the best of my knowledge, no more likely cause than masturbation, a habit whose importance in the aetiology of bed-wetting in general is still insufficiently appreciated. In my experience, the children concerned have themselves at one time been very well aware of this connection, and all its psychological consequences follow from it as though they had never forgotten it. Now, at the time when Dora reported the dream, we were engaged upon a line of enquiry which led straight towards an admission that she had masturbated in childhood. A short while before, she had raised the question of why it was that precisely she had fallen ill, and, before I could answer, had put the blame on her father. The justification for this was forthcoming not out of her unconscious thoughts but from her conscious knowledge. It turned out, to my astonishment, that the girl knew what the nature of her father's illness had been. After his return from consulting me she had overheard a conversation in which the name of the disease had been mentioned. At a still earlier period - at the time of the detached retina - an oculist who was called in must have hinted at a luetic aetiology; for the inquisitive and anxious girl overheard an old aunt of hers saying to her mother: 'He was ill before his marriage, you know', and adding something which she could not understand, but which she subsequently connected in her mind with improper subjects.

[1905e, 1411]
I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a self-accusation. I met her half-way by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.¹ I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step towards the confession. For on that day she wore at her waist - a thing she never did on any other occasion before or after - a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it - opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a ‘symptomatic act’.² I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: ‘Why should I not wear a reticule like this, as it is now the fashion to do?’ But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though on the other hand the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

¹ The proof of infantile masturbation in other cases is established in a precisely similar way. The evidence for it is mostly of a similar nature: indications of the presence of leucorrhoea, bed-wetting, hand-ceremonials (obsessional washing), and such things. It is always possible to discover with certainty from the nature of the symptoms of the case whether the habit was discovered by the person in charge of the child or not, or whether this sexual activity was brought to an end by long efforts on the child’s part to break itself of the habit, or by a sudden change. In Dora’s case the masturbation had remained undiscovered, and had come to an end at a single blow (cf. her secret, her fear of doctors, and the replacement by dyspnoea). The patients, it is true, invariably dispute the conclusiveness of circumstantial evidence such as this, and they do so even when they have retained a conscious recollection of the catarh or of their mother’s warning (e.g. ‘That makes people stupid; it’s dangerous’). But some time later the memory, which has been so long repressed, of this piece of infantile sexual life emerges with certainty, and it does so in every instance. I am reminded of the case of a patient of mine suffering from obsessions, which were direct derivatives of infantile masturbation. Her peculiarities, such as self-prohibitions and self-punishments, the feeling that if she had done this she must not do that, the idea that she must not be interrupted, the introduction of pauses between one procedure (with her hands) and the next, her hand-washing, etc., - all of these turned out to be unaltered fragments of her nurse’s efforts to break her of the habit. The only thing which had remained permanently in her memory were the words of warning: ‘Ugh! That’s dangerous!’ Compare also in this connection my Three Essays on the Theory of Sexuality, 1905d.

² [1905e, 1413]

[1905e, 1416]
There now arise a whole series of questions of the greatest importance concerning the aetiology of hysteria: is Dora's case to be regarded as aetiological typical? does it represent the only type of causation? and so on. Nevertheless, I am sure that I am taking the right course in postponing my answer to such questions until a considerable number of other cases have been similarly analysed and published. Moreover, I should have to begin by criticizing the way in which the questions are framed. Instead of answering 'Yes' or 'No' to the question whether the aetiology of this case is to be looked for in masturbation during childhood, I should first have to discuss the concept of aetiology as applied to the psychoneuroses. It would then become evident that the standpoint from which I should be able to answer the question would be very widely removed from the standpoint from which it was put. Let it suffice if we can reach the conviction that in this case the occurrence of masturbation in childhood is established, and that its occurrence cannot be an accidental element nor an immaterial one in the conformation of the clinical picture.¹

[1905e, 1417]

Thumb-sucking appears already in early infancy and may continue into maturity, or even persist all through life. It consists in the rhythmic repetition of a sucking contact by the mouth (or lips). There is no question of the purpose of this procedure being the taking of nourishment. A portion of the lip itself, the tongue, or any other part of the skin within reach - even the big toe - may be taken as the object upon which this sucking is carried out. In this connection a grasping-instinct may appear and may manifest itself as a simultaneous rhythmic tugging at the lobes of the ears or a catching hold of some part of another person (as a rule the ear) for the same purpose. Sensual sucking involves a complete absorption of the attention and leads either to sleep or even to a motor reaction in the nature of an orgasm.¹ It is not infrequently combined with rubbing some sensitive part of the body such as the breast or the external genitalia. Many children proceed by this path from sucking to masturbation.

[1905d, 1501]

ACTIVITY OF THE GENITAL ZONES Among the erotogenic zones that form part of the child's body there is one which certainly does not play the opening part, and which cannot be the vehicle of the oldest sexual impulses, but which is destined to great things in the future. In both male and female children it is brought into connection with micturition (in the glans and clitoris) and in the former is enclosed in a pouch of mucous membrane, so that there can be no lack of stimulation of it by secretions which may give an early start to sexual excitation. The sexual activities of this erotogenic zone, which forms part of the sexual organs proper, are the beginning of what is later to become 'normal' sexual life. The anatomical situation of this region, the secretions in which it is bathed, the washing and rubbing to which it is subjected in the course of a child's toilet, as well as accidental stimulation (such as the movement of intestinal worms in the case of girls), make it inevitable that the pleasurable feeling which this part of the body is capable of producing should be noticed by children even during their earliest infancy, and should give rise to a need for its repetition. If we consider this whole range of contrivances and bear in mind that both making a mess and measures for keeping clean are bound to operate in much the same way, it is scarcely possible to avoid the conclusion that the foundations for the future primacy over sexual activity exercised by this erotogenic zone are established by early infantile masturbation, which scarcely a single individual escapes. The action which dispenses of the stimulus and brings about satisfaction consists in a rubbing movement with the hand or in the application of pressure (no doubt on the lines of a pre-existing reflex) either from the hand or by bringing the thighs together. This last method is by far the more common in the case of girls. The preference for the hand which is shown by boys is already evidence of the important contribution which the instinct for mastery is destined to make to masculine sexual activity.¹

[1905d, 1508]
It will be in the interests of clarity if I say at once that three phases of infantile masturbation are to be distinguished. The first of these belongs to early infancy, and the second to the brief efflorescence of sexual activity about the fourth year of life; only the third phase corresponds to pubertal masturbation, which is often the only kind taken into account.

¹ [Footnote added 1915:] Unusual techniques in carrying out masturbation in later years seem to point to the influence of a prohibition against masturbation which has been overcome.

SECOND PHASE OF INFANTILE MASTURBATION   The masturbation of early infancy seems to disappear after a short time; but it may persist uninterruptedly until puberty, and this would constitute the first great deviation from the course of development laid down for civilized men. At some point of childhood after early infancy, as a rule before the fourth year, the sexual instinct belonging to the genital zone usually revives and persists again for a time until it is once more suppressed, or it may continue without interruption. This second phase of infantile sexual activity may assume a variety of different forms which can only be determined by a precise analysis of individual cases. But all its details leave behind the deepest (unconscious) impressions in the subject's memory, determine the development of his character, if he is to remain healthy, and the symptomatology of his neurosis, if he is to fall ill after puberty.¹ In the latter case we find that this sexual period has been forgotten and that the conscious memories that bear witness to it have been displaced. (I have already mentioned that I am also inclined to relate normal infantile amnesia to this infantile sexual activity.) Psychoanalytic investigation enables us to make what has been forgotten conscious and thus do away with a compulsion that arises from the unconscious psychical material.

RETURN OF EARLY INFANTILE MASTURBATION   During the years of childhood with which I am now dealing, the sexual excitation of early infancy returns, either as a centrally determined tickling stimulus which seeks satisfaction in masturbation, or as a process in the nature of a nocturnal emission which, like the nocturnal emissions of adult years, achieves satisfaction without the help of any action by the subject. The latter case is the more frequent with girls and in the second half of childhood; its determinants are not entirely intelligible and often, though not invariably, it seems to be conditioned by a period of earlier active masturbation. The symptoms of these sexual manifestations are scanty; they are mostly displayed on behalf of the still undeveloped sexual apparatus by the urinary apparatus, which thus acts, as it were, as the former's trustee. Most of the so-called bladder disorders of this period are sexual disturbances: nocturnal enuresis, unless it represents an epileptic fit, corresponds to a nocturnal emission.
The reappearance of sexual activity is determined by internal causes and external contingencies, both of which can be guessed in cases of neurotic illness from the form taken by their symptoms and can be discovered with certainty by psycho-analytic investigation. I shall have to speak presently of the internal causes; great and lasting importance attaches at this period to the accidental external contingencies. In the foreground we find the effects of seduction, which treats a child as a sexual object prematurely and teaches him, in highly emotional circumstances, how to obtain satisfaction from his genital zones, a satisfaction which he is then usually obliged to repeat again and again by masturbation. An influence of this kind may originate either from adults or from other children. I cannot admit that in my paper on 'The Aetiology of Hysteria' (1896) I exaggerated the frequency or importance of that influence, though I did not then know that persons who remain normal may have had the same experiences in their childhood, and though I consequently overrated the importance of seduction in comparison with the factors of sexual constitution and development.¹ Obviously seduction is not required in order to arouse a child's sexual life; that can also come about spontaneously from internal causes. [1905d, 1510]

COMPONENT INSTINCTS Moreover, the effects of seduction do not help to reveal the early history of the sexual instinct; they rather confuse our view of it by presenting children prematurely with a sexual object for which the infantile sexual instinct at first shows no need. It must, however, be admitted that infantile sexual life, in spite of the preponderating dominance of erotogenic zones, exhibits components which from the very first involve other people as sexual objects. Such are the instincts of scopophilia, exhibitionism and cruelty, which appear in a sense independently of erotogenic zones; these instincts do not enter into intimate relations with genital life until later, but are already to be observed in childhood as independent impulses, distinct in the first instance from erotogenic sexual activity. Small children are essentially without shame, and at some periods of their earliest years show an unmistakable satisfaction in exposing their bodies, with especial emphasis on the sexual parts. The counterpart of this supposedly perverse inclination, curiosity to see other people's genitals, probably, does not become manifest until somewhat later in childhood, when the obstacle set up by a sense of shame has already reached a certain degree of development. Under the influence of seduction the scopophilic perversion can attain great importance in the sexual life of a child. But my researches into the early years of normal people, as well as of neurotic patients, force me to the conclusion that scopophilia can also appear in children as a spontaneous manifestation. Small children whose attention has once been drawn - as a rule by masturbation - to their own genitals usually take the further step without help from outside and develop a lively interest in the genitals of their playmates. Since opportunities for satisfying curiosity of this kind usually occur only in the course of satisfying the two kinds of need for excretion, children of this kind turn into voyeurs, eager spectators of the processes of micturition and defaecation. When repression of these inclinations sets in, the desire to see other people's genitals (whether of their own or the opposite sex) persists as a tormenting compulsion, which in some cases of neurosis later affords the strongest motive force for the formation of symptoms. [1905d, 1511]
As we all know, it is not until puberty that the sharp distinction is established between the masculine and feminine characters. From that time on, this contrast has a more decisive influence than any other upon the shaping of human life. It is true that the masculine and feminine dispositions are already easily recognizable in childhood. The development of the inhibitions of sexuality (shame, disgust, pity, etc.) takes place in little girls earlier and in the face of less resistance than in boys; the tendency to sexual repression seems in general to be greater; and, where the component instincts of sexuality appear, they prefer the passive form. The auto-erotic activity of the erotogenic zones is, however, the same in both sexes, and owing to this uniformity there is no possibility of a distinction between the two sexes such as arises after puberty. So far as the auto-erotic and masturbatory manifestations of sexuality are concerned, we might lay it down that the sexuality of little girls is of a wholly masculine character. Indeed, if we were able to give a more definite connotation to the concepts of 'masculine' and 'feminine', it would even be possible to maintain that libido is invariably and necessarily of a masculine nature, whether it occurs in men or in women and irrespective of whether its object is a man or a woman.¹

LEADING ZONES IN MEN AND WOMEN
Apart from this I have only the following to add. The leading erotogenic zone in female children is located at the clitoris, and is thus homologous to the masculine genital zone of the glans penis. All my experience concerning masturbation in little girls has related to the clitoris and not to the regions of the external genitalia that are important in later sexual functioning. I am even doubtful whether a female child can be led by the influence of seduction to anything other than clitoridal masturbation. If such a thing occurs, it is quite exceptional. The spontaneous discharges of sexual excitement which occur so often precisely in little girls are expressed in spasms of the clitoris. Frequent erections of that organ make it possible for girls to form a correct judgement, even without any instruction, of the sexual manifestations of the other sex: they merely transfer on to boys the sensations derived from their own sexual processes.

It was not possible to say what amount of sexual activity can occur in childhood without being described as abnormal or detrimental to further development. The nature of these sexual manifestations was found to be predominantly masturbatory. Experience further showed that the external influences of seduction are capable of provoking interruptions of the latency period or even its cessation, and that in this connection the sexual instinct of children proves in fact to be polymorphously perverse; it seems, moreover, that any such premature sexual activity diminishes a child's educability.
Though even to-day I do not consider these assertions incorrect, it is not to be wondered at that, in the course of ten years of continuous effort at reaching an understanding of these phenomena, I have made a considerable step forward from the views I then held, and now believe that I am in a position, on the basis of deeper experience, to correct the insufficiencies, the displacements and the misunderstandings under which my theory then laboured. At that time my material was still scanty, and it happened by chance to include a disproportionately large number of cases in which sexual seduction by an adult or by older children played the chief part in the history of the patient's childhood. I thus over-estimated the frequency of such events (though in other respects they were not open to doubt). Moreover, I was at that period unable to distinguish with certainty between falsifications made by hysterics in their memories of childhood and traces of real events. Since then I have learned to explain a number of phantasies of seduction as attempts at fending off memories of the subject's own sexual activity (infantile masturbation). When this point had been clarified, the 'traumatic' element in the sexual experiences of childhood lost its importance and what was left was the realization that infantile sexual activity (whether spontaneous or provoked) prescribes the direction that will be taken by later sexual life after maturity. The same clarification (which corrected the most important of my early mistakes) also made it necessary to modify my view of the mechanism of hysterical symptoms. They were now no longer to be regarded as direct derivatives of the repressed memories of childhood experiences; but between the symptoms and the childish impressions there were inserted the patient's phantasies (or imaginary memories), mostly produced during the years of puberty, which on the one side were built up out of and over the childhood memories and on the other side were transformed directly into the symptoms. It was only after the introduction of this element of hysterical phantasies that the texture of the neurosis and its relation to the patient's life became intelligible; a surprising analogy came to light, too, between these unconscious phantasies of hysterics and the imaginary creations of paranoics which become conscious as delusions.

Unconscious phantasies have either been unconscious all along and have been formed in the unconscious; or - as is more often the case - they were once conscious phantasies, day-dreams, and have since been purposely forgotten and have become unconscious through 'repression'. Their content may afterwards either have remained the same or have undergone alterations, so that the present unconscious phantasies are derivatives of the once conscious ones. Now an unconscious phantasy has a very important connection with the subject's sexual life; for it is identical with the phantasy which served to give him sexual satisfaction during a period of masturbation. At that time the masturbatory act (in the widest sense of the term) was compounded of two parts. One was the evocation of a phantasy and the other some active behaviour for obtaining self-gratification at the height of the phantasy. This compound, as we know, was itself merely soldered together.¹ Originally the action was a purely auto-erotic procedure for the purpose of obtaining pleasure from some particular part of the body, which could be described as erotogenic. Later, this action became merged with a wishful idea from the sphere of object-love and served as a partial realization of the situation in which the phantasy culminated. When, subsequently, the subject renounces this type of satisfaction, composed of masturbation and phantasy, the action is given up, while the phantasy, from being conscious, becomes unconscious. If no other mode of sexual satisfaction supervenes, the subject remains abstinent; and if he does not succeed in sublimating his libido - that is, in deflecting his sexual excitation to higher aims -, the condition is now fulfilled for his unconscious phantasy to be revived and to proliferate, and, at least as regards some part of its content, to put itself into effect, with the whole force of his need for love, in the form of a pathological symptom.

[1906a, 1578]

[1908a, 1934]
If this idea of a woman with a penis becomes "fixed" in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.
[1908c, 1971]

Meanwhile his interest in widdlers was by no means a purely theoretical one; as might have been expected, it also impelled him to touch his member. When he was three and a half his mother found him with his hand on his penis. She threatened him in these words: 'If you do that, I shall send for Dr. A. to cut off your widdler. And then what'll you widdle with?'
[1909b, 2003]

¹ Another mother, a neurotic, who was unwilling to believe in infantile masturbation, told me of a similar attempt at seduction on the part of her three-and-a-half-year-old daughter. She had had a pair of drawers made for the little girl, and was trying them on her to see whether they were not too tight for walking. To do this she passed her hand upwards along the inner surface of the child's thigh. Suddenly the little girl shut her legs together on her mother's hand, saying: 'Oh, Mummy, do leave your hand there. It feels so lovely.'
[1909b, 2013]

There is another point in regard to which we must avoid giving way to this temptation. Hans admitted that every night before going to sleep he amused himself with playing with his penis. 'Ah!' the family doctor will be inclined to say, 'now we have it. The child masturbated: hence his pathological anxiety.' But gently. That the child was getting pleasure for himself by masturbating does not by any means explain his anxiety; on the contrary, it makes it more problematical than ever. States of anxiety are not produced by masturbation or by getting satisfaction in any shape. Moreover, we may presume that Hans, who was now four and three-quarters, had been indulging in this pleasure every evening for at least a year (see p. 2003). And we shall find that at this moment he was actually engaged in a struggle to break himself of the habit - a state of things which fits in much better with repression and the generation of anxiety.
[1909b, 2020]
Hans’s father had no reason to doubt that it was a real event that the boy was describing. I may also mention that the sensations of itching in the glans penis, which lead children to touch their genitals, are usually described by them in the phrase ‘Es beisst mich’ ['I'm itching', literally 'it bites me']. [1909b, 2022]

This was none of it a dream, but a masturbatory phantasy, which was, however, equivalent to a dream. What he made his mother do was evidently intended as a piece of self-justification: ‘If Mummy shows her widdler, I may too.’ [1909b, 2023]

³ They were the children of his phantasy, that is to say, of his masturbation. [1909b, 2080]

The first trait in little Hans which can be regarded as part of his sexual life was a quite peculiarly lively interest in his ‘widdler’ - an organ deriving its name from that one of its two functions which, scarcely the less important of the two, is not to be eluded in the nursery. This interest aroused in him the spirit of enquiry, and he thus discovered that the presence or absence of a widdler made it possible to differentiate between animate and inanimate objects. He assumed that all animate objects were like himself, and possessed this important bodily organ; he observed that it was present in the larger animals, suspected that this was so too in both his parents, and was not deterred by the evidence of his own eyes from authenticating the fact in his new-born sister. One might almost say that it would have been too shattering a blow to his 'Weltanschauung' if he had had to make up his mind to forgo the presence of this organ in a being similar to him; it would have been as though it were being torn away from himself. It was probably on this account that a threat of his mother's, which was concerned precisely with the loss of his widdler, was hastily dismissed from his thoughts and only succeeded in making its effects apparent at a later period. The reason for his mother's intervention had been that he used to like giving himself feelings of pleasure by touching his member: the little boy had begun to practise the commonest - and most normal - form of auto-erotic sexual activity. [1909b, 2091]

The pleasure which a person takes in his own sexual organ may become associated with scopophilia (or sexual pleasure in looking) in its active and passive forms, in a manner which has been very aptly described by Alfred Adler (1908) as 'confluence of instincts'. So little Hans began to try to get a sight of other people's widdlers; his sexual curiosity developed, and at the same time he liked to exhibit his own widdler. One of his dreams, dating from the beginning of his period of repression, expressed a wish that one of his little girl friends should assist him in widdling, that is, that she should share the spectacle. The dream shows, therefore, that up till then this wish had subsisted unrepresed, and later information confirmed the fact that he had been in the habit of gratifying it. The active side of his sexual scopophilia soon became associated in him with a definite theme. He repeatedly expressed both to his father and his mother his regret that he had never yet seen their widdlers; and it was probably the need for making a comparison which impelled him to do this. The ego is always the standard by which one measures the external world; one learns to understand it by means of a constant comparison with oneself. Hans had observed that large animals had widdlers that were correspondingly larger than his; he consequently suspected that the same was true of his parents, and was anxious to make sure of this. His mother, he thought, must certainly have a widdler 'like a horse'. He was then prepared with the comforting reflection that his widdler would grow with him. It was as though the child's wish to be bigger had been concentrated on his genitals. [1909b, 2091]
At this juncture it is as well to emphasize at once the fact that during his phobia there was an unmistakable repression of these two well-developed components of his sexual activity. He was ashamed of micturating before other people, accused himself of putting his finger to his widdler, made efforts to give up masturbating, and showed disgust at 'lumf' and 'widdle' and everything that reminded him of them. In his phantasy of looking after his children he undid this latter repression.

But the beginnings of this psychological situation go back further still. During the preceding summer Hans had had similar moods of mingled longing and apprehension, in which he had said similar things; and at that time they had secured him the advantage of being taken by his mother into her bed. We may assume that since then Hans had been in a state of intensified sexual excitement, the object of which was his mother. The intensity of this excitement was shown by his two attempts at seducing his mother (the second of which occurred just before the outbreak of his anxiety); and he found an incidental channel of discharge for it by masturbating every evening and in that way obtaining gratification. Whether the sudden change-over of this excitement into anxiety took place spontaneously, or as a result of his mother's rejection of his advances, or owing to the accidental revival of earlier impressions by the 'precipitating cause' of his illness (about which we shall hear presently) - this we cannot decide; and, indeed, it is a matter of indifference, for these three alternative possibilities cannot be regarded as mutually incompatible. The fact remains that his sexual excitement suddenly changed into anxiety.

The arrival of his sister brought into Hans's life many new elements, which from that time on gave him no rest. In the first place he was obliged to submit to a certain degree of privation: to begin with, a temporary separation from his mother, and later a permanent diminution in the amount of care and attention which he had received from her and which thenceforward he had to grow accustomed to sharing with his sister. In the second place, he experienced a revival of the pleasures he had enjoyed when he was looked after as an infant; for they were called up by all that he saw his mother doing for the baby. As a result of these two influences his erotic needs became intensified, while at the same time they began to obtain insufficient satisfaction. He made up for the loss which his sister's arrival had entailed on him by imagining that he had children of his own; and so long as he was at Gmunden - on his second visit there - and could really play with these children, he found a sufficient outlet for his affections. But after his return to Vienna he was once more alone, and set all his hopes upon his mother. He had meanwhile suffered another privation, having been exiled from his parents' bedroom at the age of four and a half. His intensified erotic excitability now found expression in phantasies, by which in his loneliness he conjured up his playmates of the past summer, and in regular auto-erotic satisfaction obtained by a masturbatory stimulation of his genitals.

It is hard to say what the influence was which, in the situation we have just sketched, led to the sudden change in Hans and to the transformation of his libidinal longing into anxiety - to say from what direction it was that repression set in. The question could probably only be decided by making a comparison between this analysis and a number of similar ones. Whether the scales were turned by the child's intellectual inability to solve the difficult problem of the begetting of children and to cope with the aggressive impulses that were liberated by his approaching its solution, or whether the effect was produced by a somatic incapacity, a constitutional intolerance of the masturbatory gratification in which he regularly indulged (whether, that is, the mere persistence of sexual excitement at such a high pitch of intensity was bound to bring about a revulsion) - this question must be left open until fresh experience can come to our assistance.
It deserves to be noticed that the ideational content of Hans's phobia as it then stood had to be submitted to one further process of distortion and substitution before his consciousness took cognizance of it. Hans's first formulation of his anxiety was: 'the horse will bite me'; and this was derived from another episode at Gmunden, which was on the one hand related to his hostile wishes towards his father and on the other hand was reminiscent of the warning he had been given against masturbation. Some interfering influence, emanating from his parents perhaps, had made itself felt. I am not certain whether the reports upon Hans were at that time drawn up with sufficient care to enable us to decide whether he expressed his anxiety in this form before or not until after his mother had taken him to task on the subject of masturbating. I should be inclined to suspect that it was not until afterwards, though this would contradict the account given in the case history. At any rate, it is evident that at every point Hans's hostile complex against his father screened his lustful one about his mother, just as it was the first to be disclosed and dealt with in the analysis.

[1909b, 2116]

Before I can regard this synthesis as completed I must turn to yet another aspect of the case, which will take us into the very heart of the difficulties that lie in the way of our understanding of neurotic states. We have seen how our little patient was overtaken by a great wave of repression and that it caught precisely those of his sexual components that were dominant.¹ He gave up masturbation, and turned away in disgust from everything that reminded him of excrement and of looking on at other people performing their natural functions. But these were not the components which were stirred up by the precipitating cause of the illness (his seeing the horse fall down) or which provided the material for the symptoms, that is, the content of the phobia.

[1909b, 2117]
To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to
the history of the masturbatory side of our patient's sexual activities. There is a conflict between
the opinions of doctors and patients on this subject which has not hitherto been properly
appreciated. The patients are unanimous in their belief that masturbation, by which they mean
masturbation during puberty, is the root and origin of all their troubles. The doctors are, upon
the whole, unable to decide what line to take; but, influenced by the knowledge that not only
neurotics but most normal people pass through a period of masturbation during their puberty,
the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In
my opinion the patients are once again nearer to a correct view than the doctors; for the
patients have some glimmering notion of the truth, while the doctors are in danger of
overlooking an essential point. The thesis propounded by the patients certainly does not
correspond to the facts in the sense in which they themselves construe it, namely, that
masturbation during puberty (which may almost be described as a typical occurrence) is
responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation
of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has
hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule,
between the ages of three and four or five; and it is the clearest expression of a child's sexual
constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised
way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality;
and they are perfectly right in doing so. On the other hand, the problem of masturbation
becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the
discharge of every variety of sexual component and of every sort of phantasy to which such
components can give rise. The injurious effects of masturbation are only in a very small degree
autonomous - that is to say, determined by its own nature. They are in substance merely part
and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so
many people can tolerate masturbation - that is, a certain amount of it - without injury merely
shows that their sexual constitution and the course of development of their sexual life have
been such as to allow them to exercise the sexual function within the limits of what is culturally
permissible; whereas other people, because their sexual constitution has been less favourable
or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that
is, achieve the necessary suppression or sublimation of their sexual components without having
recourse to inhibitions or substitutes.¹
[1909d, 2159]
Starting from these indications and from other data of a similar kind, I ventured to put forward a construction to the effect that when he was a child of under six he had been guilty of some sexual misdemeanour connected with masturbation and had been soundly castigated for it by his father. This punishment, according to my hypothesis, had, it was true, put an end to his masturbations, but on the other hand it had left behind it an ineradicable grudge against his father and had established him for all time in his role of an interferer with the patient's sexual enjoyment.¹ To my great astonishment the patient then informed me that his mother had repeatedly described to him an occurrence of this kind which dated from his earliest childhood and had evidently escaped being forgotten by her on account of its remarkable consequences. He himself, however, had no recollection of it whatever. The tale was as follows. When he was very small - it became possible to establish the date more exactly owing to its having coincided with the fatal illness of an elder sister - he had done something naughty, for which his father had given him a beating. The little boy had flown into a terrible rage and had hurled abuse at his father even while he was under his blows. But as he knew no bad language, he had called him all the names of common objects that he could think of, and had screamed: 'You lamp! You towel! You plate!' and so on. His father, shaken by such an outburst of elemental fury, had stopped beating him, and had declared: 'The child will be either a great man or a great criminal!'² The patient believed that the scene made a permanent impression upon himself as well as upon his father. His father, he said, never beat him again; and he also attributed to this experience a part of the change which came over his own character. From that time forward he was a coward - out of fear of the violence of his own rage. His whole life long, moreover, he was terribly afraid of blows, and used to creep away and hide, filled with terror and indignation, when one of his brothers or sisters was beaten.

¹[1909d, 2161]

²[1910h, 2332]

As an almost invariable corollary to this sexual enlightenment, the boy at the same time gains a knowledge of the existence of certain women who practise sexual intercourse as a means of livelihood, and who are for this reason held in general contempt. The boy himself is necessarily far from feeling this contempt: as soon as he learns that he too can be initiated by these unfortunates into sexual life, which till then he accepted as being reserved exclusively for 'grown-ups', he regards them only with a mixture of longing and horror. When after this he can no longer maintain the doubt which makes his parents an exception to the universal and odious norms of sexual activity, he tells himself with cynical logic that the difference between his mother and a whore is not after all so very great, since basically they do the same thing. The enlightening information he has received has in fact awakened the memory-traces of the impressions and wishes of his early infancy, and these have led to a reactivation in him of certain mental impulses. He begins to desire his mother herself in the sense with which he has recently become acquainted, and to hate his father anew as a rival who stands in the way of this wish; he comes, as we say, under the dominance of the Oedipus complex. He does not forgive his mother for having granted the favour of sexual intercourse not to himself but to his father, and he regards it as an act of unfaithfulness. If these impulses do not quickly pass, there is no outlet for them other than to run their course in phantasies which have as their subject his mother's sexual activities under the most diverse circumstances; and the consequent tension leads particularly readily to his finding relief in masturbation. As a result of the constant combined operation of the two driving forces, desire and thirst for revenge, phantasies of his mother's unfaithfulness are by far the most preferred; the lover with whom she commits her act of infidelity almost always exhibits the features of the boy's own ego, or more accurately, of his own idealized personality, grown up and so raised to a level with his father. What I have elsewhere¹ described as the 'family romance' comprises the manifold ramifications of this imaginative activity and the way in which they are interwoven with various egoistic interests of this period of life.

¹[1910h, 2332]
I have, as you know, divided masturbation according to the subject's age into (1) masturbation in infants, which includes all auto-erotic activities serving the purpose of sexual satisfaction, (2) masturbation in children, which arises directly out of the preceding kind and has already become fixed to certain erotogenic zones, and (3) masturbation at puberty, which is either continuous with childhood masturbation or is separated from it by the period of latency. In some of the accounts which I have heard you give, full justice has not quite been done to this temporal division. The ostensible unity of masturbation, which is fostered by the customary medical terminology, has given rise to some generalizations where a differentiation according to the three periods of life would have been better justified. It has been a matter for regret, too, that we have not been able to pay as much attention to female as to male masturbation; female masturbation, I believe, is deserving of a special study and in its case it is particularly true that a special emphasis lies on the modifications in it that arise in relation to the subject's age.

I come now to the objections raised by Reitler to my teleological argument in favour of the ubiquity of masturbation in infancy. I admit that this argument must be abandoned. If one more edition of my *Three Essays on the Theory of Sexuality* is called for, it will not contain the sentence under attack. I will renounce my attempt at guessing the purposes of Nature and will content myself with describing the facts.

There is another question that I might draw your attention to, which has been dealt with too little in our discussions: that of 'unconscious' masturbation. I mean masturbation during sleep, during abnormal states, or fits. You will recall the many hysterical fits in which masturbatory acts recur in a disguised or unrecognizable way, after the subject has renounced that form of satisfaction, and the many symptoms in obsessional neurosis which seek to replace and repeat this kind of sexual activity, which has formerly been forbidden. We may also speak of a therapeutic return of masturbation. A number of you will have found on occasion, as I have, that it represents a great advance if during the treatment the patient ventures to take up masturbation once more, though he may have no intention of making a permanent stop at that infantile halting-place. In this connection I may remind you that a considerable number of precisely the most severe sufferers from neurosis have avoided all recollection of masturbation during historic times, while psycho-analysis is able to prove that that species of sexual activity had by no means been strange to them during the forgotten earliest period of their lives.
The remarkable characteristic of the male organ which enables it to rise up in defiance of the laws of gravity, one of the phenomena of erection, leads to its being represented symbolically by balloons, flying-machines and most recently by Zeppelin airships. But dreams can symbolize erection in yet another, far more expressive manner. They can treat the sexual organ as the essence of the dreamer's whole person and make him himself fly. Do not take it to heart if dreams of flying, so familiar and often so delightful, have to be interpreted as dreams of general sexual excitement, as erection-dreams. Among students of psycho-analysis, Paul Federn has placed this interpretation beyond any doubt; but the same conclusion was reached from his investigations by Mourly Vold, who has been so much praised for his sobriety, who carried out the dream-experiments I have referred to with artificially arranged positions of the arms and legs and who was far removed from psycho-analysis and may have known nothing about it. And do not make an objection out of the fact that women can have the same flying dreams as men. Remember, rather, that our dreams aim at being the fulfilments of wishes and that the wish to be a man is found so frequently, consciously or unconsciously, in women. Nor will anyone with a knowledge of anatomy be bewildered by the fact that it is possible for women to realize this wish through the same sensations as men. Women possess as part of their genitals a small organ similar to the male one; and this small organ, the clitoris, actually plays the same part in childhood and during the years before sexual intercourse as the large organ in men.

Another symbol of the female genitals which deserves mention is a jewel-case. Jewel and treasure are used in dreams as well as in waking life to describe someone who is loved. Sweets frequently represent sexual enjoyment. Satisfaction obtained from a person's own genitals is indicated by all kinds of playing, including piano-playing. Symbolic representations par excellence of masturbation are gliding or sliding and pulling off a branch. The falling out of a tooth or the pulling out of a tooth is a particularly notable dream-symbol. Its first meaning is undoubtedly castration as a punishment for masturbating. We come across special representations of sexual intercourse less often than might be expected from what has been said so far. Rhythmical activities such as dancing, riding and climbing must be mentioned here, as well as violent experiences such as being run over; so, too, certain manual crafts, and, of course, threatening with weapons.

If an infant could speak, he would no doubt pronounce the act of sucking at his mother's breast by far the most important in his life. He is not far wrong in this, for in this single act he is satisfying at once the two great vital needs. We are therefore not surprised to learn from psycho-analysis how such psychological importance the act retains all through life. Sucking at the mother's breast is the starting-point of the whole of sexual life, the unmatched prototype of every later sexual satisfaction, to which phantasy often enough recurs in times of need. This sucking involves making the mother's breast the first object of the sexual instinct. I can give you no idea of the important bearing of this first object upon the choice of every later object, of the profound effects it has in its transformations and substitutions in even the remotest regions of our sexual life. But at first the infant, in his sucking activity, gives up this object and replaces it by a part of his own body. He begins to suck his thumbs or his own tongue. In this way he makes himself independent of the consent of the external world as regards gaining pleasure, and besides this he increases it by adding the excitation of a second area of his body. The erotogenic zones are not all equally generous in yielding pleasure; it is therefore an important experience when the infant, as Lindner reports, discovers, in the course of feeling around, the specially excitant regions afforded by his genitals and so finds his way from sucking to masturbation.
Allow me, therefore, to proceed with my brief account of infantile sexuality. What I have already reported of two systems of organs might be confirmed in reference to the others. A child's sexual life is indeed made up entirely of the activities of a number of component instincts which seek, independently of one another, to obtain pleasure, in part from the subject's own body and in part already from an external object. Among these organs the genitals come into prominence very soon. There are people in whom obtaining pleasure from their own genitals, without the assistance of any other genitals or of an object, continues uninterruptedly from infantile masturbation to the unavoidable masturbation of puberty and persists for an indefinite length of time afterwards. Incidentally, the topic of masturbation is not one that can be so easily disposed of: it is something that calls for examination from many angles.

[1916-1917, 3386]

And one thing more! On the whole you will have gained very little for what you want to assert - the sexual purity of children - even if you succeed in convincing me that it would be better to regard the activities of infants-in-arms as non-sexual. For the sexual life of children is already free from all these doubts from the third year of life onwards: at about that time the genitals already begin to stir, a period of infantile masturbation - of genital satisfaction, therefore - sets in, regularly perhaps. The mental and social phenomena of sexual life need no longer be absent; the choice of an object, an affectionate preference for particular people, a decision, even, in favour of one of the two sexes, jealousy - all these have been established by impartial observations made independently of psycho-analysis and before its time, and they can be confirmed by any observer who cares to see them. You will object that you have never doubted the early awakening of affection; you have only doubted whether this affection bears a 'sexual' character. It is true that children have already learnt to conceal this between the ages of three and eight. But if you are attentive you will be able nevertheless to collect enough evidence of the 'sensual' aims of this affection, and whatever you still lack after that can easily be supplied in plenty by the investigations of analysis. The sexual aims at this period of life are intimately connected with the child's contemporary sexual researches, of which I have given you some instances. The perverse character of some of these aims is of course dependent on the child's constitutional immaturity, for he has not yet discovered the aim that consists in the act of copulation.

[1916-1917, 3393]
Among the occurrences which recur again and again in the youthful history of neurotics - which are scarcely ever absent - there are a few of particular importance, which also deserve, on that account, I think, to be brought into greater prominence than the rest. As specimens of this class I will enumerate these: observation of parental intercourse, seduction by an adult and threat of being castrated. It would be a mistake to suppose that they are never characterized by material reality; on the contrary, this is often established incontestably through enquiries from older members of the patient's family. It is by no means a rare thing, for instance, for a little boy, who is beginning to play with his penis in a naughtly way and is not yet aware that one must conceal such activities, to be threatened by a parent or nurse with having his penis or his sinful hand cut off. Parents will often admit this when they are asked, since they think they have done something useful in making such a threat; a number of people have a correct conscious memory of such a threat, especially if it was made at a somewhat later period. If the threat is delivered by the mother or some other female she usually shifts its performance on to the father or the doctor. In Struwwelpeter, the famous work of the Frankfurt paediatrician Hoffmann (which owes its popularity precisely to an understanding of the sexual and other complexes of childhood), you will find castration softened into a cutting-off of the thumbs as a punishment for obstinate sucking. But it is highly improbable that children are threatened with castration as often as it appears in the analyses of neurotics. We shall be satisfied by realizing that the child puts a threat of this kind together in his imagination on the basis of hints, helped out by a knowledge that auto-erotic satisfaction is forbidden and under the impression of his discovery of the female genitals. Nor is it only in proletarian families that it is perfectly possible for a child, while he is not yet credited with possessing an understanding or a memory, to be a witness of the sexual act between his parents or other grown-up people; and the possibility cannot be rejected that he will be able to understand and react to the impression in retrospect. If, however, the intercourse is described with the most minute details, which would be difficult to observe, or if, as happens most frequently, it turns out to have been intercourse from behind more ferarum [in the manner of animals], there can be no remaining doubt that the phantasy is based on an observation of intercourse between animals (such as dogs) and that its motive was the child's unsatisfied scopophilia during puberty. The extreme achievement on these lines is a phantasy of observing parental intercourse while one is still an unborn baby in the womb. Phantasies of being seduced are of particular interest, because so often they are not phantasies but real memories. Fortunately, however, they are nevertheless not real as often as seemed at first to be shown by the findings of analysis. Seduction by an older child or by one of the same age is even more frequent than by an adult; and if in the case of girls who produce such an event in the story of their childhood their father figures fairly regularly as the seducer, there can be no doubt either of the imaginary nature of the accusation or of the motive that has led to it. A phantasy of being seduced when no seduction has occurred is usually employed by a child to screen the auto-erotic period of his sexual activity. He spares himself shame about masturbation by retrospectively phantasying a desired object into these earliest times. You must not suppose, however, that sexual abuse of a child by its nearest male relatives belongs entirely to the realm of phantasy. Most analysts will have treated cases in which such events were real and could be unimpeachably established; but even so they related to the later years of childhood and had been transposed into earlier times.

[1916-1917, 3426]
How did the boy react to the allurements of his elder sister? By a refusal, is the answer, but by a refusal which applied to the person and not to the thing. His sister was not agreeable to him as a sexual object, probably because his relation to her had already been determined in a hostile direction owing to their rivalry for their parents’ love. He held aloof from her, and, moreover, her solicitations soon ceased. But he tried to win, instead of her, another person of whom he was fonder; and the information which his sister herself had given him, and in which the had claimed his Nanya as a model, turned his choice in that direction. He therefore began to play with his penis in his Nanya's presence, and this, like so many other instances in which children do not conceal their masturbation, must be regarded as an attempt at seduction. His Nanya disillusioned him; she made a serious face, and explained that that wasn't good; children who did that, she added, got a ‘wound’ in the place.

One of the patient's pieces of information will make it easier for us to understand the alteration in his character which appeared during his parents’ absence as a somewhat indirect consequence of his seduction. He said that he gave up masturbating very soon after his Nanya's refusal and threat. His sexual life, therefore, which was beginning to come under the sway of the genital zone, gave way before an external obstacle, and was thrown back by its influence into an earlier phase of pregenital organization. As a result of the suppression of his masturbation, the boy's sexual life took on a sadistic-anal character. He became irritable and a tormentor, and gratified himself in this way at the expense of animals and humans. His principal object was his beloved Nanya, and he knew how to torment her till she burst into tears. In this way he revenged himself on her for the refusal he had met with, and at the same time gratified his sexual lust in the form which corresponded to his present regressive phase. He began to be cruel to small animals, to catch flies and pull off their wings, to crush beetles underfoot; in his imagination he liked beating large animals (horses) as well. All of these, then, were active and sadistic proceedings; we shall discuss his anal impulses at this period in a later connection.

We may note too in passing that the analysis of the infantile perversion dealt with here is also of help in solving an old riddle - one which, it is true, has always troubled those who have not accepted psycho-analysis more than analysts themselves. Yet quite recently even Bleuler regarded it as a remarkable and inexplicable fact that neurotics make masturbation the central point of their sense of guilt. We have long assumed that this sense of guilt relates to the masturbation of early childhood and not to that of puberty, and that in the main it is to be connected not with the act of masturbation but with the phantasy which, although unconscious, lies at its root - that is to say, with the Oedipus complex.

When the (male) child's interest turns to his genitals he betrays the fact by manipulating them frequently; and he then finds that the adults do not approve of this behaviour. More or less plainly, more or less brutally, a threat is pronounced that this part of him which he values so highly will be taken away from him. Usually it is from women that the threat emanates; very often they seek to strengthen their authority by a reference to the father or the doctor, who, so they say, will carry out the punishment. In a number of cases the women will themselves mitigate the threat in a symbolic manner by telling the child that what is to be removed is not his genital, which actually plays a passive part, but his hand, which is the active culprit. It happens particularly often that the little boy is threatened with castration, not because he plays with his penis with his hand, but because he wets his bed every night and cannot be got to be clean. Those in charge of him behave as if this nocturnal incontinence was the result and the proof of his being unduly concerned with his penis, and they are probably right. In any case, long-continued bed-wetting is to be equated with the emissions of adults. It is an expression of the same excitation of the genitals which has impelled the child to masturbate at this period.
We should not be as short-sighted as the person in charge of the child who threatens him with castration, and we must not overlook the fact that at this time masturbation by no means represents the whole of his sexual life. As can be clearly shown, he stands in the Oedipus attitude to his parents; his masturbation is only a genital discharge of the sexual excitation belonging to the complex, and throughout his later years will owe its importance to that relationship. The Oedipus complex offered the child two possibilities of satisfaction, an active and a passive one. He could put himself in his father's place in a masculine fashion and have intercourse with his mother as his father did, in which case he would soon have felt the latter as a hindrance; or he might want to take the place of his mother and be loved by his father, in which case his mother would become superfluous. The child may have had only very vague notions as to what constitutes a satisfying erotic intercourse; but certainly the penis must play a part in it, for the sensations in his own organ were evidence of that. So far he had had no occasion to doubt that women possessed a penis. But now his acceptance of the possibility of castration, his recognition that women were castrated, made an end of both possible ways of obtaining satisfaction from the Oedipus complex. For both of them entailed the loss of his penis - the masculine one as a resulting punishment and the feminine one as a precondition. If the satisfaction of love in the field of the Oedipus complex is to cost the child his penis, a conflict is bound to arise between his narcissistic interest in that part of his body and the libidinal cathexis of his parental objects. In this conflict the first of these forces normally triumphs: the child's ego turns away from the Oedipus complex.

It is an odd thing that the regular and essential part of this sexual activity was not overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle. We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.
The brilliantly told, faultlessly motivated story is of course complete in itself and is certain to make a deep effect upon the reader. But analysis shows us that its invention is based fundamentally upon a wishful phantasy belonging to the period of puberty, which a number of people actually remember consciously. The phantasy embodies a boy's wish that his mother should herself initiate him into sexual life in order to save him from the dreaded injuries caused by masturbation. (The numerous creative works that deal with the theme of redemption have the same origin.) The 'vice' of masturbation is replaced by the addiction to gambling; and the emphasis laid upon the passionate activity of the hands betrays this derivation. Indeed, the passion for play is an equivalent of the old compulsion to masturbate; 'playing' is the actual word used in the nursery to describe the activity of the hands upon the genitals. The irresistible nature of the temptation, the solemn resolutions, which are nevertheless invariably broken, never to do it again, the stupefying pleasure and the bad conscience which tells the subject that he is ruining himself (committing suicide) - all these elements remain unaltered in the process of substitution. It is true that Zweig's story is told by the mother, not by the son. It must flatter the son to think: 'if my mother only knew what dangers masturbation involves me in, she would certainly save me from them by allowing me to lavish all my tenderness on her own body'. The equation of the mother with a prostitute, which is made by the young man in the story, is linked up with the same phantasy. It brings the unattainable woman within easy reach. The bad conscience which accompanies the phantasy brings about the unhappy ending of the story. It is also interesting to notice how the facade given to the story by its author seeks to disguise its analytic meaning. For it is extremely questionable whether the erotic life of women is dominated by sudden and mysterious impulses. On the contrary, analysis reveals an adequate motivation for the surprising behaviour of this woman who had hitherto turned away from love. Faithful to the memory of her dead husband, she had armed herself against all similar attractions; but - and here the son's phantasy is right - she did not, as a mother, escape her quite unconscious transference of love on to her son, and Fate was able to catch her at this undefended spot. [1928b, 4568]

If the addiction to gambling, with the unsuccessful struggles to break the habit and the opportunities it affords for self-punishment, is a repetition of the compulsion to masturbate, we shall not be surprised to find that it occupied such a large space in Dostoevsky's life. After all, we find no cases of severe neurosis in which the auto-erotic satisfaction of early childhood and of puberty has not played a part; and the relation between efforts to suppress it and fear of the father are too well known to need more than a mention.¹ [1928b, 4568]

Little girls usually discover for themselves their characteristic phallic activity - masturbation of the clitoris; and to begin with this is no doubt unaccompanied by phantasy. The part played in starting it by nursery hygiene is reflected in the very common phantasy which makes the mother or nurse into a seducer. Whether little girls masturbate less frequently and from the first less energetically than little boys is not certain; quite possibly it is so. Actual seduction, too, is common enough; it is initiated either by other children or by someone in charge of the child who wants to soothe it, or send it to sleep or make it dependent on them. Where seduction intervenes it invariably disturbs the natural course of the developmental processes, and it often leaves behind extensive and lasting consequences. [1931b, 4596]
A prohibition of masturbation, as we have seen, becomes an incentive for giving it up; but it also becomes a motive for rebelling against the person who prohibits it - that is to say, the mother, or the mother-substitute who later regularly merges with her. A defiant persistence in masturbation appears to open the way to masculinity. Even where the girl has not succeeded in suppressing her masturbation, the effect of the apparently vain prohibition is seen in her later efforts to free herself at all costs from a satisfaction which has been spoilt for her. When she reaches maturity her object-choice may still be influenced by this persisting purpose. Her resentment at being prevented from free sexual activity plays a big part in her detachment from her mother. The same motive comes into operation again after puberty, when her mother takes up her duty of guarding her daughter's chastity. We shall, of course, not forget that the mother is similarly opposed to a boy's masturbating and thus provides him, too, with a strong motive for rebellion.

This account of how girls respond to the impression of castration and the prohibition against masturbation will very probably strike the reader as confused and contradictory. This is not entirely the author's fault. In truth, it is hardly possible to give a description which has general validity. We find the most different reactions in different individuals, and in the same individual the contrary attitudes exist side by side. With the first intervention of the prohibition, the conflict is there, and from now on it will accompany the development of the sexual function. Insight into what takes place is made particularly difficult by the fact of its being so hard to distinguish the mental processes of this first phase from later ones by which they are overlaid and are distorted in memory. Thus, for instance, a girl may later construe the fact of castration as a punishment for her masturbatory activity, and she will attribute the carrying out of this punishment to her father, but neither of these ideas can have been a primary one. Similarly, boys regularly fear castration from their father, although in their case, too, the threat most usually comes from their mother.

Lastly, intense active wishful impulses directed towards the mother also arise during the phallic phase. The sexual activity of this period culminates in clitoridal masturbation. This is probably accompanied by ideas of the mother, but whether the child attaches a sexual aim to the idea, and what that aim is, I have not been able to discover from my observations. It is only when all her interests have received a fresh impetus through the arrival of a baby brother or sister that we can clearly recognize such an aim. The little girl wants to believe that she has given her mother the new baby, just as the boy wants to; and her reaction to this event and her behaviour to the baby is exactly the same as his. No doubt this sounds quite absurd, but perhaps that is only because it sounds so unfamiliar.

The turning-away from her mother is an extremely important step in the course of a little girl's development. It is more than a mere change of object. We have already described what takes place in it and the many motives put forward for it; we may now add that hand in hand with it there is to be observed a marked lowering of the active sexual impulses and a rise of the passive ones. It is true that the active trends have been affected by frustration more strongly; they have proved totally unrealizable and are therefore abandoned by the libido more readily. But the passive trends have not escaped disappointment either. With the turning-away from the mother clitoridal masturbation frequently ceases as well; and often enough when the small girl represses her previous masculinity a considerable portion of her sexual trends in general is permanently injured too. The transition to the father-object is accomplished with the help of the passive trends in so far as they have escaped the catastrophe. The path to the development of femininity now lies open to the girl, to the extent to which it is not restricted by the remains of the pre-Oedipus attachment to her mother which she has surmounted.
Both sexes seem to pass through the early phases of libidinal development in the same manner. It might have been expected that in girls there would already have been some lag in aggressiveness in the sadistic-anal phase, but such is not the case. Analysis of children's play has shown our women analysts that the aggressive impulses of little girls leave nothing to be desired in the way of abundance and violence. With their entry into the phallic phase the differences between the sexes are completely eclipsed by their agreements. We are now obliged to recognize that the little girl is a little man. In boys, as we know, this phase is marked by the fact that they have learnt how to derive pleasurable sensations from their small penis and connect its excited state with their ideas of sexual intercourse. Little girls do the same thing with their still smaller clitoris. It seems that with them all their masturbatory acts are carried out on this penis-equivalent, and that the truly feminine vagina is still undiscovered by both sexes. It is true that there are a few isolated reports of early vaginal sensations as well, but it could not be easy to distinguish these from sensations in the anus or vestibulum; in any case they cannot play a great part. We are entitled to keep to our view that in the phallic phase of girls the clitoris is the leading erotogenic zone. But it is not, of course, going to remain so. With the change to femininity the clitoris should wholly or in part hand over its sensitivity, and at the same time its importance, to the vagina. This would be one of the two tasks which a woman has to perform in the course of her development, whereas the more fortunate man has only to continue at the time of his sexual maturity the activity that he has previously carried out at the period of the early efflorescence of his sexuality.

You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitorial masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.
With the phallic phase and in the course of it the sexuality of early childhood reaches its height and approaches its dissolution. Thereafter boys and girls have different histories. Both have begun to put their intellectual activity at the service of sexual researches; both start off from the premiss of the universal presence of the penis. But now the paths of the sexes diverge. The boy enters the Oedipus phase; he begins to manipulate his penis and simultaneously has phantasies of carrying out some sort of activity with it in relation to his mother, till, owing to the combined effect of a threat of castration and the sight of the absence of a penis in females, he experiences the greatest trauma of his life and this introduces the period of latency with all its consequences. The girl, after vainly attempting to do the same as the boy, comes to recognize her lack of a penis or rather the inferiority of her clitoris, with permanent effects on the development of her character; as a result of this first disappointment in rivalry, she often begins by turning away altogether from sexual life.

[1940a [1938], 4965]

² The occurrence of early vaginal excitations is often asserted. But it is most probable that what is in question are excitations in the clitoris - that is, in an organ analogous to the penis. This does not invalidate our right to describe the phase as phallic.
[1940a [1938], 4965]
Glosses on a dream, or apparently innocent comments on it, often serve to disguise a portion of what has been dreamt in the subtlest fashion, though in fact betraying it. For instance, a dreamer remarked that at one point 'the dream had been wiped away'; and the analysis led to an infantile recollection of his listening to someone wiping himself after defaecating. Or here is another example which deserves to be recorded in detail. A young man had a very clear dream which reminded him of some phantasies of his boyhood that had remained conscious. He dreamt that it was evening and that he was in a hotel at a summer resort. He mistook the number of his room and went into one in which an elderly lady and her two daughters were undressing and going to bed. He proceeded: 'Here there are some gaps in the dream; there's something missing. Finally there was a man in the room who tried to throw me out, and I had to have a struggle with him.' He made vain endeavours to recall the gist and drift of the boyish phantasy to which the dream was evidently alluding; until at last the truth emerged that what he was in search of was already in his possession in his remark about the obscure part of the dream. The 'gaps' were the genital apertures of the women who were going to bed; and 'there's something missing' described the principal feature of the female genitalia. When he was young he had had a consuming curiosity to see a woman's genitals and had been inclined to hold to the infantile sexual theory according to which women have male organs.

[1900a, 801]

Indeed, when we look into the matter more closely, we must recognize the fact that the dream-work is doing nothing original in making substitutions of this kind. In order to gain its ends - in this case the possibility of a representation hampered by censorship - it merely follows the paths which it finds already laid down in the unconscious; and it gives preference to those transformations of the repressed material which can also become conscious in the form of jokes or allusions and of which the phantasies of neurotic patients are so full. At this point we suddenly reach an understanding of Scherner's dream interpretations, whose essential correctness I have defended elsewhere. The imagination's pre-occupation with the subject's own body is by no means peculiar to dreams or characteristic only of them. My analyses have shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted, is a house the only circle of ideas employed for symbolizing the body; and this is equally true of dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far beyond the sphere of the external genitalia.) For these patients pillars and columns represent the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices (a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual images.¹ In the former case the way has been well prepared by linguistic usage, itself the precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual symbolism can find its best hiding-place behind what is commonplace and inconspicuous. There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics of the natural human dread of snakes. Wherever neuroses make use of such disguises they are following paths along which all humanity passed in the earliest periods of civilization - paths of whose continued existence today, under the thinnest of veils, evidence is to be found in linguistic usages, superstitions and customs.

[1900a, 815]
Subject to these qualifications and reservations I will now proceed. The Emperor and Empress (or the King and Queen) as a rule really represent the dreamer’s parents; and a Prince or Princess represents the dreamer himself or herself. But the same high authority is attributed to great men as to the Emperor; and for that reason Goethe, for instance, appears as a father-symbol in some dreams (Hitschmann, 1913.) - All elongated objects, such as sticks, tree-trunks and umbrellas (the opening of these last being comparable to an erection) may stand for the male organ - as well as all long, sharp weapons, such as knives, daggers and pikes. Another frequent though not entirely intelligible symbol of the same thing is a nail-file - possibly on account of the rubbing up and down. - Boxes, cases, chests, cupboards and ovens represent the uterus, and also hollow objects, ships, and vessels of all kinds. - Rooms in dreams are usually women (‘Frauenzimmer’); if the various ways in and out of them are represented, this interpretation is scarcely open to doubt.¹ In this connection interest in whether the room is open or locked is easily intelligible. (Cf. Dora’s first dream in my ‘Fragment of an Analysis of a Case of Hysteria’, 1905.) There is no need to name explicitly the key that unlocks the room; in his ballad of Count Eberstein, Uhland has used the symbolism of locks and keys to construct a charming piece of bawdry. - A dream of going through a suite of rooms is a brothel or harem dream. But, as Sachs has shown by some neat examples, it can also be used (by antithesis) to represent marriage. - We find an interesting link with the sexual researches of childhood when a dreamer dreams of two rooms which were originally one, or when he sees a familiar room divided into two in the dream, or vice versa. In childhood the female genitals and the anus are regarded as a single area - the ‘bottom’ (in accordance with the infantile ‘cloaca theory’); and it is not until later that the discovery is made that this region of the body comprises two separate cavities and orifices. - Steps, ladders or staircases, or, as the case may be, walking up or down them, are representations of the sexual act.² - Smooth walls over which the dreamer climbs, the façades of houses, down which he lowers himself - often in great anxiety - correspond to erect human bodies, and are probably repeating in the dream recollections of a baby’s climbing up his parents or nurse. The ‘smooth’ walls are men; in his fear the dreamer often clutches hold of ‘projections’ in the façades of houses. Tables, tables laid for a meal, and boards also stand for women - no doubt by antithesis, since the contours of their bodies are eliminated in the symbols. ‘Wood’ seems, from its linguistic connections, to stand in general for female ‘material.’ The name of the Island of ‘Madeira’ means ‘wood’ in Portuguese. Since ‘bed and board’ constitute marriage, the latter often takes the place of the former in dreams and the sexual complex of ideas is, so far as may be, transposed on to the eating complex. - As regards articles of clothing, a woman’s hat can very often be interpreted with certainty as a genital organ, and, moreover, as a man’s. The same is true of an overcoat [German ‘Mantel’], though in this case it is not clear to what extent the use of the symbol is due to a verbal assonance. In men’s dreams a necktie often appears as a symbol for the penis. No doubt this is not only because neckties are long, dependent objects and peculiar to men, but also because they can be chosen according to taste - a liberty which, in the case of the object symbolized, is forbidden by Nature.³ Men who make use of this symbol in dreams are often very extravagant in ties in real life and own whole collections of them. - It is highly probable that all complicated machinery and apparatus occurring in dreams stand for the genitals (and as a rule male ones - in describing which dream-symbolism is as indefatigable as the ‘joke-work.’) Nor is there any doubt that all weapons and tools are used as symbols for the male organ: e.g. ploughs, hammers, rifles, revolvers, daggers, sabres, etc.

[1900a, 821]
- In the same way many landscapes in dreams, especially any containing bridges or wooded hills, may clearly be recognized as descriptions of the genitals. Marcinowski has published a collection of dreams illustrated by their dreamers with drawings that ostensibly represent landscapes and other localities occurring in the dreams. These drawings bring out very clearly the distinction between a dream's manifest and latent meaning. Whereas to the innocent eye they appear as plans, maps, and so on, closer inspection shows that they represent the human body, the genitals, etc., and only then do the dreams become intelligible. (See in this connection Pfister's papers on cryptograms and puzzle-pictures.) In the case of unintelligible neologisms, too, it is worth considering whether they may not be put together from components with a sexual meaning. - Children in dreams often stand for the genitals; and, indeed, both men and women are in the habit of referring to their genitals affectionately as their 'little ones.' Stekel is right in recognizing a 'little brother' as the penis. Playing with a little child, beating it, etc., often represent masturbation in dreams. - To represent castration symbolically, the dream-work makes use of baldness, hair-cutting, falling out of teeth and decapitation. If one of the ordinary symbols for a penis occurs in a dream doubled or multiplied, it is to be regarded as a warding-off of castration. The appearance in dreams of lizards - animals whose tails grow again if they are pulled off - has the same significance. (Cf. the lizard-dream on p. 525 f.) - Many of the beasts which are used as genital symbols in mythology and folklore play the same part in dreams: e.g. fishes, snails, cats, mice (on account of the pubic hair), and above all those most important symbols of the male organ - snakes. Small animals and vermin represent small children - for instance, undesired brothers and sisters. Being plagued with vermin is often a sign of pregnancy. - A quite recent symbol of the male organ in dreams deserves mention: the airship, whose use in this sense is justified by its connection with flying as well as sometimes by its shape.

[1900a, 821]

ANALYSIS. - It is no easy matter to give a complete interpretation of the dream. It formed part of a cycle of dreams and can only be fully understood if it is taken in connection with the others. There is difficulty in obtaining in sufficient isolation the material necessary for establishing the symbolism. - In the first place, the patient declared that the train journey was to be interpreted historically, as an allusion to a journey she had taken when she was leaving a sanatorium for nervous diseases, with whose director, needless to say, she had been in love. Her mother had fetched her away, and the doctor had appeared at the station and handed her a bouquet of flowers as a parting present. It had been very awkward that her mother should have witnessed this tribute. At this point, then, her mother figured as interfering with her attempts at a love affair; and this had in fact been the part played by that severe lady during the patient's girlhood. - Her next association related to the sentence: 'she looked round to see whether the parts could not be seen from behind.' The façade of the dream would of course lead one to think of the parts of her little daughter who had been run over and mangled. But her association led in quite another direction. She recollected having once seen her father naked in the bath room from behind; she went on to talk of the distinctions between the sexes, and laid stress on the fact that a man's genitals can be seen even from behind but a woman's cannot. In this connection she herself interpreted 'the little one' as meaning the genitals and 'her little one' - she had a four-year-old daughter - as her own genitals. She reproached her mother with having expected her to live as though she had no genitals, and pointed out that the same reproach was expressed in the opening sentence of the dream: 'her mother sent her little one away, so that she had to go by herself.' In her imagination 'going by herself in the streets' meant not having a man, not having any sexual relations ('coire' in Latin means literally 'to go with') - and she disliked that. Her accounts all went to show that when she was a girl she had in fact suffered from her mother's jealousy owing to the preference shown her by her father.

[1900a, 825]
The deeper interpretation of this dream was shown by another dream of the same night, in which the dreamer identified herself with her brother. She had actually been a boyish girl, and had often been told that she should have been a boy. This identification with her brother made it particularly clear that 'the little one' meant a genital organ. Her mother was threatening him (or her) with castration, which could only have been a punishment for playing with her penis; thus the identification also proved that she herself had masturbated as a child - a memory which till then she had only had as applied to her brother. The information supplied by the second dream showed that she must have come to know about the male organ at an early age and have afterwards forgotten it. Further, the second dream alluded to the infantile sexual theory according to which girls are boys who have been castrated. When I suggested to her that she had had this childish belief, she at once confirmed the fact by telling me that she had heard the anecdote of the little boy's saying to the little girl: 'Cut off?' and of the little girl's replying: 'No, always been like that.'

ANALYSIS. -This dreamer belonged to a type whose therapeutic prospects are not favourable: up to a certain point they offer no resistance at all to analysis, but from then onwards turn out to be almost inaccessible. He interpreted this dream almost unaided. 'The Rotunda', he said, 'was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was, that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. Since he had in fact never questioned his father in this way, we had to look upon the dream-thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment. . .' We shall presently find the continuation of this thought in another part of the dream.

¹ The same considerations apply equally, of course, to cases in which the superficial associations appear openly in the content of the dream, as, for instance, in the two dreams of Maury's quoted above on page 59. (Pélerinage - Pelletier- pelle; kilomètre - kilogramme - Gilolo - Lobelia - Lopez - lotto.) My work with neurotic patients has taught me the nature of the memories of which this is a favourite method of representation. They are occasions on which the subject has turned over the pages of encyclopaedias or dictionaries in order (like most people at the inquisitive age of puberty) to satisfy their craving for an answer to the riddles of sex.

[1900a, 825]

[1900a, 964]
A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot. This is a good example of a very common sort of anxiety-dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often noticed blood in his mother's bed.

[1900a, 1012]

¹ [Footnote added 1924:] Anyone who is interested in the mental life of these years of childhood will find it easy to guess the deeper determinant of the demand made on the big brother. The child of not yet three had understood that the little sister who had recently arrived had grown inside his mother. He was very far from approving of this addition to the family, and was full of mistrust and anxiety that his mother's inside might conceal still more children. The wardrobe or cupboard was a symbol for him of his mother's inside. So he insisted on looking into this cupboard, and turned for this to his big brother, who (as is clear from other material) had taken his father's place as the child's rival. Besides the well-founded suspicion that this brother had had the lost nurse 'boxed up', there was a further suspicion against him - namely that he had in some way introduced the recently born baby into his mother's inside. The affect of disappointment when the cupboard was found to be empty derived, therefore, from the superficial motivation for the child's demand. As regards the deeper trend of thought, the affect was in the wrong place. On the other hand, his great satisfaction over his mother's slimness on her return can only be fully understood in the light of this deeper layer.

[1901b, 1143]

If I may suppose that the scene of the kiss took place in this way, I can arrive at the following derivation for the feelings of disgust.² Such feelings seem originally to be a reaction to the smell (and afterwards also to the sight) of excrement. But the genitals can act as a reminder of the excretory functions; and this applies especially to the male member, for that organ performs the function of micturition as well as the sexual function. Indeed, the function of micturition is the earlier known of the two, and the only one known during the pre-sexual period. Thus it happens that disgust becomes one of the means of affective expression in the sphere of sexual life. The Early Christian Father's 'inter urinas et faeces nascimur' clings to sexual life and cannot be detached from it in spite of every effort at idealization. I should like, however, expressly to emphasize my opinion that the problem is not solved by the mere pointing out of this path of association. The fact that this association can be called up does not show that it actually will be called up. And indeed in normal circumstances it will not be. A knowledge of the paths does not render less necessary a knowledge of the forces which travel along them.³

[1905e, 1370]
I informed Dora of the conclusions I had reached. The impression made upon her must have been forcible, for there immediately appeared a piece of the dream which had been forgotten: *she went calmly to her room, and began reading a big book that lay on her writing table.*¹ The emphasis here was upon the two details 'calmly' and 'big' in connection with 'book'. I asked whether the book was in *encyclopaedia format*, and she said it was. Now children never read about forbidden subjects in an *encyclopaedia calmly*. They do it in fear and trembling, with an uneasy look over their shoulder to see if some one may not be coming. Parents are very much in the way while reading of this kind is going on. But this uncomfortable situation had been radically improved, thanks to the dream's power of fulfilling wishes. Dora's father was dead, and the others had already gone to the cemetery. She might calmly read whatever she chose. Did not this mean that one of her motives for revenge was a revolt against her parents' constraint? If her father was dead she could read or love as she pleased.

² Psycho-analysis has cleared up one of the remaining gaps in our understanding of fetishism. It has shown the importance, as regards the choice of a fetish, of a *coprophilic* pleasure in smelling which has disappeared owing to repression. Both the feet and the hair are objects with a strong smell which have been exalted into fetishes after the olfactory sensation has become unpleasurable and been abandoned. Accordingly, in the perversion that corresponds to foot fetishism, it is only dirty and evil-smelling feet that become sexual objects. Another factor that helps towards explaining the fetishistic preference for the foot is to be found among the sexual theories of children (see below p. 1514): the foot represents a woman's penis, the absence of which is deeply felt. [Added 1915:] In a number of cases of foot-fetishism it has been possible to show that the scopophilic instinct, seeking to reach its object (originally the genitals) from underneath, was brought to a halt in its pathway by prohibition and repression. For that reason it became attached to a fetish in the form of a foot or shoe, the female genitals (in accordance with the expectations of childhood/children) being imagined as male ones.

³ The contents of the bowels, which act as a stimulating mass upon a sexually sensitive portion of mucous membrane, behave like forerunners of another organ, which is destined to come into action after the phase of childhood. But they have other important meanings for the infant. They are clearly treated as a part of the infant's own body and represent his first 'gift': by producing them he can express his active compliance with his environment and, by withholding them, his disobedience. From being a 'gift' they later come to acquire the meaning of 'baby' - for babies, according to one of the sexual theories of children, are acquired by eating and are born through the bowels.

I was further made aware of a defect in the account I have given in the text, which, in the interests of lucidity, describes the conceptual distinction between the two phases of auto-erotism and object-love as though it were also a separation in time. But the analyses that I have just mentioned, as well as the findings of Bell quoted on p. 1496, above, show that children between the ages of three and five are capable of very clear object-choice, accompanied by strong affects.

THE INSTINCT FOR KNOWLEDGE  At about the same time as the sexual life of children reaches its first peak, between the ages of three and five, they also begin to show signs of the activity which may be ascribed to the instinct for knowledge or research. This instinct cannot be counted among the elementary instinctual components, nor can it be classed as exclusively belonging to sexuality. Its activity corresponds on the one hand to a sublimated manner of obtaining mastery, while on the other hand it makes use of the energy of scopophilia. Its relations to sexual life, however, are of particular importance, since we have learnt from psycho-analysis that the instinct for knowledge in children is attracted unexpectedly early and intensively to sexual problems and is in fact possibly first aroused by them.
THE RIDDLE OF THE SPHINX  It is not by theoretical interests but by practical ones that activities of research are set going in children. The threat to the bases of a child’s existence offered by the discovery or the suspicion of the arrival of a new baby and the fear that he may, as a result of it, cease to be cared for and loved, make him thoughtful and clear-sighted. And this history of the instinct’s origin is in line with the fact that the first problem with which it deals is not the question of the distinction between the sexes but the riddle of where babies come from. (This, in a distorted form which can easily be rectified, is the same riddle that was propounded by the Theban Sphinx.) On the contrary, the existence of two sexes does not to begin with arouse any difficulties or doubts in children. It is self-evident to a male child that a genital like his own is to be attributed to everyone he knows, and he cannot make its absence tally with his picture of these other people.
[1905d, 1513]

CASTRATION COMPLEX AND PENIS ENVY  This conviction is energetically maintained by boys, is obstinately defended against the contradictions which soon result from observation, and is only abandoned after severe internal struggles (the castration complex). The substitutes for this penis which they feel is missing in women play a great part in determining the form taken by many perversions.¹
[1905d, 1514]

The assumption that all human beings have the same (male) form of genital is the first of the many remarkable and momentous sexual theories of children. It is of little use to a child that the science of biology justifies his prejudice and has been obliged to recognize the female clitoris as a true substitute for the penis.
[1905d, 1514]

¹ [Footnote added 1920:] We are justified in speaking of a castration complex in women as well. Both male and female children form a theory that women no less than men originally had a penis, but that they have lost it by castration. The conviction which is finally reached by males that women have no penis often leads them to an enduringly low opinion of the other sex.
[1905d, 1514]

THEORIES OF BIRTH  Many people can remember clearly what an intense interest they took during the prepubertal period in the question of where babies come from. The anatomical answers to the question were at the time very various: babies come out of the breast, or are cut out of the body, or the navel opens to let them through.¹ Outside analysis, there are very seldom memories of any similar researches having been carried out in the early years of childhood. These earlier researches fell a victim to repression long since, but all their findings were of a uniform nature: people get babies by eating some particular thing (as they do in fairy tales) and babies are born through the bowel like a discharge of faeces. These infantile theories remind us of conditions that exist in the animal kingdom - and especially of the cloaca in types of animals lower than mammals.
[1905d, 1515]
SADISTIC VIEW OF SEXUAL INTERCOURSE  If children at this early age witness sexual intercourse between adults - for which an opportunity is provided by the conviction of grown-up people that small children cannot understand anything sexual - they inevitably regard the sexual act as a sort of ill-treatment or act of subjugation: they view it, that is, in a sadistic sense. Psycho-analysis also shows us that an impression of this kind in early childhood contributes a great deal towards a predisposition to a subsequent sadistic displacement of the sexual aim. Furthermore, children are much concerned with the problem of what sexual intercourse - or, as they put it, being married - consists in: and they usually seek a solution of the mystery in some common activity concerned with the function of micturition or defaecation.

[1905d, 1515]

TYPICAL FAILURE OF INFANTILE SEXUAL RESEARCHES  We can say in general of the sexual theories of children that they are reflections of their own sexual constitution, and that in spite of their grotesque errors the theories show more understanding of sexual processes than one would have given their creators credit for. Children also perceive the alterations that take place in their mother owing to pregnancy and are able to interpret them correctly. The fable of the stork is often told to an audience that receives it with deep, though mostly silent, mistrust. There are, however, two elements that remain undiscovered by the sexual researches of children: the fertilizing role of semen and the existence of the female sexual orifice - the same elements, incidentally, in which the infantile organization is itself undeveloped. It therefore follows that the efforts of the childish investigator are habitually fruitless, and end in a renunciation which not infrequently leaves behind it a permanent injury to the instinct for knowledge. The sexual researches of these early years of childhood are always carried out in solitude. They constitute a first step towards taking an independent attitude in the world, and imply a high degree of alienation of the child from the people in his environment who formerly enjoyed his complete confidence.

[1905d, 1515]

¹ [Footnote added 1924:] In these later years of childhood there is a great wealth of sexual theories, of which only a few examples are given in the text.

[1905d, 1515]

LEADING ZONES IN MEN AND WOMEN  Apart from this I have only the following to add. The leading erotogenic zone in female children is located at the clitoris, and is thus homologous to the masculine genital zone of the glans penis. All my experience concerning masturbation in little girls has related to the clitoris and not to the regions of the external genitalia that are important in later sexual functioning. I am even doubtful whether a female child can be led by the influence of seduction to anything other than clitoridal masturbation. If such a thing occurs, it is quite exceptional. The spontaneous discharges of sexual excitement which occur so often precisely in little girls are expressed in spasms of the clitoris. Frequent erections of that organ make it possible for girls to form a correct judgement, even without any instruction, of the sexual manifestations of the other sex: they merely transfer on to boys the sensations derived from their own sexual processes.

[1905d, 1534]
¹ [Footnote added 1920:] The phantasies of the pubertal period have as their starting-point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'Family Romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909).

[1905d, 1539]

I am expected, therefore, to answer questions on the following points: whether children ought to be given any enlightenment at all about the facts of sexual life, at what age this ought to happen and in what manner it should be carried out. Let me admit to you at once that I find a discussion of the second and third points perfectly reasonable, but that to my mind it is quite incomprehensible how there could be a difference of opinion on the first point. What can be the purpose of withholding from children - or, let us say, from young people - enlightenment of this kind about the sexual life of human beings? Is it from a fear of arousing their interest in these matters prematurely, before it awakens in them spontaneously? Is it from a hope that a concealment of this kind may retard the sexual instinct altogether until such time as it can find its way into the only channels open to it in our middle-class social order? Is it supposed that children would show no interest or understanding for the facts and riddles of sexual life if they were not prompted to do so by outside influences? Is it thought possible that the knowledge which is withheld from them will not reach them in other ways? Or is it genuinely and seriously intended that later on they should regard everything to do with sex as something degraded and detestable from which their parents and teachers wished to keep them away as long as possible?

[1907c, 1912]
A child's intellectual interest in the riddles of sex, his desire for sexual knowledge, shows itself accordingly at an unexpectedly early age. If it has not been possible to make observations such as I am now going to put before you more frequently, that can only be because parents are either afflicted with blindness in regard to this interest on the part of their children, or, because, if they cannot overlook it, they at once take steps to stifle it. I know a delightful little boy, now four years old, whose understanding parents abstain from forcibly suppressing one part of the child's development. Little Hans has certainly not been exposed to anything in the nature of seduction by a nurse, yet he has already for some time shown the liveliest interest in the part of the body which he calls his 'widdler'. When he was only three he asked his mother: 'Mummy, have you got a widdler too?' His mother answered: 'Of course. What did you think?' He also asked his father the same question repeatedly. At the same age he was taken to a cow-shed for the first time and saw a cow being milked. 'Oh look!' he said, in surprise, 'there's milk coming out of its widdler!' At the age of three and three quarters he was on the way to making an independent discovery of correct categories by means of his observations. He saw some water being let out of an engine and said, 'Oh, look, the engine's widdling. Where's it got its widdler?' He added afterwards in reflective tones: 'A dog and a horse have widdlers; a table and a chair haven't.' Recently he was watching his seven-day-old little sister being given a bath. 'But her widdler's still quite small', he remarked; 'when she grows up it'll get bigger all right.' (I have been told of this same attitude towards the problem of sex distinction in other boys of similar age.) I should like to say explicitly that little Hans is not a sensual child or at all pathologically disposed. The fact is simply, I think, that, not having been intimidated or oppressed with a sense of guilt, he gives expression quite ingenuously to what he thinks.¹

The second great problem which exercises a child's mind - only at a somewhat later age, no doubt - is the question of the origin of babies. This is usually started by the unwelcome arrival of a small brother or sister. It is the oldest and most burning question that confronts immature humanity. Those who understand how to interpret myths and legends can detect it in the riddle which the Theban Sphinx set to Oedipus. The customary answers given to the child in the nursery damage his genuine instinct of research and as a rule deal the first blow, too, at his confidence in his parents. From that time on he usually begins to mistrust grown-up people, and to keep his most intimate interests secret from them. The following little document shows how tormenting this curiosity can become in older children. It is a letter written by a motherless girl of eleven and a half who had been speculating on the problem with her younger sister.

'Dear Aunt Mali,

'Will you please be so kind as to tell me how you got Christel and Paul. You must know because you are married. We were arguing about it yesterday evening and we want to know the truth. We have nobody else to ask. When are you coming to Salzburg? You know, Aunt Mali, we simply can't understand how the stork brings babies. Trudel thought the stork brings them in a shirt. Then we want to know as well if the stork gets them out of the pond and why one never sees babies in ponds. And will you please tell me, too, how one knows beforehand when one is going to have one. Write and tell me everything about it.

'With thousands of greetings and kisses from us all,

'Your inquisitive niece,

Lili.'

I do not believe that this touching letter brought the two sisters the enlightenment they wanted. Later on the writer of it fell ill of the neurosis that arises from unanswered unconscious questions - of obsessional brooding.¹

[1907c, 1916]
There does not seem to me to be a single good reason for denying children the enlightenment which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child's power of independent thought as early as possible, in favour of the 'goodness' which they think so much of, they cannot set about this better than by deceiving him in sexual matters and intimidating him in matters of religion. The stronger natures will, it is true, withstand these influences and become rebels against the authority of their parents and later against every other authority. If children are not given the explanations for which they turn to their elders, they go on tormenting themselves with the problem in secret and produce attempts at solution in which the truth they have guessed is mingled in the most extraordinary way with grotesque untruths; or they whisper information to one another in which, because of the young enquirers' sense of guilt, everything sexual is stamped as being horrible and disgusting. These infantile sexual theories would be well worth collecting and examining. From this time on, children usually lose the only proper attitude to sexual questions, and many of them never regain it.

That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.

There remains a difficult question to decide. How far may one assume that what is here reported of children generally is true of all children - that is, of every particular child? Pressure of education and varying intensity of the sexual instinct certainly make great individual variations in the sexual behaviour of children possible, and, above all, influence the date at which a child's sexual interest appears. For this reason, I have not divided my presentation of the material according to the successive epochs of childhood, but have combined into a single account things that come into play in different children sometimes earlier and sometimes later. It is my conviction that no child - none, at least, who is mentally normal and still less one who is intellectually gifted - can avoid being occupied with the problems of sex in the years before puberty.

In consequence of unfavourable circumstances, both of an external and an internal nature, the following observations apply chiefly to the sexual development of one sex only - that is, of males. The value of a compilation such as I am attempting here need not, however, be a purely descriptive one. A knowledge of infantile sexual theories in the shapes they assume in the thoughts of children can be of interest in various ways - even, surprisingly enough, for the elucidation of myths and fairy tales. They are indispensable, moreover, for an understanding of the neuroses themselves; for in them these childish theories are still operative and acquire a determining influence upon the form taken by the symptoms.
If we could divest ourselves of our corporeal existence, and could view the things of this earth with a fresh eye as purely thinking beings, from another planet for instance, nothing perhaps would strike our attention more forcibly than the fact of the existence of two sexes among human beings, who, though so much alike in other respects, yet mark the difference between them with such obvious external signs. But it does not seem that children choose this fundamental fact in the same way as the starting-point of their researches into sexual problems. Since they have known a father and mother as far back as they can remember in life, they accept their existence as a reality which needs no further enquiry, and a boy has the same attitude towards a little sister from whom he is separated by only a slight difference of age of one or two years. A child's desire for knowledge on this point does not in fact awaken spontaneously, prompted perhaps by some inborn need for established causes; it is aroused under the goad of the self-seeking instincts that dominate him, when - perhaps after the end of his second year - he is confronted with the arrival of a new baby. And a child whose own nursery has received no such addition is able, from observations made in other homes, to put himself in the same situation. The loss of his parents' care, which he actually experiences or justly fears, and the presentiment that from now on he must for evermore share all his possessions with the newcomer, have the effect of awakening his emotions and sharpening his capacities for thought. The elder child expresses unconcealed hostility towards his rival, which finds vent in unfriendly criticisms of it, in wishes that 'the stork should take it away again' and occasionally even in small attacks upon the creature lying helpless in the cradle. A wider difference in age usually softens the expression of this primary hostility. In the same way, at a rather later age, if no small brother or sister has appeared, the child's wish for a playmate, such as he has seen in other families, may gain the upper hand.

[1908c, 1968]
At the instigation of these feelings and worries, the child now comes to be occupied with the first, grand problem of life and asks himself the question: 'Where do babies come from?' - a question which, there can be no doubt, first ran: 'Where did this particular, intruding baby come from?' We seem to hear the echoes of this first riddle in innumerable riddles of myth and legend. The question itself is, like all research, the product of a vital exigency, as though thinking were entrusted with the task of preventing the recurrence of such dreaded events. Let us assume, however, that the child's thinking soon becomes independent of this instigation, and henceforward goes on operating as a self-sustained instinct for research. Where a child is not already too much intimidated, he sooner or later adopts the direct method of demanding an answer from his parents or those in charge of him, who are in his eyes the source of all knowledge. This method, however, fails. The child receives either evasive answers or a rebuke for his curiosity, or he is dismissed with the mythologically significant piece of information which, in German countries, runs: 'The stork brings the babies; it fetches them out of the water.' I have reason to believe that far more children than their parents suspect are dissatisfied with this solution and meet it with energetic doubts, which, however, they do not always openly admit. I know of a three-year-old boy who, after receiving this piece of enlightenment, disappeared - to the terror of his nurse. He was found at the edge of the big pond adjoining the country house, to which he had hurried in order to see the babies in the water. I also know of another boy who could only allow his disbelief to find expression in a hesitant remark that he knew better, that it was not a stork that brought babies but a heron. It seems to me to follow from a great deal of information I have received that children refuse to believe the stork theory and that from the time of this first deception and rebuff they nourish a distrust of adults and have a suspicion of there being something forbidden which is being withheld from them by the 'grown-ups', and that they consequently hide their further researches under a cloak of secrecy. With this, however, the child also experiences the first occasion for a 'psychical conflict', in that views for which he feels an instinctual kind of preference, but which are not 'right' in the eyes of the grown-ups, come into opposition with other views, which are supported by the authority of the grown-ups without being acceptable to him himself. Such a psychical conflict may soon turn into a 'psychical dissociation'. The set of views which are bound up with being 'good', but also with a cessation of reflection, become the dominant and conscious views; while the other set, for which the child's work of research has meanwhile obtained fresh evidence, but which are not supposed to count, become the suppressed and 'unconscious' ones. The nuclear complex of a neurosis is in this way brought into being.

[1908c, 1969]

Recently, the analysis of a five-year-old boy, which his father undertook and which he has handed over to me for publication, has given me irrefutable proof of the correctness of a view towards which the psycho-analysis of adults had long been leading me. I now know that the change which takes place in the mother during pregnancy does not escape the child's sharp eyes and that he is very well able before long to establish the true connection between the increase in his mother's stoutness and the appearance of the baby. In the case just mentioned the boy was three and a half years old when his sister was born and four and three quarters when he showed his better knowledge by the most unmistakable allusions. This precocious discovery, however, is always kept secret, and later, in conformity with the further vicissitudes of the child's sexual researches, it is repressed and forgotten.

[1908c, 1970]
The ‘stork fable’, therefore, is not one of the sexual theories of children. On the contrary, it is the child’s observation of animals, who hide so little of their sexual life and to whom he feels so closely akin, that strengthens his disbelief in it. With his knowledge, independently obtained, that babies grow inside the mother’s body, he would be on the right road to solving the problem on which he first tries out his powers of thinking. But this further progress is inhibited by a piece of ignorance which cannot be made good and by false theories which the state of his own sexuality imposes on him.

[1908c, 1970]

These false sexual theories, which I shall now discuss, all have one very curious characteristic. Although they go astray in a grotesque fashion, yet each one of them contains a fragment of real truth; and in this they are analogous to the attempts of adults, which are looked at as strokes of genius, at solving the problems of the universe which are too hard for human comprehension. What is correct and hits the mark in such theories is to be explained by their origin from the components of the sexual instinct which are already stirring in the childish organism. For it is not owing to any arbitrary mental act or to chance impressions that those notions arise, but to the necessities of the child’s psychosexual constitution; and this is why we can speak of sexual theories in children as being typical, and why we find the same mistaken beliefs in every child whose sexual life is accessible to us.

[1908c, 1970]

The first of these theories starts out from the neglect of the differences between the sexes on which I laid stress at the beginning of this paper as being characteristic of children. It consists in attributing to everyone, including females, the possession of a penis, such as the boy knows from his own body. It is precisely in what we must regard as the ‘normal’ sexual constitution that already in childhood the penis is the leading erotogenic zone and the chief auto-erotic sexual object; and the boy’s estimate of its value is logically reflected in his inability to imagine a person like himself who is without this essential constituent. When a small boy sees his little sister’s genitals, what he says shows that his prejudice is already strong enough to falsify his perception. He does not comment on the absence of a penis, but invariably says, as though by way of consolation and to put things right: ‘Her ---’s still quite small. But when she gets bigger it’ll grow all right.’ The idea of a woman with a penis returns in later life, in the dreams of adults: the dreamer, in a state of nocturnal sexual excitation, will throw a woman down, strip her and prepare for intercourse - and then, in place of the female genitals, he beholds a well-developed penis and breaks off the dream and the excitation. The numerous hermaphrodites of classical antiquity faithfully reproduce this idea, universally held in childhood; one may observe that to most normal people they cause no offence, while the real hermaphroditic formations of the genitals which are permitted to occur by Nature nearly always excite the greatest abhorrence.

[1908c, 1971]
If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.
[1908c, 1971]

If children could follow the hints given by the excitation of the penis they would get a little nearer to the solution of their problem. That the baby grows inside the mother's body is obviously not a sufficient explanation. How does it get inside? What starts its development? That the father has something to do with it seems likely; he says that the baby is his baby as well.¹ Again, the penis certainly has a share, too, in these mysterious happenings; the excitation in it which accompanies all these activities of the child's thoughts bears witness to this. Attached to this excitation are impulsions which the child cannot account for - obscure urges to do something violent, to press in, to knock to pieces, to tear open a hole somewhere. But when the child thus seems to be well on the way to postulating the existence of the vagina and to concluding that an incursion of this kind by his father's penis into his mother is the act by means of which the baby is created in his mother's body - at this juncture his enquiry is broken off in helpless perplexity. For standing in its way is his theory that his mother possesses a penis just as a man does, and the existence of the cavity which receives the penis remains undiscovered by him. It is not hard to guess that the lack of success of his intellectual efforts makes it easier for him to reject and forget them. This brooding and doubting, however, becomes the prototype of all later intellectual work directed towards the solution of problems, and the first failure has a crippling effect on the child's whole future.
[1908c, 1972]
Their ignorance of the vagina also makes it possible for children to believe in the second of their sexual theories. If the baby grows in the mother's body and is then removed from it, this can only happen along the one possible pathway - the anal aperture. The baby must be evacuated like a piece of excrement, like a stool. When, in later childhood, the same question is the subject of solitary reflection or of a discussion between two children, the explanations probably arrived at are that the baby emerges from the navel, which comes open, or that the abdomen is slit up and the baby taken out - which was what happened to the wolf in the story of Little Red Riding-Hood. These theories are expressed aloud and also consciously remembered later on; they no longer contain anything objectionable. These same children have by then completely forgotten that in earlier years they believed in another theory of birth, which is now obstructed by the repression of the anal sexual components that has meanwhile occurred. At that time a motion was something which could be talked about in the nursery without shame. The child was still not so distant from his constitutional coprophilic inclinations. There was nothing degraded about coming into the world like a heap of faeces, which had not yet been condemned by feelings of disgust. The cloacal theory, which, after all, is valid for so many animals, was the most natural theory, and it alone could obtrude upon the child as being a probable one. [1908c, 1973]

This being so, however, it was only logical that the child should refuse to grant women the painful prerogative of giving birth to children. If babies are born through the anus, then a man can give birth just as well as a woman. It is therefore possible for a boy to imagine that he, too, has children of his own, without there being any need to accuse him on that account of having feminine inclinations. He is merely giving evidence in this of the anal erotism which is still alive in him. [1908c, 1973]

If the cloacal theory of birth is preserved in consciousness during later years of childhood, as occasionally happens, it is accompanied too by a solution - no longer, it is true, a primary one - of the problem of the origin of babies. Here it is like being in a fairy story; one eats some particular thing and gets a child from it. This infantile theory of birth is revived in cases of insanity. A manic woman, for instance, will lead the visiting doctor to a little heap of faeces which she has deposited in a corner of her cell, and say to him with a laugh: 'That's the baby I had to-day.' [1908c, 1974]
The third of the typical sexual theories arises in children if, through some chance domestic occurrence, they become witnesses of sexual intercourse between their parents. Their perceptions of what is happening are bound, however, to be only very incomplete. Whatever detail it may be that comes under their observation - whether it is the relative positions of the two people, or the noises they make, or some accessory circumstance - children arrive in every case at the same conclusion. They adopt what may be called a sadistic view of coition. They see it as something that the stronger participant is forcibly inflicting on the weaker, and they (especially boys) compare it to the romping familiar to them from their childish experience - romping which, incidentally, is not without a dash of sexual excitation. I have not been able to ascertain that children recognize this behaviour which they have witnessed between their parents as the missing link needed for solving the problem of babies; it appears more often that the connection is overlooked by them for the very reason that they have interpreted the act of love as an act of violence. But this view of it itself gives an impression of being a return of the obscure impulse towards cruel behaviour which became attached to the excitations of the child's penis when he first began to think about the problem of where babies came from. The possibility, too, cannot be excluded that this premature sadistic impulse, which might so nearly have led to the discovery of coition, itself first emerged under the influence of extremely obscure memories of parental intercourse, for which the child had obtained the material - though at the time he made no use of it - while he was still in his first years and was sharing his parents’ bedroom.¹

The sadistic theory of coitus which, taken in isolation, is misleading where it might have provided confirmatory evidence, is, once again, the expression of one of the innate components of the sexual instinct, any of which may be strongly marked to a greater or lesser degree in each particular child. For this reason the theory is correct up to a certain point; it has in part divined the nature of the sexual act and the ‘sex-battle’ that precedes it. Not infrequently, too, the child is in a position to support this view by accidental observations which he understands in part correctly, but also in part incorrectly and indeed in a reversed sense. In many marriages the wife does in fact recoil from her husband's embraces, which bring her no pleasure, but the risk of a fresh pregnancy. And so the child who is believed to be asleep (or who is pretending to be asleep) may receive an impression from his mother which he can only interpret as meaning that she is defending herself against an act of violence. At other times the whole marriage offers an observant child the spectacle of an unceasing quarrel, expressed in loud words and unfriendly gestures; so that he need not be surprised if the quarrel is carried on at night as well, and finally settled by the same method which he himself is accustomed to use in his relations with his brothers and sisters or playmates.

Moreover, if the child discovers spots of blood in his mother's bed or on her underclothes, he regards it as a confirmation of his view. It proves to him that his father has made another similar assault on his mother during the night (whereas we should rather take the fresh spots of blood to mean that there had been a temporary cessation of sexual intercourse). Much of the otherwise inexplicable 'horror of blood' shown by neurotics finds its explanation from this connection. Once again, however, the child's mistake contains a fragment of truth. For in certain familiar circumstances a trace of blood is in fact judged as a sign that sexual intercourse has been begun.

¹ [1908c, 1974]

[1908c, 1975]
A question connected somewhat indirectly with the insoluble problem of where babies come from also engages the child - the question as to the nature and content of the state called 'being married'; and he answers the question differently according as his chance perceptions in relation to his parents have coincided with instincts of his own which are still pleasurably coloured. All that these answers seem to have in common is that the child promises himself pleasurable satisfaction from being married and supposes that it involves a disregard of modesty. The notion I have most frequently met with is that each of the married couple urinate in front of the other. A variation of this, which sounds as if it was meant to indicate a greater knowledge symbolically, is that the man urinates into the woman's chamber-pot. In other instances the meaning of marriage is supposed to be that the two people show their behinds to each other (without being ashamed). In one case, in which education had succeeded in postponing sexual knowledge especially late, a fourteen-year-old girl, who had already begun to menstruate, arrived from the books she had read at the idea that being married consisted in a 'mixing of blood'; and since her own sister had not yet started her periods, the lustful girl made an assault on a female visitor who had confessed that she was just then menstruating, so as to force her to take part in this 'blood mixing'.

Childhood opinions about the nature of marriage, which are not seldom retained by conscious memory, have great significance for the symptomatology of later neurotic illness. At first they find expression in children's games in which each child does with another whatever it is that in his view constitutes being married; and then, later on, the wish to be married may choose the infantile form of expression and so make its appearance in a phobia which is at first sight unrecognizable, or in some corresponding symptom.

These seem to be the most important of the typical sexual theories that children produce spontaneously in early childhood, under the sole influence of the components of the sexual instinct. I know that I have not succeeded in making my material complete or in establishing an unbroken connection between it and the rest of infantile life. But I may add one or two supplementary observations, whose absence would otherwise be noticed by any well-informed person. Thus, for instance, there is the significant theory that a baby is got by a kiss - a theory which obviously betrays the predominance of the erogenous zone of the mouth. In my experience this theory is exclusively feminine and is sometimes found to be pathogenic in girls whose sexual researches have been subjected to exceedingly strong inhibitions in childhood. Again, through an accidental observation, one of my women patients happened upon the theory of the 'cuvade', which, as is well known, is a general custom among some races and is probably intended to contradict the doubts as to paternity which can never be entirely overcome. A rather eccentric uncle of this patient's stayed at home for days after the birth of his child and received visitors in his dressing-gown, from which she concluded that both parents took part in the birth of their children and had to go to bed.
In about their tenth or eleventh year, children get to hear about sexual matters. A child who has grown up in a comparatively uninhibited social atmosphere, or who has found better opportunities for observation, tells other children what he knows, because this makes him feel mature and superior. What children learn in this way is mostly correct - that is, the existence of the vagina and its purpose is revealed to them; but otherwise the explanations they get from one another are not infrequently mixed with false ideas and burdened with remains of the older infantile sexual theories. They are scarcely ever complete or sufficient to solve the primordial problem. Just as formerly it was ignorance of the vagina which prevented the whole process from being understood, so now is it ignorance of the semen. The child cannot guess that another substance besides urine is excreted from the male sexual organ, and occasionally an 'innocent' girl on her wedding night is still indignant at her husband 'urinating into her'. This information acquired in the years of pre-puberty is followed by a new access of sexual researches by the child. But the theories which he now produces no longer have the typical and original stamp which was characteristic of the primary theories of early childhood as long as the infantile sexual components could find expression in theories in an uninhibited and unmodified fashion. The child's later intellectual efforts at solving the puzzles of sex have not seemed to me worth collecting, nor can they have much claim to a pathogenic significance. Their multiplicity is of course mainly dependent on the nature of the enlightenment which a child receives; but their significance consists rather in the fact that they re-awaken the traces, which have since become unconscious, of his first period of sexual interest; so that it is not infrequent for masturbatory sexual activity and some degree of emotional detachment from his parents to be linked up with them. Hence the condemnatory judgement of teachers that enlightenment of such a kind at this age 'corrupts' children.

[1908c, 1977]

Let me give a few examples to show what elements often enter into theseLate speculations by children about sexual life. A girl had heard from her schoolmates that the husband gives his wife an egg, which she hatches out in her body. A boy, who had also heard of the egg, identified it with the testicle, which [in German] is vulgarly called by the same word [Ei]; and he racked his brains to make out how the contents of the scrotum could be constantly renewed. The information given seldom goes far enough to prevent important uncertainties about sexual events. Thus a girl may arrive at an expectation that intercourse occurs on one occasion only, but that it lasts a very long time - twenty-four hours - and that all the successive babies come from this single occasion. One would suppose that this child had got her knowledge of the reproductive process from certain insects; but it turned out that this was not so and that the theory emerged as a spontaneous creation. Other girls are ignorant of the period of gestation, the life in the womb, and assume that the baby appears immediately after the first night of intercourse. Marcel Prevost has turned this girlhood mistake into an amusing story in one of his 'Lettres de femmes'. These later sexual researches of children, or of adolescents who have been retarded at the stage of childhood, offer an almost inexhaustible theme and one which is perhaps not uninteresting in general; but it is more remote from my present interest. I must only lay stress on the fact that in this field children produce many incorrect ideas in order to contradict older and better knowledge which has become unconscious and is repressed.

[1908c, 1978]
The way in which children react to the information they are given also has its significance. In some, sexual repression has gone so far that they will not listen to anything; and these succeed in remaining ignorant even in later life - apparently ignorant, at least - until, in the psycho-analysis of neurotics, the knowledge that originated in early childhood comes to light. I also know of two boys between ten and thirteen years old who, though it is true that they listened to the sexual information, rejected it with the words: 'Your father and other people may do something like that, but I know for certain my father never would.' But however widely children's later reactions to the satisfaction of their sexual curiosity may vary, we may assume that in the first years of childhood their attitude was absolutely uniform, and we may feel certain that at that time all of them tried most eagerly to discover what it was that their parents did with each other so as to produce babies. [1908c, 1978]

The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly marked imaginative activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar day-dreaming⁽¹⁾ which persists far beyond puberty. If these day-dreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of replacing them by others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or less effort to obtain verisimilitude. This state is reached at a time at which the child is still in ignorance of the sexual determinants of procreation. [1909c, 1988]

When presently the child comes to know the difference in the parts played by fathers and mothers in their sexual relations, and realizes that 'pater semper incertus est', while the mother is 'certissima', the family romance undergoes a curious curtailment: it contents itself with exalting the child's father, but no longer casts any doubts on his maternal origin, which is regarded as something unalterable. This second (sexual) stage of the family romance is actuated by another motive as well, which is absent in the first (asexual) stage. The child, having learnt about sexual processes, tends to picture to himself erotic situations and relations, the motive force behind this being his desire to bring his mother (who is the subject of the most intense sexual curiosity) into situations of secret infidelity and into secret love-affairs. In this way the child's phantasies, which started by being, as it were, asexual, are brought up to the level of his later knowledge. [1909c, 1989]
The first reports of Hans date from a period when he was not quite three years old. At that time, by means of various remarks and questions, he was showing a quite peculiarly lively interest in that portion of his body which he used to describe as his 'widdler'.¹ Thus he once asked his mother this question:

[1909b, 2003]

Animals owe a good deal of their importance in myths and fairy tales to the openness with which they display their genitals and their sexual functions to the inquisitive little human child. There can be no doubt about Hans’s sexual curiosity; but it also roused the spirit of enquiry in him and enabled him to arrive at genuine abstract knowledge.

[1909b, 2005]

Thirst for knowledge seems to be inseparable from sexual curiosity. Hans's curiosity was particularly directed towards his parents.

[1909b, 2005]

'Everything he says shows that he connects what is strange in the situation with the arrival of the stork. He meets everything he sees with a very suspicious and intent look, and there can be no question that his first doubts about the stork have taken root.'²

[1909b, 2006]

'A little later Hans was watching his seven-day-old sister being given a bath. "But her widdler's still quite small," he remarked; and then added, as though by way of consolation: "When she grows up it'll get bigger all right."²

[1909b, 2007]

² Two other boys were reported to me as having made the same judgement, expressed in identical words and followed by the same anticipation, when they were allowed to satisfy their curiosity and look at their baby sister's body for the first time. One might well feel horrified at such signs of the premature decay of a child's intellect. Why was it that these young enquirers did not report what they really saw - namely, that there was no widdler there? In little Hans's case, at all events, we can account completely for the faulty perception. We are aware that by a process of careful induction he had arrived at the general proposition that every animate object, in contradistinction to inanimate ones, possesses a widdler. His mother had confirmed him in this conviction by giving him corroborative information in regard to persons inaccessible to his own observation. He was now utterly incapable of surrendering what he had achieved merely on the strength of this single observation made upon his little sister. He therefore made a judgement that in that instance also there was a widdler present, only that it was still very small, but that it would grow till it was as big as a horse's.

[1909b, 2007]

We can go a step further in vindicating little Hans's honour. As a matter of fact, he was behaving no worse than a philosopher of the school of Wundt. In the view of that school, consciousness is the invariable characteristic of what is mental, just as in the view of little Hans a widdler is the indispensable criterion of what is animate. If now the philosopher comes across mental processes whose existence cannot but be inferred, but about which there is not a trace of consciousness to be detected - for the subject, in fact, knows nothing of them, although it is impossible to avoid inferring their existence - then, instead of saying that they are unconscious mental processes, he calls them semi-conscious. The widdler's still very small! And in this comparison the advantage is in favour of little Hans. For, as is so often the case with the sexual researches of children, behind the mistake a piece of genuine knowledge lies concealed. Little girls do possess a small widdler, which we call a clitoris, though it does not grow any larger but remains permanently stunted. Compare my short paper on 'The Sexual Theories of Children' (1908c).

[1909b, 2007]
His interest in widdlers led him to invent a special game of his own. 'Leading out of the front hall there is a lavatory and also a dark storeroom for keeping wood in. For some time past Hans has been going into this wood-cupboard and saying: "I'm going to my W.C." I once looked in to see what he was doing in the dark storeroom. He showed me his parts and said: "I'm widdling." That is to say, he has been "playing" at W.C. That it is in the nature of a game is shown not merely by the fact that he was only pretending to widdle, but also by the fact that he does not go into the W.C., which would after all be far simpler, but prefers the wood-cupboard and calls it "his W.C."
[1909b, 2009]

We can gather two things from this phantasy: first, that his mother's reproof had produced a powerful result on him at the time it was made, and secondly, that the enlightenment he had been given to the effect that women have no widdlers was not accepted by him at first. He regretted that it should be so, and in his phantasy he stuck to his former view. He may also perhaps have had his reasons for refusing to believe his father for the moment.
[1909b, 2023]

Hans's last words of comfort throw a light upon the situation and allow us to make some small corrections in his father's assertions. It is true that he was afraid of big animals because he was obliged to think of their big widdlers; but it cannot really be said that he was afraid of big widdlers themselves. Formerly the idea of them had been decidedly pleasurable to him, and he used to make every effort to get a glimpse of one. Since that time this enjoyment had been spoiled for him, owing to the general reversal of pleasure into unpleasure which had come over the whole of his sexual researches - in a way which has not yet been explained - and also owing to something which is clearer to us, namely, to certain experiences and reflections which had led to distressing conclusions. We may infer from his self-consolatory words ('my widdler will get bigger as I get bigger') that during his observations he had constantly been making comparisons, and that he had remained extremely dissatisfied with the size of his own widdler. Big animals reminded him of his defect, and were for that reason disagreeable to him. But since the whole train of thought was probably incapable of becoming clearly conscious, this distressing feeling, too, was transformed into anxiety, so that his present anxiety was erected both upon his former pleasure and his present unpleasure. When once a state of anxiety establishes itself, the anxiety swallows up all other feelings; with the progress of repression, and the more those ideas which are charged with affect and which have been conscious move down into the unconscious, all affects are capable of being changed into anxiety.
[1909b, 2025]

A most suitable continuation of the giraffe phantasy. He had a suspicion that to take possession of his mother was forbidden; he had come up against the barrier against incest. But he regarded it as forbidden in itself. His father was with him each time in the forbidden exploits which he carried out in his imagination, and was locked up with him. His father, he thought, also did that enigmatic forbidden something with his mother which he replaced by an act of violence such as smashing a window-pane or forcing a way into an enclosed space.
[1909b, 2030]
What can be the meaning of the boy's obstinate persistence in all this nonsense? Oh no, it was no nonsense: it was parody, it was Hans's revenge upon his father. It was as much as to say: 'If you really expect me to believe that the stork brought Hanna in October, when even in the summer, while we were travelling to Gmunden, I'd noticed how big Mother's stomach was, - then I expect you to believe my lies.' What can be the meaning of the assertion that even the summer before the last Hanna had travelled with them to Gmunden 'in the box', except that he knew about his mother's pregnancy? His holding out the prospect of a repetition of this journey in the box in each successive year exemplifies a common way in which unconscious thoughts from the past emerge into consciousness; or it may have special reasons and express his dread of seeing a similar pregnancy repeated on their next summer holiday. We now see, moreover, what the circumstances were that had made him take a dislike to the journey to Gmunden, as his second phantasy had indicated.

I had predicted to his father that it would be possible to trace back Hans's phobia to thoughts and wishes occasioned by the birth of his baby sister. But I had omitted to point out that according to the sexual theory of children a baby is a 'lump', so that Hans's path would lie through the excremental complex. It was owing to this neglect on my part that the progress of the case became temporarily obscured. Now that the matter had been cleared up, Hans's father attempted to examine the boy a second time upon this important point.

¹ There is no need to find fault with Hans's inconsistencies. In the previous conversation his disbelief in the stork had emerged from his unconscious and had been coupled with the exasperation he felt against his father for making so many mysteries. But he had now become calmer and was answering his father's questions with official thoughts in which he had worked out glosses upon the many difficulties involved in the stork hypothesis.

¹ Here is another bit of infantile sexual theory with an unsuspected meaning.

As his parents still hesitated to give him the information which was already long overdue, little Hans had by a bold stroke taken the conduct of the analysis into his own hands. By means of a brilliant symptomatic act, 'Look!' he had said to them, 'this is how I imagine that a birth takes place.' What he had told the maid-servant about the meaning of his game with the doll had been insincere; to his father he explicitly denied that he had only wanted to see its widdler. After his father had told him, as a kind of payment on account, how chickens come out of eggs, Hans gave a combined expression to his dissatisfaction, his mistrust, and his superior knowledge in a charming piece of persiflage, which culminated with his last words in an unmistakable allusion to his sister's birth.

¹: "But you can't have a little girl."

¹'Hans: "But I belong to you."

¹ So long as the child is in ignorance of the female genitals, there is naturally a vital gap in his comprehension of sexual matters.

¹ Here is another bit of infantile sexual theory with an unsuspected meaning.
It is easy to see that Hans's enjoyment of his phantasy was interfered with by his uncertainty as to the part played by fathers and by his doubts as to whether the begetting of children would be under his control.
[1909b, 2078]

And yet, even during the analysis, the small patient gave evidence of enough independence to acquit him upon the charge of 'suggestion'. Like all other children, he applied his childish sexual theories to the material before him without having received any encouragement to do so. These theories are extremely remote from the adult mind. Indeed, in this instance I actually omitted to warn Hans's father that the boy would be bound to approach the subject of childbirth by way of the excretory complex. This negligence on my part, though it led to an obscure phase in the analysis, was nevertheless the means of producing a good piece of evidence of the genuineness and independence of Hans's mental processes. He suddenly became occupied with 'lumf', without his father, who is supposed to have been practising suggestion upon him, having the least idea how he had arrived at that subject or what was going to come of it. Nor can his father be saddled with any responsibility for the production of the two plumber phantasies, which arose out of Hans's early acquired 'castration complex'. And I must here confess that, out of theoretical interest, I entirely concealed from Hans's father my expectation that there would turn out to be some such connection, so as not to interfere with the value of a piece of evidence such as does not often come within one's grasp.
[1909b, 2090]

The most important influence upon the course of Hans's psychosexual development was the birth of a baby sister when he was three and a half years old. That event accentuated his relations to his parents and gave him some insoluble problems to think about; and later, as he watched the way in which the infant was looked after, the memory-traces of his own earliest experiences of pleasure were revived in him. This influence, too, is a typical one: in an unexpectedly large number of life-histories, normal as well as pathological, we find ourselves obliged to take as our starting-point an outburst of sexual pleasure and sexual curiosity connected, like this one, with the birth of the next child. Hans's behaviour towards the new arrival was just what I have described in The Interpretation of Dreams. In his fever a few days later he betrayed how little he liked the addition to the family. Affection for his sister might come later,¹ but his first attitude was hostility. From that time forward fear that yet another baby might arrive found a place among his conscious thoughts. In the neurosis, his hostility, already suppressed, was represented by a special fear - a fear of the bath. In the analysis he gave undisguised expression to his death-wish against his sister, and was not content with allusions which required supplementing by his father. His inner conscience did not consider this wish so wicked as the analogous one against his father; but it is clear that in his unconscious he treated both persons in the same way, because they both took his mummy away from him, and interfered with his being alone with her.
[1909b, 2098]
I had expressed a suspicion that Hans's repressed wish might now be that he wanted at all costs to see his mother's widdler. As his behaviour to a new maid fitted in with this hypothesis, his father gave him his first piece of enlightenment, namely, that women have no widdlers. He reacted to this first effort at helping him by producing a phantasy that he had seen his mother showing her widdler.¹ This phantasy and a remark made by him in conversation, to the effect that his widdler was 'fixed in, of course', allow us our first glimpse into the patient's unconscious mental processes. The fact was that the threat of castration made to him by his mother some fifteen months earlier was now having a deferred effect upon him. For his phantasy that his mother was doing the same as he had done (the familiar tu quoque repartee of inculpated children) was intended to serve as a piece of self-justification; it was a protective or defensive phantasy. At the same time we must remark that it was Hans's parents who had extracted from the pathogenic material operating in him the particular theme of his interest in widdlers. Hans followed their lead in this matter, but he had not yet taken any line of his own in the analysis. And no therapeutic success was to be observed. The analysis had passed far away from the subject of horses; and the information that women have no widdlers was calculated, if anything, to increase his concern for the preservation of his own.

[1909b, 2102]

Hans showed fear of being given a bath in the big bath; and this fear was once more a composite one. One part of it escaped us as yet, but the other part could at once be elucidated in connection with his baby sister having her bath. Hans confessed to having wished that his mother might drop the child while she was being given her bath, so that she should die. His own anxiety while he was having his bath was a fear of retribution for this evil wish and of being punished by the same thing happening to him. Hans now left the subject of lumf and passed on directly to that of his baby sister. We may well imagine what this juxtaposition signified: nothing less, in fact, than that little Hanna was a lumf herself - that all babies were lumfs and were born like lumfs. We can now recognize that all furniture-vans and drays and buses were only stork-box carts, and were only of interest to Hans as being symbolic representations of pregnancy; and that when a heavy or heavily loaded horse fell down he can have seen in it only one thing - a childbirth, a delivery ['ein Niederkommen']. Thus the falling horse was not only his dying father but also his mother in childbirth.

[1909b, 2110]

What remains are just such confirmations on Hans's part of analytical conclusions which our interpretations had already established. In an entirely unequivocal symptomatic act, which he disguised slightly from the maid but not at all from his father, he showed how he imagined a birth took place; but if we look into it more closely we can see that he showed something else, that he was hinting at something which was not alluded to again in the analysis. He pushed a small penknife which belonged to his mother in through a round hole in the body of an india-rubber doll, and then let it drop out again by tearing apart the doll's legs. The enlightenment which he received from his parents soon afterwards, to the effect that children do in fact grow inside their mother's body and are pushed out of it like a lumf, came too late; it could tell him nothing new. Another symptomatic act, happening as though by accident, involved a confession that he had wished his father dead; for, just at the moment his father was talking of this death-wish, Hans let a horse that he was playing with fall down - knocked it over in fact. Further, he confirmed in so many words the hypothesis that heavily loaded carts represented his mother's pregnancy to him, and the horse's falling down was like having a baby. The most delightful piece of confirmation in this connection - a proof that, in his view, children were 'lumfs' - was his inventing the name of 'Lodi' for his favourite child. There was some delay in reporting this fact, for it then appeared that he had been playing with this sausage child of his for a long time past.¹

[1909b, 2111]
I remember a set of drawings by T. T. Heine in a copy of *Simplicissimus*, in which that brilliant illustrator depicted the fate of the pork-butcher's child, who fell into the sausage machine, and then, in the shape of a small sausage, was mourned over by his parents, received the Church's blessing, and flew up to Heaven. The artist's idea seems a puzzling one at first, but the Lodi episode in this analysis enables us to trace it back to its infantile root.

[1909b, 2111]

But in the third place his sister's birth stimulated him to an effort of thought which, on the one hand, it was impossible to bring to a conclusion, and which, on the other hand, involved him in emotional conflicts. He was faced with the great riddle of where babies come from, which is perhaps the first problem to engage a child's mental powers, and of which the riddle of the Theban Sphinx is probably no more than a distorted version. He rejected the proffered solution of the stork having brought Hanna. For he had noticed that months before the baby's birth his mother's body had grown big, that then she had gone to bed, and had groaned while the birth was taking place, and that when she got up she was thin again. He therefore inferred that Hanna had been inside his mother's body, and had then come out like a 'lumf'. He was able to imagine the act of giving birth as a pleasurable one by relating it to his own first feelings of pleasure in passing stool; and he was thus able to find a double motive for wishing to have children of his own: the pleasure of giving birth to them and the pleasure (the compensatory pleasure, as it were) of looking after them. There was nothing in all of this that could have led him into doubts or conflicts.

[1909b, 2113]

But his father not only knew where children came from, he actually performed it - the thing that Hans could only obscurely divine. The widdler must have something to do with it, for his own grew excited whenever he thought of these things - and it must be a big widdler too, bigger than Hans's own. If he listened to these premonitory sensations he could only suppose that it was a question of some act of violence performed upon his mother, of smashing something, of making an opening into something, of forcing a way into an enclosed space - such were the impulses that he felt stirring within him. But although the sensations of his penis had put him on the road to postulating a vagina, yet he could not solve the problem, for within his experience no such thing existed as his widdler required. On the contrary, his conviction that his mother possessed a penis just as he did stood in the way of any solution. His attempt at discovering what it was that had to be done with his mother in order that she might have children sank down into his unconscious; and his two active impulses - the hostile one towards his father and the sadistic-tender one towards his mother - could be put to no use, the first because of the love that existed side by side with the hatred, and the second because of the perplexity in which his infantile sexual theories left him.

[1909b, 2114]

It is hard to say what the influence was which, in the situation we have just sketched, led to the sudden change in Hans and to the transformation of his libidinal longing into anxiety - to say from what direction it was that repression set in. The question could probably only be decided by making a comparison between this analysis and a number of similar ones. Whether the scales were turned by the child's *intellectual* inability to solve the difficult problem of the begetting of children and to cope with the aggressive impulses that were liberated by his approaching its solution, or whether the effect was produced by a *somatic* incapacity, a constitutional intolerance of the masturbatory gratification in which he regularly indulged (whether, that is, the mere persistence of sexual excitement at such a high pitch of intensity was bound to bring about a revulsion) - this question must be left open until fresh experience can come to our assistance.

[1909b, 2115]
This allows us, therefore, to make a radical distinction. We shall probably come to understand the case more deeply if we turn to those other components which do fulfil the two conditions that have just been mentioned. These other components were tendencies in Hans which had already been suppressed and which, so far as we can tell, had never been able to find uninhibited expression: hostile and jealous feelings towards his father, and sadistic impulses (premonitions, as it were, of copulation) towards his mother. These early suppressions may perhaps have gone to form the predisposition for his subsequent illness. These aggressive propensities of Hans's found no outlet, and as soon as there came a time of privation and of intensified sexual excitement, they tried to break their way out with reinforced strength. It was then that the battle which we call his 'phobia' burst out. During the course of it a part of the repressed ideas, in a distorted form and transposed on to another complex, forced their way into consciousness as the content of the phobia. But it was a decidedly paltry success. Victory lay with the forces of repression; and they made use of the opportunity to extend their domain over components other than those that had rebelled. This last circumstance, however, does not in the least alter the fact that the essence of Hans's illness was entirely dependent upon the nature of the instinctual components that had to be repulsed. The content of his phobia was such as to impose a very great measure of restriction upon his freedom of movement, and that was its purpose. It was therefore a powerful reaction against the obscure impulses to movement which were especially directed against his mother. For Hans horses had always typified pleasure in movement ('I'm a young horse', he had said as he jumped about); but since this pleasure in movement included the impulse to copulate, the neurosis imposed a restriction on it and exalted the horse into an emblem of terror. Thus it would seem as though all that the repressed instincts got from the neurosis was the honour of providing pretexts for the appearance of the anxiety in consciousness. But however clear may have been the victory in Hans's phobia of the forces that were opposed to sexuality, nevertheless, since such an illness is in its very nature a compromise, this cannot have been all that the repressed instincts obtained. After all, Hans's phobia of horses was an obstacle to his going into the street, and could serve as a means of allowing him to stay at home with his beloved mother. In this way, therefore, his affection for his mother triumphantly achieved its aim. In consequence of his phobia, the lover clung to the object of his love - though, to be sure, steps had been taken to make him innocuous. The true character of a neurotic disorder is exhibited in this twofold result. [1909b, 2117]

If matters had lain entirely in my hands, I should have ventured to give the child the one remaining piece of enlightenment which his parents withheld from him. I should have confirmed his instinctive premonitions, by telling him of the existence of the vagina and of copulation; thus I should have still further diminished his unsolved residue, and put an end to his stream of questions. I am convinced that this new piece of enlightenment would have made him lose neither his love for his mother nor his own childish nature, and that he would have understood that his preoccupation with these important, these momentous things must rest for the present - until his wish to be big had been fulfilled. But the educational experiment was not carried so far. [1909b, 2122]

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object-love, and in the formation of that complex which deserves to be called the nuclear complex of the neuroses. It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened - usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about. [1909d, 2162]
It was only then that it became possible to understand the inexplicable process by which his obsessional idea had been formed. With the assistance of our knowledge of infantile sexual theories and of symbolism (as learnt from the interpretation of dreams) the whole thing could be translated and given a meaning. When, at the afternoon halt (during which he had lost his pince-nez), the captain had told him about the rat punishment, the patient had only been struck at first by the combined cruelty and lasciviousness of the situation depicted. But immediately afterwards a connection had been set up with the scene from his childhood in which he himself had bitten some one. The captain - a man who could defend such punishments - had become a substitute for his father, and had thus drawn down upon himself a part of the reviving animosity which had burst out, on the original occasion, against his cruel father. The idea which came into his consciousness for a moment, to the effect that something of the sort might happen to some one he was fond of, is probably to be translated into a wish such as 'You ought to have the same thing done to you!' aimed at the teller of the story, but through him at his father. A day and a half later,¹ when the captain had handed him the packet upon which the charges were due and had requested him to pay back the 3.80 kronen to Lieutenant A., he had already been aware that his 'cruel superior' was making a mistake, and that the only person he owed anything to was the young lady at the post office. It might easily, therefore, have occurred to him to think of some derisive reply, such as, 'Will I, though?' or 'Pay your grandmother!' or 'Yes! You bet I'll pay him back the money!' - answers which would have been subject to no compulsive force. But instead, out of the stirrings of his father-complex and out of his memory of the scene from his childhood, there formed in his mind some such answer as: 'Yes! I'll pay back the money to A. when my father and the lady have children!' or 'As sure as my father and the lady can have children, I'll pay him back the money!' In short, a derisive affirmation attached to an absurd condition which could never be fulfilled.²

I may add a word upon the interpretation of the 'sanction' which, it will be remembered, was to the effect that 'otherwise the rat punishment will be carried out on both of them'. It was based upon the influence of two infantile sexual theories, which I have discussed elsewhere.¹ The first of these theories is that babies come out of the anus; and the second, which follows logically from the first, is that men can have babies just as well as women. According to the technical rules for interpreting dreams, the notion of coming out of the rectum can be represented by the opposite notion of creeping into the rectum (as in the rat punishment), and vice versa.

During the time when the child is dominated by the still unrepressed nuclear complex, an important part of his intellectual activity is brought into the service of his sexual interests. He begins to enquire where babies come from, and, on the basis of the evidence presented to him, guesses more of the true facts than the grown-ups imagine. His interest in these researches is usually set going by the very real threat offered to him by the arrival of a new baby, which to begin with he regards merely as a competitor. Under the influence of the component instincts that are active in himself, he arrives at a number of 'infantile sexual theories' - such as attributing a male genital organ to both sexes alike, or supposing that babies are conceived by eating and born through the end of the bowel, or regarding sexual intercourse as a hostile act, a kind of violent subjugation. But as a result precisely of the incompleteness of his sexual constitution, and of the gap in his knowledge due to the hidden nature of the female sexual channel, the young investigator is obliged to abandon his work as a failure. The fact of this childish research itself, as well as the different infantile sexual theories that it brings to light, remain of importance in determining the formation of the child's character and the content of any later neurotic illness.

¹[1909d, 2169]
²[1909d, 2171]

¹[1910a, 2232]
There seem to be special difficulties in applying these expectations to the case of an overpowerful instinct for investigation, since precisely in the case of children there is a reluctance to credit them with either this serious instinct or any noteworthy sexual interests. However, these difficulties are easily overcome. The curiosity of small children is manifested in their untiring love of asking questions; this is bewildering to the adult so long as he fails to understand that all these questions are merely circumlocutions and that they cannot come to an end because the child is only trying to make them take the place of a question which he does not ask. When he grows bigger and becomes better informed this expression of curiosity often comes to a sudden end. Psycho-analytic investigation provides us with a full explanation by teaching us that many, perhaps most children, or at least the most gifted ones, pass through a period, beginning when they are about three, which may be called the period of infantile sexual researches. So far as we know, the curiosity of children of this age does not awaken spontaneously, but is aroused by the impression made by some important event - by the actual birth of a little brother or sister, or by a fear of it based on external experiences - in which the child perceives a threat to his selfish interests. Researches are directed to the question of where babies come from, exactly as if the child were looking for ways and means to avert so undesired an event. In this way we have been astonished to learn that children refuse to believe the bits of information that are given them - for example that they energetically reject the fable of the stork with its wealth of mythological meaning -, that they date their intellectual independence from this act of disbelief, and that they often feel in serious opposition to adults and in fact never afterwards forgive them for having deceived them here about the true facts of the case. They investigate along their own lines, divine the baby's presence inside its mother's body, and following the lead of the impulses of their own sexuality form theories of babies originating from eating, of their being born through the bowels, and of the obscure part played by the father. By that time they already have a notion of the sexual act, which appears to them to be something hostile and violent. But since their own sexual constitution has not yet reached the point of being able to produce babies, their investigation of where babies come from must inevitably come to nothing too and be abandoned as insoluble. The impression caused by this failure in the first attempt at intellectual independence appears to be of a lasting and deeply depressing kind.¹

¹ These improbable-sounding assertions can be confirmed from a study of my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909b) and of similar observations. In a paper on 'The Sexual Theories of Children' (1908c) I wrote: 'This brooding and doubting, however, becomes the prototype of all later intellectual work directed towards the solution of problems, and the first failure has a crippling effect on the child's whole future.'
When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

In virtue of a special disposition, the third type, which is the rarest and most perfect, escapes both inhibition of thought and neurotic compulsive thinking. It is true that here too sexual repression comes about, but it does not succeed in relegating a component instinct of sexual desire to the unconscious. Instead, the libido evades the fate of repression by being sublimated from the very beginning into curiosity and by becoming attached to the powerful instinct for research as a reinforcement. Here, too, the research becomes to some extent compulsive and a substitute for sexual activity; but owing to the complete difference in the underlying psychical processes (sublimation instead of an irruption from the unconscious ) the quality of neurosis is absent; there is no attachment to the original complexes of infantile sexual research, and the instinct can operate freely in the service of intellectual interest. Sexual repression, which has made the instinct so strong through the addition to it of sublimated libido, is still taken into account by the instinct, in that it avoids any concern with sexual themes.

If it is true that the unintelligible memories of a person's childhood and the phantasies that are built on them invariably emphasize the most important elements in his mental development, then it follows that the fact which the vulture phantasy confirms, namely that Leonardo spent the first years of his life alone with his mother, will have been of decisive influence in the formation of his inner life. An inevitable effect of this state of affairs was that the child - who was confronted in his early life with one problem more than other children - began to brood on this riddle with special intensity, and so at a tender age became a researcher, tormented as he was by the great question of where babies come from and what the father has to do with their origin. It was a vague suspicion that his researches and the history of his childhood were connected in this way which later prompted him to exclaim that he had been destined from the first to investigate the problem of the flight of birds since he had been visited by a vulture as he lay in his cradle. Later on it will not be difficult to show how his curiosity about the flight of birds was derived from the sexual researches of his childhood.
Infantile sexual theories provide the explanation. There was once a time when the male genital was found compatible with the picture of the mother. When a male child first turns his curiosity to the riddles of sexual life, he is dominated by his interest in his own genital. He finds that part of his body too valuable and too important for him to be able to believe that it could be missing in other people whom he feels he resembles so much. As he cannot guess that there exists another type of genital structure of equal worth, he is forced to make the assumption that all human beings, women as well as men, possess a penis like his own. This preconception is so firmly planted in the youthful investigator that it is not destroyed even when he first observes the genitals of little girls. His perception tells him, it is true, that there is something different from what there is in him, but he is incapable of admitting to himself that the content of this perception is that he cannot find a penis in girls. That the penis could be missing strikes him as an uncanny and intolerable idea, and so in an attempt at a compromise he comes to the conclusion that little girls have a penis as well, only it is still very small; it will grow later.¹ If it seems from later observations that this expectation is not realized, he has another remedy at his disposal: little girls too had a penis, but it was cut off and in its place was left a wound. This theoretical advance already makes use of personal experiences of a distressing kind: the boy in the meantime has heard the threat that the organ which is so dear to him will be taken away from him if he shows his interest in it too plainly. Under the influence of this threat of castration he now sees the notion he has gained of the female genitals in a new light; henceforth he will tremble for his masculinity, but at the same time he will despise the unhappy creatures on whom the cruel punishment has, as he supposes, already fallen.²

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

¹ [1910c, 2270]
² [1910c, 2271]
Impressive analogies from biology have prepared us to find that the individual's mental
development repeats the course of human development in an abbreviated form; and the
conclusions which psycho-analytic research into the child's mind has reached concerning the
high value set on the genitals in infancy will not therefore strike us as improbable. The child's
assumption that his mother has a penis is thus the common source from which are derived the
androgyously-formed mother goddesses such as the Egyptian Mut and the vultures' ‘coda’ in
Leonardo's childhood phantasy. It is in fact only due to a misunderstanding that we describe
these representations of gods as hermaphrodite in the medical sense of the word. In none of
them is there a combination of the true genitals of both sexes - a combination which, to the
abhorrence of all beholders, is found in some cases of malformation; all that has happened is
that the male organ has been added to the breasts which are the mark of a mother, just as it
was present in the child's first idea of his mother's body. This form of the mother's body, the
revered creation of praemal phantasy, has been preserved for the faithful by mythology. We
can now provide the following translation of the emphasis given to the vulture's tail in
Leonardo's phantasy: 'That was a time when my fond curiosity was directed to my mother, and
when I still believed she had a genital organ like my own.' Here is more evidence of Leonardo's
early sexual researches, which in our opinion had a decisive effect on the whole of his later life.
[1910c, 2272]

But if his imitation of his father did him damage as an artist, his rebellion against his father
was the infantile determinant of what was perhaps an equally sublime achievement in the field
of scientific research. In Merezhkovsky's admirable simile (1903, 348), he was like a man who
had awoken too early in the darkness, while everyone else was still asleep. He dared to utter
the bold assertion which contains within itself the justification for all independent research: 'He
who appeals to authority when there is a difference of opinion works with his memory rather
than with his reason.'¹ Thus he became the first modern natural scientist, and an abundance of
discoveries and suggestive ideas rewarded his courage for being the first man since the time of
the Greeks to probe the secrets of nature while relying solely on observation and his own
judgement. But in teaching that authority should be looked down on and that imitation of the
'ancients' should be repudiated, and in constantly urging that the study of nature was the source
of all truth, he was merely repeating - in the highest sublimation attainable by man - the one-
sided point of view which had already forced itself on the little boy as he gazed in wonder on the
world. If we translate scientific abstraction back again into concrete individual experience, we
see that the 'ancients' and authority simply correspond to his father, and nature once more
becomes the tender and kindly mother who had nourished him. In most other human beings -
no less to-day than in praemal times - the need for support from an authority of some sort is
so compelling that their world begins to totter if that authority is threatened. Only Leonardo
could dispense with that support; he would not have been able to do so had he not learnt in the
first years of his life to do without his father. His later scientific research, with all its boldness
and independence, presupposed the existence of infantile sexual researches uninhibited by his
father, and was a prolongation of them with the sexual element excluded.
[1910c, 2293]
The findings, mentioned above, which we have reached concerning the development of the mental life of children suggest the view that in Leonardo's case too the first researches of childhood were concerned with the problems of sexuality. Indeed he himself gives this away in a transparent disguise by connecting his urge for research with the vulture phantasy, and by singling out the problem of the flight of birds as one to which, as the result of a special chain of circumstances, he was destined to turn his attention. A highly obscure passage in his notes which is concerned with the flight of birds, and which sounds like a prophecy, gives a very good demonstration of the degree of affective interest with which he clung to his wish to succeed in imitating the art of flying himself: 'The great bird will take its first flight from the back of its Great Swan; it will fill the universe with stupefaction, and all writings with renown, and be the eternal glory of the nest where it was born.'¹ He probably hoped that he himself would be able to fly one day, and we know from wish-fulfilling dreams what bliss is expected from the fulfillment of that hope.
[1910c, 2296]

But why do so many people dream of being able to fly? The answer that psycho-analysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual activity is 'vögeln' ['to bird': 'Vogel' is the German for 'bird']; that the male organ is actually called 'l'uccello' ['the bird'] in Italian - all of these are only small fragments from a whole mass of connected ideas, from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.² This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier they would probably tell a different story. It seems that childhood is not the blissful idyll into which we distort it in retrospect, and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which they are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.
[1910c, 2296]

In admitting to us that ever since his childhood he felt bound up in a special and personal way with the problem of flight, Leonardo gives us confirmation that his childhood researches were directed to sexual matters; and this is what we were bound to expect as a result of our investigations on children in our own time. Here was one problem at least which had escaped the repression that later estranged him from sexuality. With slight changes in meaning, the same subject continued to interest him from his years of childhood until the time of his most complete intellectual maturity; and it may very well be that the skill that he desired was no more attainable by him in its primary sexual sense than in its mechanical one, and that he remained frustrated in both wishes.
[1910c, 2297]
We have no information about the circumstances of his heredity; on the other hand we have seen that the accidental conditions of his childhood had a profound and disturbing effect on him. His illegitimate birth deprived him of his father's influence until perhaps his fifth year, and left him open to the tender seductions of a mother whose only solace he was. After being kissed by her into precocious sexual maturity, he must no doubt have embarked on a phase of infantile sexual activity of which only one single manifestation is definitely attested - the intensity of his infantile sexual researches. The instinct to look and the instinct to know were those most strongly excited by the impressions of his early childhood; the erotogenic zone of the mouth was given an emphasis which it never afterwards surrendered. From his later behaviour in the contrary direction, such as his exaggerated sympathy for animals, we can conclude that there was no lack of strong sadistic traits in this period of his childhood.

If we are to understand the love-objects chosen by our type as being above all mother-surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psycho-analysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they have one single question to ask, but it never crosses their lips. It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.

On the other hand the second precondition for loving - the condition that the object chosen should be like a prostitute - seems energetically to oppose a derivation from the mother complex. The adult's conscious thought likes to regard his mother as a person of unimpeachable moral purity; and there are few ideas which he finds so offensive when they come from others, or feels as so tormenting when they spring from his own mind, as one which calls this aspect of his mother in question. This very relation of the sharpest contrast between 'mother' and 'prostitute' will however encourage us to enquire into the history of the development of these two complexes and the unconscious relation between them, since we long ago discovered that what, in the conscious, is found split into a pair of opposites often occurs in the unconscious as a unity. Investigation then leads us back to the time in a boy's life at which he first gains a more or less complete knowledge of the sexual relations between adults, somewhere about the years of pre-puberty. Brutal pieces of information, which are undisguisedly intended to arouse contempt and rebelliousness, now acquaint him with the secret of sexual life and destroy the authority of adults, which appears incompatible with the revelation of their sexual activities. The aspect of these disclosures which affects the newly initiated child most strongly is the way in which they apply to his own parents. This application is often flatly rejected by him, in some such words as these: 'Your parents and other people may do something like that with one another, but my parents can't possibly do it.
As an almost invariable corollary to this sexual enlightenment, the boy at the same time gains a knowledge of the existence of certain women who practise sexual intercourse as a means of livelihood, and who are for this reason held in general contempt. The boy himself is necessarily far from feeling this contempt: as soon as he learns that he too can be initiated by these unfortunates into sexual life, which till then he accepted as being reserved exclusively for 'grown-ups', he regards them only with a mixture of longing and horror. When after this he can no longer maintain the doubt which makes his parents an exception to the universal and odious norms of sexual activity, he tells himself with cynical logic that the difference between his mother and a whore is not after all so very great, since basically they do the same thing. The enlightening information he has received has in fact awakened the memory-traces of the impressions and wishes of his early infancy, and these have led to a reactivation in him of certain mental impulses. He begins to desire his mother herself in the sense with which he has recently become acquainted, and to hate his father anew as a rival who stands in the way of this wish; he comes, as we say, under the dominance of the Oedipus complex. He does not forgive his mother for having granted the favour of sexual intercourse not to himself but to his father, and he regards it as an act of unfaithfulness. If these impulses do not quickly pass, there is no outlet for them other than to run their course in phantasies which have as their subject his mother's sexual activities under the most diverse circumstances; and the consequent tension leads particularly readily to his finding relief in masturbation. As a result of the constant combined operation of the two driving forces, desire and thirst for revenge, phantasies of his mother's unfaithfulness are by far the most preferred; the lover with whom she commits her act of infidelity almost always exhibits the features of the boy's own ego, or more accurately, of his own idealized personality, grown up and so raised to a level with his father. What I have elsewhere¹ described as the 'family romance' comprises the manifold ramifications of this imaginative activity and the way in which they are interwoven with various egoistic interests of this period of life.

[1910h, 2332]

I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psycho-analysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations¹ have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object-love.² This stage has been given the name of narcissism. What happens is this. There comes a time in the development of the individual at which he unifies his sexual instincts (which have hitherto been engaged in auto-erotic activities) in order to obtain a love-object; and he begins by taking himself, his own body, as his love-object, and only subsequently proceeds from this to the choice of some person other than himself as his object. This half-way phase between auto-erotism and object-love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals - that is, to homosexual object-choice - and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence.

[1911c, 2430]
Subsequent enquiry from the lady to whom I owe the first part of this interpretation afforded some unexpected information about the nurse's previous life. Before she took up nursing she had wanted to marry a man who had been keenly interested in her; but she had abandoned the projected marriage on account of the opposition of an aunt, towards whom her relations were a curious mixture of dependence and defiance. This aunt who prevented the marriage was the Superior of a nursing Order. The dreamer always regarded her as her pattern. She had expectations of an inheritance from her and was tied to her for that reason. Nevertheless, she opposed her aunt by not entering the Order as that lady had planned. The defiance shown in the dream was therefore directed against the aunt. We have ascribed an anal-erotic origin to this character-trait, and may take into consideration that the interests which made her dependent on her aunt were of a financial nature; we are also reminded that children favour the anal theory of birth.

[1913a, 2592]

The overmastering interest which must be felt in psycho-analysis by the theory of education is based upon a fact which has become evident. Only someone who can feel his way into the minds of children can be capable of educating them; and we grown-up people cannot understand children because we no longer understand our own childhood. Our infantile amnesia proves that we have grown estranged from our childhood. Psycho-analysis has brought to light the wishes, the thought structures and the developmental processes of childhood. All earlier attempts in this direction have been in the highest degree incomplete and misleading because they have entirely overlooked the inestimably important factor of sexuality in its physical and mental manifestations. The incredulous astonishment which meets the most certainly established findings of psycho-analysis on the subject of childhood - the Oedipus complex, self-love (or 'narcissism'), the disposition to perversions, anal erotism, sexual curiosity - is a measure of the gulf which separates our mental life, our judgements of value and, indeed, our processes of thought from those of even normal children.

[1913j, 2825]

Nothing factual. The dream pointed to the female genitals and the anus, which, as a child, he had regarded as one area, the 'bottom' (in accordance with the infantile 'cloaca theory'), while he now knows that there are two separate cavities and orifices. A reversed representation.

[1913h, 2831]
In connection with the attempt, which psycho-analysis has made necessary, to correlate the fundamental principle of its theory with the mental life of children, Adler exhibits the most serious departures from actual observation and the most fundamental confusion in his concepts. The biological, social and psychological meanings of 'masculine' and 'feminine' are here hopelessly mixed. It is impossible, and is disproved by observation, that a child, whether male or female, should found the plan of its life on an original depreciation of the female sex and take the wish to be a real man as its 'guiding line'. Children have, to begin with, no idea of the significance of the distinction between the sexes; on the contrary, they start with the assumption that the same genital organ (the male one) is possessed by both sexes; they do not begin their sexual researches with the problem of the distinction between the sexes, while the social underestimation of women is completely foreign to them. There are women in whose neurosis the wish to be a man has played no part. Whatever in the nature of a masculine protest can be shown to exist is easily traceable to a disturbance in primary narcissism due to threats of castration or to the earliest interferences with sexual activities. All disputes about the psychogenesis of the neuroses must eventually be decided in the field of the neuroses of childhood. Careful dissection of a neurosis in early childhood puts an end to all misapprehensions about the aetiology of the neuroses and to all doubts about the part played by the sexual instincts in them. That is why, in his criticism of Jung's paper 'Conflicts in the Mind of the Child', Adler was obliged to resort to the imputation that the facts of the case had been one-sidedly arranged, 'no doubt by the father'.

[1914d, 2918]

(b) She saw a deep pit in the vineyard, which she knew had been caused by a tree being torn out. She added a remark that the tree was missing. She meant that she had not seen the tree in her dream; but the same wording served to express another thought which made the symbolic interpretation quite certain. The dream referred to another piece of infantile sexual theory - to the belief that girls originally had the same genitals as boys and that their later shape was the result of castration (the tearing out of a tree).

[1916-1917, 3282]

(c) She was standing in front of the drawer of her writing-table which she was so familiar with that she could tell at once if anyone had been into it. Like all drawers, chests and cases, the writing-table drawer stood for the female genitals. She knew that indications of sexual intercourse (and, as she thought, of touching) could be observed on the genitals and had long feared such a discovery. In all these three dreams, I think, the accent is to be placed on knowledge. She was recalling the period of her sexual researches when she was a child, of whose outcome she had been quite proud at the time.

[1916-1917, 3282]

The dreamer himself interpreted: 'The Rotunda was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was - that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. Since he had in fact never questioned his father in this way, we had to look upon the dream-thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment. . . .' We shall presently find the continuation of this thought in another part of the dream.

[1916-1917, 3285]
First and foremost, it is an untenable error to deny that children have a sexual life and to suppose that sexuality only begins at puberty with the maturation of the genitals. On the contrary, from the very first children have a copious sexual life, which differs at many points from what is later regarded as normal. What in adult life is described as 'perverse' differs from the normal in these respects: first, by disregarding the barrier of species (the gulf between men and animals), secondly, by overstepping the barrier against disgust, thirdly that against incest (the prohibition against seeking sexual satisfaction from near blood-relations), fourthly that against members of one's own sex and fifthly the transferring of the part played by the genitals to other organs and areas of the body. None of these barriers existed from the beginning; they were only gradually erected in the course of development and education. Small children are free from them. They recognize no frightful gulf between human beings and animals; the arrogance with which men separate themselves from animals does not emerge until later. To begin with, children exhibit no disgust at excreta but acquire this slowly under the pressure of education; they attach no special importance to the distinction between the sexes, but attribute the same conformation of the genitals to both; they direct their first sexual lusts and their curiosity to those who are nearest and for other reasons dearest to them - parents, brothers and sisters, or nurses; and finally, they show (what later on breaks through once again at the climax of a love-relation) that they expect to derive pleasure not only from their sexual organs, but that many other parts of the body lay claim to the same sensitivity, afford them analogous feelings of pleasure and can accordingly play the part of genitals. Children may thus be described as 'polymorphously perverse', and if these impulses only show traces of activity, that is because on the one hand they are of less intensity compared with those in later life and on the other hand all a child's sexual manifestations are at once energetically suppressed by education. This suppression is, as it were, extended into theory; for adults endeavour to overlook one portion of the sexual manifestations of children and to disguise another portion by misinterpreting its sexual nature, so that they can then disavow the whole of them. It is often the very same people who in the nursery are furious with any sexual naughtinesses of children and afterwards at their writing-tables defend the sexual purity of the same children. When children are left to themselves, or under the influence of seduction, they often bring about quite considerable achievements in the way of perverse sexual activity. Adults are of course right not to take this too seriously and to regard it as 'childishness', or 'playfulness', for children are not to be condemned as fully capable or fully responsible either before the judgement-seat of morals or before the law; but nonetheless these things exist. They have their importance both as indications of a child's innate constitution and as causes and encouragements of later developments in him; they give us information on the sexual life of children and so on human sexual life in general. If, therefore, we once more find all these perverse wishful impulses behind our distorted dreams, that only means that in this field too dreams have taken a step backwards into the state of infancy.

[1916-1917, 3297]
Let us once again take up the dream we have already so often returned to: the dream of the three theatre-tickets for 1 florin 50. (I can assure you that I originally chose out this example without any special purpose in view.) You know the latent dream thoughts: anger at having been in such a hurry to get married which arose when she heard the news that her friend had only just become engaged, putting a low value on her husband and the idea that she might have got a better one if only she had waited. We already know the wish which made a dream out of these thoughts: it was the desire to look, to be able to go to the theatre, most probably an offshoot of her old curiosity to discover at long last what really happens when one is married. This curiosity is, as we know, regularly directed by children towards their parents' sexual life: it is an infantile curiosity, and, so far as it still persists later, an instinctual impulse with roots reaching back into infancy. But the news the dreamer had received during the day gave no occasion for awakening this desire to look, but only for awakening anger and regret. This wishful impulse was not in the first instance connected with the latent dream-thoughts; and we were able to include the outcome of the dream-interpretation in the analysis without taking any account of that impulse. But the anger in itself was not capable of creating a dream. A dream could not arise out of the thoughts that 'it was absurd to marry so early' until they had awakened the old wish to see at long last what happens in marriage. This wish then gave the dream-content its form by replacing marriage by going to the theatre, and the form was that of an earlier wish-fulfilment: 'There! now I may go to the theatre and look at everything that's forbidden, and you mayn't! I'm married and you must wait!' In this way the dreamer's present situation was transformed into its opposite, an old triumph was put in the place of her recent defeat. And, incidentally, a satisfaction of her scopophilia was mixed with a satisfaction of her egoistic competitive sense. This satisfaction then determined the manifest content of the dream, in which the position actually was that she was sitting in the theatre while her friend could not gain admission to it. The portions of the content of the dream behind which the latent dream-thoughts still lay concealed were superimposed on this situation of satisfaction as a misplaced and unintelligible modification of it. The dream's interpretation had to disregard everything that served to represent the wish-fulfilment and to re-establish the distressing latent dream-thoughts from these obscure remaining hints.

Though I am anxious to cut short this discussion still further, I must nevertheless tell you a little about the sexual researches of children: they are too characteristic of infantile sexuality and of too great significance for the symptomatology of the neuroses to be passed over. Infantile sexual researches begin very early, sometimes before the third year of life. They do not relate to the distinction between the sexes, for this means nothing to children, since they (or at any rate boys) attribute the same male genital to both sexes. If, afterwards, a boy makes the discovery of the vagina from seeing his little sister or a girl playmate, he tries, to begin with, to disavow the evidence of his senses, for he cannot imagine a human creature like himself who is without such a precious portion. Later on, he takes fright at the possibility thus presented to him; and any threats that may have been made to him earlier, because he took too intense an interest in his little organ, now produce a deferred effect. He comes under the sway of the castration complex, the form taken by which plays a great part in the construction of his character if he remains normal, in his neurosis if he falls ill, and in his resistances if he comes into analytic treatment. As regards little girls, we can say of them that they feel greatly at a disadvantage owing to their lack of a big, visible penis, that they envy boys for possessing one and that, in the main for this reason, they develop a wish to be a man - a wish that re-emerges later on, in any neurosis that may arise if they meet with a mishap in playing a feminine part. In her childhood, moreover, a girl's clitoris takes on the role of a penis entirely: it is characterized by special excitability and is the area in which auto-erotic satisfaction is obtained. The process of a girl's becoming a woman depends very much on the clitoris passing on this sensitivity to the vaginal orifice in good time and completely. In cases of what is known as sexual anaesthesia in women the clitoris has obstinately retained its sensitivity.
The sexual interest of children begins by turning, rather, to the problem of where babies come from - the same problem which underlies the question put by the Theban Sphinx - and it is most often raised by egoistic fears on the arrival of a new baby. The reply which is ready to hand in the nursery, that babies are brought by the stork, comes up against disbelief on the part even of small children far oftener than we are aware. The sense of being defrauded of the truth by the grown-ups contributes much to making children feel lonely and to developing their independence. But a child is not in a position to solve this problem by his own means. His undeveloped sexual constitution sets definite limits to his power of perception. He begins by supposing that babies come from people taking in something special in their food, nor does he know that only women can have babies. Later he becomes aware of this limitation and ceases to regard eating as the origin of babies - though the theory persists in fairy tales. When the child has grown bigger, he soon notices that his father must play some part in getting babies, but he cannot guess what. If he happens to witness a sexual act, he regards it as an attempt at subjugation, a struggle, and this is the sadistic misunderstanding of coition. But at first he does not connect this act with the coming into being of a baby. So, too, if he finds traces of blood on his mother's bed or on her underclothes, he takes it as a sign that she has been injured by his father. Still later in childhood, he no doubt suspects that the man's sexual organ has an essential share in producing babies, but the only function he can attribute to that part of the body is micturition. [1916-1917, 3388]

From the very first, children are at one in thinking that babies must be born through the bowel; they must make their appearance like lumps of faeces. This theory is not abandoned until all anal interests have been deprived of their value, and it is then replaced by the hypothesis that the navel comes open or that the area of the breast between the nipples is where birth takes place. In this way the child in the course of his researches comes nearer to the facts about sex, or, feeling at a loss owing to his ignorance, he passes them by till, usually in the years before puberty, he is given what is as a rule a depreciatory and incomplete explanation, which often produces traumatic effects. [1916-1917, 3388]

And one thing more! On the whole you will have gained very little for what you want to assert - the sexual purity of children - even if you succeed in convincing me that it would be better to regard the activities of infants-in-arms as non-sexual. For the sexual life of children is already free from all these doubts from the third year of life onwards: at about that time the genitals already begin to stir, a period of infantile masturbation - of genital satisfaction, therefore - sets in, regularly perhaps. The mental and social phenomena of sexual life need no longer be absent; the choice of an object, an affectionate preference for particular people, a decision, even, in favour of one of the two sexes, jealousy - all these have been established by impartial observations made independently of psycho-analysis and before its time, and they can be confirmed by any observer who cares to see them. You will object that you have never doubted the early awakening of affection; you have only doubted whether this affection bears a 'sexual' character. It is true that children have already learnt to conceal this between the ages of three and eight. But if you are attentive you will be able nevertheless to collect enough evidence of the 'sensual' aims of this affection, and whatever you still lack after that can easily be supplied in plenty by the investigations of analysis. The sexual aims at this period of life are intimately connected with the child's contemporary sexual researches, of which I have given you some instances. The perverse character of some of these aims is of course dependent on the child's constitutional immaturity, for he has not yet discovered the aim that consists in the act of copulation. [1916-1917, 3393]
When other children appear on the scene the Oedipus complex is enlarged into a family complex. This, with fresh support from the egoistic sense of injury, gives grounds for receiving the new brothers or sisters with repugnance and for unhesitatingly getting rid of them by a wish. It is even true that as a rule children are far readier to give verbal expression to these feelings of hate than to those arising from the parental complex. If a wish of this kind is fulfilled and the undesired addition to the family is removed again shortly afterwards by death, we can discover from a later analysis what an important experience this death has been to the child, even though it need not have remained fixed in his memory. A child who has been put into second place by the birth of a brother or sister, and who is now for the first time almost isolated from his mother, does not easily forgive her this loss of place; feelings which in an adult would be described as greatly embittered arise in him and are often the basis of a permanent estrangement. We have already mentioned that the child's sexual researches, with all their consequences, usually follow from this vital experience of his. As these brothers and sisters grow up, the boy's attitude to them undergoes very significant transformations. He may take his sister as a love-object by way of substitute for his faithless mother. Where there are several brothers, all of them courting a younger sister, situations of hostile rivalry, which are so important for later life, arise already in the nursery. A little girl may find in her elder brother a substitute for her father who no longer takes an affectionate interest in her as he did in her earliest years. Or she may take a younger sister as a substitute for the baby she has vainly wished for from her father.

[1916-1917, 3400]

It agrees entirely with our anticipations when we learn that, after his first genital excitations, his sexual researches began, and that he soon came upon the problem of castration. At this time he succeeded in observing two girls - his sister and a friend of hers - while they were micturating. His acumen might well have enabled him to gather the true facts from this spectacle, but he behaved as we know other male children behave in these circumstances. He rejected the idea that he saw before him a confirmation of the wound with which his Nanya had threatened him, and he explained to himself that this was the girls' 'front bottom'. The theme of castration was not settled by this decision; he found new allusions to it in everything that he heard. Once when the children were given some coloured sugar-sticks, the governess, who was inclined to disordered fancies, pronounced that they were pieces of chopped-up snakes. He remembered afterwards that his father had once met a snake while he was walking along a footpath, and had beaten it to pieces with his stick. He heard the story (out of *Reynard the Fox*) read aloud, of how the wolf wanted to go fishing in the winter, and used his tail as a bait, and how in that way his tail was broken off in the ice. He learned the different names by which horses are distinguished, according to whether their sexual organs are intact or not. Thus he was occupied with thoughts about castration, but as yet he had no belief in it and no dread of it. Other sexual problems arose for him out of the fairy tales with which he became familiar at this time. In 'Little Red Riding-Hood' and 'The Seven Little Goats' the children were taken out of the wolf's body. Was the wolf a female creature, then, or could men have children in their bodies as well? At this time the question was not yet settled. Moreover, at the time of these enquiries he had as yet no fear of wolves.

[1918b, 3516]
There were several conclusions, too, to be drawn from the raw material which had been produced by the patient's first analysis of the dream, and these had to be fitted into the collocation of which we were in search. Behind the mention of the sheep-breeding, evidence was to be expected of his sexual researches, his interest in which he was able to gratify during his visits with his father; but there must also have been allusions to a fear of death, since the greater part of the sheep had died of the epidemic. The most obtrusive thing in the dream, the wolves on the tree, led straight to his grandfather's story; and what was fascinating about this story and capable of provoking the dream can scarcely have been anything but its connection with the theme of castration.

[1918b, 3525]

There was another dream, which belongs to the period before his emancipation by the tutor, and which I mention because it was forgotten until its appearance during the treatment. He saw himself riding on a horse and pursued by a gigantic caterpillar. He recognized in this dream an allusion to an earlier one from the period before the tutor, which we had interpreted long before. In this earlier dream he saw the Devil dressed in black and in the upright posture with which the wolf and the lion had terrified him so much in their day. He was pointing with his out-stretched finger at a gigantic snail. The patient had soon guessed that this Devil was the Demon out of a well-known poem, and that the dream itself was a version of a very popular picture representing the Demon in a love-scene with a girl. The snail was in the woman's place, as being a perfect female sexual symbol. Guided by the Demon's pointing gesture, we were soon able to give as the dream's meaning that the patient was longing for some one who should give him the last pieces of information that were still missing upon the riddle of sexual intercourse, just as his father had given him the first in the primal scene long before.

[1918b, 3552]

At this point we must consider an objection, the discussion of which may contribute much to the elucidation of the apparent confusion of the circumstances. We have been driven to assume that during the process of the dream he understood that women are castrated, that instead of a male organ they have a wound which serves for sexual intercourse, and that castration is the necessary condition of femininity; we have been driven to assume that the threat of this loss induced him to repress his feminine attitude towards men, and that he awoke from his homosexual enthusiasm in anxiety. Now how can this comprehension of sexual intercourse, this recognition of the vagina, be brought into harmony with the selection of the bowel for the purpose of identification with women? Are not the intestinal symptoms based on what is probably an older notion, and one which in any case completely contradicts the dread of castration - the notion, namely, that sexual intercourse takes place at the anus?

[1918b, 3560]
When his Christmas dream, with its excitement and expectancy, conjured up before him the picture of the sexual intercourse of his parents as it had once been observed (or construed) by him, there can be no doubt that the first view of it to come up was the old one, according to which the part of the female body which received the male organ was the anus. And, indeed, what else could he have supposed when at the age of one and a half he was a spectator of the scene?¹ But now came the new event that occurred when he was four years old. What he had learnt in the meantime, the allusions which he had heard to castration, awoke and cast a doubt on the 'cloacal theory'; they brought to his notice the difference between the sexes and the sexual part played by women. In this contingency he behaved as children in general behave when they are given an unwished for piece of information - whether sexual or of any other kind. He rejected what was new (in our case from motives connected with his fear of castration) and clung fast to what was old. He decided in favour of the intestine and against the vagina, just as, for similar motives, he later on took his father's side against God. He rejected the new information and clung to the old theory. The latter must have provided the material for his identification with women, which made its appearance later as a dread of death in connection with the bowels, and for his first religious scruples, about whether Christ had had a behind, and so on. It is not that his new insight remained without any effect; quite the reverse. It developed an extraordinarily powerful effect, for it became a motive for keeping the whole process of the dream under repression and for excluding it from being worked over later in consciousness. But with that its effect was exhausted; it had no influence in deciding the sexual problem. That it should have been possible from that time onwards for a fear of castration to exist side by side with an identification with women by means of the bowel admittedly involved a contradiction. But it was only a logical contradiction - which is not saying much. On the contrary, the whole process is characteristic of the way in which the unconscious works. A repression is something very different from a condemning judgement.

[1918b, 3561]

At a later stage of sexual development faeces take on the meaning of a baby. For babies, like faeces, are born through the anus. The 'gift' meaning of faeces readily admits of this transformation. It is a common usage to speak of a baby as a 'gift'. The more frequent expression is that the woman has 'given' the man a baby; but in the usage of the unconscious equal attention is justly paid to the other aspect of the relation, namely, to the woman having 'received' the baby as a gift from the man.

[1918b, 3564]

The deeper significance of our patient's early screen memory, to the effect that he had his first fit of rage because he was not given enough presents one Christmas, is now revealed to us. What he was feeling the want of was sexual satisfaction, which he had taken as being anal. His sexual researches came during the course of the dream to understand what they had been prepared for finding before the dream, namely, that the sexual act solved the problem of the origin of babies. Even before the dream he had disliked babies. Once, when he had come upon a small unfledged bird that had fallen out of its nest, he had taken it for a human baby and been horrified at it. The analysis showed that all small animals, such as caterpillars and insects, that he had been so enraged with, had had the meaning of babies to him.¹ His position in regard to his elder sister had given him every opportunity for reflecting upon the relation between elder and younger children. His Nanya had once told him that his mother was so fond of him because he was the youngest, and this gave him good grounds for wishing that no younger child might come after him. His dread of this youngest child was revived under the influence of the dream which brought up before him his parents' intercourse.

[1918b, 3564]
The sadistic-anal organization can easily be regarded as a continuation and development of the oral one. The violent muscular activity, directed upon the object, by which it is characterized, is to be explained as an action preparatory to eating. The eating then ceases to be a sexual aim, and the preparatory action becomes a sufficient aim in itself. The essential novelty, as compared with the previous stage, is that the receptive passive function becomes disengaged from the oral zone and attached to the anal zone. In this connection we can hardly fail to think of biological parallels or of the theory that the pregenital organizations in man should be regarded as vestiges of conditions which have been permanently retained in several classes of animals. The building up of the instinct for research out of its various components is another characteristic feature of this stage of development.

His seduction continued to make its influence felt, by maintaining the passivity of his sexual aim. It transformed his sadism to a great extent into the masochism which was its passive counterpart. But it is questionable whether the seduction can be made entirely responsible for this characteristic of passivity, for the child’s reaction to his observation of intercourse at the age of one and a half was already preponderantly a passive one. His sympathetic sexual excitement expressed itself by his passing a stool, though it is true that in this behaviour an active element is also to be distinguished. Side by side with the masochism which dominated his sexual impulses and also found expression in phantasies, his sadism, too, persisted and was directed against small animals. His sexual researches had set in from the time of the seduction and had been concerned, in essence, with two problems: the origin of children and the possibility of losing the genitals. These researches wove themselves into the manifestations of his instinctual impulses, and directed his sadistic propensities on to small animals as being representatives of small children.

As the interest in faeces recedes in a normal way, the organic analogy we have described here has the effect of transferring the interest on to the penis. When, later, in the course of the child’s researches he discovers that babies are born from the bowel, they inherit the greater part of his anal erotism; they have, however, been preceded by the penis in this as well as in another sense.

Another part of the nexus of relations can be observed much more clearly in the male. It arises when the boy’s sexual researches lead him to the discovery of the absence of a penis in women. He concludes that the penis must be a detachable part of the body, something analogous to faeces, the first piece of bodily substance the child had to part with. Thus the old anal defiance enters into the composition of the castration complex. The organic analogy which enabled the intestinal contents to be the forerunner of the penis during the pregenital phase cannot come into account as a motive; but the boy’s sexual researches lead him to a psychical substitute for it. When a baby appears on the scene he regards it as ‘lumf’, in accordance with those researches, and he cathects it with powerful anal-erotic interest. When social experiences teach that a baby is to be regarded as a love-token, a gift, the wish for a baby receives a second contribution from the same source. Faeces, penis and baby are all three solid bodies; they all three, by forcible entry or expulsion, stimulate a membranous passage, i.e., the rectum and the vagina, the latter being as it were ‘taken on lease’ from the rectum, as Lou Andreas-Salomé aptly remarks.¹ Infantile sexual researches can only lead to the conclusion that the baby follows the same route as the faecal mass. The function of the penis is not usually discovered by those researches. But it is interesting to note that after so many detours an organic correspondence reappears in the psychical sphere as an unconscious identity.

¹ Lou Andreas-Salomé, The Death of愿望. (1915)
It is clear that the child's sexual life has reached the stage of genital organization, now that its incestuous love has achieved this premature choice of an object. This can be demonstrated more easily in the case of boys, but is also indisputable in the case of girls. Something like a premonition of what are later to be the final and normal sexual aims governs the child's libidinal trends. We may justly wonder why this should be so, but we may regard it as a proof of the fact that the genitals have already begun playing their part in the process of excitation. With boys the wish to beget a child from their mother is never absent, with girls the wish to have a child by their father is equally constant; and this in spite of their being completely incapable of forming any clear idea of the means for fulfilling these wishes. The child seems to be convinced that the genitals have something to do with the matter, even though in its constant brooding it may look for the essence of the presumed intimacy between its parents in relations of another sort, such as in their sleeping together, micturating in each other's presence, etc.; and material of the latter kind can be more easily apprehended in verbal images than the mystery that is connected with the genitals.

[1919e, 3650]

The early efflorescence of infantile sexual life is doomed to extinction because its wishes are incompatible with reality and with the inadequate stage of development which the child has reached. That efflorescence comes to an end in the most distressing circumstances and to the accompaniment of the most painful feelings. Loss of love and failure leave behind them a permanent injury to self-regard in the form of a narcissistic scar, which in my opinion, as well as in Marcinowski's (1918), contributes more than anything to the 'sense of inferiority' which is so common in neurotics. The child's sexual researches, on which limits are imposed by his physical development, lead to no satisfactory conclusion; hence such later complaints as 'I can't accomplish anything; I can't succeed in anything'. The tie of affection, which binds the child as a rule to the parent of the opposite sex, succumbs to disappointment, to a vain expectation of satisfaction or to jealousy over the birth of a new baby - unmistakable proof of the infidelity of the object of the child's affections. His own attempt to make a baby himself, carried out with tragic seriousness, fails shamefully. The lessening amount of affection he receives, the increasing demands of education, hard words and an occasional punishment - these show him at last the full extent to which he has been scorned. These are a few typical and constantly recurring instances of the ways in which the love characteristic of the age of childhood is brought to a conclusion.

[1920g, 3725]

Readers of my Three Essays on the Theory of Sexuality (1905d) will be aware that I have never undertaken any thorough remodelling of that work in its later editions, but have retained the original arrangement and have kept abreast of the advances made in our knowledge by means of interpolations and alterations in the text. In doing this, it may often have happened that what was old and what was more recent did not admit of being merged into an entirely uncontradictory whole. Originally, as we know, the accent was on a portrayal of the fundamental difference between the sexual life of children and of adults; later, the pregenital organizations of the libido made their way into the foreground, and also the remarkable and momentous fact of the diphasic onset of sexual development. Finally, our interest was engaged by the sexual researches of children; and from this we were able to recognize the far-reaching approximation of the final outcome of sexuality in childhood (in about the fifth year) to the definitive form taken by it in the adult. This is the point at which I left things in the last (1922) edition of my Three Essays.

[1923e, 4058]
Unfortunately we can describe this state of things only as it affects the male child; the corresponding processes in the little girl are not known to us. The small boy undoubtedly perceives the distinction between men and women, but to begin with he has no occasion to connect it with a difference in their genitals. It is natural for him to assume that all other living beings, humans and animals, possess a genital like his own; indeed, we know that he looks for an organ analogous to his own in inanimate things as well.¹ This part of the body, which is easily excitable, prone to changes and so rich in sensations, occupies the boy’s interest to a high degree and is constantly setting new tasks to his instinct for research. He wants to see it in other people as well, so as to compare it with his own; and he behaves as though he had a vague idea that this organ could and should be bigger. The driving force which this male portion of the body will develop later at puberty expresses itself at this period of life mainly as an urge to investigate, as sexual curiosity. Many of the acts of exhibitionism and aggression which children commit, and which in later years would be judged without hesitation to be expressions of lust, prove in analysis to be experiments undertaken in the service of sexual research.¹

In the course of these researches the child arrives at the discovery that the penis is not a possession which is common to all creatures that are like himself. An accidental sight of the genitals of a little sister or playmate provides the occasion for this discovery. In unusually intelligent children, the observation of girls urinating will even earlier have aroused a suspicion that there is something different here. For they will have seen a different posture and heard a different sound, and will have made attempts to repeat their observations so as to obtain enlightenment. We know how children react to their first impressions of the absence of a penis. They disavow the fact and believe that they do see a penis, all the same. They gloss over the contradiction between observation and preconception by telling themselves that the penis is still small and will grow bigger presently; and they then slowly come to the emotionally significant conclusion that after all the penis had at least been there before and been taken away afterwards. The lack of a penis is regarded as a result of castration, and so now the child is faced with the task of coming to terms with castration in relation to himself. The further developments are too well known generally to make it necessary to recapitulate them here. But it seems to me that the significance of the castration complex can only be rightly appreciated if its origin in the phase of phallic primacy is also taken into account.¹

It should not be supposed, however, that the child quickly and readily makes a generalization from his observation that some women have no penis. He is in any case debarred from doing so by his assumption that the lack of a penis is the result of having been castrated as a punishment. On the contrary, the child believes that it is only unworthy female persons that have lost their genitals - females who, in all probability, were guilty of inadmissible impulses similar to his own. Women whom he respects, like his mother, retain a penis for a long time. For him, being a woman is not yet synonymous with being without a penis.² It is not till later, when the child takes up the problems of the origin and birth of babies, and when he guesses that only women can give birth to them - it is only then that the mother, too, loses her penis. And, along with this, quite complicated theories are built up to explain the exchange of the penis for a baby. In all this, the female genitals never seem to be discovered. The baby, we know, is supposed to live inside the mother’s body (in her bowel) and to be born through the intestinal outlet. These last theories carry us beyond the stretch of time covered by the infantile sexual period.¹

[1923e, 4059]

[1923e, 4060]

[1923e, 4061]
This is an opportunity for correcting a statement which I made many years ago. I believed that the sexual interest of children, unlike that of pubescents, was aroused, not by the difference between the sexes, but by the problem of where babies come from. We now see that, at all events with girls, this is certainly not the case. With boys it may no doubt happen sometimes one way and sometimes the other; or with both sexes chance experiences may determine the event.

The process of arriving at an object, which plays such an important part in mental life, takes place alongside of the organization of the libido. After the stage of auto-erotism, the first love-object in the case of both sexes is the mother; and it seems probable that to begin with a child does not distinguish its mother’s organ of nutrition from its own body. Later, but still in the first years of infancy, the relation known as the Oedipus complex becomes established: boys concentrate their sexual wishes upon their mother and develop hostile impulses against their father as being a rival, while girls adopt an analogous attitude. All of the different variations and consequences of the Oedipus complex are important; and the innately bisexual constitution of human beings makes itself felt and increases the number of simultaneously active tendencies. Children do not become clear for quite a long time about the differences between the sexes; and during this period of sexual researches they produce typical sexual theories which, being circumscribed by the incompleteness of their authors’ own physical development, are a mixture of truth and error and fail to solve the problems of sexual life (the riddle of the Sphinx - that is, the question of where babies come from). We see, then, that a child's first object-choice is an incestuous one. The whole course of development that I have described is run through rapidly. For the most remarkable feature of the sexual life of man is its diphasic onset, its onset in two waves, with an interval between them. It reaches a first climax in the fourth or fifth year of a child's life. But thereafter this early efflorescence of sexuality passes off; the sexual impulses which have shown such liveliness are overcome by repression, and a period of latency follows, which lasts until puberty and during which the reaction-formations of morality, shame, and disgust are built up. Of all living creatures man alone seems to show this diphasic onset of sexual growth, and it may perhaps be the biological determinant of his predisposition to neuroses. At puberty the impulses and object-relations of a child's early years become reanimated, and amongst them the emotional ties of its Oedipus complex. In the sexual life of puberty there is a struggle between the urges of early years and the inhibitions of the latency period. Before this, and while the child is at the highest point of its infantile sexual development, a genital organization of a sort is established; but only the male genitals play a part in it, and the female ones remain undiscovered. (I have described this as the period of phallic primacy.) At this stage the contrast between the sexes is not stated in terms of 'male' or 'female' but of 'possessing a penis' or 'castrated'. The castration complex which arises in this connection is of the profoundest importance in the formation alike of character and of neuroses.
Nothing, however, deserves more notice than the fact that children regularly direct their sexual wishes towards their nearest relatives - in the first place, therefore, towards their father and mother, and afterwards towards their brothers and sisters. The first object of a boy's love is his mother, and of a girl's her father (except in so far as an innate bisexual disposition favours the simultaneous presence of the contrary attitude). The other parent is felt as a disturbing rival and not infrequently viewed with strong hostility. You must understand me aright. What I mean to say is not that the child wants to be treated by its favourite parent merely with the kind of affection which we adults like to regard as the essence of the parent-child relation. No, analysis leaves us in no doubt that the child's wishes extend beyond such affection to all that we understand by sensual satisfaction - so far, that is, as the child's powers of imagination allow. It is easy to see that the child never guesses the actual facts of sexual intercourse; he replaces them by other notions derived from his own experience and feelings. As a rule his wishes culminate in the intention to bear, or in some in definable way, to procreate a baby. Boys, too, in their ignorance, do not exclude themselves from the wish to bear a baby. We give the whole of this mental structure the name of 'Oedipus complex', after the familiar Greek legend. With the end of the early sexual period it should normally be given up, should radically disintegrate and become transformed; and the results of this transformation are destined for important functions in later mental life. But as a rule this is not effected radically enough, in which case puberty brings about a revival of the complex, which may have serious consequences. [1926e, 4355]

Various sorts. In the first place, impressions capable of permanently influencing the child's budding sexual life - such as observations of sexual activities between adults, or sexual experiences of his own with an adult or another child (no rare events); or, again, overhearing conversations, understood either at the time or retrospectively, from which the child thought it could draw conclusions about mysterious or uncanny matters; or again, remarks or actions by the child himself which give evidence of significant attitudes of affection or enmity towards other people. It is of special importance in an analysis to induce a memory of the patient's own forgotten sexual activity as a child and also of the intervention by the adults which brought it to an end. [1926e, 4358]

We may suppose, therefore, that this was the way in which things happened. The sight of a woman's dead body, naked or on the point of being stripped, reminded the young man of his mother. It roused in him a longing for his mother which sprang from his Oedipus complex, and this was immediately completed by a feeling of indignation against his father. His ideas of 'father' and 'God' had not yet become widely separated; so that his desire to destroy his father could become conscious as doubt in the existence of God and could seek to justify itself in the eyes of reason as indignation about the ill-treatment of a mother object. It is of course typical for a child to regard what his father does to his mother in sexual intercourse as ill-treatment. The new impulse, which was displaced into the sphere of religion, was only a repetition of the Oedipus situation and consequently soon met with a similar fate. It succumbed to a powerful opposing current. During the actual conflict the level of displacement was not maintained: there is no mention of arguments in justification of God, nor are we told what the infallible signs were by which God proved his existence to the doubter. The conflict seems to have been unfolded in the form of a hallucinatory psychosis: inner voices were heard which uttered warnings against resistance to God. But the outcome of the struggle was displayed once again in the sphere of religion and it was of a kind predetermined by the fate of the Oedipus complex: complete submission to the will of God the Father. The young man became a believer and accepted everything he had been taught since his childhood about God and Jesus Christ. He had had a religious experience and had undergone a conversion. [1928a, 4550]
We have been able to study transformations of instinct and similar processes particularly in anal erotism, the excitations arising from the sources of the erotogenic anal zone, and we were surprised at the multiplicity of uses to which these instinctual impulses are put. It may not be easy, perhaps, to get free from the contempt into which this particular zone has fallen in the course of evolution. Let us therefore allow ourselves to be reminded by Abraham that embryologically the anus corresponds to the primitive mouth, which has migrated down to the end of the bowel. We have learnt, then, that after a person's own faeces, his excrement, has lost its value for him, this instinctual interest derived from the anal source passes over on to objects that can be presented as gifts. And this is rightly so, for faeces were the first gift that an infant could make, something he could part with out of love for whoever was looking after him. After this, corresponding exactly to analogous changes of meaning that occur in linguistic development, this ancient interest in faeces is transformed into the high valuation of gold and money but also makes a contribution to the affective cathexis of baby and penis. It is a universal conviction among children, who long retain the cloaca theory, that babies are born from the bowel like a piece of faeces: defaecation is the model of the act of birth. But the penis too has its fore-runner in the column of faeces which fills and stimulates the mucous membrane of the bowel. When a child, unwillingly enough, comes to realize that there are human creatures who do not possess a penis, that organ appears to him as something detachable from the body and becomes unmistakably analogous to the excrement, which was the first piece of bodily material that had to be renounced. A great part of anal erotism is thus carried over into a cathexis of the penis. But the interest in that part of the body has, in addition to its anal-erotic root, an oral one which is perhaps more powerful still: for when sucking has come to an end, the penis also becomes heir of the mother's nipple.

[1933a, 4705]

The sexual organ of the male has two functions; and there are those to whom this association is an annoyance. It serves for the evacuation of the bladder, and it carries out the act of love which sets the craving of the genital libido at rest. The child still believes that he can unite the two functions. According to a theory of his, babies are made by the man urinating into the woman's body. But the adult knows that in reality the acts are mutually incompatible - as incompatible as fire and water. When the penis is in the state of excitation which led to its comparison with a bird, and while the sensations are being experienced which suggest the warmth of fire, urination is impossible; and conversely, when the organ is serving to evacuate urine (the water of the body) all its connections with the genital function seem to be quenched. The antithesis between the two functions might lead us to say that man quenches his own fire with his own water. And primal man, who had to understand the external world by the help of his own bodily sensations and states, would surely not have failed to notice and utilize the analogies pointed out to him by the behaviour of fire.

[1932a, 4786]

(1) (a) All these traumas occur in early childhood up to about the fifth year. Impressions from the time at which a child is beginning to talk stand out as being of particular interest; the periods between the ages of two and four seem to be the most important; it cannot be determined with certainty how long after birth this period of receptivity begins. (b) The experiences in question are as a rule totally forgotten, they are not accessible to memory and fall within the period of infantile amnesia, which is usually broken into by a few separate mnemic residues, what are known as 'screen memories'. (c) They relate to impressions of a sexual and aggressive nature, and no doubt also to early injuries to the ego (narcissistic mortifications). In this connection it should be remarked that such young children make no sharp distinction between sexual and aggressive acts, as they do later. (Cf. the misunderstanding of the sexual act in a sadistic sense.) The predominance of the sexual factor is, of course, most striking and calls for theoretical consideration.

[1939a, 4900]
The third phase is that known as the phallic one, which is, as it were, a forerunner of the final form taken by sexual life and already much resembles it. It is to be noted that it is not the genitals of both sexes that play a part at this stage, but only the male ones (the phallus). The female genitals long remain unknown: in children's attempts to understand the sexual processes they pay homage to the venerable cloacal theory - a theory which has a genetic justification.²

With the phallic phase and in the course of it the sexuality of early childhood reaches its height and approaches its dissolution. Thereafter boys and girls have different histories. Both have begun to put their intellectual activity at the service of sexual researches; both start off from the premiss of the universal presence of the penis. But now the paths of the sexes diverge. The boy enters the Oedipus phase; he begins to manipulate his penis and simultaneously has phantasies of carrying out some sort of activity with it in relation to his mother, till, owing to the combined effect of a threat of castration and the sight of the absence of a penis in females, he experiences the greatest trauma of his life and this introduces the period of latency with all its consequences. The girl, after vainly attempting to do the same as the boy, comes to recognize her lack of a penis or rather the inferiority of her clitoris, with permanent effects on the development of her character; as a result of this first disappointment in rivalry, she often begins by turning away altogether from sexual life.

This therefore leaves only the one method open to us - the one which was in all probability the only one originally contemplated. We tell the patient about the possibilities of other instinctual conflicts, and we arouse his expectation that such conflicts may occur in him. What we hope is that this information and this warning will have the effect of activating in him one of the conflicts we have indicated, in a modest degree and yet sufficiently for treatment. But this time experience speaks with no uncertain voice. The expected result does not come about. The patient hears our message, but there is no response. He may think to himself: 'This is very interesting, but I feel no trace of it.' We have increased his knowledge, but altered nothing else in him. The situation is much the same as when people read psycho-analytic writings. The reader is 'stimulated' only by those passages which he feels apply to himself - that is, which concern conflicts that are active in him at the time. Everything else leaves him cold. We can have analogous experiences, I think, when we give children sexual enlightenment. I am far from maintaining that this is a harmful or unnecessary thing to do, but it is clear that the prophylactic effect of this liberal measure has been greatly over-estimated. After such enlightenment, children know something they did not know before, but they make no use of the new knowledge that has been presented to them. We come to see that they are not even in so great a hurry to sacrifice for this new knowledge the sexual theories which might be described as a natural growth and which they have constructed in harmony with, and dependence on, their imperfect libidinal organization - theories about the part played by the stork, about the nature of sexual intercourse and about the way in which babies are made. For a long time after they have been given sexual enlightenment they behave like primitive races who have had Christianity thrust upon them and who continue to worship their old idols in secret.

[1937c, 5029]
It is not every child who sucks in this way. It may be assumed that those children do so in whom there is a constitutional intensification of the erotogenic significance of the labial region. If that significance persists, these same children when they are grown up will become epicures in kissing, will be inclined to perverse kissing, or, if males, will have a powerful motive for drinking and smoking. If, however, repression ensues, they will feel disgust at food and will produce hysterical vomiting. The repression extends to the nutritional instinct owing to the dual purpose served by the labial zone. Many of my women patients who suffer from disturbances of eating, globus hystericus, constriction of the throat and vomiting, have indulged energetically in sucking during their childhood.

[1905d, 1503]

We have apparently digressed widely from our problem, though in doing so we have touched on the manner in which neurotic pathological conditions are related to our mental life as a whole. But let us now return to the narrower question. The sexual and ego-instincts alike have in general the same organs and systems of organs at their disposal. Sexual pleasure is not attached merely to the function of the genitals. The mouth serves for kissing as well as for eating and communication by speech; the eyes perceive not only alterations in the external world which are important for the preservation of life, but also characteristics of objects which lead to their being chosen as objects of love - their charms. The saying that it is not easy for anyone to serve two masters is thus confirmed. The closer the relation into which an organ with a dual function of this kind enters with one of the major instincts, the more it withholds itself from the other. This principle is bound to lead to pathological consequences if the two fundamental instincts are disunited and if the ego maintains a repression of the sexual component instinct concerned. It is easy to apply this to the eye and to seeing. Let us suppose that the sexual component instinct which makes use of looking - sexual pleasure in looking - has drawn upon itself defensive action by the ego-instincts in consequence of its excessive demands, so that the ideas in which its desires are expressed succumb to repression and are prevented from becoming conscious; in that case there will be a general disturbance of the relation of the eye and of the act of seeing to the ego and consciousness. The ego will have lost its dominance over the organ, which will now be wholly at the disposal of the repressed sexual instinct. It looks as though the repression had been carried too far by the ego, as though it had emptied the baby out with the bath-water: the ego refuses to see anything at all any more, now that the sexual interest in seeing has made itself so prominent. But the alternative picture seems more to the point. This attributes the active role instead to the repressed pleasure in looking. The repressed instinct takes its revenge for being held back from further psychical expansion, by becoming able to extend its dominance over the organ that is in its service. The loss of conscious dominance over the organ is the detrimental substitute for the repression which had miscarried and was only made possible at that price.

[1910i, 2369]
As you probably know, the hysterical neurosis can produce its symptoms in any system of organs and so disturb any function. Analysis shows that in this way all the so-called perverse impulses which seek to replace the genital by some other organ manifest themselves: these organs are then behaving like substitutive genitals. The symptoms of hysteria have actually led us to the view that the bodily organs, besides the functional part they play, must be recognized as having a sexual (erotogenic) significance, and that the execution of the first of these tasks is disturbed if the second of them makes too many claims. Countless sensations and innervations which we come across as symptoms of hysteria in organs that have no apparent connection with sexuality are in this way revealed to us as being in the nature of fulfilments of perverse sexual impulses in relation to which other organs have acquired the significance of the sexual parts. We learn too to what a large extent the organs for the intake of nourishment and for excretion can in particular become the vehicles of sexual excitation. Here, then, we have the same thing that we were shown by the perversions; only in their case it was visible easily and unmistakably, whereas in hysteria we have to take a circuitous path by way of the interpretation of symptoms, and do not then ascribe the perverse sexual impulses concerned to the subject's consciousness but locate them in his unconscious.
[1916-1917, 3380]

The sexual organ of the male has two functions; and there are those to whom this association is an annoyance. It serves for the evacuation of the bladder, and it carries out the act of love which sets the craving of the genital libido at rest. The child still believes that he can unite the two functions. According to a theory of his, babies are made by the man urinating into the woman's body. But the adult knows that in reality the acts are mutually incompatible - as incompatible as fire and water. When the penis is in the state of excitation which led to its comparison with a bird, and while the sensations are being experienced which suggest the warmth of fire, urination is impossible; and conversely, when the organ is serving to evacuate urine (the water of the body) all its connections with the genital function seem to be quenched. The antithesis between the two functions might lead us to say that man quenches his own fire with his own water. And primal man, who had to understand the external world by the help of his own bodily sensations and states, would surely not have failed to notice and utilize the analogies pointed out to him by the behaviour of fire.
[1932a, 4786]
PATHWAYS OF MUTUAL INFLUENCE  

(b) If we now drop the figurative expression that we have so long adopted in speaking of the ‘sources’ of sexual excitation, we are led to the suspicion that all the connecting pathways that lead from other functions to sexuality must also be traversable in the reverse direction. If, for instance, the common possession of the labial zone by the two functions is the reason why sexual satisfaction arises during the taking of nourishment, then the same factor also enables us to understand why there should be disorders of nutrition if the erotogenic functions of the common zone are disturbed. Or again, if we know that concentration of attention may give rise to sexual excitation, it seems plausible to assume that by making use of the same path, but in a contrary direction, the condition of sexual excitation may influence the possibility of directing the attention. A good portion of the symptomatology of the neuroses, which I have traced to disturbances of the sexual processes, is expressed in disturbances of other, non-sexual, somatic functions; and this circumstance, which has hitherto been unintelligible, becomes less puzzling if it is only the counterpart of the influences which bring about the production of sexual excitation.

[1905d, 1523]

The same pathways, however, along which sexual disturbances trench upon the other somatic functions must also perform another important function in normal health. They must serve as paths for the attraction of sexual instinctual forces to aims that are other than sexual, that is to say, for the sublimation of sexuality. But we must end with a confession that very little is as yet known with certainty of these pathways, though they certainly exist and can probably be traversed in both directions.

[1905d, 1523]
This apparatus is to be set in motion by stimuli, and observation shows us that stimuli can impinge on it from three directions: from the external world by means of the excitation of the erotogenic zones with which we are already familiar, from the organic interior by ways which we have still to explore, and from mental life, which is itself a storehouse for external impressions and a receiving-post for internal excitations. All three kinds of stimuli produce the same effect, namely a condition described as 'sexual excitement', which shows itself by two sorts of indication, mental and somatic. The mental indications consist in a peculiar feeling of tension of an extremely compelling character; and among the numerous somatic ones are first and foremost a number of changes in the genitals, which have the obvious sense of being preparations for the sexual act - the erection of the male organ and the lubrication of the vagina.

[1905d, 1525]

SEXUAL TENSION The fact that sexual excitement possesses the character of tension raises a problem the solution of which is no less difficult than it would be important in helping us to understand the sexual processes. In spite of all the differences of opinion that reign on the subject among psychologists, I must insist that a feeling of tension necessarily involve unpleasure. What seems to me decisive is the fact that a feeling of this kind is accompanied by an impulsion to make a change in the psychological situation, that it operates in an urgent way which is wholly alien to the nature of the feeling of pleasure. If, however, the tension of sexual excitement is counted as an unpleasurable feeling, we are at once brought up against the fact that it is also undoubtedly felt as pleasurable. In every case in which tension is produced by sexual processes it is accompanied by pleasure; even in the preparatory changes in the genitals a feeling of satisfaction of some kind is plainly to be observed. How, then, are this unpleasurable tension and this feeling of pleasure to be reconciled?

[1905d, 1526]

We remain in complete ignorance both of the origin and of the nature of the sexual tension which arises simultaneously with the pleasure when erotogenic zones are satisfied.¹ The most obvious explanation, that this tension arises in some way out of the pleasure itself, is not only extremely improbable in itself but becomes untenable when we consider that in connection with the greatest pleasure of all, that which accompanies the discharge of the sexual products, no tension is produced, but on the contrary all tension is removed. Thus pleasure and sexual tension can only be connected in an indirect manner.

[1905d, 1529]

PART PLAYED BY THE SEXUAL SUBSTANCES Apart from the fact that normally it is only the discharge of the sexual substances that brings sexual excitation to an end, there are other points of contact between sexual tension and the sexual products. In the case of a man living a continent life, the sexual apparatus, at varying intervals, which, however, are not ungoverned by rules, discharges the sexual substances during the night, to the accompaniment of a pleasurable feeling and in the course of a dream which hallucinates a sexual act. And in regard to this process (nocturnal emission) it is difficult to avoid the conclusion that the sexual tension, which succeeds in making use of the short cut of hallucination as a substitute for the act itself, is a function of the accumulation of semen in the vesicles containing the sexual products. Our experience in connection with the exhaustibility of the sexual mechanism argues in the same sense. If the store of semen is exhausted, not only is it impossible to carry out the sexual act, but the susceptibility of the erotogenic zones to stimulus ceases, and their appropriate excitation no longer gives rise to any pleasure. We thus learn incidentally that a certain degree of sexual tension is required even for the excitability of the erotogenic zones.

[1905d, 1529]
This would seem to lead to what is, if I am not mistaken, the fairly wide-spread hypothesis that the accumulation of the sexual substances creates and maintains sexual tension; the pressure of these products upon the walls of the vesicles containing them might be supposed to act as a stimulus upon a spinal centre, the condition of which would be perceived by higher centres and would then give rise in consciousness to the familiar sensation of tension. If the excitation of the erotogenic zones increases sexual tension, this could only come about on the supposition that the zones in question are in an anatomical connection that has already been laid down with these centres, that they increase the tonus of the excitation in them, and, if the sexual tension is sufficient, set the sexual act in motion or, if it is insufficient, stimulate the production of the sexual substances.

The weakness of this theory, which we find accepted, for instance, in Krafft-Ebing's account of the sexual processes, lies in the fact that, having been designed to account for the sexual activity of adult males, it takes too little account of three sets of conditions which it should also be able to explain. These are the conditions in children, in females and in castrated males. In none of these three cases can there be any question of an accumulation of sexual products in the same sense as in males, and this makes a smooth application of the theory difficult. Nevertheless it may at once be admitted that it is possible to find means by which the theory may be made to cover these cases as well. In any case we are warned not to lay more weight on the factor of the accumulation of the sexual products than it is able to bear.

IMPORTANCE OF THE INTERNAL SEXUAL ORGANS Observations on castrated males seem to show that sexual excitation can occur to a considerable degree independently of the production of the sexual substances. The operation of castration occasionally fails to bring about a limitation of libido, although such limitation, which provides the motive for the operation, is the usual outcome. Moreover, it has long been known that diseases which abolish the production of the masculine sex-cells leave the patient, though he is now sterile, with his libido and potency undamaged. It is therefore by no means as astonishing as Rieger represents it to be that the loss of the masculine sex-glands in an adult may have no further effect upon his mental behaviour. It is true that if castration is performed at a tender age, before puberty, it approximates in its effect to the aim of obliterating the sexual characters; but here too it is possible that what is in question is, besides the actual loss of the sex-glands, an inhibition (connected with that loss) in the development of other factors.
CHEMICAL THEORY  Experiments in the removal of the sex-glands (testes and ovaries) of animals, and in the grafting into vertebrates of sex-glands from other individuals of the opposite sex,¹ have at last thrown a partial light on the origin of sexual excitation, and have at the same time still further reduced the significance of a possible accumulation of cellular sexual products. It has become experimentally possible (E. Steinach) to transform a male into a female, and conversely a female into a male. In this process the psychosexual behaviour of the animal alters in accordance with the somatic sexual characters and simultaneously with them. It seems, however, that this sex-determining influence is not an attribute of that part of the sex-glands which gives rise to the specific sex-cells (spermatozoa and ovum) but of their interstitial tissue, upon which special emphasis is laid by being described in the literature as the 'puberty-gland'. It is quite possible that further investigation will show that this puberty-gland has normally a hermaphrodite disposition. If this were so, the theory of the bisexuality of the higher animals would be given anatomical foundation. It is already probable that the puberty-gland is not the only organ concerned with the production of sexual excitation and sexual characters. In any case, what we already know of the part played by the thyroid gland in sexuality fits in with this new biological discovery. It seems probable, then, that special chemical substances are produced in the interstitial portion of the sex-glands; these are then taken up in the blood stream and cause particular parts of the central nervous system to be charged with sexual tension. (We are already familiar with the fact that other toxic substances, introduced into the body from outside, can bring about a similar transformation of a toxic condition into a stimulus acting on a particular organ.) The question of how sexual excitation arises from the stimulation of erotogenic zones, when the central apparatus has been previously charged, and the question of what interplay arises in the course of these sexual processes between the effects of purely toxic stimuli and of physiological ones - none of this can be treated, even hypothetically, in the present state of our knowledge. It must suffice us to hold firmly to what is essential in this view of the sexual processes: the assumption that substances of a peculiar kind arise from the sexual metabolism. For this apparently arbitrary supposition is supported by a fact which has received little attention but deserves the closest consideration. The neuroses, which can be derived only from disturbances of sexual life, show the greatest clinical similarity to the phenomena of intoxication and abstinence that arise from the habitual use of toxic, pleasure-producing substances (alkaloids).

[1905d, 1530]

The conceptual scaffolding which we have set up to help us in dealing with the psychical manifestations of sexual life tallies well with these hypotheses as to the chemical basis of sexual excitation. We have defined the concept of libido as a quantitatively variable force which could serve as a measure of processes and transformations occurring in the field of sexual excitation. We distinguish this libido in respect of its special origin from the energy which must be supposed to underlie mental processes in general, and we thus also attribute a qualitative character to it. In thus distinguishing between libidinal and other forms of psychical energy we are giving expression to the presumption that the sexual processes occurring in the organism are distinguished from the nutritive processes by a special chemistry. The analysis of the perversions and psychoneuroses has shown us that this sexual excitation is derived not from the so-called sexual parts alone, but from all the bodily organs. We thus reach the idea of a quantity of libido, to the mental representation of which we give the name of 'ego-libido', and whose production, increase or diminution, distribution and displacement should afford us possibilities for explaining the psychosexual phenomena observed.

[1905d, 1531]
I know that no one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my _Three Essays on the Theory of Sexuality_ in 1905. I there attempted to show that the sexual instinct of man is highly complex and is put together from contributions made by numerous constituents and component instincts. Important contributions to 'sexual excitation' are furnished by the peripheral excitations of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes, nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others - a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' - i.e. from the completion of the fifth year to the first manifestations of puberty (round about the eleventh year) - reaction-formations, or counter-forces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual instincts. Now anal erotism is one of the components of the instinct which, in the course of development and in accordance with the education demanded by our present civilization, have become unserviceable for sexual aims. It is therefore plausible to suppose that these character-traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.²

[1908b, 1943]

There can be no question but that the libido has somatic sources, that it streams to the ego from various organs and parts of the body. This is most clearly seen in the case of that portion of the libido which, from its instinctual aim, is described as sexual excitation. The most prominent of the parts of the body from which this libido arises are known by the name of 'erotogenic zones', though in fact the whole body is an erotogenic zone of this kind. The greater part of what we know about Eros - that is to say, about its exponent, the libido - has been gained from a study of the sexual function, which, indeed, on the prevailing view, even if not according to our theory, coincides with Eros. We have been able to form a picture of the way in which the sexual urge, which is destined to exercise a decisive influence on our life, gradually develops out of successive contributions from a number of component instincts, which represent particular erotogenic zones.

[1940a [1938], 4962]
SEXUAL TENSION  The fact that sexual excitement possesses the character of tension raises a problem the solution of which is no less difficult than it would be important in helping us to understand the sexual processes. In spite of all the differences of opinion that reign on the subject among psychologists, I must insist that a feeling of tension necessarily involve unpleasure. What seems to me decisive is the fact that a feeling of this kind is accompanied by an impulsion to make a change in the psychological situation, that it operates in an urgent way which is wholly alien to the nature of the feeling of pleasure. If, however, the tension of sexual excitement is counted as an unpleasurable feeling, we are at once brought up against the fact that it is also undoubtedly felt as pleasurable. In every case in which tension is produced by sexual processes it is accompanied by pleasure; even in the preparatory changes in the genitals a feeling of satisfaction of some kind is plainly to be observed. How, then, are this unpleasurable tension and this feeling of pleasure to be reconciled?

Everything relating to the problem of pleasure and unpleasure touches upon one of the sorest spots of present-day psychology. It will be my aim to learn as much as possible from the circumstances of the instance with which we are at present dealing, but I shall avoid any approach to the problem as a whole.

We remain in complete ignorance both of the origin and of the nature of the sexual tension which arises simultaneously with the pleasure when erotogenic zones are satisfied. The most obvious explanation, that this tension arises in some way out of the pleasure itself, is not only extremely improbable in itself but becomes untenable when we consider that in connection with the greatest pleasure of all, that which accompanies the discharge of the sexual products, no tension is produced, but on the contrary all tension is removed. Thus pleasure and sexual tension can only be connected in an indirect manner.

PART PLAYED BY THE SEXUAL SUBSTANCES  Apart from the fact that normally it is only the discharge of the sexual substances that brings sexual excitation to an end, there are other points of contact between sexual tension and the sexual products. In the case of a man living a continent life, the sexual apparatus, at varying intervals, which, however, are not ungoverned by rules, discharges the sexual substances during the night, to the accompaniment of a pleasurable feeling and in the course of a dream which hallucinates a sexual act. And in regard to this process (nocturnal emission) it is difficult to avoid the conclusion that the sexual tension, which succeeds in making use of the short cut of hallucination as a substitute for the act itself, is a function of the accumulation of semen in the vesicles containing the sexual products. Our experience in connection with the exhaustibility of the sexual mechanism argues in the same sense. If the store of semen is exhausted, not only is it impossible to carry out the sexual act, but the susceptibility of the erotogenic zones to stimulus ceases, and their appropriate excitation no longer gives rise to any pleasure. We thus learn incidentally that a certain degree of sexual tension is required even for the excitability of the erotogenic zones.
This would seem to lead to what is, if I am not mistaken, the fairly wide-spread hypothesis that the accumulation of the sexual substances creates and maintains sexual tension; the pressure of these products upon the walls of the vesicles containing them might be supposed to act as a stimulus upon a spinal centre, the condition of which would be perceived by higher centres and would then give rise in consciousness to the familiar sensation of tension. If the excitation of the erotogenic zones increases sexual tension, this could only come about on the supposition that the zones in question are in an anatomical connection that has already been laid down with these centres, that they increase the tonus of the excitation in them, and, if the sexual tension is sufficient, set the sexual act in motion or, if it is insufficient, stimulate the production of the sexual substances.

[1905d, 1529]

The weakness of this theory, which we find accepted, for instance, in Krafft-Ebing's account of the sexual processes, lies in the fact that, having been designed to account for the sexual activity of adult males, it takes too little account of three sets of conditions which it should also be able to explain. These are the conditions in children, in females and in castrated males. In none of these three cases can there be any question of an accumulation of sexual products in the same sense as in males, and this makes a smooth application of the theory difficult. Nevertheless it may at once be admitted that it is possible to find means by which the theory may be made to cover these cases as well. In any case we are warned not to lay more weight on the factor of the accumulation of the sexual products than it is able to bear.

[1905d, 1529]

**IMPORTANCE OF THE INTERNAL SEXUAL ORGANS** Observations on castrated males seem to show that sexual excitation can occur to a considerable degree independently of the production of the sexual substances. The operation of castration occasionally fails to bring about a limitation of libido, although such limitation, which provides the motive for the operation, is the usual outcome. Moreover, it has long been known that diseases which abolish the production of the masculine sex-cells leave the patient, though he is now sterile, with his libido and potency undamaged. It is therefore by no means as astonishing as Rieger represents it to be that the loss of the masculine sex-glands in an adult may have no further effect upon his mental behaviour. It is true that if castration is performed at a tender age, before puberty, it approximates in its effect to the aim of obliterating the sexual characters; but here too it is possible that what is in question is, besides the actual loss of the sex-glands, an inhibition (connected with that loss) in the development of other factors.

[1905d, 1530]
CHEMICAL THEORY   Experiments in the removal of the sex-glands (testes and ovaries) of animals, and in the grafting into vertebrates of sex-glands from other individuals of the opposite sex¹ have at last thrown a partial light on the origin of sexual excitation, and have at the same time still further reduced the significance of a possible accumulation of cellular sexual products. [1905d, 1530]
An important element in the theory of repression is the view that repression is not an event that occurs once but that it requires a permanent expenditure. If this expenditure were to cease, the repressed impulse, which is being fed all the time from its sources, would on the next occasion flow along the channels from which it had been forced away, and the repression would either fail in its purpose or would have to be repeated an indefinite number of times. Thus it is because instincts are continuous in their nature that the ego has to make its defensive action secure by a permanent expenditure. This action undertaken to protect repression is observable in analytic treatment as resistance. Resistance presupposes the existence of what I have called anticathexis. An anticathexis of this kind is clearly seen in obsesssional neurosis. It appears there in the form of an alteration of the ego, as a reaction-formation in the ego, and is effected by the reinforcement of the attitude which is the opposite of the instinctual trend that has to be repressed - as, for instance, in pity, conscientiousness and cleanliness. These reaction-formations of obsesssional neurosis are essentially exaggerations of the normal traits of character which develop during the latency period. The presence of an anticathexis in hysteria is much more difficult to detect, though theoretically it is equally indispensable. In hysteria, too, a certain amount of alteration of the ego through reaction-formation is unmistakable and in some circumstances becomes so marked that it forces itself on our attention as the principal symptom. The conflict due to ambivalence, for instance, is resolved in hysteria by this means. The subject's hatred of a person whom he loves is kept down by an exaggerated amount of tenderness for him and apprehensiveness about him. But the difference between reaction-formations in obsesssional neurosis and in hysteria is that in the latter they do not have the universality of a character-trait but are confined to particular relationships. A hysterical woman, for instance, may be specially affectionate with her own children whom at bottom she hates; but she will not on that account be more loving in general than other women or even more affectionate to other children. The reaction-formation of hysteria clings tenaciously to a particular object and never spreads over into a general disposition of the ego, whereas what is characteristic of obsesssional neurosis is precisely a spreading-over of this kind - a loosening of relations to the object and a facilitation of displacement in the choice of object.

[1926d, 4310]

It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis - a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and plastic representations in ancient times. A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revivified after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

[1932a, 4784]
The question may be asked whether we may attribute to the mythopoeic activity an attempt to give (in play, as it were) a disguised representation to universally familiar, though also extremely interesting, mental processes that are accompanied by physical manifestations, with no motive other than the sheer pleasure of representation. We can certainly give no decided answer to this question without having fully grasped the nature of myths; but in the two instances before us, it is easy to recognize the same content and, with it, a definite purpose. Each describes the revival of libidinal desires after they have been quenched through being sated. That is to say, each brings out the indestructibility of those desires; and this emphasis is particularly appropriate as a consolation where the historical core of the myth deals with a defeat of instinctual life, with a renunciation of instinct that has become necessary. It is, as it were, the second part of primal man's understandable reaction when he has suffered a blow in his instinctual life: after the punishment of the offender comes the assurance that after all at bottom he has done no damage.

[1932a, 4785]
SEXUAL TENSION  The fact that sexual excitement possesses the character of tension raises a problem the solution of which is no less difficult than it would be important in helping us to understand the sexual processes. In spite of all the differences of opinion that reign on the subject among psychologists, I must insist that a feeling of tension necessarily involve unpleasure. What seems to me decisive is the fact that a feeling of this kind is accompanied by an impulse to make a change in the psychological situation, that it operates in an urgent way which is wholly alien to the nature of the feeling of pleasure. If, however, the tension of sexual excitement is counted as an unpleasurable feeling, we are at once brought up against the fact that it is also undoubtedly felt as pleasurable. In every case in which tension is produced by sexual processes it is accompanied by pleasure; even in the preparatory changes in the genitals a feeling of satisfaction of some kind is plainly to be observed. How, then, are this unpleasurable tension and this feeling of pleasure to be reconciled?  
[1905d, 1526]

Our right to separate the ego-instincts from the sexual ones cannot, no doubt, be shaken: it is implied in the existence of sexual life as a distinct activity of the individual. The only question is what importance we attribute to this separation, how deep-going we wish to consider it. The answer to this question, however, will be guided by how far we are able to establish the extent to which the sexual instincts behave differently in their somatic and mental manifestations from the others which we are contrasting with them, and how important the consequences are which arise from those differences. Moreover, we have, of course, no motive for asserting an essential difference between the two groups of instincts which is not plainly appreciable. Both of them come before us merely as designations of sources of energy in the individual, and the discussion as to whether they are fundamentally one or essentially different and as to when, if they are one, they became separate from each other - this discussion cannot be conducted on the basis of the connotation of the terms but must keep to the biological facts lying behind them. At the moment we know too little about these, and even if we knew more it would have no relevance for our analytic task.  
[1916-1917, 3458]

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them.  
[1916-1917, 3613]
THE INFANTILE SEXUAL AIM  The sexual aim of the infantile instinct consists in obtaining satisfaction by means of an appropriate stimulation of the erotogenic zone which has been selected in one way or another. This satisfaction must have been previously experienced in order to have left behind a need for its repetition; and we may expect that Nature will have made safe provisions so that this experience of satisfaction shall not be left to chance.¹ We have already learnt what the contrivance is that fulfils this purpose in the case of the labial zone: it is the simultaneous connection which links this part of the body with the taking in of food. We shall come across other, similar contrivances as sources of sexuality. The state of being in need of a repetition of the satisfaction reveals itself in two ways: by a peculiar feeling of tension, possessing, rather, the character of unpleasure, and by a sensation of itching or stimulation which is centrally conditioned and projected on to the peripheral erotogenic zone. We can therefore formulate a sexual aim in another way: it consists in replacing the projected sensation of stimulation in the erotogenic zone by an external stimulus which removes that sensation by producing a feeling of satisfaction. This external stimulus will usually consist in some kind of manipulation that is analogous to the sucking.

[1905d, 1505]

In one class of cases being in love is nothing more than object cathectic on the part of the sexual instincts with a view to directly sexual satisfaction, a cathectic which expires, moreover, when this aim has been reached; this is what is called common, sensual love. But, as we know, the libidinal situation rarely remains so simple. It was possible to calculate with certainty upon the revival of the need which had just expired; and this must no doubt have been the first motive for directing a lasting cathectic upon the sexual object and for 'loving' it in the passionless intervals as well.

[1921c, 3803]

It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis—a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and plastic representations in ancient times. A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revivified after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

[1932a, 4784]

The question may be asked whether we may attribute to the mythopoeic activity an attempt to give (in play, as it were) a disguised representation to universally familiar, though also extremely interesting, mental processes that are accompanied by physical manifestations, with no motive other than the sheer pleasure of representation. We can certainly give no decided answer to this question without having fully grasped the nature of myths; but in the two instances before us, it is easy to recognize the same content and, with it, a definite purpose. Each describes the revival of libidinal desires after they have been quenched through being sated. That is to say, each brings out the indestructibility of those desires; and this emphasis is particularly appropriate as a consolation where the historical core of the myth deals with a defeat of instinctual life, with a renunciation of instinct that has become necessary. It is, as it were, the second part of primal man's understandable reaction when he has suffered a blow in his instinctual life: after the punishment of the offender comes the assurance that after all at bottom he has done no damage.

[1932a, 4785]
I have no experience of my own of other kinds of typical dreams, in which the dreamer finds himself flying through the air to the accompaniment of agreeable feelings or falling with feelings of anxiety; and whatever I have to say on the subject is derived from psycho-analyses. The information provided by the latter forces me to conclude that these dreams, too, reproduce impressions of childhood; they relate, that is, to games involving movement, which are extraordinarily attractive to children. There cannot be a single uncle who has not shown a child how to fly by rushing across the room with him in his outstretched arms, or who has not played at letting him fall by riding him on his knee and then suddenly stretching out his leg, or by holding him up high and then suddenly pretending to drop him. Children are delighted by such experiences and never tire of asking to have them repeated, especially if there is something about them that causes a little fright or giddiness. In after years they repeat these experiences in dreams; but in the dreams they leave out the hands which held them up, so that they float or fall unsupported. The delight taken by young children in games of this kind (as well as in swings and see-saws) is well known; and when they come to see acrobatic feats in a circus their memory of such games is revived.¹ Hysterical attacks in boys sometimes consist merely in reproductions of feats of this kind, carried out with great skill. It not uncommonly happens that these games of movement, though innocent in themselves, give rise to sexual feelings.² Childish 'romping', if I may use a word which commonly describes all such activities, is what is being repeated in dreams of flying, falling, giddiness and so on; while the pleasurable feelings attached to these experiences are transformed into anxiety. But often enough, as every mother knows, romping among children actually ends in squabbling and tears. [1900a, 747]

² A young medical colleague, who is quite free from any kind of nervous trouble, has given me the following information on this point: 'I know from my own experience that in my childhood I had a peculiar sensation in my genitals when I was on a swing and especially when the downward motion reached its greatest momentum. And though I cannot say I really enjoyed this sensation I must describe it as a pleasurable one.' - Patients have often told me that the first pleasurable erections that they can remember occurred in their boyhood while they were climbing about. - Psycho-analysis makes it perfectly certain that the first sexual impulses frequently have their roots in games involving romping and wrestling played during childhood. [1900a, 747]

Our efforts to trace the origins of the sexual instinct have shown us so far that sexual excitation arises (a) as a reproduction of a satisfaction experienced in connection with other organic processes, (b) through appropriate peripheral stimulation of erotogenic zones and (c) as an expression of certain 'instincts' (such as the scopophilic instinct and the instinct of cruelty) of which the origin is not yet completely intelligible. Psycho-analytic investigation, reaching back into childhood from a later time, and contemporary observation of children combine to indicate to us still other regularly active sources of sexual excitation. The direct observation of children has the disadvantage of working upon data which are easily misunderstood; psycho-analysis is made difficult by the fact that it can only reach its data, as well as its conclusions, after long detours. But by co-operation the two methods can attain a satisfactory degree of certainty in their findings. [1905d, 1519]

We have already discovered in examining the erotogenic zones that these regions of the skin merely show a special intensification of a kind of susceptibility to stimulus which is possessed in a certain degree by the whole cutaneous surface. We shall therefore not be surprised to find that very definite erotogenic effects are to be ascribed to certain kinds of general stimulation of the skin. Among these we may especially mention thermal stimuli, whose importance may help us to understand the therapeutic effects of warm baths. [1905d, 1519]
MECHANICAL EXCITATIONS  At this point we must also mention the production of sexual excitation by rhythmic mechanical agitation of the body. Stimuli of this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of these pleasurable sensations - and it is worth emphasizing the fact that in this connection the concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction, a circumstance which we must later endeavour to explain - the existence, then, of these pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by the fact that children are so fond of games of passive movement, such as swinging and being thrown up into the air, and insist on such games being incessantly repeated.¹ It is well known that rocking is habitually used to induce sleep in restless children. The shaking produced by driving in carriages and later by railway-travel exercises such a fascinating effect upon older children that every boy, at any rate, has at one time or other in his life wanted to be an engine driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest in things connected with railways, and, at the age at which the production of phantasies is most active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly sexual. A compulsive link of this kind between railway-travel and sexuality is clearly derived from the pleasurable character of the sensations of movement. In the event of repression, which turns so many childish preferences into their opposite, these same individuals, when they are adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will protect themselves against a repetition of the painful experience by a dread of railway-travel. [1905d, 1520]

Here again we must mention the fact, which is not yet understood, that the combination of fright and mechanical agitation produces the severe, hysteriform, traumatic neurosis. It may at least be assumed that these influences, which, when they are of small intensity, become sources of sexual excitation, lead to a profound disorder in the sexual mechanism or chemistry if they operate with exaggerated force. [1905d, 1520]

¹ Some people can remember that in swinging they felt the impact of moving air upon their genitals as an immediate sexual pleasure.
[1905d, 1520]

MUSCULAR ACTIVITY  We are all familiar with the fact that children feel a need for a large amount of active muscular exercise and derive extraordinary pleasure from satisfying it. Whether this pleasure has any connection with sexuality, whether it itself comprises sexual satisfaction or whether it can become the occasion of sexual excitation - all of this is open to critical questioning, which may indeed also be directed against the view maintained in the previous paragraphs that the pleasure derived from sensations of passive movement is of a sexual nature or may produce sexual excitation. It is, however, a fact that a number of people report that they experienced the first signs of excitement in their genitals while they were romping or wrestling with playmates - a situation in which, apart from general muscular exertion, there is a large amount of contact with the skin of the opponent. An inclination to physical struggles with some one particular person, just as in later years an inclination to verbal disputes,¹ is a convincing sign that object-choice has fallen on him. One of the roots of the sadistic instinct would seem to lie in the encouragement of sexual excitation by muscular activity. In many people the infantile connection between romping and sexual excitation is among the determinants of the direction subsequently taken by their sexual instinct.²
[1905d, 1521]
AFFECTIVE PROCESSES  The further sources of sexual excitation in children are open to less
doubt. It is easy to establish, whether by contemporary observation
or by subsequent research, that all comparatively intense affective processes, including even
terrifying ones, trench upon sexuality - a fact which may incidentally help to explain the
pathogenic effect of emotions of that kind. In schoolchildren dread of going in for an
examination or tension over a difficult piece of work can be important not only in affecting the
child's relations at school but also in bringing about an irruption of sexual manifestations. For
quite often in such circumstances a stimulus may be felt which urges the child to touch his
genitals, or something may take place akin to a nocturnal emission with all its bewildering
consequences. The behaviour of children at school, which confronts a teacher with plenty of
puzzles, deserves in general to be brought into relation with their budding sexuality. The
sexually exciting effect of many emotions which are in themselves unpleasurable, such as
feelings of apprehension, fright or horror, persists in a great number of people throughout their
adult life. There is no doubt that this is the explanation of why so many people seek
opportunities for sensations of this kind, subject to the proviso that the seriousness of the
unpleasurable feeling is damped down by certain qualifying facts, such as its occurring in an
imaginary world, in a book or in a play.
[1905d, 1521]

If we assume that a similar erotogenic effect attaches even to intensely painful feelings,
especially when the pain is toned down or kept at a distance by some accompanying condition,
we should here have one of the main roots of the masochistic-sadistic instinct, into whose
numerous complexities we are very gradually gaining some insight.³
[1905d, 1521]

INTELLECTUAL WORK   Finally, it is an unmistakable fact that concentration of the attention
upon an intellectual task and intellectual strain in general produce a
concomitant sexual excitation in many young people as well as adults. This is no doubt the only
justifiable basis for what is in other respects the questionable practice of ascribing nervous
disorders to intellectual 'overwork'.
[1905d, 1521]

² [Footnote added 1910:] The analysis of cases of neurotic abasia and agoraphobia removes all doubt as
to the sexual nature of pleasure in movement. Modern education, as we know, makes great use of games
in order to divert young people from sexual activity. It would be more correct to say that in these young
people it replaces sexual enjoyment by pleasure in movement - and forces sexual activity back to one of
its auto-erotic components.
[1905d, 1521]
If we now cast our eyes over the tentative suggestions which I have made as to the sources of infantile sexual excitation, though I have not described them completely nor enumerated them fully, the following conclusions emerge with more or less certainty. It seems that the fullest provisions are made for setting in motion the process of sexual excitation - a process the nature of which has, it must be confessed, become highly obscure to us. The setting in motion of this process is first and foremost provided for in a more or less direct fashion by the excitations of the sensory surfaces - the skin and the sense organs - and, most directly of all, by the operation of stimuli on certain areas known as erotogenic zones. The decisive element in these sources of sexual excitation is no doubt the quality of the stimuli, though the factor of intensity, in the case of pain, is not a matter of complete indifference. But apart from these sources there are present in the organism contrivances which bring it about that in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits. What we have called the component instincts of sexuality are either derived directly from these internal sources or are composed of elements both from those sources and from the erotogenic zones. It may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual instinct.

It does not seem to me possible at present to state these general conclusions with any greater clarity or certainty. For this I think two factors are responsible: first, the novelty of the whole method of approach to the subject, and secondly, the fact that the whole nature of sexual excitation is completely unknown to us. Nevertheless I am tempted to make two observations which promise to open out wide future prospects:

VARIETIES OF SEXUAL CONSTITUTION   (a) Just as we saw previously that it was possible to derive a multiplicity of innate sexual constitutions from variety in the development of the erotogenic zones, so we can now make a similar attempt by including the indirect sources of sexual excitation. It may be assumed that, although contributions are made from these sources in the case of everyone, they are not in all cases of equal strength, and that further help towards the differentiation of sexual constitutions may be found in the varying development of the individual sources of sexual excitation.¹

PATHWAYS OF MUTUAL INFLUENCE   (b) If we now drop the figurative expression that we have so long adopted in speaking of the 'sources' of sexual excitation, we are led to the suspicion that all the connecting pathways that lead from other functions to sexuality must also be traversable in the reverse direction. If, for instance, the common possession of the labial zone by the two functions is the reason why sexual satisfaction arises during the taking of nourishment, then the same factor also enables us to understand why there should be disorders of nutrition if the erotogenic functions of the common zone are disturbed. Or again, if we know that concentration of attention may give rise to sexual excitation, it seems plausible to assume that by making use of the same path, but in a contrary direction, the condition of sexual excitation may influence the possibility of directing the attention. A good portion of the symptomatology of the neuroses, which I have traced to disturbances of the sexual processes, is expressed in disturbances of other, non-sexual, somatic functions; and this circumstance, which has hitherto been unintelligible, becomes less puzzling if it is only the counterpart of the influences which bring about the production of sexual excitation.
After having explained the preponderance of perverse tendencies in psychoneurotics by recognizing it as a collateral filling of subsidiary channels when the main current of the instinctual stream has been blocked by 'repression',¹ we proceeded to a consideration of sexual life in childhood. We found it a regrettable thing that the existence of the sexual instinct in childhood has been denied and that the sexual manifestations not infrequently to be observed in children have been described as irregularities. It seemed to us on the contrary that children bring germs of sexual activity with them into the world, that they already enjoy sexual satisfaction when they begin to take nourishment and that they persistently seek to repeat the experience in the familiar activity of 'thumb-sucking'. The sexual activity of children, however, does not, it appeared, develop pari passu with their other functions, but, after a short period of efflorescence from the ages of two to five, enters upon the so-called period of latency. During that period the production of sexual excitation is not by any means stopped but continues and produces a store of energy which is employed to a great extent for purposes other than sexual - namely, on the one hand in contributing the sexual components to social feelings and on the other hand (through repression and reaction-forming) in building up the subsequently developed barriers against sexuality. On this view, the forces destined to retain the sexual instinct upon certain lines are built up in childhood chiefly at the cost of perverse sexual impulses and with the assistance of education. A certain portion of the infantile sexual impulses would seem to evade these uses and succeed in expressing itself as sexual activity. We next found that sexual excitation in children springs from a multiplicity of forces. Satisfaction arises first and foremost from the appropriate sensory excitation of what we have described as erotogenic zones. It seems probable that any part of the skin and any sense-organ - probably, indeed, any organ - can function as an erotogenic zone, though there are some particularly marked erotogenic zones whose excitation would seem to be secured from the very first by certain organic contrivances. It further appears that sexual excitation arises as a by-product, as it were, of a large number of processes that occur in the organism, as soon as they reach a certain degree of intensity, and most especially of any relatively powerful emotion, even though it is of a distressing nature. The excitations from all these sources are not yet combined; but each follows its own separate aim, which is merely the attainment of a certain sort of pleasure. In childhood, therefore, the sexual instinct is not unified and is at first without an object, that is, auto-erotic.

[1905d, 1543]
If, as has been assumed since the time of Aristotle, the purpose of drama is to arouse 'terror and pity' and so 'to purge the emotions', we can describe that purpose in rather more detail by saying that it is a question of opening up sources of pleasure or enjoyment in our emotional life, just as, in the case of intellectual activity, joking or fun open up similar sources, many of which that activity had made inaccessible. In this connection the prime factor is unquestionably the process of getting rid of one's own emotions by 'blowing off steam'; and the consequent enjoyment corresponds on the one hand to the relief produced by a thorough discharge and on the other hand, no doubt, to an accompanying sexual excitation; for the latter, as we may suppose, appears as a by-product whenever an affect is aroused, and gives people the sense, which they so much desire, of a raising of the potential of their psychical state. Being present as an interested spectator at a spectacle or play does for adults what play does for children, whose hesitant hopes of being able to do what grown-up people do are in that way gratified. The spectator is a person who experiences too little, who feels that he is a 'poor wretch to whom nothing of importance can happen', who has long been obliged to damp down, or rather displace, his ambition to stand in his own person at the hub of world affairs; he longs to feel and to act and to arrange things according to his desires - in short, to be a hero. And the playwright and actor enable him to do this by allowing him to identify himself with a hero. They spare him something, too. For the spectator knows quite well that actual heroic conduct such as this would be impossible for him without pains and sufferings and acute fears, which would almost cancel out the enjoyment. He knows, moreover, that he has only one life and that he might perhaps perish even in a single such struggle against adversity. Accordingly, his enjoyment is based on an illusion; that is to say, his suffering is mitigated by the certainty that, firstly, it is someone other than himself who is acting and suffering on the stage, and, secondly, that after all it is only a game, which can threaten no damage to his personal security. In these circumstances he can allow himself to enjoy being a 'great man', to give way without a qualm to such suppressed impulses as a craving for freedom in religious, political, social and sexual matters, and to 'blow off steam' in every direction in the various grand scenes that form part of the life represented on the stage.

[1942a [1905], 1607]

I know that no one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my Three Essays on the Theory of Sexuality in 1905. I there attempted to show that the sexual instinct of man is highly complex and is put together from contributions made by numerous constituents and component instincts. Important contributions to 'sexual excitation' are furnished by the peripheral excitations of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes, nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others - a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' - i.e. from the completion of the fifth year to the first manifestations of puberty (round about the eleventh year) - reaction-formations, or counter-forces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual instincts. Now anal erotism is one of the components of the instinct which, in the course of development and in accordance with the education demanded by our present civilization, have become unserviceable for sexual aims. It is therefore plausible to suppose that these character-traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.

[1908b, 1943]
The third of the typical sexual theories arises in children if, through some chance domestic occurrence, they become witnesses of sexual intercourse between their parents. Their perceptions of what is happening are bound, however, to be only very incomplete. Whatever detail it may be that comes under their observation - whether it is the relative positions of the two people, or the noises they make, or some accessory circumstance - children arrive in every case at the same conclusion. They adopt what may be called a sadistic view of coition. They see it as something that the stronger participant is forcibly inflicting on the weaker, and they (especially boys) compare it to the romping familiar to them from their childish experience - romping which, incidentally, is not without a dash of sexual excitation. I have not been able to ascertain that children recognize this behaviour which they have witnessed between their parents as the missing link needed for solving the problem of babies; it appears more often that the connection is overlooked by them for the very reason that they have interpreted the act of love as an act of violence. But this view of it itself gives an impression of being a return of the obscure impulse towards cruel behaviour which became attached to the excitations of the child's penis when he first began to think about the problem of where babies came from. The possibility, too, cannot be excluded that this premature sadistic impulse, which might so nearly have led to the discovery of coition, itself first emerged under the influence of extremely obscure memories of parental intercourse, for which the child had obtained the material - though at the time he made no use of it - while he was still in his first years and was sharing his parents' bedroom.

Infantile sexuality exhibits two other characteristics which are of importance from a biological point of view. It turns out to be put together from a number of component instincts which seem to be attached to certain regions of the body ('erotogenic zones') and some of which emerge from the beginning in pairs of opposites - instincts with an active and a passive aim. Just as in later life what is loved is not merely the object's sexual organs but his whole body, so from the very first it is not merely the genitals but many other parts of the body which are the seat of sexual excitation and respond to appropriate stimuli with sexual pleasure. This fact is closely related to the second characteristic of infantile sexuality - namely that to start with it is attached to the functions of nutrition and excretion, and, in all probability, of muscular excitation and sensory activity.

Our view of sadism is further prejudiced by the circumstance that this instinct, side by side with its general aim (or perhaps, rather, within it), seems to strive towards the accomplishment of a quite special aim - not only to humiliate and master, but, in addition, to inflict pains. Psychoanalysis would appear to show that the infliction of pain plays no part among the original purposive actions of the instinct. A sadistic child takes no account of whether or not he inflicts pains, nor does he intend to do so. But when once the transformation into masochism has taken place, the pains are very well fitted to provide a passive masochistic aim; for we have every reason to believe that sensations of pain, like other unpleasurable sensations, trench upon sexual excitation and produce a pleasurable condition, for the sake of which the subject will even willingly experience the unpleasure of pain. When once feeling pains has become a masochistic aim, the sadistic aim of causing pains can arise also, retrogressively; for while these pains are being inflicted on other people, they are enjoyed masochistically by the subject through his identification of himself with the suffering object. In both cases, of course, it is not the pain itself which is enjoyed, but the accompanying sexual excitation - so that this can be done especially conveniently from the sadistic position. The enjoyment of pain would thus be an aim which was originally masochistic, but which can only become an instinctual aim in someone who was originally sadistic.
I have argued elsewhere¹ that 'war neuroses' (in so far as that term implies something more than a reference to the circumstances of the illness's onset) may very well be traumatic neuroses which have been facilitated by a conflict in the ego. The fact to which I have referred in the first paragraph of Chapter II, that a gross physical injury caused simultaneously by the trauma diminishes the chances that a neurosis will develop, becomes intelligible if one bears in mind two facts which have been stressed by psycho-analytic research: firstly, that mechanical agitation must be recognized as one of the sources of sexual excitation,² and secondly, that painful and feverish illnesses exercise a powerful effect, so long as they last, on the distribution of libido. Thus, on the one hand, the mechanical violence of the trauma would liberate a quantity of sexual excitation which, owing to the lack of preparation for anxiety, would have a traumatic effect; but, on the other hand, the simultaneous physical injury, by calling for a narcissistic hypercathectic of the injured organ,³ would bind the excess of excitation. It is also well known, though the libido theory has not yet made sufficient use of the fact, that such severe disorders in the distribution of libido as melancholia are temporarily brought to an end by intercurrent organic illness, and indeed that even a fully developed condition of dementia praecox is capable of a temporary remission in these same circumstances.

[1920g, 3736]

In my Three Essays on the Theory of Sexuality, in the section on the sources of infantile sexuality, I put forward the proposition that 'in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits'. Indeed, 'it may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual instinct'. In accordance with this, the excitation of pain and unpleasure would be bound to have the same result, too. The occurrence of such a libidinal sympathetic excitation when there is tension due to pain and unpleasure would be an infantile physiological mechanism which ceases to operate later on. It would attain a varying degree of development in different sexual constitutions; but in any case it would provide the physiological foundation on which the psychical structure of erotogenic masochism would afterwards be erected.

[1924c, 4075]
Let us begin by casting a glance at the way in which the erotogenic zones fit themselves into the new arrangement. They have to play an important part in introducing sexual excitation. The eye is perhaps the zone most remote from the sexual object, but it is the one which, in the situation of wooing an object, is liable to be the most frequently stimulated by the particular quality of excitation whose cause, when it occurs in a sexual object, we describe as beauty. (For the same reason the merits of a sexual object are described as 'attractions'.) This stimulation is on the one hand already accompanied by pleasure, while on the other hand it leads to an increase of sexual excitement or produces it if it is not yet present. If the excitation now spreads to another erotogenic zone - to the hand, for instance, through tactile sensations - the effect is the same: a feeling of pleasure on the one side, which is quickly intensified by pleasure arising from the preparatory changes, and on the other side an increase of sexual tension, which soon passes over into the most obvious unpleasure if it cannot be met by a further accession of pleasure. Another instance will perhaps make this even clearer. If an erotogenic zone in a person who is not sexually excited (e.g. the skin of a woman's breast) is stimulated by touch, the contact produces a pleasurable feeling; but it is at the same time better calculated than anything to arouse a sexual excitation that demands an increase of pleasure. The problem is how it can come about that an experience of pleasure can give rise to a need for greater pleasure.

THE MECHANISM OF FORE-PLEASURE The part played in this by the erotogenic zones, however, is clear. What is true of one of them is true of all. They are all used to provide a certain amount of pleasure by being stimulated in the way appropriate to them. This pleasure then leads to an increase in tension which in its turn is responsible for producing the necessary motor energy for the conclusion of the sexual act. The penultimate stage of that act is once again the appropriate stimulation of an erotogenic zone (the genital zone itself, in the glans penis) by the appropriate object (the mucous membrane of the vagina); and from the pleasure yielded by this excitation the motor energy is obtained, this time by a reflex path, which brings about the discharge of the sexual substances. This last pleasure is the highest in intensity, and its mechanism differs from that of the earlier pleasure. It is brought about entirely by discharge: it is wholly a pleasure of satisfaction and with it the tension of the libido is for the time being extinguished.

I was able recently to throw light upon another instance, in a quite different department of mental life, of a slight feeling of pleasure similarly making possible the attainment of a greater resultant pleasure, and thus operating as an 'incentive bonus'. In the same connection I was also able to go more deeply into the nature of pleasure.¹
DANGERS OF FORE-PLEASURE   The connection between fore-pleasure and infantile sexual life is, however, made clearer by the pathogenic part which it can come to play. The attainment of the normal sexual aim can clearly be endangered by the mechanism in which fore-pleasure is involved. This danger arises if at any point in the preparatory sexual processes the fore-pleasure turns out to be too great and the element of tension too small. The motive for proceeding further with the sexual process then disappears, the whole path is cut short, and the preparatory act in question takes the place of the normal sexual aim. Experience has shown that the precondition for this damaging event is that the erotogenic zone concerned or the corresponding component instinct shall already during childhood have contributed an unusual amount of pleasure. If further factors then come into play, tending to bring about a fixation, a compulsion may easily arise in later life which resists the incorporation of this particular fore-pleasure into a new context. Such is in fact the mechanism of many perversions, which consist in a lingering over the preparatory acts of the sexual process.

This failure of the function of the sexual mechanism owing to fore-pleasure is best avoided if the primacy of the genitals too is adumbrated in childhood; and indeed things seem actually arranged to bring this about in the second half of childhood (from the age of eight to puberty). During these years the genital zones already behave in much the same way as in maturity; they become the seat of sensations of excitation and of preparatory changes whenever any pleasure is felt from the satisfaction of other erotogenic zones, though this result is still without a purpose - that is to say, contributes nothing to a continuation of the sexual process. Already in childhood, therefore, alongside of the pleasure of satisfaction there is a certain amount of sexual tension, although it is less constant and less in quantity. We can now understand why, in discussing the sources of sexuality, we were equally justified in saying of a given process that it was sexually satisfying or sexually exciting. It will be noticed that in the course of our enquiry we began by exaggerating the distinction between infantile and mature sexual life, and that we are now setting this right. Not only the deviations from normal sexual life but its normal form as well are determined by the infantile manifestations of sexuality.

We remain in complete ignorance both of the origin and of the nature of the sexual tension which arises simultaneously with the pleasure when erotogenic zones are satisfied.¹ The most obvious explanation, that this tension arises in some way out of the pleasure itself, is not only extremely improbable in itself but becomes untenable when we consider that in connection with the greatest pleasure of all, that which accompanies the discharge of the sexual products, no tension is produced, but on the contrary all tension is removed. Thus pleasure and sexual tension can only be connected in an indirect manner.
PART PLAYED BY THE SEXUAL SUBSTANCES  Apart from the fact that normally it is only the discharge of the sexual substances that brings sexual excitation to an end, there are other points of contact between sexual tension and the sexual products. In the case of a man living a continent life, the sexual apparatus, at varying intervals, which, however, are not ungoverned by rules, discharges the sexual substances during the night, to the accompaniment of a pleasurable feeling and in the course of a dream which hallucinates a sexual act. And in regard to this process (nocturnal emission) it is difficult to avoid the conclusion that the sexual tension, which succeeds in making use of the short cut of hallucination as a substitute for the act itself, is a function of the accumulation of semen in the vesicles containing the sexual products. Our experience in connection with the exhaustibility of the sexual mechanism argues in the same sense. If the store of semen is exhausted, not only is it impossible to carry out the sexual act, but the susceptibility of the erotogenic zones to stimulus ceases, and their appropriate excitation no longer gives rise to any pleasure. We thus learn incidentally that a certain degree of sexual tension is required even for the excitability of the erotogenic zones.

[1905d, 1529]

This would seem to lead to what is, if I am not mistaken, the fairly wide-spread hypothesis that the accumulation of the sexual substances creates and maintains sexual tension; the pressure of these products upon the walls of the vesicles containing them might be supposed to act as a stimulus upon a spinal centre, the condition of which would be perceived by higher centres and would then give rise in consciousness to the familiar sensation of tension. If the excitation of the erotogenic zones increases sexual tension, this could only come about on the supposition that the zones in question are in an anatomical connection that has already been laid down with these centres, that they increase the tonus of the excitation in them, and, if the sexual tension is sufficient, set the sexual act in motion or, if it is insufficient, stimulate the production of the sexual substances.

[1905d, 1529]

The weakness of this theory, which we find accepted, for instance, in Krafft-Ebing's account of the sexual processes, lies in the fact that, having been designed to account for the sexual activity of adult males, it takes too little account of three sets of conditions which it should also be able to explain. These are the conditions in children, in females and in castrated males. In none of these three cases can there be any question of an accumulation of sexual products in the same sense as in males, and this makes a smooth application of the theory difficult. Nevertheless it may at once be admitted that it is possible to find means by which the theory may be made to cover these cases as well. In any case we are warned not to lay more weight on the factor of the accumulation of the sexual products than it is able to bear.

[1905d, 1529]

¹ It is a highly instructive fact that the German language in its use of the word 'Lust' takes into account the part played by the preparatory sexual excitations which, as has been explained above, simultaneously produce an element of satisfaction and a contribution to sexual tension. 'Lust' has two meanings, and is used to describe the sensation of sexual tension ('Ich habe Lust' = 'I should like to', 'I feel an impulse to') as well as the feeling of satisfaction.

[1905d, 1529]
IMPORTANCE OF THE INTERNAL SEXUAL ORGANS  Observations on castrated males seem to show that sexual excitation can occur to a considerable degree independently of the production of the sexual substances. The operation of castration occasionally fails to bring about a limitation of libido, although such limitation, which provides the motive for the operation, is the usual outcome. Moreover, it has long been known that diseases which abolish the production of the masculine sex-cells leave the patient, though he is now sterile, with his libido and potency undamaged. It is therefore by no means as astonishing as Rieger represents it to be that the loss of the masculine sex-glands in an adult may have no further effect upon his mental behaviour. It is true that if castration is performed at a tender age, before puberty, it approximates in its effect to the aim of obliterating the sexual characters; but here too it is possible that what is in question is, besides the actual loss of the sex-glands, an inhibition (connected with that loss) in the development of other factors.

CHEMICAL THEORY  Experiments in the removal of the sex-glands (testes and ovaries) of animals, and in the grafting into vertebrates of sex-glands from other individuals of the opposite sex, have at last thrown a partial light on the origin of sexual excitation, and have at the same time still further reduced the significance of a possible accumulation of cellular sexual products. It has become experimentally possible (E. Steinach) to transform a male into a female, and conversely a female into a male. In this process the psychosexual behaviour of the animal alters in accordance with the somatic sexual characters and simultaneously with them. It seems, however, that this sex-determining influence is not an attribute of that part of the sex-glands which gives rise to the specific sex-cells (spermatozoa and ovum) but of their interstitial tissue, upon which special emphasis is laid by being described in the literature as the 'puberty-gland'. It is quite possible that further investigation will show that this puberty-gland has normally a hermaphrodite disposition. If this were so, the theory of the bisexuality of the higher animals would be given anatomical foundation. It is already probable that the puberty-gland is not the only organ concerned with the production of sexual excitation and sexual characters. In any case, what we already know of the part played by the thyroid gland in sexuality fits in with this new biological discovery. It seems probable, then, that special chemical substances are produced in the interstitial portion of the sex-glands; these are then taken up in the blood stream and cause particular parts of the central nervous system to be charged with sexual tension. (We are already familiar with the fact that other toxic substances, introduced into the body from outside, can bring about a similar transformation of a toxic condition into a stimulus acting on a particular organ.) The question of how sexual excitation arises from the stimulation of erogenous zones, when the central apparatus has been previously charged, and the question of what interplay arises in the course of these sexual processes between the effects of purely toxic stimuli and of physiological ones - none of this can be treated, even hypothetically, in the present state of our knowledge. It must suffice us to hold firmly to what is essential in this view of the sexual processes: the assumption that substances of a peculiar kind arise from the sexual metabolism. For this apparently arbitrary supposition is supported by a fact which has received little attention but deserves the closest consideration. The neuroses, which can be derived only from disturbances of sexual life, show the greatest clinical similarity to the phenomena of intoxication and abstinence that arise from the habitual use of toxic, pleasure-producing substances (alkaloids).

[1905d, 1530]
The erotogenic zone of the genitals begins to make itself noticeable, it seems, even during the years of childhood. This may happen in two ways. Either, like any other erotogenic zone, it yields satisfaction in response to appropriate sensory stimulation; or, in a manner which is not quite understandable, when satisfaction is derived from other sources, a sexual excitation is simultaneously produced which has a special relation to the genital zone. We were reluctantly obliged to admit that we could not satisfactorily explain the relation between sexual satisfaction and sexual excitation, or that between the activity of the genital zone and the activity of the other sources of sexuality.

In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child's sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

An examination of the determinants of laughing will perhaps lead us to a plainer idea of what happens when a joke affords assistance against suppression. Even now, however, we can see that the case of tendentious jokes is a special case of the 'principle of assistance'. A possibility of generating pleasure supervenes in a situation in which another possibility of pleasure is obstructed so that, as far as the latter alone is concerned, no pleasure would arise. The result is a generation of pleasure far greater than that offered by the supervening possibility. This has acted, as it were, as an incentive bonus with the assistance of the offer of a small amount of pleasure, a much greater one, which would otherwise have been hard to achieve, has been gained. I have good reason to suspect that this principle corresponds with an arrangement that holds good in many widely separated departments of mental life and it will, I think, be expedient to describe the pleasure that serves to initiate the large release of pleasure as 'fore-pleasure', and the principle as the 'fore-pleasure principle'.

[1905d, 1544]

[1905d, 1545]

[1905c, 1726]
You will remember how I have said that the day-dreamer carefully conceals his phantasies from other people because he feels he has reasons for being ashamed of them. I should now add that even if he were to communicate them to us he could give us no pleasure by his disclosures. Such phantasies, when we learn them, repel us or at least leave us cold. But when a creative writer presents his plays to us or tells us what we are inclined to take to be his personal day dreams, we experience a great pleasure, and one which probably arises from the confluence of many sources. How the writer accomplishes this is his innermost secret; the essential *ars poetica* lies in the technique of overcoming the feeling of repulsion in us which is undoubtedly connected with the barriers that rise between each single ego and the others. We can guess two of the methods used by this technique. The writer softens the character of his egoistic day-dreams by altering and disguising it, and he bribes us by the purely formal - that is, aesthetic - yield of pleasure which he offers us in the presentation of his phantasies. We give the name of an *incentive bonus*, or a *fore-pleasure*, to a yield of pleasure such as this, which is offered to us so as to make possible the release of still greater pleasure arising from deeper psychical sources. In my opinion, all the aesthetic pleasure which a creative writer affords us has the character of a fore-pleasure of this kind, and our actual enjoyment of an imaginative work proceeds from a liberation of tensions in our minds. It may even be that not a little of this effect is due to the writer's enabling us thenceforward to enjoy our own day-dreams without self-reproach or shame. This brings us to the threshold of new, interesting and complicated enquiries; but also, at least for the moment, to the end of our discussion.

[1908e, 1929]

We find ourselves on firmer ground when we investigate the manner in which the life of the instincts serves the sexual function. Here we have acquired quite definite knowledge, with which you too are already familiar. It is not the case, then, that we recognize a sexual instinct which is from the first the vehicle of an urge towards the aim of the sexual function - the union of the two sex-cells. What we see is a great number of component instincts arising from different areas and regions of the body, which strive for satisfaction fairly independently of one another and find that satisfaction in something that we may call 'organ-pleasure'. The genitals are the latest of these 'erotogenic zones' and the name of 'sexual' pleasure cannot be withheld from their organ-pleasure. These impulses which strive for pleasure are not all taken up into the final organization of the sexual function. A number of them are set aside as unserviceable, by repression or some other means; a few of them are diverted from their aim in the remarkable manner I have mentioned and used to strengthen other impulses; yet others persist in minor roles, and serve for the performance of introductory acts, for the production of fore-pleasure. You have heard how in the course of this long-drawn-out development several phases of preliminary organization can be recognized and also how this history of the sexual function explains its aberrations and atrophies. The first of these 'pregenital' phases is known to us as the *oral* one because, in conformity with the way in which an infant in arms is nourished, the erotogenic zone of the mouth dominates what may be called the sexual activity of that period of life. At a second level the *sadistic* and *anal* impulses come to the fore, undoubtedly in connection with the appearance of the teeth, the strengthening of the muscular apparatus and the control of the sphincter functions. We have learnt a number of interesting details about this remarkable stage of development in particular. Thirdly comes the *phallic* phase in which in both sexes the male organ (and what corresponds to it in girls) attains an importance which can no longer be overlooked. We have reserved the name of *genital* phase for the definitive sexual organization which is established after puberty and in which the female genital organ for the first time meets with the recognition which the male one acquired long before.

[1933a, 4703]
It would be a mistake to suppose that these three phases succeed one another in a clear-cut fashion. One may appear in addition to another; they may overlap one another, may be present alongside of one another. In the early phases the different component instincts set about their pursuit of pleasure independently of one another; in the phallic phase there are the beginnings of an organization which subordinates the other urges to the primacy of the genitals and signifies the start of a co-ordination of the general urge towards pleasure into the sexual function. The complete organization is only achieved at puberty, in a fourth, genital phase. A state of things is then established in which (1) some earlier libidinal cathexes are retained, (2) others are taken into the sexual function as preparatory, auxiliary acts, the satisfaction of which produces what is known as fore-pleasure, and (3) other urges are excluded from the organization, and are either suppressed altogether (repressed) or are employed in the ego in another way, forming character-traits or undergoing sublimation with a displacement of their aims.

[1940a [1938], 4966]
THE INFANTILE SEXUAL AIM  The sexual aim of the infantile instinct consists in obtaining satisfaction by means of an appropriate stimulation of the erotogenic zone which has been selected in one way or another. This satisfaction must have been previously experienced in order to have left behind a need for its repetition; and we may expect that Nature will have made safe provisions so that this experience of satisfaction shall not be left to chance.¹ We have already learnt what the contrivance is that fulfils this purpose in the case of the labial zone: it is the simultaneous connection which links this part of the body with the taking in of food. We shall come across other, similar contrivances as sources of sexuality. The state of being in need of a repetition of the satisfaction reveals itself in two ways: by a peculiar feeling of tension, possessing, rather, the character of unpleasure, and by a sensation of itching or stimulation which is centrally conditioned and projected on to the peripheral erotogenic zone. We can therefore formulate a sexual aim in another way: it consists in replacing the projected sensation of stimulation in the erotogenic zone by an external stimulus which removes that sensation by producing a feeling of satisfaction. This external stimulus will usually consist in some kind of manipulation that is analogous to the sucking.
[1905d, 1505]

The fact that the need can also be evoked peripherally, by a real modification of the erotogenic zone, is in complete harmony with our physiological knowledge. This strikes us as somewhat strange only because, in order to remove one stimulus, it seems necessary to adduce a second one at the same spot.
[1905d, 1505]

MECHANICAL EXCITATIONS  At this point we must also mention the production of sexual excitation by rhythmic mechanical agitation of the body. Stimuli of this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of these pleasurable sensations - and it is worth emphasizing the fact that in this connection the concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction, a circumstance which we must later endeavour to explain - the existence, then, of these pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by the fact that children are so fond of games of passive movement, such as swinging and being thrown up into the air, and insist on such games being incessantly repeated.¹ It is well known that rocking is habitually used to induce sleep in restless children. The shaking produced by driving in carriages and later by railway-travel exercises such a fascinating effect upon older children that every boy, at any rate, has at one time or other in his life wanted to be an engine driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest in things connected with railways, and, at the age at which the production of phantasies is most active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly sexual. A compulsive link of this kind between railway-travel and sexuality is clearly derived from the pleasurable character of the sensations of movement. In the event of repression, which turns so many childish preferences into their opposite, these same individuals, when they are adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will protect themselves against a repetition of the painful experience by a dread of railway-travel.
[1905d, 1520]
THE MECHANISM OF FORE-PLEASURE The part played in this by the erotogenic zones, however, is clear. What is true of one of them is true of all. They are all used to provide a certain amount of pleasure by being stimulated in the way appropriate to them. This pleasure then leads to an increase in tension which in its turn is responsible for producing the necessary motor energy for the conclusion of the sexual act. The penultimate stage of that act is once again the appropriate stimulation of an erotogenic zone (the genital zone itself, in the glans penis) by the appropriate object (the mucous membrane of the vagina); and from the pleasure yielded by this excitation the motor energy is obtained, this time by a reflex path, which brings about the discharge of the sexual substances. This last pleasure is the highest in intensity, and its mechanism differs from that of the earlier pleasure. It is brought about entirely by discharge; it is wholly a pleasure of satisfaction and with it the tension of the libido is for the time being extinguished.

I was able recently to throw light upon another instance, in a quite different department of mental life, of a slight feeling of pleasure similarly making possible the attainment of a greater resultant pleasure, and thus operating as an 'incentive bonus'. In the same connection I was also able to go more deeply into the nature of pleasure.¹

After having explained the preponderance of perverse tendencies in psychoneurotics by recognizing it as a collateral filling of subsidiary channels when the main current of the instinctual stream has been blocked by 'repression',¹ we proceeded to a consideration of sexual life in childhood. We found it a regrettable thing that the existence of the sexual instinct in childhood has been denied and that the sexual manifestations not infrequently to be observed in children have been described as irregularities. It seemed to us on the contrary that children bring germs of sexual activity with them into the world, that they already enjoy sexual satisfaction when they begin to take nourishment and that they persistently seek to repeat the experience in the familiar activity of 'thumb-sucking'. The sexual activity of children, however, does not, it appeared, develop pari passu with their other functions, but, after a short period of efflorescence from the ages of two to five, enters upon the so-called period of latency. During that period the production of sexual excitation is not by any means stopped but continues and produces a store of energy which is employed to a great extent for purposes other than sexual - namely, on the one hand in contributing the sexual components to social feelings and on the other hand (through repression and reaction-forming) in building up the subsequently developed barriers against sexuality. On this view, the forces destined to retain the sexual instinct upon certain lines are built up in childhood chiefly at the cost of perverse sexual impulses and with the assistance of education. A certain portion of the infantile sexual impulses would seem to evade these uses and succeed in expressing itself as sexual activity. We next found that sexual excitation in children springs from a multiplicity of forces. Satisfaction arises first and foremost from the appropriate sensory excitation of what we have described as erotogenic zones. It seems probable that any part of the skin and any sense-organ - probably, indeed, any organ - can function as an erotogenic zone, though there are some particularly marked erotogenic zones whose excitation would seem to be secured from the very first by certain organic contrivances. It further appears that sexual excitation arises as a by-product, as it were, of a large number of processes that occur in the organism, as soon as they reach a certain degree of intensity, and most especially of any relatively powerful emotion, even though it is of a distressing nature. The excitations from all these sources are not yet combined; but each follows its own separate aim, which is merely the attainment of a certain sort of pleasure. In childhood, therefore, the sexual instinct is not unified and is at first without an object, that is, auto-erotic.

[1905d, 1527]

[1905d, 1543]
It is my belief that, however strange it may sound, we must reckon with the possibility that something in the nature of the sexual instinct itself is unfavourable to the realization of complete satisfaction. If we consider the long and difficult developmental history of the instinct, two factors immediately spring to mind which might be made responsible for this difficulty. Firstly, as a result of the diphasic onset of object-choice, and the interposition of the barrier against incest, the final object of the sexual instinct is never any longer the original object but only a surrogate for it. Psycho-analysis has shown us that when the original object of a wishful impulse has been lost as a result of repression, it is frequently represented by an endless series of substitutive objects none of which, however, brings full satisfaction. This may explain the inconstancy in object-choice, the 'craving for stimulation' which is so often a feature of the love of adults.

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - *inter unrinas et faeces* - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing to-day.
Wherever primitive man has set up a taboo he fears some danger and it cannot be disputed that a generalized dread of women is expressed in all these rules of avoidance. Perhaps this dread is based on the fact that woman is different from man, forever incomprehensible and mysterious, strange and therefore apparently hostile. The man is afraid of being weakened by the woman, infected with her femininity and of then showing himself incapable. The effect which coitus has on discharging tensions and causing flaccidity may be the prototype of what the man fears; and realization of the influence which the woman gains over him through sexual intercourse, the consideration she thereby forces from him, may justify the extension of this fear. In all this there is nothing obsolete, nothing which is not still alive among ourselves. [1918a, 2354]

Let us start with the latter, the scientific errors. The doctor's advice to the lady shows clearly in what sense he understands the expression 'sexual life' - in the popular sense, namely, in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of the sexual substances. He cannot have remained unaware, however, that psycho-analysis is commonly reproached with having extended the concept of what is sexual far beyond its usual range. The fact is undisputed; I shall not discuss here whether it may justly be used as a reproach. In psycho-analysis the concept of what is sexual comprises far more; it goes lower and also higher than its popular sense. This extension is justified genetically; we reckon as belonging to 'sexual life' all the activities of the tender feelings which have primitive sexual impulses as their source, even when those impulses have become inhibited in regard to their original sexual aim or have exchanged this aim for another which is no longer sexual. For this reason we prefer to speak of psychosexuality, thus laying stress on the point that the mental factor in sexual life should not be overlooked or underestimated. We use the word 'sexuality' in the same comprehensive sense as that in which the German language uses the word lieben ['to love']. We have long known, too, that mental absence of satisfaction with all its consequences can exist where there is no lack of normal sexual intercourse; and as therapists we always bear in mind that the unsatisfied sexual trends (whose substitutive satisfactions in the form of nervous symptoms we combat) can often find only very inadequate outlet in coitus or other sexual acts. [1910k, 2375]

Let us make a sharper distinction than we have hitherto made between function and tendency. The pleasure principle, then, is a tendency operating in the service of a function whose business it is to free the mental apparatus entirely from excitation or to keep the amount of excitation in it constant or to keep it as low as possible. We cannot yet decide with certainty in favour of any of these ways of putting it; but it is clear that the function thus described would be concerned with the most universal endeavour of all living substance - namely to return to the quiescence of the inorganic world. We have all experienced how the greatest pleasure attainable by us, that of the sexual act, is associated with a momentary extinction of a highly intensified excitation. The binding of an instinctual impulse would be a preliminary function designed to prepare the excitation for its final elimination in the pleasure of discharge. [1920g, 3761]
Here might be the starting-point for fresh investigations. Our consciousness communicates to us feelings from within not only of pleasure and unpleasure but also of a peculiar tension which in its turn can be either pleasurable or unpleasurable. Should the difference between these feelings enable us to distinguish between bound and unbound processes of energy? or is the feeling of tension to be related to the absolute magnitude, or perhaps to the level, of the cathexis, while the pleasure and unpleasure series indicates a change in magnitude of the cathexis within a given unit of time? Another striking fact is that the life instincts have so much more contact with our internal perception - emerging as breakers of the peace and constantly producing tensions whose release is felt as pleasure - while the death instincts seem to do their work unobtrusively. The pleasure principle seems actually to serve the death instincts. It is true that it keeps watch upon stimuli from without, which are regarded as dangers by both kinds of instincts; but it is more especially on guard against increases of stimulation from within, which would make the task of living more difficult. This in turn raises a host of other questions to which we can at present find no answer. We must be patient and await fresh methods and occasions of research. We must be ready, too, to abandon a path that we have followed for a time, if it seems to be leading to no good end. Only believers, who demand that science shall be a substitute for the catechism they have given up, will blame an investigator for developing or even transforming his views. We may take comfort, too, for the slow advances of our scientific knowledge in the words of the poet:

[1920g, 3762]

It is interesting to see that it is precisely those sexual impulsions that are inhibited in their aims which achieve such lasting ties between people. But this can easily be understood from the fact that they are not capable of complete satisfaction, while sexual impulsions which are uninhibited in their aims suffer an extraordinary reduction through the discharge of energy every time the sexual aim is attained. It is the fate of sensual love to become extinguished when it is satisfied; for it to be able to last, it must from the beginning be mixed with purely affectionate components - with such, that is, as are inhibited in their aims - or it must itself undergo a transformation of this kind.

[1921c, 3807]

Even in sexual chemistry things must be rather more complicated. For psychology, however, it is a matter of indifference whether there is a single sexually exciting substance in the body or two or countless numbers of them. Psycho-analysis teaches us to manage with a single libido, which, it is true, has both active and passive aims (that is, modes of satisfaction). This antithesis and, above all, the existence of libidinal trends with passive aims, contains within itself the remainder of our problem.

[1931b, 4604]

The sexual organ of the male has two functions; and there are those to whom this association is an annoyance. It serves for the evacuation of the bladder, and it carries out the act of love which sets the craving of the genital libido at rest. The child still believes that he can unite the two functions. According to a theory of his, babies are made by the man urinating into the woman's body. But the adult knows that in reality the acts are mutually incompatible - as incompatible as fire and water. When the penis is in the state of excitation which led to its comparison with a bird, and while the sensations are being experienced which suggest the warmth of fire, urination is impossible; and conversely, when the organ is serving to evacuate urine (the water of the body) all its connections with the genital function seem to be quenched. The antithesis between the two functions might lead us to say that man quenches his own fire with his own water. And primal man, who had to understand the external world by the help of his own bodily sensations and states, would surely not have failed to notice and utilize the analogies pointed out to him by the behaviour of fire.

[1932a, 4786]
I have argued elsewhere¹ that 'war neuroses' (in so far as that term implies something more than a reference to the circumstances of the illness's onset) may very well be traumatic neuroses which have been facilitated by a conflict in the ego. The fact to which I have referred in the first paragraph of Chapter II, that a gross physical injury caused simultaneously by the trauma diminishes the chances that a neurosis will develop, becomes intelligible if one bears in mind two facts which have been stressed by psycho-analytic research: firstly, that mechanical agitation must be recognized as one of the sources of sexual excitation,² and secondly, that painful and feverish illnesses exercise a powerful effect, so long as they last, on the distribution of libido. Thus, on the one hand, the mechanical violence of the trauma would liberate a quantity of sexual excitation which, owing to the lack of preparation for anxiety, would have a traumatic effect; but, on the other hand, the simultaneous physical injury, by calling for a narcissistic hypercatheexis of the injured organ,³ would bind the excess of excitation. It is also well known, though the libido theory has not yet made sufficient use of the fact, that such severe disorders in the distribution of libido as melancholia are temporarily brought to an end by intercurrent organic illness, and indeed that even a fully developed condition of dementia praecox is capable of a temporary remission in these same circumstances.

[1920g, 3736]
Some of my medical colleagues have looked upon my theory of hysteria as a purely psychological one, and have for that reason pronounced it ipso facto incapable of solving a pathological problem. They may perhaps discover from this paper that their objection was based upon their having unjustifiably transferred what is a characteristic of the technique on to the theory itself. It is the therapeutic technique alone that is purely psychological; the theory does not by any means fail to point out that neuroses have an organic basis - though it is true that it does not look for that basis in any pathological anatomical changes, and provisionally substitutes the conception of organic functions for the chemical changes which we should expect to find but which we are at present unable to apprehend. No one, probably, will be inclined to deny the sexual function the character of an organic factor, and it is the sexual function that I look upon as the foundation of hysteria and of the psychoneuroses in general. No theory of sexual life will, I suspect, be able to avoid assuming the existence of some definite sexual substances having an excitant action. Indeed, of all the clinical pictures which we meet with in clinical medicine, it is the phenomena of intoxication and abstinence in connection with the use of certain chronic poisons that most closely resemble the genuine psychoneuroses. [1905e, 1447]

There is a further provisional assumption that we cannot escape in the theory of the instincts. It is to the effect that excitations of two kinds arise from the somatic organs, based upon differences of a chemical nature. One of these kinds of excitation we describe as being specifically sexual, and we speak of the organ concerned as the ‘erotogenic zone’ of the sexual component instinct arising from it.² [1905d, 1492]

Here again we must mention the fact, which is not yet understood, that the combination of fright and mechanical agitation produces the severe, hysteriform, traumatic neurosis. It may at least be assumed that these influences, which, when they are of small intensity, become sources of sexual excitation, lead to a profound disorder in the sexual mechanism or chemistry if they operate with exaggerated force. [1905d, 1520]

PART PLAYED BY THE SEXUAL SUBSTANCES Apart from the fact that normally it is only the discharge of the sexual substances that brings sexual excitation to an end, there are other points of contact between sexual tension and the sexual products. In the case of a man living a continent life, the sexual apparatus, at varying intervals, which, however, are not ungoverned by rules, discharges the sexual substances during the night, to the accompaniment of a pleasurable feeling and in the course of a dream which hallucinates a sexual act. And in regard to this process (nocturnal emission) it is difficult to avoid the conclusion that the sexual tension, which succeeds in making use of the short cut of hallucination as a substitute for the act itself, is a function of the accumulation of semen in the vesicles containing the sexual products. Our experience in connection with the exhaustibility of the sexual mechanism argues in the same sense. If the store of semen is exhausted, not only is it impossible to carry out the sexual act, but the susceptibility of the erotogenic zones to stimulus ceases, and their appropriate excitation no longer gives rise to any pleasure. We thus learn incidentally that a certain degree of sexual tension is required even for the excitability of the erotogenic zones. [1905d, 1529]
This would seem to lead to what is, if I am not mistaken, the fairly wide-spread hypothesis that the accumulation of the sexual substances creates and maintains sexual tension; the pressure of these products upon the walls of the vesicles containing them might be supposed to act as a stimulus upon a spinal centre, the condition of which would be perceived by higher centres and would then give rise in consciousness to the familiar sensation of tension. If the excitation of the erotogenic zones increases sexual tension, this could only come about on the supposition that the zones in question are in an anatomical connection that has already been laid down with these centres, that they increase the tonus of the excitation in them, and, if the sexual tension is sufficient, set the sexual act in motion or, if it is insufficient, stimulate the production of the sexual substances.
[1905d, 1529]

The weakness of this theory, which we find accepted, for instance, in Krafft-Ebing's account of the sexual processes, lies in the fact that, having been designed to account for the sexual activity of adult males, it takes too little account of three sets of conditions which it should also be able to explain. These are the conditions in children, in females and in castrated males. In none of these three cases can there be any question of an accumulation of sexual products in the same sense as in males, and this makes a smooth application of the theory difficult. Nevertheless it may at once be admitted that it is possible to find means by which the theory may be made to cover these cases as well. In any case we are warned not to lay more weight on the factor of the accumulation of the sexual products than it is able to bear.
[1905d, 1529]

IMPORTANCE OF THE INTERNAL SEXUAL ORGANS Observations on castrated males seem to show that sexual excitation can occur to a considerable degree independently of the production of the sexual substances. The operation of castration occasionally fails to bring about a limitation of libido, although such limitation, which provides the motive for the operation, is the usual outcome. Moreover, it has long been known that diseases which abolish the production of the masculine sex-cells leave the patient, though he is now sterile, with his libido and potency undamaged. It is therefore by no means as astonishing as Rieger represents it to be that the loss of the masculine sex-glands in an adult may have no further effect upon his mental behaviour. It is true that if castration is performed at a tender age, before puberty, it approximates in its effect to the aim of obliterating the sexual characters; but here too it is possible that what is in question is, besides the actual loss of the sex-glands, an inhibition (connected with that loss) in the development of other factors.
[1905d, 1530]
CHEMICAL THEORY   Experiments in the removal of the sex-glands (testes and ovaries) of animals, and in the grafting into vertebrates of sex-glands from other individuals of the opposite sex,¹ have at last thrown a partial light on the origin of sexual excitation, and have at the same time still further reduced the significance of a possible accumulation of cellular sexual products. It has become experimentally possible (E. Steinach) to transform a male into a female, and conversely a female into a male. In this process the psychosexual behaviour of the animal alters in accordance with the somatic sexual characters and simultaneously with them. It seems, however, that this sex-determining influence is not an attribute of that part of the sex-glands which gives rise to the specific sex-cells (spermatozoa and ovum) but of their interstitial tissue, upon which special emphasis is laid by being described in the literature as the 'puberty-gland'. It is quite possible that further investigation will show that this puberty-gland has normally a hermaphrodite disposition. If this were so, the theory of the bisexuality of the higher animals would be given anatomical foundation. It is already probable that the puberty-gland is not the only organ concerned with the production of sexual excitation and sexual characters. In any case, what we already know of the part played by the thyroid gland in sexuality fits in with this new biological discovery. It seems probable, then, that special chemical substances are produced in the interstitial portion of the sex-glands; these are then taken up in the blood stream and cause particular parts of the central nervous system to be charged with sexual tension. (We are already familiar with the fact that other toxic substances, introduced into the body from outside, can bring about a similar transformation of a toxic condition into a stimulus acting on a particular organ.) The question of how sexual excitation arises from the stimulation of erotogenic zones, when the central apparatus has been previously charged, and the question of what interplay arises in the course of these sexual processes between the effects of purely toxic stimuli and of physiological ones - none of this can be treated, even hypothetically, in the present state of our knowledge. It must suffice us to hold firmly to what is essential in this view of the sexual processes: the assumption that substances of a peculiar kind arise from the sexual metabolism. For this apparently arbitrary supposition is supported by a fact which has received little attention but deserves the closest consideration. The neuroses, which can be derived only from disturbances of sexual life, show the greatest clinical similarity to the phenomena of intoxication and abstinence that arise from the habitual use of toxic, pleasure-producing substances (alkaloids).

[1905d, 1530]

The conceptual scaffolding which we have set up to help us in dealing with the psychical manifestations of sexual life tallies well with these hypotheses as to the chemical basis of sexual excitation. We have defined the concept of libido as a quantitatively variable force which could serve as a measure of processes and transformations occurring in the field of sexual excitation. We distinguish this libido in respect of its special origin from the energy which must be supposed to underlie mental processes in general, and we thus also attribute a qualitative character to it. In thus distinguishing between libidinal and other forms of psychical energy we are giving expression to the presumption that the sexual processes occurring in the organism are distinguished from the nutritive processes by a special chemistry. The analysis of the perversions and psychoneuroses has shown us that this sexual excitation is derived not from the so-called sexual parts alone, but from all the bodily organs. We thus reach the idea of a quantity of libido, to the mental representation of which we give the name of 'ego-libido', and whose production, increase or diminution, distribution and displacement should afford us possibilities for explaining the psychosexual phenomena observed.

[1905d, 1531]
For the present, therefore, no further development of the libido theory is possible, except upon speculative lines. It would, however, be sacrificing all that we have gained hitherto from psychoanalytic observation, if we were to follow the example of C. G. Jung and water down the meaning of the concept of libido itself by equating it with psychical instinctual force in general. The distinguishing of the sexual instinctual impulses from the rest and the consequent restriction of the concept of libido to the former receives strong support from the assumption which I have already discussed that there is a special chemistry of the sexual function.

The unsatisfactory conclusion, however, that emerges from these investigations of the disturbances of sexual life is that we know far too little of the biological processes constituting the essence of sexuality to be able to construct from our fragmentary information a theory adequate to the understanding alike of normal and of pathological conditions.

We have been led on imperceptibly from the question of the causation of the psychoneuroses to the problem of their essential nature. If we are prepared to take into account what has been learnt from psycho-analysis, we can only say that the essence of these illnesses lies in disturbances of the sexual processes, the processes which determine in the organism the formation and utilization of sexual libido. It is scarcely possible to avoid picturing these processes as being in the last resort of a chemical nature; so that in what are termed the 'actual' neuroses we may recognize the somatic effects of disturbances of the sexual metabolism, and in the psychoneuroses the psychical effects of those disturbances as well. The similarity of the neuroses to the phenomena of intoxication and abstinence after the use of certain alkaloids, as well as to Graves' disease and Addison's disease, is forced upon our notice clinically. And just as these last two illnesses should no longer be described as 'nervous diseases', so also the 'neuroses' proper, in spite of their name, may soon have to be excluded from that category as well.

In the total absence of any theory of the instincts which would help us to find our bearings, we may be permitted, or rather, it is incumbent upon us, to start off by working out some hypothesis to its logical conclusion, until it either breaks down or is confirmed. There are various points in favour of the hypothesis of there having been from the first a separation between sexual instincts and others, ego-instincts, besides the serviceability of such a hypothesis in the analysis of the transference neuroses. I admit that this latter consideration alone would not be unambiguous, for it might be a question of an indifferent psychical energy which only becomes libido through the act of cathecting an object. But, in the first place, the distinction made in this concept corresponds to the common, popular distinction between hunger and love. In the second place, there are biological considerations in its favour. The individual does actually carry on a twofold existence: one to serve his own purposes and the other as a link in a chain, which he serves against his will, or at least involuntarily. The individual himself regards sexuality as one of his own ends; whereas from another point of view he is an appendage to his germ plasm, at whose disposal he puts his energies in return for a bonus of pleasure. He is the mortal vehicle of a (possibly) immortal substance - like the inheritor of an entailed property, who is only the temporary holder of an estate which survives him. The separation of the sexual instincts from the ego-instincts would simply reflect this twofold function of the individual. Thirdly, we must recollect that all our provisional ideas in psychology will presumably some day be based on an organic substructure. This makes it probable that it is special substances and chemical processes which perform the operations of sexuality and provide for the extension of individual life into that of the species. We are taking this probability into account in replacing the special chemical substances by special psychical forces.
By the source [Quelle] of an instinct is meant the somatic process which occurs in an organ or part of the body and whose stimulus is represented in mental life by an instinct. We do not know whether this process is invariably of a chemical nature or whether it may also correspond to the release of other, e.g. mechanical, forces. The study of the sources of instincts lies outside the scope of psychology. Although instincts are wholly determined by their origin in a somatic source, in mental life we know them only by their aims. An exact knowledge of the sources of an instinct is not invariably necessary for purposes of psychological investigation; sometimes its source may be inferred from its aim.

[1915c, 2961]

I am altogether doubtful whether any decisive pointers for the differentiation and classification of the instincts can be arrived at on the basis of working over the psychological material. This working-over seems rather itself to call for the application to the material of definite assumptions concerning instinctual life, and it would be a desirable thing if those assumptions could be taken from some other branch of knowledge and carried over to psychology. The contribution which biology has to make here certainly does not run counter to the distinction between sexual and ego-instincts. Biology teaches that sexuality is not to be put on a par with other functions of the individual; for its purposes go beyond the individual and have as their content the production of new individuals - that is, the preservation of the species. It shows, further, that two views, seemingly equally well-founded, may be taken of the relation between the ego and sexuality. On the one view, the individual is the principal thing, sexuality is one of its activities and sexual satisfaction one of its needs; while on the other view the individual is a temporary and transient appendage to the quasi-immortal germ-plasm, which is entrusted to him by the process of generation. The hypothesis that the sexual function differs from other bodily processes in virtue of a special chemistry is, I understand, also a postulate of the Ehrlich school of biological research.

[1915c, 2962]

It is not the case that the perversions alone would have obliged us to make the change in the concept of sexuality which has brought such violent contradictions down on us. The study of infantile sexuality had even more to do with it and it was the concurrence of the two which was decisive for us. But the manifestations of infantile sexuality, however unmistakable they may be in later childhood, seem to melt into indefiniteness towards their beginnings. Anyone who chooses to disregard the history of their development and their analytic context will deny that they are of a sexual character and will attribute some undifferentiated character to them instead. You must not forget that at the moment we are not in possession of any generally recognized criterion of the sexual nature of a process, apart, once again, from a connection with the reproductive function which we must reject as being too narrow-minded. The biological criteria, such as the periodicities of twenty-three and twenty-eight days postulated by Wilhelm Fliess, are still highly debatable; the chemical characteristics of the sexual process, which we may suspect, are still awaiting discovery. On the other hand, the sexual perversions of adults are something tangible and unambiguous. As is already shown by the name by which they are universally known, they are unquestionably sexual. Whether they are described as indications of degeneracy or in any other way, no one has yet had the courage to class them as anything but phenomena of sexual life. On their account alone we are justified in asserting that sexuality and reproduction do not coincide, for it is obvious that all of them disavow the aim of reproduction.

[1916-1917, 3389]
Clinical medicine has given us a valuable pointer towards an interpretation of these disturbances, and one that has been taken into account by various enquirers. The 'actual' neuroses, in the details of their symptoms and also in their characteristic of influencing every organic system and every function, exhibit an unmistakable resemblance to the pathological states which arise from the chronic influence of external toxic substances and from a sudden withdrawal of them - to intoxications and conditions of abstinence. The two groups of disorders are brought together still more closely by intermediate conditions such as Grave's disease which we have learnt to recognize as equally due to the operation of toxic substances, but of toxins which are not introduced into the body from outside but originate in the subject's own metabolism. In view of these analogies, we cannot, I think, avoid regarding the neuroses as results of disturbances in the sexual metabolism, whether because more of these sexual toxins is produced than the subject can deal with, or whether because internal and even psychical conditions restrict the proper employment of these substances. The popular mind has from time immemorial paid homage to hypotheses of this kind on the nature of sexual desire, speaking of love as an 'intoxication' and believing that falling in love is brought about by love philtres - though here the operative agent is to some extent externalized. And for us this would be an occasion for recalling the erotogenic zones and our assertion that sexual excitation can be generated in the most various organs. But for the rest the phrase 'sexual metabolism' or 'chemistry of sexuality' is a term without content; we know nothing about it and cannot even decide whether we are to assume two sexual substances, which would then be named 'male' and 'female', or whether we could be satisfied with one sexual toxin which we should have to recognize as the vehicle of all the stimulant effects of the libido. The theoretical structure of psycho-analysis that we have created is in truth a superstructure, which will one day have to be set upon its organic foundation. But we are still ignorant of this.

[1916-1917, 3439]

In my opinion, therefore, the question of how we are to carry the undoubtedly justifiable separation between the sexual and self-preservative instincts is not of much importance for psycho-analysis. Nor is psycho-analysis competent to answer the question. Biology, however, offers a number of suggestive possibilities which speak in favour of the distinction having some importance. Sexuality is, indeed, the single function of the living organism which extends beyond the individual and is concerned with his relation to the species. It is an unmistakable fact that it does not always, like the individual organism's other functions, bring it advantages, but, in return for an unusually high degree of pleasure, brings dangers which threaten the individual's life and often enough destroy it. It is probable, too, that quite special metabolic processes are necessary, differing from all others, in order to maintain a portion of the individual life as a disposition for its descendants. And finally, the individual organism, which regards itself as the main thing and its sexuality as a means, like any other, for its own satisfaction, is from the point of view of biology only an episode in a succession of generations, a short-lived appendage to a germ-plasm endowed with virtual immortality - like the temporary holder of an entail which will outlast him.

[1916-1917, 3459]

On this view, a special physiological process (of anabolism of catabolism) would be associated with each of the two classes of instincts; both kinds of instinct would be active in every particle of living substance, though in unequal proportions, so that some one substance might be the principal representative of Eros.

[1923b, 3975]
I was thus led into regarding the neuroses as being without exception disturbances of the sexual function, the so-called 'actual neuroses' being the direct toxic expression of such disturbances and the psychoneuroses their mental expression. My medical conscience felt pleased at my having arrived at this conclusion. I hoped that I had filled up a gap in medical science, which, in dealing with a function of such great biological importance, had failed to take into account any injuries beyond those caused by infection or by gross anatomical lesions. The medical aspect of the matter was, moreover, supported by the fact that sexuality was not something purely mental. It had a somatic side as well, and it was possible to assign special chemical processes to it and to attribute sexual excitation to the presence of some particular, though at present unknown, substances. There must also have been some good reason why the true spontaneous neuroses resembled no group of diseases more closely than the phenomena of intoxication and abstinence, which are produced by the administration or privation of certain toxic substances, or than exophthalmic goitre, which is known to depend upon the product of the thyroid gland.

[1925d, 4203]

To take the second point first. It is unnecessary here to reproduce the whole pathology of epilepsy, for it would throw no decisive light on the problem. But this may be said. The old morbus sacer is still in evidence as an ostensible clinical entity, the uncanny disease with its incalculable, apparently unprovoked convulsive attacks, its changing of the character into irritability and aggressiveness, and its progressive lowering of all the mental faculties. But the outlines of this picture are quite lacking in precision. The attacks, so savage in their onset, accompanied by biting of the tongue and incontinence of urine and working up to the dangerous status epilepticus with its risk of severe self-injuries, may, nevertheless, be reduced to brief periods of absence, or rapidly passing fits of vertigo or may be replaced by short spaces of time during which the patient does something out of character, as though he were under the control of his unconscious. These attacks, though as a rule determined, in a way we do not understand, by purely physical causes, may nevertheless owe their first appearance to some purely mental cause (a fright, for instance) or may react in other respects to mental excitations. However characteristic intellectual impairment may be in the overwhelming majority of cases, at least one case is known to us (that of Helmholtz) in which the affliction did not interfere with the highest intellectual achievement. (Other cases of which the same assertion has been made are either disputable or open to the same doubts as the case of Dostoevsky himself.) People who are victims of epilepsy may give an impression of dullness and arrested development just as the disease often accompanies the most palpable idiocy and the grossest cerebral defects, even though not as a necessary component of the clinical picture. But these attacks, with all their variations, also occur in other people who display complete mental development and, if anything, an excessive and as a rule insufficiently controlled emotional life. It is no wonder in these circumstances that it has been found impossible to maintain that 'epilepsy' is a single clinical entity. The similarity that we find in the manifest symptoms seems to call for a functional view of them. It is as though a mechanism for abnormal instinctual discharge had been laid down organically, which could be made use of in quite different circumstances - both in the case of disturbances of cerebral activity due to severe histolytic or toxic affections, and also in the case of inadequate control over the mental economy and at times when the activity of the energy operating in the mind reaches crisis-pitch. Behind this dichotomy we have a glimpse of the identity of the underlying mechanism of instinctual discharge. Nor can that mechanism stand remote from the sexual processes, which are fundamentally of toxic origin: the earliest physicians described coition as a minor epilepsy, and thus recognized in the sexual act a mitigation and adaptation of the epileptic method of discharging stimuli.

[1928b, 4556]
Biological factors subsequently deflect those libidinal forces from their original aims and conduct even active and in every sense masculine trends into feminine channels. Since we cannot dismiss the notion that sexual excitation is derived from the operation of certain chemical substances, it seems plausible at first to expect that biochemistry will one day disclose a substance to us whose presence produces a male sexual excitation and another substance which produces a female one. But this hope seems no less naïve than the other one - happily obsolete to-day - that it may be possible under the microscope to isolate the different exciting factors of hysteria, obsessional neurosis, melancholia, and so on.
[1931b, 4604]

Even in sexual chemistry things must be rather more complicated. For psychology, however, it is a matter of indifference whether there is a single sexually exciting substance in the body or two or countless numbers of them. Psycho-analysis teaches us to manage with a single libido, which, it is true, has both active and passive aims (that is, modes of satisfaction). This antithesis and, above all, the existence of libidinal trends with passive aims, contains within itself the remainder of our problem.
[1931b, 4604]
VARIETIES OF SEXUAL CONSTITUTION  

(a) Just as we saw previously that it was possible to derive a multiplicity of innate sexual constitutions from variety in the development of the erotogenic zones, so we can now make a similar attempt by including the indirect sources of sexual excitation. It may be assumed that, although contributions are made from these sources in the case of everyone, they are not in all cases of equal strength, and that further help towards the differentiation of sexual constitutions may be found in the varying development of the individual sources of sexual excitation.¹

[1905d, 1523]

A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hysterics - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erotogenic zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons.¹ Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotogenic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two. [1909b, 2093]

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarry, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations. [1926f, 4405]
We can follow the object-libido through still further vicissitudes. When it is withdrawn from objects, it is held in suspense in peculiar conditions of tension and is finally drawn back into the ego, so that it becomes ego-libido once again. In contrast to object-libido, we also describe ego-libido as 'narcissistic' libido. From the vantage-point of psycho-analysis we can look across a frontier, which we may not pass, at the activities of narcissistic libido, and may form some idea of the relation between it and object-libido.¹ Narcissistic or ego-libido seems to be the great reservoir from which the object-cathexes are sent out and into which they are withdrawn once more; the narcissistic libidinal cathexis of the ego is the original state of things, realized in earliest childhood, and is merely covered by the later extrusions of libido, but in essentials persists behind them.
[1905d, 1532]

Although we are not yet in a position to describe with sufficient accuracy the characteristics of this narcissistic stage, at which the hitherto dissociated sexual instincts come together into a single unity and cathect the ego as an object, we suspect already that this narcissistic organization is never wholly abandoned. A human being remains to some extent narcissistic even after he has found external objects for his libido. The cathexes of objects which he effects are as it were emanations of the libido that still remains in his ego and can be drawn back into it once more. The state of being in love, which is psychologically so remarkable and is the normal prototype of the psychoses, shows these emanations at their maximum compared to the level of self-love.
[1912-1913, 2732]

Hitherto it has been a premiss of our work that we can distinguish the ego-instincts from the sexual ones by their manifestations. With the transference neuroses this could be done without difficulty. We termed the cathexes of energy which the ego directs towards the objects of its sexual desires 'libido'; all the others, which are sent out by the self-preservative instincts, we termed 'interest'. By tracing the course of the libidinal cathexes, their transformations and final vicissitudes, we were able to obtain a first insight into the machinery of the mental forces. For this purpose the transference neuroses offered us the most favourable material. But the ego, its composition out of various organizations and their construction and mode of functioning, remained hidden from us; and we were driven to suspect that only the analysis of other neurotic disorders would be able to bring us the necessary insight.
[1916-1917, 3460]

To put the matter shortly, we pictured the relation of ego-libido to object-libido in a way which I can make plain to you by an analogy from zoology. Think of those simplest of living organisms which consist of a little-differentiated globule of protoplasmic substance. They put out protrusions, known as pseudopodia, into which they cause the substance of their body to flow over. They are able, however, to withdraw the protrusions once more and form themselves again into a globule. We compare the putting-out of these protrusions, then, to the emission of libido on to objects while the main mass of libido can remain in the ego; and we suppose that in normal circumstances ego-libido can be transformed unhindered into object-libido and that this can once more be taken back into the ego.
[1916-1917, 3461]
During the work of treatment we have to consider the distribution of the patient's libido; we look for the object presentations to which it is bound and free it from them, so as to place it at the disposal of the ego. In the course of this, we have come to form a very curious picture of the original, primal distribution of libido in human beings. We have been driven to assume that at the beginning of the development of the individual all his libido (all his erotic tendencies, all his capacity for love) is tied to himself - that as we say, it cathects his own ego. It is only later that, being attached to the satisfaction of the major vital needs, the libido flows over from the ego on to external objects. Not till then are we able to recognize the libidinal instincts as such and distinguish them from the ego instincts. It is possible for the libido to become detached from these objects and withdrawn again into the ego.

Thus in our view the individual advances from narcissism to object-love. But we do not believe that the whole of the libido ever passes over from the ego to objects. A certain quantity of libido is always retained in the ego; even when object-love is highly developed, a certain amount of narcissism persists. The ego is a great reservoir from which the libido that is destined for objects flows out and into which it flows back from those objects. Object-libido was at first ego-libido and can be transformed back into ego-libido. For complete health it is essential that the libido should not lose this full mobility. As an illustration of this state of things we may think of an amoeba, whose viscous substance puts out pseudopodia, elongations into which the substance of the body extends but which can be retracted at any time so that the form of the protoplasmic mass is restored.

The next step was taken when psycho-analysis felt its way closer towards the psychological ego, which it had first come to know only as a repressive, censoring agency, capable of erecting protective structures and reactive formations. Critical and far-seeing minds had, it is true, long since objected to the concept of libido being restricted to the energy of the sexual instincts directed towards an object. But they failed to explain how they had arrived at their better knowledge or to derive from it anything of which analysis could make use. Advancing more cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the object and directed on to the ego (the process of introversion); and, by studying the libidinal development of children in its earliest phases, came to the conclusion that the ego is the true and original reservoir of libido, and that it is only from that reservoir that libido is extended on to objects. The ego now found its position among sexual objects and was at once given the foremost place among them. Libido which was in this way lodged in the ego was described as 'narcissistic'.¹ This narcissistic libido was of course also a manifestation of the force of the sexual instinct in the analytical sense of those words, and it had necessarily to be identified with the 'self-preservative instincts' whose existence had been recognized from the first. Thus the original opposition between the ego-instincts and the sexual instincts proved to be inadequate. A portion of the ego-instincts was seen to be libidinal; sexual instincts - probably alongside others - operated in the ego. Nevertheless we are justified in saying that the old formula which lays it down that psychoneuroses are based on a conflict between ego-instincts and sexual instincts contains nothing that we need reject to-day. It is merely that the distinction between the two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now be characterized differently - namely as being topographical. And in particular it is still true that the transference neuroses, the essential subject of psycho-analytic study, are the result of a conflict between the ego and the libidinal cathexis of objects.

¹ A portion of the libido is always retained in the ego; even when object-love is highly developed, a certain amount of narcissism persists. The ego is a great reservoir from which the libido that is destined for objects flows out and into which it flows back from those objects. Object-libido was at first ego-libido and can be transformed back into ego-libido. For complete health it is essential that the libido should not lose this full mobility. As an illustration of this state of things we may think of an amoeba, whose viscous substance puts out pseudopodia, elongations into which the substance of the body extends but which can be retracted at any time so that the form of the protoplasmic mass is restored.

² The next step was taken when psycho-analysis felt its way closer towards the psychological ego, which it had first come to know only as a repressive, censoring agency, capable of erecting protective structures and reactive formations. Critical and far-seeing minds had, it is true, long since objected to the concept of libido being restricted to the energy of the sexual instincts directed towards an object. But they failed to explain how they had arrived at their better knowledge or to derive from it anything of which analysis could make use. Advancing more cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the object and directed on to the ego (the process of introversion); and, by studying the libidinal development of children in its earliest phases, came to the conclusion that the ego is the true and original reservoir of libido, and that it is only from that reservoir that libido is extended on to objects. The ego now found its position among sexual objects and was at once given the foremost place among them. Libido which was in this way lodged in the ego was described as 'narcissistic'.¹ This narcissistic libido was of course also a manifestation of the force of the sexual instinct in the analytical sense of those words, and it had necessarily to be identified with the 'self-preservative instincts' whose existence had been recognized from the first. Thus the original opposition between the ego-instincts and the sexual instincts proved to be inadequate. A portion of the ego-instincts was seen to be libidinal; sexual instincts - probably alongside others - operated in the ego. Nevertheless we are justified in saying that the old formula which lays it down that psychoneuroses are based on a conflict between ego-instincts and sexual instincts contains nothing that we need reject to-day. It is merely that the distinction between the two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now be characterized differently - namely as being topographical. And in particular it is still true that the transference neuroses, the essential subject of psycho-analytic study, are the result of a conflict between the ego and the libidinal cathexis of objects.
Narcissism. - The most important theoretical advance has certainly been the application of the libido theory to the repressing ego. The ego itself came to be regarded as a reservoir of what was described as narcissistic libido, from which the libidinal cathexes of objects flowed out and into which they could be once more withdrawn. By the help of this conception it became possible to embark upon the analysis of the ego and to make a clinical distinction of the psychoneuroses into transference neuroses and narcissistic disorders. In the former (hysteria and obsessional neurosis) the subject has at his disposal a quantity of libido striving to be transferred on to extraneous objects, and use is made of this in carrying out analytic treatment; on the other hand, the narcissistic disorders (dementia praecox, paranoia, melancholia) are characterized by a withdrawal of the libido from objects and they are therefore scarcely accessible to analytic therapy. But their therapeutic inaccessibility has not prevented analysis from making the most fruitful beginnings in the deeper study of these illnesses, which are counted among the psychoses.

[1923a, 3925]

Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject's own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservative instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego.

[1923a, 3933]

¹ Now that we have distinguished between the ego and the id, we must recognize the id as the great reservoir of libido indicated in my paper on narcissism (1914c). The libido which flows into the ego owing to the identifications described above brings about its 'secondary narcissism'.

[1923b, 3964]

This would seem to imply an important amplification of the theory of narcissism. At the very beginning, all the libido is accumulated in the id, while the ego is still in process of formation or is still feeble. The id sends part of this libido out into erotic object-cathexes, whereupon the ego, now grown stronger, tries to get hold of this object-libido and to force itself on the id as a love-object. The narcissism of the ego is thus a secondary one, which has been withdrawn from objects.

[1923b, 3980]
In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called narcissism or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object-cathexes are sent out and into which the libido can stream back again from the objects. Thus narcissistic libido is constantly being transformed into object-libido, and vice versa. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had only been paid to what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the instincts of self-preservation operating in the ego (the 'ego-instincts') and that it was brought to bear upon the libidinal instincts. But since the instincts of self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object-libido, the interest of self-preservation was defending itself against the demands of object-love, and therefore against the demands of sexuality in the narrower sense as well.
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken inBeyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their præmaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]

It is hard to say anything of the behaviour of the libido in the id and in the super-ego. All that we know about it relates to the ego, in which at first the whole available quota of libido is stored up. We call this state absolute, primary narcissism. It lasts till the ego begins to cathect the ideas of objects with libido, to transform narcissistic libido into object-libido. Throughout the whole of life the ego remains the great reservoir from which libidinal cathexes are sent out to objects and into which they are also once more withdrawn, just as an amoeba behaves with its pseudopodia. It is only when a person is completely in love that the main quota of libido is transferred on to the object and the object to some extent takes the place of the ego. A characteristic of the libido which is important in life is its mobility, the facility with which it passes from one object to another. This must be contrasted with the fixation of the libido to particular objects, which often persists throughout life.

[1940a [1938], 4961]
The next step was taken when psycho-analysis felt its way closer towards the psychological ego, which it had first come to know only as a repressive, censoring agency, capable of erecting protective structures and reactive formations. Critical and far-seeing minds had, it is true, long since objected to the concept of libido being restricted to the energy of the sexual instincts directed towards an object. But they failed to explain how they had arrived at their better knowledge or to derive from it anything of which analysis could make use. Advancing more cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the object and directed on to the ego (the process of introversion); and, by studying the libidinal development of children in its earliest phases, came to the conclusion that the ego is the true and original reservoir of libido, and that it is only from that reservoir that libido is extended on to objects. The ego now found its position among sexual objects and was at once given the foremost place among them. Libido which was in this way lodged in the ego was described as 'narcissistic'.¹ This narcissistic libido was of course also a manifestation of the force of the sexual instinct in the analytical sense of those words, and it had necessarily to be identified with the 'self-preservative instincts' whose existence had been recognized from the first. Thus the original opposition between the ego-instincts and the sexual instincts proved to be inadequate. A portion of the ego-instincts was seen to be libidinal; sexual instincts - probably alongside others - operated in the ego. Nevertheless we are justified in saying that the old formula which lays it down that psychoneuroses are based on a conflict between ego-instincts and sexual instincts contains nothing that we need reject to-day. It is merely that the distinction between the two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now be characterized differently - namely as being topographical. And in particular it is still true that the transference neuroses, the essential subject of psycho-analytic study, are the result of a conflict between the ego and the libidinal cathexis of objects.

[1920g, 3753]

But it is all the more necessary for us to lay stress upon the libidinal character of the self-preservation instincts now that we are venturing upon the further step of recognizing the sexual instinct as Eros, the preserver of all things, and of deriving the narcissistic libido of the ego from the stores of libido by means of which the cells of the soma are attached to one another. But we now find ourselves suddenly faced by another question. If the self-preservation instincts too are of a libidinal nature, are there perhaps no other instincts whatever but the libidinal ones? At all events there are none other visible. But in that case we shall after all be driven to agree with the critics who suspected from the first that psycho-analysis explains everything by sexuality, or with innovators like Jung who, making a hasty judgement, have used the word 'libido' to mean instinctual force in general. Must not this be so?

[1920g, 3753]
It was not our intention at all events to produce such a result. Our argument had as its point of departure a sharp distinction between ego-instincts, which we equated with death instincts, and sexual instincts, which we equated with life instincts. (We were prepared at one stage to include the so-called self-preservation instincts of the ego among the death instincts; but we subsequently corrected ourselves on this point and withdrew it.) Our views have from the very first been dualistic, and to-day they are even more definitely dualistic than before - now that we describe the opposition as being, not between ego-instincts and sexual instincts but between life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us otherwise. We suspect that instincts other than those of self-preservation operate in the ego, and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-instincts which are still strange to us. Even before we had any clear understanding of narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components attached to them. But these are very uncertain possibilities, to which our opponents will pay very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to point to any instincts other than the libidinal ones. That, however, is no reason for our falling in with the conclusion that no others in fact exist.

¹ I will add a few words to clarify our terminology, which has undergone some development in the course of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and to the reproductive function. We retained this name after we had been obliged by the findings of psycho-analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into Eros, which seeks to force together and hold together the portions of living substance. What are commonly called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance. These speculations seek to solve the riddle of life by supposing that these two instincts were struggling with each other from the very first. It is not so easy, perhaps, to follow the transformations though which the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its object. These narcissistic self-preservation instincts had thenceforward to be counted among the libidinal sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our speculations have transformed this opposition into one between the life instincts (Eros) and the death instincts.
Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject's own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservative instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego. [1923a, 3933]

Apparent Approach to Jung's Views. - It thus seemed on the face of it as though the slow process of psycho-analytic research was following in the steps of Jung's speculation about a primal libido, especially because the transformation of object-libido into narcissism necessarily carried along with it a certain degree of desexualization, or abandonment of the specifically sexual aims. Nevertheless, it has to be borne in mind that the fact that the self-preservative instincts of the ego are recognized as libidinal does not necessarily prove that there are no other instincts operating in the ego. [1923a, 3933]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically. [1923b, 3974]
In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called narcissism or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object-cathexes are sent out and into which the libido can stream back again from the objects. Thus narcissistic libido is constantly being transformed into object-libido, and vice versa. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had only been paid to what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the instincts of self-preservation operating in the ego (the 'ego-instincts') and that it was brought to bear upon the libidinal instincts. But since the instincts of self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object-libido, the interest of self-preservation was defending itself against the demands of object-love, and therefore against the demands of sexuality in the narrower sense as well.

There is no more urgent need in psychology than for a securely founded theory of the instincts on which it might then be possible to build further. Nothing of the sort exists, however, and psycho-analysis is driven to making tentative efforts towards some such theory. It began by drawing a contrast between the ego-instincts (the instinct of self-preservation, hunger) and the libidinal instincts (love), but later replaced it by a new contrast between narcissistic and object-libido. This was clearly not the last word on the subject; biological considerations seemed to make it impossible to remain content with assuming the existence of only a single class of instincts.

In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulse towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.
If anxiety is a reaction of the ego to danger, we shall be tempted to regard the traumatic neuroses, which so often follow upon a narrow escape from death, as a direct result of a fear of death (or fear for life) and to dismiss from our minds the question of castration and the dependent relationships of the ego. Most of those who observed the traumatic neuroses that occurred during the last war took this line, and triumphantly announced that proof was now forthcoming that a threat to the instinct of self-preservation could by itself produce a neurosis without any admixture of sexual factors and without requiring any of the complicated hypotheses of psycho-analysis. It is in fact greatly to be regretted that not a single analysis of a traumatic neurosis of any value is extant. And it is to be regretted, not because such an analysis would contradict the aetiological importance of sexuality - for any such contradiction has long since been disposed of by the introduction of the concept of narcissism, which brings the libidinal cathectic of the ego into line with the cathexes of objects and emphasizes the libidinal character of the instinct of self-preservation - but because, in the absence of any analyses of this kind, we have lost a most precious opportunity of drawing decisive conclusions about the relations between anxiety and the formation of symptoms. In view of all that we know about the structure of the comparatively simple neuroses of everyday life, it would seem highly improbable that a neurosis could come into being merely because of the objective presence of danger, without any participation of the deeper levels of the mental apparatus. But the unconscious seems to contain nothing that could give any content to our concept of the annihilation of life. Castration can be pictured on the basis of the daily experience of the faeces being separated from the body or on the basis of losing the mother's breast at weaning. But nothing resembling death can ever have been experienced; or if it has, as in fainting, it has left no observable traces behind. I am therefore inclined to adhere to the view that the fear of death should be regarded as analogous to the fear of castration and that the situation to which the ego is reacting is one of being abandoned by the protecting super-ego - the powers of destiny - so that it has no longer any safeguard against all the dangers that surround it. In addition, it must be remembered that in the experiences which lead to a traumatic neurosis the protective shield against external stimuli is broken through and excessive amounts of excitation impinge upon the mental apparatus; so that we have here a second possibility - that anxiety is not only being signalled as an affect but is also being freshly created out of the economic conditions of the situation.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

[1926d, 4286]

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
It is now time, however, for me to go back both in history and in my subject-matter and once more to take up the most general problems of instinctual life. To begin with, the opposition between the ego-instincts and the sexual instincts lay at the base of our libido theory. When later on we began to study the ego itself more closely and arrived at the conception of narcissism, this distinction itself lost its foundation. In rare cases one can observe that the ego has taken itself as an object and is behaving as though it were in love with itself. Hence the term 'narcissism', borrowed from the Greek myth. But that is only an extreme exaggeration of a normal state of affairs. We came to understand that the ego is always the main reservoir of libido, from which libidinal cathexes of objects go out and into which they return again, while the major part of this libido remains permanently in the ego. Thus ego-libido is being constantly changed into object-libido and object-libido into ego-libido. But in that case they could not be different in their nature and it could have no sense to distinguish the energy of the one from the energy of the other; we could either drop the term 'libido' or use it as synonymous with psychical energy in general.

[1933a, 4706]

The forces which we assume to exist behind the tensions caused by the needs of the id are called instincts. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitancies and vacillations we have decided to assume the existence of only two basic instincts, Eros and the destructive instinct. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the death instinct. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards reunion.'

[1940a [1938], 4959]
I will add a few words to clarify our terminology, which has undergone some development in the course of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and to the reproductive function. We retained this name after we had been obliged by the findings of psycho-analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into Eros, which seeks to force together and hold together the portions of living substance. What are commonly called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance. These speculations seek to solve the riddle of life by supposing that these two instincts were struggling with each other from the very first. It is not so easy, perhaps, to follow the transformations though which the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its object. These narcissistic self-preservative instincts had thenceforward to be counted among the libidinal sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our speculations have transformed this opposition into one between the life instincts (Eros) and the death instincts.

Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject's own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservative instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego.

[1920g, 3760]

[1923a, 3933]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
Apparent Approach to Jung’s Views. - It thus seemed on the face of it as though the slow process of psycho-analytic research was following in the steps of Jung’s speculation about a primal libido, especially because the transformation of object-libido into narcissism necessarily carried along with it a certain degree of desexualization, or abandonment of the specifically sexual aims. Nevertheless, it has to be borne in mind that the fact that the self-preservative instincts of the ego are recognized as libidinal does not necessarily prove that there are no other instincts operating in the ego.

[1923a, 3933]

The transformation of object-libido into narcissistic libido which thus takes place obviously implies an abandonment of sexual aims, a desexualization - a kind of sublimation, therefore. Indeed, the question arises, and deserves careful consideration, whether this is not the universal road to sublimation, whether all sublimation does not take place though the mediation of the ego, which begins by changing sexual object-libido into narcissistic libido and then, perhaps, goes on to give it another aim.¹ We shall later on have to consider whether other instinctual vicissitudes may not also result from this transformation, whether, for instance, it may not bring about a defusion of the various instincts that are fused together.

[1923b, 3964]

¹ Now that we have distinguished between the ego and the id, we must recognize the id as the great reservoir of libido indicated in my paper on narcissism (1914c). The libido which flows into the ego owing to the identifications described above brings about its ‘secondary narcissism’.

[1923b, 3964]

In the present discussion, moreover, I am only putting forward a hypothesis; I have no proof to offer. It seems a plausible view that this displaceable and neutral energy, which is no doubt active in both in the ego and in the id, proceeds from the narcissistic store of libido - that it is desexualized Eros. (The erotic instincts appear to be altogether more plastic, more readily diverted and displaced than the destructive instincts.) From this we can easily go on to assume that this displaceable libido is employed in the service of the pleasure principle to obviate blockages and to facilitate discharge. In this connection it is easy to observe a certain indifference as to the path along which the discharge takes place, so long as it takes place somehow. We know this trait; it is characteristic of the cathetic processes in the id. It is found in erotic cathexes, where a peculiar indifference in regard to the object displays itself; and it is especially evident in the transferences arising in analysis, which develop inevitably, irrespective of the persons who are their object. Not long ago Rank published some good examples of the way in which neurotic acts of revenge can be directed against the wrong people. Such behaviour on the part of the unconscious reminds one of the comic story of the three village tailors, one of whom had to be hanged because the only village blacksmith had committed a capital offence. Punishment must be exacted even if it does not fall upon the guilty. It was in studying the dream-work that we first came upon this kind of looseness in the displacements brought about by the primary process. In that case it was the objects that were thus relegated to a position of no more than secondary importance, just as in the case we are now discussing it is the paths of discharge. It would be characteristic of the ego to be more particular about the choice both of an object and of a path of discharge.

[1923b, 3979]
Here we arrive again at the possibility which has already been discussed that sublimation may take place regularly, through the mediation of the ego. The other case will be recollected, in which the ego deals with the first object-cathexes of the id (and certainly with later ones too) by taking over the libido from them into itself and binding it to the alteration of the ego produced by means of identification. The transformation into ego-libido of course involves an abandonment of sexual aims, a desexualization. In any case this throws light upon an important function of the ego in its relation to Eros. By thus getting hold of the libido from the object-cathexes, setting itself up as sole love-object, and desexualizing or sublimating the libido of the id, the ego is working in opposition to the purposes of Eros and placing itself at the service of the opposing instinctual impulses. It has to acquiesce in some of the other object-cathexes of the id; it has, so to speak, to participate in them. We shall come back later to another possible consequence of this activity of the ego.

I cannot go further in my consideration of these questions without introducing a fresh hypothesis. The super-ego arises, as we know, from an identification with the father taken as a model. Every such identification is in the nature of a desexualization or even of a sublimation. It now seems as though when a transformation of this kind takes place, an instinctual defusion occurs at the same time. After sublimation the erotic component no longer has the power to bind the whole of the destructiveness that was combined with it, and this is released in the form of an inclination to aggression and destruction. This defusion would be the source of the general character of harshness and cruelty exhibited by the ideal - its dictatorial 'Thou shalt'.

I have described elsewhere how this turning away takes place. The object-cathexes are given up and replaced by identifications. The authority of the father or the parents is introjected into the ego, and there it forms the nucleus of the super-ego, which takes over the severity of the father and perpetuates his prohibition against incest, and so secures the ego from the return of the libidinal object-cathexis. The libidinal trends belonging to the Oedipus complex are in part desexualized and sublimated (a thing which probably happens with every transformation into an identification) and in part inhibited in their aim and changed into impulses of affection. The whole process has, on the one hand, preserved the genital organ - has averted the danger of its loss - and, on the other, has paralysed it - has removed its function. This process ushers in the latency period, which now interrupts the child's sexual development.
In this secondary defensive struggle the ego presents two faces with contradictory expressions. The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization. It is based on the maintenance of free intercourse and of the possibility of reciprocal influence between all its parts. Its desexualized energy still shows traces of its origin in its impulsion to bind together and unify, and this necessity to synthesize grows stronger in proportion as the strength of the ego increases. It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and alien by using every possible method to bind them to itself in one way or another, and to incorporate them into its organization by means of those bonds. As we know, a tendency of this kind is already operative in the very act of forming a symptom. A classical instance of this are those hysterical symptoms which have been shown to be a compromise between the need for satisfaction and the need for punishment. Such symptoms participate in the ego from the very beginning, since they fulfil a requirement of the super-ego, while on the other hand they represent positions occupied by the repressed and points at which an irruption has been made by it into the ego-organization. They are a kind of frontier-station with a mixed garrison. (Whether all primary hysterical symptoms are constructed on these lines would be worth enquiring into very carefully.) The ego now proceeds to behave as though it recognized that the symptom had come to stay and that the only thing to do was to accept the situation in good part and draw as much advantage from it as possible. It makes an adaptation to the symptom - to this piece of the internal world which is alien to it - just as it normally does to the real external world. It can always find plenty of opportunities for doing so. The presence of a symptom may entail a certain impairment of capacity, and this can be exploited to appease some demand on the part of the super-ego or to refuse some claim from the external world. In this way the symptom gradually comes to be the representative of important interests; it is found to be useful in asserting the position of the self and becomes more and more closely merged with the ego and more and more indispensable to it. It is only very rarely that the physical process of 'healing' round a foreign body follows such a course as this. There is a danger, too, of exaggerating the importance of a secondary adaptation of this kind to a symptom, and of saying that the ego has created the symptom merely in order to enjoy its advantages. It would be equally true to say that a man who had lost his leg in the war had got it shot away so that he might thenceforward live on his pension without having to do any more work.

The objection to this view arose from our coming to regard the ego as the sole seat of anxiety. It was one of the results of the attempt at a structural division of the mental apparatus which I made in *The Ego and the Id*. Whereas the old view made it natural to suppose that anxiety arose from the libido belonging to the repressed instinctual impulses, the new one, on the contrary, made the ego the source of anxiety. Thus it is a question of instinctual (id-) anxiety or ego-anxiety. Since the energy which the ego employs is desexualized, the new view also tended to weaken the close connection between anxiety and libido. I hope I have at least succeeded in making the contradiction plain and in giving a clear idea of the point in doubt.
I will begin by repeating what emerged as the most superficial layer of her memories. The youngest of three daughters, she was tenderly attached to her parents and spent her youth on their estate in Hungary. Her mother's health was frequently troubled by an affection of the eyes as well as by nervous states. Thus it came about that she found herself drawn into especially intimate contact with her father, a vivacious man of the world, who used to say that this daughter of his took the place of a son and a friend with whom he could exchange thoughts. Although the girl's mind found intellectual stimulation from this relationship with her father, he did not fail to observe that her mental constitution was on that account departing from the ideal which people like to see realized in a girl. He jokingly, called her 'cheeky' and 'cock-sure', and warned her against being too positive in her judgements and against her habit of regardlessly telling people the truth, and he often said she would find it hard to get a husband. She was in fact greatly discontented with being a girl. She was full of ambitious plans. She wanted to study or to have a musical training, and she was indignant at the idea of having to sacrifice her inclinations and her freedom of judgement by marriage. As it was, she nourished herself on her pride in her father and in the prestige and social position of her family, and she jealously guarded everything that was bound up with these advantages. The unselfishness, however, with which she put her mother and elder sisters first, when an occasion arose, reconciled her parents completely to the harsher side of her character.

I shall refrain from describing more complicated instances of the sexual process in a similar way. I will only state that in essentials this formula is applicable to women as well, in spite of the confusion introduced into the problem by all the artificial retarding and stunting of the female sexual instinct. In women too we must postulate a somatic sexual excitation and a state in which this excitation becomes a psychical stimulus - libido - and provokes the urge to the specific action to which voluptuous feeling is attached. Where women are concerned, however, we are not in a position to say what the process analogous to the relaxation of tension of the seminal vesicles may be.

The aetiological conditions applying to women can be brought into the framework of my scheme with no greater difficulties than in the case of men. Virginal anxiety is a particularly clear example. For here the groups of ideas to which the somatic sexual excitation should become attached are not yet enough developed. In the newly-married woman who is anaesthetic, anxiety only appears if the first cohabitations arouse a sufficient amount of somatic excitation. When the local indications of such excitement (spontaneous sensations of stimulation, desire to micturate and so on) are lacking, anxiety is also absent. The case of ejaculatio praecox and of coitus interruptus can be explained on the same lines as in men, namely that the libidinal desire for the psychically unsatisfying act gradually disappears, while the excitation which has been aroused during the act is expended subcortically. The alienation between the somatic and the psychical sphere is established more readily and is more difficult to remove in women than in men. The cases of widowhood and of voluntary abstinence, and also that of the climacteric, are dealt with in the same way in both sexes; but where abstinence is concerned there is in the case of women no doubt the further matter of intentional repression of the sexual circle of ideas, to which an abstinent woman, in her struggle against temptation, must often make up her mind. The horror which, at the time of the menopause, an ageing woman feels at her unduly increased libido may act in a similar sense.
Nor is it true that patients put insuperable obstacles in the way of an investigation into their sexual life. After some slight hesitation, adults usually adjust themselves to the situation by saying: 'After all, I'm at the doctor's; I can say anything to him.' A great many women who find it difficult enough to go through life concealing their sexual feelings, are relieved to find that with the doctor no other consideration outweighs that of their recovery, and they are grateful to him that for once they are allowed to behave quite humanly about sexual things. A dim knowledge of the overwhelming importance of sexual factors in the production of neuroses (a knowledge which I am trying to capture afresh for science) seems never to have been lost in the consciousness of laymen. How often do we witness scenes like this: A married couple, one of whom is suffering from a neurosis, comes to us for consultation. After we have made a great many introductory remarks and apologies to the effect that no conventional barriers should exist between them and the doctor who wants to be of use in such cases, and so on, we tell them that we suspect that the cause of the illness lies in the unnatural and detrimental form of sexual intercourse which they must have chosen since the wife's last confinement. We tell them that doctors do not as a rule concern themselves with such matters, but that that is reprehensible of them, even though the patients do not want to be told about things like that, etc. Thereupon one of the couple nudges the other and says: 'You see! I told you all along it would make me ill.' And the other answers: 'Well, I know, I thought so too; but what is one to do?'

[1897b, 457]

In certain other circumstances, such as when one is dealing with young girls, who, after all, are systematically brought up to conceal their sexual life, one will have to be content with a very small measure of sincere response on the part of the patient. But an important consideration comes into play here namely that a doctor who is experienced in these things does not meet his patients unprepared and as a rule does not have to ask them for information but only for a confirmation of his surmises. Anyone who will follow my indications as to how to elucidate the morphology of the neuroses and translate it into aetiological terms, will need the addition of very few further admissions from his patients; in the very description of their symptoms, which they are only too ready to give, they have usually acquainted him at the same time with the sexual factors that are hidden behind.

[1897b, 458]

It is of quite particular interest, however, to observe the behaviour of small children up to the age of two or three or a little older towards their younger brothers and sisters. Here, for instance, was a child who had so far been the only one; and now he was told that the stork had brought a new baby. He looked the new arrival up and down and then declared decisively: 'The stork can take him away again!'¹ I am quite seriously of the opinion that a child can form a just estimate of the set-back he has to expect at the hands of the little stranger. A lady of my acquaintance, who is on very good terms to-day with a sister four years her junior, tells me that she greeted the news of her first arrival with this qualification: 'But all the same I shan't give her my red cap!' Even if a child only comes to realize the situation later on, his hostility will date from that moment. I know of a case in which a little girl of less than three tried to strangle an infant in its cradle because she felt that its continued presence boded her no good. Children at that time of life are capable of jealousy of any degree of intensity and obviousness. Again, if it should happen that the baby sister does in fact disappear after a short while, the elder child will find the whole affection of the household once more concentrated upon himself. If after that the stork should bring yet another baby, it seems only logical that the little favourite should nourish a wish that his new competitor may meet with the same fate as the earlier one, so that he himself may be as happy as he was originally and during the interval.² Normally, of course, this attitude of a child towards a younger brother or sister is a simple function of the difference between their ages. Where the gap in time is sufficiently long, an elder girl will already begin to feel the stirring of her maternal instincts towards the helpless new born baby.

[1900a, 730]
Between the scene in which her wish had been fulfilled and the time of the dream more than twenty-five years elapsed. In the meantime Frau B. had become the widow of a second husband who left her with a child and a fortune. The old lady's affection was still centred on Dr. K., who was now her adviser and the administrator of her estate and whom she saw frequently. Let us suppose that during the few days before the dream she had been expecting a visit from him, but that this had not taken place - he was no longer so pressing as he used to be. She may then have quite well had a nostalgic dream one night which took her back to the old days. Her dream was probably of a rendez-vous at the time of her love affair, and the chain of her dream-thoughts carried her back to the occasion when, without any pre-arrangement, he had come in at the very moment at which she had been longing for him. She probably had dreams of this kind quite often now; they were a part of the belated punishment with which a woman pays for her youthful cruelty. But such dreams - derivatives of a suppressed current of thought, filled with memories of rendez-vous of which, since her second marriage, she no longer liked to think - such dreams were put aside on waking. And that was what happened to our ostensibly prophetic dream. She then went out, and in the Kärntnerstrasse, at a spot which was in itself indifferent, she met her old family doctor, Dr. K. It was a very long time since she had seen him. He was intimately associated with the excitements of that happy-unhappy time. He too had been a helper, and we may suppose that he had been used in her thoughts, and perhaps in her dreams as well, as a screen figure behind which she concealed the better-loved figure of the other Dr. K. This meeting now revived her recollection of the dream. She must have thought: 'Yes, I had a dream last night of my rendez-vous with Dr. K.' But this recollection had to undergo the distortion which the dream escaped only because it had been completely forgotten. She inserted the indifferent K. (who had reminded her of the dream) in place of the beloved K. The content of the dream - the rendez-vous - was transferred to a belief that she had dreamt of that particular spot, for a rendez-vous consists in two people coming to the same spot at the same time. And if she then had an impression that a dream had been fulfilled, she was only giving effect in that way to her memory of the scene in which she had longed in her misery for him to come and her longing had at once been fulfilled.

[1900a, 1048]

¹ Women, with their subtler understanding of unconscious mental processes, are as a rule more apt to take offence when someone does not recognize them in the street and therefore fails to greet them, than to think of the most obvious explanations - namely that the offender is short-sighted, or was so engrossed in his thoughts that he did not notice them. They conclude that he would have seen them if he had 'set any store by them'.

[1901b, 1237]
¹ For the sake of preserving the unity of the subject I may perhaps interrupt the general arrangement I have adopted, and, in addition to what I have said above, point out that people's memories show a particular partiality in money matters. Paramnesias of having already paid for something can often be very obstinate, as I know from my own experience. When free play is given to avaricious aims apart from the serious interests of life - for fun, in fact -, as in card-playing, the most honourable men show an inclination to make errors and mistakes in memory and counting, and, without quite knowing how, they even find themselves involved in petty cheating. The psychically refreshing nature of these games is partly due to liberties of this kind. We must admit the truth of the saying that in play we can get to know a person's character - that is, if we are not thinking of his manifest character. - If waiters still make unintentional mistakes in the bill, the same explanation obviously applies to them. - In commercial circles a certain delay can frequently be observed in paying out sums of money (for settling accounts and so on) which in point of fact brings the owner no profit and can only be understood in psychological terms - as an expression of a counter-will against paying out money. - [The next sentence was added in 1912:] Brill puts the matter with epigrammatic brevity: 'We are more apt to mislay letters containing bills than cheques.' - The fact that women in particular evince a special amount of displeasure at paying their doctor is connected with the most intimate impulses, which are very far from having been elucidated. Women patients have usually forgotten their purse and so cannot pay at the time of consultation; they then regularly forget to send the fee after they reach home, and thus arrange things so that one has treated them for nothing - 'for the sake of their beaux yeux'. They pay one, as it were, by the sight of their countenance. [1901b, 1238]

¹ After all, the case is no different from that of a sexual assault upon a woman, where the man's attack cannot be repelled by her full muscular strength because a portion of her unconscious impulses meets the attack with encouragement. It is said, as we know, that a situation of this kind paralyses a woman's strength; all we need do is to add the reasons for this paralysis. To that extent the ingenious judgement delivered by Sancho Panza as governor of his island is psychologically unjust (Don Quixote, Part 2, Chapter 45). A woman dragged a man before the judge alleging he had robbed her of her honour by violence. In compensation Sancho gave her a full purse of money which he took from the accused; but after the woman's departure he gave him permission to pursue her and snatch his purse back again from her. The two returned struggling, the woman priding herself on the fact that the villain had not been able to take the purse from her. Thereupon Sancho declared: 'If you had defended your honour with half the determination with which you have defended this purse, the man could not have robbed you of it.' [1901b, 1261]

I must now proceed to touch upon some further relations existing between Dora's genital catarrh and her hysterical symptoms. At a time when any psychological elucidation of hysteria was still very remote, I used to hear experienced fellow-doctors who were my seniors maintain that in the case of hysterical patients suffering from leucorrhoea any increase in the catarrh was regularly followed by an intensification of the hysterical troubles, and especially of loss of appetite and vomiting. No one was very clear about the nature of the connection but I fancy the general inclination was towards the opinion held by gynaecologists. According to their hypothesis, as is well known, disorders of the genitals exercise upon the nervous functions a direct and far-reaching influence in the nature of an organic disturbance - though a therapeutic test of this theory is apt to leave one in the lurch. In the light of our present knowledge we cannot exclude the possibility of the existence of a direct organic influence of this sort; but it is at all events easier to indicate its psychical coating. The pride taken by women in the appearance of their genitals is quite a special feature of their vanity; and disorders of the genitals which they think calculated to inspire feelings of repugnance or even disgust have an incredible power of humiliating them, of lowering their self-esteem, and of making them irritable, sensitive, and distrustful. An abnormal secretion of the mucous membrane of the vagina is looked upon as a source of disgust. [1905e, 1419]
'May you not have thought that he wanted to get divorced from his wife so as to marry you? And that now he no longer wants to because he has no one to replace her? It is true that two years ago you were very young. But you told me yourself that your mother was engaged at seventeen and then waited two years for her husband. A daughter usually takes her mother's love-story as her model. So you too wanted to wait for him, and you took it that he was only waiting till you were grown up enough to be his wife.¹ I imagine that this was a perfectly serious plan for the future in your eyes. You have not even got the right to assert that it was out of the question for Herr K. to have had any such intention; you have told me enough about him that points directly towards his having such an intention.² Nor does his behaviour at L-- contradict this view. After all, you did not let him finish his speech and do not know what he meant to say to you. Incidentally, the scheme would by no means have been so impracticable. Your father's relations with Frau K.- and it was probably only for this reason that you lent them your support for so long - made it certain that her consent to a divorce could be obtained; and you can get anything you like out of your father. Indeed, if your temptation at L-- had had a different upshot, this would have been the only possible solution for all the parties concerned. And I think that is why you regretted the actual event so deeply and emended it in the phantasy which made its appearance in the shape of the appendicitis. So it must have been a bitter piece of disillusionment for you when the effect of your charges against Herr K. was not that he renewed his proposals but that he replied instead with denials and slanders. You will agree that nothing makes you so angry as having it thought that you merely fancied the scene by the lake. I know now - and this is what you do not want to be reminded of - that you did fancy that Herr K.'s proposals were serious, and that he would not leave off until you had married him.'

[1905e, 1443]

The significance of the factor of sexual overvaluation can be best studied in men, for their erotic life alone has become accessible to research. That of women - partly owing to the stunting effect of civilized conditions and partly owing to their conventional secretiveness and insincerity - is still veiled in an impenetrable obscurity.³

[1905d, 1477]

¹ [Footnote added 1920:] Lou Andreas-Salomé (1916), in a paper which has given us a very much deeper understanding of the significance of anal erotism, has shown how the history of the first prohibition which a child comes across - the prohibition against getting pleasure from anal activity and its products - has a decisive effect on his whole development. This must be the first occasion on which the infant has a glimpse of an environment hostile to his instinctual impulses, on which he learns to separate his own entity from this alien one and on which he carries out the first 'repression' of his possibilities for pleasure. From that time on, what is 'anal' remains the symbol of everything that is to be repudiated and excluded from life. The clear-cut distinction between anal and genital processes which is later insisted upon is contradicted by the close anatomical and functional analogies and relations which hold between them. The genital apparatus remains the neighbour of the cloaca, and actually 'in the case of women is only taken from it on lease'.

[1905d, 1507]

CASTRATION COMPLEX AND PENIS ENVY  This conviction is energetically maintained by boys, is obstinately defended against the contradictions which soon result from observation, and is only abandoned after severe internal struggles (the castration complex). The substitutes for this penis which they feel is missing in women play a great part in determining the form taken by many perversions.¹

[1905d, 1514]

The assumption that all human beings have the same (male) form of genital is the first of the many remarkable and momentous sexual theories of children. It is of little use to a child that the science of biology justifies his prejudice and has been obliged to recognize the female clitoris as a true substitute for the penis.

[1905d, 1514]
Little girls do not resort to denial of this kind when they see that boys' genitals are formed differently from their own. They are ready to recognize them immediately and are overcome by envy for the penis - an envy culminating in the wish, which is so important in its consequences, to be boys themselves. [1905d, 1514]

¹ [Footnote added 1920:] We are justified in speaking of a castration complex in women as well. Both male and female children form a theory that women no less than men originally had a penis, but that they have lost it by castration. The conviction which is finally reached by males that women have no penis often leads them to an enduringly low opinion of the other sex. [1905d, 1514]

LEADING ZONES IN MEN AND WOMEN Apart from this I have only the following to add. The leading erotogenic zone in female children is located at the clitoris, and is thus homologous to the masculine genital zone of the glans penis. All my experience concerning masturbation in little girls has related to the clitoris and not to the regions of the external genitalia that are important in later sexual functioning. I am even doubtful whether a female child can be led by the influence of seduction to anything other than clitoral masturbation. If such a thing occurs, it is quite exceptional. The spontaneous discharges of sexual excitement which occur so often precisely in little girls are expressed in spasms of the clitoris. Frequent erections of that organ make it possible for girls to form a correct judgement, even without any instruction, of the sexual manifestations of the other sex: they merely transfer on to boys the sensations derived from their own sexual processes. [1905d, 1534]

If we are to understand how a little girl turns into a woman, we must follow the further vicissitudes of this excitability of the clitoris. Puberty, which brings about so great an accession of libido in boys, is marked in girls by a fresh wave of repression, in which it is precisely clitoral sexuality that is affected. What is thus overtaken by repression is a piece of masculine sexuality. The intensification of the brake upon sexuality brought about by pubertal repression in women serves as a stimulus to the libido in men and causes an increase of its activity. Along with this heightening of libido there is also an increase of sexual overvaluation which only emerges in full force in relation to a woman who holds herself back and who denies her sexuality. When at last the sexual act is permitted and the clitoris itself becomes excited, it still retains a function: the task, namely, of transmitting the excitation to the adjacent female sexual parts, just as - to use a simile - pine shavings can be kindled in order to set a log of harder wood on fire. Before this transference can be effected, a certain interval of time must often elapse, during which the young woman is anaesthetic. This anaesthesia may become permanent if the clitoral zone refuses to abandon its excitability, an event for which the way is prepared precisely by an extensive activity of that zone in childhood. Anaesthesia in women, as is well known, is often only apparent and local. They are anaesthetic at the vaginal orifice but are by no means incapable of excitement originating in the clitoris or even in other zones. Alongside these erotogenic determinants of anaesthesia must also be set the psychical determinants, which equally, arise from repression. [1905d, 1534]
When erotogenic susceptibility to stimulation has been successfully transferred by a woman from the clitoris to the vaginal orifice, it implies that she has adopted a new leading zone for the purposes of her later sexual activity. A man, on the other hand, retains his leading zone unchanged from childhood. The fact that women change their leading erotogenic zone in this way, together with the wave of repression at puberty, which, as it were, puts aside their childish masculinity, are the chief determinants of the greater proneness of woman to neurosis and especially to hysteria. These determinants, therefore, are intimately related to the essence of femininity.

[1905d, 1534]

It is in the world of ideas, however, that the choice of an object is accomplished at first; and the sexual life of maturing youth is almost entirely restricted to indulging in phantasies, that is, in ideas that are not destined to be carried into effect.¹ In these phantasies the infantile tendencies invariably emerge once more, but this time with intensified pressure from somatic sources. Among these tendencies the first place is taken with uniform frequency by the child's sexual impulses towards his parents, which are as a rule already differentiated owing to the attraction of the opposite sex - the son being drawn towards his mother and the daughter towards her father.² At the same time as these plainly incestuous phantasies are overcome and repudiated, one of the most significant, but also one of the most painful, psychical achievements of the pubertal period is completed: detachment from parental authority, a process that alone makes possible the opposition, which is so important for the progress of civilization, between the new generation and the old. At every stage in the course of development through which all human beings ought by rights to pass, a certain number are held back; so there are some who have never got over their parents' authority and have withdrawn their affection from them either very incompletely or not at all. They are mostly girls, who, to the delight of their parents, have persisted in all their childish love far beyond puberty. It is most instructive to find that it is precisely these girls who in their later marriage lack the capacity to give their husbands what is due to them; they make cold wives and remain sexually anaesthetic. We learn from this that sexual love and what appears to be non-sexual love for parents are fed from the same sources; the latter, that is to say, merely corresponds to an infantile fixation of the libido.

[1905d, 1539]

The closer one comes to the deeper disturbances of psychosexual development, the more unmistakably the importance of incestuous object-choice emerges. In psychoneurotics a large portion or the whole of their psychosexual activity in finding an object remains in the unconscious as a result of their repudiation of sexuality. Girls with an exaggerated need for affection and an equally exaggerated horror of the real demands made by sexual life have an irresistible temptation on the one hand to realize the ideal of asexual love in their lives and on the other hand to conceal their libido behind an affection which they can express without self-reproaches, by holding fast throughout their lives to their infantile fondness, revived at puberty, for their parents or brothers and sisters. Psycho-analysis has no difficulty in showing persons of this kind that they are in love, in the everyday sense of the word, with these blood-relations of theirs; for, with the help of their symptoms and other manifestations of their illness, it traces their unconscious thoughts and translates them into conscious ones. In cases in which someone who has previously been healthy falls ill after an unhappy experience in love it is also possible to show with certainty that the mechanism of his illness consists in a turning-back of his libido on to those whom he preferred in his infancy.

[1905d, 1539]
In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child’s sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

[1905d, 1545]

The hereditary conditions in the case of positive perverts are less well known, for they know how to avoid investigation. Yet there are good reasons to suppose that what is true of the neuroses applies also to the perversions. For it is no rare thing to find perversions and psychoneuroses occurring in the same family, and distributed between the two sexes in such a way that the male members of the family, or one of them, are positive perverts, while the females, true to the tendency of their sex to repression, are negative perverts, that is, hysterics. This is good evidence of the essential connections which we have shown to exist between the two disorders.

[1905d, 1546]

It can only help to clarify things if at this point we go back to fundamental facts. A desire to see the organs peculiar to each sex exposed is one of the original components of our libido. It may itself be a substitute for something earlier and go back to a hypothetical primary desire to touch the sexual parts. As so often, looking has replaced touching.¹ The libido for looking and touching is present in everyone in two forms, active and passive, male and female; and, according to the preponderance of the sexual character, one form or the other predominates. It is easy to observe the inclination to self-exposure in young children. In cases in which the germ of this inclination escapes its usual fate of being buried and suppressed, it develops in men into the familiar perversion known as exhibitionism. In women the inclination to passive exhibitionism is almost invariably buried under the imposing reactive function of sexual modesty, but not without a loophole being left for it in relation to clothes. I need only hint at the elasticity and variability in the amount of exhibitionism that women are permitted to retain in accordance with differing convention and circumstances.

[1905c, 1695]
The woman's inflexibility is therefore the first condition for the development of smut, although, to be sure, it seems merely to imply a postponement and does not indicate that further efforts will be in vain. The ideal case of a resistance of this kind on the woman's part occurs if another man is present at the same time - a third person -, for in that case an immediate surrender by the woman is as good as out of the question. This third person soon acquires the greatest importance in the development of the smut; to begin with, however, the presence of the woman is not to be overlooked. Among country people or in inns of the humbler sort it will be noticed that it is not until the entrance of the barmaid or the innkeeper's wife that smuttiness starts up. Only at higher social levels is the opposite found, and the presence of a woman brings the smut to an end. The men save up this kind of entertainment, which originally presupposed the presence of a woman who was feeling ashamed, till they are 'alone together'. So that gradually, in place of the woman, the onlooker, now the listener, becomes the person to whom the smut is addressed, and owing to this transformation it is already near to assuming the character of a joke.

[1905c, 1695]

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

[1905c, 1697]

Let us now make ourselves acquainted with a few of the characteristics of phantasying. We may lay it down that a happy person never phantasies, only an unsatisfied one. The motive forces of phantasies are unsatisfied wishes, and every single phantasy is the fulfilment of a wish, a correction of unsatisfying reality. These motivating wishes vary according to the sex, character and circumstances of the person who is having the phantasy; but they fall naturally into two main groups. They are either ambitious wishes, which serve to elevate the subject's personality; or they are erotic ones. In young women the erotic wishes predominate almost exclusively, for their ambition is as a rule absorbed by erotic trends. In young men egoistic and ambitious wishes come to the fore clearly enough alongside of erotic ones. But we will not lay stress on the opposition between the two trends; we would rather emphasize the fact that they are often united. Just as, in many altar-pieces, the portrait of the donor is to be seen in a corner of the picture, so, in the majority of ambitious phantasies, we can discover in some corner or other the lady for whom the creator of the phantasy performs all his heroic deeds and at whose feet all his triumphs are laid. Here, as you see, there are strong enough motives for concealment; the well-brought-up young woman is only allowed a minimum of erotic desire, and the young man has to learn to suppress the excess of self-regard which he brings with him from the spoilt days of his childhood, so that he may find his place in a society which is full of other individuals making equally strong demands.

[1908e, 1924]
Experience teaches us that for most people there is a limit beyond which their constitution cannot comply with the demands of civilization. All who wish to be more noble-minded than their constitution allows fall victims to neurosis; they would have been more healthy if it could have been possible for them to be less good. The discovery that perversions and neuroses stand in the relation of positive and negative is often unmistakably confirmed by observations made on the members of one generation of a family. Quite frequently a brother is a sexual pervert, while his sister, who, being a woman, possesses a weaker sexual instinct, is a neurotic whose symptoms express the same inclinations as the perversions of her sexually more active brother. And correspondingly, in many families the men are healthy, but from a social point of view immoral to an undesirable degree, while the women are high-minded and over-refined, but severely neurotic.

This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place only for a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure in so far as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus doomed puts both partners back in the state they were in before their marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual instinct. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them - although only with reluctance and under a veil of silence - by even the strictest sexual code. The ‘double’ sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their instincts, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child - experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives. (Under the cultural conditions of to-day, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual instinct of the civilized person in his youth, proves to be inadequate even to the demands of the actual period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it.

[1908d, 1955]
The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

[1908d, 1959]

The sexual behaviour of a human being often lays down the pattern for all his other modes of reacting to life. If a man is energetic in winning the object of his love, we are confident that he will pursue his other aims with an equally unswerving energy; but if, for all sorts of reasons, he refrains from satisfying his strong sexual instincts, his behaviour will be conciliatory and resigned rather than vigorous in other spheres of life as well. A special application of this proposition that sexual life lays down the pattern for the exercise of other functions can easily be recognized in the female sex as a whole. Their upbringing forbids their concerning themselves intellectually with sexual problems though they nevertheless feel extremely curious about them, and frightens them by condemning such curiosity as unwomanly and a sign of a sinful disposition. In this way they are scared away from any form of thinking, and knowledge loses its value for them. The prohibition of thought extends beyond the sexual field, partly through unavoidable association, partly automatically, like the prohibition of thought about religion among men, or the prohibition of thought about loyalty among faithful subjects. I do not believe that women's 'physiological feeble-mindedness' is to be explained by a biological opposition between intellectual work and sexual activity, as Moebius has asserted in a work which has been widely disputed. I think that the undoubted intellectual inferiority of so many women can rather be traced back to the inhibition of thought necessitated by sexual suppression.

[1908d, 1960]
All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulsons. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man’s weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfill her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.
If this idea of a woman with a penis becomes 'fixed' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women. Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex - a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis - that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations - all this seems to show that there is some truth in the infantile sexual theory that women, like men, possess a penis.

[1908c, 1971]

It is easy to observe that little girls fully share their brother's opinion of it. They develop a great interest in that part of the boy's body. But this interest promptly falls under the sway of envy. They feel themselves unfairly treated. They make attempts to micturate in the posture that is made possible for boys by their possessing a big penis; and when a girl declares that 'she would rather be a boy', we know what deficiency her wish is intended to put right.

[1908c, 1972]

The sadistic theory of coitus which, taken in isolation, is misleading where it might have provided confirmatory evidence, is, once again, the expression of one of the innate components of the sexual instinct, any of which may be strongly marked to a greater or lesser degree in each particular child. For this reason the theory is correct up to a certain point; it has in part divined the nature of the sexual act and the 'sex-battle' that precedes it. Not infrequently, too, the child is in a position to support this view by accidental observations which he understands in part correctly, but also in part incorrectly and indeed in a reversed sense. In many marriages the wife does in fact recoil from her husband's embraces, which bring her no pleasure, but the risk of a fresh pregnancy. And so the child who is believed to be asleep (or who is pretending to be asleep) may receive an impression from his mother which he can only interpret as meaning that she is defending herself against an act of violence. At other times the whole marriage offers an observant child the spectacle of an unceasing quarrel, expressed in loud words and unfriendly gestures; so that he need not be surprised if the quarrel is carried on at night as well, and finally settled by the same method which he himself is accustomed to use in his relations with his brothers and sisters or playmates.

[1908c, 1975]
Speaking as a whole, hysterical attacks, like hysteria in general, revive a piece of sexual activity in women which existed during their childhood and at that time revealed an essentially masculine character. It can often be observed that girls who have shown a boyish nature and inclinations up to the years before puberty are precisely those who become hysterical from puberty onwards. In a whole number of cases the hysterical neurosis merely represents an excessive accentuation of the typical wave of repression which, by doing away with her masculine sexuality, allows the woman to emerge.²

For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least feels he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from him than from her. In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

We can go a step further in vindicating little Hans's honour. As a matter of fact, he was behaving no worse than a philosopher of the school of Wundt. In the view of that school, consciousness is the invariable characteristic of what is mental, just as in the view of little Hans a widdler is the indispensable criterion of what is animate. If now the philosopher comes across mental processes whose existence cannot but be inferred, but about which there is not a trace of consciousness to be detected - for the subject, in fact, knows nothing of them, although it is impossible to avoid inferring their existence - then, instead of saying that they are unconscious mental processes, he calls them semi-conscious. The widdler's still very small! And in this comparison the advantage is in favour of little Hans. For, as is so often the case with the sexual researches of children, behind the mistake a piece of genuine knowledge lies concealed. Little girls do possess a small widdler, which we call a clitoris, though it does not grow any larger but remains permanently stunted. Compare my short paper on 'The Sexual Theories of Children' (1908c).

¹[1909c, 1987]
²[1909a, 1984]
If we examine with the eyes of a psycho-analyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall having come across the same sort of thing in many places, for example in dreams; so that we may venture to translate the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, 'coda', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages; the situation in the phantasy, of a vulture opening the child's mouth and beating about inside it vigorously with its tail, corresponds to the idea of an act of fellatio, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).

The inclination to take a man's sexual organ into the mouth and suck at it, which in respectable society is considered a loathsome sexual perversion, is nevertheless found with great frequency among women of to-day - and of earlier times as well, as ancient sculptures show -, and in the state of being in love it appears completely to lose its repulsive character. Phantasies derived from this inclination are found by doctors even in women who have not become aware of the possibilities of obtaining sexual satisfaction in this way by reading Krafft Ebing's *Psychopathia Sexualis* or from other sources of information. Women, it seems, find no difficulty in producing this kind of wishful phantasy spontaneously.¹ Further investigation in forms us that this situation, which morality condemns with such severity, may be traced to an origin of the most innocent kind. It only repeats in a different form a situation in which we all once felt comfortable - when we were still in our suckling days ('essendo io in culla')² and took our mother's (or wet-nurse's) nipple into our mouth and sucked at it. The organic impression of this experience - the first source of pleasure in our life - doubtless remains indelibly printed on us; and when at a later date the child becomes familiar with the cow's udder whose function is that of a nipple, but whose shape and position under the belly make it resemble a penis, the preliminary stage has been reached which will later enable him to form the repellent sexual phantasy.

In our civilized world women are under the influence of a similar after-effect of their upbringing, and, in addition, of their reaction to men's behaviour. It is naturally just as unfavourable for a woman if a man approaches her without his full potency as it is if his initial overvaluation of her when he is in love gives place to undervaluation after he has possessed her. In the case of women there is little sign of a need to debase their sexual object. This is no doubt connected with the absence in them as a rule of anything similar to the sexual overvaluation found in men. But their long holding back from sexuality and the lingering of their sensuality in phantasy has another important consequence for them. They are subsequently often unable to undo the connection between sensual activity and the prohibition, and prove to be psychically impotent, that is, frigid, when such activity is at last allowed them. This is the origin of the endeavour made by many women to keep even legitimate relations secret for a while; and of the capacity of other women for normal sensation as soon as the condition of prohibition is re-established by a secret love affair: unfaithful to their husband, they are able to keep a second order of faith with their lover.
The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education for cultural reasons, between sexual maturity and sexual activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life. [1912d, 2344]

From this point we have no trouble in justifying what looked at first like a prejudice, by referring to our views on the erotic life of women. Whoever is the first to satisfy a virgin's desire for love, long and laboriously held in check, and who in doing so overcomes the resistances which have been built up in her through the influences of her milieu and education, that is the man she will take into a lasting relationship, the possibility of which will never again be open to any other man. This experience creates a state of bondage in the woman which guarantees that possession of her shall continue undisturbed and makes her able to resist new impressions and enticements from outside. [1918a, 2349]

Von Krafft-Ebing derives the formation of sexual bondage from a conjunction of an 'uncommon degree of the state of being in love and of weakness of character' in one person and unbounded egoism in the other. Analytic experience, however, will not let us rest satisfied with this simple attempt at explanation. We can see, rather, that the decisive factor is the amount of sexual resistance that is overcome and in addition the fact that the process of overcoming the resistance is concentrated and happens only once. This state of bondage is, accordingly, far more frequent and more intense in women than in men, though it is true it occurs in the latter more often nowadays than it did in ancient times. Wherever we have been able to study sexual bondage in men it has shown itself as resulting from an overcoming of psychical impotence through one particular woman, to whom the man in question has remained subsequently bound. Many strange marriages and not a few tragic events - even some with far-reaching consequences - seem to owe their explanation to this origin. [1918a, 2350]
I do not want to introduce at this point the attempts - which are so frequent - to take flight from the first occasion of sexual intercourse, because they are open to several interpretations and are in the main, although not altogether, to be understood as an expression of the general female tendency to take a defensive line. As against this, I do believe that light is thrown on the riddle of female frigidity by certain pathological cases in which, after the first and indeed after each repeated instance of sexual intercourse, the woman gives unconcealed expression to her hostility towards the man by abusing him, raising her hand against him or actually striking him. In one very clear case of this kind, which I was able to submit to a thorough analysis, this happened although the woman loved the man very much, used to demand intercourse herself and unmistakably found great satisfaction in it. I think that this strange, contradictory reaction is the result of the very same impulses which ordinarily can only find expression as frigidity - which, that is, can hold back the tender reaction without at the same time being able to put themselves into effect. In the pathological case we find separated so to speak into its two components what in the far more common instance of frigidity is united to produce an inhibiting effect, just like the process we have long recognized in the so-called 'diphasic symptoms' of obsessional neurosis. The danger which is thus aroused through the defloration of a woman would consist in drawing her hostility down upon oneself, and the prospective husband is just the person who would have every reason to avoid such enmity.

[1918a, 2357]

Now analysis enables us to infer without difficulty which impulses in women take part in bringing about this paradoxical behaviour, in which I expect to find the explanation of frigidity. The first act of intercourse mobilizes a number of impulses which are out of place in the desired feminine attitude, some of which, incidentally, need not recur during subsequent intercourse. In the first place we think of the pain which defloration causes a virgin, and we are perhaps even inclined to consider this factor as decisive and to give up the search for any others. But we cannot well ascribe such importance to this pain; we must rather substitute for it the narcissistic injury which proceeds from the destruction of an organ and which is even represented in a rationalized form in the knowledge that loss of virginity brings a diminution of sexual value. The marriage customs of primitive peoples, however, contain a warning against over-estimating this. We have heard that in some cases the rite falls into two phases: after the hymen has been ruptured (by hand or with some instrument) there follows a ceremonial act of coitus or mock-intercourse with the representatives of the husband, and this proves to us that the purpose of the taboo observance is not fulfilled by avoiding anatomical defloration, that the husband is to be spared something else as well as the woman's reaction to the painful injury.

[1918a, 2358]

We find a further reason for the disappointment experienced in the first act of intercourse in the fact that, with civilized women at least, fulfilment cannot be in accordance with expectations. Before this, sexual intercourse has been associated in the strongest possible way with prohibitions; lawful and permissible intercourse is not, therefore, felt to be the same thing. Just how close this association can be is demonstrated in an almost comic fashion by the efforts of so many girls about to be married to keep their new love-relationship secret from everyone outside, and indeed even from their parents, where there is no real necessity to do so and no objection can be looked for. Girls often say openly that their love loses value for them if other people know of it. On occasion this feeling can become dominating and can completely prevent the development of any capacity for love in a marriage. The woman only recovers her susceptibility to tender feelings in an illicit relationship which has to be kept secret, and in which alone she knows for certain that her own will is uninfluenced.

[1918a, 2358]
However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.

[1918a, 2358]

There is another motive, reaching down into still deeper layers, which can be shown to bear the chief blame for the paradoxical reaction towards the man, and which, in my view, further makes its influence felt in female frigidity. The first act of intercourse activates in a woman other impulses of long standing as well as those already described, and these are in complete opposition to her womanly role and function.

[1918a, 2359]

We have learnt from the analysis of many neurotic women that they go through an early age in which they envy their brothers their sign of masculinity and feel at a disadvantage and humiliated because of the lack of it (actually because of its diminished size) in themselves. We include this 'envy for the penis' in the 'castration complex'. If we understand 'masculine' as including the idea of wishing to be masculine, then the designation 'masculine protest' fits this behaviour; the phrase was coined by Adler with the intention of proclaiming this factor as being responsible for neurosis in general. During this phase, little girls often make no secret of their envy, nor of the hostility towards their favoured brothers which arises from it. They even try to urinate standing upright like their brothers in order to prove the equality which they lay claim to. In the case already described in which the woman used to show uncontrolled aggression after intercourse towards her husband, whom otherwise she loved, I was able to establish that this phase had existed before that of object-choice. Only later was the little girl's libido directed towards her father, and then, instead of wanting to have a penis, she wanted - a child.²

[1918a, 2359]

I should not be surprised if in other cases the order in which these impulses occurred were reversed and this part of the castration complex only became effective after a choice of object had been successfully made. But the masculine phase in the girl in which she envies the boy for his penis is in any case developmentally the earlier, and it is closer to the original narcissism than it is to object-love.

[1918a, 2360]
Some time ago I chanced to have an opportunity of obtaining insight into a dream of a newly-married woman which was recognizable as a reaction to the loss of her virginity. It betrayed spontaneously the woman's wish to castrate her young husband and to keep his penis for herself. Certainly there was also room for the more innocent interpretation that what she wished for was the prolongation and repetition of the act, but several details of the dream did not fit into this meaning and the character as well as the subsequent behaviour of the woman who had the dream gave evidence in favour of the more serious view. Behind this envy for the penis, there comes to light the woman's hostile bitterness against the man, which never completely disappears in the relations between the sexes, and which is clearly indicated in the strivings and in the literary productions of 'emancipated' women. In a palaeo-biological speculation, Ferenczi has traced back this hostility of women - I do not know if he is the first to do so - to the period in time when the sexes became differentiated. At first, in his opinion, copulation took place between two similar individuals, one of which, however, developed into the stronger and forced the weaker one to submit to sexual union. The feelings of bitterness arising from this subjection still persist in the present-day disposition of women. I do not think there is any harm in employing such speculations, so long as one avoids setting too much value on them.

[1918a, 2360]

After this enumeration of the motives for the paradoxical reaction of women to defloration, traces of which persist in frigidity, we may sum up by saying that a woman's immature sexuality, is discharged on to the man who first makes her acquainted with the sexual act. This being so, the taboo of virginity is reasonable enough and we can understand the rule which decrees that precisely the man who is to enter upon a life shared with this woman shall avoid these dangers. At higher stages of civilization the importance attributed to this danger diminishes in face of her promise of bondage and no doubt of other motives and inducements; virginity is looked upon as a possession which the husband is not called upon to renounce. But analysis of disturbed marriages teaches us that the motives which seek to drive a woman to take vengeance for her defloration are not completely extinguished even in the mental life of civilized women. I think it must strike the observer in how uncommonly large a number of cases the woman remains frigid and feels unhappy in a first marriage, whereas after it has been dissolved she becomes a tender wife, able to make her second husband happy. The archaic reaction has, so to speak, exhausted itself on the first object.

[1918a, 2361]

The taboo of virginity and something of its motivation has been depicted most powerfully of all in a well-known dramatic character, that of Judith in Hebbel's tragedy Judith und Holofernes. Judith is one of those women whose virginity is protected by a taboo. Her first husband was paralysed on the bridal night by a mysterious anxiety, and never again dared to touch her, 'My beauty is like belladonna,' she says. 'Enjoyment of it brings madness and death.' When the Assyrian general is besieging her city, she conceives the plan of seducing him by her beauty and of destroying him, thus employing a patriotic motive to conceal a sexual one. After she has been deflowered by this powerful man, who boasts of his strength and ruthlessness, she finds the strength in her fury to strike off his head, and thus becomes the liberator of her people. Beheading is well known to us as a symbolic substitute for castrating; Judith is accordingly the woman who castrates the man who has deflowered her, which was just the wish of the newly-married woman expressed in the dream I reported. It is clear that Hebbel has intentionally sexualized the patriotic narrative from the Apocrypha of the Old Testament, for there Judith is able to boast after her return that she has not been defiled, nor is there in the Biblical text any mention of her uncanny wedding night. But probably, with the fine perception of a poet, he sensed the ancient motive, which had been lost in the tendentious narrative, and has merely restored its earlier content to the material.

[1918a, 2362]
Sadger (1912) has shown in a penetrating analysis how Hebbel was determined in his choice of material by his own parental complex, and how he came to take the part of the woman so regularly in the struggle between the sexes, and to feel his way into the most hidden impulses of her mind. He also quotes the motives which the poet himself gives for the alteration he has made in the material, and he rightly finds them artificial and as though intended to justify outwardly something the poet himself is unconscious of, while at bottom concealing it. I will not dispute Sadger's explanation of why Judith, who according to the Biblical narrative is a widow, has to become a virgin widow. He refers to the purpose found in childish phantasies of denying the sexual intercourse of the parents and of turning the mother into an untouched virgin. But I will add: after the poet has established his heroine's virginity, his sensitive imagination dwells on the hostile reaction released by the violation of her maidenhood.

We may say, then, in conclusion that defloration has not only the one, civilized consequence of binding the woman lastingly to the man; it also unleashes an archaic reaction of hostility towards him, which can assume pathological forms that are frequently enough expressed in the appearance of inhibitions in the erotic side of married life, and to which we may ascribe the fact that second marriages so often turn out better than first. The taboo of virginity, which seems so strange to us, the horror with which, among primitive peoples, the husband avoids the act of defloration, are fully justified by this hostile reaction.

It is interesting that in one's capacity as analyst one can meet with women in whom the opposed reactions of bondage and hostility both find expression and remain intimately associated with each other. There are women of this kind who seem to have fallen out with their husbands completely and who all the same can only make vain efforts to free themselves. As often as they try to direct their love towards some other man, the image of the first, although he is no longer loved, intervenes with inhibiting effect. Analysis then teaches us that these women, it is true, still cling to their first husbands in a state of bondage, but no longer through affection. They cannot get away from them, because they have not completed their revenge upon them, and in pronounced cases they have not even brought the impulses for vengeance to consciousness.

'It is not I who love the women - he loves them.' The jealous woman suspects her husband in relation to all the women by whom she is herself attracted owing to her homosexuality and the dispositional effect of her excessive narcissism. The influence of the time of life at which her fixation occurred is clearly shown by the selection of the love-objects which she imputes to her husband; they are often old and quite inappropriate for a real love relation - revivals of the nurses and servants and girls who were her friends in childhood, or sisters who were her actual rivals.
I have, as you know, divided masturbation according to the subject's age into (1) masturbation in infants, which includes all auto-erotic activities serving the purpose of sexual satisfaction, (2) masturbation in children, which arises directly out of the preceding kind and has already become fixed to certain erotogenic zones, and (3) masturbation at puberty, which is either continuous with childhood masturbation or is separated from it by the period of latency. In some of the accounts which I have heard you give, full justice has not quite been done to this temporal division. The ostensible unity of masturbation, which is fostered by the customary medical terminology, has given rise to some generalizations where a differentiation according to the three periods of life would have been better justified. It has been a matter for regret, too, that we have not been able to pay as much attention to female as to male masturbation; female masturbation, I believe, is deserving of a special study and in its case it is particularly true that a special emphasis lies on the modifications in it that arise in relation to the subject's age.

Rumpelstiltskin was connected with the contemporary thoughts underlying the dream - the day's residues - by a neat antithetic relation. In the fairy tale he comes in order to take away the queen's first child. In the dream the little man comes in the shape of a father, because he had presumably brought a second child. But Rumpelstiltskin also gave access to the deeper, infantile stratum of the dream-thoughts. The droll little fellow, whose very name is unknown, whose secret is so eagerly canvassed, who can perform such extraordinary tricks - in the fairy tale he turns straw into gold - the fury against him, or rather against his possessor, who is envied for possessing him (the girl's envy for the penis) - all of these were elements whose relation to the foundations of the patient's neurosis can, as I have said, barely be touched upon in this paper. The short-cut hair of the manikin in the dream was no doubt also connected with the subject of castration.

Unfortunately I am unable, for familiar reasons, to enter into the history of the case as far as I should like, and I must restrict myself to the account which follows. Up to the time of her falling ill the patient had been a happy and almost completely satisfied wife. She wanted to have children, from motives based on an infantile fixation of her wishes, and she fell ill when she learned that it was impossible for her to have any by the husband who was the only object of her love. The anxiety hysteria with which she reacted to this frustration corresponded, as she herself soon learned to understand, to the repudiation of phantasies of seduction in which her firmly implanted wish for a child found expression. She now did all she could to prevent her husband from guessing that she had fallen ill owing to the frustration of which he was the cause. But I have had good reason for asserting that everyone possesses in his own unconscious an instrument with which he can interpret the utterances of the unconscious in other people. Her husband understood, without any admission or explanation on her part, what his wife's anxiety meant; he felt hurt, without showing it, and in his turn reacted neurotically by - for the first time - failing in sexual intercourse with her. Immediately afterwards he started on a journey. His wife believed that he had become permanently impotent, and produced her first obsessional symptoms on the day before his expected return.
But it is precisely in the field of character-development that we come across a good analogy with the case we have been describing - a confirmation, that is, of the occurrence of the pregenital sadistic anal-erotic sexual organization. It is a well-known fact, and one that has given much ground for complaint, that after women have lost their genital function their character often undergoes a peculiar alteration. They become quarrelsome, vexatious and overbearing, petty and stingy; that is to say, they exhibit typically sadistic and anal-erotic traits which they did not possess earlier, during their period of womanliness. Writers of comedy and satirists have in all ages directed their invectives against the 'old dragon' into which the charming girl, the loving wife and the tender mother have been transformed. We can see that this alteration of character corresponds to a regression of sexual life to the pregenital sadistic and anal-erotic stage, in which we have discovered the disposition to obsessional neurosis. It seems, then, to be not only the precursor of the genital phase but often enough its successor as well, its termination after the genitals have fulfilled their function.

On the other hand, it is not hard to show that another regression to an earlier level occurs in hysteria too. The sexuality of female children, is, as we know, dominated and directed by a masculine organ (the clitoris) and often behaves like the sexuality of boys. This masculine sexuality has to be got rid of by a last wave of development at puberty, and the vagina, an organ derived from the cloaca, has to be raised into the dominant erotogenic zone. Now, it is very common in hysterical neurosis for this repressed masculine sexuality to be re-activated and then for the defensive struggle on the part of the ego-syntonic instincts to be directed against it. But it seems to me too early to enter here into a discussion of the problems of the disposition to hysteria.

After several days of resistance the patient reported that she had felt very much snubbed because a young man whom she met regularly near the doctor's house, and who used as a rule to look at her admiringly, had on the last occasion looked contemptuously at her feet. In fact she had no reason to be ashamed of her feet. She produced the explanation herself after admitting that she had regarded the young man as the doctor's son, who thus (by way of the transference) stood for her elder brother. There now followed a memory of having been in the habit of accompanying her brother to the lavatory when she was about five years old and of watching him micturate. She was overcome with envy at not being able to do it in the same way as he did and one day tried to copy him (envy for the penis). But in doing so she wet her shoes and got very angry when her brother teased her about it. For a long time afterwards her anger recurred whenever her brother looked contemptuously at her shoes with the object of reminding her of her misfortune. She added that this experience had determined her later behaviour at school. If she was unsuccessful in anything at the first attempt she could never bring herself to try again, so that in many subjects she failed completely. This is a good example of the way in which sexual life acts as a model and influences character.
A comparison of the male and female sexes then shows that there are fundamental
differences between them in respect of their type of object-choice, although these differences
are of course not universal. Complete object-love of the attachment type is, properly speaking,
characteristic of the male. It displays the marked sexual overvaluation which is doubtless
derived from the child's original narcissism and thus corresponds to a transference of that
narcissism to the sexual object. This sexual overvaluation is the origin of the peculiar state of
being in love, a state suggestive of a neurotic compulsion, which is thus traceable to an
impoverishment of the ego in favour of the love-object. A different course is
followed in the type of female most frequently met with, which is probably the purest and truest
one. With the onset of puberty the maturing of the female sexual organs, which up till then have
been in a condition of latency, seems to bring about an intensification of the original narcissism,
and this is unfavourable to the development of a true object-choice with its accompanying
sexual overvaluation. Women, especially if they grow up with good looks, develop a certain self-
contentment which compensates them for the social restrictions that are imposed upon them in
their choice of object. Strictly speaking, it is only themselves that such women love with an
intensity comparable to that of the man's love for them. Nor does their need lie in the direction
of loving, but of being loved; and the man who fulfils this condition is the one who finds favour
with them. The importance of this type of woman for the erotic life of mankind is to be rated very
high. Such women have the greatest fascination for men, not only for aesthetic reasons, since
as a rule they are the most beautiful, but also because of a combination of interesting
psychological factors. For it seems very evident that another person's narcissism has a great
attraction for those who have renounced part of their own narcissism and are in search of
object-love. The charm of a child lies to a great extent in his narcissism, his self-contentment
and inaccessibility, just as does the charm of certain animals which seem not to concern
themselves about us, such as cats and the large beasts of prey. Indeed, even great criminals
and humorists, as they are represented in literature, compel our interest by the narcissistic
consistency with which they manage to keep away from their ego anything that would diminish
it. It is as if we envied them for maintaining a blissful state of mind - an unassailable libidinal
position which we ourselves have since abandoned. The great charm of narcissistic women
has, however, its reverse side; a large part of the lover's dissatisfaction, of his doubts of the
woman's love, of his complaints of her enigmatic nature, has its root in this incongruity between
the types of object-choice.

Perhaps it is not out of place here to give an assurance that this description of the feminine
form of erotic life is not due to my tendentious desire on my part to depreciate women. Apart
from the fact that tendentiousness is quite alien to me, I know that these different lines of
development correspond to the differentiation of functions in a highly complicated biological
whole; further, I am ready to admit that there are quite a number of women who love according
to the masculine type and who also develop the sexual overvaluation proper to that type.

Even for narcissistic women, whose attitude towards men remains cool, there is a road which
leads to complete object-love. In the child which they bear, a part of their own body confronts
them like an extraneous object, to which, starting out from their narcissism, they can then give
complete object-love. There are other women, again, who do not have to wait for a child in order
to take the step in development from (secondary) narcissism to object-love. Before puberty they
feel masculine and develop some way along masculine lines; after this trend has been cut short
on their reaching female maturity, they still retain the capacity of longing for a masculine ideal -
an ideal which is in fact a survival of the boyish nature that they themselves once possessed.
Before leaving the ‘exceptions’, however, we may point out that the claim of women to privileges and to exemption from so many of the importunities of life rests upon the same foundation. As we learn from psycho-analytic work, women regard themselves as having been damaged in infancy, as having been undeservedly cut short of something and unfairly treated; and the embitterment of so many daughters against their mother derives, ultimately, from the reproach against her of having brought them into the world as women instead of as men. [1916d, 3103]

Unexpectedly, a hint reaches us from a direction in which we have not so far looked. Linguistic usage, which is no chance thing, but the precipitate of old discoveries, though, to be sure, it must not be employed incautiously - our language, then, is acquainted with things that bear the strange name of ‘day dreams’. Day-dreams are phantasies (products of the imagination); they are very general phenomena, observable, once more, in healthy as well as in sick people, and are easily accessible to study in our own mind. The most remarkable thing about these imaginative structures is that they have been given the name of ‘day-dreams’, for there is no trace in them of the two things that are common to dreams. Their relation to sleep is already contradicted by their name; and, as regards the second thing common to dreams, we do not experience or hallucinate anything in them but imagine something, we know that we are having a phantasy, we do not see but think. These day-dreams appear in the prepubertal period, often in the later part of childhood even; they persist until maturity is reached and are then either given up or maintained till the end of life. The content of these phantasies is dominated by a very transparent motive. They are scenes and events in which the subject’s egoistic needs of ambition and power or his erotic wishes and satisfaction. In young men the ambitious phantasies are the most prominent, in women, whose ambition is directed to success in love, the erotic ones. But in men, too, erotic needs are often enough present in the background: all their heroic deeds and successes seem only to aim at courting the admiration and favour of women. In other respects these day-dreams are of many different kinds and pass through changing vicissitudes. They are either, each one of them, dropped after a short time and replaced by a fresh one, or they are retained, spun out into long stories and adapted to the changes in the circumstances of the subject's life. They go along with the times, so to speak, and receive a ‘date stamp’ which bears witness to the influence of the new situation. They are the raw material of poetic production, for the creative writer uses his day-dreams, with certain remodellings, disguises and omissions, to construct the situations which he introduces into his short stories, his novels or his plays. The hero of the day dreams is always the subject himself, either directly or by an obvious identification with someone else. [1916-1917, 3198]
The remarkable characteristic of the male organ which enables it to rise up in defiance of the laws of gravity, one of the phenomena of erection, leads to its being represented symbolically by balloons, flying-machines and most recently by Zeppelin airships. But dreams can symbolize erection in yet another, far more expressive manner. They can treat the sexual organ as the essence of the dreamer's whole person and make him himself fly. Do not take it to heart if dreams of flying, so familiar and often so delightful, have to be interpreted as dreams of general sexual excitement, as erection-dreams. Among students of psycho-analysis, Paul Federn has placed this interpretation beyond any doubt; but the same conclusion was reached from his investigations by Mourly Vold, who has been so much praised for his sobriety, who carried out the dream-experiments I have referred to with artificially arranged positions of the arms and legs and who was far removed from psycho-analysis and may have known nothing about it. And do not make an objection out of the fact that women can have the same flying dreams as men. Remember, rather, that our dreams aim at being the fulfilments of wishes and that the wish to be a man is found so frequently, consciously or unconsciously, in women. Nor will anyone with a knowledge of anatomy be bewildered by the fact that it is possible for women to realize this wish through the same sensations as men. Women possess as part of their genitals a small organ similar to the male one; and this small organ, the clitoris, actually plays the same part in childhood and during the years before sexual intercourse as the large organ in men.

[1916-1917, 3249]

Naturally this does not answer all the questions that we might ask in connection with this case. On the contrary, the case bristles with further problems-some that have in general not yet become soluble and others which could not be solved owing to the particular circumstances being unfavourable. For instance, why did this lady who was happily married fall in love with her son-in-law? and why did the relief, which might have been possible in other ways, take the form of this mirror-image this projection of her state on to her husband? You must no: think it is otiose or frivolous to raise such questions. We already have some material at our disposal which might possibly serve to answer them. The lady was at a critical age, at which sexual needs in women suffer a sudden and undesired increase; that alone might account for the event. Or it may further have been that her excellent and faithful husband had for some years no longer enjoyed the sexual capacity which the well-preserved woman required for her satisfaction. Experience has shown us that it is precisely men in this position, whose faithfulness can consequently be taken for granted, who are distinguished by treating their wives with unusual tenderness, and by showing particular forbearance for their nervous troubles. Or, again, it may not be without significance that the object of this pathogenic love was precisely the young husband of one of her daughters. A powerful erotic tie with a daughter, which goes back in the last resort to the mother's sexual constitution, often finds a way of persisting in a transformation of this sort. In this connection I may perhaps remind you that the relation between mother-in-law and son-in-law has been regarded from the earliest times of the human race as a particularly awkward one and that among primitive people it has given rise to very powerful taboo regulations and 'avoidances'. The relation is frequently excessive by civilized standards both in a positive and negative direction. Which of these three factors became operative in our case, or whether two of them or perhaps all three came together, I cannot, it is true, tell you; but that is only because I was not permitted to continue the analysis of the case for more than two sessions.

[1916-1917, 3335]
Though I am anxious to cut short this discussion still further, I must nevertheless tell you a little about the sexual researches of children: they are too characteristic of infantile sexuality and of too great significance for the symptomatology of the neuroses to be passed over. Infantile sexual researches begin very early, sometimes before the third year of life. They do not relate to the distinction between the sexes, for this means nothing to children, since they (or at any rate boys) attribute the same male genital to both sexes. If, afterwards, a boy makes the discovery of the vagina from seeing his little sister or a girl playmate, he tries, to begin with, to disavow the evidence of his senses, for he cannot imagine a human creature like himself who is without such a precious portion. Later on, he takes fright at the possibility thus presented to him; and any threats that may have been made to him earlier, because he took too intense an interest in his little organ, now produce a deferred effect. He comes under the sway of the castration complex, the form taken by which plays a great part in the construction of his character if he remains normal, in his neurosis if he falls ill, and in his resistances if he comes into analytic treatment. As regards little girls, we can say of them that they feel greatly at a disadvantage owing to their lack of a big, visible penis, that they envy boys for possessing one and that, in the main for this reason, they develop a wish to be a man - a wish that re-emerges later on, in any neurosis that may arise if they meet with a mishap in playing a feminine part. In her childhood, moreover, a girl's clitoris takes on the role of a penis entirely: it is characterized by special excitability and is the area in which auto-erotic satisfaction is obtained. The process of a girl's becoming a woman depends very much on the clitoris passing on this sensitivity to the vaginal orifice in good time and completely. In cases of what is known as sexual anaesthesia in women the clitoris has obstinately retained its sensitivity.

[1916-1917, 3387]

As you see, I have only described the relation of a boy to his father and mother. Things happen in just the same way with little girls, with the necessary changes: an affectionate attachment to her father, a need to get rid of her mother as superfluous and to take her place, a coquetry which already employs the methods of later womanhood - these offer a charming picture, especially in small girls, which makes us forget the possibly grave consequences lying behind this infantile situation. We must not omit to add that the parents themselves often exercise a determining influence on the awakening of a child's Oedipus attitude by themselves obeying the pull of sexual attraction, and that where there are several children the father will give the plainest evidence of his greater affection for his little daughter and the mother for her son. But the spontaneous nature of the Oedipus complex in children cannot be seriously shaken even by this factor.

[1916-1917, 3400]

The fact of there being a connection between sexual restraint and anxiety states is, so far as I know, no longer disputed even by physicians who have no contact with psycho-analysis. But I can well believe that an attempt is made to reverse the relation and to put forward the view that the people concerned are such as are already inclined to apprehensiveness and for that reason practise restraint in sexual matters as well. This, however, is decisively contradicted by the behaviour of women, whose sexual activity is essentially of a passive nature - is determined, that is to say, by their treatment by the man. The more passionate a woman is - the more inclined, therefore, to sexual intercourse and the more capable of being satisfied - the more certain she is to react with manifestations of anxiety to a man's impotence or to coitus interruptus, whereas in the case of anaesthetic women or those without much libido such ill-treatment plays a far smaller part.

[1916-1917, 3449]
If we penetrate deeply enough into the neurosis of a woman, we not infrequently meet with the repressed wish to possess a penis like a man. We call this wish 'envy for a penis' and include it in the castration complex. Chance mishaps in the life of such a woman, mishaps which are themselves frequently the result of a very masculine disposition, have re-activated this infantile wish and, through the backward flow of libido, made it the chief vehicle of her neurotic symptoms. In other women we find no evidence of this wish for a penis; it is replaced by the wish for a baby, the frustration of which in real life can lead to the outbreak of a neurosis. It looks as if such women had understood (although this could not possibly have acted as a motive) that nature has given babies to women as a substitute for the penis that has been denied them. With other women, again, we learn that both wishes were present in their childhood and that one replaced the other. At first they had wanted a penis like a man; then at a later, though still childish, stage there appeared instead the wish for a baby. The impression is forced upon us that this variety in our findings is caused by accidental factors during childhood (e.g. the presence or absence of brothers or the birth of a new baby at some favourable time of life), so that the wish for a penis and the wish for a baby would be fundamentally identical. [1917c, 3601]

We can say what the ultimate outcome of the infantile wish for a penis is in women in whom the determinants of a neurosis in later life are absent: it changes into the wish for a man, and thus puts up with the man as an appendage to the penis. This transformation, therefore, turns an impulse which is hostile to the female sexual function into one which is favourable to it. Such women are in this way made capable of an erotic life based on the masculine type of object-love, which can exist alongside the feminine one proper, derived from narcissism. We already know that in other cases it is only a baby that makes the transition from narcissistic self-love to object-love possible. So that in this respect too a baby can be represented by the penis. [1917c, 3601]

I have had occasional opportunities of being told women's dreams that had occurred after their first experience of intercourse. They revealed an unmistakable wish in the woman to keep for herself the penis which she had felt. Apart from their libidinal origin, then, these dreams indicated a temporary regression from man to penis as the object of her wish. One would certainly be inclined to trace back the wish for a man in a purely rationalistic way to the wish for a baby, since a woman is bound to understand sooner or later that there can be no baby without the co-operation of a man. It is, however, more likely that the wish for a man arises independently of the wish for a baby, and that when it arises - from understandable motives belonging entirely to ego-psychology - the original wish for a penis becomes attached to it as an unconscious libidinal reinforcement. The importance of the process described lies in the fact that a part of the young woman's narcissistic masculinity is thus changed into femininity, and so can no longer operate in a way harmful to the female sexual function. [1917c, 3602]
Thus the interest in faeces is continued partly as interest in money, partly as a wish for a baby, in which latter an anal-erotic and a genital impulse ('envy for a penis') converge. But the penis has another anal-erotic significance apart from its relation to the interest in a baby. The relationship between the penis and the passage lined with mucous membrane which it fills and excites already has its prototype in the pregenital, anal-sadistic phase. The faecal mass, or as one patient called it, the faecal 'stick', represents as it were the first penis, and the stimulated mucous membrane of the rectum represents that of the vagina. There are people whose anal erotism remains vigorous and unmodified up to the age preceding puberty (ten to twelve years); we learn from them that during the pregenital phase they had already developed in phantasy and in perverse play an organization analogous to the genital one, in which penis and vagina were represented by the faecal stick and the rectum. In other people - obsessional neurotics - we can observe the result of a regressive debasement of the genital organization. This is expressed in the fact that every phantasy originally conceived on the genital level is transposed to the anal level - the penis being replaced by the faecal mass and the vagina by the rectum.

Anal erotism finds a narcissistic application in the production of defiance, which constitutes an important reaction on the part of the ego against demands made by other people. Interest in faeces is carried over first to interest in gifts, and then to interest in money. In girls, the discovery of the penis gives rise to envy for it, which later changes into the wish for a man as the possessor of a penis. Even before this the wish for a penis has changed into the wish for a baby, or the latter wish has taken the place of the former one. An organic analogy between penis and baby (dotted line) is expressed by the existence of a symbol ('little one') common to both. A rational wish (double line) then leads from the wish for a baby to the wish for a man: we have already appreciated the importance of this instinctual transformation.

Another part of the nexus of relations can be observed much more clearly in the male. It arises when the boy's sexual researches lead him to the discovery of the absence of a penis in women. He concludes that the penis must be a detachable part of the body, something analogous to faeces, the first piece of bodily substance the child had to part with. Thus the old anal defiance enters into the composition of the castration complex. The organic analogy which enabled the intestinal contents to be the forerunner of the penis during the pregenital phase cannot come into account as a motive; but the boy's sexual researches lead him to a psychical substitute for it. When a baby appears on the scene he regards it as 'lumf', in accordance with those researches, and he cathects it with powerful anal-erotic interest. When social experiences teach that a baby is to be regarded as a love-token, a gift, the wish for a baby receives a second contribution from the same source. Faeces, penis and baby are all three solid bodies; they all three, by forcible entry or expulsion, stimulate a membranous passage, i.e. the rectum and the vagina, the latter being as it were 'taken on lease' from the rectum, as Lou Andreas-Salomé aptly remarks.¹ Infantile sexual researches can only lead to the conclusion that the baby follows the same route as the faecal mass. The function of the penis is not usually discovered by those researches. But it is interesting to note that after so many detours an organic correspondence reappears in the psychical sphere as an unconscious identity.
We find here for the first time, too, something like a constancy of sex in the persons who play a part in the phantasy. The children who are being beaten are almost invariably boys, in the phantasies of boys just as much as in those of girls. This characteristic is naturally not to be explained by any rivalry between the sexes, as otherwise of course in the phantasies of boys it would be girls who would be being beaten; and it has nothing to do with the sex of the child who was hated in the first phase. But it points to a complication in the case of girls. When they turn away from their incestuous love for their father, with its genital significance, they easily abandon their feminine role. They spur their 'masculinity complex' (Van Ophuijsen, 1917) into activity, and from that time forward only want to be boys. For that reason the whipping-boys who represent them are boys too. In both the cases of day-dreaming - one of which almost rose to the level of a work of art - the heroes were always young men; indeed women used not to come into these creations at all, and only made their first appearance after many years, and then in minor parts.

[1919e, 3652]

Little light is thrown upon the genesis of masochism by our discussion of the beating-phantasy. To begin with, there seems to be a confirmation of the view that masochism is not the manifestation of a primary instinct, but originates from sadism which has been turned round upon the self - that is to say, by means of regression from an object to the ego.¹ Instincts with a passive aim must be taken for granted as existing, especially among women. But passivity is not the whole of masochism. The characteristic of unpleasure belongs to it as well, - a bewildering accompaniment to the satisfaction of an instinct. The transformation of sadism into masochism appears to be due to the influence of the sense of guilt which takes part in the act of repression. Thus repression is operative here in three ways: it renders the consequences of the genital organization unconscious, it compels that organization itself to regress to the earlier sadistic-anal stage, and it transforms the sadism of this stage into masochism, which is passive and again in a certain sense narcissistic. The second of these three effects is made possible by the weakness of the genital organization, which must be presupposed in these cases. The third becomes necessary because the sense of guilt takes as much objection to sadism as to incestuous object-choice genitally conceived. Again, the analyses do not tell us the origin of the sense of guilt itself. It seems to be brought along by the new phase upon which the child is entering, and, if it afterwards persists, it seems to correspond to a scar-like formation which is similar to the sense of inferiority. According to our present orientation in the structure of the ego, which is as yet uncertain, we should assign it to the agency in the mind which sets itself up as a critical conscience over against the rest of the ego, which produces Silberer's functional phenomenon in dreams, and which cuts itself loose from the ego in delusions of being watched. [1919e, 3654]
I am aware of the importance attaching to the first of these questions. But one should not exaggerate it and allow it to overshadow the fact that sporadic secondary characteristics of the opposite sex are very often present in normal individuals, and that well-marked physical characteristics of the opposite sex may be found in persons whose choice of object has undergone no change in the direction of inversion; in other words, that in both sexes the degree of physical hermaphroditism is to a great extent independent of psychical hermaphroditism. In modification of these statements it must be added that this independence is more evident in men than women, where bodily and mental traits belonging to the opposite sex are apt to coincide. Still I am not in a position to give a satisfactory answer to the first of our questions about my patient. The psycho-analyst customarily forgoes a thorough physical examination of his patients in certain cases. Certainly there was no obvious deviation from the feminine physical type, nor any menstrual disturbance. The beautiful and well-made girl had, it is true, her father's tall figure, and her facial features were sharp rather than soft and girlish, traits which might be regarded as indicating a physical masculinity. Some of her intellectual attributes also could be connected with masculinity: for instance, her acuteness of comprehension and her lucid objectivity, in so far as she was not dominated by her passion. But these distinctions are conventional rather than scientific. What is certainly of greater importance is that in her behaviour towards her love-object she had throughout assumed the masculine part: that is to say, she displayed the humility and the sublime overvaluation of the sexual object so characteristic of the male lover, the renunciation of all narcissistic satisfaction, and the preference for being the lover rather than the beloved. She had thus not only chosen a feminine love-object, but had also developed a masculine attitude towards that object.

After this highly discursive introduction I am only able to present a very concise summary of the sexual history of the case under consideration. In childhood the girl had passed through the normal attitude characteristic of the feminine Oedipus complex¹ in a way that was not at all remarkable, and had later also begun to substitute for her father a brother slightly older than herself. She did not remember any sexual traumas in early life, nor were any discovered by the analysis. Comparison of her brother's genital organs and her own, which took place about the beginning of the latency period (at five years old or perhaps a little earlier), left a strong impression on her and had far-reaching after-effects. There were very few signs pointing to infantile masturbation, or else the analysis did not go far enough to throw light on this point. The birth of a second brother when she was between five and six years old exercised no special influence upon her development. During the pre-pubertal years at school she gradually became acquainted with the facts of sex, and she received this knowledge with mixed feelings of lasciviousness and frightened aversion, in a way which may be called normal and was not exaggerated in degree. This amount of information about her seems meagre enough, nor can I guarantee that it is complete. It may be that the history of her youth was much richer in experiences; I do not know. As I have already said, the analysis was broken off after a short time, and therefore yielded an anamnesis not much more reliable than the other anamneses of homosexuals, which there is good cause to question. Further, the girl had never been neurotic, and came to the analysis without even one hysterical symptom, so that opportunities for investigating the history of her childhood did not present themselves so readily as usual.

[1920a, 3844]
The analysis showed, further, that the girl had brought along with her from her childhood a strongly marked 'masculinity complex'. A spirited girl, always ready for romping and fighting, she was not at all prepared to be second to her slightly older brother; after inspecting his genital organs she had developed a pronounced envy for the penis, and the thoughts derived from this envy still continued to fill her mind. She was in fact a feminist; she felt it to be unjust that girls should not enjoy the same freedom as boys, and rebelled against the lot of woman in general. At the time of the analysis the idea of pregnancy and child-birth was disagreeable to her, partly, I surmise, on account of the bodily disfigurement connected with them. Her girlish narcissism had fallen back on this defence,¹ and ceased to express itself as pride in her good looks. Various clues indicated that she must formerly have had strong exhibitionist and scopophilic tendencies. Anyone who is anxious that the claims of acquired as opposed to hereditary factors should not be under-estimated in aetiology will call attention to the fact that the girl's behaviour, as described above, was exactly what would follow from the combined effect in a person with a strong mother-fixation of the two influences of her mother's neglect and her comparison of her genital organs with her brother's. It is possible here to attribute to the impress of the operation of external influence in early life something which one would have liked to regard as a constitutional peculiarity. On the other hand, a part even of this acquired disposition (if it was really acquired) has to be ascribed to inborn constitution. So we see in practice a continual mingling and blending of what in theory we should try to separate into a pair of opposites - namely, inherited and acquired characters.

[1920a, 3858]

When it happens that a person has to give up a sexual object, there quite often ensues an alteration of his ego which can only be described as a setting up of the object inside the ego, as it occurs in melancholia; the exact nature of this substitution is as yet unknown to us. It may be that by this introjection, which is a kind of regression to the mechanism of the oral phase, the ego makes it easier for the object to be given up or renders that process possible. It may be that this identification is the sole condition under which the id can give up its objects. At any rate the process, especially in the early phases of development, is a very frequent one, and it makes it possible to suppose that the character of the ego is a precipitate of abandoned object-cathexes and that it contains the history of those object-choices. It must, of course, be admitted from the outset that there are varying degrees of capacity for resistance, which decide the extent to which a person's character fends off or accepts the influences of the history of his erotic object-choices. In women who have had many experiences in love there seems to be no difficulty in finding vestiges of their object-cathexes in the traits of their character. We must also take into consideration cases of simultaneous object-cathexis and identification - cases, that is, in which the alteration in character occurs before the object has been given up. In such cases the alteration in character has been able to survive the object-relation and in a certain sense to conserve it.

[1923b, 3963]

Erotogenic masochism accompanies the libido through all its developmental phases and derives from them its changing psychical coatings. The fear of being eaten up by the totem animal (the father) originates from the primitive oral organization; the wish to be beaten by the father comes from the sadistic-anal phase which follows it; castration, although it is later disavowed, enters into the content of masochistic phantasies as a precipitate of the phallic stage or organization;¹ and from the final genital organization there arise, of course, the situations of being copulated with and of giving birth, which are characteristic of femaleness. The part played in masochism by the nates, too, is easily understandable, apart from its obvious basis in reality. The nates are the part of the body which is given erotogenic preference in the sadistic-anal phase, like the breast in the oral phase and the penis in the genital phase.

[1924c, 4077]
At this point our material - for some incomprehensible reason - becomes far more obscure and full of gaps. The female sex, too, develops an Oedipus complex, a super-ego and a latency period. May we also attribute a phallic organization and a castration complex to it? The answer is in the affirmative; but these things cannot be the same as they are in boys. Here the feminist demand for equal rights for the sexes does not take us far, for the morphological distinction is bound to find expression in differences of psychical development. 'Anatomy is Destiny', to vary a saying of Napoleon's. The little girl's clitoris behaves just like a penis to begin with; but, when she makes a comparison with a playfellow of the other sex, she perceives that she has 'come off badly' and she feels this as a wrong done to her and as a ground for inferiority. For a while still she consoles herself with the expectation that later on, when she grows older, she will acquire just as big an appendage as the boy's. Here the masculinity complex of women branches off. A female child, however, does not understand her lack of a penis as being a sex character; she explains it by assuming that at some earlier date she had possessed an equally large organ and had then lost it by castration. She seems not to extend this inference from herself to other, adult females, but, entirely on the lines of the phallic phase, to regard them as possessing large and complete - that is to say, male - genitals. The essential difference thus comes about that the girl accepts castration as an accomplished fact, whereas the boy fears the possibility of its occurrence.

The fear of castration being thus excluded in the little girl, a powerful motive also drops out for the setting-up of a super-ego and for the breaking-off of the infantile genital organization. In her, far more than in the boy, these changes seem to be the result of upbringing and of intimidation from outside which threatens her with a loss of love. The girl's Oedipus complex is much simpler than that of the small bearer of the penis; in my experience, it seldom goes beyond the taking of her mother's place and the adopting of a feminine attitude towards her father. Renunciation of the penis is not tolerated by the girl without some attempt at compensation. She slips - along the line of a symbolic equation, one might say - from the penis to a baby. Her Oedipus complex culminates in a desire, which is long retained, to receive a baby from her father as a gift - to bear him a child. One has an impression that the Oedipus complex is then gradually given up because this wish is never fulfilled. The two wishes - to possess a penis and a child - remain strongly cathexed in the unconscious and help to prepare the female creature for her later sexual role. The comparatively lesser strength of the sadistic contribution to her sexual instinct, which we may no doubt connect with the stunted growth of her penis, makes it easier in her case for the direct sexual trends to be transformed into aim-inhibited trends of an affectionate kind. It must be admitted, however, that in general our insight into these developmental processes in girls is unsatisfactory, incomplete and vague.

The old paediatrician Lindner once remarked that a child discovers the genital zones (the penis or the clitoris) as a source of pleasure while indulging in sensual sucking (thumb sucking).¹ I shall leave it an open question whether it is really true that the child takes the newly found source of pleasure in exchange for the recent loss of the mother's nipple - a possibility to which later phantasies (fellatio) seem to point. Be that as it may, the genital zone is discovered at some time or other, and there seems no justification for attributing any psychical content to the first activities in connection with it. But the first step in the phallic phase which begins in this way is not the linking-up of the masturbation with the object-cathexes of the Oedipus complex, but a momentous discovery which little girls are destined to make. They notice the penis of a brother or playmate, strikingly visible and of large proportions, at once recognize it as the superior counterpart of their own small and inconspicuous organ, and from that time forward fall a victim to envy for the penis.
Here what has been named the masculinity complex of women branches off. It may put great difficulties in the way of their regular development towards femininity, if it cannot be got over soon enough. The hope of some day obtaining a penis in spite of everything and so of becoming like a man may persist to an incredibly late age and may become a motive for strange and otherwise unaccountable actions. Or again, a process may set in which I should like to call a 'disavowal', a process which in the mental life of children seems neither uncommon nor very dangerous but which in an adult would mean the beginning of a psychosis. Thus a girl may refuse to accept the fact of being castrated, may harden herself in the conviction that she does possess a penis, and may subsequently be compelled to behave as though she were a man.

The psychical consequences of envy for the penis, in so far as it does not become absorbed in the reaction-formation of the masculinity complex, are various and far-reaching. After a woman has become aware of the wound to her narcissism, she develops, like a scar, a sense of inferiority. When she has passed beyond her first attempt at explaining her lack of a penis as being a punishment personal to herself and has realized that that sexual character is a universal one, she begins to share the contempt felt by men for a sex which is the lesser in so important a respect, and, at least in holding that opinion, insists on being like a man.

Even after penis-envy has abandoned its true object, it continues to exist: by an easy displacement it persists in the character-trait of jealousy. Of course, jealousy is not limited to one sex and has a wider foundation than this, but I am of opinion that it plays a far larger part in the mental life of women than of men and that that is because it is enormously reinforced from the direction of displaced penis-envy. While I was still unaware of this source of jealousy and was considering the phantasy 'a child is being beaten', which occurs so commonly in girls, I constructed a first phase for it in which its meaning was that another child, a rival of whom the subject was jealous, was to be beaten. This phantasy seems to be a relic of the phallic period in girls. The peculiar rigidity which struck me so much in the monotonous formula 'a child is being beaten' can probably be interpreted in a special way. The child which is being beaten (or caressed) may ultimately be nothing more nor less than the clitoris itself, so that at its very lowest level the statement will contain a confession of masturbation, which has remained attached to the content of the formula from its beginning in the phallic phase till later life.

A third consequence of penis-envy seems to be a loosening of the girl's relation with her mother as a love-object. The situation as a whole is not very clear, but it can be seen that in the end the girl's mother, who sent her into the world so insufficiently equipped, is almost always held responsible for her lack of a penis. The way in which this comes about historically is often that soon after the girl has discovered that her genitals are unsatisfactory she begins to show jealousy of another child on the ground that her mother is fonder of it than of her, which serves as a reason for her giving up her affectionate relation to her mother. It will fit in with this if the child which has been preferred by her mother is made into the first object of the beating-phantasy which ends in masturbation.
There is yet another surprising effect of penis-envy, or of the discovery of the inferiority of the clitoris, which is undoubtedly the most important of all. In the past I had often formed an impression that in general women tolerate masturbation worse than men, that they more frequently fight against it and that they are unable to make use of it in circumstances in which a man would seize upon it as a way of escape without any hesitation. Experience would no doubt elicit innumerable exceptions to this statement, if we attempted to turn it into a rule. The reactions of human individuals of both sexes are of course made up of masculine and feminine traits. But it appeared to me nevertheless as though masturbation were further removed from the nature of women than of men, and the solution of the problem could be assisted by the reflection that masturbation, at all events of the clitoris, is a masculine activity and that the elimination of clitoridal sexuality is a necessary precondition for the development of femininity. Analyses of the remote phallic period have now taught me that in girls, soon after the first signs of penis-envy, an intense current of feeling against masturbation makes its appearance, which cannot be attributed exclusively to the educational influence of those in charge of the child. This impulse is clearly a forerunner of the wave of repression which at puberty will do away with a large amount of the girl's masculine sexuality in order to make room for the development of her femininity. It may happen that this first opposition to auto-erotic activity fails to attain its end. And this was in fact the case in the instances which I analysed. The conflict continued, and both then and later the girl did everything she could to free herself from the compulsion to masturbate. Many of the later manifestations of sexual life in women remain unintelligible unless this powerful motive is recognized.

I cannot explain the opposition which is raised in this way by little girls to phallic masturbation except by supposing that there is some concurrent factor which turns her violently against that pleasurable activity. Such a factor lies close at hand. It cannot be anything else than her narcissistic sense of humiliation which is bound up with penis-envy, the reminder that after all this is a point on which she cannot compete with boys and that it would therefore be best for her to give up the idea of doing so. Thus the little girl's recognition of the anatomical distinction between the sexes forces her away from masculinity and masculine masturbation on to new lines which lead to the development of femininity.

So far there has been no question of the Oedipus complex, nor has it up to this point played any part. But now the girl's libido slips into a new position along the line - there is no other way of putting it - of the equation 'penis-child'. She gives up her wish for a penis and puts in place of it a wish for a child: and with that purpose in view she takes her father as a love object. Her mother becomes the object of her jealousy. The girl has turned into a little woman. If I am to credit a single analytic instance, this new situation can give rise to physical sensations which would have to be regarded as a premature awakening of the female genital apparatus. When the girl's attachment to her father comes to grief later on and has to be abandoned, it may give place to an identification with him and the girl may thus return to her masculinity complex and perhaps remain fixated in it.
I have now said the essence of what I had to say: I will stop, therefore, and cast an eye over our findings. We have gained some insight into the prehistory of the Oedipus complex in girls. The corresponding period in boys is more or less unknown. In girls the Oedipus complex is a secondary formation. The operations of the castration complex precede it and prepare for it. As regards the relation between the Oedipus and castration complexes there is a fundamental contrast between the two sexes. Wherein in boys the Oedipus complex is destroyed by the castration complex, in girls it is made possible and led up to by the castration complex. This contradiction is cleared up if we reflect that the castration complex always operates in the sense implied in its subject-matter: it inhibits and limits masculinity and encourages femininity. The difference between the sexual development of males and females at the stage we have been considering is an intelligible consequence of the anatomical distinction between their genitals and of the psychical situation involved in it; it corresponds to the difference between a castration that has been carried out and one that has merely been threatened. In their essentials, therefore, our findings are self-evident and it should have been possible to foresee them.

In girls the motive for the demolition of the Oedipus complex is lacking. Castration has already had its effect, which was to force the child into the situation of the Oedipus complex. Thus the Oedipus complex escapes the fate which it meets with in boys: it may be slowly abandoned or dealt with by repression, or its effects may persist far into women's normal mental life. I cannot evade the notion (though I hesitate to give it expression) that for women the level of what is ethically normal is different from what it is in men. Their super-ego is never so inexorable, so impersonal, so independent of its emotional origins as we require it to be in men. Character-traits which critics of every epoch have brought up against women - that they show less sense of justice than men, that they are less ready to submit to the great exigencies of life, that they are more often influenced in their judgements by feelings of affection or hostility - all these would be amply accounted for by the modification in the formation of their super-ego which we have inferred above. We must not allow ourselves to be deflected from such conclusions by the denials of the feminists, who are anxious to force us to regard the two sexes as completely equal in position and worth; but we shall, of course, willingly agree that the majority of men are also far behind the masculine ideal and that all human individuals, as a result of their bisexual disposition and of cross-inheritance, combine in themselves both masculine and feminine characteristics, so that pure masculinity and femininity remain theoretical constructions of uncertain content.

¹ (Footnote added 1935:) The information about infantile sexuality was obtained from the study of men and the theory deduced from it was concerned with male children. It was natural enough to expect to find a complete parallel between the two sexes; but this turned out not to hold. Further investigations and reflections revealed profound differences between the sexual development of men and women. The first sexual object of a baby girl (just as of a baby boy) is her mother; and before a woman can reach the end of her normal development she has to change not only her sexual object but also her leading genital zone. From this circumstance difficulties arise and possibilities of inhibition which are not present in the case of men.

That there is a relationship between inhibition and anxiety is pretty evident. Some inhibitions obviously represent a relinquishment of a function because its exercise would produce anxiety. Many women are openly afraid of the sexual function. We class this anxiety under hysteria, just as we do the defensive symptom of disgust which, arising originally as a deferred reaction to the experiencing of a passive sexual act, appears later whenever the idea of such an act is presented. Furthermore, many obsessional acts turn out to be measures of precaution and security against sexual experiences and are thus of a phobic character.
This is as far as our investigations into the formation of symptoms take us. It is hardly worth while summing them up, for the results they have yielded are scanty and incomplete and tell us scarcely anything that we do not already know. It would be fruitless to turn our attention to symptom-formation in other disorders besides phobias, conversion hysteria and obsessional neurosis, for too little is known about them. But in reviewing those three neuroses together we are brought up against a very serious problem the consideration of which can no longer be put off. All three have as their outcome the destruction of the Oedipus complex; and in all three the motive force of the ego’s opposition is, we believe, the fear of castration. Yet it is only in the phobias that this fear comes to the surface and is acknowledged. What has become of it in the other two neuroses? How has the ego spared itself this fear? The problem becomes accentuated when we recall the possibility, already referred to, that anxiety arises directly, by a kind of fermentation, from a libidinal cathexis whose processes have been disturbed. Furthermore, is it absolutely certain that fear of castration is the only motive force of repression (or defence)? If we think of neuroses in women we are bound to doubt it. For though we can with certainty establish in them the presence of a castration complex, we can hardly speak with propriety of castration anxiety where castration has already taken place.

When, in an earlier part of this discussion, we found that the danger of castration was of importance in more than one neurotic illness, we put ourselves on guard against overestimating that factor, since it could not be a decisive one for the female sex, who are undoubtedly more subject to neuroses than men. We now see that there is no danger of our regarding castration anxiety as the sole motive force of the defensive processes which lead to neurosis. I have shown elsewhere how little girls, in the course of their development, are led into making a tender object-cathexis by their castration complex. It is precisely in women that the danger situation of loss of object seems to have remained the most effective. All we need to do is to make a slight modification in our description of their determinant of anxiety, in the sense that it is no longer a matter of feeling the want of, or actually losing the object itself, but of losing the object’s love. Since there is no doubt that hysteria has a strong affinity with femininity, just as obsessional neurosis has with masculinity, it appears probable that, as a determinant of anxiety, loss of love plays much the same part in hysteria as the threat of castration does in phobias and fear of the super-ego in obsessional neurosis.

¹ It may quite often happen that although a danger-situation is correctly estimated in itself, a certain amount of instinctual anxiety is added to the realistic anxiety. In that case the instinctual demand before whose satisfaction the ego recoils is a masochistic one: the instinct of destruction directed against the subject himself. Perhaps an addition of this kind explains cases in which reactions of anxiety are exaggerated, inexpedient or paralysing. Phobias of heights (windows, towers, precipices and so on) may have some such origin. Their hidden feminine significance is closely connected with masochism.

Another characteristic of early infantile sexuality is that the female sexual organ proper as yet plays no part in it: the child has not yet discovered it. Stress falls entirely on the male organ, all the child’s interest is directed towards the question of whether it is present or not. We know less about the sexual life of little girls than of boys. But we need not feel ashamed of this distinction; after all, the sexual life of adult women is a ‘dark continent’ for psychology. But we have learnt that girls feel deeply their lack of a sexual organ that is equal in value to the male one; they regard themselves on that account as inferior, and this ‘envy for the penis’ is the origin of a whole number of characteristic feminine reactions.
But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they must be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeble-mindedness' - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

Furthermore, women soon come into opposition to civilization and display their retarding and restraining influence - those very women who, in the beginning, laid the foundations of civilization by the claims of their love. Women represent the interests of the family and of sexual life. The work of civilization has become increasingly the business of men, it confronts them with ever more difficult tasks and compels them to carry out instinctual sublimations of which women are little capable. Since a man does not have unlimited quantities of psychical energy at his disposal, he has to accomplish his tasks by making an expedient distribution of his libido. What he employs for cultural aims he to a great extent withdraws from women and sexual life. His constant association with men, and his dependence on his relations with them, even estrange him from his duties as a husband and father. Thus the woman finds herself forced into the background by the claims of civilization and she adopts a hostile attitude towards it.

[1930a, 4497]
The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

[1930a, 4505]

In conclusion we may say that the normal prototype of fetishes is a man's penis, just as the normal prototype of inferior organs is a woman's real small penis, the clitoris.

[1927e, 4538]
The brilliantly told, faultlessly motivated story is of course complete in itself and is certain to make a deep effect upon the reader. But analysis shows us that its invention is based fundamentally upon a wishful phantasy belonging to the period of puberty, which a number of people actually remember consciously. The phantasy embodies a boy's wish that his mother should herself initiate him into sexual life in order to save him from the dreaded injuries caused by masturbation. (The numerous creative works that deal with the theme of redemption have the same origin.) The 'vice' of masturbation is replaced by the addiction to gambling; and the emphasis laid upon the passionate activity of the hands betrays this derivation. Indeed, the passion for play is an equivalent of the old compulsion to masturbate; 'playing' is the actual word used in the nursery to describe the activity of the hands upon the genitals. The irresistible nature of the temptation, the solemn resolutions, which are nevertheless invariably broken, never to do it again, the stupefying pleasure and the bad conscience which tells the subject that he is ruining himself (committing suicide) - all these elements remain unaltered in the process of substitution. It is true that Zweig's story is told by the mother, not by the son. It must flatter the son to think: 'if my mother only knew what dangers masturbation involves me in, she would certainly save me from them by allowing me to lavish all my tenderness on her own body'. The equation of the mother with a prostitute, which is made by the young man in the story, is linked up with the same phantasy. It brings the unattainable woman within easy reach. The bad conscience which accompanies the phantasy brings about the unhappy ending of the story. It is also interesting to notice how the façade given to the story by its author seeks to disguise its analytic meaning. For it is extremely questionable whether the erotic life of women is dominated by sudden and mysterious impulses. On the contrary, analysis reveals an adequate motivation for the surprising behaviour of this woman who had hitherto turned away from love. Faithful to the memory of her dead husband, she had armed herself against all similar attractions; but - and here the son's phantasy is right - she did not, as a mother, escape her quite unconscious transference of love on to her son, and Fate was able to catch her at this undefended spot. [1928b, 4568]

During the phase of the normal Oedipus complex we find the child tenderly attached to the parent of the opposite sex, while its relation to the parent of its own sex is predominantly hostile. In the case of a boy there is no difficulty in explaining this. His first love-object was his mother. She remains so; and, with the strengthening of his erotic desires and his deeper insight into the relations between his father and mother, the former is bound to become his rival. With the small girl it is different. Her first object, too, was her mother. How does she find her way to her father? How, when and why does she detach herself from her mother? We have long understood that the development of female sexuality is complicated by the fact that the girl has the task of giving up what was originally her leading genital zone the clitoris - in favour of a new zone - the vagina. But it now seems to us that there is a second change of the same sort which is no less characteristic and important for the development of the female: the exchange of her original object - her mother - for her father. The way in which the two tasks are connected with each other is not yet clear to us. [1931b, 4590]
It is well known that there are many women who have a strong attachment to their father; nor need they be in any way neurotic. It is upon such women that I have made the observations which I propose to report here and which have led me to adopt a particular view of female sexuality. I was struck, above all, by two facts. The first was that where the woman's attachment to her father was particularly intense, analysis showed that it had been preceded by a phase of exclusive attachment to her mother which had been equally intense and passionate. Except for the change of her love-object, the second phase had scarcely added any new feature to her erotic life. Her primary relation to her mother had been built up in a very rich and many-sided manner. The second fact taught me that the duration of this attachment had also been greatly underestimated. In several cases it lasted until well into the fourth year - in one case into the fifth year - so that it covered by far the longer part of the period of early sexual efflorescence. Indeed, we had to reckon with the possibility that a number of women remain arrested in their original attachment to their mother and never achieve a true change-over towards men. This being so, the pre-Oedipus phase in women gains an importance which we have not attributed to it hitherto.

Since this phase allows room for all the fixations and repressions from which we trace the origin of the neuroses, it would seem as though we must retract the universality of the thesis that the Oedipus complex is the nucleus of the neuroses. But if anyone feels reluctant about making this correction, there is no need for him to do so. On the one hand, we can extend the content of the Oedipus complex to include all the child's relations to both parents; or, on the other, we can take due account of our new findings by saying that the female only reaches the normal positive Oedipus situation after she has surmounted a period before it that is governed by the negative complex. And indeed during that phase a little girl's father is not much else for her than a troublesome rival, although her hostility towards him never reaches the pitch which is characteristic of boys. We have, after all, long given up any expectation of a neat parallelism between male and female sexual development.

Everything in the sphere of this first attachment to the mother seemed to me so difficult to grasp in analysis - so grey with age and shadowy and almost impossible to revivify - that it was as if it had succumbed to an especially inexorable repression. But perhaps I gained this impression because the women who were in analysis with me were able to cling to the very attachment to the father in which they had taken refuge from the early phase that was in question. It does indeed appear that women analysts - as, for instance, Jeanne Lampl-de Groot and Helene Deutsch - have been able to perceive these facts more easily and clearly because they were helped in dealing with those under their treatment by the transference to a suitable mother-substitute. Nor have I succeeded in seeing my way through any case completely, and I shall therefore confine myself to reporting the most general findings and shall give only a few examples of the new ideas which I have arrived at. Among these is a suspicion that this phase of attachment to the mother is especially intimately related to the aetiology of hysteria, which is not surprising when we reflect that both the phase and the neurosis are characteristically feminine, and further, that in this dependence on the mother we have the germ of later paranoia in women.¹ For this germ appears to be the surprising, yet regular, fear of being killed (?) devoured) by the mother. It is plausible to assume that this fear corresponds to a hostility which develops in the child towards her mother in consequence of the manifold restrictions imposed by the latter in the course of training and bodily care and that the mechanism of projection is favoured by the early age of the child's psychical organization.

¹[1931b, 4591]
First of all, there can be no doubt that the bisexuality, which is present, as we believe, in the innate disposition of human beings, comes to the fore much more clearly in women than in men. A man, after all, has only one leading sexual zone, one sexual organ, whereas a woman has two: the vagina - the female organ proper - and the clitoris, which is analogous to the male organ. We believe we are justified in assuming that for many years the vagina is virtually non-existent and possibly does not produce sensations until puberty. It is true that recently an increasing number of observers report that vaginal impulses are present even in these early years. In women, therefore, the main genital occurrences of childhood must take place in relation to the clitoris. Their sexual life is regularly divided into two phases, of which the first has a masculine character, while only the second is specifically feminine. Thus in female development there is a process of transition from the one phase to the other, to which there is nothing analogous in the male. A further complication arises from the fact that the clitoris, with its virile character, continues to function in later female sexual life in a manner which is very variable and which is certainly not yet satisfactorily understood. We do not, of course, know the biological basis of these peculiarities in women; and still less are we able to assign them any teleological purpose.

[1931b, 4592]

Parallel with this first great difference there is the other, concerned with the finding of the object. In the case of a male, his mother becomes his first love-object as a result of her feeding him and looking after him, and she remains so until she is replaced by someone who resembles her or is derived from her. A female's first object, too, must be her mother: the primary conditions for a choice of object are, of course, the same for all children. But at the end of her development, her father - a man - should have become her new love-object. In other words, to the change in her own sex there must correspond a change in the sex of her object. The new problems that now require investigating are in what way this change takes place, how radically or how incompletely it is carried out, and what the different possibilities are which present themselves in the course of this development.

[1931b, 4592]

Quite different are the effects of the castration complex in the female. She acknowledges the fact of her castration, and with it, too, the superiority of the male and her own inferiority; but she rebels against this unwelcome state of affairs. From this divided attitude three lines of development open up. The first leads to a general revulsion from sexuality. The little girl, frightened by the comparison with boys, grows dissatisfied with her clitoris, and gives up her phallic activity and with it her sexuality in general as well as a good part of her masculinity in other fields. The second line leads her to cling with defiant self-assertiveness to her threatened masculinity. To an incredibly late age she clings to the hope of getting a penis some time. That hope becomes her life's aim; and the phantasy of being a man in spite of everything often persists as a formative factor over long periods. This ‘masculinity complex’ in women can also result in a manifest homosexual choice of object. Only if her development follows the third, very circuitous, path does she reach the final normal female attitude, in which she takes her father as her object and so finds her way to the feminine form of the Oedipus complex. Thus in women the Oedipus complex is the end-result of a fairly lengthy development. It is not destroyed, but created, by the influence of castration; it escapes the strongly hostile influences which, in the male, have a destructive effect on it, and indeed it is all too often not surmounted by the female at all. For this reason, too, the cultural consequences of its break-up are smaller and of less importance in her. We should probably not be wrong in saying that it is this difference in the reciprocal relation between the Oedipus and the castration complex which gives its special stamp to the character of females as social beings.¹

[1931b, 4594]
It is to be anticipated that men analysts with feminist views, as well as our women analysts, will disagree with what I have said here. They will hardly fail to object that such notions spring from the 'masculinity complex' of the male and are designed to justify on theoretical grounds his innate inclination to disparage and suppress women. But this sort of psycho-analytic argumentation reminds us here, as it so often does, of Dostoevsky's famous 'knife that cuts both ways'. The opponents of those who argue in this way will on their side think it quite natural that the female sex should refuse to accept a view which appears to contradict their eagerly coveted equality with men. The use of analysis as a weapon of controversy can clearly lead to no decision.

We see, then, that the phase of exclusive attachment to the mother, which may be called the pre-Oedipus phase, possesses a far greater importance in women than it can have in men. Many phenomena of female sexual life which were not properly understood before can be fully explained by reference to this phase. Long ago, for instance, we noticed that many women who have chosen their husband on the model of their father, or have put him in their father's place, nevertheless repeat towards him, in their married life, their bad relations with their mother. The husband of such a woman was meant to be the inheritor of her relation to her father, but in reality he became the inheritor of her relation to her mother. This is easily explained as an obvious case of regression. Her relation to her mother was the original one, and her attachment to her father was built up on it, and now, in marriage, the original relation emerges from repression. For the main content of her development to womanhood lay in the carrying over of her affective object attachments from her mother to her father.

With many women we have the impression that their years of maturity are occupied by a struggle with their husband, just as their youth was spent in a struggle with their mother. In the light of the previous discussions we shall conclude that their hostile attitude to their mother is not a consequence of the rivalry implicit in the Oedipus complex, but originates from the preceding phase and has merely been reinforced and exploited in the Oedipus situation. And actual analytic examination confirms this view. Our interest must be directed to the mechanisms that are at work in her turning away from the mother who was an object so intensely and exclusively loved. We are prepared to find, not a single factor, but a whole number of them operating together towards the same end.

Among these factors are some which are determined by the circumstances of infantile sexuality in general, and so hold good equally for the erotic life of boys. First and foremost we may mention jealousy of other people - of brothers and sisters, rivals, among whom the father too has a place. Childhood love is boundless; it demands exclusive possession, it is not content with less than all. But it has a second characteristic: it has, in point of fact, no aim and is incapable of obtaining complete satisfaction; and principally for that reason it is doomed to end in disappointment and to give place to a hostile attitude. Later on in life the lack of an ultimate satisfaction may favour a different result. This very factor may ensure the uninterrupted continuance of the libidinal cathexis, as happens with love-relations that are inhibited in their aim. But in the stress of the processes of development it regularly happens that the libido abandons its unsatisfying position in order to find a new one.
Another, much more specific motive for turning away from the mother arises from the effect of the castration complex on the creature who is without a penis. At some time or other the little girl makes the discovery of her organic inferiority - earlier and more easily, of course, if there are brothers or other boys about. We have already taken note of the three paths which diverge from this point: (a) the one which leads to a cessation of her whole sexual life, (b) the one which leads to a defiant over-emphasis of her masculinity, and (c) the first steps towards definitive femininity. It is not easy to determine the exact timing here or the typical course of events. Even the point of time when the discovery of castration is made varies, and a number of other factors seem to be inconstant and to depend on chance. The state of the girl's own phallic activity plays a part; and so too does the question whether this activity was found out or not, and how much interference with it she experienced afterwards.

Little girls usually discover for themselves their characteristic phallic activity - masturbation of the clitoris; and to begin with this is no doubt unaccompanied by phantasy. The part played in starting it by nursery hygiene is reflected in the very common phantasy which makes the mother or nurse into a seducer. Whether little girls masturbate less frequently and from the first less energetically than little boys is not certain; quite possibly it is so. Actual seduction, too, is common enough; it is initiated either by other children or by someone in charge of the child who wants to soothe it, or send it to sleep or make it dependent on them. Where seduction intervenes it invariably disturbs the natural course of the developmental processes, and it often leaves behind extensive and lasting consequences.

A prohibition of masturbation, as we have seen, becomes an incentive for giving it up; but it also becomes a motive for rebelling against the person who prohibits it - that is to say, the mother, or the mother-substitute who later regularly merges with her. A defiant persistence in suppressing her masturbation, the effect of the apparently vain prohibition is seen in her later efforts to free herself at all costs from a satisfaction which has been spoilt for her. When she reaches maturity her object-choice may still be influenced by this persisting purpose. Her resentment at being prevented from free sexual activity plays a big part in her detachment from her mother. The same motive comes into operation again after puberty, when her mother takes up her duty of guarding her daughter's chastity. We shall, of course, not forget that the mother is similarly opposed to a boy's masturbating and thus provides him, too, with a strong motive for rebellion.

When the little girl discovers her own deficiency, from seeing a male genital, it is only with hesitation and reluctance that she accepts the unwelcome knowledge. As we have seen, she clings obstinately to the expectation of one day having a genital of the same kind too, and her wish for it survives long after her hope has expired. The child invariably regards castration in the first instance as a misfortune peculiar to herself; only later does she realize that it extends to certain other children and lastly to certain grown-ups. When she comes to understand the general nature of this characteristic, it follows that femaleness - and with it, of course, her mother - suffers a great depreciation in her eyes.
However this may be, at the end of this first phase of attachment to the mother, there emerges, as the girl's strongest motive for turning away from her, the reproach that her mother did not give her a proper penis - that is to say, brought her into the world as a female. A second reproach, which does not reach quite so far back, is rather a surprising one. It is that her mother did not give her enough milk, did not suckle her long enough. Under the conditions of modern civilization this may be true often enough, but certainly not so often as is asserted in analyses. It would seem rather that this accusation gives expression to the general dissatisfaction of children, who, in our monogamous civilization, are weaned from the breast after six or nine months, whereas the primitive mother devotes herself exclusively to her child for two or three years. It is as though our children had remained for ever unsated, as though they had never sucked long enough at their mother's breast. But I am not sure whether, if one analysed children who had been suckled as long as the children of primitive peoples, one would not come upon the same complaint. Such is the greed of a child's libido!

[1931b, 4598]

When we survey the whole range of motives for turning away from the mother which analysis brings to light - that she failed to provide the little girl with the only proper genital, that she did not feed her sufficiently, that she compelled her to share her mother's love with others, that she never fulfilled all the girl's expectations of love, and, finally, that she first aroused her sexual activity and then forbade it - all these motives seem nevertheless insufficient to justify the girl's final hostility. Some of them follow inevitably from the nature of infantile sexuality; others appear like rationalizations devised later to account for the uncomprehended change in feeling. Perhaps the real fact is that the attachment to the mother is bound to perish, precisely because it was the first and was so intense; just as one can often see happen in the first marriages of young women which they have entered into when they were most passionately in love. In both situations the attitude of love probably comes to grief from the disappointments that are unavoidable and from the accumulation of occasions for aggression. As a rule, second marriages turn out much better.

[1931b, 4598]

The turning-away from her mother is an extremely important step in the course of a little girl's development. It is more than a mere change of object. We have already described what takes place in it and the many motives put forward for it; we may now add that hand in hand with it there is to be observed a marked lowering of the active sexual impulses and a rise of the passive ones. It is true that the active trends have been affected by frustration more strongly; they have proved totally unrealizable and are therefore abandoned by the libido more readily. But the passive trends have not escaped disappointment either. With the turning-away from the mother clitoridal masturbation frequently ceases as well; and often enough when the small girl represses her previous masculinity a considerable portion of her sexual trends in general is permanently injured too. The transition to the father-object is accomplished with the help of the passive trends in so far as they have escaped the catastrophe. The path to the development of femininity now lies open to the girl, to the extent to which it is not restricted by the remains of the pre-Oedipus attachment to her mother which she has surmounted.

[1931b, 4603]

If we now survey the stage of sexual development in the female which I have been describing, we cannot resist coming to a definite conclusion about female sexuality as a whole. We have found the same libidinal forces at work in it as in the male child and we have been able to convince ourselves that for a period of time these forces follow the same course and have the same outcome in each.

[1931b, 4604]
Biological factors subsequently deflect those libidinal forces from their original aims and conduct even active and in every sense masculine trends into feminine channels. Since we cannot dismiss the notion that sexual excitation is derived from the operation of certain chemical substances, it seems plausible at first to expect that biochemistry will one day disclose a substance to us whose presence produces a male sexual excitation and another substance which produces a female one. But this hope seems no less naïve than the other one - happily obsolete to-day - that it may be possible under the microscope to isolate the different exciting factors of hysteria, obsessional neurosis, melancholia, and so on.

Abraham's (1921) description of the manifestations of the castration complex in the female is still unsurpassed; but one would be glad if it had included the factor of the girl's original exclusive attachment to her mother. I am in agreement with the principal points in Jeanne Lampl-de Groot's¹ (1927) important paper. In this the complete identity of the pre-Oedipus phase in boys and girls is recognized, and the girl's sexual (phallic) activity towards her mother is affirmed and substantiated by observations. The turning-away from the mother is traced to the influence of the girl's recognition of castration, which obliges her to give up her sexual object, and often masturbation along with it. The whole development is summed up in the formula that the girl goes through a phase of the 'negative' Oedipus complex before she can enter the positive one. A point on which I find the writer's account inadequate is that it represents the turning-away from the mother as being merely a change of object and does not discuss the fact that it is accompanied by the plainest manifestations of hostility. To this hostility full justice is done in Helene Deutsch's latest paper, on feminine masochism and its relation to frigidity (1930), in which she also recognizes the girl's phallic activity and the intensity of her attachment to her mother. Helene Deutsch states further that the girl's turning towards her father takes place viâ her passive trends (which have already been awakened in relation to her mother). In her earlier book (1925) the author had not yet set herself free from the endeavour to apply the Oedipus pattern to the pre-Oedipus phase, and she therefore interpreted the little girl's phallic activity as an identification with her father.

Some writers are inclined to reduce the importance of the child's first and most original libidinal impulses in favour of later developmental processes, so that - to put this view in its most extreme form - the only role left to the former is merely to indicate certain paths, while the intensities which flow along those paths are supplied by later regressions and reaction-formations. Thus, for instance, Karin Horney (1926) is of the opinion that we greatly overestimate the girl's primary penis-envy and that the strength of the masculine trend which she develops later is to be attributed to a secondary penis-envy which is used to fend off her feminine impulses and, in particular, her feminine attachment to her father. This does not tally with my impressions. Certain as is the occurrence of later reinforcements through regression and reaction-formation, and difficult as it is to estimate the relative strength of the confluent libidinal components, I nevertheless think that we should not overlook the fact that the first libidinal impulses have an intensity of their own which is superior to any that come later and which may indeed be termed incommensurable. It is undoubtedly true that there is an antithesis between the attachment to the father and the masculinity complex; it is the general antithesis that exists between activity and passivity, masculinity and femininity. But this gives us no right to assume that only one of them is primary and that the other owes its strength merely to the force of defence. And if the defence against femininity is so energetic, from what other source can it draw its strength than from the masculine trend which found its first expression in the child's penis-envy and therefore deserves to be named after it?
We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how this particular symbol had come to have that particular meaning. In such cases confirmations from elsewhere - from philology, folklore, mythology or ritual - were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak. We have said that in a woman's dreams this stands for a man. I hope it will impress you when you hear that Theodor Reik (1920) gives us this information: 'During the extremely ancient bridal ceremonial of the Bedouins, the bridegroom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!" (Quoted from Robert Eisler). We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922) a spider in dreams is a symbol of the mother, but of the phallic mother, of whom we are afraid; so that the fear of spiders expresses dread of mother-incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same motif of fright at castration. The other symbol I want to talk to you about is that of the bridge, which has been explained by Ferenczi (1921 and 1922). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. In so far as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore.

[1933a, 4637]

The basis of the process is what is called an 'identification' - that is to say, the assimilation of one ego to another one, as a result of which the first ego behaves like the second in certain respects, imitates it and in a sense takes it up into itself. Identification has been not unsuitably compared with the oral, cannibalistic incorporation of the other person. It is a very important form of attachment to someone else, probably the very first, and not the same thing as the choice of an object. The difference between the two can be expressed in some such way as this. If a boy identifies himself with his father, he wants to be like his father; if he makes him the object of his choice, he wants to have him, to possess him. In the first case his ego is altered on the model of his father; in the second case that is not necessary. Identification and object-choice are to a large extent independent of each other; it is however possible to identify oneself with someone whom, for instance, one has taken as a sexual object, and to alter one's ego on his model. It is said that the influencing of the ego by the sexual object occurs particularly often with women and is characteristic of femininity. I must already have spoken to you in my earlier lectures of what is by far the most instructive relation between identification and object-choice. It can be observed equally easily in children and adults, in normal as in sick people. If one has lost an object or has been obliged to give it up, one often compensates oneself by identifying oneself with it and by setting it up once more in one's ego, so that here object-choice regresses, as it were, to identification.

[1933a, 4672]
Fear of castration is not, of course, the only motive for repression: indeed, it finds no place in women, for though they have a castration complex they cannot have a fear of being castrated. Its place is taken in their sex by a fear of loss of love, which is evidently a later prolongation of the infant's anxiety if it finds its mother absent. You will realize how real a situation of danger is indicated by this anxiety. If a mother is absent or has withdrawn her love from her child, it is no longer sure of the satisfaction of its needs and is perhaps exposed to the most distressing feelings of tension. Do not reject the idea that these determinants of anxiety may at bottom repeat the situation of the original anxiety at birth, which, to be sure, also represented a separation from the mother. Indeed, if you follow a train of thought suggested by Ferenczi, you may add the fear of castration to this series, for a loss of the male organ results in an inability to unite once more with the mother (or a substitute for her) in the sexual act. I may mention to you incidentally that the very frequent phantasy of returning into the mother's womb is a substitute for this wish to copulate. There would be many interesting things and surprising connections to tell you at this point, but I cannot go outside the framework of an introduction to psycho-analysis. I will only draw your attention to the fact that here psychological researches trench upon the facts of biology.

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is ‘taken on lease’ from the rectum: in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.

To-day's lecture, too, should have no place in an introduction; but it may serve to give you an example of a detailed piece of analytic work, and I can say two things to recommend it. It brings forward nothing but observed facts, almost without any speculative additions, and it deals with a subject which has a claim on your interest second almost to no other. Throughout history people have knocked their heads against the riddle of the nature of femininity -
Nor will you have escaped worrying over this problem - those of you who are men; to those of you who are women this will not apply - you are yourselves the problem. When you meet a human being, the first distinction you make is 'male or female?' and you are accustomed to make the distinction with unhesitating certainty. Anatomical science shares your certainty at one point and not much further. The male sexual product, the spermatozoon, and its vehicle are male; the ovum and the organism that harbours it are female. In both sexes organs have been formed which serve exclusively for the sexual functions; they were probably developed from the same disposition into two different forms. Besides this, in both sexes the other organs, the bodily shapes and tissues, show the influence of the individual's sex, but this is inconstant and its amount variable; these are what are known as the secondary sexual characters. Science next tells you something that runs counter to your expectations and is probably calculated to confuse your feelings. It draws your attention to the fact that portions of the male sexual apparatus also appear in women's bodies, though in an atrophied state, and vice versa in the alternative case. It regards their occurrence as indications of bisexuality, as though an individual is not a man or a woman but always both - merely a certain amount more the one than the other. You will then be asked to make yourselves familiar with the idea that the proportion in which masculine and feminine are mixed in an individual is subject to quite considerable fluctuations. Since, however, apart from the very rarest cases, only one kind of sexual product - ova or semen - is nevertheless present in one person, you are bound to have doubts as to the decisive significance of those elements and must conclude that what constitutes masculinity or femininity is an unknown characteristic which anatomy cannot lay hold of.

Can psychology do so perhaps? We are accustomed to employ 'masculine' and 'feminine' as mental qualities as well, and have in the same way transferred the notion of bisexuality to mental life. Thus we speak of a person, whether male or female, as behaving in a masculine way in one connection and in a feminine way in another. But you will soon perceive that this is only giving way to anatomy or to convention. You cannot give the concepts of 'masculine' and 'feminine' any new connotation. The distinction is not a psychological one; when you say 'masculine', you usually mean 'active', and when you say 'feminine', you usually mean 'passive'. Now it is true that a relation of the kind exists. The male sex-cell is actively mobile and searches out the female one, and the latter, the ovum, is immobile and waits passively. This behaviour of the elementary sexual organisms is indeed a model for the conduct of sexual individuals during intercourse. The male pursues the female for the purpose of sexual union, seizes hold of her and penetrates into her. But by this you have precisely reduced the characteristic of masculinity to the factor of aggressiveness so far as psychology is concerned. You may well doubt whether you have gained any real advantage from this when you reflect that in some classes of animals the females are the stronger and more aggressive and the male is active only in the single act of sexual union. This is so, for instance, with the spiders. Even the functions of rearing and caring for the young, which strike us as feminine par excellence, are not invariably attached to the female sex in animals. In quite high species we find that the sexes share the task of caring for the young between them or even that the male alone devotes himself to it. Even in the sphere of human sexual life you soon see how inadequate it is to make masculine behaviour coincide with activity and feminine with passivity. A mother is active in every sense towards her child; the act of lactation itself may equally be described as the mother suckling the baby or as her being sucked by it. The further you go from the narrow sexual sphere the more obvious will the 'error of superimposition' become. Women can display great activity in various directions, men are not able to live in company with their own kind unless they develop a large amount of passive adaptability. If you now tell me that these facts go to prove precisely that both men and women are bisexual in the psychological sense, I shall conclude that you have decided in your own minds to make 'active' coincide with 'masculine' and 'passive' with 'feminine'. But I advise you against it. It seems to me to serve no useful purpose and adds nothing to our knowledge.
One might consider characterizing femininity psychologically as giving preference to passive aims. This is not, of course, the same thing as passivity; to achieve a passive aim may call for a large amount of activity. It is perhaps the case that in a woman, on the basis of her share in the sexual function, a preference for passive behaviour and passive aims is carried over into her life to a greater or lesser extent, in proportion to the limits, restricted or far-reaching, within which her sexual life thus serves as a model. But we must beware in this of underestimating the influence of social customs, which similarly force women into passive situations. All this is still far from being cleared up. There is one particularly constant relation between femininity and instinctual life which we do not want to overlook. The suppression of women's aggressiveness which is prescribed for them constitutionally and imposed on them socially favours the development of powerful masochistic impulses, which succeed, as we know, in binding erotically the destructive trends which have been diverted inwards. Thus masochism, as people say, is truly feminine. But if, as happens so often, you meet with masochism in men, what is left to you but to say that these men exhibit very plain feminine traits?

And now you are already prepared to hear that psychology too is unable to solve the riddle of femininity. The explanation must no doubt come from elsewhere, and cannot come till we have learnt how in general the differentiation of living organisms into two sexes came about. We know nothing about it, yet the existence of two sexes is a most striking characteristic of organic life which distinguishes it sharply from inanimate nature. However, we find enough to study in those human individuals who, through the possession of female genitals, are characterized as manifestly or predominantly feminine. In conformity with its peculiar nature, psycho-analysis does not try to describe what a woman is - that would be a task it could scarcely perform - but sets about enquiring how she comes into being, how a woman develops out of a child with a bisexual disposition. In recent times we have begun to learn a little about this, thanks to the circumstance that several of our excellent women colleagues in analysis have begun to work at the question. The discussion of this has gained special attractiveness from the distinction between the sexes. For the ladies, whenever some comparison seemed to turn out unfavourable to their sex, were able to utter a suspicion that we, the male analysts, had been unable to overcome certain deeply-rooted prejudices against what was feminine, and that this was being paid for in the partiality of our researches. We, on the other hand, standing on the ground of bisexuality, had no difficulty in avoiding impoliteness. We had only to say: 'This doesn't apply to you. You're the exception; on this point you're more masculine than feminine.'
We approach the investigation of the sexual development of women with two expectations. The first is that here once more the constitution will not adapt itself to its function without a struggle. The second is that the decisive turning-points will already have been prepared for or completed before puberty. Both expectations are promptly confirmed. Furthermore, a comparison with what happens with boys tells us that the development of a little girl into a normal woman is more difficult and more complicated, since it includes two extra tasks, to which there is nothing corresponding in the development of a man. Let us follow the parallel lines from their beginning. Undoubtedly the material is different to start with in boys and girls: it did not need psycho-analysis to establish that. The difference in the structure of the genitals is accompanied by other bodily differences which are too well known to call for mention. Differences emerge too in the instinctual disposition which give a glimpse of the later nature of women. A little girl is as a rule less aggressive, defiant and self-sufficient; she seems to have a greater need for being shown affection and on that account to be more dependent and pliant. It is probably only as a result of this pliancy that she can be taught more easily and quicker to control her excretions: urine and faeces are the first gifts that children make to those who look after them, and controlling them is the first concession to which the instinctual life of children can be induced. One gets an impression, too, that little girls are more intelligent and livelier than boys of the same age; they go out more to meet the external world and at the same time form stronger object-cathexes. I cannot say whether this lead in development has been confirmed by exact observations, but in any case there is no question that girls cannot be described as intellectually backward. These sexual differences are not, however, of great consequence: they can be outweighed by individual variations. For our immediate purposes they can be disregarded.

Both sexes seem to pass through the early phases of libidinal development in the same manner. It might have been expected that in girls there would already have been some lag in aggressiveness in the sadistic-anal phase, but such is not the case. Analysis of children's play has shown our women analysts that the aggressive impulses of little girls leave nothing to be desired in the way of abundance and violence. With their entry into the phallic phase the differences between the sexes are completely eclipsed by their agreements. We are now obliged to recognize that the little girl is a little man. In boys, as we know, this phase is marked by the fact that they have learnt how to derive pleasurable sensations from their small penis and connect its excited state with their ideas of sexual intercourse. Little girls do the same thing with their still smaller clitoris. It seems that with them all their masturbatory acts are carried out on this penis-equivalent, and that the truly feminine vagina is still undiscovered by both sexes. It is true that there are a few isolated reports of early vaginal sensations as well, but it could not be easy to distinguish these from sensations in the anus or vestibulum; in any case they cannot play a great part. We are entitled to keep to our view that in the phallic phase of girls the clitoris is the leading erotogenic zone. But it is not, of course, going to remain so. With the change to femininity the clitoris should wholly or in part hand over its sensitivity, and at the same time its importance, to the vagina. This would be one of the two tasks which a woman has to perform in the course of her development, whereas the more fortunate man has only to continue at the time of his sexual maturity the activity that he has previously carried out at the period of the early efflorescence of his sexuality.
We shall return to the part played by the clitoris; let us now turn to the second task with which a girl's development is burdened. A boy's mother is the first object of his love, and she remains so too during the formation of his Oedipus complex and, in essence, all through his life. For a girl too her first object must be her mother (and the figures of wet-nurses and foster-mothers that merge into her). The first object-cathexes occur in attachment to the satisfaction of the major and simple vital needs, and the circumstances of the care of children are the same for both sexes. But in the Oedipus situation the girl's father has become her love-object, and we expect that in the normal course of development she will find her way from this paternal object to her final choice of an object. In the course of time, therefore, a girl has to change her erotogenic zone and her object - both of which a boy retains. The question then arises of how this happens: in particular, how does a girl pass from her mother to an attachment to her father? or, in other words, how does she pass from her masculine phase to the feminine one to which she is biologically destined?

[1933a, 4720]

It would be a solution of ideal simplicity if we could suppose that from a particular age onwards the elementary influence of the mutual attraction between the sexes makes itself felt and impels the small woman towards men, while the same law allows the boy to continue with his mother. We might suppose in addition that in this the children are following the pointer given them by the sexual preference of their parents. But we are not going to find things so easy; we scarcely know whether we are to believe seriously in the power of which poets talk so much and with such enthusiasm but which cannot be further dissected analytically. We have found an answer of quite another sort by means of laborious investigations, the material for which at least was easy to arrive at. For you must know that the number of women who remain till a late age tenderly dependent on a paternal object, or indeed on their real father, is very great. We have established some surprising facts about these women with an intense attachment of long duration to their father. We knew, of course, that there had been a preliminary stage of attachment to the mother, but we did not know that it could be so rich in content and so long-lasting, and could leave behind so many opportunities for fixations and dispositions. During this time the girl's father is only a troublesome rival; in some cases the attachment to her mother lasts beyond the fourth year of life. Almost everything that we find later in her relation to her father was already present in this earlier attachment and has been transferred subsequently on to her father. In short, we get an impression that we cannot understand women unless we appreciate this phase of their pre-Oedipus attachment to their mother.

[1933a, 4721]
We shall be glad, then, to know the nature of the girl's libidinal relations to her mother. The answer is that they are of very many different kinds. Since they persist through all three phases of infantile sexuality, they also take on the characteristics of the different phases and express themselves by oral, sadistic-anal and phallic wishes. These wishes represent active as well as passive impulses; if we relate them to the differentiation of the sexes which is to appear later - though we should avoid doing so as far as possible - we may call them masculine and feminine. Besides this, they are completely ambivalent, both affectionate and of a hostile and aggressive nature. The latter often only come to light after being changed into anxiety ideas. It is not always easy to point to a formulation of these early sexual wishes; what is most clearly expressed is a wish to get the mother with child and the corresponding wish to bear her a child - both belonging to the phallic period and sufficiently surprising, but established beyond doubt by analytic observation. The attractiveness of these investigations lies in the surprising detailed findings which they bring us. Thus, for instance, we discover the fear of being murdered or poisoned, which may later form the core of a paranoic illness, already present in this pre-Oedipus period, in relation to the mother. Or another case: you will recall an interesting episode in the history of analytic research which caused me many distressing hours. In the period in which the main interest was directed to discovering infantile sexual traumas, almost all my women patients told me that they had been seduced by their father. I was driven to recognize in the end that these reports were untrue and so came to understand that hysterical symptoms are derived from phantasies and not from real occurrences. It was only later that I was able to recognize in this phantasy of being seduced by the father the expression of the typical Oedipus complex in women. And now we find the phantasy of seduction once more in the pre-Oedipus prehistory of girls; but the seducer is regularly the mother. Here, however, the phantasy touches the ground of reality, for it was really the mother who by her activities over the child's bodily hygiene inevitably stimulated, and perhaps even roused for the first time, pleasurable sensations in her genitals.

As you hear, then, we ascribe a castration complex to women as well. And for good reasons, though its content cannot be the same as with boys. In the latter the castration complex arises after they have learnt from the sight of the female genitals that the organ which they value so highly need not necessarily accompany the body. At this the boy recalls to mind the threats he brought on himself by his doings with that organ, he begins to give credence to them and falls under the influence of fear of castration, which will be the most powerful motive force in his subsequent development. The castration complex of girls is also started by the sight of the genitalia of the other sex. They at once notice the difference and, it must be admitted, its significance too. They feel seriously wronged, often declare that they want 'to have something like it too', and fall a victim to 'envy for the penis', which will leave ineradicable traces on their development and the formation of their character and which will not be surmounted in even the most favourable cases without a severe expenditure of psychical energy. The girl's recognition of the fact of her being without a penis does not by any means imply that she submits to the fact easily. On the contrary, she continues to hold on for a long time to the wish to get something like it herself and she believes in that possibility for improbably long years; and analysis can show that, at a period when knowledge of reality has long since rejected the fulfilment of the wish as unattainable, it persists in the unconscious and retains a considerable cathexis of energy. The wish to get the longed-for penis eventually in spite of everything may contribute to the motives that drive a mature woman to analysis, and what she may reasonably expect from analysis - a capacity, for instance, to carry on an intellectual profession - may often be recognized as a sublimated modification of this repressed wish.

[1933a, 4722]
One cannot very well doubt the importance of envy for the penis. You may take it as an instance of male injustice if I assert that envy and jealousy play an even greater part in the mental life of women than of men. It is not that I think these characteristics are absent in men or that I think they have no other roots in women than envy for the penis; but I am inclined to attribute their greater amount in women to this latter influence. Some analysts, however, have shown an inclination to depreciate the importance of this first instalment of penis-envy in the phallic phase. They are of opinion that what we find of this attitude in women is in the main a secondary structure which has come about on the occasion of later conflicts by regression to this early infantile impulse. This, however, is a general problem of depth psychology. In many pathological - or even unusual - instinctual attitudes (for instance, in all sexual perversions) the question arises of how much of their strength is to be attributed to early infantile fixations and how much to the influence of later experiences and developments. In such cases it is almost always a matter of complemental series such as we put forward in our discussion of the aetiology of the neuroses. Both factors play a part in varying amounts in the causation; a less on the one side is balanced by a more on the other. The infantile factor sets the pattern in all cases but does not always determine the issue, though it often does. Precisely in the case of penis-envy I should argue decidedly in favour of the preponderance of the infantile factor.

[1933a, 4727]

The discovery that she is castrated is a turning-point in a girl's growth. Three possible lines of development start from it: one leads to sexual inhibition or to neurosis, the second to change of character in the sense of a masculinity complex, the third, finally, to normal femininity. We have learnt a fair amount, though not everything, about all three.

[1933a, 4728]

The essential content of the first is as follows: the little girl has hitherto lived in a masculine way, has been able to get pleasure by the excitation of her clitoris and has brought this activity into relation with her sexual wishes directed towards her mother, which are often active ones; now, owing to the influence of her penis-envy, she loses her enjoyment in her phallic sexuality. Her self-love is mortified by the comparison with the boy's far superior equipment and in consequence she renounces her masturbatory satisfaction from her clitoris, repudiates her love for her mother and at the same time not infrequently represses a good part of her sexual trends in general. No doubt her turning away from her mother does not occur all at once, for to begin with the girl regards her castration as an individual misfortune, and only gradually extends it to other females and finally to her mother as well. Her love was directed to her phallic mother; with the discovery that her mother is castrated it becomes possible to drop her as an object, so that the motives for hostility, which have long been accumulating, gain the upper hand. This means, therefore, that as a result of the discovery of women's lack of a penis they are debased in value for girls just as they are for boys and later perhaps for men.

[1933a, 4728]
You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitorial masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

Along with the abandonment of clitorial masturbation a certain amount of activity is renounced. Passivity now has the upper hand, and the girl's turning to her father is accomplished principally with the help of passive instuctual impulses. You can see that a wave of development like this, which clears the phallic activity out of the way, smooths the ground for femininity. If too much is not lost in the course of it through repression, this femininity may turn out to be normal. The wish with which the girl turns to her father is no doubt originally the wish for a penis which her mother has refused her and which she now expects from her father. The feminine situation is only established, however, if the wish for a penis is replaced by one for a baby, if, that is, a baby takes the place of a penis in accordance with an ancient symbolic equivalence. It has not escaped us that the girl has wished for a baby earlier, in the undisturbed phallic phase: that, of course, was the meaning of her playing with dolls. But that play was not in fact an expression of her femininity; it served as an identification with her mother with the intention of substituting activity for passivity. She was playing the part of her mother and the doll was herself: now she could do with the baby everything that her mother used to do with her. Not until the emergence of the wish for a penis does the doll-baby become a baby from the girl's father, and thereafter the aim of the most powerful feminine wish. Her happiness is great if later on this wish for a baby finds fulfilment in reality, and quite especially so if the baby is a little boy who brings the longed-for penis with him. Often enough in her combined picture of 'a baby from her father' the emphasis is laid on the baby and her father left unstressed. In this way the ancient masculine wish for the possession of a penis is still faintly visible through the femininity now achieved. But perhaps we ought rather to recognize this wish for a penis as being par excellence a feminine one.
With the transference of the wish for a penis-baby on to her father, the girl has entered the situation of the Oedipus complex. Her hostility to her mother, which did not need to be freshly created, is now greatly intensified, for she becomes the girl's rival, who receives from her father everything that she desires from him. For a long time the girl's Oedipus complex concealed her pre-Oedipus attachment to her mother from our view, though it is nevertheless so important and leaves such lasting fixations behind it. For girls the Oedipus situation is the outcome of a long and difficult development; it is a kind of preliminary solution, a position of rest which is not soon abandoned, especially as the beginning of the latency period is not far distant. And we are now struck by a difference between the two sexes, which is probably momentous, in regard to the relation of the Oedipus complex to the castration complex. In a boy the Oedipus complex, in which he desires his mother and would like to get rid of his father as being a rival, develops naturally from the phase of his phallic sexuality. The threat of castration compels him, however, to give up that attitude. Under the impression of the danger of losing his penis, the Oedipus complex is abandoned, repressed and, in the most normal cases, entirely destroyed, and a severe super-ego is set up as its heir. What happens with a girl is almost the opposite. The castration complex prepares for the Oedipus complex instead of destroying it; the girl is driven out of her attachment to her mother through the influence of her envy for the penis and she enters the Oedipus situation as though into a haven of refuge. In the absence of fear of castration the chief motive is lacking which leads boys to surmount the Oedipus complex. Girls remain in it for an indeterminate length of time; they demolish it late and, even so, incompletely. In these circumstances the formation of the super-ego must suffer; it cannot attain the strength and independence which give it its cultural significance, and feminists are not pleased when we point out to them the effects of this factor upon the average feminine character.

[1933a, 4731]

To go back a little. We mentioned as the second possible reaction to the discovery of female castration the development of a powerful masculinity complex. By this we mean that the girl refuses, as it were, to recognize the unwelcome fact and, defiantly rebellious, even exaggerates her previous masculinity, clings to her clitoridal activity and takes refuge in an identification with her phallic mother or her father. What can it be that decides in favour of this outcome? We can only suppose that it is a constitutional factor, a greater amount of activity, such as is ordinarily characteristic of a male. However that may be, the essence of this process is that at this point in development the wave of passivity is avoided which opens the way to the turn towards femininity. The extreme achievement of such a masculinity complex would appear to be the influencing of the choice of an object in the sense of manifest homosexuality. Analytic experience teaches us, to be sure, that female homosexuality is seldom or never a direct continuation of infantile masculinity. Even for a girl of this kind it seems necessary that she should take her father as an object for some time and enter the Oedipus situation. But afterwards, as a result of her inevitable disappointments from her father, she is driven to regress into her early masculinity complex. The significance of these disappointments must not be exaggerated; a girl who is destined to become feminine is not spared them, though they do not have the same effect. The predominance of the constitutional factor seems indisputable; but the two phases in the development of female homosexuality are well mirrored in the practices of homosexuals, who play the parts of mother and baby with each other as often and as clearly as those of husband and wife.

[1933a, 4732]
It is not my intention to pursue the further behaviour of femininity through puberty to the period of maturity. Our knowledge, moreover, would be insufficient for the purpose. But I will bring a few features together in what follows. Taking its prehistory as a starting-point, I will only emphasize here that the development of femininity remains exposed to disturbance by the residual phenomena of the early masculine period. Regressions to the fixations of the pre-Oedipus phases very frequently occur; in the course of some women's lives there is a repeated alternation between periods in which masculinity or femininity gains the upper hand. Some portion of what we men call 'the enigma of women' may perhaps be derived from this expression of bisexuality in women's lives. But another question seems to have become ripe for judgement in the course of these researches. We have called the motive force of sexual life 'the libido'. Sexual life is dominated by the polarity of masculine-feminine; thus the notion suggests itself of considering the relation of the libido to this antithesis. It would not be surprising if it were to turn out that each sexuality had its own special libido appropriated to it, so that one sort of libido would pursue the aims of a masculine sexual life and another sort those of a feminine one. But nothing of the kind is true. There is only one libido, which serves both the masculine and the feminine sexual functions. To it itself we cannot assign any sex; if, following the conventional equation of activity and masculinity, we are inclined to describe it as masculine, we must not forget that it also covers trends with a passive aim. Nevertheless the juxtaposition 'feminine libido' is without any justification. Furthermore, it is our impression that more constraint has been applied to the libido when it is pressed into the service of the feminine function, and that - to speak teleologically - Nature takes less careful account of its demands than in the case of masculinity. And the reason for this may lie - thinking once again teleologically - in the fact that the accomplishment of the aim of biology has been entrusted to the aggressiveness of men and has been made to some extent independent of women's consent.

I have promised to tell you of a few more psychical peculiarities of mature femininity, as we come across them in analytic observation. We do not lay claim to more than an average validity for these assertions; nor is it always easy to distinguish what should be ascribed to the influence of the sexual function and what to social breeding. Thus, we attribute a larger amount of narcissism to femininity, which also affects women's choice of object, so that to be loved is a stronger need for them than to love. The effect of penis-envy has a share, further, in the physical vanity of women, since they are bound to value their charms more highly as a late compensation for their original sexual inferiority. Shame, which is considered to be a feminine characteristic par excellence but is far more a matter of convention than might be supposed, has as its purpose, we believe, concealment of genital deficiency. We are not forgetting that at a later time shame takes on other functions. It seems that women have made few contributions to the discoveries and inventions in the history of civilization; there is, however, one technique which they may have invented - that of plaiting and weaving. If that is so, we should be tempted to guess the unconscious motive for the achievement. Nature herself would seem to have given the model which this achievement imitates by causing the growth at maturity of the pubic hair that conceals the genitals. The step that remained to be taken lay in making the threads adhere to one another, while on the body they stick into the skin and are only matted together. If you reject this idea as fantastic and regard my belief in the influence of lack of a penis on the configuration of femininity as an idée fixe, I am of course defenceless.

[1933a, 4733]

[1933a, 4734]
The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him.

A woman's identification with her mother allows us to distinguish two strata: the pre-Oedipus one which rests on her affectionate attachment to her mother and takes her as a model, and the later one from the Oedipus complex which seeks to get rid of her mother and take her place with her father. We are no doubt justified in saying that much of both of them is left over for the future and that neither of them is adequately surmounted in the course of development. But the phase of the affectionate pre-Oedipus attachment is the decisive one for a woman's future: during it preparations are made for the acquisition of the characteristics with which she will later fulfil her role in the sexual function and perform her invaluable social tasks. It is in this identification too that she acquires her attractiveness to a man, whose Oedipus attachment to his mother it kindles into passion. How often it happens, however, that it is only his son who obtains what he himself aspired to! One gets an impression that a man's love and a woman's are a phase apart psychologically.
The fact that women must be regarded as having little sense of justice is no doubt related to the predominance of envy in their mental life; for the demand for justice is a modification of envy and lays down the condition subject to which one can put envy aside. We also regard women as weaker in their social interests and as having less capacity for sublimating their instincts than men. The former is no doubt derived from the disocial quality which unquestionably characterizes all sexual relations. Lovers find sufficiency in each other, and families too resist inclusion in more comprehensive associations. The aptitude for sublimation is subject to the greatest individual variations. On the other hand I cannot help mentioning an impression that we are constantly receiving during analytic practice. A man of about thirty strikes us as a youthful, somewhat unformed individual, whom we expect to make powerful use of the possibilities for development opened up to him by analysis. A woman of the same age, however, often frightens us by her psychical rigidity and unchangeability. Her libido has taken up final positions and seems incapable of exchanging them for others. There are no paths open to further development; it is as though the whole process had already run its course and remains thenceforward insusceptible to influence - as though, indeed, the difficult development to femininity had exhausted the possibilities of the person concerned. As therapists we lament this state of things, even if we succeed in putting an end to our patient's ailment by doing away with her neurotic conflict.

That is all I had to say to you about femininity. It is certainly incomplete and fragmentary and does not always sound friendly. But do not forget that I have only been describing women in so far as their nature is determined by their sexual function. It is true that that influence extends very far; but we do not overlook the fact that an individual woman may be a human being in other respects as well. If you want to know more about femininity, enquire from your own experiences of life, or turn to the poets, or wait until science can give you deeper and more coherent information.

The prohibition against thought issued by religion to assist in its self-preservation is also far from being free from danger either for the individual or for human society. Analytic experience has taught us that a prohibition like this, even if it is originally limited to a particular field, tends to widen out and thereafter to become the cause of severe inhibitions in the subject's conduct of life. This result may be observed, too, in the female sex, following from their being forbidden to have anything to do with their sexuality even in thought. Biography is able to point to the damage done by the religious inhibition of thought in the life stories of nearly all eminent individuals in the past. On the other hand intellect - or let us call it by the name that is familiar to us, reason - is among the powers which we may most expect to exercise a unifying influence on men - on men who are held together with such difficulty and whom it is therefore scarcely possible to rule. It may be imagined how impossible human society would be, merely if everyone had his own multiplication table and his own private units of length and weight. Our best hope for the future is that intellect - the scientific spirit, reason - may in process of time establish a dictatorship in the mental life of man. The nature of reason is a guarantee that afterwards it will not fail to give man's emotional impulses and what is determined by them the position they deserve. But the common compulsion exercised by such a dominance of reason will prove to be the strongest uniting bond among men and lead the way to further unions. Whatever, like religion's prohibition against thought, opposes such a development, is a danger for the future of mankind.
With the phallic phase and in the course of it the sexuality of early childhood reaches its height and approaches its dissolution. Thereafter boys and girls have different histories. Both have begun to put their intellectual activity at the service of sexual researches; both start off from the premiss of the universal presence of the penis. But now the paths of the sexes diverge. The boy enters the Oedipus phase; he begins to manipulate his penis and simultaneously has phantasies of carrying out some sort of activity with it in relation to his mother, till, owing to the combined effect of a threat of castration and the sight of the absence of a penis in females, he experiences the greatest trauma of his life and this introduces the period of latency with all its consequences. The girl, after vainly attempting to do the same as the boy, comes to recognize her lack of a penis or rather the inferiority of her clitoris, with permanent effects on the development of her character; as a result of this first disappointment in rivalry, she often begins by turning away altogether from sexual life.

² The occurrence of early vaginal excitations is often asserted. But it is most probable that what is in question are excitations in the clitoris - that is, in an organ analogous to the penis. This does not invalidate our right to describe the phase as phallic.

The effects of the castration complex in little girls are more uniform and no less profound. A female child has, of course, no need to fear the loss of a penis; she must, however, react to the fact of not having received one. From the very first she envies boys its possession; her whole development may be said to take place under the colours of envy for the penis. She begins by making vain attempts to do the same as boys and later, with greater success, makes efforts to compensate for her defect - efforts which may lead in the end to a normal feminine attitude. If during the phallic phase she tries to get pleasure like a boy by the manual stimulation of her genitals, it often happens that she fails to obtain sufficient satisfaction and extends her judgement of inferiority from her stunted penis to her whole self. As a rule she soon gives up masturbating, since she has no wish to be reminded of the superiority of her brother or playmate, and turns away from sexuality altogether.

² If a little girl persists in her first wish - to grow into a boy - in extreme cases she will end as a manifest homosexual, and otherwise she will exhibit markedly masculine traits in the conduct of her later life, will choose a masculine vocation, and so on. The other path leads by way of abandoning the mother she has loved: the daughter, under the influence of her envy for the penis, cannot forgive her mother for having sent her into the world so insufficiently equipped. In her resentment over this she gives up her mother and puts someone else in her place as the object of her love - her father. If one has lost a love-object, the most obvious reaction is to identify oneself with it, to replace it from within, as it were, by identification. This mechanism now comes to the little girl's help. Identification with her mother can take the place of attachment to her mother. The little daughter puts herself in her mother's place, as she has always done in her games; she tries to take her mother's place with her father, and begins to hate the mother she used to love, and from two motives: from jealousy as well as from mortification over the penis she has been denied. Her new relation to her father may start by having as its content a wish to have his penis at her disposal, but it culminates in another wish - to have a baby from him as a gift. The wish for a baby has thus taken the place of the wish for a penis, or has at all events split off from it.
It is an interesting thing that the relation between the Oedipus complex and the castration complex should take such a different shape - an opposite one, in fact - in the case of females as compared to that of males. In males, as we have seen, the threat of castration brings the Oedipus complex to an end; in females we find that, on the contrary, it is their lack of a penis that forces them into their Oedipus complex. It does little harm to a woman if she remains in her feminine Oedipus attitude. (The term 'Electra complex' has been proposed for it.) She will in that case choose her husband for his paternal characteristics and be ready to recognize his authority. Her longing to possess a penis, which is in fact unappeasable, may find satisfaction if she can succeed in completing her love for the organ by extending it to the bearer of the organ, just as happened earlier when she progressed from her mother's breast to her mother as a whole person.
[1940a [1938], 5001]

The two corresponding themes are in the female, *an envy for the penis* - a positive striving to possess a male genital - and, in the male, a struggle against his passive or feminine attitude to another male. What is common to the two themes was singled out at an early date by psychoanalytic nomenclature as an attitude towards the castration complex. Subsequently Alfred Adler brought the term 'masculine protest' into current use. It fits the case of males perfectly; but I think that, from the start, 'repudiation of femininity' would have been the correct description of this remarkable feature in the psychical life of human beings.
[1937c, 5044]

In trying to introduce this factor into the structure of our theory, we must not overlook the fact that it cannot, by its very nature, occupy the same position in both sexes. In males the striving to be masculine is completely ego-syntonic from the first; the passive attitude, since it presupposes an acceptance of castration, is energetically repressed, and often its presence is only indicated by excessive overcompensations. In females, too, the striving to be masculine is ego-syntonic at a certain period - namely in the phallic phase, before the development to femininity has set in. But it then succumbs to the momentous process of repression whose outcome, as has so often been shown, determines the fortunes of a woman's femininity. A great deal depends on whether a sufficient amount of her masculinity complex escapes repression and exercises a permanent influence on her character. Normally, large portions of the complex are transformed and contribute to the construction of her femininity: the appeased wish for a penis is destined to be converted into a wish for a baby and for a husband, who possesses a penis. It is strange, however, how often we find that the wish for masculinity has been retained in the unconscious and, from out of its state of repression, exercises a disturbing influence.
[1937c, 5044]
The paramount importance of these two themes - in females the wish for a penis and in males the struggle against passivity - did not escape Ferenczi's notice. In the paper read by him in 1927 he made it a requirement that in every successful analysis those two complexes must have been mastered.¹ I should like to add that, speaking from my own experience, I think that in this Ferenczi was asking a very great deal. At no other point in one's analytic work does one suffer more from an oppressive feeling that all one's repeated efforts have been in vain, and from a suspicion that one has been 'preaching to the winds', than when one is trying to persuade a woman to abandon her wish for a penis on the ground of its being unrealizable or when one is seeking to convince a man that a passive attitude to men does not always signify castration and that it is indispensable in many relationships in life. The rebellious overcompensation of the male produces one of the strongest transference-resistances. He refuses to subject himself to a father-substitute, or to feel indebted to him for anything, and consequently he refuses to accept his recovery from the doctor. No analogous transference can arise from the female's wish for a penis, but it is the source of outbreaks of severe depression in her, owing to an internal conviction that the analysis will be of no use and that nothing can be done to help her. And we can only agree that she is right, when we learn that her strongest motive in coming for treatment was the hope that, after all, she might still obtain a male organ, the lack of which was so painful to her.

[1937c, 5045]
Anyone who believes in the occurrence of half-intentional self-injury - if I may use a clumsy expression - will be prepared also to assume that in addition to consciously intentional suicide there is such a thing as half-intentional self-destruction (self-destruction with an unconscious intention), capable of making skilful use of a threat to life and of disguising it as a chance mishap. There is no need to think such self-destruction rare. For the trend to self-destruction is present to a certain degree in very many more human beings than those in whom it is carried out; self-injuries are as a rule a compromise between this instinct and the forces that are still working against it, and even where suicide actually results, the inclination to suicide will have been present for a long time before in lesser strength or in the form of an unconscious and suppressed trend.

[1901b, 1260]

As regards active algolagnia, sadism, the roots are easy to detect in the normal. The sexuality of most male human beings contains an element of aggressiveness - a desire to subjugate; the biological significance of it seems to lie in the need for overcoming the resistance of the sexual object by means other than the process of wooing. Thus sadism would correspond to an aggressive component of the sexual instinct which has become independent and exaggerated and, by displacement, has usurped the leading position.

[1905d, 1484]

² [Footnote added 1923:] The above passage was written at a time when Adler seemed still to be taking his stand upon the ground of psycho-analysis, and before he had put forward the masculine protest and disavowed repression. Since then I have myself been obliged to assert the existence of an 'aggressive instinct', but it is different from Adler's. I prefer to call it the 'destructive' or 'death instinct'. See Beyond the Pleasure Principle (1920) and The Ego and the Id (1923b). Its opposition to the libidinal instincts finds an expression in the familiar polarity of love and hate. My disagreement with Adler's view, which results in a universal characteristic of instincts in general being reduced to be the property of a single one of them, remains unaltered.

[1909b, 2118]

Let us suppose, then, that all the organic instincts are conservative, are acquired historically and tend towards the restoration of an earlier state of things. It follows that the phenomena of organic development must be attributed to external disturbing and diverting influences. The elementary living entity would from its very beginning have had no wish to change; if conditions remained the same, it would do no more than constantly repeat the same course of life. In the last resort, what has left its mark on the development of organisms must be the history of the earth we live in and of its relation to the sun. Every modification which is thus imposed upon the course of the organism's life is accepted by the conservative organic instincts and stored up for further repetition. Those instincts are therefore bound to give a deceptive appearance of being forces tending towards change and progress, whilst in fact they are merely seeking to reach an ancient goal by paths alike old and new. Moreover it is possible to specify this final goal of all organic striving. It would be in contradiction to the conservative nature of the instincts if the goal of life were a state of things which had never yet been attained. On the contrary, it must be an old state of things, an initial state from which the living entity has at one time or other departed and to which it is striving to return by the circuitous paths along which its development leads. If we are to take it as a truth that knows no exception that everything living dies for internal reasons - becomes inorganic once again - then we shall be compelled to say that 'the aim of life is death' and, looking backwards, that 'inanimate things existed before living ones'.

[1920g, 3740]
The attributes of life were at some time evoked in inanimate matter by the action of a force of whose nature we can form no conception. It may perhaps have been a process similar in type to that which later caused the development of consciousness in a particular stratum of living matter. The tension which then arose in what had hitherto been an inanimate substance endeavoured to cancel itself out. In this way the first instinct came into being: the instinct to return to the inanimate state. It was still an easy matter at that time for a living substance to die; the course of its life was probably only a brief one, whose direction was determined by the chemical structure of the young life. For a long time, perhaps, living substance was thus being constantly created afresh and easily dying, till decisive external influences altered in such a way as to oblige the still surviving substance to diverge ever more widely from its original course of life and to make ever more complicated détours before reaching its aim of death. These circuitous paths to death, faithfully kept to by the conservative instincts, would thus present us to-day with the picture of the phenomena of life. If we firmly maintain the exclusively conservative nature of instincts, we cannot arrive at any other notions as to the origin and aim of life.

[1920g, 3740]

The implications in regard to the great groups of instincts which, as we believe, lie behind the phenomena of life in organisms must appear no less bewildering. The hypothesis of self-preservation instincts, such as we attribute to all living beings, stands in marked opposition to the idea that instinctual life as a whole serves to bring about death. Seen in this light, the theoretical importance of the instincts of self-preservation, of self-assertion and of mastery greatly diminishes. They are component instincts whose function it is to assure that the organism shall follow its own path to death, and to ward off any possible ways of returning to inorganic existence other than those which are immanent in the organism itself. We have no longer to reckon with the organism's puzzling determination (so hard to fit into any context) to maintain its own existence in the face of every obstacle. What we are left with is the fact that the organism wishes to die only in its own fashion. Thus these guardians of life, too, were originally the myrmidons of death. Hence arises the paradoxical situation that the living organism struggles most energetically against events (dangers, in fact) which might help it to attain its life's aim rapidly - by a kind of short-circuit. Such behaviour is, however, precisely what characterizes purely instinctual as contrasted with intelligent efforts.

[1920g, 3741]

The instincts which watch over the destinies of these elementary organisms that survive the whole individual, which provide them with a safe shelter while they are defenceless against the stimuli of the external world, which bring about their meeting with other germ-cells, and so on - these constitute the group of the sexual instincts. They are conservative in the same sense as the other instincts in that they bring back earlier states of living substance; but they are conservative to a higher degree in that they are peculiarly resistant to external influences; and they are conservative too in another sense in that they preserve life itself for a comparatively long period.¹ They are the true life instincts. They operate against the purpose of the other instincts, which leads, by reason of their function, to death; and this fact indicates that there is an opposition between them and the other instincts, an opposition whose importance was long ago recognized by the theory of the neuroses. It is as though the life of the organism moved with a vacillating rhythm. One group of instincts rushes forward so as to reach the final aim of life as swiftly as possible; but when a particular stage in the advance has been reached, the other group jerks back to a certain point to make a fresh start and so prolong the journey. And even though it is certain that sexuality and the distinction between the sexes did not exist when life began, the possibility remains that the instincts which were later to be described as sexual may have been in operation from the very first, and it may not be true that it was only at a later time that they started upon their work of opposing the activities of the ‘ego-instincts’.²

[1920g, 3742]
If such an assumption as this is permissible, then we have met the demand that we should produce an example of a death instinct - though, it is true, a displaced one. But this way of looking at things is very far from being easy to grasp and creates a positively mystical impression. It looks suspiciously as though we were trying to find a way out of a highly embarrassing situation at any price. We may recall, however, that there is nothing new in an assumption of this kind. We put one forward on an earlier occasion, before there was any question of an embarrassing situation. Clinical observations led us at that time to the view that masochism, the component instinct which is complementary to sadism, must be regarded as sadism that has been turned round upon the subject's own ego. But there is no difference in principle between an instinct turning from an object to the ego and its turning from the ego to an object - which is the new point now under discussion. Masochism, the turning round of the instinct upon the subject's own ego, would in that case be a return to an earlier phase of the instinct's history, a regression. The account that was formerly given of masochism requires emendation as being too sweeping in one respect: there might be such a thing as primary masochism - a possibility which I had contested at that time.

Let us, however, return to the self-preservative sexual instincts. The experiments upon protista have already shown us that conjugation - that is, the coalescence of two individuals which separate soon afterwards without any subsequent cell-division occurring - has a strengthening and rejuvenating effect upon both of them. In later generations they show no signs of degenerating and seem able to put up a longer resistance to the injurious effects of their own metabolism. This single observation may, I think, be taken as typical of the effect produced by sexual union as well. But how is it that the coalescence of two only slightly different cells can bring about this renewal of life? The experiment which replaces the conjugation of protozoa by the application of chemical or even of mechanical stimuli (cf. Lipschütz, 1914) enables us to give what is no doubt a conclusive reply to this question. The result is brought about by the influx of fresh amounts of stimulus. This tallies well with the hypothesis that the life process of the individual leads for internal reasons to an abolition of chemical tensions, that is to say, to death, whereas union with the living substance of a different individual increases those tensions, introducing what may be described as fresh 'vital differences' which must then be lived off. As regards this dissimilarity there must of course be one or more optima. The dominating tendency of mental life, and perhaps of nervous life in general, is the effort to reduce, to keep constant or to remove internal tension due to stimuli (the 'Nirvana principle', to borrow a term from Barbara Low) - a tendency which finds expression in the pleasure principle; and our recognition of that fact is one of our strongest reasons for believing in the existence of death instincts.

[1920g, 3755]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructive or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulse towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.
From the first of these standpoints, the *dynamic* one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of *instincts*; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power (*the compulsion to repeat*); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name *libido*.

[1926f, 4403]

In none of my previous writings have I had so strong a feeling as now that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive instinct means an alteration of the psycho-analytic theory of the instincts.

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]

The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

[1930a, 4511]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]

For, whether a man is a homosexual or a necrophilic, a hysteric suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psychoanalysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in Wallenstein:

[1933a, 4743]
I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions that there is something at work in them - an instinct for hatred and destruction - which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of an instinct of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the instincts which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psycho-analysis?

[1933b, 4798]

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4800]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life.
[1937c, 5037]
Let us suppose, then, that all the organic instincts are conservative, are acquired historically and tend towards the restoration of an earlier state of things. It follows that the phenomena of organic development must be attributed to external disturbing and diverting influences. The elementary living entity would from its very beginning have had no wish to change; if conditions remained the same, it would do no more than constantly repeat the same course of life. In the last resort, what has left its mark on the development of organisms must be the history of the earth we live in and of its relation to the sun. Every modification which is thus imposed upon the course of the organism's life is accepted by the conservative organic instincts and stored up for further repetition. Those instincts are therefore bound to give a deceptive appearance of being forces tending towards change and progress, whilst in fact they are merely seeking to reach an ancient goal by paths alike old and new. Moreover it is possible to specify this final goal of all organic striving. It would be in contradiction to the conservative nature of the instincts if the goal of life were a state of things which had never yet been attained. On the contrary, it must be an old state of things, an initial state from which the living entity has at one time or other departed and to which it is striving to return by the circuitous paths along which its development leads. If we are to take it as a truth that knows no exception that everything living dies for internal reasons - becomes inorganic once again - then we shall be compelled to say that 'the aim of life is death' and, looking backwards, that 'inanimate things existed before living ones'.

[1920g, 3740]

The attributes of life were at some time evoked in inanimate matter by the action of a force of whose nature we can form no conception. It may perhaps have been a process similar in type to that which later caused the development of consciousness in a particular stratum of living matter. The tension which then arose in what had hitherto been an inanimate substance endeavoured to cancel itself out. In this way the first instinct came into being: the instinct to return to the inanimate state. It was still an easy matter at that time for a living substance to die; the course of its life was probably only a brief one, whose direction was determined by the chemical structure of the young life. For a long time, perhaps, living substance was thus being constantly created afresh and easily dying, till decisive external influences altered in such a way as to oblige the still surviving substance to diverge ever more widely from its original course of life and to make ever more complicated détours before reaching its aim of death. These circuitous paths to death, faithfully kept to by the conservative instincts, would thus present us to-day with the picture of the phenomena of life. If we firmly maintain the exclusively conservative nature of instincts, we cannot arrive at any other notions as to the origin and aim of life.

[1920g, 3740]

The implications in regard to the great groups of instincts which, as we believe, lie behind the phenomena of life in organisms must appear no less bewildering. The hypothesis of self-preservation instincts, such as we attribute to all living beings, stands in marked opposition to the idea that instinctual life as a whole serves to bring about death. Seen in this light, the theoretical importance of the instincts of self-preservation, of self-assertion and of mastery greatly diminishes. They are component instincts whose function it is to assure that the organism shall follow its own path to death, and to ward off any possible ways of returning to inorganic existence other than those which are immanent in the organism itself. We have no longer to reckon with the organism's puzzling determination (so hard to fit into any context) to maintain its own existence in the face of every obstacle. What we are left with is the fact that the organism wishes to die only in its own fashion. Thus these guardians of life, too, were originally the myrmidons of death. Hence arises the paradoxical situation that the living organism struggles most energetically against events (dangers, in fact) which might help it to attain its life's aim rapidly - by a kind of short-circuit. Such behaviour is, however, precisely what characterizes purely instinctual as contrasted with intelligent efforts.

[1920g, 3741]
The instincts which watch over the destinies of these elementary organisms that survive the whole individual, which provide them with a safe shelter while they are defenceless against the stimuli of the external world, which bring about their meeting with other germ-cells, and so on - these constitute the group of the sexual instincts. They are conservative in the same sense as the other instincts in that they bring back earlier states of living substance; but they are conservative to a higher degree in that they are peculiarly resistant to external influences; and they are conservative too in another sense in that they preserve life itself for a comparatively long period.¹ They are the true life instincts. They operate against the purpose of the other instincts, which leads, by reason of their function, to death; and this fact indicates that there is an opposition between them and the other instincts, an opposition whose importance was long ago recognized by the theory of the neuroses. It is as though the life of the organism moved with a vacillating rhythm. One group of instincts rushes forward so as to reach the final aim of life as swiftly as possible; but when a particular stage in the advance has been reached, the other group jerks back to a certain point to make a fresh start and so prolong the journey. And even though it is certain that sexuality and the distinction between the sexes did not exist when life began, the possibility remains that the instincts which were later to be described as sexual may have been in operation from the very first, and it may not be true that it was only at a later time that they started upon their work of opposing the activities of the 'ego-instincts'.²

Let us make a bold attempt at another step forward. It is generally considered that the union of a number of cells into a vital association - the multicellular character of organisms - has become a means of prolonging their life. One cell helps to preserve the life of another, and the community of cells can survive even if individual cells have to die. We have already heard that conjugation, too, the temporary coalescence of two unicellular organisms, has a life-preserving and rejuvenating effect on both of them. Accordingly, we might attempt to apply the libido theory which has been arrived at in psycho-analysis to the mutual relationship of cells. We might suppose that the life instincts or sexual instincts which are active in each cell take the other cells as their object, that they partly neutralize the death instincts (that is, the processes set up by them) in those cells and thus preserve their life; while the other cells do the same for them, and still others sacrifice themselves in the performance of this libidinal function. The germ-cells themselves would behave in a completely 'narcissistic' fashion - to use the phrase that we are accustomed to use in the theory of the neuroses to describe a whole individual who retains his libido in his ego and pays none of it out in object-cathexes. The germ-cells require their libido, the activity of their life instincts, for themselves, as a reserve against their later momentous constructive activity. (The cells of the malignant neoplasms which destroy the organism should also perhaps be described as narcissistic in this same sense: pathology is prepared to regard their germs as innate and to ascribe embryonic attributes to them.) In this way the libido of our sexual instincts would coincide with the Eros of the poets and philosophers which holds all living things together.

¹ [1920g, 3742]
² [1920g, 3751]
I will add a few words to clarify our terminology, which has undergone some development in the course of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and to the reproductive function. We retained this name after we had been obliged by the findings of psycho-analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into Eros, which seeks to force together and hold together the portions of living substance. What are commonly called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance. These speculations seek to solve the riddle of life by supposing that these two instincts were struggling with each other from the very first. It is not so easy, perhaps, to follow the transformations though which the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its object. These narcissistic self-preservation instincts had thenceforward to be counted among the libidinal sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our speculations have transformed this opposition into one between the life instincts (Eros) and the death instincts.

Let us make a sharper distinction than we have hitherto made between function and tendency. The pleasure principle, then, is a tendency operating in the service of a function whose business it is to free the mental apparatus entirely from excitation or to keep the amount of excitation in it constant or to keep it as low as possible. We cannot yet decide with certainty in favour of any of these ways of putting it; but it is clear that the function thus described would be concerned with the most universal endeavour of all living substance - namely to return to the quiescence of the inorganic world. We have all experienced how the greatest pleasure attainable by us, that of the sexual act, is associated with a momentary extinction of a highly intensified excitation. The binding of an instinctual impulse would be a preliminary function designed to prepare the excitation for its final elimination in the pleasure of discharge.

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.
I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]

Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.¹

[1923b, 3980]

¹ In fact, on our view it is through the agency of Eros that the destructive instincts that are directed towards the external world have been diverted from the self.

[1923b, 3980]

It will be remembered that we have taken the view that the principle which governs all mental processes is a special case of Fechner's 'tendency towards stability',¹ and have accordingly attributed to the mental apparatus the purpose of reducing to nothing, or at least of keeping as low as possible, the sums of excitation which flow in upon it. Barbara Low has suggested the name 'Nirvana principle' for this supposed tendency, and we have accepted the term. But we have unhesitatingly identified the pleasure-unpleasure principle with this Nirvana principle. Every displeasure ought thus to coincide with a heightening, and every pleasure with a lowering, of mental tension due to stimulus; the Nirvana principle (and the pleasure principle which is supposedly identical with it) would be entirely in the service of the death instincts, whose aim is to conduct the restlessness of life into the stability of the inorganic state, and it would have the function of giving warnings against the demands of the life instincts - the libido - which try to disturb the intended course of life. But such a view cannot be correct. It seems that in the series of feelings of tension we have a direct sense of the increase and decrease of amounts of stimulus, and it cannot be doubted that there are pleasurable tensions and unpleasant relaxations of tension. The state of sexual excitation is the most striking example of a pleasurable increase of stimulus of this sort, but it is certainly not the only one.

[1924c, 4071]
In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.

The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1925d, 4232]

[1930a, 4510]
The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

[1930a, 4511]

In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nurse-maids try to appease with their lullaby about Heaven.

[1930a, 4512]
We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

[1933a, 4707]

But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a 'death instinct' which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death.

[1933a, 4711]
The forces which we assume to exist behind the tensions caused by the needs of the id are called *instincts*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitancies and vacillations we have decided to assume the existence of only two basic instincts, *Eros* and the *destructive instinct*. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death instinct*. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards reunion.¹

[1940a [1938], 4959]

The two fundamental principles of Empedocles - φιλία and νείκος - are, both in name and function, the same as our two primal instincts, *Eros* and *destructiveness*, the first of which endeavours to combine what exists into ever greater unities, while the second endeavours to dissolve those combinations and to destroy the structures to which they have given rise. We shall not be surprised, however, to find that, on its re-emergence after two and a half millennia, this theory has been altered in some of its features. Apart from the restriction to the biophysical field which is imposed on us, we no longer have as our basic substances the four elements of Empedocles; what is living has been sharply differentiated from what is inanimate, and we no longer think of the mingling and separation of particles of substance, but of the soldering together and defusion of instinctual components. Moreover, we have provided some sort of biological basis for the principle of 'strife' by tracing back our instinct of destruction to the death instinct, to the urge of what is living to return to an inanimate state. This is not to deny that an analogous instinct already existed earlier, nor, of course, to assert that an instinct of this sort only came into existence with the emergence of life. And no one can foresee in what guise the nucleus of truth contained in the theory of Empedocles will present itself to later understanding.

[1937c, 5040]
I will add a few words to clarify our terminology, which has undergone some development in the course of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and to the reproductive function. We retained this name after we had been obliged by the findings of psycho-analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into Eros, which seeks to force together and hold together the portions of living substance. What are commonly called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance. These speculations seek to solve the riddle of life by supposing that these two instincts were struggling with each other from the very first. It is not so easy, perhaps, to follow the transformations though which the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its object. These narcissistic self-preservative instincts had thenceforward to be counted among the libidinal sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our speculations have transformed this opposition into one between the life instincts (Eros) and the death instincts.

The Nature of the Instincts. - This view would enable us to characterize instincts as tendencies inherent in living substance towards restoring an earlier state of things: that is to say, they would be historically determined and of a conservative nature and, as it were, the expression of an inertia or elasticity present in what is organic. Both classes of instincts, Eros as well as the death instinct, would, on this view, have been in operation and working against each other from the first origin of life.
I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]

It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's's does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.

[1926d, 4282]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1923a, 3934]

[1933b, 4800]
The forces which we assume to exist behind the tensions caused by the needs of the id are called *instincts*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitancies and vacillations we have decided to assume the existence of only two basic instincts, *Eros* and the *destructive instinct*. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death instinct*. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards re-union.¹

[1940a [1938], 4959]

There can be no question of restricting one or the other of the basic instincts to one of the provinces of the mind. They must necessarily be met with everywhere. We may picture an initial state as one in which the total available energy of Eros, which henceforward we shall speak of as 'libido', is present in the still undifferentiated ego-id and serves to neutralize the destructive tendencies which are simultaneously present. (We are without a term analogous to 'libido' for describing the energy of the destructive instinct.) At a later stage it becomes relatively easy for us to follow the vicissitudes of the libido, but this is more difficult with the destructive instinct.

[1940a [1938], 4960]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego’s relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life. [1937c, 5037]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the ‘death instincts’; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructive or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but ‘defusions’ would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.¹

¹ [1923a, 3934]

¹ [1923b, 3974]
The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
According to our hypothesis human instincts are of only two kinds: those which seek to preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual', with a deliberate extension of the popular conception of 'sexuality' - and those which seek to destroy and kill and which we group together as the aggressive or destructive instinct. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither of these instincts is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though an instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in need of some contribution from the instinct for mastery if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of instinct in their actual manifestations is indeed what has so long prevented us from recognizing them.

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4798]

[1933b, 4800]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life. [1937c, 5037]
If such an assumption as this is permissible, then we have met the demand that we should produce an example of a death instinct - though, it is true, a displaced one. But this way of looking at things is very far from being easy to grasp and creates a positively mystical impression. It looks suspiciously as though we were trying to find a way out of a highly embarrassing situation at any price. We may recall, however, that there is nothing new in an assumption of this kind. We put one forward on an earlier occasion, before there was any question of an embarrassing situation. Clinical observations led us at that time to the view that masochism, the component instinct which is complementary to sadism, must be regarded as sadism that has been turned round upon the subject's own ego.² But there is no difference in principle between an instinct turning from an object to the ego and its turning from the ego to an object - which is the new point now under discussion. Masochism, the turning round of the instinct upon the subject's own ego, would in that case be a return to an earlier phase of the instinct's history, a regression. The account that was formerly given of masochism requires emendation as being too sweeping in one respect: there might be such a thing as primary masochism - a possibility which I had contested at that time.³

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

¹ In fact, on our view it is through the agency of Eros that the destructive instincts that are directed towards the external world have been diverted from the self.

² [1920g, 3755]

³ [1923a, 3934]

The dangerous death instincts are dealt with in the individual in various ways: in part they are rendered harmless by being fused with erotic components, in part they are diverted towards the external world in the form of aggression, while to a large extent they undoubtedly continue their internal work unhindered. How is it then that in melancholia the super-ego can become a kind of gathering-place for the death instincts?

⁴ [1923b, 3988]
The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulse to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]
But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat'. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'daemonic' character to the compulsion to repeat.
