"I have listened to your account of the medical quack in analysis without interrupting you, though I formed an impression that you are dominated by a hostility against the medical profession to the historical explanation of which you yourself have pointed the way. But I will grant you one thing: if analyses are to be carried out, it should be by people who have been thoroughly trained for it. And do you not think that with time the doctors who turn to analysis will do everything to obtain that training?"
[1926e, 4375]

I fear not. So long as the attitude of the medical school to the analytic training institute remains unaltered, doctors will find the temptation to make things easier for themselves too great.
[1926e, 4375]

"But you seem to be consistently evading any direct pronouncement on the question of lay analysis. What I guess now is that, because it is impossible to keep a check on doctors who want to analyse, you are proposing, out of revenge, as it were, to punish them by depriving them of their monopoly in analysis and by throwing open this medical activity to laymen as well."
[1926e, 4375]

I cannot say whether you have guessed my motives correctly. Perhaps I shall be able later on to put evidence before you of a less partial attitude. But I lay stress on the demand that no one should practise analysis who has not acquired the right to do so by a particular training. Whether such a person is a doctor or not seems to me immaterial.
[1926e, 4375]
I have not got so far as that yet; and I cannot tell whether I shall get there at all. I should like to
discuss another question with you, and first of all to touch on one special point. It is said that the
authorities, at the instigation of the medical profession, want to forbid the practice of analysis by
laymen altogether. Such a prohibition would also affect the non-medical members of the
Psycho-Analytical Society, who have enjoyed an excellent training and have perfected
themselves greatly by practice. If the prohibition were enacted, we should find ourselves in a
position in which a number of people are prevented from carrying out an activity which one can
safely feel convinced they can perform very well, while the same activity is opened to other
people for whom there is no question of a similar guarantee. That is not precisely the sort of
result to which legislation should lead. However, this special problem is neither very important
nor difficult to solve. Only a handful of people are concerned, who cannot be seriously
damaged. They will probably emigrate to Germany where no legislation will prevent them from
finding recognition for their proficiency. If it is desired to spare them this and to mitigate the law's
severity, that can easily be done on the basis of some well-known precedents. Under the
Austrian Monarchy it repeatedly happened that permission was given to notorious quacks, ad
personam, to carry out medical activities in certain fields, because people were convinced of
their real ability. Those concerned were for the most part peasant healers, and their
recommendation seems regularly to have been made by one of the Archduchesses who were
once so numerous; but it ought to be possible for it also to be done in the case of town-dwellers
and on the basis of a different and merely expert guarantee. Such a prohibition would have
more important effects on the Vienna analytic training institute, which would thenceforward be
unable to accept any candidates for training from non-medical circles. Thus once again in our
country a line of intellectual activity would be suppressed which is allowed to develop freely
elsewhere. I am the last person to claim any competence in judging laws and regulations. But
this much I can see: that to lay emphasis on our quackery law does not lead in the direction of
the approach to conditions in Germany which is so much aimed at to-day, and that the
application of that law to the case of psycho-analysis has something of an anachronism about it,
since at the time of its enactment there was as yet no such thing as analysis and the peculiar
nature of neurotic illnesses was not yet recognized.
[1926e, 4376]
I come now to a question the discussion of which seems to me more important. Is the practice of psycho-analysis a matter which should in general be subject to official interference, or would it be more expedient to leave it to follow its natural development? I shall certainly not come to any decision on this point here and now, but I shall take the liberty of putting the problem before you for your consideration. In our country from of old a positive *furor prohibendi* has been the rule, a tendency to keep people under tutelage, to interfere and to forbid, which, as we all know, has not borne particularly good fruit. In our new republican Austria, it seems, things have not yet changed very much. I fancy you will have an important word to say in deciding the case of psycho-analysis which we are now considering; I do not know whether you have the wish or the influence with which to oppose these bureaucratic tendencies. At all events, I shall not spare you my unauthoritative thoughts on the subject. In my opinion a superabundance of regulations and prohibitions injures the authority of the law. It can be observed that where only a few prohibitions exist they are carefully observed, but where one is accompanied by prohibitions at every step, one feels definitely tempted to disregard them. Moreover, it does not mean one is quite an anarchist if one is prepared to realize that laws and regulations cannot from their origin claim to possess the attribute of being sacred and untransgressable, that they are often inadequately framed and offend our sense of justice, or will do so after a time, and that, in view of the sluggishness of the authorities, there is often no other means of correcting such inexpedient laws than by boldly violating them. Furthermore, if one desires to maintain respect for laws and regulations it is advisable not to enact any where a watch cannot easily be kept on whether they are obeyed or transgressed. Much of what I have quoted above on the practice of analysis by doctors could be repeated here in regard to genuine analysis by laymen which the law is seeking to suppress. The course of an analysis is most inconspicuous, it employs neither medicines nor instruments and consists only in talking and an exchange of information; it will not be easy to prove that a layman is practising 'analysis', if he asserts that he is merely giving encouragement and explanations and trying to establish a healthy human influence on people who are in search of mental assistance. It would surely not be possible to forbid that merely because doctors sometimes do the same thing. In English-speaking countries the practices of Christian Science have become very widespread: a kind of dialectical denial of the evils in life, based on an appeal to the doctrines of the Christian religion. I do not hesitate to assert that that procedure represents a regrettable aberration of the human spirit; but who in America or England would dream of forbidding it and making it punishable? Are the authorities so certain of the right path to salvation that they venture to prevent each man from trying 'to be saved after his own fashion'. And granted that many people if they are left to themselves run into danger and come to grief, would not the authorities do better carefully to mark the limits of the regions which are to be regarded as not to be trespassed upon, and for the rest, so far as possible, to allow human beings to be educated by experience and mutual influence? Psycho-analysis is something so new in the world, the mass of mankind is so little instructed about it, the attitude of official science to it is still so vacillating, that it seems to me over-hasty to intervene in its development with legislative regulations. Let us allow patients themselves to discover that it is damaging to them to look for mental assistance to people who have not learnt how to give it. If we explain this to them and warn them against it, we shall have spared ourselves the need to forbid it. On the main roads of Italy the pylons that carry high-tension cables bear the brief and impressive inscription: 'Chi tocca, muore.' This is perfectly calculated to regulate the behaviour of passers-by to any wires that may be hanging down. The corresponding German notices exhibit an unnecessary and offensive verbosity: 'Das Berühren der Leitungsdrähte ist, weil lebensgefährlich, strengstens verboten.' Why the prohibition? Anyone who holds his life dear will make the prohibition for himself; and anyone who wants to kill himself in that way will not ask for permission.

[1926e, 4377]
But I have already told you that I have no intention of making proposals which are based on the decision as to whether legal control or letting things go is to be preferred in the matter of analysis. I know this is a question of principle on the reply to which the inclinations of persons in authority will probably have more influence than arguments. I have already set out what seems to me to speak in favour of a policy of *laissez faire*. If the other decision is taken - for a policy of active intervention - then it seems to me that in any case a lame and unjust measure of ruthlessly forbidding analysis by non-doctors will be an insufficient outcome. More will have to be considered in that case: the conditions will have to be laid down under which the practice of analysis shall be permitted to all those who seek to make use of it, an authority will have to be set up from whom one can learn what analysis is and what sort of preparation is needed for it, and the possibilities for instruction in analysis will have to be encouraged. We must therefore either leave things alone or establish order and clarity; we must not rush into a complicated situation with a single isolated prohibition derived mechanically from a regulation that has become inadequate.

[1926e, 4379]

'Yes, but the doctors! the doctors! I cannot induce you to go into the real subject of our conversations. You still keep on evading me. It is a question of whether we should not give doctors the exclusive right of practising analysis - for all I care, after they have fulfilled certain conditions. The majority of doctors are certainly not quacks in analysis as you have represented them. You say yourself that the great majority of your pupils and followers are doctors. It has come to my ears that they are far from sharing your point of view on the question of lay analysis. I may no doubt assume that your pupils agree with your demands for sufficient preparation and so on; and yet these pupils think it consistent to close the practice of analysis to laymen. Is that so? and if so, how do you explain it?'

[1926e, 4380]

I see you are well informed. Yes, it is so. Not all, it is true, but a good proportion of my medical colleagues do not agree with me over this, and are in favour of doctors having an exclusive right to the analytic treatment of neurotics. This will show you that differences of opinion are allowed even in our camp. The side I take is well known and the contradiction on the subject of lay analysis does not interfere with our good understanding. How can I explain the attitude of these pupils of mine to you? I do not know for certain; I think it must be the power of professional feeling. The course of their development has been different from mine, they still feel uncomfortable in their isolation from their colleagues, they would like to be accepted by the 'profession' as having plenary rights, and are prepared, in exchange for that tolerance, to make a sacrifice at a point whose vital importance is not obvious to them. Perhaps it may be otherwise; to impute motives of competition to them would be not only to accuse them of base sentiments but also to attribute a strange shortsightedness to them. They are always ready to introduce other doctors into analysis, and from a material point of view it must be a matter of indifference to them whether they have to share the available patients with medical colleagues or with laymen. But something different probably plays a part. These pupils of mine may be influenced by certain factors which guarantee a doctor an undoubted advantage over a layman in analytic practice.

[1926e, 4380]

'Guarantee him an advantage? There we have it. So you are admitting the advantage at last? This should settle the question.'

[1926e, 4381]

The admission is not hard for me to make. It may show you that I am not so passionately prejudiced as you suppose. I have put off mentioning these things because their discussion will once again make theoretical considerations necessary.

[1926e, 4381]
'What are you thinking of now?'

First there is the question of diagnosis. When one takes into analysis a patient suffering from what are described as nervous disorders, one wishes beforehand to be certain - so far, of course, as certainty can be attained - that he is suited for this kind of treatment, that one can help him, that is to say, by this method. That, however, is only the case if he really has a neurosis.

'I should have thought that would be recognizable from the phenomena, the symptoms, of which he complains.'

This is where a fresh complication arises. It cannot always be recognized with complete certainty. The patient may exhibit the external picture of a neurosis, and yet it may be something else - the beginning of an incurable mental disease or the preliminary of a destructive process in the brain. The distinction - the differential diagnosis - is not always easy and cannot be made immediately in every phase. The responsibility for such a decision can of course only be undertaken by a doctor. As I have said, it is not always easy for him. The illness may have an innocent appearance for a considerable time, till in the end it after all displays its evil character. Indeed, it is one of the regular fears of neurotics that they may become insane. However, if a doctor has been mistaken for a time over a case of this sort or has been in uncertainty about it, no harm has been caused and nothing unnecessary has been done. Nor indeed would the analytic treatment of this case have done any harm, though it would have been exposed as an unnecessary waste. And moreover there would certainly be enough people who would blame the analysis for the unfortunate outcome. Unjustly, no doubt, but such occasions ought to be avoided.

I fear you are overshooting the mark. What we have been discussing was a piece of pathology, what we are concerned with in analysis is a therapeutic procedure. I allow - no, I insist - that in every case which is under consideration for analysis the diagnosis shall be established first by a doctor. For the greater number of neuroses which occupy us are fortunately of a psychogenic nature and give no grounds for pathological suspicions. Once the doctor has established this, he can confidently hand over the treatment to a lay analyst. In our analytical societies matters have always been arranged in that way. Thanks to the intimate contact between medical and non-medical members, mistakes such as might be feared have been as good as completely avoided. There is a further contingency, again, in which the analyst has to ask the doctor's help. In the course of an analytic treatment, symptoms - most often physical symptoms - may appear about which one is doubtful whether they should be regarded as belonging to the neurosis or whether they should be related to an independent organic illness that has intervened. The decision on this point must once again be left to a doctor.

'So that even during the course of an analysis a lay analyst cannot do without a doctor. A fresh argument against their fitness.'

No. No argument against lay analysts can be manufactured out of this possibility, for in such circumstances a medical analyst would not act differently.
'I do not understand that.'
[1926e, 4384]

There is a technical rule that an analyst, if dubious symptoms like this emerge during the treatment, shall not submit them to his own judgement but shall get them reported upon by a doctor who is not connected with analysis - a consultant physician, perhaps - even if the analyst himself is a doctor and still well versed in his medical knowledge.
[1926e, 4384]

'And why should a rule be made that seems to me so uncalled-for?'
[1926e, 4384]

It is not uncalled-for; in fact there are several reasons for it. In the first place it is not a good plan for a combination of organic and psychical treatment to be carried out by one and the same person. Secondly the relation in the transference may make it inadvisable for the analyst to examine the patient physically. And thirdly the analyst has every reason for doubting whether he is unprejudiced, since his interests are directed so intensely to the psychical factors.
[1926e, 4385]

'I now understand your attitude to lay analysis quite clearly. You are determined that there must be lay analysts. And since you cannot dispute their inadequacy for their task, you are scraping together everything you can to excuse them and make their existence easier. But I cannot in the least see why there should be lay analysts, who, after all, can only be therapists of the second class. I am ready, so far as I am concerned, to make an exception in the case of the few laymen who have already been trained as analysts; but no fresh ones should be created and the training institutes should be put under an obligation to take no more laymen into training.'
[1926e, 4385]

I am at one with you, if it can be shown that all the interests involved will be served by this restriction. You will agree that these interests are of three sorts: that of the patients, that of the doctors and - last not least - that of science, which indeed comprises the interests of all future patients. Shall we examine these three points together?
[1926e, 4385]

For the patient, then, it is a matter of indifference whether the analyst is a doctor or not, provided only that the danger of his condition being misunderstood is excluded by the necessary medical report before the treatment begins and on some possible occasions during the course of it. For him it is incomparably more important that the analyst should possess personal qualities that make him trustworthy, and that he should have acquired the knowledge and understanding as well as the experience which alone can make it possible for him to fulfil his task. It might be thought that it would damage an analyst's authority if the patient knows that he is not a doctor and cannot in some situations do without a doctor's support. We have, of course, never omitted to inform patients of their analyst's qualification, and we have been able to convince ourselves that professional prejudices find no echo in them and that they are ready to accept a cure from whatever direction it is offered them - which, incidentally, the medical profession discovered long ago to its deep mortification. Nor are the lay analysts who practise analysis to-day any chance collection of riff-raff, but people of academic education, doctors of philosophy, educationalists, together with a few women of great experience in life and outstanding personality. The analysis, to which all the candidates in an analytic training institute have to submit, is at the same time the best means of forming an opinion of their personal aptitude for carrying out their exacting occupation.
[1926e, 4385]
Now as to the interest of the doctors. I cannot think that it would gain by the incorporation of psycho-analysis into medicine. The medical curriculum already lasts for five years and the final examinations extend well into a sixth year. Every few years fresh demands are made on the student, without the fulfilment of which his equipment for the future would have to be declared insufficient. Access to the medical profession is very difficult and its practice neither very satisfying nor very remunerative. If one supports what is certainly a fully justified demand that doctors should also be familiar with the mental side of illness, and if on that account one extends medical education to include some preparation for analysis, that implies a further increase in the curriculum and a corresponding prolongation of the period of study. I do not know whether the doctors will be pleased by this consequence of their claim upon analysis. But it can scarcely be escaped. And this at a period in which the conditions of material existence have so greatly deteriorated for the classes from which doctors are recruited, a period in which the younger generation sees itself compelled to make itself self-supporting as early in life as possible.

[1926e, 4386]

But perhaps you will choose not to burden medical studies with the preparation for analytic practice but think it more expedient for future analysts to take up their necessary training only after the end of their medical studies. You may say the loss of time involved in this is of no practical account, since after all a young man of less than thirty will never enjoy his patients’ confidence, which is a sine qua non of giving mental assistance. It might no doubt be said in reply that a newly-fledged physician for physical illnesses cannot count upon being treated by his patients with very great respect either, and that a young analyst might very well fill in his time by working in a psycho-analytic out-patient clinic under the supervision of experienced practitioners.

[1926e, 4386]
But what seems to me more important is that with this proposal of yours you are giving support to a waste of energy for which, in these difficult times, I can really find no economic justification. Analytic training, it is true, cuts across the field of medical education, but neither includes the other. If - which may sound fantastic to-day - one had to found a college of psycho-analysis, much would have to be taught in it which is also taught by the medical faculty: alongside of depth-psychology, which would always remain the principal subject, there would be an introduction to biology, as much as possible of the science of sexual life, and familiarity with the symptomatology of psychiatry. On the other hand, analytic instruction would include branches of knowledge which are remote from medicine and which the doctor does not come across in his practice: the history of civilization, mythology, the psychology of religion and the science of literature. Unless he is well at home in these subjects, an analyst can make nothing of a large amount of his material. By way of compensation, the great mass of what is taught in medical schools is of no use to him for his purposes. A knowledge of the anatomy of the tarsal bones, of the constitution of the carbohydrates, of the course of the cranial nerves, a grasp of all that medicine has brought to light on bacillary exciting causes of disease and the means of combating them, on serum reactions and on neoplasms - all of this knowledge, which is undoubtedly of the highest value in itself, is nevertheless of no consequence to him; it does not concern him; it neither helps him directly to understand a neurosis and to cure it nor does it contribute to a sharpening of those intellectual capacities on which his occupation makes the greatest demands. It cannot be objected that the case is much the same when a doctor takes up some other special branch of medicine - dentistry, for instance: in that case, too, he may not need some of what he has to pass examinations in, and he will have to learn much in addition, for which his schooling has not prepared him. But the two cases cannot be put on a par. In dentistry the great principles of pathology - the theories of inflammation, suppuration, necrosis, and of the metabolism of the bodily organs - still retain their importance. But the experience of an analyst lies in another world, with other phenomena and other laws. However much philosophy may ignore the gulf between the physical and the mental, it still exists for our immediate experience and still more for our practical endeavours.

[1926e, 4387]

It is unjust and inexpedient to try to compel a person who wants to set someone else free from the torment of a phobia or an obsession to take the roundabout road of the medical curriculum. Nor will such an endeavour have any success, unless it results in suppressing analysis entirely. Imagine a landscape in which two paths lead to a hilltop with a view - one short and straight, the other long, winding and circuitous. You try to stop up the short path by a prohibitory notice, perhaps because it passes by some flower-beds that you want to protect. The only chance you have of your prohibition being respected is if the short path is steep and difficult while the longer one leads gently up. If, however, that is not so, and the roundabout path is on the contrary the harder, you may imagine the use of your prohibition and the fate of your flower-beds! I fear you will succeed in compelling the laymen to study medicine just as little as I shall be able to induce doctors to learn analysis. For you know human nature as well as I do.

[1926e, 4388]

"If you are right, that analytic treatment cannot be carried out without special training, but that the medical curriculum cannot bear the further burden of a preparation for it, and that medical knowledge is to a great extent unnecessary for an analyst, how shall we achieve the ideal physician who shall be equal to all the tasks of his calling?"

[1926e, 4388]
I cannot foresee the way out of these difficulties, nor is it my business to point it out. I see only two things, first that analysis is an embarrassment to you and that the best thing would be for it not to exist - though neurotics, no doubt, are an embarrassment too; and secondly, that the interests of everyone concerned would for the time being be met if the doctors could make up their minds to tolerate a class of therapists which would relieve them of the tedium of treating the enormously common psychogenic neuroses while remaining in constant touch with them to the benefit of the patients.
[1926e, 4388]

For here a further prospect stretches ahead, which cannot be encroached upon with impunity. If the representatives of the various mental sciences are to study psycho-analysis so as to be able to apply its methods and angles of approach to their own material, it will not be enough for them to stop short at the findings which are laid down in analytic literature. They must learn to understand analysis in the only way that is possible - by themselves undergoing an analysis. The neurotics who need analysis would thus be joined by a second class of persons, who accept analysis from intellectual motives, but who will no doubt also welcome the increase in their capacities which they will incidentally achieve. To carry out these analyses a number of analysts will be needed, for whom any medical knowledge will have particularly little importance. But these 'teaching analysts' - let us call them - will require to have had a particularly careful education. If this is not to be stunted, they must be given an opportunity of collecting experience from instructive and informative cases; and since healthy people who also lack the motive of curiosity do not present themselves for analysis, it is once more only upon neurotics that it will be possible for the teaching analysts - under careful supervision - to be educated for their subsequent non-medical activity. All this, however, requires a certain amount of freedom of movement, and is not compatible with petty restrictions.
[1926e, 4389]

Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.
[1926e, 4390]
Why not? Our imagination always follows patterns. The stream of eager learners who will then flow to Europe will be obliged to pass Vienna by, for here the development of analysis may have succumbed to a premature trauma of prohibition. You smile? I am not saying this as a bribe for your support. Not in the least. I know you do not believe me; nor can I guarantee that it will happen. But one thing I do know. It is by no means so important what decision you give on the question of lay analysis. It may have a local effect. But the things that really matter - the possibilities in psycho-analysis for internal development - can never be affected by regulations and prohibitions.

[1926e, 4391]

Nor did I expect that I should succeed in bringing about unanimity in the attitude of analysts themselves towards the problem of lay analysis. Anyone who compares the views expressed by the Hungarian Society in this discussion with those of the New York group will perhaps conclude that my book has produced no effect whatever and that everyone persists in his former opinion. But I do not believe this either. I think that many of my colleagues have modified their extreme parti pris and that the majority have accepted my view that the problem of lay analysis ought not to be decided along the lines of traditional usage but that it arises from a novel situation and therefore demands a fresh judgement.

[1926e, 4392]

Again, the turn which I gave to the whole discussion seems to have met with approval. My main thesis was that the important question is not whether an analyst possesses a medical diploma but whether he has had the special training necessary for the practice of analysis. This served as the starting-point for a discussion, which was eagerly embarked upon, as to what is the training most suitable for an analyst. My own view was and still remains that it is not the training prescribed by the University for future doctors. What is known as medical education appears to me to be an arduous and circuitous way of approaching the profession of analysis. No doubt it offers an analyst much that is indispensable to him. But it burdens him with too much else of which he can never make use, and there is a danger of its diverting his interest and his whole mode of thought from the understanding of psychical phenomena. A scheme of training for analysts has still to be created. It must include elements from the mental sciences, from psychology, the history of civilization and sociology, as well as from anatomy, biology and the study of evolution. There is so much to be taught in all this that it is justifiable to omit from the curriculum anything which has no direct bearing on the practice of analysis and only serves indirectly (like any other study) as a training for the intellect and for the powers of observation. It is easy to meet this suggestion by objecting that analytic colleges of this kind do not exist and that I am merely setting up an ideal. An ideal, no doubt. But an ideal which can and must be realized. And in our training institutes, in spite of all their youthful insufficiencies, that realization has already begun.

[1926e, 4393]
It will not have escaped my readers that in what I have said I have assumed as axiomatic something that is still violently disputed in the discussion. I have assumed, that is to say, that psycho-analysis is not a specialized branch of medicine. I cannot see how it is possible to dispute this. Psycho-analysis is a part of psychology; not of medical psychology in the old sense, not of the psychology of morbid processes, but simply of psychology. It is certainly not the whole of psychology, but its sub-structure and perhaps even its entire foundation. The possibility of its application to medical purposes must not lead us astray. Electricity and radiology also have their medical application, but the science to which they both belong is none the less physics. Nor can their situation be affected by historical arguments. The whole theory of electricity had its origin in an observation of a nerve-muscle preparation; yet no one would dream to-day of regarding it as a part of physiology. It is argued that psycho-analysis was after all discovered by a physician in the course of his efforts to assist his patients. But that is clearly neither here nor there. Moreover, the historical argument is double-edged. We might pursue the story and recall the unfriendliness and indeed the animosity with which the medical profession treated analysis from the very first. That would seem to imply that it can have no claims over analysis to-day. And though I do not accept that implication, I still feel some doubts as to whether the present wooing of psycho-analysis by the doctors is based, from the point of view of the libido theory, upon the first or upon the second of Abraham's sub-stages - whether they wish to take possession of their object for the purpose of destroying or of preserving it.

No doubt what I have just said throws little light on the problem of lay analysis; it was only intended to exhibit my personal credentials as being myself a supporter of the inherent value of psycho-analysis and of its independence of its application to medicine. But it will be objected at this point that whether psycho-analysis, regarded as a science, is a subdivision of medicine or of psychology is a purely academic question and of no practical interest. The real point at issue, it will be said, is a different one, namely the application of analysis to the treatment of patients; in so far as it claims to do this it must be content, the argument will run, to be accepted as a specialized branch of medicine, like radiology, for instance, and to submit to the rules laid down for all therapeutic methods. I recognize that that is so; I admit it. I only want to feel assured that the therapy will not destroy the science. Unluckily analogies never carry one more than a certain distance; a point is soon reached at which the subjects of the comparison take divergent paths. The case of analysis differs from that of radiology. A physicist does not require to have a patient in order to study the laws that govern X-rays. But the only subject-matter of psycho-analysis is the mental processes of human beings and it is only in human beings that it can be studied. For reasons which can easily be understood, neurotic human beings offer far more instructive and accessible material than normal ones, and to withhold that material from anyone who wishes to study and apply analysis is to dock him of a good half of his training possibilities. I have, of course, no intention of asking that the interests of neurotic patients should be sacrificed to those of instruction and scientific research. The aim of my small volume on the question of lay analysis was precisely to show that, if certain precautions are observed, the two interests can quite easily be brought into harmony and that the interests of medicine, as rightly understood, will not be the last to profit by such a solution.
I myself brought forward all the necessary precautions and I can safely say that the discussion added nothing on this point. But I should like to remark that the emphasis was often placed in a manner which did not do justice to the facts. What was said about the difficulties of differential diagnosis and the uncertainty in many cases in deciding about somatic symptoms - situations, that is, in which medical knowledge and medical intervention are necessary - this is all of it perfectly true. Nevertheless, the number of cases in which doubts of this kind never arise at all and in which a doctor is not required is surely incomparably greater. These cases may be quite uninteresting scientifically, but they play an important enough part in life to justify the activity of lay analysts, who are perfectly competent to deal with them. Some time ago I analysed a colleague who gave evidence of a particularly strong dislike of the idea of anyone being allowed to engage in a medical activity who was not himself a medical man. I was in a position to say to him: 'We have now been working for more than three months. At what point in our analysis have I had occasion to make use of my medical knowledge?' He admitted that I had had no such occasion.

[1926e, 4395]

Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I do know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?

[1926e, 4396]
Some remarks that have been made in the course of this discussion have led me to suspect that, in spite of everything, my book on lay analysis has been misunderstood in one respect. The doctors have been defended against me, as though I had declared that they were in general incompetent to practise analysis and as though I had given it out as a password that medical reinforcements were to be rejected. That was not my intention. The idea probably arose from my having been led to declare in the course of my observations (which had a controversial end in view) that untrained medical analysts were even more dangerous than laymen. I might make my true opinion on this question clear by echoing a cynical remark about women that once appeared in *Simplicissimus*. One man was complaining to another about the weaknesses and troublesome nature of the fair sex. ‘All the same,’ replied his companion, ‘women are the best thing we have of the kind.’ I am bound to admit that, so long as schools such as we desire for the training of analysts are not yet in existence, people who have had a preliminary education in medicine are the best material for future analysts. We have a right to demand, however, that they should not mistake their preliminary education for a complete training, that they should overcome the one-sidedness that is fostered by instruction in medical schools and that they should resist the temptation to flirt with endocrinology and the autonomic nervous system, when what is needed is an apprehension of psychological facts with the help of a framework of psychological concepts. I also share the view that all those problems which relate to the connection between psychical phenomena and their organic, anatomical and chemical foundations can be approached only by those who have studied both, that is, by medical analysts. It should not be forgotten, however, that this is not the whole of psycho-analysis, and that for its other aspect we can never do without the co-operation of people who have had a preliminary education in the mental sciences. For practical reasons we have been in the habit - and this is true, incidentally, of our publications as well - of distinguishing between medical and applied analysis. But that is not a logical distinction. The true line of division is between scientific analysis and its applications alike in medical and in non-medical fields.

In these discussions the bluntest rejection of lay analysis has been expressed by our American colleagues. A few words to them in reply will, I think, not be out of place. I can scarcely be accused of making a misuse of analysis for controversial purposes if I express an opinion that their resistance is derived wholly from practical factors. They see how in their own country lay analysts put analysis to all kinds of mischievous and illegitimate purposes and in consequence cause injury both to their patients and to the good name of analysis. It is therefore not to be wondered at if in their indignation they give the widest possible berth to such unscrupulous mischief-makers and try to prevent any laymen from having a share in analysis. But these facts are already enough to diminish the significance of the American position; for the question of lay analysis must not be decided on practical considerations alone, and local conditions in America cannot be the sole determining influence on our views.

The resolution passed by our American colleagues against lay analysts, based as it essentially is upon practical reasons, appears to me nevertheless to be unpractical; for it cannot affect any of the factors which govern the situation. It is more or less equivalent to an attempt at repression. If it is impossible to prevent the lay analysts from pursuing their activities and if the public does not support the campaign against them, would it not be more expedient to recognize the fact of their existence by offering them opportunities for training? Might it not be possible in this way to gain some influence over them? And, if they were offered as an inducement the possibility of receiving the approval of the medical profession and of being invited to co-operate, might they not have some interest in raising their own ethical and intellectual level?
I take the opportunity of informing you that I have just sent to press a small work on *The Question of Lay Analysis*. In it I have tried to show what a psycho-analysis is and what demands it makes on the analyst. I have considered the far from simple relations between psycho-analysis and medicine, and have drawn the conclusion that any mechanical application to trained analysts of the section against quackery is open to grave doubts.
[1926i, 4608]

And here, Ladies and Gentlemen, I feel that I must make a pause to take breath - which you too will welcome as a relief - and, before I go on, to apologize to you. My intention is to give you some addenda to the introductory lectures on psycho-analysis which I began fifteen years ago, and I am obliged to behave as though you as well as I had in the interval done nothing but practise psycho-analysis. I know that that assumption is out of place; but I am helpless, I cannot do otherwise. This is no doubt related to the fact that it is in general so hard to give anyone who is not himself a psycho-analyst an insight into psycho-analysis. You can believe me when I tell you that we do not enjoy giving an impression of being members of a secret society and of practising a mystical science. Yet we have been obliged to recognize and express as our conviction that no one has a right to join in a discussion of psycho-analysis who has not had particular experiences which can only be obtained by being analysed oneself. When I gave you my lectures fifteen years ago I tried to spare you certain speculative portions of our theory; but it is precisely from them that are derived the new acquisitions of which I must speak to you to-day.
[1933a, 4678]

It cannot be disputed that analysts in their own personalities have not invariably come up to the standard of psychical normality to which they wish to educate their patients. Opponents of analysis often point to this fact with scorn and use it as an argument to show the uselessness of analytic exertions. We might reject this criticism as making unjustifiable demands. Analysts are people who have learned to practise a particular art; alongside of this, they may be allowed to be human beings like anyone else. After all, nobody maintains that a physician is incapable of treating internal diseases if his own internal organs are not sound; on the contrary, it may be argued that there are certain advantages in a man who is himself threatened with tuberculosis specializing in the treatment of persons suffering from that disease. But the cases are not on all fours. So long as he is capable of practising at all, a doctor suffering from disease of the lungs or heart is not handicapped either in diagnosing or treating internal complaints; whereas the special conditions of analytic work do actually cause the analyst's own defects to interfere with his making a correct assessment of the state of things in his patient and reacting to them in a useful way. It is therefore reasonable to expect of an analyst, as a part of his qualifications, a considerable degree of mental normality and correctness. In addition, he must possess some kind of superiority, so that in certain analytic situations he can act as a model for his patient and in others as a teacher. And finally we must not forget that the analytic relationship is based on a love of truth - that is, on a recognition of reality - and that it precludes any kind of sham or deceit.
[1937c, 5041]
Here let us pause for a moment to assure the analyst that he has our sincere sympathy in the very exacting demands he has to fulfil in carrying out his activities. It almost looks as if analysis were the third of those ‘impossible’ professions in which one can be sure beforehand of achieving unsatisfying results. The other two, which have been known much longer, are education and government. Obviously we cannot demand that the prospective analyst should be a perfect being before he takes up analysis, in other words that only persons of such high and rare perfection should enter the profession. But where and how is the poor wretch to acquire the ideal qualifications which he will need in his profession? The answer is, in an analysis of himself, with which his preparation for his future activity begins. For practical reasons this analysis can only be short and incomplete. Its main object is to enable his teacher to make a judgement as to whether the candidate can be accepted for further training. It has accomplished its purpose if it gives the learner a firm conviction of the existence of the unconscious, if it enables him, when repressed material emerges, to perceive in himself things which would otherwise be incredible to him, and if it shows him a first sample of the technique which has proved to be the only effective one in analytic work. This alone would not suffice for his instruction; but we reckon on the stimuli that he has received in his own analysis not ceasing when it ends and on the processes of remodelling the ego continuing spontaneously in the analysed subject and making use of all subsequent experiences in this newly-acquired sense. This does in fact happen, and in so far as it happens it makes the analysed subject qualified to be an analyst himself.

Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.¹ Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the instinctual demands which he is otherwise able to keep under suppression. These, too, are ‘dangers of analysis’, though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically - at intervals of five years or so - submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

¹[1937c, 5042]
Nevertheless I cannot bring myself to accept the idea that this part of psycho-analytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation of this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psycho-analysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.

[1905d, 1462]

There is, however, another angle from which you may seek to understand the psycho-analytic method. The uncovering and translating of the unconscious occurs in the face of a continuous resistance on the part of the patient. The process of bringing this unconscious material to light is associated with unpleasure, and because of this the patient rejects it again and again. It is for you then to interpose in this conflict in the patient's mental life. If you succeed in persuading him to accept, by virtue of a better understanding, something that up to now, in consequence of this automatic regulation by unpleasure, he has rejected (repressed), you will have accomplished something towards his education. For it is education even to induce someone who dislikes getting up early to do so all the same. Psycho-analytic treatment may in general be conceived of as such a re-education in overcoming internal resistances. Re-education of this kind is, however, in no respect more necessary to nervous patients than in regard to the mental element in their sexual life. For nowhere else have civilization and education done so much harm as in this field, and this is the point, as experience will show you, at which to look for those aetologies of the neuroses that are amenable to influence; for the other aetiological factor, the constitutional component, consists of something fixed and unalterable. And from this it follows that one important qualification is required of the physician in this work: not only must his own character be irreproachable - 'As to morals, that goes without saying', as the hero of Vischer's novel Auch Einer was in the habit of declaring - but he must also have overcome in his own mind that mixture of prurience and prudery with which, unfortunately, so many people habitually consider sexual problems.

[1905a, 1571]

Other innovations in technique relate to the physician himself. We have become aware of the 'counter-transference', which arises in him as a result of the patient's influence on his unconscious feelings, and we are almost inclined to insist that he shall recognize this counter-transference in himself and overcome it. Now that a considerable number of people are practising psycho-analysis and exchanging their observations with one another, we have noticed that no psycho-analyst goes further than his own complexes and internal resistances permit; and we consequently require that he shall begin his activity with a self-analysis and continually carry it deeper while he is making his observations on his patients. Anyone who fails to produce results in a self-analysis of this kind may at once give up any idea of being able to treat patients by analysis.

[1910d, 2309]
But if the doctor is to be in a position to use his unconscious in this way as an instrument in the analysis, he must himself fulfill one psychological condition to a high degree. He may not tolerate any resistances in himself which hold back from his consciousness what has been perceived by his unconscious; otherwise he would introduce into the analysis a new species of selection and distortion which would be far more detrimental than that resulting from concentration of conscious attention. It is not enough for this that he himself should be an approximately normal person. It may be insisted, rather, that he should have undergone a psycho-analytic purification and have become aware of those complexes of his own which would be apt to interfere with his grasp of what the patient tells him. There can be no reasonable doubt about the disqualifying effect of such defects in the doctor; every unresolved repression in him constitutes what has been aptly described by Stekel as a 'blind spot' in his analytic perception.

[1912e, 2471]

And it must be so, firstly, because analysis is entirely founded on complete candour. Financial circumstances, for instance, are discussed with equal detail and openness: things are said that are kept back from every fellow-citizen, even if he is not a competitor or a tax-collector. I will not dispute - indeed, I will myself insist with energy - that this obligation to candour puts a grave moral responsibility on the analyst as well. And it must be so, secondly, because factors from sexual life play an extremely important, a dominating, perhaps even a specific part among the causes and precipitating factors of neurotic illnesses. What else can analysis do but keep close to its subject-matter, to the material brought up by the patient? The analyst never entices his patient on to the ground of sex. He does not say to him in advance: 'We shall be dealing with the intimacies of your sexual life!' He allows him to begin what he has to say whenever he pleases, and quietly waits until the patient himself touches on sexual things. I used always to warn my pupils: 'Our opponents have told us that we shall come upon cases in which the factor of sex plays no part. Let us be careful not to introduce it into our analyses and so spoil our chance of finding such a case.' But so far none of us has had that good fortune.

[1926e, 4350]

Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

[1926e, 4362]
Everything now depends on that. And the whole skill in handling the 'transference' is devoted to bringing it about. As you see, the requirements of analytic technique reach their maximum at this point. Here the gravest mistakes can be made or the greatest successes be registered. It would be folly to attempt to evade the difficulties by suppressing or neglecting the transference; whatever else had been done in the treatment, it would not deserve the name of an analysis. To send the patient away as soon as the inconveniences of his transference neurosis make their appearance would be no more sensible, and would moreover be cowardly. It would be as though one had conjured up spirits and run away from them as soon as they appeared.

Sometimes, it is true, nothing else is possible. There are cases in which one cannot master the unleashed transference and the analysis has to be broken off; but one must at least have struggled with the evil spirits to the best of one's strength. To yield to the demands of the transference, to fulfil the patient's wishes for affectionate and sensual satisfaction, is not only justly forbidden by moral considerations but is also completely ineffective as a technical method for attaining the purpose of the analysis. A neurotic cannot be cured by being enabled to reproduce uncorrected an unconscious stereotype plate that is ready to hand in him. If one engages in compromises with him by offering him partial satisfactions in exchange for his further collaboration in the analysis, one must beware of falling into the ridiculous situation of the cleric who was supposed to convert a sick insurance agent. The sick man remained unconverted but the cleric took his leave insured. The only possible way out of the transference situation is to trace it back to the patient's past, as he really experienced it or as he pictured it through the wish-fulfilling activity of his imagination. And this demands from the analyst much skill, patience, calm and self-abnegation.

There are at the moment two Institutes at which instruction in psycho-analysis is given. The first has been founded in Berlin by Dr. Max Eitingon, who is a member of the Society there. The second is maintained by the Vienna Psycho-Analytical Society at its own expense and at considerable sacrifice. The part played by the authorities is at present limited to the many difficulties which they put in the way of the young undertaking. A third training Institute is at this moment being opened in London by the Society there, under the direction of Dr. Ernest Jones. At these Institutes the candidates themselves are taken into analysis, receive theoretical instruction by lectures on all the subjects that are important for them, and enjoy the supervision of older and more experienced analysts when they are allowed to make their first trials with comparatively slight cases. A period of some two years is calculated for this training. Even after this period, of course, the candidate is only a beginner and not yet a master. What is still needed must be acquired by practice and by an exchange of ideas in the psycho-analytical societies in which young and old members meet together. Preparation for analytic activity is by no means so easy and simple. The work is hard, the responsibility great. But anyone who has passed through such a course of instruction, who has been analysed himself, who has mastered what can be taught to-day of the psychology of the unconscious, who is at home in the science of sexual life, who has learnt the delicate technique of psycho-analysis, the art of interpretation, of fighting resistances and of handling the transference - anyone who has accomplished all this is no longer a layman in the field of psycho-analysis. He is capable of undertaking the treatment of neurotic disorders, and will be able in time to achieve in that field whatever can be required from this form of therapy.
I should like to consider the historical argument a moment longer. Since it is with me personally that we are concerned, I can throw a little light, for anyone who may be interested, on my own motives. After forty-one years of medical activity, my self-knowledge tells me that I have never really been a doctor in the proper sense. I became a doctor through being compelled to deviate from my original purpose; and the triumph of my life lies in my having, after a long and roundabout journey, found my way back to my earliest path. I have no knowledge of having had any craving in my early childhood to help suffering humanity. My innate sadistic disposition was not a very strong one, so that I had no need to develop this one of its derivatives. Nor did I ever play the 'doctor game'; my infantile curiosity evidently chose other paths. In my youth I felt an overpowering need to understand something of the riddles of the world in which we live and perhaps even to contribute something to their solution. The most hopeful means of achieving this end seemed to be to enrol myself in the medical faculty; but even after that I experimented - unsuccessfully - with zoology and chemistry, till at last, under the influence of Brücke, who carried more weight with me than any one else in my whole life, I settled down to physiology, though in those days it was too narrowly restricted to histology. By that time I had already passed all my medical examinations; but I took no interest in anything to do with medicine till the teacher whom I so deeply respected warned me that in view of my impoverished material circumstances I could not possibly take up a theoretical career. Thus I passed from the histology of the nervous system to neuropathology and then, prompted by fresh influences, I began to be concerned with the neuroses. I scarcely think, however, that my lack of a genuine medical temperament has done much damage to my patients. For it is not greatly to the advantage of patients if their doctor's therapeutic interest has too marked an emotional emphasis. They are best helped if he carries out his task coolly and keeping as closely as possible to the rules.

[1926e, 4394]

It cannot be disputed that analysts in their own personalities have not invariably come up to the standard of psychical normality to which they wish to educate their patients. Opponents of analysis often point to this fact with scorn and use it as an argument to show the uselessness of analytic exertions. We might reject this criticism as making unjustifiable demands. Analysts are people who have learned to practise a particular art; alongside of this, they may be allowed to be human beings like anyone else. After all, nobody maintains that a physician is incapable of treating internal diseases if his own internal organs are not sound; on the contrary, it may be argued that there are certain advantages in a man who is himself threatened with tuberculosis specializing in the treatment of persons suffering from that disease. But the cases are not on all fours. So long as he is capable of practising at all, a doctor suffering from disease of the lungs or heart is not handicapped either in diagnosing or treating internal complaints; whereas the special conditions of analytic work do actually cause the analyst's own defects to interfere with his making a correct assessment of the state of things in his patient and reacting to them in a useful way. It is therefore reasonable to expect of an analyst, as a part of his qualifications, a considerable degree of mental normality and correctness. In addition, he must possess some kind of superiority, so that in certain analytic situations he can act as a model for his patient and in others as a teacher. And finally we must not forget that the analytic relationship is based on a love of truth - that is, on a recognition of reality - and that it precludes any kind of sham or deceit.

[1937c, 5041]
Here let us pause for a moment to assure the analyst that he has our sincere sympathy in the very exacting demands he has to fulfil in carrying out his activities. It almost looks as if analysis were the third of those 'impossible' professions in which one can be sure beforehand of achieving unsatisfying results. The other two, which have been known much longer, are education and government. Obviously we cannot demand that the prospective analyst should be a perfect being before he takes up analysis, in other words that only persons of such high and rare perfection should enter the profession. But where and how is the poor wretch to acquire the ideal qualifications which he will need in his profession? The answer is, in an analysis of himself, with which his preparation for his future activity begins. For practical reasons this analysis can only be short and incomplete. Its main object is to enable his teacher to make a judgement as to whether the candidate can be accepted for further training. It has accomplished its purpose if it gives the learner a firm conviction of the existence of the unconscious, if it enables him, when repressed material emerges, to perceive in himself things which would otherwise be incredible to him, and if it shows him a first sample of the technique which has proved to be the only effective one in analytic work. This alone would not suffice for his instruction; but we reckon on the stimuli that he has received in his own analysis not ceasing when it ends and on the processes of remodelling the ego continuing spontaneously in the analysed subject and making use of all subsequent experiences in this newly-acquired sense. This does in fact happen, and in so far as it happens it makes the analysed subject qualified to be an analyst himself.

[1937c, 5042]

Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.¹ Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the instinctual demands which he is otherwise able to keep under suppression. These, too, are 'dangers of analysis', though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically - at intervals of five years or so - submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

[1937c, 5043]
Other innovations in technique relate to the physician himself. We have become aware of the 'counter-transference', which arises in him as a result of the patient's influence on his unconscious feelings, and we are almost inclined to insist that he shall recognize this counter-transference in himself and overcome it. Now that a considerable number of people are practising psycho-analysis and exchanging their observations with one another, we have noticed that no psycho-analyst goes further than his own complexes and internal resistances permit; and we consequently require that he shall begin his activity with a self-analysis and continually carry it deeper while he is making his observations on his patients. Anyone who fails to produce results in a self-analysis of this kind may at once give up any idea of being able to treat patients by analysis.

[1910d, 2309]

But if the doctor is to be in a position to use his unconscious in this way as an instrument in the analysis, he must himself fulfil one psychological condition to a high degree. He may not tolerate any resistances in himself which hold back from his consciousness what has been perceived by his unconscious; otherwise he would introduce into the analysis a new species of selection and distortion which would be far more detrimental than that resulting from concentration of conscious attention. It is not enough for this that he himself should be an approximately normal person. It may be insisted, rather, that he should have undergone a psycho-analytic purification and have become aware of those complexes of his own which would be apt to interfere with his grasp of what the patient tells him. There can be no reasonable doubt about the disqualifying effect of such defects in the doctor; every unresolved repression in him constitutes what has been aptly described by Stekel as a 'blind spot' in his analytic perception.

[1912e, 2471]

Our justification for making such inferences and interpolations and the degree of certainty attaching to them of course remain open to criticism in each individual instance; and it cannot be denied that it is often extremely difficult to arrive at a decision - a fact which finds expression in the lack of agreement among analysts. The novelty of the problem is to blame for this - that is to say, a lack of training. But there is besides this a special factor inherent in the subject itself; for in psychology, unlike physics, we are not always concerned with things which can only arouse a cool scientific interest. Thus we shall not be very greatly surprised if a woman analyst who has not been sufficiently convinced of the intensity of her own wish for a penis also fails to attach proper importance to that factor in her patients. But such sources of error, arising from the personal equation, have no great importance in the long run. If one looks through old textbooks on the use of the microscope, one is astonished to find the extraordinary demands which were made on the personality of those who made observations with that instrument while its technique was still young - of all of which there is no question to-day.

[1940a [1938], 5004]
Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.¹ Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the instinctual demands which he is otherwise able to keep under suppression. These, too, are 'dangers of analysis', though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically - at intervals of five years or so - submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

[1937c, 5043]
Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

[1926e, 4362]

In 1927, Ferenczi read an instructive paper on the problem of the termination of analyses. It ends with a comforting assurance that 'analysis is not an endless process, but one which can be brought to a natural end with sufficient skill and patience on the analyst's part'. The paper as a whole, however, seems to me to be in the nature of a warning not to aim at shortening analysis but at deepening it. Ferenczi makes the further important point that success depends very largely on the analyst's having learnt sufficiently from his own 'errors and mistakes' and having got the better of 'the weak points in his own personality'. This provides an important supplement to our theme. Among the factors which influence the prospects of analytic treatment and add to its difficulties in the same manner as the resistances, must be reckoned not only the nature of the patient's ego but the individuality of the analyst.

[1937c, 5041]
It cannot be disputed that analysts in their own personalities have not invariably come up to the standard of psychical normality to which they wish to educate their patients. Opponents of analysis often point to this fact with scorn and use it as an argument to show the uselessness of analytic exertions. We might reject this criticism as making unjustifiable demands. Analysts are people who have learned to practise a particular art; alongside of this, they may be allowed to be human beings like anyone else. After all, nobody maintains that a physician is incapable of treating internal diseases if his own internal organs are not sound; on the contrary, it may be argued that there are certain advantages in a man who is himself threatened with tuberculosis specializing in the treatment of persons suffering from that disease. But the cases are not on all fours. So long as he is capable of practising at all, a doctor suffering from disease of the lungs or heart is not handicapped either in diagnosing or treating internal complaints; whereas the special conditions of analytic work do actually cause the analyst's own defects to interfere with his making a correct assessment of the state of things in his patient and reacting to them in a useful way. It is therefore reasonable to expect of an analyst, as a part of his qualifications, a considerable degree of mental normality and correctness. In addition, he must possess some kind of superiority, so that in certain analytic situations he can act as a model for his patient and in others as a teacher. And finally we must not forget that the analytic relationship is based on a love of truth - that is, on a recognition of reality - and that it precludes any kind of sham or deceit.

[1937c, 5041]
I must give a few examples to illustrate my point. Those who are familiar with the findings of psycho-analytic investigation into the psychoneuroses will not be surprised to learn that what is being represented in obsessive actions or in ceremonials is derived from the most intimate, and for the most part from the sexual, experiences of the patient. [1907b, 1904]

It may seem surprising that this method of free association, carried out subject to the observation of the fundamental rule of psycho-analysis, should have achieved what was expected of it, namely the bringing into consciousness of the repressed material which was held back by resistances. We must, however, bear in mind that free association is not really free. The patient remains under the influence of the analytic situation even though he is not directing his mental activities on to a particular subject. We shall be justified in assuming that nothing will occur to him that has not some reference to that situation. His resistance against reproducing the repressed material will now be expressed in two ways. Firstly it will be shown by critical objections; and it was to deal with these that the fundamental rule of psycho-analysis was invented. But if the patient observes that rule and so overcomes his reticences, the resistance will find another means of expression. It will so arrange it that the repressed material itself will never occur to the patient but only something which approximates to it in an allusive way; and the greater the resistance, the more remote from the actual idea that the analyst is in search of will be the substitutive association which the patient has to report. The analyst, who listens composedly but without any constrained effort to the stream of associations and who, from his experience, has a general notion of what to expect, can make use of the material brought to light by the patient according to two possibilities. If the resistance is slight he will be able from the patient's allusions to infer the unconscious material itself; or if the resistance is stronger he will be able to recognize its character from the associations, as they seem to become more remote from the topic in hand, and will explain it to the patient. Uncovering the resistance, however, is the first step towards overcoming it. Thus the work of analysis involves an art of interpretation, the successful handling of which may require tact and practice but which is not hard to acquire. But it is not only in the saving of labour that the method of free association has an advantage over the earlier method. It exposes the patient to the least possible amount of compulsion, it never allows of contact being lost with the actual current situation, it guarantees to a great extent that no factor in the structure of the neurosis will be overlooked and that nothing will be introduced into it by the expectations of the analyst. It is left to the patient in all essentials to determine the course of the analysis and the arrangement of the material; any systematic handling of particular symptoms or complexes thus becomes impossible. In complete contrast to what happened with hypnotism and with the urging method, interrelated material makes its appearance at different times and at different points in the treatment. To a spectator, therefore - though in fact there must be none - an analytic treatment would seem completely obscure. [1925d, 4216]

Whether this happens will depend on people who are not obliged to be familiar with the peculiarities of an analytic treatment. It is our task to give information on the subject to these impartial persons, whom we shall assume to be, at the moment, still in ignorance. It is to be regretted that we cannot let them be present as an audience at a treatment of this kind. But the 'analytic situation' allows of the presence of no third person. Moreover the different sessions are of very unequal value. An unauthorized listener who hit upon a chance one of them would as a rule form no useful impression; he would be in danger of not understanding what was passing between the analyst and the patient, or he would be bored. For good or ill, therefore, he must be content with our information, which we shall try to make as trustworthy as possible. [1926e, 4328]
There are many very effective mental procedures which the physician is obliged to renounce. He either has not the power or has not the right to invoke them. This applies in particular to the provocation of strong affects - the most powerful of all the means by which the mind affects the body. The vicissitudes of life often cure illnesses through the experience of great joy, through the satisfaction of needs or the fulfilment of wishes. The physician, who is often impotent outside his profession, cannot compete along these lines. It might be more within his power to employ fear and fright for therapeutic ends; but, except in the case of children, he must have the gravest doubts about the use of such double-edged tools. On the other hand, the physician must rule out any relations with his patient that are bound up with tender feelings, owing to their implications in practical life. Thus from the first his power to bring about mental changes in his patients seems so restricted that mental treatment conducted on a deliberate plan would seem to offer no advantages over the earlier haphazard method.

Everything now depends on that. And the whole skill in handling the 'transference' is devoted to bringing it about. As you see, the requirements of analytic technique reach their maximum at this point. Here the gravest mistakes can be made or the greatest successes be registered. It would be folly to attempt to evade the difficulties by suppressing or neglecting the transference; whatever else had been done in the treatment, it would not deserve the name of an analysis. To send the patient away as soon as the inconveniences of his transference neurosis make their appearance would be no more sensible, and would moreover be cowardly. It would be as though one had conjured up spirits and run away from them as soon as they appeared. Sometimes, it is true, nothing else is possible. There are cases in which one cannot master the unleashed transference and the analysis has to be broken of; but one must at least have struggled with the evil spirits to the best of one's strength. To yield to the demands of the transference, to fulfil the patient's wishes for affectionate and sensual satisfaction, is not only justly forbidden by moral considerations but is also completely ineffective as a technical method for attaining the purpose of the analysis. A neurotic cannot be cured by being enabled to reproduce uncorrected an unconscious stereotype plate that is ready to hand in him. If one engages in compromises with him by offering him partial satisfactions in exchange for his further collaboration in the analysis, one must beware of falling into the ridiculous situation of the cleric who was supposed to convert a sick insurance agent. The sick man remained unconverted but the cleric took his leave insured. The only possible way out of the transference situation is to trace it back to the patient's past, as he really experienced it or as he pictured it through the wish-fulfilling activity of his imagination. And this demands from the analyst much skill, patience, calm and self-abnegation.

And now for the other side of the situation. Since the transference reproduces the patient's relation with his parents, it takes over the ambivalence of that relation as well. It almost inevitably happens that one day his positive attitude towards the analyst changes over into the negative, hostile one. This too is as a rule a repetition of the past. His obedience to his father (if it is his father that is in question), his courting of his father's favour, had its roots in an erotic wish directed towards him. Some time or other that demand will press its way forward in the transference as well and insist on being satisfied. In the analytic situation it can only meet with frustration. Real sexual relations between patients and analysts are out of the question, and even the subtler methods of satisfaction, such as the giving of preference, intimacy and so on, are only sparingly granted by the analyst. A rejection of this kind is taken as the occasion for the change-over; probably things happened in the same way in the patient's childhood.
In one single respect an educator's responsibility may perhaps exceed that of a doctor. The doctor has as a rule to deal with psychical structures which have already become rigid and he will find in the patient's established individuality a limit to his own achievement but at the same time a guarantee of the patient's capacity to stand alone. The educator, however, works upon material which is plastic and open to every impression, and he must keep before himself an obligation not to mould the young mind in accordance with his own personal ideals but rather according to his subject's dispositions and possibilities.

[1913b, 2636]

I do not think I have exhausted the range of desirable activity on the part of the physician in saying that a condition of privation is to be kept up during the treatment. Activity in another direction during analytic treatment has already, as you will remember, been a point at issue between us and the Swiss school. We refused most emphatically to turn a patient who puts himself into our hands in search of help into our private property, to decide his fate for him, to force our own ideals upon him, and with the pride of a Creator to form him in our own image and see that it is good. I still adhere to this refusal, and I think that this is the proper place for the medical discretion which we have had to ignore in other connections. I have learnt by experience, too, that such a far-reaching activity towards patients is not in the least necessary for therapeutic purposes. For I have been able to help people with whom I had nothing in common - neither race, education, social position nor outlook upon life in general - without affecting their individuality. At the time of the controversy I have just spoken of, I had the impression, to be sure, that the objections of our spokesmen - I think it was Ernest Jones who took the chief part - were too harsh and uncompromising. We cannot avoid taking some patients for treatment who are so helpless and incapable of ordinary life that for them one has to combine analytic with educative influence; and even with the majority, occasions now and then arise in which the physician is bound to take up the position of teacher and mentor. But it must always be done with great caution, and the patient should be educated to liberate and fulfil his own nature, not to resemble ourselves.

[1919a, 3633]

Our honoured friend, J. J. Putnam, in the land of America which is now so hostile to us, must forgive us if we cannot accept his proposal either - namely that psycho-analysis should place itself in the service of a particular philosophical outlook on the world and should urge this upon the patient for the purpose of ennobling his mind. In my opinion, this is after all only to use violence, even though it is overlaid with the most honourable motives.

[1919a, 3634]
Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psycho-analytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.

The description we have given applies to the most extreme instances of this state of affairs, but in a lesser measure this factor has to be reckoned with in very many cases, perhaps in all comparatively severe cases of neurosis. In fact it may be precisely this element in the situation, the attitude of the ego ideal, that determines the severity of a neurotic illness. We shall not hesitate therefore, to discuss rather more fully the way in which the sense of guilt expresses itself under different conditions.

Moreover, the relation of transference brings with it two further advantages. If the patient puts the analyst in the place of his father (or mother), he is also giving him the power which his super-ego exercises over his ego, since his parents were, as we know, the origin of his super-ego. The new super-ego now has an opportunity for a sort of after-education of the neurotic; it can correct mistakes for which his parents were responsible in educating him. But at this point a warning must be given against misusing this new influence. However much the analyst may be tempted to become a teacher, model and ideal for other people and to create men in his own image, he should not forget that that is not his task in the analytic relationship, and indeed that he will be disloyal to his task if he allows himself to be led on by his inclinations. If he does, he will only be repeating a mistake of the parents who crushed their child's independence by their influence, and he will only be replacing the patient's earlier dependence by a new one. In all his attempts at improving and educating the patient the analyst should respect his individuality. The amount of influence which he may legitimately allow himself will be determined by the degree of developmental inhibition present in the patient. Some neurotics have remained so infantile that in analysis too they can only be treated as children.
It is plausible to suppose that it is a question here of unconscious suggestion: the patient expects to be relieved of his sufferings by this procedure, and it is this expectation, and not the verbal utterance, which is the operative factor. This, however, is not so. The first case of this kind that came under observation dates back to the year 1881, that is to say to the 'pre-suggestion' era. A highly complicated case of hysteria was analysed in this way, and the symptoms, which sprang from separate causes, were separately removed. This observation was made possible by spontaneous auto-hypnoses on the part of the patient, and came as a great surprise to the observer.

[1895d, 10]

Though it cannot be denied that in a state of somnambulism she was highly suggestible, she was far from exhibiting a pathological absence of resistance. It can be asserted on the whole that I did not make more impression on her in that state than I might have expected to do if I were making an investigation of this kind into the psychical mechanisms of someone in full possession of his faculties who put complete confidence in what I said. The only difference was that Frau von N. was unable, in what passed as her normal state, to meet me with any such favourable mental attitude. If, as with her animal phobia, I failed to give her convincing reasons, or did not go into the psychical history of the origin of a symptom but tried to operate by the agency of authoritative suggestion, I invariably observed a strained and dissatisfied expression on her face; and when, at the end of the hypnosis, I asked her whether she would still be afraid of the animal, she would answer: 'No - since you insist.' A promise like this, based only on her obedience to me, never met with any success, any more than did the many general injunctions which I laid upon her, instead of which I might just as well have repeated the single suggestion that she should get well.

[1895d, 90]

But this same person who clung so obstinately to her symptoms in the face of suggestion and would only abandon them in response to psychical analysis or personal conviction, was on the other hand as amenable as the best medium to be found in any hospital, so far as irrelevant suggestions were concerned - so far as it was a question of matters not connected with her illness. I have given instances of her post-hypnotic obedience in the course of the case history. There does not seem to me to be anything contradictory in this behaviour. Here, too, the stronger idea was bound to assert itself. If we go into the mechanism of 'idées fixes', we find that they are based upon and supported by so many experiences operating with such intensity that we cannot be surprised to find that these ideas are able to put up a successful resistance against the opposing idea brought forward by suggestion, which is clothed with only limited powers. It would have to be a truly pathological brain from which it was possible to blow away by mere suggestion such well founded products of intense psychical events.
I have been deeply impressed in another of my patients by this interesting contrast during somnambulism between a most far-reaching obedience in everything unconnected with the symptoms and the obstinacy with which those symptoms persist because they are deeply rooted and inaccessible to analysis. A lively and gifted girl, who had suffered for eighteen months from severe disturbances of her power of walking, was under my treatment for more than five months without my being able to help her. She was analgesic and had painful areas in both legs and a rapid tremor in her hands. She walked bent forward, dragging her legs and with short steps; she staggered as though she was a cerebellar case and, indeed, often fell down. Her temperament was strikingly cheerful. One of the leading authorities in Vienna at the time was misled by this syndrome into diagnosing her case as one of multiple sclerosis. Another specialist recognized her as a hysterical - a diagnosis which was supported by the complicated picture presented by the disease in its beginnings (pains, fainting-fits, amaurosis) - and handed her on to me for treatment. I tried to improve her gait by suggestion, manipulation of her legs under hypnosis, etc., but I had no success in spite of her being an excellent subject for somnambulism. One day, after she once more came tottering into the room, one arm supported on her father's, the other on an umbrella whose tip was already much worn down, I lost patience and shouted at her in her hypnosis: 'This has gone on too long. To-morrow morning that umbrella of yours will break in your hands and you'll have to walk without it, and from that time on you will never need an umbrella again.' I cannot imagine how I came to be so foolish as to give a suggestion to an umbrella. Afterwards I felt ashamed of myself, and did not suspect that my clever patient would save my reputation in the eyes of her father, who was a physician and was present during her hypnoses. Next day her father said to me: 'What do you think she did yesterday? We were walking along the Ringstrasse when she suddenly got into the highest spirits. She began singing - in the very middle of the street - "Ein freies Leben führen wir" ["We live a free life"] and beat time on the pavement with her umbrella and broke it.' Of course she herself had no notion that she had wittily transformed a nonsensical suggestion into a brilliantly successful one. Since her condition was not improved by assurances, commands and treatment under hypnosis, I turned to psychical analysis and requested her to tell me what emotion had preceded the onset of her illness. She answered (under hypnosis but without any signs of feeling) that a short time previously a young relative of hers had died to whom she had for many years considered herself engaged. This piece of information, however, produced no alteration whatever in her condition. Accordingly, during her next hypnosis, I told her I was quite convinced that her cousin's death had had nothing at all to do with her state, but that something else had happened which she had not mentioned. At this she gave way to the extent of letting fall a single significant phrase; but she had hardly said a word before she stopped, and her old father, who was sitting behind her, began to sob bitterly. Naturally I pressed my investigation no further; but I never saw the patient again.

It was while I was studying Frau von N.'s abulia that I began for the first time to have grave doubts about the validity of Bernheim's assertion, "tout est dans la suggestion" ['suggestion is everything'] and about his clever friend Delboeuf's inference: 'Comme quoi il n'y a pas d'hypnotisme' ['That being so, there is no such thing as hypnotism']. And to this day I cannot understand how it can be supposed that by merely holding up a finger and saying once 'go to sleep' I had created in the patient the peculiar psychical state in which her memory had access to all her psychical experiences. I may have called up the state by my suggestion but I did not create it, since its features - which are, incidentally, found universally - came as such a surprise to me.

[1895d, 90]

[1895d, 91]
The case history makes sufficiently plain the way in which therapeutic work was carried out during somnambulism. As is the usual practice in hypnotic psychotherapy, I fought against the patient's pathological ideas by means of assurances and prohibitions, and by putting forward opposing ideas of every sort. But I did not content myself with this. I investigated the genesis of the individual symptoms so as to be able to combat the premises on which the pathological ideas were erected. In the course of such an analysis it habitually happened that the patient gave verbal utterance with the most violent agitation to matters whose accompanying affect had hitherto only found outlet as an expression of emotion. I cannot say how much of the therapeutic success each time was due to my suggesting the symptom away in statu nascendi and how much to my resolving the affect by abreaction, since I combined both these therapeutic factors. Accordingly, this case cannot strictly be used as evidence for the therapeutic efficacy of the cathartic procedure; at the same time I must add that only those symptoms of which I carried out a psychical analysis were really permanently removed.

[1895d, 91]

The most immediate objections to this conclusion will probably be that sexual assaults on small children happen too often for them to have any aetiological importance, or that these sorts of experiences are bound to be without effect precisely because they happen to a person who is sexually undeveloped; and further, that one must beware of forcing on patients supposed reminiscences of this kind by questioning them, or of believing in the romances which they themselves invent. In reply to the latter objections we may ask that no one should form too certain judgements in this obscure field until he has made use of the only method which can throw light on it - of psycho-analysis for the purpose of making conscious what has so far been unconscious.¹ What is essential in the first objections can be disposed of by pointing out that it is not the experiences themselves which act traumatically their revival as a memory after the subject has entered on sexual maturity.

[1896b, 385]

(5) I shall dwell longer on analyses of numerical associations, since I know of no other separate observations that would prove so forcefully the existence of highly composite thought-processes which are yet quite unknown to consciousness. At the same time I know of no better example of analyses in which the part contributed by the physician (suggestion) - so often held responsible - is so definitely ruled out. I shall therefore give a report here (with his consent) of the analysis of a number which occurred to a patient of mine. I need only add that he is the youngest child in a large family and at an early age lost his greatly admired father. While he was in a particularly cheerful mood the number 426718 came to his mind, and he asked himself: 'What ideas occur to me in that connection? First of all, a joke I have heard: "When a doctor treats a cold it lasts for 42 days; when it is not treated, it lasts 6 weeks."' This corresponds to the first figures in the number (42 = 6 x 7). In the stoppage that followed this first solution I drew his attention to the fact that the six-figure number he had chosen contained all the first digits except for 3 and 5. He then immediately found the continuation of the interpretation. 'There are 7 of us brothers and sisters, and I am the youngest. In the order of our age, 3 corresponds to my sister A., and 5 to my brother L.; they were my two enemies. As a child I used to pray to God every night for him to remove these two tormenting spirits from life. It seems to me now that in this choice of numbers I was myself fulfilling this wish; 3 and 5, the wicked brother and the hated sister, are passed over.' - 'If the number represents the order of your brothers and sisters, what does the 18 at the end mean? There were only 7 of you after all, - 'I have often thought that if my father had lived longer I should not have remained the youngest child. If there had been 1 more we should have been 8 and I should have had a younger child after me to whom I should have played the elder brother.'

[1901b, 1319]
Secondly, let me draw your attention to the fact that we physicians cannot discard psychotherapy, if only because another person intimately concerned in the process of recovery - the patient - has no intention of discarding it. You will know of the increase in knowledge on this subject that we owe to the Nancy school, to Lièbeault and Bernheim. A factor dependent on the psychical disposition of the patient contributes, without any intention on our part, to the effect of every therapeutic process initiated by a physician; most frequently it is favourable to recovery, but often it acts as an inhibition. We have learned to use the word 'suggestion' for this phenomenon, and Möbius has taught us that the unreliability which we deplore in so many of our therapeutic measures may be traced back to the disturbing influence of this very powerful factor. All physicians, therefore, yourselves included, are continually practising psychotherapy, even when you have no intention of doing so and are not aware of it; it is a disadvantage, however, to leave the mental factor in your treatment so completely in the patient's hands. Thus it is impossible to keep a check on it, to administer it in doses or to intensify it. Is it not then a justifiable endeavour on the part of a physician to seek to obtain command of this factor, to use it with a purpose, and to direct and strengthen it? This and nothing else is what scientific psychotherapy proposes.

Some further points may be mentioned in connection with the state of hypnosis. The words spoken by the hypnotist which have the magical results that I have described are known as a 'suggestion' and it has become customary to apply the term as well where there is merely an intention to produce a similar effect. Not only do the hypnotic subject's movements and feelings obey suggestions, but all his other mental activities; and he does not as a rule take any action on his own initiative. Hypnotic obedience can be employed in making a number of highly remarkable experiments, which afford a deep insight into the workings of the mind and produce in the observer an ineradicable conviction of the unsuspected power of the mind over the body. Just as a hypnotized subject can be obliged to see what is not there, so he can be forbidden to see what is there and is seeking to impress itself on his senses - some particular person, for instance. (This is known as a 'negative hallucination'.) The person in question then finds it impossible to attract the subject's attention by any kind of stimulation; he is treated as though he were 'thin air'. Again, a suggestion may be made to the subject to carry out some action a certain length of time after waking from hypnosis ('post-hypnotic suggestion'); the subject keeps to the allotted time and performs the suggested action in the middle of his waking state without being able to give any reason for it. If he is asked why he has done what he has, he will either refer to an obscure impulse which he was unable to resist, or he will invent some half-satisfactory excuse - without remembering the real explanation - namely the suggestion he has been given.

[1905a, 1564]

[1890a, 1599]
And there is another, still more important consideration. In describing the very remarkable results of suggestion, people are only too ready to forget that here, as in all mental operations, relative size and strength must be taken into account. If we put a healthy person into deep hypnosis and then tell him to take a bite out of a potato under the impression that it is a pear, or if we tell him that he is meeting one of his acquaintances and must greet him as such, he is likely to prove completely tractable, because the hypnotized subject has no serious reason for resisting the suggestion. But in the case of other instructions - if, for instance, we ask a naturally modest girl to uncover herself or if we ask an honest man to steal some valuable object - we may already find the subject putting up a resistance, which may even go to the length of his refusing to obey the suggestion. This teaches us that even in the best hypnosis suggestion does not exercise unlimited power but only power of a definite strength. The hypnotic subject will make small sacrifices, but, just as though he were awake, he hesitates before making great ones. If, then, we are dealing with a patient, and urge him by suggestion to give up his illness, we perceive that this means a great sacrifice to him and not a small one. Here the power of suggestion is contending against the force which created the symptom, and maintains them, and experience shows that that force is of quite a different order of strength from hypnotic influences. The same patient who is perfectly tractable in putting himself into any dream-situation one may suggest to him (if it is not actually objectionable) may remain completely recalcitrant towards a suggestion which denies the reality of, let us say, an imaginary paralysis. There is the further fact, moreover, that precisely neurotic patients are for the most part bad hypnotic subjects, so that the struggle against the powerful forces by which the illness is rooted in the patient's mind has to be waged not by a complete hypnotic influence but only by a fragment of it.

Thus suggestion is not certain as a matter of course of defeating the illness as soon as hypnosis (even deep hypnosis) has been achieved. A further battle has to be fought, and its outcome is very often uncertain. A single hypnotic treatment will accordingly effect nothing against severe disturbances of mental origin. If, however, hypnosis is repeated, it loses some of the miraculous effect which the patient may perhaps have anticipated. A succession of hypnoses may eventually bring about by degrees the influence over the illness which was lacking at first, till in the end a satisfactory result is achieved. But a hypnotic treatment such as this may be just as tedious and wearisome as a treatment of any other kind.

There is yet another way in which the relative weakness of suggestion is betrayed as compared with the illnesses it has to combat. It is true that suggestion can bring about a cessation of the symptoms of an illness - but only for a short time. At the end of this time they return and have to be repelled once again by renewed hypnosis and suggestion. If this course of events is repeated often enough, it usually exhausts the patience both of the patient and the physician and ends in the abandonment of hypnotic treatment. These, too, are the cases in which the patient becomes dependent on the physician and a kind of addiction to hypnosis is established.
It is a good thing for patients to be aware of these weaknesses in hypnotic therapy and of the possibilities of disappointment in its use. The curative power of hypnotic suggestion is something real and it needs no exaggerated recommendation. On the other hand, it is not surprising that physicians, to whom hypnotic mental treatment promised so much more than it could give, are indefatigable in their search for other procedures, which would make possible a deeper, or at least a less unpredictable, influence on a patient's mind. It may safely be anticipated that systematic modern mental treatment, which is a quite recent revival of ancient therapeutic methods, will provide physicians with far more powerful weapons for the fight against illness. A deeper insight into the processes of mental life, the beginnings of which are based precisely on hypnotic experience, will point out the ways and means to this end.

[1890a, 1604]

Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone represented psycho-analysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling-resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became accustomed to that long ago. People simply did not believe me, just as even to-day people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of all arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patient's minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses - arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psycho-analysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electro-therapy, but that does not enable such measures to get the better of neuroses. Time will show whether psycho-analytic treatment can accomplish more.

[1910d, 2311]

This seems perfectly sound and will satisfy anyone who can ignore the many enigmas that lie concealed behind the concepts of hypnosis, suggestion and autosuggestion. Autosuggestion in particular raises further questions. When and under what conditions does an idea become so powerful that it is able to behave like a suggestion and turn into reality without more ado? Closer investigation has taught us that we cannot answer this question without calling the concept of the 'unconscious' to our assistance. Many philosophers rebel against the assumption of a mental unconscious of this kind, because they have not concerned themselves with the phenomena which compel us to make that assumption. Psychopathologists have found that they cannot avoid working with such things as unconscious mental processes, unconscious ideas, and so on.

[1910i, 2366]
Thus the solution of the puzzle is that transference to the doctor is suitable for resistance to the treatment only so far as it is a negative transference or a positive transference of repressed erotic impulses. If we 'remove' the transference by making it conscious, we are detaching only these two components of the emotional act from the person of the doctor; the other component, which is admissible to consciousness and unobjectionable, persists and is the vehicle of success in psycho-analysis exactly as it is in other methods of treatment. To this extent we readily admit that the results of psycho-analysis rest upon suggestion; by suggestion, however, we must understand, as Ferenczi (1909) does, the influencing of a person by means of the transference phenomena which are possible in his case. We take care of the patient's final independence by employing suggestion in order to get him to accomplish a piece of psychological work which has as its necessary result a permanent improvement in his psychical situation.

[1912b, 2462]

But in psycho-analytic relations things often happen differently from what the psychology of consciousness might lead us to expect. Experience does not speak in favour of an affective technique of this kind. Nor is it hard to see that it involves a departure from psycho-analytic principles and verges upon treatment by suggestion. It may induce the patient to bring forward sooner and with less difficulty things he already knows but would otherwise have kept back for a time through conventional resistances. But this technique achieves nothing towards the uncovering of what is unconscious to the patient. It makes him even more incapable of overcoming his deeper resistances, and in severer cases it invariably fails by encouraging the patient to be insatiable: he would like to reverse the situation, and finds the analysis of the doctor more interesting than his own. The resolution of the transference, too - one of the main tasks of the treatment - is made more difficult by an intimate attitude on the doctor's part, so that any gain there may be at the beginning is more than outweighed at the end. I have no hesitation, therefore, in condemning this kind of technique as incorrect. The doctor should be opaque to his patients and, like a mirror, should show them nothing but what is shown to him. In practice, it is true, there is nothing to be said against a psychotherapist combining a certain amount of analysis with some suggestive influence in order to achieve a perceptible result in a shorter time - as is necessary, for instance, in institutions. But one has a right to insist that he himself should be in no doubt about what he is doing and should know that his method is not that of true psycho-analysis.

[1912e, 2472]

Both lay public and doctors - still ready to confuse psycho-analysis with treatment by suggestion - are inclined to attribute great importance to the expectations which the patient brings to the new treatment. They often believe in the case of one patient that he will not give much trouble, because he has great confidence in psycho-analysis and is fully convinced of its truth and efficacy; whereas in the case of another, they think that he will undoubtedly prove more difficult, because he has a sceptical outlook and will not believe anything until he has experienced its successful results on his own person. Actually, however, this attitude on the part of the patient has very little importance. His initial trust or distrust is almost negligible compared with the internal resistances which hold the neurosis firmly in place. It is true that the patient's happy trustfulness makes our earliest relationship with him a very pleasant one; we are grateful to him for that, but we warn him that his favourable prepossession will be shattered by the first difficulty that arises in the analysis. To the sceptic we say that the analysis requires no faith, that he may be as critical and suspicious as he pleases and that we do not regard his attitude as the effect of his judgement at all, for he is not in a position to form a reliable judgement on these matters; his distrust is only a symptom like his other symptoms and it will not be an interference, provided he conscientiously carries out what the rule of the treatment requires of him.

[1913c, 2479]
To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished - in the last resort, no doubt, the 'timelessness' of our unconscious processes. When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me from this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they over-estimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate much of it. But on the whole, once begun, it goes its own way and does not allow either the direction it takes or the order in which it picks up its points to be prescribed for it. The analyst's power over the symptoms of the disease may thus be compared to male sexual potency. A man can, it is true, beget a whole child, but even the strongest man cannot create in the female organism a head alone or an arm or a leg; he cannot even prescribe the child's sex. He, too, only sets in motion a highly complicated process, determined by events in the remote past, which ends with the severance of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, in so far as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

We may give as instances of disorders that are accessible to psycho-analytic treatment hysterical convulsions and paralyses as well as the various symptoms of obsessional neurosis (obsessive ideas and actions). All of these are conditions which are occasionally subject to spontaneous recovery and are dependent on the personal influence of the physician in a haphazard fashion which has not yet been explained. Psycho-analysis has no therapeutic effect on the severer forms of mental disorder properly so called. But - for the first time in the history of medicine - psycho-analysis has made it possible to get some insight into the origin and mechanism alike of the neuroses and psychoses.
A capacity for directing libidinal object-cathexes on to people must of course be attributed to every normal person. The tendency to transference of the neurotics I have spoken of is only an extraordinary increase of this universal characteristic. It would indeed be very strange if a human trait so widespread and so important had never been noticed or appreciated. And in fact it has been. Bernheim, with an unerring eye based his theory of hypnotic phenomena on the thesis that everyone is in some way 'suggestible'. His suggestibility was nothing other than the tendency to transference, somewhat too narrowly conceived, so that it did not include negative transference. But Bernheim was never able to say what suggestion actually was and how it came about. For him it was a fundamental fact on whose origin he could throw no light. He did not know that his 'suggéristibilité' depended on sexuality, on the activity of the libido. And it must dawn on us that in our technique we have abandoned hypnosis only to rediscover suggestion in the shape of transference.

[1916-1917, 3488]

But here I will pause, and let you have a word; for I see an objection boiling up in you so fiercely that it would make you incapable of listening if it were not put into words: 'Ah! so you've admitted it at last! You work with the help of suggestion, just like the hypnotists! That is what we've thought for a long time. But, if so, why the roundabout road by way of memories of the past, discovering the unconscious, interpreting and translating back distortions - this immense expenditure of labour, time and money - when the one effective thing is after all only suggestion? Why do you not make direct suggestion against the symptoms, as the others do - the honest hypnotists? Moreover, if you try to excuse yourself for your long detour on the ground that you have made a number of important psychological discoveries which are hidden by direct suggestion - what about the certainty of these discoveries now? Are not they a result of suggestion too, of unintentional suggestion? Is it not possible that you are forcing on the patient what you want and what seems to you correct, in this field as well?'

[1916-1917, 3488]

LADIES AND GENTLEMEN, - You know what we are going to talk about to-day. You asked me why we do not make use of direct suggestion in psycho-analytic therapy, when we admit that our influence rests essentially on transference - that is, on suggestion; and you added a doubt whether, in view of this predominance of suggestion, we are still able to claim that our psychological discoveries are objective. I promised I would give you a detailed reply.

[1916-1917, 3490]

Direct suggestion is suggestion aimed against the manifestation of the symptoms; it is a struggle between your authority and the motives for the illness. In this you do not concern yourself with these motives; you merely request the patient to suppress their manifestation in symptoms. It makes no difference of principle whether you put the patient under hypnosis or not. Once again Bernheim, with his characteristic perspicacity, maintained that suggestion was the essential element in the phenomena of hypnotism, that hypnosis itself was already a result of suggestion, a suggested state; and he preferred to practise suggestion in a waking state, which can achieve the same effects as suggestion under hypnosis.

[1916-1917, 3490]
I hope I have now made it clear to you in what way our method of employing suggestion therapeutically differs from the only method possible in hypnotic treatment. You will understand too, from the fact that suggestion can be traced back to transference, the capriciousness which struck us in hypnotic therapy, while analytic treatment remains calculable within its limits. In using hypnosis we are dependent on the state of the patient's capacity for transference without being able to influence it itself. The transference of a person who is to be hypnotized may be negative or, as most frequently, ambivalent, or he may have protected himself against his transference by adopting special attitudes; of that we learn nothing. In psycho-analysis we act upon the transference itself, resolve what opposes it, adjust the instrument with which we wish to make our impact. Thus it becomes possible for us to derive an entirely fresh advantage from the power of suggestion; we get it into our hands. The patient does not suggest to himself whatever he pleases: we guide his suggestion so far as he is in any way accessible to its influence.
[1916-1917, 3492]

This memory recurred occasionally during the analysis, and called for an explanation; but for a long time none was to be found. Nevertheless it was to be assumed as a matter of course that a detail like this had not kept its place in his recollection on its own account, but that it was a screen-memory, representing something of more importance with which it was in some way connected. One day he told me that in his language a butterfly was called 'babushka', 'granny'. He added that in general butterflies had seemed to him like women and girls, and beetles and caterpillars like boys. So there could be little doubt that in this anxiety scene a recollection of some female person had been aroused. I will not hide the fact that at that time I put forward the possibility that the yellow stripes on the butterfly had reminded him of similar stripes on a piece of clothing worn by some woman. I only mention this as an illustration to show how inadequate the physician's constructive efforts usually are for clearing up questions that arise, and how unjust it is to attribute the results of analysis to the physician's imagination and suggestion.
[1918b, 3571]

Twenty five years of intense work have had as their result that the immediate aims of psychoanalytic technique are quite other to-day than they were at the outset. At first the analysing physician could do no more than discover the unconscious material that was concealed from the patient, put it together, and, at the right moment, communicate it to him. Psychoanalysis was then first and foremost an art of interpreting. Since this did not solve the therapeutic problem, a further aim quickly came in view: to oblige the patient to confirm the analyst's construction from his own memory. In that endeavour the chief emphasis lay upon the patient's resistances: the art consisted now in uncovering these as quickly as possible, in pointing them out to the patient and in inducing him by human influence - this was where suggestion operating as 'transference' played its part - to abandon his resistances.
[1920g, 3723]
Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psychoanalytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.

But from here our interest proceeds to the question whether the latent dream-thoughts that have to be arrived at by interpretation can also be influenced or suggested by the analyst. And to this the answer must once more be that they obviously can be. For a portion of these latent dream-thoughts correspond to preconscious thought-formations, perfectly capable of being conscious, with which the dreamer might quite well have reacted to the physician's remarks in his waking state too - whether the patient's reactions were in harmony with those remarks or in opposition to them. In fact, if we replace the dream by the dream-thoughts which it contains, the question of how far one can suggest dreams coincides with the more general question of how far a patient in analysis is accessible to suggestion.

It may well be that dreams during psycho-analysis succeed in bringing to light what is repressed to a greater extent than dreams outside that situation. But it cannot be proved, since the two situations are not comparable; the employment of dreams in analysis is something very remote from their original purpose. On the other hand, it cannot be doubted that within an analysis far more of the repressed is brought to light in connection with dreams than by any other method. In order to account for this, there must be some motive power, some unconscious force, which is better able to lend support to the purposes of analysis during the state of sleep than at other times. What is here in question cannot well be any factor other than the patient's compliance towards the analyst which is derived from his parental complex - in other words, the positive portion of what we call the transference; and in fact, in many dreams which recall what has been forgotten and repressed, it is impossible to discover any other unconscious wish to which the motive force for the formation of the dream can be attributed. So that if anyone wishes to maintain that most of the dreams that can be made use of in analysis are obliging dreams and owe their origin to suggestion, nothing can be said against that opinion from the point of view of analytic theory. In that case I need only add a reference to what I have said in my Introductory Lectures, where I have dealt with the relation between transference and suggestion and shown how little the trustworthiness of our results is affected by a recognition of the operation of suggestion in our sense.
It is perfectly true that psycho-analysis, like other psychotherapeutic methods, employs the instrument of suggestion (or transference). But the difference is this: that in analysis it is not allowed to play the decisive part in determining the therapeutic results. It is used instead to induce the patient to perform a piece of psychical work - the overcoming of his transference resistances - which involves a permanent alteration in his mental economy. The transference is made conscious to the patient by the analyst, and it is resolved by convincing him that in his transference-attitude he is re-experiencing emotional relations which had their origin in his earliest object-attachments during the repressed period of his childhood. In this way the transference is changed from the strongest weapon of the resistance into the best instrument of the analytic treatment. Nevertheless its handling remains the most difficult as well as the most important part of the technique of analysis.

[1925d, 4218]

"Then, after all, I do not understand," comes the rejoinder. "What can you possibly mean by "telling more than he knows"? But I can well believe that as an analyst you gain a stronger influence over your patients than a Father Confessor over his penitents, since your contacts with him are so much longer, more intensive and also more individual, and since you use this increased influence to divert him from his sick thoughts, to talk him out of his fears, and so on. It would certainly be strange if it were possible by such means to control purely physical phenomena as well, such as vomiting, diarrhoea, convulsions; but I know that influence like that is in fact quite possible if a person is put into a state of hypnosis. By the trouble you take with the patient you probably succeed in bringing about a hypnotic relation of that sort with him - a suggestive attachment to yourself - even though you may not intend to; and in that case the miraculous results of your treatment are the effect of hypnotic suggestion. But, so far as I know, hypnotic treatment works much faster than your analysis, which, as you tell me, lasts for months and years."

[1926e, 4332]

What you say about the special personal influence of the analyst certainly deserves great attention. An influence of the kind exists and plays a large part in analysis - but not the same part as in hypnotism. It ought to be possible to convince you that the situations in the two cases are quite different. It may be enough to point out that we do not use this personal influence, the factor of 'suggestion', to suppress the symptoms of the illness, as happens with hypnotic suggestion. Further, it would be a mistake to believe that this factor is the vehicle and promoter of the treatment throughout its length. At its beginning, no doubt. But later on it opposes our analytic intentions and forces us to adopt the most far-reaching counter-measures. And I should like to show by an example how far diverting a patient's thoughts and talking him out of things are from the technique of analysis. If a patient of ours is suffering from a sense of guilt, as though he had committed a serious crime, we do not recommend him to disregard his qualms of conscience and do not emphasize his undoubted innocence; he himself has often tried to do so without success. What we do is to remind him that such a strong and persistent feeling must after all be based on something real, which it may perhaps be possible to discover.

[1926e, 4333]

"If I ever felt any desire to poach on your preserves and try my hand at analysing someone else, what you tell me about the resistances would have cured me of it. But how about the special personal influence that you yourself have after all admitted? Does not that come into action against the resistances?"

[1926e, 4366]
It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances.

[1926e, 4366]

The therapeutic successes that occurred under the sway of the positive transference are open to the suspicion of being of a suggestive nature. If the negative transference gains the upper hand, they are blown away like chaff before the wind. We observe with horror that all our trouble and labour hitherto have been in vain. Indeed, what we might have regarded as a permanent intellectual gain by the patient, his understanding of psycho-analysis and his reliance on its efficacy, suddenly vanish. He behaves like a child who has no power of judgement of his own but blindly believes anyone whom he loves and no one who is a stranger to him. The danger of these states of transference evidently lies in the patient's misunderstanding their nature and taking them for fresh real experiences instead of reflections of the past. If he (or she) becomes aware of the strong erotic desire that lies concealed behind the positive transference, he believes that he has fallen passionately in love; if the transference changes over, then he feels insulted and neglected, he hates the analyst as his enemy and is ready to abandon the analysis. In both these extreme cases he has forgotten the pact that he made at the beginning of the treatment and has become useless for continuing the common work. It is the analyst's task constantly to tear the patient out of his menacing illusion and to show him again and again that what he takes to be new real life is a reflection of the past. And lest he should fall into a state in which he is inaccessible to all evidence, the analyst takes care that neither the love nor the hostility reach an extreme height. This is effected by preparing him in good time for these possibilities and by not overlooking the first signs of them. Careful handling of the transference on these lines is as a rule richly rewarded. If we succeed, as we usually can, in enlightening the patient on the true nature of the phenomena of transference, we shall have struck a powerful weapon out of the hand of his resistance and shall have converted dangers into gains. For a patient never forgets again what he has experienced in the form of transference; it carries a greater force of conviction than anything he can acquire in other ways.

[1940a [1938], 4986]
In the present paper our attention will be turned exclusively to this preliminary labour performed by constructions. And here, at the very start, the question arises of what guarantee we have while we are working on these constructions that we are not making mistakes and risking the success of the treatment by putting forward some construction that is incorrect. It may seem that no general reply can in any event be given to this question; but even before discussing it we may lend our ear to some comforting information that is afforded by analytic experience. For we learn from it that no damage is done if, for once in a way, we make a mistake and offer the patient a wrong construction as the probable historical truth. A waste of time is, of course, involved, and anyone who does nothing but present the patient with false combinations will neither create a very good impression on him nor carry the treatment very far; but a single mistake of the sort can do no harm. What in fact occurs in such an event is rather that the patient remains as though he were untouched by what has been said and reacts to it with neither a 'Yes' nor a 'No'. This may possibly mean no more than that his reaction is postponed; but if nothing further develops we may conclude that we have made a mistake and we shall admit as much to the patient at some suitable opportunity without sacrificing any of our authority. Such an opportunity will arise when some new material has come to light which allows us to make a better construction and so to correct our error. In this way the false construction drops out, as if it had never been made; and, indeed, we often get an impression as though, to borrow the words of Polonius, our bait of falsehood had taken a carp of truth. The danger of our leading a patient astray by suggestion, by persuading him to accept things which we ourselves believe but which he ought not to, has certainly been enormously exaggerated. An analyst would have had to behave very incorrectly before such a misfortune could overtake him; above all, he would have to blame himself with not allowing his patients to have their say. I can assert without boasting that such an abuse of 'suggestion' has never occurred in my practice. [1937d, 5053]
The most immediate objections to this conclusion will probably be that sexual assaults on
small children happen too often for them to have any aetiological importance, or that these sorts
of experiences are bound to be without effect precisely because they happen to a person who is
sexually undeveloped; and further, that one must beware of forcing on patients supposed
reminiscences of this kind by questioning them, or of believing in the romances which they
themselves invent. In reply to the latter objections we may ask that no one should form too
certain judgements in this obscure field until he has made use of the only method which can
throw light on it - of psycho-analysis for the purpose of making conscious what has so far been
unconscious.¹ What is essential in the first objections can be disposed of by pointing out that it
is not the experiences themselves which act traumatically their revival as a memory after the
subject has entered on sexual maturity.
[1896b, 385]

But other people, too, although they may be less averse to psychological theories of hysteria,
will be tempted, when considering our analytic findings, to ask what degree of certainty the
application of psycho-analysis offers. Is it not very possible either that the physician forces such
scenes upon his docile patients, alleging that they are memories, or else that the patients tell
the physician things which they have deliberately invented or have imagined and that he
accepts those things as true? Well, my answer to this is that the general doubt about the
reliability of the psycho-analytic method can be appraised and removed only when a complete
presentation of its technique and results is available. Doubts about the genuineness of the
infantile sexual scenes can, however, be deprived of their force here and now by more than one
argument. In the first place, the behaviour of patients while they are reproducing these infantile
experiences is in every respect incompatible with the assumption that the scenes are anything
else than a reality which is being felt with distress and reproduced with the greatest reluctance.
Before they come for analysis the patients know nothing about these scenes. They are
indignant as a rule if we warn them that such scenes are going to emerge. Only the strongest
compulsion of the treatment can induce them to embark on a reproduction of them. While they
are recalling these infantile experiences to consciousness, they suffer under the most violent
sensations, of which they are ashamed and which they try to conceal; and, even after they have
gone through them once more in such a convincing manner, they still attempt to withhold belief
from them, by emphasizing the fact that, unlike what happens in the case of other forgotten
material, they have no feeling of remembering the scenes.¹
[1896c, 418]

It is less easy to refute the idea that the doctor forces reminiscences of this sort on the patient,
that he influences him by suggestion to imagine and reproduce them. Nevertheless it appears to
me equally untenable. I have never yet succeeded in forcing on a patient a scene I was
expecting to find, in such a way that he seemed to be living through it with all the appropriate
feelings. Perhaps others may be more successful in this.
[1896c, 418]

There are, however, a whole number of other things that vouch for the reality of infantile
sexual scenes. In the first place there is the uniformity which they exhibit in certain details,
which is a necessary consequence if the preconditions of these experiences are always of the
same kind, but which would otherwise lead us to believe that there were secret understandings
between the various patients. In the second place, patients sometimes describe as harmless
events whose significance they obviously do not understand, since they would be bound
otherwise to be horrified by them. Or again, they mention details, without laying any stress on
them, which only someone of experience in life can understand and appreciate as subtle traits
of reality.
[1896c, 419]
Without wishing to lay special stress on the point, I will add that in a number of cases therapeutic evidence of the genuineness of the infantile scenes can also be brought forward. There are cases in which a complete or partial cure can be obtained without our having to go as deep as the infantile experiences. And there are others in which no success at all is obtained until the analysis has come to its natural end with the uncovering of the earliest traumas. In the former cases we are not, I believe, secure against relapses; and my expectation is that a complete psycho-analysis implies a radical cure of the hysteria. We must not, however, be led into forestalling the lessons of observation.

[1896c, 420]

There would be one other proof, and a really unassailable one, of the genuineness of childhood sexual experiences namely, if the statements of someone who is being analysed were to be confirmed by someone else, whether under treatment or not. These two people will have had to have taken part in the same experience in their childhood - perhaps to have stood in some sexual relationship to each other. Such relations between children are, as you will hear in a moment, by no means rare. Moreover, it quite often happens that both of those concerned subsequently fall ill of neuroses; yet I regard it as a fortunate accident that, out of eighteen cases, I have been able to obtain an objective confirmation of this sort in two. In one instance, it was the brother (who had remained well) who of his own accord confirmed - not, it is true, his earliest sexual experiences with his sister (who was the patient) - but at least scenes of that kind from later childhood, and the fact that there had been sexual relations dating further back. In the other instance, it happened that two women whom I was treating had as children had sexual relations with the same man, in the course of which certain scenes had taken place à trois. A particular symptom, which was derived from these childhood events, had developed in both women, as evidence of what they had experienced in common.

[1896c, 420]

That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect; but, in addition to thus, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psycho-analysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psycho-analytic technique acquire an extensive confidence in its findings.

[1908c, 1966]
I must here turn for a moment to the history of the treatment. When once the Grusha scene had been assimilated - the first experience that he could really remember, and one which he had remembered without any conjectures or intervention on my part - the problem of the treatment had every appearance of having been solved. From that time forward there were no more resistances; all that remained to be done was to collect and to co-ordinate. The old trauma theory of the neuroses, which was after all built up upon impressions gained from psycho-analytic practice, had suddenly come to the front once more. Out of critical interest I made one more attempt to force upon the patient another view of his story, which might commend itself more to sober common sense. It was true that there could be no doubt about the scene with Grusha, but, I suggested, in itself that scene meant nothing; it had been emphasized *ex post facto* by a regression from the circumstances of his object choice, which, as a result of his intention to debase, had been diverted from his sister on to servant girls. On the other hand, his observation of intercourse, I argued, was a phantasy of his later years; its historical nucleus may perhaps have been an observation or an experience by the patient of the administration of an innocent enema. Some of my readers will possibly be inclined to think that with such hypotheses as these I was for the first time beginning to approach an understanding of the case; but the patient looked at me uncomprehendingly and a little contemptuously when I put this view before him, and he never reacted to it again. I have already stated my own arguments against any such rationalization at their proper point in the discussion.

[1918b, 3576]

On these issues I can venture upon no decision. I must confess, however, that I regard it as greatly to the credit of psycho-analysis that it should even have reached the stage of raising such questions as these. Nevertheless, I cannot deny that the scene with Grusha, the part it played in the analysis, and the effects that followed from it in the patient's life can be most naturally and completely explained if we consider that the primal scene, which may in other cases be a phantasy, was a reality in the present one. After all, there is nothing impossible about it; and the hypothesis of its reality is entirely compatible with the inciting action of the observations upon animals which are indicated by the sheep-dogs in the dream-picture.

[1918b, 3577]
While the analysis of a case is in progress it is impossible to obtain any clear impression of the structure and development of the neurosis. That is the business of a synthetic process which must be performed subsequently. In attempting to carry out such a synthesis of little Hans's phobia we shall take as our basis the account of his mental constitution, of his governing sexual wishes, and of his experiences up to the time of his sister's birth, which we have given in an earlier part of this paper.

[1909b, 2112]

This well-founded comparison of medical psycho-analytic activity with a chemical procedure might suggest a new direction for our therapy. We have analysed the patient - that is, separated his mental processes into their elementary constituents and demonstrated these instinctual elements in him singly and in isolation; what could be more natural than to expect that we should also help him to make a new and a better combination of them? You know that this demand has actually been put forward. We have been told that after an analysis of a sick mind a synthesis of it must follow. And, close upon this, concern has been expressed that the patient might be given too much analysis and too little synthesis; and there has then followed a move to put all the weight on this synthesis as the main factor in the psychotherapeutic effect, to see in it a kind of restoration of something that had been destroyed - destroyed, as it were, by vivisection.

[1919a, 3629]

But I cannot think, Gentlemen, that any new task is set us by this psycho-synthesis. If I allowed myself to be frank and uncivil I should say it was nothing but an empty phrase. I will limit myself to remarking that it is merely pushing a comparison so far that it ceases to have any meaning, or, if you prefer, that it is an unjustifiable exploitation of a name. A name, however, is only a label applied to distinguish a thing from other similar things, not a syllabus, a description of its content or a definition. And the two objects compared need only coincide at a single point and may be entirely different from each other in everything else. What is psychical is something so unique and peculiar to itself that no one comparison can reflect its nature. The work of psycho-analysis suggests analogies with chemical analysis, but it does so just as much with the intervention of a surgeon or the manipulations of an orthopaedist or the influence of an educator. The comparison with chemical analysis has its limitation: for in mental life we have to deal with trends that are under a compulsion towards unification and combination. Whenever we succeed in analysing a symptom into its elements, in freeing an instinctual impulse from one nexus, it does not remain in isolation, but immediately enters into a new one.¹

[1919a, 3630]

In actual fact, indeed, the neurotic patient presents us with a torn mind, divided by resistances. As we analyse it and remove the resistances, it grows together; the great unity which we call his ego fits into itself all the instinctual impulses which before had been split off and held apart from it. The psycho-synthesis is thus achieved during analytic treatment without our intervention, automatically and inevitably. We have created the conditions for it by breaking up the symptoms into their elements and by removing the resistances. It is not true that something in the patient has been divided into its components and is now quietly waiting for us to put it somehow together again.

[1919a, 3630]
But at this point we become aware of a state of things which also confronts us in many other instances in which light has been thrown by psycho-analysis on a mental process. So long as we trace the development from its final outcome backwards, the chain of events appears continuous, and we feel we have gained an insight which is completely satisfactory or even exhaustive. But if we proceed the reverse way, if we start from the premises inferred from the analysis and try to follow these up to the final result, then we no longer get the impression of an inevitable sequence of events which could not have been otherwise determined. We notice at once that there might have been another result, and that we might have been just as well able to understand and explain the latter. The synthesis is thus not so satisfactory as the analysis; in other words, from a knowledge of the premises we could not have foretold the nature of the result.

[1920a, 3856]

It is very easy to account for this disturbing state of affairs. Even supposing that we have a complete knowledge of the aetiological factors that decide a given result, nevertheless what we know about them is only their quality, and not their relative strength. Some of them are suppressed by others because they are too weak, and they therefore do not affect the final result. But we never know beforehand which of the determining factors will prove the weaker or the stronger. We only say at the end that those which succeeded must have been the stronger. Hence the chain of causation can always be recognized with certainty if we follow the line of analysis, whereas to predict it along the line of synthesis is impossible.

[1920a, 3857]
It is only too easy to explain why most people (whether medical observers or others) will hear nothing of the sexual life of children. They have forgotten their own infantile sexual activity under the pressure of their education to a civilized life, and they do not wish to be reminded of what has been repressed. They would arrive at other convictions if they were to begin their enquiry with a self-analysis, a revision and interpretation of their childhood memories.

[1910a, 2229]

Other innovations in technique relate to the physician himself. We have become aware of the 'counter-transference', which arises in him as a result of the patient's influence on his unconscious feelings, and we are almost inclined to insist that he shall recognize this counter-transference in himself and overcome it. Now that a considerable number of people are practising psycho-analysis and exchanging their observations with one another, we have noticed that no psycho-analyst goes further than his own complexes and internal resistances permit; and we consequently require that he shall begin his activity with a self-analysis and continually carry it deeper while he is making his observations on his patients. Anyone who fails to produce results in a self-analysis of this kind may at once give up any idea of being able to treat patients by analysis.

[1910d, 2309]

It was only my success in this direction that enabled me to persevere. The result is that I have acquired a habit of gauging the measure of a psychologist's understanding by his attitude to dream-interpretation; and I have observed with satisfaction that most of the opponents of psycho-analysis avoid this field altogether or else display remarkable clumsiness if they attempt to deal with it. Moreover, I soon saw the necessity of carrying out a self-analysis, and this I did with the help of a series of my own dreams which led me back through all the events of my childhood; and I am still of the opinion to-day that this kind of analysis may suffice for anyone who is a good dreamer and not too abnormal.

[1914d, 2889]
That the method is confined within these limits is to a large extent explained by the circumstances in which I had to work it out. My material does in fact consist of chronic nervous cases derived from the more educated classes. I think it very probable that supplementary methods may be devised for treating children and the public who go for assistance to hospitals. I ought also to say that up to the present I have tried my treatment exclusively on severe cases of hysteria and obsessional neurosis; I cannot tell how it would turn out with those mild cases which, to all appearance at least, are cured by some unspecific kind of treatment lasting for a few months. It will readily be understood that a new therapy which calls for many sacrifices can only reckon on obtaining patients who have already tried the generally accepted methods without success, or whose condition has justified the inference that they could expect nothing from these supposedly more convenient and shorter therapeutic procedures. Thus it happened that I was obliged to tackle the hardest tasks straightaway with an imperfect instrument. The test has proved all the more convincing.

[1897b, 474]

¹ [Footnote added 1910:] When the account which I have given above of infantile sexuality was first published in 1905, it was founded for the most part on the results of psycho-analytic research upon adults. At that time it was impossible to make full use of direct observation on children: only isolated hints and some valuable pieces of confirmation came from that source. Since then it has become possible to gain direct insight into infantile psycho-sexuality by the analysis of some cases of neurotic illness during the early years of childhood. It is gratifying to be able to report that direct observation has fully confirmed the conclusions arrived at by psycho-analysis - which is incidentally good evidence of the trustworthiness of that method of research. In addition to this, the 'Analysis of a Phobia in a Five-Year-Old Boy' (1909b) has taught us much that is new for which we have not been prepared by psycho-analysis: for instance, the fact that sexual symbolism - the representation of what is sexual by non-sexual objects and relations - extends back into the first years of possession of the power of speech.

[1905d, 1512]

Our efforts to trace the origins of the sexual instinct have shown us so far that sexual excitation arises (a) as a reproduction of a satisfaction experienced in connection with other organic processes, (b) through appropriate peripheral stimulation of erotogenic zones and (c) as an expression of certain 'instincts' (such as the scopophilic instinct and the instinct of cruelty) of which the origin is not yet completely intelligible. Psycho-analytic investigation, reaching back into childhood from a later time, and contemporary observation of children combine to indicate to us still other regularly active sources of sexual excitation. The direct observation of children has the disadvantage of working upon data which are easily misunderstandable; psycho-analysis is made difficult by the fact that it can only reach its data, as well as its conclusions, after long detours. But by co-operation the two methods can attain a satisfactory degree of certainty in their findings.

[1905d, 1519]

(3) The age of patients has this much importance in determining their fitness for psycho-analytic treatment, that, on the one hand, near or above the age of fifty the elasticity of the mental processes, on which the treatment depends, is as a rule lacking - old people are no longer educable - and, on the other hand, the mass of material to be dealt with would prolong the duration of the treatment indefinitely. In the other direction the age limit can be determined only individually; youthful persons under the age of adolescence are often exceedingly amenable to influence.

[1905a, 1569]
In the following pages I propose to describe the course of the illness and recovery of a very youthful patient. The case history is not, strictly speaking, derived from my own observation. It is true that I laid down the general lines of the treatment, and that on one single occasion, when I had a conversation with the boy, I took a direct share in it; but the treatment itself was carried out by the child's father, and it is to him that I owe my sincerest thanks for allowing me to publish his notes upon the case. But his services go further than this. No one else, in my opinion, could possibly have prevailed on the child to make any such avowals; the special knowledge by means of which he was able to interpret the remarks made by his five-year-old son was indispensable, and without it the technical difficulties in the way of conducting a psycho-analysis upon so young a child would have been insuperable. It was only because the authority of a father and of a physician were united in a single person, and because in him both affectionate care and scientific interest were combined, that it was possible in this one instance to apply the method to a use to which it would not otherwise have lent itself.

But the peculiar value of this observation lies in the considerations which follow. When a physician treats an adult neurotic by psycho-analysis, the process he goes through of uncovering the psychical formations, layer by layer, eventually enables him to frame certain hypotheses as to the patient's infantile sexuality; and it is in the components of the latter that he believes he has discovered the motive forces of all the neurotic symptoms of later life. I have set out these hypotheses in my *Three Essays on the Theory of Sexuality* (1905), and I am aware that they seem as strange to an outside reader as they seem incontrovertible to a psycho-analyst. But even a psycho-analyst may confess to the wish for a more direct and less roundabout proof of these fundamental theorems. Surely there must be a possibility of observing in children at first hand and in all the freshness of life the sexual impulses and wishes which we dig out so laboriously in adults from among their own débris - especially as it is also our belief that they are the common property of all men, a part of the human constitution, and merely exaggerated or distorted in the case of neurotics.

With this end in view I have for many years been urging my pupils and my friends to collect observations of the sexual life of children - the existence of which has as a rule been cleverly overlooked or deliberately denied. Among the material which came into my possession as a result of these requests, the reports which I received at regular intervals about little Hans soon began to take a prominent place. His parents were both among my closest adherents, and they had agreed that in bringing up their first child they would use no more coercion than might be absolutely necessary for maintaining good behaviour. And, as the child developed into a cheerful, good-natured and lively little boy, the experiment of letting him grow up and express himself without being intimidated went on satisfactorily. I shall now proceed to reproduce his father's records of little Hans just as I received them; and I shall of course refrain from any attempt at spoiling the naïveté and directness of the nursery by making any conventional emendations.
It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

[1909b, 2089]

I cannot take leave of our small patient's phobia without giving expression to a notion which has made its analysis, leading as it did to a recovery, seem of especial value to me. Strictly speaking, I learnt nothing new from this analysis, nothing that I had not already been able to discover (though often less distinctly and more indirectly) from other patients analysed at a more advanced age. But the neuroses of these other patients could in every instance be traced back to the same infantile complexes that were revealed behind Hans's phobia. I am therefore tempted to claim for this neurosis of childhood the significance of being a type and a model, and to suppose that the multiplicity of the phenomena of repression exhibited by neuroses and the abundance of their pathogenic material do not prevent their being derived from a very limited number of processes concerned with identical ideational complexes.

[1909b, 2123]

In the beginning, my statements about infantile sexuality were founded almost exclusively on the findings of analysis in adults which led back into the past. I had no opportunity of direct observations on children. It was therefore a very great triumph when it became possible years later to confirm almost all my inferences by direct observation and the analysis of very young children - a triumph that lost some of its magnitude as one gradually realized that the nature of the discovery was such that one should really be ashamed of having had to make it. The further one carried these observations on children, the more self-evident the facts became; but the more astonishing, too, did it become that one had taken so much trouble to overlook them.

[1914d, 2887]
In the first place observation shows, in a manner that excludes all doubt, that the infantile experiences have an importance of their own and give evidence of it already in childhood. Children too have their neuroses, in which the factor of displacement backwards in time is necessarily very much reduced or is even completely absent, since the onset of the illness follows the traumatic experiences immediately. The study of these infantile neuroses protects us from more than one dangerous misunderstanding of the neuroses of adults, just as the dreams of children gave the key to an understanding of adult dreams. Children's neuroses are very common, much commoner than is supposed. They are often overlooked, regarded as signs of a bad or naughty child, often, too, kept under by the nursery authorities; but they can always be easily recognized in retrospect. They usually appear in the form of anxiety hysteria. We shall learn on a later occasion what that means. If a neurosis breaks out in later life, analysis regularly reveals it as a direct continuation of the infantile illness which may have emerged as no more than a veiled hint. As I have said, however, there are cases in which these signs of neurosis in childhood proceed uninterruptedly into a lifelong illness. We have been able to analyse a few examples of these children's neuroses in childhood itself - when they were actually present; but far more often we have had to be content with someone who has fallen ill in adult life enabling us to obtain a deferred insight into his childhood neurosis. In such cases we must not fail to make certain corrections and take certain precautions.

My description will therefore deal with an infantile neurosis which was analysed not while it actually existed, but only fifteen years after its termination. This state of things has its advantages as well as its disadvantages in comparison with the alternative. An analysis which is conducted upon a neurotic child itself must, as a matter of course, appear to be more trustworthy, but it cannot be very rich in material; too many words and thoughts have to be lent to the child, and even so the deepest strata may turn out to be impenetrable to consciousness. An analysis of a childhood disorder through the medium of recollection in an intellectually mature adult is free from these limitations; but it necessitates our taking into account the distortion and refurbishing to which a person's own past is subjected when it is looked back upon from a later period. The first alternative perhaps gives the more convincing results; the second is by far the more instructive.

In any case it may be maintained that analysis of children's neuroses can claim to possess a specially high theoretical interest They afford us, roughly speaking, as much help towards a proper understanding of the neuroses of adults as do children's dreams in respect to the dreams of adults. Not, indeed, that they are more perspicuous or poorer in elements; in fact, the difficulty of feeling one's way into the mental life of a child makes them set the physician a particularly difficult task. But nevertheless, so many of the later deposits are wanting in them that the essence of the neurosis springs to the eyes with unmistakable distinctness. In the present phase of the battle which is raging round psycho-analysis the resistance to its findings has, as we know, taken on a new form. People were content formerly to dispute the reality of the facts which are asserted by analysis; and for this purpose the best technique seemed to be to avoid examining them. That procedure appears to be slowly exhausting itself; and people are now adopting another plan of recognizing the facts, but of eliminating, by means of twisted interpretations, the consequences that follow from them, so that the critics can still ward off the objectionable novelties as efficiently as ever. The study of children's neuroses exposes the complete inadequacy of these shallow or high-handed attempts at re-interpretation. It shows the predominant part that is played in the formation of neuroses by those libidinal motive forces which are so eagerly disavowed, and reveals the absence of any aspirations towards remote cultural aims, of which the child still knows nothing, and which cannot therefore be of any significance for him.
I myself have contributed nothing to the application of analysis to education. It was natural, however, that the analytic discoveries about the sexual life and mental development of children should attract the attention of educators and make them see their problems in a new light. Dr. Oskar Pfister, a protestant pastor at Zurich, led the way as a tireless pioneer along these lines, nor did he find the practice of analysis incompatible with the retention of his religion, though it is true that this was of a sublimated kind. Among the many others who worked alongside of him I may mention Frau Dr. Hug-Hellmuth and Dr. S. Bernfeld, both of Vienna.¹ The application of analysis to the prophylactic upbringing of healthy children and to the correcting of those who, though not actually neurotic, have deviated from the normal course of development has led to one consequence which is of practical importance. It is no longer possible to restrict the practice of psycho-analysis to doctors and to exclude laymen from it. In fact, a doctor who has not been through a special training is, in spite of his diploma, a layman in analysis, and a non-doctor who has been suitably trained can, with occasional reference to a doctor, carry out the analytic treatment not only of children but also of neurotics.
[1925d, 4242]

Oh, by no means. It is based on direct observation. What happened was this. We had begun by inferring the content of sexual childhood from the analysis of adults - that is to say, some twenty to forty years later. Afterwards, we undertook analyses on children themselves, and it was no small triumph when we were thus able to confirm in them everything that we had been able to divine, in spite of the amount to which it had been overlaid and distorted in the interval. [1926e, 4356]

"What? You have had small children in analysis? children of less than six years? Can that be done? And is it not most risky for the children?"
[1926e, 4356]
It can be done very well. It is hardly to be believed what goes on in a child of four or five years old. Children are very active-minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupider. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreproachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians to-day, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition.

Let me return to your question about certainty. We have become quite generally convinced from the direct analytic examination of children that we were right in our interpretation of what adults told us about their childhood. In a number of cases, however, another sort of confirmation has become possible. The material of the analysis of some patients has enabled us to reconstruct certain external happenings, certain impressive events of their childhood years, of which they have preserved no conscious memory. Lucky accidents, information from parents or nurses, have afterwards provided irrefutable evidence that these occurrences which we had inferred really did take place. This, of course, has not happened often, but when it has it has made an overwhelming impression. The correct reconstruction, you must know, of such forgotten experiences of childhood always has a great therapeutic effect, whether they permit of objective confirmation or not. These events owe their importance, of course, to their having occurred at such an early age, at a time when they could still produce a traumatic effect on the feeble ego.

Let me return to your question about certainty. We have become quite generally convinced from the direct analytic examination of children that we were right in our interpretation of what adults told us about their childhood. In a number of cases, however, another sort of confirmation has become possible. The material of the analysis of some patients has enabled us to reconstruct certain external happenings, certain impressive events of their childhood years, of which they have preserved no conscious memory. Lucky accidents, information from parents or nurses, have afterwards provided irrefutable evidence that these occurrences which we had inferred really did take place. This, of course, has not happened often, but when it has it has made an overwhelming impression. The correct reconstruction, you must know, of such forgotten experiences of childhood always has a great therapeutic effect, whether they permit of objective confirmation or not. These events owe their importance, of course, to their having occurred at such an early age, at a time when they could still produce a traumatic effect on the feeble ego.
Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.

We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1926e, 4390]

[1927c, 4452]
We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no super-ego, the method of free association does not carry far with him, transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis - and even the analysis itself - is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child-analysis. It has automatically happened that child-analysis has become the domain of women analysts, and no doubt this will remain true.

[1933a, 4748]
The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice.

[1933a, 4749]
Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman's belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that covers in the way of deeper determinants.

[1933a, 4752]

It will be enough for my purposes if I return to two general characteristics of the phenomena of derealization. The first is that they all serve the purpose of defence; they aim at keeping something away from the ego, at disavowing it. Now, new elements, which may give occasion for defensive measures, approach the ego from two directions - from the real external world and from the internal world of thoughts and impulses that emerge in the ego. It is possible that this alternative coincides with the choice between derealizations proper and depersonalizations. There are an extraordinarily large number of methods (or mechanisms, as we say) used by our ego in the discharge of its defensive functions. An investigation is at this moment being carried on close at hand which is devoted to the study of these methods of defence: my daughter, the child analyst, is writing a book upon them. The most primitive and thorough-going of these methods, 'repression', was the starting point of the whole of our deeper understanding of psychopathology. Between repression and what may be termed the normal method of fending off what is distressing or unbearable, by means of recognizing it, considering it, making a judgement upon it and taking appropriate action about it, there lie a whole series of more or less clearly pathological methods of behaviour on the part of the ego. May I stop for a moment to remind you of a marginal case of this kind of defence? You remember the famous lament of the Spanish Moors 'Ay de mi Alhama', which tells how King Boabdil received the news of the fall of his city of Alhama. He feels that this loss means the end of his rule. But he will not 'let it be true', he determines to treat the news as 'non arrivé'. The verse runs:

[1936a, 4829]
It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of primaeval history purely imaginary would be gravely under-estimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten primaeval age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son's relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations. [1939a, 4908]
What means have we at our disposal for overcoming this continual resistance? Few, but they include almost all those by which one man can ordinarily exert a psychical influence on another. In the first place, we must reflect that a psychical resistance, especially one that has been in force for a long time, can only be resolved slowly and by degrees, and we must wait patiently. In the next place, we may reckon on the intellectual interest which the patient begins to feel after working for a short time. By explaining things to him, by giving him information about the marvellous world of psychical processes into which we ourselves only gained insight by such analyses, we make him himself into a collaborator, induce him to regard himself with the objective interest of an investigator, and thus push back his resistance, resting as it does on an affective basis. But lastly - and this remains the strongest lever - we must endeavour, after we have discovered the motives for his defence, to deprive them of their value or even to replace them by more powerful ones. This no doubt is where it ceases to be possible to state psychotherapeutic activity in formulas. One works to the best of one's power, as an elucidator (where ignorance has given rise to fear), as a teacher, as the representative of a freer or superior view of the world, as a father confessor who gives absolution, as it were, by a continuance of his sympathy and respect after the confession has been made. One tries to give the patient human assistance, so far as this is allowed by the capacity of one's own personality and by the amount of sympathy that one can feel for the particular case. It is an essential precondition for such psychical activity that we should have more or less divined the nature of the case and the motives of the defence operating in it, and fortunately the technique of insistence and pressure takes us as far as this. The more such riddles we have already solved, the easier we may find it to guess a new one and the sooner we shall be able to start on the truly curative psychical work. For it is well to recognize this clearly: the patient only gets free from the hysterical symptom by reproducing the pathogenic impressions that caused it and by giving utterance to them with an expression of affect, and thus the therapeutic task consists solely in inducing him to do so; when once this task has been accomplished there is nothing left for the physician to correct or to remove. Whatever may be required for this purpose in the way of counter-suggestions has already been expended during the struggle against the resistance. The situation may be compared with the unlocking of a locked door, after which opening it by turning the handle offers no further difficulty.

[1895d, 249]

When I have promised my patients help or improvement by means of a cathartic treatment I have often been faced by this objection: 'Why, you tell me yourself that my illness is probably connected with my circumstances and the events of my life. You cannot alter these in any way. How do you propose to help me, then?' And I have been able to make this reply: 'No doubt fate would find it easier than I do to relieve you of your illness. But you will be able to convince yourself that much will be gained if we succeed in transforming your hysterical misery into common unhappiness. With a mental life that has been restored to health you will be better armed against that unhappiness.'

[1895d, 269]

You must not suppose, then, that very much has been gained by this for the therapeutics of hysteria. Hysteria, like the neuroses, has its deeper causes; and it is those deeper causes that set limits, which are often very appreciable, to the success of our treatment.

[1893a, 298]
The ego takes a similar interest, however, in the development and maintenance of the neurosis in every other case. I have already shown that symptoms are supported by the ego, too, because they have a side with which they offer satisfaction to the repressing purpose of the ego. Moreover, settling the conflict by constructing a symptom is the most convenient way out and the one most agreeable to the pleasure principle: it unquestionably spares the ego a large amount of internal work which is felt as distressing. Indeed there are cases in which even the physician must admit that for a conflict to end in neurosis is the most harmless and socially tolerable solution. You must not be surprised to hear that even the physician may occasionally take the side of the illness he is combating. It is not his business to restrict himself in every situation in life to being a fanatic in favour of health. He knows that there is not only neurotic misery in the world but real, irremovable suffering as well, that necessity may even require a person to sacrifice his health; and he learns that a sacrifice of this kind made by a single person can prevent immeasurable unhappiness for many others. If we may say, then, that whenever a neurotic is faced by a conflict he takes flight into illness, yet we must allow that in some cases that flight is fully justified, and a physician who has recognized how the situation lies will silently and solicitously withdraw.

[1916-1917, 3435]

You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninformative; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

[1933a, 4751]
Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman’s belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.

The first of these factors is often unjustly overlooked. However great may be the plasticity of mental life and the possibility of reviving old conditions, not everything can be brought to life again. Some changes seem to be definitive and correspond to scars formed when a process has run its course. On other occasions one has an impression of a general stiffening of mental life; the psychical processes, to which one could very well indicate other paths, seem incapable of abandoning the old ones. But perhaps this is the same thing as what I mentioned just now, only looked at differently. All too often one seems to see that it is only the treatment’s lack of the necessary motive force that prevents one from bringing the change about. One particular dependent relation, one special instinctual component, is too powerful in comparison with the opposing forces that we are able to mobilize. This is quite generally true with the psychoses. We understand them well enough to know the point at which the levers should be applied, but they would not be able to move the weight. It is here, indeed, that hope for the future lies: the possibility that our knowledge of the operation of the hormones (you know what they are) may give us the means of successfully combating the quantitative factors of the illnesses: but we are far from that to-day. I realize that the uncertainty in all these matters is a constant instigation towards perfecting analysis and in particular the transference. Beginners in analysis especially are left in doubt in case of a failure whether they should blame the peculiarities of the case or their own clumsy handling of the therapeutic procedure. But, as I have said already, I do not think much can be achieved by efforts in this direction.

[1933a, 4752]
I am afraid these detailed discussions are exhausting your interest. But I should be still more sorry if you were to think it is my intention to lower your opinion of psycho-analysis as a therapy. Perhaps I really made a clumsy start. For I wanted to do the opposite: to excuse the therapeutic limitations of analysis by pointing out their inevitability. With the same aim in view I turn to another point: the reproach against analytic treatment that it takes a disproportionately long time. On this it must be said that psychical changes do in fact only take place slowly; if they occur rapidly, suddenly, that is a bad sign. It is true that the treatment of a fairly severe neurosis may easily extend over several years; but consider, in case of success, how long the illness would have lasted. A decade, probably, for every year of treatment: the illness, that is to say (as we see so often in untreated cases), would not have ended at all. In some cases we have reasons for resuming an analysis many years afterwards. Life had developed fresh pathological reactions to fresh precipitating causes; but in the meantime our patient had been well. The first analysis had not in fact brought to light all his pathological dispositions, and it was natural for the analysis to have been stopped when success was achieved. There are also severely handicapped people who are kept under analytic supervision all through their lives and are taken back into analysis from time to time. But these people would otherwise have been altogether incapable of existence and we must feel glad that they can be kept on their feet by this piecemeal and recurrent treatment. The analysis of character disorders also calls for long periods of treatment; but it is often successful; and do you know of any other therapy with which such a task could even be approached? Therapeutic ambition may feel unsatisfied by such results; but we have learnt from the example of tuberculosis and lupus that success can only be obtained when the treatment has been adapted to the characteristics of the illness.

We shall not be disappointed, but, on the contrary, we shall find it entirely intelligible, if we reach the conclusion that the final outcome of the struggle we have engaged in depends on quantitative relations - on the quota of energy we are able to mobilize in the patient to our advantage as compared with the sum of energy of the powers working against us. Here once again God is on the side of the big battalions. It is true that we do not always succeed in winning, but at least we can usually recognize why we have not won. Those who have been following our discussion only out of therapeutic interest will perhaps turn away in contempt after this admission. But here we are concerned with therapy only in so far as it works by psychological means; and for the time being we have no other. The future may teach us to exercise a direct influence, by means of particular chemical substances, on the amounts of energy and their distribution in the mental apparatus. It may be that there are other still undreamt-of possibilities of therapy. But for the moment we have nothing better at our disposal than the technique of psycho-analysis, and for that reason, in spite of its limitations, it should not be despised.

The effect brought about in the ego by the defences can rightly be described as an ‘alteration of the ego’ if by that we understand a deviation from the fiction of a normal ego which would guarantee unshakable loyalty to the work of analysis. It is easy, then, to accept the fact, shown by daily experience, that the outcome of an analytic treatment depends essentially on the strength and on the depth of root of these resistances that bring about an alteration of the ego. Once again we are confronted with the importance of the quantitative factor, and once again we are reminded that analysis can only draw upon definite and limited amounts of energy which have to be measured against the hostile forces. And it seems as if victory is in fact as a rule on the side of the big battalions.
How parts of these two classes of instincts combine to fulfil the various vital functions, under what conditions such combinations grow looser or break up, to what disturbances these changes correspond and with what feelings the perceptual scale of the pleasure principle replies to them - these are problems whose elucidation would be the most rewarding achievement of psychological research. For the moment we must bow to the superiority of the forces against which we see our efforts come to nothing. Even to exert a psychical influence on simple masochism is a severe tax upon our powers.

[1937c, 5038]
I will digress for a moment to ask if you know what is meant by a causal therapy. That is how we describe procedure which does not take the symptoms of an illness as its point of attack but sets about removing its causes. Well, then, is our psycho-analytic method a causal therapy or not? The reply is not a simple one, but it may perhaps give us an opportunity of realizing the worthlessness of a question framed in this way. In so far as analytic therapy does not make it its first task to remove the symptoms, it is behaving like a causal therapy. In another respect, you may say, it is not. For we long ago traced the causal chain back through the repressions to the instinctual dispositions, their relative intensities in the constitution and the deviations in the course of their development. Supposing, now, that it was possible, by some chemical means, perhaps, to interfere in this mechanism, to increase or diminish the quantity of libido present at a given time or to strengthen one instinct at the cost of another - this then would be a causal therapy in the true sense of the word, for which our analysis would have carried out the indispensable preliminary work of reconnaissance. At present, as you know, there is no question of any such method of influencing libidinal processes; with our psychical therapy we attack at a different point in the combination - not exactly at what we know are the roots of the phenomena, but nevertheless far enough away from the symptoms, at a point which has been made accessible to us by some very remarkable circumstances.

[1916-1917, 3478]

Now let us assume that by some kind of organization we succeeded in increasing our numbers to an extent sufficient for treating a considerable mass of the population. On the other hand, it is possible to foresee that at some time or other the conscience of society will awake and remind it that the poor man should have just as much right to assistance for his mind as he now has to the life-saving help offered by surgery; and that the neuroses threaten public health no less than tuberculosis, and can be left as little as the latter to the impotent care of individual members of the community. When this happens, institutions or out-patient clinics will be started, to which analytically-trained physicians will be appointed, so that men who would otherwise give way to drink, women who have nearly succumbed under their burden of privations, children for whom there is no choice but between running wild or neurosis, may be made capable, by analysis, of resistance and of efficient work. Such treatments will be free. It may be a long time before the State comes to see these duties as urgent. Present conditions may delay its arrival even longer. Probably these institutions will first be started by private charity. Some time or other, however, it must come to this.

[1919a, 3635]

We shall then be faced by the task of adapting our technique to the new conditions. I have no doubt that the validity of our psychological assumptions will make its impression on the uneducated too, but we shall need to look for the simplest and most easily intelligible ways of expressing our theoretical doctrines. We shall probably discover that the poor are even less ready to part with their neuroses than the rich, because the hard life that awaits them if they recover offers them no attraction, and illness gives them one more claim to social help. Often, perhaps, we may only be able to achieve anything by combining mental assistance with some material support, in the manner of the Emperor Joseph. It is very probable, too, that the large-scale application of our therapy will compel us to alloy the pure gold of analysis freely with the copper of direct suggestion; and hypnotic influence, too, might find a place in it again, as it has in the treatment of war neuroses. But, whatever form this psychotherapy for the people may take, whatever the elements out of which it is compounded, its most effective and most important ingredients will assuredly remain those borrowed from strict and untendentious psycho-analysis.

[1919a, 3635]
Psycho-Analysis as a Therapeutic Procedure. - Psycho-analysis has never set itself up as a panacea and has never claimed to perform miracles. In one of the most difficult spheres of medical activity it is the only possible method of treatment for certain illnesses and for others it is the method which yields the best or the most permanent results - though never without a corresponding expenditure of time and trouble. A physician who is not wholly absorbed in the work of giving help will find his labours amply repaid by obtaining an unhoped-for insight into the complications of mental life and the interrelations between the mental and the physical. Where at present it cannot offer help but only theoretical understanding, it may perhaps be preparing the way for some later, more direct means of influencing neurotic disorders. Its province is above all the two transference neuroses, hysteria and obsessional neurosis, in which it has contributed to the discovery of their internal structure and operative mechanisms; and, beyond them, all kinds of phobias, inhibitions, deformities of character, sexual perversions and difficulties in erotic life. Some analysts (Jelliffe, Groddeck, Felix Deutsch) have reported too that the analytic treatment of gross organic diseases is not unpromising, since a mental factor not infrequently contributes to the origin and continuance of such illnesses. Since psycho-analysis demands a certain amount of psychical plasticity from its patients, some kind of age-limit must be laid down in their selection; and since it necessitates the devotion of long and intense attention to the individual patient, it would be uneconomical to squander such expenditure upon completely worthless persons who happen to be neurotic. Experience upon material in clinics can alone show what modifications may be necessary in order to make psycho-analytic treatment accessible to wider strata of the population or to adapt it to weaker intelligences.

Its Relation to Psychiatry. - Psychiatry is at present essentially a descriptive and classificatory science whose orientation is still towards the somatic rather than the psychological and which is without the possibility of giving explanations of the phenomena which it observes. Psycho-analysis does not, however, stand in opposition to it, as the almost unanimous behaviour of the psychiatrists might lead one to believe. On the contrary, as a depth-psychology, a psychology of those processes in mental life which are withdrawn from consciousness, it is called upon to provide psychiatry with an indispensable groundwork and to free it from its present limitations. We can foresee that the future will give birth to a scientific psychiatry, to which psycho-analysis has served as an introduction.

I do not believe, therefore, that Rank's attempt has solved the problem of the causation of neurosis; nor do I believe that we can say as yet how much it may nevertheless have contributed to such a solution. If an investigation into the effects of difficult birth on the disposition to neurosis should yield negative results, we shall rate the value of his contribution low. It is to be feared that our need to find a single, tangible 'ultimate cause' of neurotic illness will remain unsatisfied. The ideal solution, which medical men no doubt still yearn for, would be to discover some bacillus which could be isolated and bred in a pure culture and which, when injected into anyone, would invariably produce the same illness; or, to put it rather less extravagantly, to demonstrate the existence of certain chemical substances the administration of which would bring about or cure particular neuroses. But the probability of a solution of this kind seems slight.
We shall only find the standpoint we are in search of if we turn from scientific medicine to practical therapeutics. A sick person is a complicated organism. He may remind us that even the mental phenomena which are so hard to grasp should not be effaced from the picture of life. Neurotics, indeed, are an undesired complication, an embarrassment as much to therapeutics as to jurisprudence and to military service. But they exist and are a particular concern of medicine. Medical education, however, does nothing, literally nothing, towards their understanding and treatment. In view of the intimate connection between the things that we distinguish as physical and mental, we may look forward to a day when paths of knowledge and, let us hope, of influence will be opened up, leading from organic biology and chemistry to the field of neurotic phenomena. That day still seems a distant one, and for the present these illnesses are inaccessible to us from the direction of medicine.

[1926e, 4373]

The crudest, but also the most effective among these methods of influence is the chemical one - intoxication. I do not think that anyone completely understands its mechanism, but it is a fact that there are foreign substances which, when present in the blood or tissues, directly cause us pleasurable sensations; and they also so alter the conditions governing our sensibility that we become incapable of receiving unpleasurable impulses. The two effects not only occur simultaneously, but seem to be intimately bound up with each other. But there must be substances in the chemistry of our own bodies which have similar effects, for we know at least one pathological state, mania, in which a condition similar to intoxication arises without the administration of any intoxicating drug. Besides this, our normal mental life exhibits oscillations between a comparatively easy liberation of pleasure and a comparatively difficult one, parallel with which there goes a diminished or an increased receptivity to unpleasure. It is greatly to be regretted that this toxic side of mental processes has so far escaped scientific examination. The service rendered by intoxicating media in the struggle for happiness and in keeping misery at a distance is so highly prized as a benefit that individuals and peoples alike have given them an established place in the economics of their libido. We owe to such media not merely the immediate yield of pleasure, but also a greatly desired degree of independence from the external world. For one knows that, with the help of this 'drowner of cares' one can at any time withdraw from the pressure of reality and find refuge in a world of one's own with better conditions of sensibility. As is well known, it is precisely this property of intoxicants which also determines their danger and their injuriousness. They are responsible, in certain circumstances, for the useless waste of a large quota of energy which might have been employed for the improvement of the human lot.

[1930a, 4477]
The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice.

[1933a, 4749]
The first of these factors is often unjustly overlooked. However great may be the plasticity of mental life and the possibility of reviving old conditions, not everything can be brought to life again. Some changes seem to be definitive and correspond to scars formed when a process has run its course. On other occasions one has an impression of a general stiffening of mental life; the psychical processes, to which one could very well indicate other paths, seem incapable of abandoning the old ones. But perhaps this is the same thing as what I mentioned just now, only looked at differently. All too often one seems to see that it is only the treatment's lack of the necessary motive force that prevents one from bringing the change about. One particular dependent relation, one special instinctual component, is too powerful in comparison with the opposing forces that we are able to mobilize. This is quite generally true with the psychoses. We understand them well enough to know the point at which the levers should be applied, but they would not be able to move the weight. It is here, indeed, that hope for the future lies: the possibility that our knowledge of the operation of the hormones (you know what they are) may give us the means of successfully combating the quantitative factors of the illnesses: but we are far from that to-day. I realize that the uncertainty in all these matters is a constant instigation towards perfecting analysis and in particular the transference. Beginners in analysis especially are left in doubt in case of a failure whether they should blame the peculiarities of the case or their own clumsy handling of the therapeutic procedure. But, as I have said already, I do not think much can be achieved by efforts in this direction.

A dream, then, is a psychosis, with all the absurdities, delusions and illusions of a psychosis. A psychosis of short duration, no doubt, harmless, even entrusted with a useful function, introduced with the subject's consent and terminated by an act of his will. None the less it is a psychosis, and we learn from it that even so deep-going an alteration of mental life as this can be undone and can give place to the normal function. Is it too bold, then, to hope that it must also be possible to submit the dreaded spontaneous illnesses of mental life to our influence and bring about their cure?

No sooner have we taken this step than a first disappointment awaits us, a first warning against over-confidence. If the patient's ego is to be a useful ally in our common work, it must, however hard it may be pressed by the hostile powers, have retained a certain amount of coherence and some fragment of understanding for the demands of reality. But this is not to be expected of the ego of a psychotic; it cannot observe a pact of this kind, indeed it can scarcely enter into one. It will very soon have tossed us away and the help we offer it and sent us to join the portions of the external world which no longer mean anything to it. Thus we discover that we must renounce the idea of trying our plan of cure upon psychotics - renounce it perhaps for ever or perhaps only for the time being, till we have found some other plan better adapted for them.
We shall not be disappointed, but, on the contrary, we shall find it entirely intelligible, if we reach the conclusion that the final outcome of the struggle we have engaged in depends on *quantitative* relations - on the quota of energy we are able to mobilize in the patient to our advantage as compared with the sum of energy of the powers working against us. Here once again God is on the side of the big battalions. It is true that we do not always succeed in winning, but at least we can usually recognize why we have not won. Those who have been following our discussion only out of therapeutic interest will perhaps turn away in contempt after this admission. But here we are concerned with therapy only in so far as it works by psychological means; and for the time being we have no other. The future may teach us to exercise a direct influence, by means of particular chemical substances, on the amounts of energy and their distribution in the mental apparatus. It may be that there are other still undreamt-of possibilities of therapy. But for the moment we have nothing better at our disposal than the technique of psycho-analysis, and for that reason, in spite of its limitations, it should not be despised.

[1940a [1938], 4991]

No doubt it is desirable to shorten the duration of analytic treatment, but we can only achieve our therapeutic purpose by increasing the power of analysis to come to the assistance of the ego. Hypnotic influence seemed to be an excellent instrument for our purposes; but the reasons for our having to abandon it are well known. No substitute for hypnosis has yet been found. From this point of view we can understand how such a master of analysis as Ferenczi came to devote the last years of his life to therapeutic experiments, which, unhappily, proved to be vain.

[1937c, 5026]
Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of beasts and I scorn to distinguish between culture and civilization, presents, as we know, two aspects to the observer. It includes on the one hand all the knowledge and capacity that men have acquired in order to control the forces of nature and extract its wealth for the satisfaction of human needs, and, on the other hand, all the regulations necessary in order to adjust the relations of men to one another and especially the distribution of the available wealth. The two trends of civilization are not independent of each other: firstly, because the mutual relations of men are profoundly influenced by the amount of instinctual satisfaction which the existing wealth makes possible; secondly, because an individual man can himself come to function as wealth in relation to another one, in so far as the other person makes use of his capacity for work, or chooses him as a sexual object; and thirdly, moreover, because every individual is virtually an enemy of civilization, though civilization is supposed to be an object of universal human interest. It is remarkable that, little as men are able to exist in isolation, they should nevertheless feel as a heavy burden the sacrifices which civilization expects of them in order to make a communal life possible. Thus civilization has to be defended against the individual, and its regulations, institutions and commands are directed to that task. They aim not only at effecting a certain distribution of wealth but at maintaining that distribution; indeed, they have to protect everything that contributes to the conquest of nature and the production of wealth against men's hostile impulses. Human creations are easily destroyed, and science and technology, which have built them up, can also be used for their annihilation.

One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.
This psychological fact has a decisive importance for our judgement of human civilization. Whereas we might at first think that its essence lies in controlling nature for the purpose of acquiring wealth and that the dangers which threaten it could be eliminated through a suitable distribution of that wealth among men, it now seems that the emphasis has moved over from the material to the mental. The decisive question is whether and to what extent it is possible to lessen the burden of the instinctual sacrifices imposed on men, to reconcile men to those which must necessarily remain and to provide a compensation for them. It is just as impossible to do without control of the mass by a minority as it is to dispense with coercion in the work of civilization. For masses are lazy and unintelligent; they have no love for instinctual renunciation, and they are not to be convinced by argument of its inevitability; and the individuals composing them support one another in giving free rein to their indiscipline. It is only through the influence of individuals who can set an example and whom masses recognize as their leaders that they can be induced to perform the work and undergo the renunciations on which the existence of civilization depends. All is well if these leaders are persons who possess superior insight into the necessities of life and who have risen to the height of mastering their own instinctual wishes. But there is a danger that in order not to lose their influence they may give way to the mass more than it gives way to them, and it therefore seems necessary that they shall be independent of the mass by having means to power at their disposal. To put it briefly, there are two widespread human characteristics which are responsible for the fact that the regulations of civilization can only be maintained by a certain degree of coercion - namely, that men are not spontaneously fond of work and that arguments are of no avail against their passions.

I know the objections which will be raised against these assertions. It will be said that the characteristic of human masses depicted here, which is supposed to prove that coercion cannot be dispensed with in the work of civilization, is itself only the result of defects in the cultural regulations, owing to which men have become embittered, revengeful and inaccessible. New generations, who have been brought up in kindness and taught to have a high opinion of reason, and who have experienced the benefits of civilization at an early age, will have a different attitude to it. They will feel it as a possession of their very own and will be ready for its sake to make the sacrifices as regards work and instinctual satisfaction that are necessary for its preservation. They will be able to do without coercion and will differ little from their leaders. If no culture has so far produced human masses of such a quality, it is because no culture has yet devised regulations which will influence men in this way, and in particular from childhood onwards.

It may be doubted whether it is possible at all, or at any rate as yet, at the present stage of our control over nature, to set up cultural regulations of this kind. It may be asked where the number of superior, unswerving and disinterested leaders are to come from who are to act as educators of the future generations, and it may be alarming to think of the enormous amount of coercion that will inevitably be required before these intentions can be carried out. The grandeur of the plan and its importance for the future of human civilization cannot be disputed. It is securely based on the psychological discovery that man is equipped with the most varied instinctual dispositions, whose ultimate course is determined by the experiences of early childhood. But for the same reason the limitations of man's capacity for education set bounds to the effectiveness of such a transformation in his culture. One may question whether, and in what degree, it would be possible for a different cultural environment to do away with the two characteristics of human masses which make the guidance of human affairs so difficult. The experiment has not yet been made. Probably a certain percentage of mankind (owing to a pathological disposition or an excess of instinctual strength) will always remain asocial; but if it were feasible merely to reduce the majority that is hostile towards civilization to-day into a minority, a great deal would have been accomplished - perhaps all that can be accomplished.
We have slipped unawares out of the economic field into the field of psychology. At first we were tempted to look for the assets of civilization in the available wealth and in the regulations for its distribution. But with the recognition that every civilization rests on a compulsion to work and a renunciation of instinct and therefore inevitably provokes opposition from those affected by these demands, it has become clear that civilization cannot consist principally or solely in wealth itself and the means of acquiring it and the arrangements for its distribution; for these things are threatened by the rebelliousness and destructive mania of the participants in civilization. Alongside of wealth we now come upon the means by which civilization can be defended - measures of coercion and other measures that are intended to reconcile men to it and to recompense them for their sacrifices. These latter may be described as the mental assets of civilization.

[1927c, 4422]

These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud, and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

[1927c, 4423]

The extent to which a civilization's precepts have been internalized - to express it popularly and unpsychologically: the moral level of its participants - is not the only form of mental wealth that comes into consideration in estimating a civilization's value. There are in addition its assets in the shape of ideals and artistic creations - that is, the satisfactions that can be derived from those sources.

[1927c, 4424]
People will be only too readily inclined to include among the psychical assets of a culture its ideals - its estimates of what achievements are the highest and the most to be striven after. It will seem at first as though these ideals would determine the achievements of the cultural unit; but the actual course of events would appear to be that the ideals are based on the first achievements which have been made possible by a combination of the culture's internal gifts and external circumstances, and that these first achievements are then held on to by the ideal as something to be carried further. The satisfaction which the ideal offers to the participants in the culture is thus of a narcissistic nature; it rests on their pride in what has already been successfully achieved. To make this satisfaction complete calls for a comparison with other cultures which have aimed at different achievements and have developed different ideals. On the strength of these differences every culture claims the right to look down on the rest. In this way cultural ideals become a source of discord and enmity between different cultural units, as can be seen most clearly in the case of nations.

The narcissistic satisfaction provided by the cultural ideal is also among the forces which are successful in combating the hostility to culture within the cultural unit. This satisfaction can be shared in not only by the favoured classes, which enjoy the benefits of the culture, but also by the suppressed ones, since the right to despise the people outside it compensates them for the wrongs they suffer within their own unit. No doubt one is a wretched plebeian, harassed by debts and military service; but, to make up for it, one is a Roman citizen, one has one's share in the task of ruling other nations and dictating their laws. This identification of the suppressed classes with the class who rules and exploits them is, however, only part of a larger whole. For, on the other hand, the suppressed classes can be emotionally attached to their masters; in spite of their hostility to them they may see in them their ideals; unless such relations of a fundamentally satisfying kind subsisted, it would be impossible to understand how a number of civilizations have survived so long in spite of the justifiable hostility of large human masses.

We have spoken of the hostility to civilization which is produced by the pressure that civilization exercises, the renunciations of instinct which it demands. If one imagines its prohibitions lifted - if, then, one may take any woman one pleases as a sexual object, if one may without hesitation kill one's rival for her love or anyone else who stands in one's way, if, too, one can carry off any of the other man's belongings without asking leave - how splendid, what a string of satisfactions one's life would be! True, one soon comes across the first difficulty: everyone else has exactly the same wishes as I have and will treat me with no more consideration than I treat him. And so in reality only one person could be made unrestrictedly happy by such a removal of the restrictions of civilization, and he would be a tyrant, a dictator, who had seized all the means to power. And even he would have every reason to wish that the others would observe at least one cultural commandment: 'thou shalt not kill'.

But how ungrateful, how short-sighted after all, to strive for the abolition of civilization! What would then remain would be a state of nature, and that would be far harder to bear. It is true that nature would not demand any restrictions of instinct from us, she would let us do as we liked; but she has her own particularly effective method of restricting us. She destroys us coldly, cruelly, relentlessly, as it seems to us, and possibly through the very things that occasioned our satisfaction. It was precisely because of these dangers with which nature threatens us that we came together and created civilization, which is also, among other things, intended to make our communal life possible. For the principal task of civilization, its actual raison d'être, is to defend us against nature.
We all know that in many ways civilization does this fairly well already, and clearly as time goes on it will do it much better. But no one is under the illusion that nature has already been vanquished; and few dare hope that she will ever be entirely subjected to man. There are the elements, which seem to mock at all human control: the earth, which quakes and is torn apart and buries all human life and its works; water, which deluges and drowns everything in a turmoil; storms, which blow everything before them; there are diseases, which we have only recently recognized as attacks by other organisms; and finally there is the painful riddle of death, against which no medicine has yet been found, nor probably will be. With these forces nature rises up against us, majestic, cruel and inexorable; she brings to our mind once more our weakness and helplessness, which we thought to escape through the work of civilization. One of the few gratifying and exalting impressions which mankind can offer is when, in the face of an elemental catastrophe, it forgets the discordancies of its civilization and all its internal difficulties and animosities, and recalls the great common task of preserving itself against the superior power of nature.

Civilization relieves him of this task; it performs it in the same way for all alike; and it is noteworthy that in this almost all civilizations act alike. Civilization does not call a halt in the task of defending man against nature, it merely pursues it by other means. The task is a manifold one. Man's self-regard, seriously menaced, calls for consolation; life and the universe must be robbed of their terrors; moreover his curiosity, moved, it is true, by the strongest practical interest, demands an answer.

I think, all the same, that I am justified in expressing myself in this way. I have tried to show that religious ideas have arisen from the same need as have all the other achievements of civilization: from the necessity of defending oneself against the crushingly superior force of nature. To this a second motive was added - the urge to rectify the shortcomings of civilization which made themselves painfully felt. Moreover, it is especially apposite to say that civilization gives the individual these ideas, for he finds them there already; they are presented to him ready-made, and he would not be able to discover them for himself. What he is entering into is the heritage of many generations, and he takes it over as he does the multiplication table, geometry, and similar things. There is indeed a difference in this, but that difference lies elsewhere and I cannot examine it yet. The feeling of strangeness that you mention may be partly due to the fact that this body of religious ideas is usually put forward as a divine revelation. But this presentation of it is itself a part of the religious system, and it entirely ignores the known historical development of these ideas and their differences in different epochs and civilizations.

It is time for us to turn our attention to the nature of this civilization on whose value as a means to happiness doubts have been thrown. We shall not look for a formula in which to express that nature in a few words, until we have learned something by examining it. We shall therefore content ourselves with saying once more that the word 'civilization' describes the whole sum of the achievements and the regulations which distinguish our lives from those of our animal ancestors and which serve two purposes - namely to protect men against nature and to adjust their mutual relations.¹ In order to learn more, we will bring together the various features of civilization individually, as they are exhibited in human communities. In doing so, we shall have no hesitation in letting ourselves be guided by linguistic usage or, as it is also called, linguistic feeling, in the conviction that we shall thus be doing justice to inner discernments which still defy expression in abstract terms.
The first stage is easy. We recognize as cultural all activities and resources which are useful to men for making the earth serviceable to them, for protecting them against the violence of the forces of nature, and so on. As regards this side of civilization, there can be scarcely any doubt. If we go back far enough, we find that the first acts of civilization were the use of tools, the gaining of control over fire and the construction of dwellings. Among these, the control over fire stands out as a quite extraordinary and unexampled achievement,¹ while the others opened up paths which man has followed ever since, and the stimulus to which is easily guessed. With every tool man is perfecting his own organs, whether motor or sensory, or is removing the limits to their functioning. Motor power places gigantic forces at his disposal, which, like his muscles, he can employ in any direction; thanks to ships and aircraft neither water nor air can hinder his movements; by means of spectacles he corrects defects in the lens of his own eye; by means of the telescope he sees into the far distance; and by means of the microscope he overcomes the limits of visibility set by the structure of his retina. In the photographic camera he has created an instrument which retains the fleeting visual impressions, just as a gramophone disc retains the equally fleeting auditory ones; both are at bottom materializations of the power he possesses of recollection, his memory. With the help of the telephone he can hear at distances which would be respected as unattainable even in a fairy tale. Writing was in its origin the voice of an absent person; and the dwelling-house was a substitute for the mother’s womb, the first lodging, for which in all likelihood man still longs, and in which he was safe and felt at ease.
[1930a, 4488]
We recognize, then, that countries have attained a high level of civilization if we find that in them everything which can assist in the exploitation of the earth by man and in his protection against the forces of nature - everything, in short, which is of use to him - is attended to and effectively carried out. In such countries rivers which threaten to flood the land are regulated in their flow, and their water is directed through canals to places where there is a shortage of it. The soil is carefully cultivated and planted with the vegetation which it is suited to support; and the mineral wealth below ground is assiduously brought to the surface and fashioned into the required implements and utensils. The means of communication are ample, rapid and reliable. Wild and dangerous animals have been exterminated, and the breeding of domesticated animals flourishes. But we demand other things from civilization besides these, and it is a noticeable fact that we hope to find them realized in these same countries. As though we were seeking to repudiate the first demand we made, we welcome it as a sign of civilization as well if we see people directing their care too to what has no practical value whatever, to what is useless - if, for instance, the green spaces necessary in a town as playgrounds and as reservoirs of fresh air are also laid out with flower-beds, or if the windows of the houses are decorated with pots of flowers. We soon observe that this useless thing which we expect civilization to value is beauty. We require civilized man to reverence beauty wherever he sees it in nature and to create it in the objects of his handiwork so far as he is able. But this is far from exhausting our demands on civilization. We expect besides to see the signs of cleanliness and order. We do not think highly of the cultural level of an English country town in Shakespeare's time when we read that there was a big dung heap in front of his father's house in Stratford; we are indignant and call it 'barbarous' (which is the opposite of civilized) when we find the paths in the Wiener Wald littered with paper. Dirtiness of any kind seems to us incompatible with civilization. We extend our demand for cleanliness to the human body too. We are astonished to learn of the objectionable smell which emanated from the Roi Soleil; and we shake our heads on the Isola Bella when we are shown the tiny wash-basin in which Napoleon made his morning toilet. Indeed, we are not surprised by the idea of setting up the use of soap as an actual yardstick of civilization. The same is true of order. It, like cleanliness, applies solely to the works of man. But whereas cleanliness is not to be expected in nature, order, on the contrary, has been imitated from her. Man's observation of the great astronomical regularities not only furnished him with a model for introducing order into his life, but gave him the first points of departure for doing so. Order is a kind of compulsion to repeat which, when a regulation has been laid down once and for all, decides when, where and how a thing shall be done, so that in every similar circumstance one is spared hesitation and indecision. The benefits of order are incontestable. It enables men to use space and time to the best advantage, while conserving their psychical forces. We should have a right to expect that order would have taken its place in human activities from the start and without difficulty; and we may well wonder that this has not happened - that, on the contrary, human beings exhibit an inborn tendency to carelessness, irregularity and unreliability in their work, and that a laborious training is needed before they learn to follow the example of their celestial models.

[1930a, 4490]

Beauty, cleanliness and order obviously occupy a special position among the requirements of civilization. No one will maintain that they are as important for life as control over the forces of nature or as some other factors with which we shall become acquainted. And yet no one would care to put them in the background as trivialities. That civilization is not exclusively taken up with what is useful is already shown by the example of beauty, which we decline to omit from among the interests of civilization. The usefulness of order is quite evident. With regard to cleanliness, we must bear in mind that it is demanded of us by hygiene as well, and we may suspect that even before the days of scientific prophylaxis the connection between the two was not altogether strange to man. Yet utility does not entirely explain these efforts; something else must be at work besides.

[1930a, 4491]
No feature, however, seems better to characterize civilization than its esteem and encouragement of man's higher mental activities - his intellectual, scientific and artistic achievements and the leading role that it assigns to ideas in human life. Foremost among those ideas are the religious systems, on whose complicated structure I have endeavoured to throw light elsewhere. Next come the speculations of philosophy; and finally what might be called man's 'ideals' - his ideas of a possible perfection of individuals, or of peoples or of the whole of humanity, and the demands he sets up on the basis of such ideas. The fact that these creations of his are not independent of one another, but are on the contrary closely interwoven, increases the difficulty not only of describing them but of tracing their psychological derivation. If we assume quite generally that the motive force of all human activities is a striving towards the two confluent goals of utility and a yield of pleasure, we must suppose that this is also true of the manifestations of civilization which we have been discussing here, although this is easily visible only in scientific and aesthetic activities. But it cannot be doubted that the other activities, too, correspond to strong needs in men - perhaps to needs which are only developed in a minority. Nor must we allow ourselves to be misled by judgements of value concerning any particular religion, or philosophic system, or ideal. Whether we think to find in them the highest achievements of the human spirit, or whether we deplore them as aberrations, we cannot but recognize that where they are present, and, in especial, where they are dominant, a high level of civilization is implied. [1930a, 4491]

The last, but certainly not the least important, of the characteristic features of civilization remains to be assessed: the manner in which the relationships of men to one another, their social relationships, are regulated - relationships which affect a person as a neighbour, as a source of help, as another person's sexual object, as a member of a family and of a State. Here it is especially difficult to keep clear of particular ideal demands and to see what is civilized in general. Perhaps we may begin by explaining that the element of civilization enters on the scene with the first attempt to regulate these social relationships. If the attempt were not made, the relationships would be subject to the arbitrary will of the individual: that is to say, the physically stronger man would decide them in the sense of his own interests and instinctual impulses. Nothing would be changed in this if this stronger man should in his turn meet someone even stronger than he. Human life in common is only made possible when a majority comes together which is stronger than any separate individual and which remains united against all separate individuals. The power of this community is then set up as 'right' in opposition to the power of the individual, which is condemned as 'brute force'. This replacement of the power of the individual by the power of a community constitutes the decisive step of civilization. The essence of it lies in the fact that the members of the community restrict themselves in their possibilities of satisfaction, whereas the individual knew no such restrictions. The first requisite of civilization, therefore, is that of justice - that is, the assurance that a law once made will not be broken in favour of an individual. This implies nothing as to the ethical value of such a law. The further course of cultural development seems to tend towards making the law no longer an expression of the will of a small community - a caste or a stratum of the population or a racial group - which, in its turn, behaves like a violent individual towards other, and perhaps more numerous, collections of people. The final outcome should be a rule of law to which all - except those who are not capable of entering a community - have contributed by a sacrifice of their instincts, and which leaves no one - again with the same exception - at the mercy of brute force. [1930a, 4492]
The liberty of the individual is no gift of civilization. It was greatest before there was any civilization, though then, it is true, it had for the most part no value, since the individual was scarcely in a position to defend it. The development of civilization imposes restrictions on it, and justice demands that no one shall escape those restrictions. What makes itself felt in a human community as a desire for freedom may be their revolt against some existing injustice, and so may prove favourable to a further development of civilization; it may remain compatible with civilization. But it may also spring from the remains of their original personality, which is still untamed by civilization and may thus become the basis in them of hostility to civilization. The urge for freedom, therefore, is directed against particular forms and demands of civilization or against civilization altogether. It does not seem as though any influence could induce a man to change his nature into a termite's. No doubt he will always defend his claim to individual liberty against the will of the group. A good part of the struggles of mankind centre round the single task of finding an expedient accommodation - one, that is, that will bring happiness - between this claim of the individual and the cultural claims of the group; and one of the problems that touches the fate of humanity is whether such an accommodation can be reached by means of some particular form of civilization or whether this conflict is irreconcilable.

[1930a, 4493]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹

Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

¹[1930a, 4494]

But if we want to know what value can be attributed to our view that the development of civilization is a special process, comparable to the normal maturation of the individual, we must clearly attack another problem. We must ask ourselves to what influences the development of civilization owes its origin, how it arose, and by what its course has been determined.

¹[1930a, 4494]
This rift between them seems unavoidable. The reason for it is not immediately recognizable. It expresses itself at first as a conflict between the family and the larger community to which the individual belongs. We have already perceived that one of the main endeavours of civilization is to bring people together into large unities. But the family will not give the individual up. The more closely the members of a family are attached to one another, the more often do they tend to cut themselves off from others, and the more difficult is it for them to enter into the wider circle of life. The mode of life in common which is phylogenetically the older, and which is the only one that exists in childhood, will not let itself be superseded by the cultural mode of life which has been acquired later. Detaching himself from his family becomes a task that faces every young person, and society often helps him in the solution of it by means of puberty and initiation rites. We get the impression that these are difficulties which are inherent in all psychical - and, indeed, at bottom, in all organic - development.

Furthermore, women soon come into opposition to civilization and display their retarding and restraining influence - those very women who, in the beginning, laid the foundations of civilization by the claims of their love. Women represent the interests of the family and of sexual life. The work of civilization has become increasingly the business of men, it confronts them with ever more difficult tasks and compels them to carry out instinctual sublimations of which women are little capable. Since a man does not have unlimited quantities of psychical energy at his disposal, he has to accomplish his tasks by making an expedient distribution of his libido. What he employs for cultural aims he to a great extent withdraws from women and sexual life. His constant association with men, and his dependence on his relations with them, even estrange him from his duties as a husband and father. Thus the woman finds herself forced into the background by the claims of civilization and she adopts a hostile attitude towards it.
The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

[1930a, 4500]
The clue may be supplied by one of the ideal demands, as we have called them, of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naïve attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too - I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earth-worm or a grass-snake, then I fear that only a small modicum of my love will fall to his share - not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable?

On closer inspection, I find still further difficulties. Not merely is this stranger in general unworthy of my love; I must honestly confess that he has more claim to my hostility and even my hatred. He seems not to have the least trace of love for me and shows me not the slightest consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask himself whether the amount of advantage he gains bears any proportion to the extent of the harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his superior power; and the more secure he feels and the more helpless I am, the more certainly I can expect him to behave like this to me. If he behaves differently, if he shows me consideration and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as thy neighbour loves thee', I should not take exception to it. And there is a second commandment, which seems to me even more incomprehensible and arouses still stronger opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in treating it as a greater imposition. At bottom it is the same thing.
If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

[1930a, 4507]

In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nursemaids try to appease with their lullaby about Heaven.

[1930a, 4512]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfill; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

[1930a, 4530]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 't’out comprendre c’est tout pardonner’ - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]

I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain that society will reward this renunciation by offering me one of the permitted methods - even after a certain amount of postponement? What these jokes whisper may be said aloud: that the wishes and desires of men have a right to make themselves acceptable alongside of exacting and ruthless morality. And in our days it has been said in forceful and stirring sentences that this morality is only a selfish regulation laid down by the few who are rich and powerful and who can satisfy their wishes at any time without any postponement. So long as the art of healing has not gone further in making our life safe and so long as social arrangements do no more to make it more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the demands of morality. Every honest man will end by making this admission, at least to himself. The decision in this conflict can only be reached by the roundabout path of fresh insight. One must bind one's own life to that of others so closely and be able to identify oneself with others so intimately that the brevity of one's own life can be overcome; and one must not fulfil the demands of one's own needs illegitimately, but must leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to change the order of society. But not every personal need can be postponed in this way and transferred to other people, and there is no general and final solution of the conflict.

[1905c, 1704]
Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',¹ in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

[1908d, 1951]

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1962]
We must not omit to consider the third of the possible outcomes of the work of psycho-
analysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction
and ought to find it in life. Our civilized standards make life too difficult for the majority of human
organizations. Those standards consequently encourage the retreat from reality and the
generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual
repression. We ought not to exalt ourselves so high as completely to neglect what was originally
animal in our nature. Nor should we forget that the satisfaction of the individual's happiness
cannot be erased from among the aims of our civilization. The plasticity of the components of
sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive
for still greater cultural achievements by still further sublimation. But, just as we do not count on
our machines converting more than a certain fraction of the heat consumed into useful
mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual
instinct from its proper ends. We cannot succeed in doing so; and if the restriction upon
sexuality were to be carried too far it would inevitably bring with it all the evils of soil-exhaustion.[1910a, 2239]

People will not reach a proper understanding of the activities of children's sexuality and will
probably take refuge in declaring that what has been said here is incredible, so long as they
cling to the attitude taken up by our civilization of depreciating the genitals and the sexual
functions. To understand the mental life of children we require analogies from primitive times.
Through a long series of generations the genitals have been for us the 'pudenda', objects of
shame, and even (as a result of further successful sexual repression) of disgust. If one makes a
broad survey of the sexual life of our time and in particular of the classes who sustain human
civilization, one is tempted to declare that it is only with reluctance that the majority of those
alive to-day obey the command to propagate their kind; they feel that their dignity as human
beings suffers and is degraded in the process. What is to be found among us in the way of
another view of sexual life is confined to the uncultivated lower strata of society; among the
higher and more refined classes it is concealed, since it is considered culturally inferior, and it
ventures to put itself into practice only in the face of a bad conscience. In the primaeval days of
the human race it was a different story. The laborious compilations of the student of civilization
provide convincing evidence that originally the genitals were the pride and hope of living beings;
they were worshipped as gods and transmitted the divine nature of their functions to all newly
learned human activities. As a result of the sublimation of their basic nature there arose
innumerable divinities; and at the time when the connection between official religions and
sexual activity was already hidden from the general consciousness, secret cults devoted
themselves to keeping it alive among a number of initiates. In the course of cultural
development so much of the divine and sacred was ultimately extracted from sexuality that the
exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all
mental traces, it is surely not surprising that even the most primitive forms of genital-worship
can be shown to have existed in very recent times and that the language, customs and
superstitions of mankind to-day contain survivals from every phase of this process of
development.²
[1910c, 2271]
We must expressly insist that we have never reckoned Leonardo as a neurotic or a 'nerve case', as the awkward phrase goes. Anyone who protests at our so much as daring to examine him in the light of discoveries gained in the field of pathology is still clinging to prejudices which we have to-day rightly abandoned. We no longer think that health and illness, normal and neurotic people, are to be sharply distinguished from each other, and that neurotic traits must necessarily be taken as proofs of a general inferiority. To-day we know that neurotic symptoms are structures which are substitutes for certain achievements of repression that we have to carry out in the course of our development from a child to a civilized human being. We know too that we all produce such substitutive structures, and that it is only their number, intensity and distribution which justify us in using the practical concept of illness and in inferring the presence of constitutional inferiority. From the slight indications we have about Leonardo's personality we should be inclined to place him close to the type of neurotic that we describe as 'obsessional'; and we may compare his researches to the 'obsessive brooding' of neurotics, and his inhibitions to what are known as their 'abulias'.

[1910c, 2300]

(2) I have said that we had much to expect from the increase in authority which must accrue to us as time goes on. I need not say much to you about the importance of authority. Only very few civilized people are capable of existing without reliance on others or are even capable of coming to an independent opinion. You cannot exaggerate the intensity of people's inner lack of resolution and craving for authority. The extraordinary increase in neuroses since the power of religions has waned may give you a measure of it. The impoverishment of the ego due to the large expenditure of energy on repression demanded of every individual by civilization may be one of the principal causes of this state of things.

[1910d, 2311]

The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education for cultural reasons, between sexual maturity and sexual activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life.

[1912d, 2344]
The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction- formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - *inter uninas et faeces* - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

[1912d, 2346]
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]

How, then, are we to account for the unexpected nobility of mind of the neurotic, who fears nothing on his own account but everything for someone he loves? Analytical inquiry shows that this attitude is not primary. Originally, that is to say at the beginning of the illness, the threat of punishment applied, as in the case of savages, to the patient himself; he was invariably in fear for his own life; it was not until later that the mortal fear was displaced on to another and a loved person. The process is a little complicated, but we can follow it perfectly. At the root of the prohibition there is invariably a hostile impulse against someone the patient loves - a wish that that person should die. This impulse is repressed by a prohibition and the prohibition is attached to some particular act, which, by displacement, represents, it may be, a hostile act against the loved person. There is a threat of death if this act is performed. But the process goes further, and the original wish that the loved person may die is replaced by fear that he may die. So that when the neurosis appears to be so tenderly altruistic, it is merely compensating for an underlying contrary attitude of brutal egoism. We may describe as 'social' the emotions which are determined by showing consideration for another person without taking him as a sexual object. The receding into the background of these social factors may be stressed as a fundamental characteristic of the neurosis, though one which is later disguised by overcompensation.

[1912-1913, 2716]

I do not propose to linger over the origin of these social impulses and their relation to the other basic human instincts but shall proceed to illustrate the second main characteristic of the neurosis by means of another example. In the forms which it assumes, taboo very closely resembles the neurotic's fear of touching, his 'touching phobia'. Now, in the case of the neurosis the prohibition invariably relates to touching of a sexual kind, and psycho-analysis has shown that it is in general true that the instinctual forces that are diverted and displaced in neuroses have a sexual origin. In the case of taboo the prohibited touching is obviously not to be understood in an exclusively sexual sense but in the more general sense of attacking, of getting control, and of asserting oneself. If there is a prohibition against touching a chief or anything that has been in contact with him, this means that an inhibition is to be laid on the same impulse which expresses itself on other occasions in keeping a suspicious watch upon the chief or even in ill-treating him physically before his coronation. (See above.) Thus the fact which is characteristic of the neurosis is the preponderance of the sexual over the social instinctual elements. The social instincts, however, are themselves derived from a combination of egoistic and erotic components into wholes of a special kind.

[1912-1913, 2716]
If we take instinctual repression as a measure of the level of civilization that has been reached, we shall have to admit that even under the animistic system advances and developments took place which are unjustly despised on account of their superstitious basis. When we are told that the warriors in a savage tribe practise the greatest continence and cleanliness when they go on the war-path, the explanation is put forward that their motive is 'a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic' (Frazer, 1911b, 157); and an analogous superstitious reason could be suggested for their continence. None the less the fact remains that they have made an instinctual renunciation; and we can understand the position better if we suppose that the savage warrior submits to these restrictions as a counter-measure because he is on the point of yielding completely to the satisfaction of cruel and hostile impulses which are as a rule prohibited to him. The same is true of the numerous cases of sexual restrictions being imposed on anyone who is engaged on difficult or responsible work (ibid., 200 f.). Though the grounds alleged for these prohibitions may belong to a magical context, yet the fundamental idea of gaining greater strength by renouncing some instinctual satisfaction remains unmistakable; and the hygienic root of the prohibition which lies alongside its magical rationalization must not be overlooked. When the men of a savage tribe go out on an expedition to hunt, to fish, to fight or to gather precious plants, their wives left at home are subjected to many oppressive restrictions, to which the savages themselves ascribe a favourable influence, operating at a distance upon the success of the expedition. But it requires very little penetration to see that this factor which operates at a distance is nothing other than the absent men's longing thoughts of home, and that behind these disguises lies a sound piece of psychological insight that the men will only do their best if they feel completely secure about the women whom they have left behind them unguarded. Sometimes they will even themselves declare, without alleging any magical reasons, that a wife's infidelity in marriage will bring to nothing the efforts of an absent husband engaged on some responsible work.
[1912-1913, 2739]
When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

Peoples are more or less represented by the states which they form, and these states by the governments which rule them. The individual citizen can with horror convince himself in this war of what would occasionally cross his mind in peace-time - that the state has forbidden to the individual the practice of wrong doing, not because it desires to abolish it, but because it desires to monopolize it, like salt and tobacco. A belligerent state permits itself every such misdeed, every such act of violence, as would disgrace the individual. It makes use against the enemy not only of the accepted *ruses de guerre*, but of deliberate lying and deception as well - and to a degree which seems to exceed the usage of former wars. The state exacts the utmost degree of obedience and sacrifice from its citizens, but at the same time it treats them like children by an excess of secrecy and a censorship upon news and expressions of opinion which leaves the spirits of those whose intellects it thus suppresses defenceless against every unfavourable turn of events and every sinister rumour. It absolves itself from the guarantees and treaties by which it was bound to other states, and confesses shamelessly to its own rapacity and lust for power, which the private individual has then to sanction in the name of patriotism.
The transformation of 'bad' instincts is brought about by two factors working in the same
direction, an internal and an external one. The internal factor consists in the influence exercised
on the bad (let us say, the egoistic) instincts by erotism - that is, by the human need for love,
taken in its widest sense. By the admixture of erotic components the egoistic instincts are
transformed into social ones. We learn to value being loved as an advantage for which we are
willing to sacrifice other advantages. The external factor is the force exercised by upbringing,
which represents the claims of our cultural environment, and this is continued later by the direct
pressure of that environment. Civilization has been attained through the renunciation of
instinctual satisfaction, and it demands the same renunciation from each newcomer in turn.
Throughout an individual's life there is a constant replacement of external by internal
compulsion. The influences of civilization cause an ever-increasing transformation of egoistic
trends into altruistic and social ones by an admixture of erotic elements. In the last resort it may
be assumed that every internal compulsion which makes itself felt in the development of human
beings was originally - that is, in the history of mankind - only an external one. Those who are
born to-day bring with them as an inherited organization some degree of tendency (disposition)
towards the transformation of egoistic into social instincts, and this disposition is easily
stimulated into bringing about that result. A further portion of this instinctual transformation has
to be accomplished during the life of the individual himself. So the human being is subject not
only to the pressure of his immediate cultural environment, but also to the influence of the
cultural history of his ancestors.
[1915b, 3074]

Thus the transformation of instinct, on which our susceptibility to culture is based, may also be
permanently or temporarily undone by the impacts of life. The influences of war are undoubtedly
among the forces that can bring about such involution; so we need not deny susceptibility to
culture to all who are at the present time behaving in an uncivilized way, and we may anticipate
that the ennoblement of their instincts will be restored in more peaceful times.
[1915b, 3078]
The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as 'phantasy'. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call 'reality-testing'. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfilments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. 'We cannot do without auxiliary constructions', as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of 'reservations' or 'nature reserves' in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

[1916-1917, 3427]

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

[1916-1917, 3477]
The turning back of sadism against the self regularly occurs where a cultural suppression of the instincts holds back a large part of the subject's destructive instinctual components from being exercised in life. We may suppose that this portion of the destructive instinct which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the super-ego, without any such transformation, and increases its sadism against the ego. The sadism of the super-ego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of an instinct can - frequently or quite generally - result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others. One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of instinct followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first instinctual renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of instinct.

[1924c, 4082]

If we leave little-known internal urges out of account, we may say that the main motive force towards the cultural development of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of instinctual impulses which could not be satisfied socially. With the further advances of civilization the demands of repression also grew. Civilization is after all built entirely on renunciation of instinct, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psycho-analysis has shown that it is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.

[1924f, 4116]

Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization rests upon two pillars, of which one is the control of natural forces and the other the restriction of our instincts. The ruler's throne rests upon fettered slaves. Among the instinctual components which are thus brought into service, the sexual instincts, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this - and will not allow the topic to be mentioned.

[1925e, 4127]
But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

It is an odd thing that the regular and essential part of this sexual activity was not overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle. We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.
One thus gets an impression that civilization is something which was imposed on a resisting majorit
majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

This psychological fact has a decisive importance for our judgement of human civilization. Whereas we might at first think that its essence lies in controlling nature for the purpose of acquiring wealth and that the dangers which threaten it could be eliminated through a suitable distribution of that wealth among men, it now seems that the emphasis has moved over from the material to the mental. The decisive question is whether and to what extent it is possible to lessen the burden of the instinctual sacrifices imposed on men, to reconcile men to those which must necessarily remain and to provide a compensation for them. It is just as impossible to do without control of the mass by a minority as it is to dispense with coercion in the work of civilization. For masses are lazy and unintelligent; they have no love for instinctual renunciation, and they are not to be convinced by argument of its inevitability; and the individuals composing them support one another in giving free rein to their indiscipline. It is only through the influence of individuals who can set an example and whom masses recognize as their leaders that they can be induced to perform the work and undergo the renunciations on which the existence of civilization depends. All is well if these leaders are persons who possess superior insight into the necessities of life and who have risen to the height of mastering their own instinctual wishes. But there is a danger that in order not to lose their influence they may give way to the mass more than it gives way to them, and it therefore seems necessary that they shall be independent of the mass by having means to power at their disposal. To put it briefly, there are two widespread human characteristics which are responsible for the fact that the regulations of civilization can only be maintained by a certain degree of coercion - namely, that men are not spontaneously fond of work and that arguments are of no avail against their passions.
We have slipped unawares out of the economic field into the field of psychology. At first we were tempted to look for the assets of civilization in the available wealth and in the regulations for its distribution. But with the recognition that every civilization rests on a compulsion to work and a renunciation of instinct and therefore inevitably provokes opposition from those affected by these demands, it has become clear that civilization cannot consist principally or solely in wealth itself and the means of acquiring it and the arrangements for its distribution; for these things are threatened by the rebelliousness and destructive mania of the participants in civilization. Alongside of wealth we now come upon the means by which civilization can be defended - measures of coercion and other measures that are intended to reconcile men to it and to recompense them for their sacrifices. These latter may be described as the mental assets of civilization.

[1927c, 4422]

For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a 'frustration', the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

[1927c, 4422]
These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

[1927c, 4423]

A different kind of satisfaction is afforded by art to the participants in a cultural unit, though as a rule it remains inaccessible to the masses, who are engaged in exhausting work and have not enjoyed any personal education. As we discovered long since, art offers substitutive satisfactions for the oldest and still most deeply felt cultural renunciations, and for that reason it serves as nothing else does to reconcile a man to the sacrifices he has made on behalf of civilization. On the other hand, the creations of art heighten his feelings of identification, of which every cultural unit stands in so much need, by providing an occasion for sharing highly valued emotional experiences. And when those creations picture the achievements of his particular culture and bring to his mind its ideals in an impressive manner, they also minister to his narcissistic satisfaction.

[1927c, 4426]

We have spoken of the hostility to civilization which is produced by the pressure that civilization exercises, the renunciations of instinct which it demands. If one imagines its prohibitions lifted - if, then, one may take any woman one pleases as a sexual object, if one may without hesitation kill one's rival for her love or anyone else who stands in one's way, if, too, one can carry off any of the other man's belongings without asking leave - how splendid, what a string of satisfactions one's life would be! True, one soon comes across the first difficulty: everyone else has exactly the same wishes as I have and will treat me with no more consideration than I treat him. And so in reality only one person could be made unrestrictedly happy by such a removal of the restrictions of civilization, and he would be a tyrant, a dictator, who had seized all the means to power. And even he would have every reason to wish that the others would observe at least one cultural commandment: 'thou shalt not kill'.

[1927c, 4427]
For the individual, too, life is hard to bear, just as it is for mankind in general. The civilization in which he participates imposes some amount of privation on him, and other men bring him a measure of suffering, either in spite of the precepts of his civilization or because of its imperfections. To this are added the injuries which untamed nature - he calls it Fate - inflicts on him. One might suppose that this condition of things would result in a permanent state of anxious expectation in him and a severe injury to his natural narcissism. We know already how the individual reacts to the injuries which civilization and other men inflict on him: he develops a corresponding degree of resistance to the regulations of civilization and of hostility to it. But how does he defend himself against the superior powers of nature, of Fate, which threaten him as they threaten all the rest?

In the course of time the first observations were made of regularity and conformity to law in natural phenomena, and with this the forces of nature lost their human traits. But man's helplessness remains and along with it his longing for his father, and the gods. The gods retain their threefold task: they must exorcize the terrors of nature, they must reconcile men to the cruelty of Fate, particularly as it is shown in death, and they must compensate them for the sufferings and privations which a civilized life in common has imposed on them.

We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.
The last, but certainly not the least important, of the characteristic features of civilization remains to be assessed: the manner in which the relationships of men to one another, their social relationships, are regulated - relationships which affect a person as a neighbour, as a source of help, as another person's sexual object, as a member of a family and of a State. Here it is especially difficult to keep clear of particular ideal demands and to see what is civilized in general. Perhaps we may begin by explaining that the element of civilization enters on the scene with the first attempt to regulate these social relationships. If the attempt were not made, the relationships would be subject to the arbitrary will of the individual: that is to say, the physically stronger man would decide them in the sense of his own interests and instinctual impulses. Nothing would be changed in this if this stronger man should in his turn meet someone even stronger than he. Human life in common is only made possible when a majority comes together which is stronger than any separate individual and which remains united against all separate individuals. The power of this community is then set up as 'right' in opposition to the power of the individual, which is condemned as 'brute force'. This replacement of the power of the individual by the power of a community constitutes the decisive step of civilization. The essence of it lies in the fact that the members of the community restrict themselves in their possibilities of satisfaction, whereas the individual knew no such restrictions. The first requisite of civilization, therefore, is that of justice - that is, the assurance that a law once made will not be broken in favour of an individual. This implies nothing as to the ethical value of such a law. The further course of cultural development seems to tend towards making the law no longer an expression of the will of a small community - a caste or a stratum of the population or a racial group - which, in its turn, behaves like a violent individual towards other, and perhaps more numerous, collections of people. The final outcome should be a rule of law to which all - except those who are not capable of entering a community - have contributed by a sacrifice of their instincts, and which leaves no one - again with the same exception - at the mercy of brute force.

[1930a, 4492]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹

Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

[1930a, 4494]
The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.
Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.
When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed ‘the psychological poverty of groups’. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]

And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual’s aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of ‘eat or be eaten’ which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]
I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a Weltanschauung, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

[1933a, 4775]
And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

[1939a, 4906]
We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as ‘traumas’, particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux’s experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego’s activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

[1940a [1938], 4993]
Psycho-analysis has established an intimate connection between these psychical achievements of individuals on the one hand and societies on the other by postulating one and the same dynamic source for both of them. It starts out from the basic idea that the principal function of the mental mechanism is to relieve the individual from the tensions created in him by his needs. One part of this task can be achieved by extracting satisfaction from the external world; and for this purpose it is essential to have control over the real world. But the satisfaction of another part of these needs - among them certain affective impulses - is regularly frustrated by reality. This leads to the further task of finding some other means of dealing with the unsatisfied impulses. The whole course of the history of civilization is no more than an account of the various methods adopted by mankind for 'binding' their unsatisfied wishes, which, according to changing conditions (modified, moreover, by technological advances) have been met by reality sometimes with favour and sometimes with frustration.

[1913], 2822

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

[1919g, 3705]
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual’s existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primal era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

[1925e, 4128]

For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a ‘frustration’, the regulation by which this frustration is established as a ‘prohibition’ and the condition which is produced by the prohibition as a ‘privation’. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

[1927c, 4422]
When civilization laid down the commandment that a man shall not kill the neighbour whom he hates or who is in his way or whose property he covets, this was clearly done in the interest of man's communal existence, which would not otherwise be practicable. For the murderer would draw down on himself the vengeance of the murdered man's kinsmen and the secret envy of others, who within themselves feel as much inclined as he does for such acts of violence. Thus he would not enjoy his revenge or his robbery for long, but would have every prospect of soon being killed himself. Even if he protected himself against his single foes by extraordinary strength and caution, he would be bound to succumb to a combination of weaker men. If a combination of this sort did not take place, the murdering would continue endlessly and the final outcome would be that men would exterminate one another. We should arrive at the same state of affairs between individuals as still persists in Corsica between families, though elsewhere only between nations. Insecurity of life, which is an equal danger for everyone, now unites men into a society which prohibits the individual from killing and reserves to itself the right to communal killing of anyone who violates the prohibition. Here, then, we have justice and punishment.

But we do not publish this rational explanation of the prohibition against murder. We assert that the prohibition has been issued by God. Thus we take it upon ourselves to guess His intentions, and we find that He, too, is unwilling for men to exterminate one another. In behaving in this way we are investing the cultural prohibition with a quite special solemnity, but at the same time we risk making its observance dependent on belief in God. If we retrace this step - if we no longer attribute to God what is our own will and if we content ourselves with giving the social reason - then, it is true, we have renounced the transfiguration of the cultural prohibition, but we have also avoided the risk to it. But we gain something else as well. Through some kind of diffusion or infection, the character of sanctity and inviolability - of belonging to another world, one might say - has spread from a few major prohibitions on to every other cultural regulation, law and ordinance. But on these the halo often looks far from becoming: not only do they invalidate one another by giving contrary decisions at different times and places, but apart from this they show every sign of human inadequacy. It is easy to recognize in them things that can only be the product of short-sighted apprehensiveness or an expression of selfishly narrow interests or a conclusion based on insufficient premisses. The criticism which we cannot fail to level at them also diminishes to an unwelcome extent our respect for other, more justifiable cultural demands. Since it is an awkward task to separate what God Himself has demanded from what can be traced to the authority of an all-powerful parliament or a high judiciary, it would be an undoubted advantage if we were to leave God out altogether and honestly admit the purely human origin of all the regulations and precepts of civilization. Along with their pretended sanctity, these commandments and laws would lose their rigidity and unchangeableness as well. People could understand that they are made, not so much to rule them as, on the contrary, to serve their interests; and they would adopt a more friendly attitude to them, and instead of aiming at their abolition, would aim only at their improvement. This would be an important advance along the road which leads to becoming reconciled to the burden of civilization.
But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

[1927c, 4451]

Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1927c, 4453]
After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In Totem and Taboo I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy. [1930a, 4495]

The fateful process of civilization would thus have set in with man's adoption of an erect posture. From that point the chain of events would have proceeded through the devaluation of olfactory stimuli and the isolation of the menstrual period to the time when visual stimuli were paramount and the genitals became visible, and thence to the continuity of sexual excitation, the founding of the family and so to the threshold of human civilization. This is only a theoretical speculation, but it is important enough to deserve careful checking with reference to the conditions of life which obtain among animals closely related to man. [1930a, 4495]
The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

¹ [1930a, 4505]

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

[1930a, 4507]
In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nurse-maids try to appease with their lullaby about Heaven.

[1930a, 4512]

Why do our relatives, the animals, not exhibit any such cultural struggle? We do not know. Very probably some of them - the bees, the ants, the termites - strove for thousands of years before they arrived at the State institutions, the distribution of functions and the restrictions on the individual, for which we admire them to-day. It is a mark of our present condition that we know from our own feelings that we should not think ourselves happy in any of these animal States or in any of the roles assigned in them to the individual. In the case of other animal species it may be that a temporary balance has been reached between the influences of their environment and the mutually contending instincts within them, and that thus a cessation of development has come about. It may be that in primitive man a fresh access of libido kindled a renewed burst of activity on the part of the destructive instinct. There are a great many questions here to which as yet there is no answer.

[1930a, 4513]

Another question concerns us more nearly. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from - that is, it is directed towards his own ego. There it is taken over by a portion of the ego as super-ego, and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh super-ego and the ego that is subjected to it, is called by us the sense of guilt; it expresses itself as a need for punishment. Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.

[1930a, 4513]
Some readers of this work may further have an impression that they have heard the formula of the struggle between Eros and the death instinct too often. It was alleged to characterize the process of civilization which mankind undergoes but it was also brought into connection with the development of the individual, and, in addition, it was said to have revealed the secret of organic life in general. We cannot, I think, avoid going into the relations of these three processes to one another. The repetition of the same formula is justified by the consideration that both the process of human civilization and of the development of the individual are also vital processes - which is to say that they must share in the most general characteristic of life. On the other hand, evidence of the presence of this general characteristic fails, for the very reason of its general nature, to help us to arrive at any differentiation, so long as it is not narrowed down by special qualifications. We can only be satisfied, therefore, if we assert that the process of civilization is a modification which the vital process experiences under the influence of a task that is set it by Eros and instigated by Ananke - by the exigencies of reality; and that this task is one of uniting separate individuals into a community bound together by libidinal ties. When, however, we look at the relation between the process of human civilization and the developmental or educative process of individual human beings, we shall conclude without much hesitation that the two are very similar in nature, if not the very same process applied to different kinds of object. The process of the civilization of the human species is, of course, an abstraction of a higher order than is the development of the individual and it is therefore harder to apprehend in concrete terms, nor should we pursue analogies to an obsessional extreme; but in view of the similarity between the aims of the two processes - in the one case the integration of a separate individual into a human group, and in the other case the creation of a unified group out of many individuals - we cannot be surprised at the similarity between the means employed and the resultant phenomena. [1930a, 4527]

This may not seem obvious at first sight, and before it can carry conviction we must recall other processes of the same character in the development of human civilization. The earliest of these and perhaps the most important is merged in the obscurity of primeval ages. Its astonishing effects compel us to assert its occurrence. In our children, in adults who are neurotic, as well as in primitive peoples, we meet with the mental phenomenon which we describe as a belief in the 'omnipotence of thoughts'. In our judgement this lies in an over-estimation of the influence which our mental (in this case, intellectual) acts can exercise in altering the external world. At bottom, all magic, the precursor of our technology, rests on this premiss. All the magic of words, too, has its place here, and the conviction of the power which is bound up with the knowledge and pronouncing of a name. The 'omnipotence of thoughts' was, we suppose, an expression of the pride of mankind in the development of speech, which resulted in such an extraordinary advancement of intellectual activities. The new realm of intellectuality was opened up, in which ideas, memories and inferences became decisive in contrast to the lower psychical activity which had direct perceptions by the sense-organs as its content. This was unquestionably one of the most important stages on the path to hominization. [1939a, 4934]
In 1913 Otto Rank and Hanns Sachs, in an extremely interesting work, brought together the results which had been achieved up to that time in the application of psycho-analysis to the mental sciences. The most easily accessible branches of those sciences seem to be mythology and the history of literature and religion. No final formula has yet been found enabling us to give an appropriate place to myths in this connection. Otto Rank, in a large volume on the incest complex (1912), has produced evidence of the surprising fact that the choice of subject matter, especially for dramatic works, is principally determined by the ambit of what psycho-analysis has termed the 'Oedipus complex'. By working it over with the greatest variety of modifications, distortions and disguises, the dramatist seeks to deal with his own most personal relations to this emotional theme. It is in attempting to master the Oedipus complex - that is to say, a person's emotional attitude towards his family, or in a narrower sense towards his father and mother - that individual neurotics come to grief, and for this reason that complex habitually forms the nucleus of their neuroses. It does not owe its importance to any unintelligible conjunction; the emphasis laid upon the relation of children to their parents is an expression of the biological facts that the young of the human race pass through a long period of dependence and are slow in reaching maturity, as well as that their capacity for love undergoes a complicated course of development. Consequently, the overcoming of the Oedipus complex coincides with the most efficient way of mastering the archaic, animal heritage of humanity. It is true that that heritage comprises all the forces that are required for the subsequent cultural development of the individual, but they must first be sorted out and worked over. This archaic heirloom is not fit to be used for the purposes of civilized social life in the form in which it is inherited by the individual.

[1919g, 3704]

These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

[1927c, 4423]
Some readers of this work may further have an impression that they have heard the formula of the struggle between Eros and the death instinct too often. It was alleged to characterize the process of civilization which mankind undergoes but it was also brought into connection with the development of the individual, and, in addition, it was said to have revealed the secret of organic life in general. We cannot, I think, avoid going into the relations of these three processes to one another. The repetition of the same formula is justified by the consideration that both the process of human civilization and of the development of the individual are also vital processes - which is to say that they must share in the most general characteristic of life. On the other hand, evidence of the presence of this general characteristic fails, for the very reason of its general nature, to help us to arrive at any differentiation, so long as it is not narrowed down by special qualifications. We can only be satisfied, therefore, if we assert that the process of civilization is a modification which the vital process experiences under the influence of a task that is set it by Eros and instigated by Ananke - by the exigencies of reality; and that this task is one of uniting separate individuals into a community bound together by libidinal ties. When, however, we look at the relation between the process of human civilization and the developmental or educative process of individual human beings, we shall conclude without much hesitation that the two are very similar in nature, if not the very same process applied to different kinds of object. The process of the civilization of the human species is, of course, an abstraction of a higher order than is the development of the individual and it is therefore harder to apprehend in concrete terms, nor should we pursue analogies to an obsessional extreme; but in view of the similarity between the aims of the two processes - in the one case the integration of a separate individual into a human group, and in the other case the creation of a unified group out of many individuals - we cannot be surprised at the similarity between the means employed and the resultant phenomena.

[1930a, 4527]

In view of its exceptional importance, we must not long postpone the mention of one feature which distinguishes between the two processes. In the developmental process of the individual, the programme of the pleasure principle, which consists in finding the satisfaction of happiness, is retained as the main aim. Integration in, or adaptation to, a human community appears as a scarcely avoidable condition which must be fulfilled before this aim of happiness can be achieved. If it could be done without that condition, it would perhaps be preferable. To put it in other words, the development of the individual seems to us to be a product of the interaction between two urges, the urge towards happiness, which we usually call 'egoistic', and the urge towards union with others in the community, which we call 'altruistic'. Neither of these descriptions goes much below the surface. In the process of individual development, as we have said, the main accent falls mostly on the egoistic urge (or the urge towards happiness); while the other urge, which may be described as a 'cultural' one, is usually content with the role of imposing restrictions. But in the process of civilization things are different. Here by far the most important thing is the aim of creating a unity out of the individual human beings. It is true that the aim of happiness is still there, but it is pushed into the background. It almost seems as if the creation of a great human community would be most successful if no attention had to be paid to the happiness of the individual. The developmental process of the individual can thus be expected to have special features of its own which are not reproduced in the process of human civilization. It is only in so far as the first of these processes has union with the community as its aim that it need coincide with the second process.

[1930a, 4528]
Just as a planet revolves around a central body as well as rotating on its own axis, so the human individual takes part in the course of development of mankind at the same time as he pursues his own path in life. But to our dull eyes the play of forces in the heavens seems fixed in a never-changing order; in the field of organic life we can still see how the forces contend with one another, and how the effects of the conflict are continually changing. So, also, the two urges, the one towards personal happiness and the other towards union with other human beings, must struggle with each other in every individual; and so, also, the two processes of individual and of cultural development must stand in hostile opposition to each other and mutually dispute the ground. But this struggle between the individual and society is not a derivative of the contradiction - probably an irreconcilable one - between the primal instincts of Eros and death. It is a dispute within the economics of the libido, comparable to the contest concerning the distribution of libido between ego and objects; and it does admit of an eventual accommodation in the individual, as, it may be hoped, it will also do in the future of civilization, however much that civilization may oppress the life of the individual to-day.

The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulsions has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual.
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [1930a, 4530]
I believe the line of thought which seeks to trace in the phenomena of cultural development the part played by a super-ego promises still further discoveries. I hasten to come to a close. But there is one question which I can hardly evade. If the development of civilization has such a far-reaching similarity to the development of the individual and if it employs the same methods, may we not be justified in reaching the diagnosis that, under the influence of cultural urges, some civilizations, or some epochs of civilization - possibly the whole of mankind - have become 'neurotic'? An analytic dissection of such neuroses might lead to therapeutic recommendations which could lay claim to great practical interest. I would not say that an attempt of this kind to carry psycho-analysis over to the cultural community was absurd or doomed to be fruitless. But we should have to be very cautious and not forget that, after all, we are only dealing with analogies and that it is dangerous, not only with men but also with concepts, to tear them from the sphere in which they have originated and been evolved. Moreover, the diagnosis of communal neuroses is faced with a special difficulty. In an individual neurosis we take as our starting-point the contrast that distinguishes the patient from his environment, which is assumed to be 'normal'. For a group all of whose members are affected by one and the same disorder no such background could exist; it would have to be found elsewhere. And as regards the therapeutic application of our knowledge, what would be the use of the most correct analysis of social neuroses, since no one possesses authority to impose such a therapy upon the group? But in spite of all these difficulties, we may expect that one day someone will venture to embark upon a pathology of cultural communities.

[1930a, 4531]

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result? [1930a, 4532]
I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a Weltanschauung, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

[1933a, 4775]
No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture. (Some people, I know, prefer to use the term 'civilization'.) We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind. The psychical modifications that go along with the process of civilization are striking and unambiguous. They consist in a progressive displacement of instinctual aims and a restriction of instinctual impulses. Sensations which were pleasurable to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization two appear to be the most important: a strengthening of the intellect, which is beginning to govern instinctual life, and an internalization of the aggressive impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a constitutional intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

[1933b, 4803]
I could not further elucidate this part of my theory without a detailed discussion of my views on repression. It will be enough here to refer to my *Three Essays* (1905d), in which I have attempted to throw some light— if only a feeble one—on the somatic processes in which the essential nature of sexuality is to be looked for. I have there shown that the constitutional sexual disposition of children is incomparably more variegated than might have been expected, that it deserves to be described as ‘polymorphously perverse’ and that what is spoken of as the normal behaviour of the sexual function emerges from this disposition after certain of its components have been repressed. By pointing out the infantile elements in sexuality I was able to establish a simple correlation between health, perversion and neurosis. I showed that normality is a result of the repression of certain component instincts and constituents of the infantile disposition and of the subordination of the remaining constituents under the primacy of the genital zones in the service of the reproductive function. I showed that perversions correspond to disturbances of this coalescence owing to the overpowering and compulsive development of certain of the component instincts, while neuroses can be traced back to an excessive repression of the libidinal trends. Since almost all the perversions of the infantile disposition can be recognized as the forces concerned in the formation of symptoms in neuroses, though in a state of repression, I was able to describe neurosis as being the ‘negative’ of perversion.

[1906a, 1581]

I should like to go back once more to the instinctual life of obsessional neurotics and add one more remark upon it. It turned out that our patient, besides all his other characteristics, was a *renifleur*. By his own account, when he was a child he had recognized every one by their smell, like a dog; and even when he was grown up he was more susceptible to sensations of smell than most people.¹ I have met with the same characteristic in other neurotics, both in hysterical and in obsessional patients, and I have come to recognize that a tendency to taking pleasure in smell, which has become extinct since childhood, may play a part in the genesis of neurosis.² And here I should like to raise the general question whether the atrophy of the sense of smell (which was an inevitable result of man’s assumption of an erect posture) and the consequent organic repression of his pleasure in smell may not have had a considerable share in the origin of his susceptibility to nervous disease. This would afford us some explanation of why, with the advance of civilization, it is precisely the sexual life that must fall a victim to repression. For we have long known the intimate connection in the animal organization between the sexual instinct and the function of the olfactory organ.

[1909d, 2193]
Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - inter unrnias et faeces - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

¹ The organic periodicity of the sexual process has persisted, it is true, but its effect on psychical sexual excitation has rather been reversed. This change seems most likely to be connected with the diminution of the olfactory stimuli by means of which the menstrual process produced an effect on the male psyche. Their role was taken over by visual excitations, which, in contrast to the intermittent olfactory stimuli, were able to maintain a permanent effect. The taboo on menstruation is derived from this 'organic repression', as a defence against a phase of development that has been surmounted. All other motives are probably of a secondary nature. (Cf. C. D. Daly, 1927.) This process is repeated on another level when the gods of a superseded period of civilization turn into demons. The diminution of the olfactory stimuli seems itself to be a consequence of man's raising himself from the ground, of his assumption of an upright gait; this made his genitals, which were previously concealed, visible and in need of protection, and so provoked feelings of shame in him.

¹ The fateful process of civilization would thus have set in with man's adoption of an erect posture. From that point the chain of events would have proceeded through the devaluation of olfactory stimuli and the isolation of the menstrual period to the time when visual stimuli were paramount and the genitals became visible, and thence to the continuity of sexual excitation, the founding of the family and so to the threshold of human civilization. This is only a theoretical speculation, but it is important enough to deserve careful checking with reference to the conditions of life which obtain among animals closely related to man.
A social factor is also unmistakably present in the cultural trend towards cleanliness, which has received *ex post facto* justification in hygienic considerations but which manifested itself before their discovery. The incitement to cleanliness originates in an urge to get rid of the excreta, which have become disagreeable to the sense perceptions. We know that in the nursery things are different. The excreta arouse no disgust in children. They seem valuable to them as being a part of their own body which has come away from it. Here upbringing insists with special energy on hastening the course of development which lies ahead, and which should make the excreta worthless, disgusting, abhorrent and abominable. Such a reversal of values would scarcely be possible if the substances that are expelled from the body were not doomed by their strong smells to share the fate which overtook olfactory stimuli after man adopted the erect posture. Anal erotism, therefore, succumbs in the first instance to the ‘organic repression’ which paved the way to civilization. The existence of the social factor which is responsible for the further transformation of anal erotism is attested by the circumstance that, in spite of all man’s developmental advances, he scarcely finds the smell of his own excreta repulsive, but only that of other people’s. Thus a person who is not clean - who does not hide his excreta - is offending other people; he is showing no consideration for them. And this is confirmed by our strongest and commonest terms of abuse. It would be incomprehensible, too, that man should use the name of his most faithful friend in the animal world - the dog - as a term of abuse if that creature had not incurred his contempt through two characteristics: that it is an animal whose dominant sense is that of smell and one which has no horror of excrement, and that it is not ashamed of its sexual functions.

[1930a, 4495]

The conjecture which goes deepest, however, is the one which takes its start from what I have said above (p. 4495) in my footnote. It is to the effect that, with the assumption of an erect posture by man and with the depreciation of his sense of smell, it was not only his anal erotism which threatened to fall a victim to organic repression, but the whole of his sexuality; so that since this, the sexual function has been accompanied by a repugnance which cannot further be accounted for, and which prevents its complete satisfaction and forces it away from the sexual aim into sublimations and libidinal displacements. I know that Bleuler (1913) once pointed to the existence of a primary repelling attitude like this towards sexual life. All neurotics, and many others besides, take exception to the fact that ‘inter urinas et faeces nascimur’. The genitals, too, give rise to strong sensations of smell which many people cannot tolerate and which spoil sexual intercourse for them. Thus we should find that the deepest root of the sexual repression which advances along with civilization is the organic defence of the new form of life achieved with man’s erect gait against his earlier animal existence. This result of scientific research coincides in a remarkable way with commonplace prejudices that have often made themselves heard. Nevertheless, these things are at present no more than unconfirmed possibilities which have not been substantiated by science. Nor should we forget that, in spite of the undeniable depreciation of olfactory stimuli, there exist even in Europe people among whom the strong genital odours which are so repellent to us are highly prized as sexual stimulants and who refuse to give them up. (Cf. the collections of folklore obtained from Iwan Bloch’s questionnaire on the sense of smell in sexual life published in different volumes of Friedrich S. Krauss’s *Anthropophyteia*.)

[1930a, 4499]
After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In Totem and Taboo I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

¹ The organic periodicity of the sexual process has persisted, it is true, but its effect on psychical sexual excitation has rather been reversed. This change seems most likely to be connected with the diminution of the olfactory stimuli by means of which the menstrual process produced an effect on the male psyche. Their role was taken over by visual excitations, which, in contrast to the intermittent olfactory stimuli, were able to maintain a permanent effect. The taboo on menstruation is derived from this 'organic repression', as a defence against a phase of development that has been surmounted. All other motives are probably of a secondary nature. (Cf. C. D. Daly, 1927.) This process is repeated on another level when the gods of a superseded period of civilization turn into demons. The diminution of the olfactory stimuli seems itself to be a consequence of man's raising himself from the ground, of his assumption of an upright gait; this made his genitals, which were previously concealed, visible and in need of protection, and so provoked feelings of shame in him.

¹ Cf. the suggestion that man is descended from a mammal which reached sexual maturity at the age of five, but that some major external influence was brought to bear on the species and at that point interrupted the straight course of development of sexuality. Other transformations in the sexual life of man as compared with that of animals might be connected with this - such as the abolition of the periodicity of the libido and the exploitation of the part played by menstruation in the relation between the sexes.

[1930a, 4495]

[1940a [1938], 4964]
Let us consider first the relation between father and son. The sanctity which we attribute to the rules laid down in the Decalogue has, I think, blunted our powers of perceiving the real facts. We seem scarcely to venture to observe that the majority of mankind disobey the Fifth Commandment. Alike in the lowest and in the highest strata of human society filial piety is wont to give way to other interests. The obscure information which is brought to us by mythology and legend from the primaeval ages of human society gives an unpleasing picture of the father's despotic power and of the ruthlessness with which he made use of it. Kronos devoured his children, just as the wild boar devours the sow's litter; while Zeus emasculated his father² and made himself ruler in his place. The more unrestricted was the rule of the father in the ancient family, the more must the son, as his destined successor, have found himself in the position of an enemy, and the more impatient must he have been to become ruler himself though his father's death. Even in our middle-class families fathers are as a rule inclined to refuse their sons independence and the means necessary to secure it and thus to foster the growth of the germ of hostility which is inherent in their relation. A physician will often be in a position to notice how a son's grief at the loss of his father cannot suppress his satisfaction at having at length won his freedom. In our society to-day fathers are apt to cling desperately to what is left of a now sadly antiquated protestas patris familias; and an author who, like Ibsen, brings the immemorial struggle between fathers and sons into prominence in his writings may be certain of producing his effect.

[1900a, 735]

It is not our task on this occasion to discuss the origin and ultimate significance of taboo observances. I have done this in my book Totem and Taboo, where I have given due consideration to the part played by primal ambivalence in determining the formation of taboo and have traced the genesis of the latter from the prehistoric events which led to the founding of the human family. We can no longer recognize an original meaning of this kind in taboos observed among primitive tribes to-day. We forget all too easily, in expecting to find any such thing, that even the most primitive peoples exist in a culture far removed from that of primaeval days, which is just as old as our own from the point of view of time and like ours corresponds to a later, if different, stage of development.

[1918a, 2356]

Thus it is an experience of a quite special kind for such an author when a book of his is translated into the Hebrew language and put into the hands of readers for whom that historic idiom is a living tongue: a book, moreover, which deals with the origin of religion and morality, though it adopts no Jewish standpoint and makes no exceptions in favour of Jewry. The author hopes, however, that he will be at one with his readers in the conviction that unprejudiced science cannot remain a stranger to the spirit of the new Jewry.

[1912-1913, 2649]
This attempt is based upon a hypothesis of Charles Darwin's upon the social state of primitive men. Darwin deduced from the habits of the higher apes that men, too, originally lived in comparatively small groups or hordes within which the jealousy of the oldest and strongest male prevented sexual promiscuity. 'We may indeed conclude from what we know of the jealousy of all male quadrupeds, armed, as many of them are, with special weapons for battling with their rivals, that promiscuous intercourse in a state of nature is extremely improbable. . . . Therefore, if we look far enough back in the stream of time, . . . judging from the social habits of man as he now exists . . . the most probable view is that primaeval man aboriginally lived in small communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men. Or he may have lived with several wives by himself, like the Gorilla; for all the natives "agree that but one adult male is seen in a band; when the young male grows up, a contest takes place for mastery, and the strongest, by killing and driving out the others, establishes himself as the head of the community". (Dr. Savage, in *Boston Journal of Nat. Hist.*, vol. v, 1845-7, p. 423.) The younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding within the limits of the same family.' (Darwin, 1871, 2, 362 f.)

Atkinson (1903) seems to have been the first to realize that the practical consequence of the conditions obtaining in Darwin's primal horde must be exogamy for the young males. Each of them might, after being driven out, establish a similar horde, in which the same prohibition upon sexual intercourse would rule owing to its leader's jealousy. In course of time this would produce what grew into a conscious law: 'No sexual relations between those who share a common home.' After the establishment of totemism this regulation would assume another form and would run: 'No sexual relations within the totem.'

William Robertson Smith, who died in 1894 - physicist, philologist, Bible critic and archaeologist - was a man of many-sided interests, clear-sighted and liberal-minded. In his book on the *Religion of the Semites* (first published in 1889) he put forward the hypothesis that a peculiar ceremony known as the 'totem meal' had from the very first formed an integral part of the totemic system. At that time he had only a single piece of evidence in support of his theory: an account of a procedure of the kind dating from the fifth century A.D. But by an analysis of the nature of sacrifice among the ancient Semites he was able to lend his hypothesis a high degree of probability. Since sacrifice implies a divinity, it was a question of arguing back from a comparatively high phase of religious ritual to the lowest one, that is, to totemism.

I will now attempt to extract from Robertson Smith's admirable work those of his statements on the origin and meaning of the ritual of sacrifice which are of decisive interest for us. In so doing I must omit all the details, often so fascinating, and neglect all the later developments. It is quite impossible for an abstract such as this to give my readers any notion of the lucidity and convincing force of the original.

The oldest form of sacrifice, then, older than the use of fire or the knowledge of agriculture, was the sacrifice of animals, whose flesh and blood were enjoyed in common by the god and his worshippers. It was essential that each one of the participants should have his share of the meal.
But why is this binding force attributed to eating and drinking together? In primitive societies there was only one kind of bond which was absolute and inviolable - that of kinship. The solidarity of such a fellowship was complete. 'A kin was a group of persons whose lives were so bound up together, in what must be called a physical unity, that they could be treated as parts of one common life. . . . In a case of homicide Arabian tribesmen do not say, "The blood of M. or N. has been spilt", naming the man; they say, "Our blood has been spilt". In Hebrew the phrase by which one claims kinship is "I am your bone and your flesh". Thus kinship implies participation in a common substance. It is therefore natural that it is not merely based on the fact that a man is a part of his mother's substance, having been born of her and having been nourished by her milk, but that it can be acquired and strengthened by food which a man eats later and with which his body is renewed. If a man shared a meal with his god he was expressing a conviction that they were of one substance; and he would never share a meal with one whom he regarded as a stranger.

[1912-1913, 2775]

The sacrificial meal, then, was originally a feast of kinsmen, in accordance with the law that only kinsmen eat together. In our own society the members of a family have their meals in common; but the sacrificial meal bears no relation to the family. Kinship is an older thing than family life, and in the most primitive societies known to us the family contained members of more than one kindred. The man married a woman of another clan and the children inherited their mother's clan; so that there was no communion of kin between the man and the other members of the family. In a family of such a kind there was no common meal. To this day, savages eat apart and alone and the religious food prohibitions of totemism often make it impossible for them to eat in common with their wives and children.

[1912-1913, 2775]

Let us now turn to the sacrificial animal. As we have heard, there is no gathering of a clan without an animal sacrifice, nor - and this now becomes significant - any slaughter of an animal except upon these ceremonial occasions. While game and the milk of domestic animals might be consumed without any qualms, religious scruples made it impossible to kill a domestic animal for private purposes. There cannot be the slightest doubt, says Robertson Smith, that the slaughter of a victim was originally among the acts which 'are illegal to an individual, and can only be justified when the whole clan shares the responsibility of the deed'.¹ So far as I know, there is only one class of actions recognized by early nations to which this description applies, viz. actions which involve an invasion of the sanctity of the tribal blood. In fact, a life which no single tribesman is allowed to invade, and which can be sacrificed only by the consent and common action of the kin, stands on the same footing with the life of the fellow-tribesman.

The rule that every participant at the sacrificial meal must eat a share of the flesh of the victim has the same meaning as the provision that the execution of a guilty tribesman must be carried out by the tribe as a whole. In other words, the sacrificial animal was treated as a member of the tribe; the sacrificing community, the god and the sacrificial animal were of the same blood and members of one clan.

[1912-1913, 2776]
Robertson Smith brings forward copious evidence for identifying the sacrificial animal with the primitive totem animal. In later antiquity there were two classes of sacrifice: one in which the victims were domestic animals of the kinds habitually used for eating, and the other extraordinary sacrifices of animals which were unclean and whose consumption was forbidden. Investigation shows that these unclean animals were sacred animals, that they were offered as sacrifices to the gods to whom they were sacred, that originally they were identical with the gods themselves, and that by means of the sacrifice the worshippers in some way laid stress upon their blood kinship with the animal and the god. But in still earlier times this distinction between ordinary and 'mystic' sacrifices disappears. Originally all animals were sacred, their flesh was forbidden meat and might only be consumed on ceremonial occasions and with the participation of the whole clan. The slaughter of an animal was equivalent to a shedding of the tribal blood and could occur subject only to the same precautions and the same insurances against incurring reproach.

[1912-1913, 2776]

The domestication of animals and the introduction of cattle-breeding seems everywhere to have brought to an end the strict and unadulterated totemism of primaeval days.¹ But such sacred character as remained to domestic animals under what had then become 'pastoral' religion is obvious enough to allow us to infer its original totemic nature. Even in late classical times ritual prescribed in many places that the sacrificial priest must take to flight after performing the sacrifice, as though to escape retribution. The idea that slaughtering oxen was a crime must at one time have prevailed generally in Greece. At the Athenian festival of Buphonia a regular trial was instituted after the sacrifice, and all the participants were called as witnesses. At the end of it, it was agreed that the responsibility for the murder should be placed upon the knife; and this was accordingly cast into the sea.

[1912-1913, 2777]

In spite of the ban protecting the lives of sacred animals in their quality of fellow-clansmen, a necessity arose for killing one of them from time to time in solemn communion and for dividing its flesh and blood among the members of the clan. The compelling motive for this deed reveals the deepest meaning of the nature of sacrifice. We have heard how in later times, whenever food is eaten in common, the participation in the same substance establishes a sacred bond between those who consume it when it has entered their bodies. In ancient times this result seems only to have been effected by participation in the substance of a sacrosanct victim. The holy mystery of sacrificial death 'is justified by the consideration that only in this way can the sacred cement be procured which creates or keeps alive a living bond of union between the worshippers and their god'.²(Ibid., 313.)

[1912-1913, 2777]

This bond is nothing else than the life of the sacrificial animal, which resides in its flesh and in its blood and is distributed among all the participants in the sacrificial meal. A notion of this kind lies at the root of all the blood covenants by which men made compacts with each other even at a late period of history. This completely literal way of regarding blood-kinship as identity of substance makes it easy to understand the necessity for renewing it from time to time by the physical process of the sacrificial meal.

[1912-1913, 2777]
At this point I will interrupt my survey of Robertson Smith's line of thought and restate the gist of it in the most concise terms. With the establishment of the idea of private property sacrifice came to be looked upon as a gift to the deity, as a transference of property from men to the god. But this interpretation left unexplained all the peculiarities of the ritual of sacrifice. In the earliest times the sacrificial animal had itself been sacred and its life untouchable; it might only be killed if all the members of the clan participated in the deed and shared their guilt in the presence of the god, so that the sacred substance could be yielded up and consumed by the clansmen and thus ensure their identity with one another and with the deity. The sacrifice was a sacrament and the sacrificial animal was itself a member of the clan. It was in fact the ancient totem animal, the primitive god himself, by the killing and consuming of which the clansmen renewed and assured their likeness to the god.

[1912-1913, 2778]

From this analysis of the nature of sacrifice Robertson Smith draws the conclusion that the periodic killing and eating of the totem in times before the worship of anthropomorphic deities had been an important element in totemic religion. The ceremonial of a totem meal of this kind is, he suggests, to be found in a description of a sacrifice of comparatively late date. St. Nilus records a sacrificial ritual current among the Bedouin of the Sinai Desert at the end of the fourth century A.D. The victim of the sacrifice, a camel, 'is bound upon a rude altar of stones piled together, and when the leader of the band has thrice led the worshippers round the altar in a solemn procession accompanied with chants, he inflicts the first wound . . . and in all haste drinks of the blood that gushes forth. Forthwith the whole company fall on the victim with their swords, hacking off pieces of the quivering flesh and devouring them raw with such wild haste, that in the short interval between the rise of the day star¹ which marked the hour for the service to begin, and the disappearance of its rays before the rising sun, the entire camel, body and bones, skin, blood and entrails, is wholly devoured.' All the evidence goes to show that this barbaric ritual, which bears every sign of extreme antiquity, was no isolated instance but was everywhere the original form taken by totemic sacrifice, though later toned down in many different directions.

[1912-1913, 2778]

Many authorities have refused to attach importance to the concept of the totem meal, because it was not supported by any direct observation at the level of totemism. Robertson Smith himself pointed to instances in which the sacramental significance of the sacrifice seemed to be assured: for instance, the human sacrifices of the Aztecs, and others which recall the circumstances of the totem meal - the sacrifice of bears by the Bear clan of the Ouataouak tribe in America and the bear feast of the Aino in Japan. These and similar cases have been reported in detail by Frazer in the Fifth Part of his great work (1912, 2). An American Indian tribe in California, which worship a large bird of prey (a buzzard), kill it once a year at a solemn festival, after which it is mourned and its skin and feathers are preserved. The Zuni Indians of New Mexico behave in a similar way to their sacred turtles.

[1912-1913, 2779]

A feature has been observed in the intichiuma ceremonies of the Central Australian tribes which agrees admirably with Robertson Smith's conjectures. Each clan, when it is performing magic for the multiplication of its totem (which it itself is normally prohibited from consuming), is obliged during the ceremony to eat a small portion of its own totem before making it accessible to the other clans. According to Frazer (ibid., 2, 590) the clearest example of a sacramental consumption of an otherwise prohibited totem is to be found among the Bini of West Africa in connection with their funeral ceremonies.

[1912-1913, 2779]
Accordingly, I propose that we should adopt Robertson Smith's hypothesis that the sacramental killing and communal eating of the totem animal, whose consumption was forbidden on all other occasions, was an important feature of totemic religion.¹

Let us call up the spectacle of a totem meal of the kind we have been discussing, amplified by a few probable features which we have not yet been able to consider. The clan is celebrating the ceremonial occasion by the cruel slaughter of its totem animal and is devouring it raw - blood, flesh and bones. The clansmen are there, dressed in the likeness of the totem and imitating it in sound and movement, as though they are seeking to stress their identity with it. Each man is conscious that he is performing an act forbidden to the individual and justifiable only through the participation of the whole clan; nor may any one absent himself from the killing and the meal. When the deed is done, the slaughtered animal is lamented and bewailed. The mourning is obligatory, imposed by dread of a threatened retribution. As Robertson Smith (1894, 412) remarks of an analogous occasion, its chief purpose is to disclaim responsibility for the killing.

What are we to make, though, of the prelude to this festive joy - the mourning over the death of the animal? If the clansmen rejoice over the killing of the totem - a normally forbidden act - why do they mourn over it as well?

As we have seen, the clansmen acquire sanctity by consuming the totem: they reinforce their identification with it and with one another. Their festive feelings and all that follows from them might well be explained by the fact that they have taken into themselves the sacred life of which the substance of the totem is the vehicle.

Psycho-analysis has revealed that the totem animal is in reality a substitute for the father; and this tallies with the contradictory fact that, though the killing of the animal is as a rule forbidden, yet its killing is a festive occasion - with the fact that it is killed and yet mourned. The ambivalent emotional attitude, which to this day characterizes the father-complex in our children and which often persists into adult life, seems to extend to the totem animal in its capacity as substitute for the father.

If, now, we bring together the psycho-analytic translation of the totem with the fact of the totem meal and with Darwin's theories of the earliest state of human society, the possibility of a deeper understanding emerges - a glimpse of a hypothesis which may seem fantastic but which offers the advantage of establishing an unsuspected correlation between groups of phenomena that have hitherto been disconnected.

There is, of course, no place for the beginnings of totemism in Darwin's primal horde. All that we find there is a violent and jealous father who keeps all the females for himself and drives away his sons as they grow up. This earliest state of society has never been an object of observation. The most primitive kind of organization that we actually come across - and one that is in force to this day in certain tribes - consists of bands of males; these bands are composed of members with equal rights and are subject to the restrictions of the totemic system, including inheritance through the mother. Can this form of organization have developed out of the other one? and if so along what lines?
If we call the celebration of the totem meal to our help, we shall be able to find an answer. One day¹ the brothers who had been driven out came together, killed and devoured their father and so made an end of the patriarchal horde. United, they had the courage to do and succeeded in doing what would have been impossible for them individually. (Some cultural advance, perhaps, command over some new weapon, had given them a sense of superior strength.) Cannibal savages as they were, it goes without saying that they devoured their victim as well as killing him. The violent primal father had doubtless been the feared and envied model of each one of the company of brothers: and in the act of devouring him they accomplished their identification with him, and each one of them acquired a portion of his strength. The totem meal, which is perhaps mankind's earliest festival, would thus be a repetition and a commemoration of this membrable and criminal deed, which was the beginning of so many things - of social organization, of moral restrictions and of religion.¹

² This hypothesis, which has such a monstrous air, of the tyrannical father being overwhelmed and killed by a combination of his exiled sons, was also arrived at by Atkinson (1903, 220 f.) as a direct implication of the state of affairs in Darwin's primal horde: 'The patriarch had only one enemy whom he should dread . . . a youthful band of brothers living together in forced celibacy, or at most in polyandrous relation with some single female captive. A horde as yet weak in their impubescence they are, but they would, when strength was gained with time, inevitably wrench by combined attacks, renewed again and again, both wife and life from the paternal tyrant.' Atkinson, who incidentally passed his whole life in New Caledonia and had unusual opportunities for studying the natives, also pointed out that the conditions which Darwin assumed to prevail in the primal horde may easily be observed in herds of wild oxen and horses and regularly lead to the killing of the father of the herd. He further supposed that, after the father had been disposed of, the horde would be disintegrated by a bitter struggle between the victorious sons. Thus any new organization of society would be precluded: there would be 'an ever-recurring violent succession to the solitary paternal tyrant, by sons whose parricidal hands were so soon again clenched in fratricidal strife.' (Ibid., 228.) Atkinson, who had no psycho-analytic hints to help him and who was ignorant of Robertson Smith's studies, found a less violent transition from the primal horde to the next social stage, at which numbers of males live together in a peaceable community. He believed that through the intervention of maternal love the sons - to begin with only the youngest, but later others as well - were allowed to remain with the horde, and that in return for this toleration the sons acknowledged their father's sexual privilege by renouncing all claim to their mother and sisters.

² In order that these latter consequences may seem plausible, leaving their premises on one side, we need only suppose that the tumultuous mob of brothers were filled with the same contradictory feelings which we can see at work in the ambivalent father-complexes of our children and of our neurotic patients. They hated their father, who presented such a formidable obstacle to their craving for power and their sexual desires; but they loved and admired him too. After they had got rid of him, had satisfied their hatred and had put into effect their wish to identify themselves with him, the affection which had all this time been pushed under was bound to make itself felt.¹ It did so in the form of remorse. A sense of guilt made its appearance, which in this instance coincided with the remorse felt by the whole group. The dead father became stronger than the living one had been - for events took the course we so often see them follow in human affairs to this day. What had up to then been prevented by his actual existence was thenceforward prohibited by the sons themselves, in accordance with the psychological procedure so familiar to us in psycho-analyses under the name of 'deferred obedience'. They revoked their deed by forbidding the killing of the totem, the substitute for their father; and they renounced its fruits by resigning their claim to the women who had now been set free. They thus created out of their filial sense of guilt the two fundamental taboos of totemism, which for that very reason inevitably corresponded to the two repressed wishes of the Oedipus complex. Whoever contravened those taboos be came guilty of the only two crimes with which primitive society concerned itself.²

¹ [1912-1913, 2782]
² [1912-1913, 2783]
This fresh emotional attitude must also have been assisted by the fact that the deed cannot have given complete satisfaction to those who did it. From one point of view it had been done in vain. Not one of the sons had in fact been able to put his original wish - of taking his father's place - into effect. And, as we know, failure is far more propitious for a moral reaction than satisfaction.

The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but - not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong - and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.

On the other hand, the claim of totemism to be regarded as a first attempt at a religion is based on the first of these two taboos - that upon taking the life of the totem animal. The animal struck the sons as a natural and obvious substitute for their father; but the treatment of it which they found imposed on themselves expressed more than the need to exhibit their remorse. They could attempt, in their relation to this surrogate father, to allay their burning sense of guilt, to bring about a kind of reconciliation with their father. The totemic system was, as it were, a covenant with their father, in which he promised them everything that a childish imagination may expect from a father - protection, care and indulgence - while on their side they undertook to respect his life, that is to say, not to repeat the deed which had brought destruction on their real father. Totemism, moreover, contained an attempt at self-justification: 'If our father had treated us in the way the totem does, we should never have felt tempted to kill him.' In this fashion totemism helped to smooth things over and to make it possible to forget the event to which it owed its origin.

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.
There is another feature which was already present in totemism and which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father-complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime - appropriation of the paternal attributes - threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the later products of religion, often in the strangest disguises and transformations. [1912-1913, 2785]

Hitherto we have followed the developments of the affectionate current of feeling towards the father, transformed into remorse, as we find them in religion and in moral ordinances (which are not sharply distinguished in totemism). But we must not overlook the fact that it was in the main with the impulses that led to parricide that the victory lay. For a long time afterwards, the social fraternal feelings, which were the basis of the whole transformation, continued to exercise a profound influence on the development of society. They found expression in the sanctification of the blood tie, in the emphasis upon the solidarity of all life within the same clan. In thus guaranteeing one another's lives, the brothers were declaring that no one of them must be treated by another as their father was treated by them all jointly. They were precluding the possibility of a repetition of their father's fate. To the religiously-based prohibition against killing the totem was now added the socially-based prohibition against fratricide. It was not until long afterwards that the prohibition ceased to be limited to members of the clan and assumed the simple form: 'Thou shalt do no murder.' The patriarchal horde was replaced in the first instance by the fraternal clan, whose existence was assured by the blood tie. Society was now based on complicity in the common crime; religion was based on the sense of guilt and the remorse attaching to it; while morality was based partly on the exigencies of this society and partly on the penance demanded by the sense of guilt. [1912-1913, 2786]

A great number of powerful motives restrain me from any attempt at picturing the further development of religions from their origin in totemism to their condition to-day. I will only follow two threads whose course I can trace with especial clarity as they run through the pattern: the theme of the totemic sacrifice and the relation of son to father.¹ [1912-1913, 2787]
As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary the priest. At the same time divine kings made their appearance in the social structure and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father-surrogate having been abandoned in favour of the superior concept of God. At this point the psycho-analytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.¹

[1912-1913, 2790]

The memory of the first great act of sacrifice thus proved indestructible, in spite of every effort to forget it; and at the very point at which men sought to be at the farthest distance from the motives that led to it, its undistorted reproduction emerged in the form of the sacrifice of the god. I need not enlarge here upon the developments of religious thought which, in the shape of rationalizations, made this recurrence possible. Robertson Smith, who had no thought of our derivation of sacrifice from the great event in human prehistory, states that the ceremonies at the festivals in which the ancient Semites celebrated the death of a deity 'were currently interpreted as the commemoration of a mythical tragedy'. 'The mourning,' he declares, 'is not a spontaneous expression of sympathy with the divine tragedy, but obligatory and enforced by fear of supernatural anger. And a chief object of the mourners is to disclaim responsibility for the god's death - a point which his already come before us in connection with theanthropic sacrifices, such as the "ox-murder at Athens".' (Ibid., 412.) It seems most probable that these 'current interpretations' were correct and that the feelings of the celebrants were fully explained by the underlying situation.

[1912-1913, 2791]

At the conclusion, then, of this exceedingly condensed inquiry, I should like to insist that its outcome shows that the beginnings of religion, morals, society and art converge in the Oedipus complex. This is in complete agreement with the psycho-analytic finding that the same complex constitutes the nucleus of all neuroses, so far as our present knowledge goes. It seems to me a most surprising discovery that the problems of social psychology, too, should prove soluble on the basis of one single concrete point - man's relation to his father. It is even possible that yet another psychological problem belongs in this same connection. I have often had occasion to point out that emotional ambivalence in the proper sense of the term - that is, the simultaneous existence of love and hate towards the same object - lies at the root of many important cultural institutions. We know nothing of the origin of this ambivalence. One possible assumption is that it is a fundamental phenomenon of our emotional life. But it seems to me quite worth considering another possibility, namely that originally it formed no part of our emotional life but was acquired by the human race in connection with their father-complex,¹ precisely where the psycho-analytic examination of modern individuals still finds it revealed at its strongest.²

[1912-1913, 2796]
No one can have failed to observe, in the first place, that I have taken as the basis of my whole position the existence of a collective mind, in which mental processes occur just as they do in the mind of an individual. In particular, I have supposed that the sense of guilt for an action has persisted for many thousands of years and has remained operative in generations which can have had no knowledge of that action. I have supposed that an emotional process, such as might have developed in generations of sons who were ill-treated by their father, has extended to new generations which were exempt from such treatment for the very reason that their father had been eliminated. It must be admitted that these are grave difficulties; and any explanation that could avoid presumptions of such a kind would seem to be preferable.

² Since I am used to being misunderstood, I think it worth while to insist explicitly that the derivations which I have proposed in these pages do not in the least overlook the complexity of the phenomena under review. All that they claim is to have added a new factor to the sources, known or still unknown, of religion, morality and society - a factor based on a consideration of the implications of psycho-analysis. I must leave to others the task of synthesizing the explanation into a unity. It does, however, follow from the nature of the new contribution that it could not play any other than a central part in such a synthesis, even though powerful emotional resistance might have to be overcome before its great importance was recognized.

Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.¹ If, however, we inquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always psychical realities and never factual ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.
May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree. Accordingly the mere hostile impulse against the father, the mere existence of a wishful phantasy of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and none the less have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father - taboo and the sacrificial ordinance - is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality - from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

A similar application of its points of view, its hypotheses and its findings has enabled psychoanalysis to throw light on the origins of our great cultural institutions - on religion, morality, justice and philosophy. By examining the primitive psychological situations which were able to provide the motive for creations of this kind, it has been in a position to reject certain attempts at an explanation that were based on too superficial a psychology and to replace them by a more penetrating insight.

Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book Totem and Taboo (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.
To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

¹ We are very well aware that we have not exhausted the nature of identification with these examples taken from pathology, and that we have consequently left part of the riddle of group formations untouched. A far more fundamental and comprehensive psychological analysis would have to intervene at this point. A path leads from identification by way of imitation to empathy, that is, to the comprehension of the mechanism by means of which we are enabled to take up any attitude at all towards another mental life. Moreover there is still much to be explained in the manifestations of existing identifications. These result among other things in a person limiting his aggressiveness towards those with whom he has identified himself, and in his sparing them and giving them help. The study of such identifications, like those, for instance which lie at the root of clan feeling, led Robertson Smith (Kinship and Marriage, 1885) to the surprising discovery that they rest upon the acknowledgement of the possession of a common substance, and may even therefore be created by a meal eaten in common. This feature makes it possible to connect this kind of identification with the early history of the human family which I constructed in Totem and Taboo.

[1919g, 3705]

In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organization, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers.¹ To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times - a 'Just-So Story', as it was amusingly called by a not unkind English critic; but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.

[1921c, 3814]

¹ It may perhaps also be assumed that the sons, when they were driven out and separated from their father, advanced from identification with one another to homosexual object-love, and in this way won freedom to kill their father.

[1921c, 3816]
By the measures that he takes, then, the hypnotist awakens in the subject a portion of his archaic heritage which had also made him compliant towards his parents and which had experienced an individual re-animation in his relation to his father; what is thus awakened is the idea of a paramount and dangerous personality, towards whom only a passive-masochistic attitude is possible, to whom one's will has to be surrendered, - while to be alone with him, 'to look him in the face', appears a hazardous enterprise. It is only in some such way as this that we can picture the relation of the individual member of the primal horde to the primal father. As we know from other reactions, individuals have preserved a variable degree of personal aptitude for reviving old situations of this kind. Some knowledge that in spite of everything hypnosis is only a game, a deceptive renewal of these old impressions, may, however, remain behind and take care that there is a resistance against any too serious consequences of the suspension of the will in hypnosis.

For this purpose we must return for a moment to the scientific myth of the father of the primal horde. He was later on exalted into the creator of the world, and with justice, for he had produced all the sons who composed the first group. He was the ideal of each one of them, at once feared and honoured, a fact which led later to the idea of taboo. These many individuals eventually banded themselves together, killed him and cut him in pieces. None of the group of victors could take his place, or, if one of them did, the battles began afresh, until they understood that they must all renounce their father's heritage. They then formed the totemic community of brothers, all with equal rights and united by the totem prohibitions which were to preserve and to expiate the memory of the murder. But the dissatisfaction with what had been achieved still remained, and it became the source of new developments. The persons who were united in this group of brothers gradually came towards a revival of the old state of things at a new level. The male became once more the chief of a family, and broke down the prerogatives of the gynaecocracy which had become established during the fatherless period. As a compensation for this he may at that time have acknowledged the mother deities, whose priests were castrated for the mother's protection, after the example that had been given by the father of the primal horde. And yet the new family was only a shadow of the old one; there were numbers of fathers and each one was limited by the rights of the others.

We shall naturally not be surprised to hear that the sexual impulsions that are inhibited in their aims arise out of the directly sexual ones when internal or external obstacles make the sexual aims unattainable. The repression during the period of latency is an internal obstacle of this kind - or rather one which has become internal. We have assumed that the father of the primal horde owing to his sexual intolerance compelled all his sons to be abstinent, and thus forced them into ties that were inhibited in their aims, while he reserved for himself freedom of sexual enjoyment and in this way remained without ties. All the ties upon which a group depends are of the character of instincts that are inhibited in their aims. But here we have approached the discussion of a new subject, which deals with the relation between directly sexual instincts and the formation of groups.
There are abundant indications that being in love only made its appearance late on in the sexual relations between men and women; so that the opposition between sexual love and group ties is also a late development. Now it may seem as though this assumption were incompatible with our myth of the primal family. For it was after all by their love for their mothers and sisters that the mob of brothers was, as we have supposed, driven to parricide; and it is difficult to imagine this love as being anything but undivided and primitive - that is, as an intimate union of the affectionate and sensual. But further consideration resolves this objection to our theory into a confirmation of it. One of the reactions to the parricide was after all the institution of totemic exogamy, the prohibition of any sexual relation with those women of the family who had been tenderly loved since childhood. In this way a wedge was driven in between a man's affectionate and sensual feelings, one still firmly fixed in his erotic life to-day.¹ As a result of this exogamy the sensual needs of men had to be satisfied with strange and unloved women.

¹ As 'retiring in favour of someone else' has not previously been mentioned among the causes of homosexuality, or in the mechanism of libidinal fixation in general, I will adduce here another analytic observation of the same kind which has a special feature of interest. I once knew two twin brothers, both of whom were endowed with strong libidinal impulses. One of them was very successful with women, and had innumerable affairs with women and girls. The other went the same way at first, but it became unpleasant for him to be trespassing on his brother's preserves, and, owing to the likeness between them, to be mistaken for him on intimate occasions; so he got out of the difficulty by becoming homosexual. He left the women to his brother, and thus retired in his favour. Another time I treated a youngish man, an artist, unmistakably bisexual in disposition, in whom the homosexual trend had come to the fore simultaneously with a disturbance in his work. He fled from both women and work together. The analysis, which was able to bring him back to both, showed that fear of his father was the most powerful psychical motive for both the disturbances, which were really renunciations. In his imagination all women belonged to his father, and he sought refuge in men out of submission, so as to retire from the conflict with his father. Such a motivation of the homosexual object-choice must be by no means uncommon; in the primaeval ages of the human race all women presumably belonged to the father and head of the primal horde.

We have here an example of the process, with which we are familiar, by which an idea that has a contradictory - an ambivalent - content becomes divided into two sharply contrasted opposites. The contradictions in the original nature of God are, however, a reflection of the ambivalence which governs the relation of the individual to his personal father. If the benevolent and righteous God is a substitute for his father, it is not to be wondered at that his hostile attitude to his father, too, which is one of hating and fearing him and of making complaints against him, should have come to expression in the creation of Satan. Thus the father, it seems, is the individual prototype of both God and the Devil. But we should expect religions to bear ineffaceable marks of the fact that the primitive primal father was a being of unlimited evil - a being less like God than the Devil.
This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]

But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

[1927c, 4451]

But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right, God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth - though subject, it is true, to some modification and disguise - whereas our rational account disavows it.

[1927c, 4451]
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]
After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In Totem and Taboo I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

[1930a, 4495]

It can also be asserted that when a child reacts to his first great instinctual frustrations with excessively strong aggressiveness and with a correspondingly severe super-ego, he is following a phylogenetic model and is going beyond the response that would be currently justified; for the father of prehistoric times was undoubtedly terrible, and an extreme amount of aggressiveness may be attributed to him. Thus, if one shifts over from individual to phylogenetic development, the differences between the two theories of the genesis of conscience are still further diminished. On the other hand, a new and important difference makes its appearance between these two developmental processes. We cannot get away from the assumption that man's sense of guilt springs from the Oedipus complex and was acquired at the killing of the father by the brothers banded together. On that occasion an act of aggression was not suppressed but carried out; but it was the same act of aggression whose suppression in the child is supposed to be the source of his sense of guilt. At this point I should not be surprised if the reader were to exclaim angrily: 'So it makes no difference whether one kills one's father or not - one gets a feeling of guilt in either case! We may take leave to raise a few doubts here. Either it is not true that the sense of guilt comes from suppressed aggressiveness, or else the whole story of the killing of the father is a fiction and the children of primeval man did not kill their fathers any more often than children do nowadays. Besides, if it is not fiction but a plausible piece of history, it would be a case of something happening which everyone expects to happen - namely, of a person feeling guilty because he really has done something which cannot be justified. And of this event, which is after all an everyday occurrence, psycho-analysis has not yet given any explanation.'

[1930a, 4521]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoiled the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt. Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere⁴ - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

[1930a, 4523]
Nor will it do any harm if we once more review the contradictions which have for a while perplexed us during our enquiry. Thus, at one point the sense of guilt was the consequence of acts of aggression that had been abstained from; but at another point - and precisely at its historical beginning, the killing of the father - it was the consequence of an act of aggression that had been carried out. But a way out of this difficulty was found. For the institution of the internal authority, the super-ego, altered the situation radically. Before this, the sense of guilt coincided with remorse. (We may remark, incidentally, that the term ‘remorse’ should be reserved for the reaction after an act of aggression has actually been carried out.) After this, owing to the omniscience of the super-ego, the difference between an aggression intended and an aggression carried out lost its force. Henceforward a sense of guilt could be produced not only by an act of violence that is actually carried out (as all the world knows), but also by one that is merely intended (as psycho-analysis has discovered). Irrespectively of this alteration in the psychological situation, the conflict arising from ambivalence - the conflict between the two primal instincts - leaves the same result behind. We are tempted to look here for the solution of the problem of the varying relation in which the sense of guilt stands to consciousness. It might be thought that a sense of guilt arising from remorse for an evil deed must always be conscious, whereas a sense of guilt arising from the perception of an evil impulse may remain unconscious. But the answer is not so simple as that. Obsessional neurosis speaks energetically against it.

The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulses has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with ‘fear of conscience’. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual.
Parricide, according to a well-known view, is the principal and primal crime of humanity as well as of the individual. (See my *Totem and Taboo* 1912-13.) It is in any case the main source of the sense of guilt, though we do not know if it is the only one: researches have not yet been able to establish with certainty the mental origin of guilt and the need for expiation. But it is not necessary for it to be the only one. The psychological situation is complicated and requires elucidation. The relation of a boy to his father is, as we say, an 'ambivalent' one. In addition to the hate which seeks to get rid of the father as a rival, a measure of tenderness for him is also habitually present. The two attitudes of mind combine to produce identification with the father; the boy wants to be in his father's place because he admires him and wants to be like him, and also because he wants to put him out of the way. This whole development now comes up against a powerful obstacle. At a certain moment the child comes to understand that an attempt to remove his father as a rival would be punished by him with castration. So from fear of castration - that is, in the interests of preserving his masculinity - he gives up his wish to possess his mother and get rid of his father. In so far as this wish remains in the unconscious it forms the basis of the sense of guilt. We believe that what we have here been describing are normal processes, the normal fate of the so-called 'Oedipus complex'; nevertheless it requires an important amplification.

[1928b, 4559]

One thing is remarkable: in the aura of the epileptic attack, one moment of supreme bliss is experienced. This may very well be a record of the triumph and sense of liberation felt on hearing the news of the death, to be followed immediately by an all the more cruel punishment. We have divined just such a sequence of triumph and mourning, of festive joy and mourning, in the brothers of the primal horde who murdered their father, and we find it repeated in the ceremony of the totem meal.¹ If it proved to be the case that Dostoevsky was free from his attacks in Siberia, that would merely substantiate the view that they were his punishment. He did not need them any longer when he was being punished in another way. But that cannot be proved. Rather does this necessity for punishment on the part of Dostoevsky's mental economy explain the fact that he passed unbroken through these years of misery and humiliation. Dostoevsky's condemnation as a political prisoner was unjust and he must have known it, but he accepted the undeserved punishment at the hands of the Little Father, the Tsar, as a substitute for the punishment he deserved for his sin against his real father. Instead of punishing himself, he got himself punished by his father's deputy. Here we have a glimpse of the psychological justification of the punishments inflicted by society. It is a fact that large groups of criminals want to be punished. Their super-ego demands it and so saves itself the necessity for inflicting the punishment itself.

[1928b, 4562]
Everyone who is familiar with the complicated transformation of meaning undergone by hysterical symptoms will understand that no attempt can be made here to follow out the meaning of Dostoevsky's attacks beyond this beginning. It is enough that we may assume that their original meaning remained unchanged behind all later accretions. We can safely say that Dostoevsky never got free from the feelings of guilt arising from his intention of murdering his father. They also determined his attitude in the two other spheres in which the father-relation is the decisive factor, his attitude towards the authority of the State and towards belief in God. In the first of these he ended up with complete submission to his Little Father, the Tsar, who had once performed with him in reality the comedy of killing which his attacks had so often represented in play. Here penitence gained the upper hand. In the religious sphere he retained more freedom: according to apparently trustworthy reports he wavered, up to the last moment of his life, between faith and atheism. His great intellect made it impossible for him to overlook any of the intellectual difficulties to which faith leads. By an individual recapitulation of a development in world-history he hoped to find a way out and a liberation from guilt in the Christ ideal, and even to make use of his sufferings as a claim to be playing a Christ-like role. If on the whole he did not achieve freedom and became a reactionary, that was because the filial guilt, which is present in human beings generally and on which religious feeling is built, had in him attained a super-individual intensity and remained insurmountable even to his great intelligence. In writing this we are laying ourselves open to the charge of having abandoned the impartiality of analysis and of subjecting Dostoevsky to judgements that can only be justified from the partisan standpoint of a particular Weltanschauung. A conservative would take the side of the Grand Inquisitor and would judge Dostoevsky differently. The objection is just; and one can only say in extenuation that Dostoevsky's decision has every appearance of having been determined by an intellectual inhibition due to his neurosis.

[1928b, 4563]

But we have not made any mention at all so far of what the real danger is that the child is afraid of as a result of being in love with his mother. The danger is the punishment of being castrated, of losing his genital organ. You will of course object that after all that is not a real danger. Our boys are not castrated because they are in love with their mothers during the phase of the Oedipus complex. But the matter cannot be dismissed so simply. Above all, it is not a question of whether castration is really carried out; what is decisive is that the danger is one that threatens from outside and that the child believes in it. He has some ground for this, for people threaten him often enough with cutting off his penis during the phallic phase, at the time of his early masturbation, and hints at that punishment must regularly find a phylogenetic reinforcement in him. It is our suspicion that during the human family's primaeval period castration used actually to be carried out by a jealous and cruel father upon growing boys, and that circumcision, which so frequently plays a part in puberty rites among primitive peoples, is a clearly recognizable relic of it. We are aware that here we are diverging widely from the general opinion; but we must hold fast to the view that fear of castration is one of the commonest and strongest motives for repression and thus for the formation of neuroses. The analysis of cases in which circumcision, though not, it is true, castration, has been carried out on boys as a cure or punishment for masturbation (a far from rare occurrence in Anglo-American society) has given our conviction a last degree of certainty. It is very tempting at this point to go more deeply into the castration complex, but I will stick to our subject.

[1933a, 4693]
I put forward these assertions as much as a quarter of a century ago in my *Totem and Taboo* (1912-13) and I need only repeat them here. My construction starts out from a statement of Darwin's and takes in a hypothesis of Atkinson's. It asserts that in primaeval times primitive man lived in small hordes, each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men - that is, to all our ancestors. The story is told in an enormously condensed form, as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property - wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

[1939a, 4905]

The first decisive step towards a change in this sort of 'social' organization seems to have been that the expelled brothers, living in a community, united to overpower their father and, as was the custom in those days, devoured him raw. There is no need to balk at this cannibalism; it continued far into later times. The essential point, however, is that we attribute the same emotional attitudes to these primitive men that we are able to establish by analytic investigation in the primitives of the present day - in our children. We suppose, that is, that they not only hated and feared their father but also honoured him as a model, and that each of them wished to take his place in reality. We can, if so, understand the cannibalistic act as an attempt to ensure identification with him by incorporating a piece of him.

[1939a, 4905]
It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

[1939a, 4906]

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

[1939a, 4912]
The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father. [1939a, 4913]

The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity. [1939a, 4913]

A decision is made still more difficult when we turn to the analogous case in primaeval times. It is quite certain that in the course of thousands of years the fact was forgotten that there had been a primal father with the characteristics we know and what his fate had been; nor can we suppose that there was any oral tradition of it, as we can in the case of Moses. In what sense, then, does a tradition come in question at all? In what form can it have been present? [1939a, 4917]
After this discussion I have no hesitation in declaring that men have always known (in this special way) that they once possessed a primal father and killed him.

[1939a, 4922]

Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

[1939a, 4922]

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

[1939a, 4923]

There is no doubt that it was a mighty prototype of a father which, in the person of Moses, stooped to the poor Jewish bondsmen to assure them that they were his dear children. And no less overwhelming must have been the effect upon them of the idea of an only, eternal, almighty God, to whom they were not too mean for him to make a covenant with them and who promised to care for them if they remained loyal to his worship. It was probably not easy for them to distinguish the image of the man Moses from that of his God; and their feeling was right in this, for Moses may have introduced traits of his own personality into the character of his God - such as his wrathful temper and his relentlessness. And if, this being so, they killed their great man one day, they were only repeating a misdeed which in ancient times had been committed, as prescribed by law, against the Divine King and which, as we know, went back to a still more ancient prototype.¹

[1939a, 4931]
Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

[1939a, 4940]

In 1912 I attempted, in my Totem and Taboo, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

[1939a, 4951]

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

[1939a, 4952]
Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.

[1939a, 4953]

¹ Castration has a place too in the Oedipus legend, for the blinding with which Oedipus punishes himself after the discovery of his crime is, by the evidence of dreams, a symbolic substitute for castration. The possibility cannot be excluded that a phylogenetic memory-trace may contribute to the extraordinarily terrifying effect of the threat - a memory-trace from the prehistory of the primal family, where the jealous father actually robbed his son of his genitals if the latter became troublesome to him as a rival with a woman. The primal custom of circumcision, another symbolic substitute for castration, can only be understood as an expression of submission to the father's will. (Cf. the puberty rites of primitive peoples.) No investigation has yet been made of the form taken by the events described above among peoples and in civilizations which do not suppress masturbation in children.

[1940a [1938], 4997]
Few details of the sexual life of primitive peoples are so alien to our own feelings as their estimate of virginity, the state in a woman of being untouched. The high value which her suitor places on a woman's virginity seems to us so firmly rooted, so much a matter of course, that we find ourselves almost at a loss if we have to give reasons for this opinion. The demand that a girl shall not bring to her marriage with a particular man any memory of sexual relations with another is, indeed, nothing other than a logical continuation of the right to exclusive possession of a woman, which forms the essence of monogamy, the extension of this monopoly to cover the past.

From this point we have no trouble in justifying what looked at first like a prejudice, by referring to our views on the erotic life of women. Whoever is the first to satisfy a virgin's desire for love, long and laboriously held in check, and who in doing so overcomes the resistances which have been built up in her through the influences of her milieu and education, that is the man she will take into a lasting relationship, the possibility of which will never again be open to any other man. This experience creates a state of bondage in the woman which guarantees that possession of her shall continue undisturbed and makes her able to resist new impressions and enticements from outside.

Von Krafft-Ebing derives the formation of sexual bondage from a conjunction of an 'uncommon degree of the state of being in love and of weakness of character' in one person and unbounded egoism in the other. Analytic experience, however, will not let us rest satisfied with this simple attempt at explanation. We can see, rather, that the decisive factor is the amount of sexual resistance that is overcome and in addition the fact that the process of overcoming the resistance is concentrated and happens only once. This state of bondage is, accordingly, far more frequent and more intense in women than in men, though it is true it occurs in the latter more often nowadays than it did in ancient times. Wherever we have been able to study sexual bondage in men it has shown itself as resulting from an overcoming of psychical impotence through one particular woman, to whom the man in question has remained subsequently bound. Many strange marriages and not a few tragic events - even some with far-reaching consequences - seem to owe their explanation to this origin.

Turning to the attitude of primitive peoples, it is incorrect to describe it by declaring that they set no value on virginity and to submit as proof of this the fact that they perform the defloration of girls outside marriage and before the first act of marital intercourse. On the contrary, it appears that for them, too, defloration is a significant act; but it has become the subject of a taboo - of a prohibition which may be described as religious. Instead of reserving it for the girl's bridegroom and future partner in marriage, custom demands that he shall shun the performance of it.¹

It is no part of my purpose to make a full collection of the literary evidence for the existence of this custom of prohibition, to pursue its geographical distribution and to enumerate all the forms in which it is expressed. I shall content myself, therefore, with stating the fact that the practice of rupturing the hymen in this way outside the subsequent marriage is very widespread among primitive races living to-day. As Crawley says 'This marriage ceremony consists in perforation of the hymen by some appointed person other than the husband; it is most common in the lowest stages of culture, especially in Australia.' (Crawley, 1902, 347.)
If, however, defloration is not to result from the first act of marital intercourse, then it must have been carried out beforehand - whatever the way and whoever the agent may have been. I shall quote a few passages from Crawley’s book, mentioned above, which provide information on these points but also give grounds for some critical observations.

The critical remarks I referred to are concerned with two points. Firstly, it is a pity that in these reports a more careful distinction is not made between simple rupture of the hymen without intercourse, and intercourse for the purpose of effecting this rupture. There is only one passage in which we are told expressly that the procedure falls into two actions: defloration (carried out by hand or with some instrument) and the act of intercourse which follows it. The material in Ploss and Bartels (1891), in other respects so rich, is almost useless for our purpose, because in their presentation of it the psychological importance of the act of defloration is completely displaced in favour of its anatomical results. Secondly, we should be glad to be informed how the ‘ceremonial’ (purely formal, ritual, or official) coitus, which takes place on these occasions, differs from ordinary sexual intercourse. The authors to whom I have had access either have been too embarrassed to discuss the matter or have once again underestimated the psychological importance of such sexual details. It is to be hoped that the first-hand accounts of travellers and missionaries may be more complete and less ambiguous, but since this literature, which is for the most part foreign, is for the time being inaccessible I cannot say anything definite on the subject. Besides, we may get round the problem arising over this second point if we bear in mind the fact that a ceremonial mock-coitus would after all only represent a substitute for, and perhaps replace altogether, an act that in earlier times would have been carried out completely.¹

There are various factors which can be adduced to explain this taboo of virginity and which I will enumerate and consider briefly. When a virgin is deflowered, her blood is as a rule shed; the first attempt at explanation, then, is based on the horror of blood among primitive races who consider blood as the seat of life. This blood taboo is seen in numerous kinds of observances which have nothing to do with sexuality; it is obviously connected with the prohibition against murder and forms a protective measure against the primal thirst for blood, primaeval man’s pleasure in killing. According to this view the taboo of virginity is connected with the taboo of menstruation which is almost universally maintained. Primitive people cannot dissociate the puzzling phenomenon of this monthly flow of blood from sadistic ideas. Menstruation, especially its first appearance, is interpreted as the bite of some spirit-animal, perhaps as a sign of sexual intercourse with this spirit. Occasionally some report gives grounds for recognizing the spirit as that of an ancestor and then, supported by other findings,² we understand that the menstruating girl is taboo because she is the property of this ancestral spirit.

Other considerations, however, warn us not to over-estimate the influence of a factor such as the horror of blood. It has not, after all, been strong enough to suppress practices like the circumcision of boys and the still more cruel equivalent with girls (excision of the clitoris and labia minora) which are to some extent the custom in these same races, nor to abolish the prevalence of other ceremonies involving bloodshed. It would not therefore be surprising, either, if this horror were overcome for the benefit of the husband on the occasion of the first cohabitation.

¹ [1918a, 2352]
² [1918a, 2352]
There is a second explanation, also unconcerned with sexuality, which has, however, a much more general scope than the first. It suggests that primitive man is prey to a perpetual lurking apprehensiveness, just as in the psycho-analytic theory of the neuroses we claim to be the case with people suffering from anxiety neurosis. This apprehensiveness will appear most strongly on all occasions which differ in any way from the usual, which involve something new or unexpected, something not understood or uncanny. This is also the origin of the ceremonial practices, widely adopted in later religions, which are connected with the beginning of every new undertaking, the start of every new period of time, the first-fruits of human, animal and plant life. The dangers which the anxious man believes to be threatening him never appear more vivid in his expectation than on the threshold of a dangerous situation, and then, too, is the only time when protecting himself against them is of any use. The first act of intercourse in marriage can certainly claim, on grounds of importance, to be preceded by such precautionary measures. These two attempts at explanation, based on horror of blood and on fear of first occurrences, do not contradict but rather reinforce each other. The first occasion of sexual intercourse is certainly a critical action, all the more so if it is to involve a flow of blood.

A third explanation - the one which Crawley prefers - draws attention to the fact that the taboo of virginity is part of a large totality which embraces the whole of sexual life. It is not only the first coitus with a woman which is taboo but sexual intercourse in general; one might almost say that women are altogether taboo. A woman is not only taboo in particular situations arising from her sexual life such as menstruation, pregnancy, childbirth and lying-in; apart from these situations, intercourse with women is subject to such solemn and numerous restrictions that we have every reason to doubt the reputed sexual freedom of savages. It is true that, on particular occasions, primitive man's sexuality will override all inhibitions; but for the most part it seems to be more strongly held in check by prohibitions than it is at higher levels of civilization. Whenever the man undertakes some special enterprise, like setting out on an expedition, a hunt or a campaign, he is obliged to keep away from his wife and especially from sexual intercourse with her; otherwise she will paralyse his strength and bring him bad luck. In the usages of daily life as well there is an unmistakable tendency to keep the sexes apart. Women live with women, men with men; family life, in our sense, seems scarcely to exist in many primitive tribes. This separation sometimes goes so far that one sex is not allowed to say aloud the personal names of members of the other sex, and that the women develop a language with a special vocabulary. Sexual needs will from time to time break through these barriers of separation afresh, but in some tribes even the encounters of husband and wife have to take place outside the house and in secret.

Wherever primitive man has set up a taboo he fears some danger and it cannot be disputed that a generalized dread of women is expressed in all these rules of avoidance. Perhaps this dread is based on the fact that woman is different from man, forever incomprehensible and mysterious, strange and therefore apparently hostile. The man is afraid of being weakened by the woman, infected with her femininity and of then showing himself incapable. The effect which coitus has on discharging tensions and causing flaccidity may be the prototype of what the man fears; and realization of the influence which the woman gains over him through sexual intercourse, the consideration she thereby forces from him, may justify the extension of this fear. In all this there is nothing obsolete, nothing which is not still alive among ourselves.

Many observers of primitive races living to-day have put forward the view that their impulsions in love are relatively weak and never reach the degree of intensity which we are accustomed to meet with in civilized men. Other observers have contradicted this opinion, but in any case the practice of the taboos we have described testifies to the existence of a force which opposes love by rejecting women as strange and hostile.
Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

[1918a, 2355]

We can see, however, that these latter considerations have led us to range far beyond our subject. The general taboo of women throws no light on the particular rules concerning the first sexual act with a virgin. As far as they are concerned, we have not got beyond the first two explanations, based on horror of blood and fear of first occurrences, and even these, we must point out, do not touch the core of the taboo in question. It is quite clear that the intention underlying this taboo is that of denying or sparing precisely the future husband something which cannot be dissociated from the first sexual act, although according to our introductory observations this very relation would lead to the woman becoming specially bound to this one man.

[1918a, 2355]

It is not our task on this occasion to discuss the origin and ultimate significance of taboo observances. I have done this in my book *Totem and Taboo*, where I have given due consideration to the part played by primal ambivalence in determining the formation of taboo and have traced the genesis of the latter from the prehistoric events which led to the founding of the human family. We can no longer recognize an original meaning of this kind in taboos observed among primitive tribes to-day. We forget all too easily, in expecting to find any such thing, that even the most primitive peoples exist in a culture far removed from that of primaeval days, which is just as old as our own from the point of view of time and like ours corresponds to a later, if different, stage of development.

[1918a, 2356]

To-day we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old motifs replaced by new ones that fit together harmoniously. Leaving aside these genetic problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

[1918a, 2356]
Now I believe that we shall receive some indication as to what this heightened danger is and why it threatens precisely the future husband, if we examine more closely the behaviour under the same circumstances of women of our own stage of civilization to-day. I will submit in advance, as the result of this examination, that such a danger really exists, so that with the taboo of virginity primitive man is defending himself against a correctly sensed, although psychical, danger.

[1918a, 2357]

I do not want to introduce at this point the attempts - which are so frequent - to take flight from the first occasion of sexual intercourse, because they are open to several interpretations and are in the main, although not altogether, to be understood as an expression of the general female tendency to take a defensive line. As against this, I do believe that light is thrown on the riddle of female frigidity by certain pathological cases in which, after the first and indeed after each repeated instance of sexual intercourse, the woman gives unconcealed expression to her hostility towards the man by abusing him, raising her hand against him or actually striking him. In one very clear case of this kind, which I was able to submit to a thorough analysis, this happened although the woman loved the man very much, used to demand intercourse herself and unmistakably found great satisfaction in it. I think that this strange, contradictory reaction is the result of the very same impulses which ordinarily can only find expression as frigidity - which, that is, can hold back the tender reaction without at the same time being able to put themselves into effect. In the pathological case we find separated so to speak into its two components what in the far more common instance of frigidity is united to produce an inhibiting effect, just like the process we have long recognized in the so-called 'diphasic symptoms' of obsessional neurosis. The danger which is thus aroused through the defloration of a woman would consist in drawing her hostility down upon oneself, and the prospective husband is just the person who would have every reason to avoid such enmity.

[1918a, 2357]

Now analysis enables us to infer without difficulty which impulses in women take part in bringing about this paradoxical behaviour, in which I expect to find the explanation of frigidity. The first act of intercourse mobilizes a number of impulses which are out of place in the desired feminine attitude, some of which, incidentally, need not recur during subsequent intercourse. In the first place we think of the pain which defloration causes a virgin, and we are perhaps even inclined to consider this factor as decisive and to give up the search for any others. But we cannot well ascribe such importance to this pain; we must rather substitute for it the narcissistic injury which proceeds from the destruction of an organ and which is even represented in a rationalized form in the knowledge that loss of virginity brings a diminution of sexual value. The marriage customs of primitive peoples, however, contain a warning against over-estimating this. We have heard that in some cases the rite falls into two phases: after the hymen has been ruptured (by hand or with some instrument) there follows a ceremonial act of coitus or mock-intercourse with the representatives of the husband, and this proves to us that the purpose of the taboo observance is not fulfilled by avoiding anatomical defloration, that the husband is to be spared something else as well as the woman's reaction to the painful injury.

[1918a, 2358]
The customs of primitive peoples seem to take account of this *motif* of the early sexual wish by handing over the task of defloration to an elder, priest or holy man, that is, to a substitute for the father (see above). There seems to me to be a direct path leading from this custom to the highly vexed question of the *jus primae noctis* of the mediaeval lord of the manor. A. J. Storfer (1911) has put forward the same view and has in addition, as Jung (1909) had already done before him, interpreted the widespread tradition of the 'Tobias nights' (the custom of continence during the first three nights of marriage) as an acknowledgement of the privilege of the patriarch. It agrees with our expectations, therefore, when we find the images of gods included among the father-surrogates entrusted with defloration. In some districts of India, the newly-married woman was obliged to sacrifice her hymen to the wooden lingam, and, according to St. Augustine's account, the same custom existed in the Roman marriage ceremony (of his time?), but modified so that the young wife only had to seat herself on the gigantic stone phallus of Priapus.¹

After this enumeration of the motives for the paradoxical reaction of women to defloration, traces of which persist in frigidity, we may sum up by saying that a woman's *immature sexuality*, is discharged on to the man who first makes her acquainted with the sexual act. This being so, the taboo of virginity is reasonable enough and we can understand the rule which decrees that precisely the man who is to enter upon a life shared with this woman shall avoid these dangers. At higher stages of civilization the importance attributed to this danger diminishes in face of her promise of bondage and no doubt of other motives and inducements; virginity is looked upon as a possession which the husband is not called upon to renounce. But analysis of disturbed marriages teaches us that the motives which seek to drive a woman to take vengeance for her defloration are not completely extinguished even in the mental life of civilized women. I think it must strike the observer in how uncommonly large a number of cases the woman remains frigid and feels unhappy in a first marriage, whereas after it has been dissolved she becomes a tender wife, able to make her second husband happy. The archaic reaction has, so to speak, exhausted itself on the first object.

The taboo of virginity, however, even apart from this has not died out in our civilized existence. It is known to the popular mind and writers have on occasion made use of this material. A comedy by Anzengrubner shows how a simple peasant lad is deterred from marrying his intended bride because she is 'a wench who'll cost her first his life'. For this reason he agrees to her marrying another man and is ready to take her when she is a widow and no longer dangerous. The title of the play, *Das Jungferngift* ['Virgin's Venom'], reminds us of the habit of snake-charmers, who make poisonous snakes first bite a piece of cloth in order to handle them afterwards without danger.¹

[1918a, 2359]

[1918a, 2361]
The taboo of virginity and something of its motivation has been depicted most powerfully of all in a well-known dramatic character, that of Judith in Hebbel's tragedy *Judith und Holofernes*. Judith is one of those women whose virginity is protected by a taboo. Her first husband was paralysed on the bridal night by a mysterious anxiety, and never again dared to touch her, 'My beauty is like belladonna,' she says. 'Enjoyment of it brings madness and death.' When the Assyrian general is besieging her city, she conceives the plan of seducing him by her beauty and of destroying him, thus employing a patriotic motive to conceal a sexual one. After she has been deflowered by this powerful man, who boasts of his strength and ruthlessness, she finds the strength in her fury to strike off his head, and thus becomes the liberator of her people. Beheading is well known to us as a symbolic substitute for castrating; Judith is accordingly the woman who castrates the man who has deflowered her, which was just the wish of the newly-married woman expressed in the dream I reported. It is clear that Hebbel has intentionally sexualized the patriotic narrative from the Apocrypha of the Old Testament, for there Judith is able to boast after her return that she has not been defiled, nor is there in the Biblical text any mention of her uncanny wedding night. But probably, with the fine perception of a poet, he sensed the ancient motive, which had been lost in the tendentious narrative, and has merely restored its earlier content to the material.

[1918a, 2362]

We may say, then, in conclusion that defloration has not only the one, civilized consequence of binding the woman lastingly to the man; it also unleashes an archaic reaction of hostility towards him, which can assume pathological forms that are frequently enough expressed in the appearance of inhibitions in the erotic side of married life, and to which we may ascribe the fact that second marriages so often turn out better than first. The taboo of virginity, which seems so strange to us, the horror with which, among primitive peoples, the husband avoids the act of defloration, are fully justified by this hostile reaction.

[1918a, 2363]

We should certainly not expect that the sexual life of these poor naked cannibals would be moral in our sense or that their sexual instincts would be subjected to any great degree of restriction. Yet we find that they set before themselves with the most scrupulous care and the most painful severity the aim of avoiding incestuous sexual relations. Indeed, their whole social organization seems to serve that purpose or to have been brought into relation with its attainment.

[1912-1913, 2651]

How did prehistoric men come to adopt totems? How, that is, did they come to make the fact of their being descended from one animal or another the basis of their social obligations and, as we shall see presently, of their sexual restrictions? There are numerous theories on the subject - of which Wundt (1906) has given an epitome for German readers - but no agreement. It is my intention to devote a special study before long to the problem of totemism, in which I shall attempt to solve it by the help of a psycho-analytic line of approach. (See the fourth essay in this work.)

[1912-1913, 2652]

And now we come at last to the characteristic of the totemic system which has attracted the interest of psycho-analysts. In almost every place where we find totems we also find *a law against persons of the same totem having sexual relations with one another and consequently against their marrying*. This, then, is 'exogamy', an institution related to totemism.

[1912-1913, 2653]
Strictly enforced as it is, this prohibition is a remarkable one. There is nothing in the concept or attributes of the totem which I have so far mentioned to lead us to anticipate it; so that it is hard to understand how it has become involved in the totemic system. We cannot, therefore, feel surprised that some investigators actually suppose that exogamy had originally - in the earliest times and in its true meaning - nothing to do with totemism, but became attached to it (without there being any underlying connection) at some time when marriage restrictions became necessary. However this may be, the bond between totemism and exogamy exists and is clearly a very firm one.

[1912-1913, 2653]

(d) But a little more reflection will show that exogamy linked with the totem effects more (and therefore aims at more) than the prevention of incest with a man's mother and sisters. It makes sexual intercourse impossible for a man with all the women of his own clan (that is to say with a number of women who are not his blood-relatives) by treating them all as though they were his blood-relatives. It is difficult at first sight to see the psychological justification for this very extensive restriction, which goes far beyond anything comparable among civilized peoples. It may be gathered from this, however, that the part played by the totem as common ancestor is taken very seriously. All those who are descended from the same totem are blood relations. They form a single family, and within that family even the most distant degree of kinship is regarded as an absolute hindrance to sexual intercourse.

[1912-1913, 2654]

The riddle of how it came about that the real family was replaced by the totem clan must perhaps remain unsolved till the nature of the totem itself can be explained. At the same time, it is to be observed that if there were a certain degree of freedom of sexual intercourse outside marriage, blood-relationship, and consequently the prevention of incest, would become so uncertain that the prohibition would stand in need of a wider basis. It is therefore worth remarking that Australian customs permit the occurrence, in certain social situations and during certain festivals, of breaches in a man's exclusive conjugal rights over a woman.

[1912-1913, 2654]

Though this use of words strikes us as so puzzling, it is easily explained if we look on it as a survival of the marriage institution which the Rev. L. Fison has called 'group marriage' and which consists in a certain number of men exercising conjugal rights over a certain number of women. The children of such a group marriage would then justly regard one another as brothers and sisters (though they were not all born of the same mother) and would regard all the men in the group as their fathers.

[1912-1913, 2655]

But when once we have put group marriage in the place of individual marriage, the apparently excessive degree of avoidance of incest which we have come across among the same peoples becomes intelligible. Totemic exogamy, the prohibition of sexual intercourse between members of the same clan, appears to have been the appropriate means for preventing group incest; it thus became established and persisted long after its raison d'être had ceased.

[1912-1913, 2655]
By far the most widespread and strictest avoidance (and the most interesting from the point of view of civilized races) is that which restricts a man's intercourse with his mother-in-law. It is quite general in Australia and also extends over Melanesia, Polynesia and the Negro races of Africa, wherever traces of totemism and the classificatory system of relationship are found and probably still further. In some of these places there are similar prohibitions against a woman having innocent intercourse with her father-in-law; but they are far less usual and severe. In a few isolated cases both parents-in-law are subject to avoidance. Since we are less concerned with the ethnographical extent of this avoidance than with its substance and purpose, I shall once again restrict myself to quoting a few examples.

I can see nothing against the presumption that it is precisely this incestuous factor in the relation that provides savages with the motive for their rules of avoidance between son-in-law and mother-in-law. Thus the explanation which we should adopt for these strictly enforced avoidances among primitive peoples is that put forward by Fison, which regards them merely as a further protection against possible incest. The same explanation holds good of all other avoidances, between both blood and tribal relations. The only difference would be that in the case of blood relations the possibility of incest is an immediate one and the intention to prevent it may be conscious; in the other cases, including that of a man's relation to his mother-in-law, the possibility of incest would seem to be a temptation in phantasy set in motion through the agency of unconscious connecting links.

² (Footnote added 1935:) The period of latency is a physiological phenomenon. It can, however, only give rise to a complete interruption of sexual life in cultural organizations which have made the suppression of infantile sexuality a part of their system. This is not the case with the majority of primitive peoples.

It is an odd thing that the regular and essential part of this sexual activity was not overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle. We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.
If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

[1930a, 4507]

We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
It is not our task on this occasion to discuss the origin and ultimate significance of taboo observances. I have done this in my book Totem and Taboo, where I have given due consideration to the part played by primal ambivalence in determining the formation of taboo and have traced the genesis of the latter from the prehistoric events which led to the founding of the human family. We can no longer recognize an original meaning of this kind in taboos observed among primitive tribes to-day. We forget all too easily, in expecting to find any such thing, that even the most primitive peoples exist in a culture far removed from that of primaeval days, which is just as old as our own from the point of view of time and like ours corresponds to a later, if different, stage of development.

To-day we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old motifs replaced by new ones that fit together harmoniously. Leaving aside these genetic problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

It will be found that the two principal themes from which the title of this little book is derived - totems and taboos - have not received the same treatment. The analysis of taboos is put forward as an assured and exhaustive attempt at the solution of the problem. The investigation of totemism does no more than declare that 'here is what psycho-analysis can at the moment contribute towards elucidating the problem of the totem'. The difference is related to the fact that taboos still exist among us. Though expressed in a negative form and directed towards another subject-matter, they do not differ in their psychological nature from Kant's 'categorical imperative', which operates in a compulsive fashion and rejects any conscious motives. Totemism, on the contrary, is something alien to our contemporary feelings - a religio-social institution which has been long abandoned as an actuality and replaced by newer forms. It has left only the slightest traces behind it in the religions, manners and customs of the civilized peoples of to-day and has been subject to far-reaching modifications even among the races over which it still holds sway. The social and technical advances in human history have affected taboos far less than the totem.

'Taboo' is a Polynesian word. It is difficult for us to find a translation for it, since the concept connoted by it is one which we no longer possess. It was still current among the ancient Romans, whose 'sacer' was the same as the Polynesian 'taboo'. So, too, the 'igkeit' of the Greeks and the 'kadesh' of the Hebrews must have had the same meaning as is expressed in 'taboo' by the Polynesians and in analogous terms by many other races in America, Africa (Madagascar) and North and Central Asia.
Since we need an impartial account of taboo to submit to psycho-analytic examination, I shall now give some extracts and summaries of portions of the article 'Taboo' in the Encyclopaedia Britannica (1910-11),¹ the author of which was Northcote W. Thomas, the anthropologist.[1912-1913, 2667]

The punishment for the violation of a taboo was no doubt originally left to an internal, automatic agency: the violated taboo itself took vengeance. When, at a later stage, ideas of gods and spirits arose, with whom taboo became associated, the penalty was expected to follow automatically from the divine power. In other cases, probably as a result of a further evolution of the concept, society itself took over the punishment of offenders, whose conduct had brought their fellows into danger. Thus the earliest human penal systems may be traced back to taboo.[1912-1913, 2668]

If I judge my readers' feelings aright, I think it is safe to say that in spite of all that they have now heard about taboo they still have very little idea of the meaning of the term or of what place to give it in their thoughts. This is no doubt due to the insufficiency of the information I have given them and to my having omitted to discuss the relation between taboo and superstition, the belief in spirits, and religion. On the other hand, I am afraid a more detailed account of what is known about taboo would have been even more confusing, and I can assure them that in fact the whole subject is highly obscure.[1912-1913, 2669]

Behind all these prohibitions there seems to be something in the nature of a theory that they are necessary because certain persons and things are charged with a dangerous power, which can be transferred through contact with them, almost like an infection. The quantity of this dangerous attribute also plays a part. Some people or things have more of it than others and the danger is actually proportional to the difference of potential of the charges. The strangest fact seems to be that anyone who has transgressed one of these prohibitions himself acquires the characteristic of being prohibited - as though the whole of the dangerous charge had been transferred over to him. This power is attached to all special individuals, such as kings, priests or new born babies, to all exceptional states, such as the physical states of menstruation, puberty or birth, and to all uncanny things, such as sickness and death and what is associated with them through their power of infection or contagion.[1912-1913, 2669]

The word 'taboo' denotes everything, whether a person or a place or a thing or a transitory condition, which is the vehicle or source of this mysterious attribute. It also denotes the prohibitions arising from the same attribute. And, finally, it has a connotation which includes alike 'sacred' and 'above the ordinary', as well as 'dangerous', 'unclean' and 'uncanny'.[1912-1913, 2670]

Wundt writes of that concept that 'it comprises all of the usages in which is expressed a dread of certain objects related to cult ideas or of actions connected with them'. (Ibid., 237.) And, in another passage: 'If we understand by it, in accordance with the general meaning of the word, every prohibition (whether laid down in usage or custom or in explicitly formulated laws) against touching an object or making use of it for one's own purposes or against using certain proscribed words . . . ' then, he goes on, there can be no race and no level of culture which has escaped the ill-effects of taboo.[1912-1913, 2671]
But, adds Wundt, the true sources of taboo lie deeper than in the interests of the privileged classes: 'they have their origin in the source of the most primitive and at the same time most lasting of human instincts - in fear of "demonic" powers.' (Ibid., 307.) 'Taboo is originally nothing other than the objectified fear of the "demonic" power which is believed to lie hidden in a tabooed object. The taboo prohibits anything that may provoke that power and commands that, if it has been injured, whether wittingly or unwittingly, the demon's vengeance must be averted.' [1912-1913, 2672]

According to Wundt, this original characteristic of taboo - the belief in a 'demonic' power which lies hidden in an object and which, if the object is touched or used unlawfully, takes its vengeance by casting a spell over the wrong-doer - is still wholly and solely 'objectified fear'. That fear has not yet split up into the two forms into which it later develops: veneration and horror. [1912-1913, 2673]

Anyone approaching the problem of taboo from the angle of psycho-analysis, that is to say, of the investigation of the unconscious portion of the individual mind, will recognize, after a moment's reflection, that these phenomena are far from unfamiliar to him. He has come across people who have created for themselves individual taboo prohibitions of this very kind and who obey them just as strictly as savages obey the communal taboos of their tribe or society. If he were not already accustomed to describing such people as 'obsessional' patients, he would find 'taboo sickness' a most appropriate name for their condition. Having learnt so much, however, about this obsessional sickness from psycho-analytic examination - its clinical aetiology and the essence of its psychical mechanism - he can scarcely refrain from applying the knowledge he has thus acquired to the parallel sociological phenomenon. [1912-1913, 2674]

A warning must be uttered at this point. The similarity between taboo and obsessional sickness may be no more than a matter of externals; it may apply only to the forms in which they are manifested and not extend to their essential character. Nature delights in making use of the same forms in the most various biological connections: as it does, for instance, in the appearance of branch-like structures both in coral and in plants, and indeed in some forms of crystal and in certain chemical precipitates. It would obviously be hasty and unprofitable to infer the existence of any internal relationship from such points of agreement as these, which merely derive from the operation of the same mechanical causes. We shall bear this warning in mind, but we need not be deterred by it from proceeding with our comparison. [1912-1913, 2674]

The most obvious and striking point of agreement between the obsessional prohibitions of neurotics and taboos is that these prohibitions are equally lacking in motive and equally puzzling in their origin. Having made their appearance at some unspecified moment, they are forcibly maintained by an irresistible fear. No external threat of punishment is required, for there is an internal certainty, a moral conviction, that any violation will lead to intolerable disaster. The most that an obsessional patient can say on this point is that he has an undefined feeling that some particular person in his environment will be injured as result of the violation. Nothing is known of the nature of the injury; and indeed even this wretchedly small amount of information is more often obtained in connection with the expiatory and defensive actions which we shall have to discuss later than with the prohibitions themselves. [1912-1913, 2674]
As in the case of taboo, the principal prohibition, the nucleus of the neurosis, is against touching; and thence it is sometimes known as 'touching phobia' or 'délire du toucher'. The prohibition does not merely apply to immediate physical contact but has an extent as wide as the metaphorical use of the phrase 'to come in contact with'. Anything that directs the patient's thoughts to the forbidden object, anything that brings him into intellectual contact with it, is just as much prohibited as direct physical contact. This same extension also occurs in the case of taboo.

[1912-1913, 2675]

Obsessional prohibitions are extremely liable to displacement. They extend from one object to another along whatever paths the context may provide, and this new object then becomes, to use the apt expression of one of my women patients, 'impossible' - till at last the whole world lies under an embargo of 'impossibility'. Obsessional patients behave as though the 'impossible' persons and things were carriers of a dangerous infection liable to be spread by contact on to everything in their neighbourhood. I have already drawn attention to the same characteristic capacity for contagion and transference in my description of taboo. We know, too, that anyone who violates a taboo by coming into contact with something that is taboo becomes taboo himself and that then no one may come into contact with him.

[1912-1913, 2675]

Obsessional prohibitions involve just as extensive renunciations and restrictions in the lives of those who are subject to them as do taboo prohibitions; but some of them can be lifted if certain actions are performed. Thereafter, these actions must be performed: they become compulsive or obsessive acts, and there can be no doubt that they are in the nature of expiation, penance, defensive measures and purification. The commonest of these obsessive acts is washing in water ('washing mania'). Some taboo prohibitions can be replaced in just the same way; or rather their violation can be made good by a similar 'ceremonial'; and here again lustration with water is the preferred method.

[1912-1913, 2676]

Let us now make the experiment of treating taboo as though it were of the same nature as an obsessional prohibition in one of our patients. We must make it clear beforehand, however, that many of the taboo prohibitions that come under our notice are of a secondary, displaced and distorted kind, and that we shall have to be satisfied if we can throw only a little light on the most fundamental and significant taboos. Moreover, the differences between the situation of a savage and of a neurotic are no doubt of sufficient importance to make any exact agreement impossible and to prevent our carrying the comparison to the point of identity in every detail.

[1912-1913, 2679]
In the first place, then, it must be said that there is no sense in asking savages to tell us the real reason for their prohibitions - the origin of taboo. It follows from our postulates that they cannot answer, since their real reason must be 'unconscious'. We can, however, reconstruct the history of taboo as follows on the model of obsessional prohibitions. Taboos, we must suppose, are prohibitions of primaeval antiquity which were at some time externally imposed upon a generation of primitive men; they must, that is to say, no doubt have been impressed on them violently by the previous generation. These prohibitions must have concerned activities towards which there was a strong inclination. They must then have persisted from generation to generation, perhaps merely as a result of tradition transmitted through parental and social authority. Possibly, however, in later generations they may have become 'organized' as an inherited psychical endowment. Who can decide whether such things as 'innate ideas' exist, or whether in the present instance they have operated, either alone or in conjunction with education, to bring about the permanent fixing of taboos? But one thing would certainly follow from the persistence of the taboo, namely that the original desire to do the prohibited thing must also still persist among the tribes concerned. They must therefore have an ambivalent attitude towards their taboos. In their unconscious there is nothing they would like more than to violate them, but they are afraid to do so; they are afraid precisely because they would like to, and the fear is stronger than the desire. The desire is unconscious, however, in every individual member of the tribe just as it is in neurotics.

The most ancient and important taboo prohibitions are the two basic laws of totemism: not to kill the totem animal and to avoid sexual intercourse with members of the totem clan of the opposite sex.

We have heard, though without understanding it, that anyone who does what is forbidden, that is, who violates a taboo, becomes taboo himself. How is this to be brought into line with the fact that taboo attaches not only to a person who has done what is forbidden but also to persons in particular states, to the states themselves, as well as to impersonal objects? What can the dangerous attribute be which remains the same under all these different conditions? There is only one thing it can be: the quality of exciting men's ambivalence and tempting them to transgress the prohibition.

Anyone who has violated a taboo becomes taboo himself because he possesses the dangerous quality of tempting others to follow his example: why should he be allowed to do what is forbidden to others? Thus he is truly contagious in that every example encourages imitation, and for that reason he himself must be shunned.

But a person who has not violated any taboo may yet be permanently or temporarily taboo because he is in a state which possesses the quality of arousing forbidden desires in others and of awakening a conflict of ambivalence in them. The majority of exceptional positions and exceptional states are of this kind and possess this dangerous power. The king or chief arouses envy on account of his privileges: everyone, perhaps, would like to be a king. Dead men, newborn babies and women menstruating or in labour stimulate desires by their special helplessness; a man who has just reached maturity stimulates them by the promise of new enjoyment. For that reason all of these persons and all of these states are taboo, since temptation must be resisted.
Now, too, we can understand why the amounts of mana possessed by different persons can be subtracted from one another and can to some extent cancel one another out. A king's taboo is too strong for one of his subjects because the social difference between them is too great. But a minister may without any harm serve as an intermediary between them. If we translate this from the language of taboo into that of normal psychology, it means something like this. A subject, who dreads the great temptation presented to him by contact with the king, can perhaps tolerate dealings with an official whom he does not need to envy so much and whose position may even seem attainable to him. A minister, again, can mitigate his envy of the king by reflecting on the power which he himself wields. So it comes about that smaller differences between the amounts of the tempting magical force possessed by two people are less to be feared than greater ones.

We have translated the contagious power inherent in taboo into the possession of some attribute likely to produce temptation or encourage imitation. This does not appear to tally with the fact that the contagious character of taboo is shown chiefly by its transmissibility on to material objects, which then themselves become carriers of taboo.

I will now sum up the respects in which light has been thrown on the nature of taboo by comparing it with the obsessional prohibitions of neurotics. Taboo is a primaeval prohibition forcibly imposed (by some authority) from outside, and directed against the most powerful longings to which human beings are subject. The desire to violate it persists in their unconscious; those who obey the taboo have an ambivalent attitude to what the taboo prohibits. The magical power that is attributed to taboo is based on the capacity for arousing temptation; and it acts like a contagion because examples are contagious and because the prohibited desire in the unconscious shifts from one thing to another. The fact that the violation of a taboo can be atoned for by a renunciation shows that renunciation lies at the basis of obedience to taboo.
There is also another path open to us. We can start an inquiry as to whether some of the hypotheses which we have carried over from neuroses to taboo or some of the results to which that procedure has led us may not be directly verifiable in the phenomena of taboo. But we must decide what we are to look for. Our assertion that taboo originated in a primaeval prohibition imposed at one time or other by some external authority is obviously incapable of demonstration. What we shall rather endeavour to confirm, therefore, are the psychological determinants of taboo, which we have learnt to know from obsessional neurosis. How did we arrive at our knowledge of these psychological factors in the case of the neurosis? Through the analytical study of its symptoms, and particularly of obsessional acts, defensive measures and obsessional commands. We found that they showed every sign of being derived from ambivalent impulses, either corresponding simultaneously to both a wish and a counter-wish or operating predominantly on behalf of one of the two opposing trends. If, now, we could succeed in demonstrating that ambivalence, that is, the dominance of opposing trends, is also to be found in the observances of taboo, or if we could point to some of them which, like obsessional acts, give simultaneous expression to both currents, we should have established the psychological agreement between taboo and obsessional neurosis in what is perhaps their most important feature.

The two fundamental prohibitions of taboo are, as I have already remarked, inaccessible to our analysis owing to their connection with totemism; while certain others of its injunctions are of a secondary nature and consequently useless for our purpose. For taboo has become the ordinary method of legislation in the communities affected by it and it has come to serve social purposes which are certainly more recent than taboo itself: such, for instance, are the taboos imposed by chiefs and priests for the protection of their own property and privileges. There nevertheless remain a large group of observances on which our investigation can be made. From these I shall select the taboos attaching (a) to enemies, (b) to chiefs and (c) to the dead; and I shall take the material for our examination from the excellent collection included by Frazer in *Taboo and the Perils of the Soul* (1911b), the second part of his great work *The Golden Bough*.

In the accepted explanation of all these observances of appeasement, restriction, expiation and purification, two principles are combined: the extension of the taboo from the slain man on to everything that has come in contact with him, and the fear of the slain man's ghost. How these two factors are to be combined with each other to explain the ceremonials, whether they are to be regarded as of equal weight, whether one is primary and the other secondary, and if so which - none of these questions receives an answer, and indeed it would be hard to find one. We, on the other hand, can lay stress on the unity of our view, which derives all of these observances from emotional ambivalence towards the enemy.
The attitude of primitive peoples to their chiefs, kings and priests is governed by two basic principles which seem to be complementary rather than contradictory. A ruler 'must not only be guarded, he must also be guarded against'. (Frazer, 1911b, 132.) Both of these ends are secured by innumerable taboo observances. We know already why it is that rulers must be guarded against. It is because they are vehicles of the mysterious and dangerous magical power which is transmitted by contact like an electric charge and which brings death and ruin to anyone who is not protected by a similar charge. Any immediate or indirect contact with this dangerous sacred entity is therefore avoided; and, if it cannot be avoided, some ceremonial is devised to avert the dreaded consequences. The Nubas of East Africa, for instance, 'believe that they would die if they entered the house of their priestly king; however they can evade the penalty of their intrusion by baring the left shoulder and getting the king to lay his hand on it'. Here we are met by the remarkable fact that contact with the king is a remedy and protection against the dangers provoked by contact with the king. No doubt, however, there is a contrast to be drawn between the remedial power of a touch made deliberately by the king and the danger which arises if he is touched - a contrast between a passive and an active relation to the king. [1912-1913, 2688]

Our space will not allow nor does our interest require us to enter further into a description of the taboos associated with the dignity of kings and priests. I will only add that the principal part is played in them by restrictions upon freedom of movement and upon diet. Two examples of taboo ceremonials occurring in civilized communities of a far higher level of culture will serve to show, however, what a conservative effect upon ancient usages is exercised by contact with these privileged personages. [1912-1913, 2691]
So far so good; but the technique of psycho-analysis allows us to go into the question further and to enter more into the details of these various impulses. If we submit the recorded facts to analysis, as though they formed part of the symptoms presented by a neurosis, our starting-point must be the excessive apprehensiveness and solicitude which is put forward as the reason for the taboo ceremonials. The occurrence of excessive solicitude of this kind is very common in neuroses, and especially in obsessional neuroses, with which our comparison is chiefly drawn. We have come to understand its origin quite clearly. It appears wherever, in addition to a predominant feeling of affection, there is also a contrary, but unconscious, current of hostility - a state of affairs which represents a typical instance of an ambivalent emotional attitude. The hostility is then shouted down, as it were, by an excessive intensification of the affection, which is expressed as solicitude and becomes compulsive, because it might otherwise be inadequate to perform its task of keeping the unconscious contrary current of feeling under repression. Every psycho-analyst knows from experience with what certainty this explanation of solicitous over-affection is found to apply even in the most unlikely circumstances - in cases, for instance, of attachments between a mother and child or between a devoted married couple. If we now apply this to the case of privileged persons, we shall realize that alongside the veneration, and indeed idolization, felt towards them, there is in the unconscious an opposing current of intense hostility; that, in fact, as we expected, we are faced by a situation of emotional ambivalence. The distrust which provides one of the unmistakable elements in kingly taboos would thus be another, more direct, expression of the same unconscious hostility. Indeed, owing to the variety of outcomes of a conflict of this kind which are reached among different peoples, we are not at a loss for examples in which the existence of this hostility is still more obviously shown. 'The savage Timmes of Sierra Leone', we learn from Frazer, 'who elect their king, reserve to themselves the right of beating him on the eve of his coronation; and they avail themselves of this constitutional privilege with such hearty goodwill that sometimes the unhappy monarch does not long survive his elevation to the throne. Hence when the leading chiefs have a spite at a man and wish to rid themselves of him, they elect him king.' Even in glaring instances like this, however, the hostility is not admitted as such, but masquerades as a ceremonial.

But the strongest support for our effort to equate taboo prohibitions with neurotic symptoms is to be found in the taboo ceremonials themselves, the effect of which upon the position of royalty has already been discussed. These ceremonials unmistakably reveal their double meaning and their derivation from ambivalent impulses, as soon as we are ready to allow that the results which they bring about were intended from the first. The taboo does not only pick out the king and exalt him above all common mortals, it also makes his existence a torment and an intolerable burden and reduces him to a bondage far worse than that of his subjects. Here, then, we have an exact counterpart of the obsessional act in the neurosis, in which the suppressed impulse and the impulse that suppresses it find simultaneous and common satisfaction. The obsessional act is ostensibly a protection against the prohibited act; but actually, in our view, it is a repetition of it. The 'ostensibly' applies to the conscious part of the mind, and the 'actually' to the unconscious part. In exactly the same way, the ceremonial taboo of kings is ostensibly the highest honour and protection for them, while actually it is a punishment for their exaltation, a revenge taken on them by their subjects. The experiences of Sancho Panza (as described by Cervantes) when he was Governor of his island convinced him that this view of court ceremonial was the only one that met the case. If we could hear the views of modern kings and rulers on the subject, we might find that there were many others who agreed with him.

The taboo upon the dead is - if I may revert to the simile of infection - especially virulent among most primitive peoples. It is manifested, in the first instance, in the consequences that follow contact with the dead and in the treatment of mourners.
The taboo observances after bodily contact with the dead are the same over the whole of Polynesia, Melanesia and a part of Africa. Their most regular feature is the prohibition against those who have had such contact touching food themselves, and the consequent necessity for their being fed by other people. It is a remarkable fact that in Polynesia (though the report may perhaps refer only to Hawaii) priestly kings were subject to the same restriction while performing their sacred functions.¹ The case of the taboo upon the dead in Tonga offers a specially clear instance of the way in which the degree of prohibition varies according to the taboo power of the person upon whom the taboo is imposed. Thus anyone who touches a dead chief is unclean for ten months; but if he himself is a chief he is only tabooed for three, four, or five months according to the rank of the dead man; but if the dead man were the 'great divine chief', even the greatest chief would be tabooed for ten months. These savages believe firmly that anyone who violates the taboo ordinances is bound to fall ill and die; indeed they believe it so firmly that, in the opinion of an observer, 'no native ever made an experiment to prove the contrary'.²

Essentially the same prohibitions (though from our point of view they are more interesting) apply to those who have been in contact with the dead only in a metaphorical sense: the dead person's mourning relations, widowers and widows. The observances that we have so far mentioned may seem merely to give characteristic expression to the virulence of the taboo and its contagious power. But those which now follow give us a hint at the reasons for the taboo - both the ostensible ones and what we must regard as the deep-lying real ones.

'Among the Agutainos, who inhabit Palawan, one of the Philippine Islands, a widow may not leave her hut for seven or eight days after the death; and even then she may only go out at an hour when she is not likely to meet anybody, for whoever looks upon her dies a sudden death. To prevent this fatal catastrophe, the widow knocks with a wooden peg on the trees as she goes along, thus warning people of her dangerous proximity; and the very trees on which she knocks soon die.' The nature of the danger feared from a widow such as this is made plain by another example. 'In the Mekeo district of British New Guinea a widower loses all his civil rights and becomes a social outcast, an object of fear and horror, shunned by all. He may not cultivate a garden, nor show himself in public, nor walk on the roads and paths. Like a wild beast he must skulk in the long grass and the bushes; and if he sees or hears anyone coming, especially a woman, he must hide behind a tree or a thicket.' This last hint makes it easy to trace the origin of the dangerous character of widowers or widows to the danger of temptation. A man who has lost his wife must resist a desire to find a substitute for her; a widow must fight against the same wish and is moreover liable, being without a lord and master, to arouse the desires of other men. Substitutive satisfactions of such a kind run counter to the sense of mourning and they would inevitably kindle the ghost's wrath.³

One of the most puzzling, but at the same time instructive usages in connection with mourning is the prohibition against uttering the name of the dead person. This custom is extremely widespread, it is expressed in a variety of ways and has had important consequences. It is found not only among the Australians and Polynesians (who usually show us taboo observances in the best state of preservation), but also among 'peoples so widely separated from each other as the Samoyeds of Siberia and the Todas of southern India; the Mongols of Tartary and the Tuaregs of the Sahara; the Ainós of Japan and the Akamba and Nandi of central Africa; the Tinguianes of the Philippines and the inhabitants of the Nicobar Islands, of Borneo, of Madagascar, and of Tasmania.' (Frazer, 1911b, 353.) In some of these cases the prohibition and its consequences last only during the period of mourning, in others they are permanent; but it seems invariably to diminish in strictness with the passage of time.
This taboo upon names will seem less puzzling if we bear in mind the fact that savages regard a name as an essential part of a man's personality and as an important possession: they treat words in every sense as things. As I have pointed out elsewhere, our own children do the same. They are never ready to accept a similarity between two words as having no meaning; they consistently assume that if two things are called by similar-sounding names this must imply the existence of some deep-lying point of agreement between them. Even a civilized adult may be able to infer from certain peculiarities in his own behaviour that he is not so far removed as he may have thought from attributing importance to proper names, and that his own name has become to a very remarkable extent bound up with his personality. So, too, psycho-analytic practice comes upon frequent confirmations of this in the evidence it finds of the importance of names in unconscious mental activities.¹

We shall no longer feel surprised, therefore, at savages regarding the name of a dead person as a portion of his personality and making it subject to the relevant taboo. So, too, uttering the name of a dead person is clearly a derivative of having contact with him. We may therefore turn to the wider problem of why such contact is submitted to so strict a taboo.

The most obvious explanation would point to horror roused by dead bodies and by the changes which quickly become visible in them. Some part must also be played in the matter by mourning for the dead person, since it must be a motive force in everything relating to him. But horror at the corpse clearly does not account for all the details of the taboo observances, and mourning cannot explain why the uttering of the dead man's name is an insult to his survivors. Mourning, on the contrary, tends to be preoccupied with the dead man, to dwell upon his memory and to preserve it as long as possible. Something other than mourning must be held responsible for the peculiarities of the taboo usages, something which has very different purposes in view. It is precisely the taboo upon names that gives us the clue to this unknown motive; and if the usages alone did not tell us, we should learn it from what the mourning savages say to us themselves.

For they make no disguise of the fact that they are afraid of the presence or of the return of the dead person's ghost; and they perform a great number of ceremonies to keep him at a distance or drive him off.¹ They feel that to utter his name is equivalent to invoking him and will quickly be followed by his presence.² And accordingly they do everything they can to avoid any such evocation. They disguise themselves so that the ghost shall not recognize them,³ or they change his name or their own; they are furious with reckless strangers who by uttering the ghost's name incite him against the survivors. It is impossible to escape the conclusion that, in the words of Wundt (1906, 49), they are victims to a fear of 'the dead man's soul which has become a demon'. Here, then, we seem to have found a confirmation of Wundt's view, which, as we have already seen (p. 2672), considers that the essence of taboo is a fear of demons. [1912-1913, 2701]
This theory is based on a supposition so extraordinary that it seems at first sight incredible: the supposition, namely, that a dearly loved relative at the moment of his death changes into a demon, from whom his survivors can expect nothing but hostility and against whose evil desires they must protect themselves by every possible means. Nevertheless, almost all the authorities are at one in attributing these views to primitive peoples. Westermarck, who, in my opinion, takes far too little notice of taboo in his book on *The Origin and Development of the Moral Ideas*, actually writes in his chapter on 'Regard for the Dead': 'Generally speaking, my collection of facts has led me to the conclusion that the dead are more commonly regarded as enemies than friends, and that Professor Jevons and Mr. Grant Allen are mistaken in their assertion that, according to early beliefs, the malevolence of the dead is for the most part directed against strangers only, whereas they exercise a fatherly care over the lives and fortunes of their descendants and fellow clansmen.'¹

We have now discovered a motive which can explain the idea that the souls of those who have just died are transformed into demons and the necessity felt by survivors to protect themselves by taboos against their hostility. Let us suppose that the emotional life of primitive peoples is characterized by an amount of ambivalence as great as that which we are led by the findings of psycho-analysis to attribute to obsessional patients. It then becomes easy to understand how after a painful bereavement savages should be obliged to produce a reaction against the hostility latent in their unconscious similar to that expressed as obsessive self-reproach in the case of neurotics. But this hostility, distressingly felt in the unconscious as satisfaction over the death, is differently dealt with among primitive peoples. The defence against it takes the form of displacing it on to the object of the hostility, on to the dead themselves. This defensive procedure, which is a common one both in normal and in pathological mental life, is known as a 'projection'. The survivor thus denies that he has ever harboured any hostile feelings against the dead loved one; the soul of the dead harbours them instead and seeks to put them into action during the whole period of mourning. In spite of the successful defence which the survivor achieves by means of projection, his emotional reaction shows the characteristics of punishment and remorse, for he is the subject of fears and submits to renunciations and restrictions, though these are in part disguised as measures of protection against the hostile demon. Once again, therefore, we find that the taboo has grown up on the basis of an ambivalent emotional attitude. The taboo upon the dead arises, like the others, from the contrast between conscious pain and unconscious satisfaction over the death that has occurred. Since such is the origin of the ghost's resentment, it follows naturally that the survivors who have the most to fear will be those who were formerly its nearest and dearest.

In this respect taboo observances, like neurotic symptoms, have a double sense. On the one hand, in their restrictive character, they are expressions of mourning; but on the other hand they clearly betray - what they seek to conceal - hostility against the dead disguised as self-defence. We have already learned that certain taboos arise out of fear of temptation. The fact that a dead man is helpless is bound to act as an encouragement to the survivor to give free rein to his hostile passions, and that temptation must be countered by a prohibition.

At the beginning of this essay disagreement was expressed with Wundt's opinion that the essence of taboo was a fear of demons. Yet we have now assented to an explanation that derives the taboo upon the dead from a fear of the soul of the dead person transformed into a demon. The apparent contradiction can easily be resolved. It is true that we have accepted the presence of demons, but not as something ultimate and psychologically unanalyzable. We have succeeded, as it were, in getting behind the demons, for we have explained them as projections of hostile feelings harboured by the survivors against the dead.
Having thus explained the basis of the exceedingly instructive taboo upon the dead, we must not omit to add a few remarks that may help to increase our understanding of taboo in general.

If we follow the changing relations between survivors and the dead through the course of ages, it becomes obvious that there has been an extraordinary diminution in ambivalence. It is now quite easy to keep down the unconscious hostility to the dead (though its existence can still be traced) without any particular expenditure of psychical energy. Where, in earlier times, satisfied hatred and pained affection fought each other, we now find that a kind of scar has been formed in the shape of piety, which declares ‘de mortuis nil nisi bonum’. It is only neurotics whose mourning for the loss of those dear to them is still troubled by obsessive self-reproaches - the secret of which is revealed by psycho-analysis as the old emotional ambivalence. We need not discuss here how this alteration came about or how much share in it is due to a constitutional modification and how much to a real improvement in family relations. But this example suggests the probability that the psychical impulses of primitive peoples were characterized by a higher amount of ambivalence than is to be found in modern civilized man. It is to be supposed that as this ambivalence diminished, taboo (a symptom of the ambivalence and a compromise between two conflicting impulses) slowly disappeared Neurotics, who are obliged to reproduce the struggle and the taboo resulting from it, may be said to have inherited an archaic constitution as an atavistic vestige; the need to compensate for this at the behest of civilization is what drives them to their immense expenditure of mental energy.

Our discussions, on the contrary, lead us to the simple conclusion that the word ‘taboo’ had a double meaning from the very first and that it was used to designate a particular kind of ambivalence and whatever arose from it. ‘Taboo’ is itself an ambivalent word; and one feels on looking back that the well-attested meaning of the word should alone have made it possible to infer - what has actually been arrived at as a result of extensive researches - that the prohibitions of taboo are to be understood as consequences of an emotional ambivalence. Study of the earliest languages has taught us that there were once many such words, which expressed contrary ideas and in a sense (though not in quite the same sense as the word ‘taboo’) were ambivalent.¹ Slight modifications in the pronunciation of the antithetical ‘primal word’ made it possible subsequently to give separate verbal expression to the two contrary ideas which were originally combined in it.

The word ‘taboo’ met with a different fate. As the importance of the ambivalence denoted by it diminished, the word itself, or rather the words analogous to it, fell out of use. I hope to be able, in a later connection, to make it probable that a definite historical chain of events is concealed behind the fate of this concept: that the word was at first attached to certain quite specific human relations which were characterized by great emotional ambivalence, and that its use then spread on to other analogous relations.

If I am not mistaken, the explanation of taboo also throws light on the nature and origin of conscience. It is possible, without any stretching of the sense of the terms, to speak of a taboo conscience or, after a taboo has been violated, of a taboo sense of guilt. Taboo conscience is probably the earliest form in which the phenomenon of conscience is met with.
Conscience is the internal perception of the rejection of a particular wish operating within us. The stress, however, is upon the fact that this rejection has no need to appeal to anything else for support, that it is quite ‘certain of itself’. This is even clearer in the case of consciousness of guilt - the perception of the internal condemnation of an act by which we have carried out a particular wish. To put forward any reason for this would seem superfluous: anyone who has a conscience must feel within him the justification for the condemnation, must feel the self-reproach for the act that has been carried out. This same characteristic is to be seen in the savage's attitude towards taboo. It is a command issued by conscience; any violation of it produces a fearful sense of guilt which follows as a matter of course and of which the origin is unknown.¹

¹ The sense of guilt in the case of taboos is not in the least diminished if the violation occurs unwittingly. (Cf. the instances above.) An interesting parallel is found in Greek mythology: the guilt of Oedipus was not palliated by the fact that he incurred it without his knowledge and even against his intention.

Since taboos are mainly expressed in prohibitions, the underlying presence of a positive current of desire may occur to us as something quite obvious and calling for no lengthy proofs based on the analogy of the neuroses. For, after all, there is no need to prohibit something that no one desires to do, and a thing that is forbidden with the greatest emphasis must be a thing that is desired. If we were to apply this plausible thesis to our primitive peoples, we should be led to the conclusion that some of their strongest temptations were to kill their kings and priests, to commit incest, to maltreat the dead, and so on - which seems scarcely probable. And we should be met with the most positive contradiction if we were to apply the same thesis to instances in which we ourselves seem most clearly to hear the voice of conscience. We should maintain with the most absolute certainty that we feel not the slightest temptation to violate any of these prohibitions - the commandment to 'do no murder', for instance - and that we feel nothing but horror at the notion of violating them.

If, however, we were to admit the claims thus asserted by our conscience, it would follow, on the one hand, that these prohibitions would be superfluous - both taboo and our own moral prohibitions - and, on the other hand, the fact of conscience would remain unexplained and no place would be left for the relations between conscience, taboo and neurosis. In other words, we should be back in the state of knowledge we were in before we approached the problem from the psycho-analytic angle.

Suppose, on the other hand, that we were to take into account the finding arrived at by psycho-analysis from the dreams of normal people, to the effect that we ourselves are subject, more strongly and more often than we suspect, to a temptation to kill someone and that that temptation produces psychical effects even though it remains out of sight of our consciousness. Suppose, again, that we were to recognize the compulsive observances of certain neurotics as being guarantees against an intensified impulse to murder or as being self-punishments on account of it. In that case we should have to attach still greater importance to our thesis that where there is a prohibition there must be an underlying desire. We should have to suppose that the desire to murder is actually present in the unconscious and that neither taboos nor moral prohibitions are psychologically superfluous but that on the contrary they are explained and justified by the existence of an ambivalent attitude towards the impulse to murder.
Before I conclude this discussion, a further point must not be overlooked which will pave the way for later inquiries. In maintaining the essential similarity between taboo prohibitions and moral prohibitions, I have not sought to dispute the fact that there must be a psychological difference between them. The only possible reason why the prohibitions no longer take the form of taboos must be some change in the circumstances governing the ambivalence underlying them.

[1912-1913, 2715]

In our analytical examination of the problems of taboo we have hitherto allowed ourselves to be led by the points of agreement that we have been able to show between it and obsessional neurosis. But after all taboo is not a neurosis but a social institution. We are therefore faced with the task of explaining what difference there is in principle between a neurosis and a cultural creation such as taboo.

[1912-1913, 2715]

Once again I will take a single fact as my starting-point. It is feared among primitive peoples that the violation of a taboo will be followed by a punishment, as a rule by some serious illness or by death. The punishment threatens to fall on whoever was responsible for violating the taboo. In obsessional neuroses the case is different. What the patient fears if he performs some forbidden action is that a punishment will fall not on himself but on someone else. This person's identity is as a rule left unstated, but can usually be shown without difficulty by analysis to be one of those closest and most dear to the patient. Here, then, the neurotic seems to be behaving altruistically and the primitive man egoistically. Only if the violation of a taboo is not automatically avenged upon the wrong-doer does a collective feeling arise among savages that they are all threatened by the outrage; and they thereupon hasten to carry out the omitted punishment themselves. There is no difficulty in explaining the mechanism of this solidarity. What is in question is fear of an infectious example, of the temptation to imitate - that is, of the contagious character of taboo. If one person succeeds in gratifying the repressed desire, the same desire is bound to be kindled in all the other members of the community. In order to keep the temptation down, the envied transgressor must be deprived of the fruit of his enterprise; and the punishment will not infrequently give those who carry it out an opportunity of committing the same outrage under color of an act of expiation. This is indeed one of the foundations of the human penal system and it is based, no doubt correctly, on the assumption that the prohibited impulses are present alike in the criminal and in the avenging community. In this, psycho-analysis is no more than confirming the habitual pronouncement of the pious: we are all miserable sinners.

[1912-1913, 2715]

I do not propose to linger over the origin of these social impulses and their relation to the other basic human instincts but shall proceed to illustrate the second main characteristic of the neurosis by means of another example. In the forms which it assumes, taboo very closely resembles the neurotic's fear of touching, his 'touching phobia'. Now, in the case of the neurosis the prohibition invariably relates to touching of a sexual kind, and psycho-analysis has shown that it is in general true that the instinctual forces that are diverted and displaced in neuroses have a sexual origin. In the case of taboo the prohibited touching is obviously not to be understood in an exclusively sexual sense but in the more general sense of attacking, of getting control, and of asserting oneself. If there is a prohibition against touching a chief or anything that has been in contact with him, this means that an inhibition is to be laid on the same impulse which expresses itself on other occasions in keeping a suspicious watch upon the chief or even in ill-treating him physically before his coronation. (See above.) Thus the fact which is characteristic of the neurosis is the preponderance of the sexual over the social instinctual elements. The social instincts, however, are themselves derived from a combination of egoistic and erotic components into wholes of a special kind.

[1912-1913, 2716]
This single comparison between taboo and obsessional neurosis is enough to enable us to gather the nature of the relation between the different forms of neurosis and cultural institutions, and to see how it is that the study of the psychology of the neuroses is important for an understanding of the growth of civilization.

[1912-1913, 2717]

Thus man's first theoretical achievement - the creation of spirits - seems to have arisen from the same source as the first moral restrictions to which he was subjected - the observances of taboo. The fact that they had the same origin need not imply, however, that they arose simultaneously. If the survivors' position in relation to the dead was really what first caused primitive man to reflect, and compelled him to hand over some of his omnipotence to the spirits and to sacrifice some of his freedom of action, then these cultural products would constitute a first acknowledgement of Ανάγκη [Necessity], which opposes human narcissism. Primitive man would thus be submitting to the supremacy of death with the same gesture with which he seemed to be denying it.

[1912-1913, 2735]

The countless taboo regulations to which the women in savage communities are subject during menstruation are said to be due to a superstitious horror of blood, and this is no doubt in fact one of their determinants. But it would be wrong to overlook the possibility that in this case the horror of blood also serves aesthetic and hygienic purposes, which are obliged in every case to cloak themselves behind magical motives.

[1912-1913, 2740]

One further group of taboo observances, which have not hitherto been accounted for, deserve mention, since they admit of an explanation which is familiar to psycho-analysts. Among many savage peoples there is a prohibition against keeping sharp weapons or cutting instruments in a house. Frazer (1911b, 238) quotes a German superstition to the effect that a knife should not be left edge upwards, for fear that God and the angels might be injured on it. May we not recognize in this taboo a premonitory warning against possible 'symptomatic acts' in the execution of which a sharp weapon might be employed by unconscious evil impulses?

[1912-1913, 2740]

This final extension of the commandment is no longer experienced by civilized man. When the furious struggle of the present war has been decided, each one of the victorious fighters will return home joyfully to his wife and children, unchecked and undisturbed by thoughts of the enemies he has killed whether at close quarters or at long range. It is worthy of note that the primitive races which still survive in the world, and are undoubtedly closer than we are to primaeval man, act differently in this respect, or did until they came under the influence of our civilization. Savages - Australians, Bushmen, Tierra del Fuegans - are far from being remorseless murderers; when they return victorious from the war-path they may not set foot in their villages or touch their wives till they have atoned for the murders they committed in war by penances which are often long and tedious. It is easy, of course, to attribute this to their superstition: the savage still goes in fear of the avenging spirits of the slain. But the spirits of his slain enemy are nothing but the expression of his bad conscience about his blood-guilt; behind this superstition there lies concealed a vein of ethical sensitiveness which has been lost by us civilized men.¹

[1915b, 3087]
Naturally this does not answer all the questions that we might ask in connection with this case. On the contrary, the case bristles with further problems-some that have in general not yet become soluble and others which could not be solved owing to the particular circumstances being unfavourable. For instance, why did this lady who was happily married fall in love with her son-in-law? and why did the relief, which might have been possible in other ways, take the form of this mirror-image this projection of her state on to her husband? You must no: think it is otiose or frivolous to raise such questions. We already have some material at our disposal which might possibly serve to answer them. The lady was at a critical age, at which sexual needs in women suffer a sudden and undesired increase; that alone might account for the event. Or it may further have been that her excellent and faithful husband had for some years no longer enjoyed the sexual capacity which the well-preserved woman required for her satisfaction. Experience has shown us that it is precisely men in this position, whose faithfulness can consequently be taken for granted, who are distinguished by treating their wives with unusual tenderness, and by showing particular forbearance for their nervous troubles. Or, again, it may not be without significance that the object of this pathogenic love was precisely the young husband of one of her daughters. A powerful erotic tie with a daughter, which goes back in the last resort to the mother's sexual constitution, often finds a way of persisting in a transformation of this sort. In this connection I may perhaps remind you that the relation between mother-in-law and son-in-law has been regarded from the earliest times of the human race as a particularly awkward one and that among primitive people it has given rise to very powerful taboo regulations and 'avoidances'. The relation is frequently excessive by civilized standards both in a positive and negative direction. Which of these three factors became operative in our case, or whether two of them or perhaps all three came together, I cannot, it is true, tell you; but that is only because I was not permitted to continue the analysis of the case for more than two sessions.

[1916-1917, 3335]

For this purpose we must return for a moment to the scientific myth of the father of the primal horde. He was later on exalted into the creator of the world, and with justice, for he had produced all the sons who composed the first group. He was the ideal of each one of them, at once feared and honoured, a fact which led later to the idea of taboo. These many individuals eventually banded themselves together, killed him and cut him in pieces. None of the group of victors could take his place, or, if one of them did, the battles began afresh, until they understood that they must all renounce their father's heritage. They then formed the totemic community of brothers, all with equal rights and united by the totem prohibitions which were to preserve and to expiate the memory of the murder. But the dissatisfaction with what had been achieved still remained, and it became the source of new developments. The persons who were united in this group of brothers gradually came towards a revival of the old state of things at a new level. The male became once more the chief of a family, and broke down the prerogatives of the gynaecocracy which had become established during the fatherless period. As a compensation for this he may at that time have acknowledged the mother deities, whose priests were castrated for the mother's protection, after the example that had been given by the father of the primal horde. And yet the new family was only a shadow of the old one; there were numbers of fathers and each one was limited by the rights of the others.

[1921c, 3826]
¹ The organic periodicity of the sexual process has persisted, it is true, but its effect on psychical sexual excitation has rather been reversed. This change seems most likely to be connected with the diminution of the olfactory stimuli by means of which the menstrual process produced an effect on the male psyche. Their role was taken over by visual excitations, which, in contrast to the intermittent olfactory stimuli, were able to maintain a permanent effect. The taboo on menstruation is derived from this 'organic repression', as a defence against a phase of development that has been surmounted. All other motives are probably of a secondary nature. (Cf. C. D. Daly, 1927.) This process is repeated on another level when the gods of a superseded period of civilization turn into demons. The diminution of the olfactory stimuli seems itself to be a consequence of man's raising himself from the ground, of his assumption of an upright gait; this made his genitals, which were previously concealed, visible and in need of protection, and so provoked feelings of shame in him. [1930a, 4495]
We should certainly not expect that the sexual life of these poor naked cannibals would be moral in our sense or that their sexual instincts would be subjected to any great degree of restriction. Yet we find that they set before themselves with the most scrupulous care and the most painful severity the aim of avoiding incestuous sexual relations. Indeed, their whole social organization seems to serve that purpose or to have been brought into relation with its attainment.

[1912-1913, 2651]

And now we come at last to the characteristic of the totemic system which has attracted the interest of psycho-analysts. In almost every place where we find totems we also find a law against persons of the same totem having sexual relations with one another and consequently against their marrying. This, then, is 'exogamy', an institution related to totemism.

[1912-1913, 2653]

Strictly enforced as it is, this prohibition is a remarkable one. There is nothing in the concept or attributes of the totem which I have so far mentioned to lead us to anticipate it; so that it is hard to understand how it has become involved in the totemic system. We cannot, therefore, feel surprised that some investigators actually suppose that exogamy had originally - in the earliest times and in its true meaning - nothing to do with totemism, but became attached to it (without there being any underlying connection) at some time when marriage restrictions became necessary. However this may be, the bond between totemism and exogamy exists and is clearly a very firm one.

[1912-1913, 2653]

Atkinson (1903) seems to have been the first to realize that the practical consequence of the conditions obtaining in Darwin's primal horde must be exogamy for the young males. Each of them might, after being driven out, establish a similar horde, in which the same prohibition upon sexual intercourse would rule owing to its leader's jealousy. In course of time this would produce what grew into a conscious law: 'No sexual relations between those who share a common home.' After the establishment of totemism this regulation would assume another form and would run: 'No sexual relations within the totem.'

[1912-1913, 2766]

This and very much else of a similar nature will be shown to you by the direct observation of children and by the consideration of clearly retained memories from childhood uninfluenced by analysis. From this you will conclude among other things that the position of a child in the family order is a factor of extreme importance in determining the shape of his later life and should deserve consideration in every life-history. But, what is more important, in view of this information which can be so easily obtained, you will not be able to recall without a smile the pronouncements of science in explanation of the prohibition of incest. There is no end to what has been invented on the subject. It has been said that sexual inclination is diverted from members of the same family who are of the opposite sex by the fact of having lived together from childhood; or, again, that a biological purpose of avoiding inbreeding is represented psychically by an innate horror of incest. In all this the fact is entirely overlooked that such an inexorable prohibition of it in law and custom would not be needed if there were any reliable natural barriers against the temptation to incest. The truth is just the opposite. A human being's first choice of an object is regularly an incestuous one, aimed, in the case of the male, at his mother and sister; and it calls for the severest prohibitions to deter this persistent infantile tendency from realization. Among the primitive races still living to-day, among savages, the prohibitions against incest are even very much stricter than among ourselves, and Theodor Reik has only recently shown in a brilliant work that the puberty rites of savages, which represent a re-birth, have the sense of releasing the boy from his incestuous bond with his mother and of reconciling him with his father.

[1916-1917, 3400]
Mother-incest was one of the crimes of Oedipus, parricide was the other. It may be remarked in passing that they are also the two great crimes proscribed by totemism, the first socio-religious institution of mankind.

[1916-1917, 3401]

There are abundant indications that being in love only made its appearance late on in the sexual relations between men and women; so that the opposition between sexual love and group ties is also a late development. Now it may seem as though this assumption were incompatible with our myth of the primal family. For it was after all by their love for their mothers and sisters that the mob of brothers was, as we have supposed, driven to parricide; and it is difficult to imagine this love as being anything but undivided and primitive - that is, as an intimate union of the affectionate and sensual. But further consideration resolves this objection to our theory into a confirmation of it. One of the reactions to the parricide was after all the institution of totemic exogamy, the prohibition of any sexual relation with those women of the family who had been tenderly loved since childhood. In this way a wedge was driven in between a man's affectionate and sensual feelings, one still firmly fixed in his erotic life to-day.¹ As a result of this exogamy the sensual needs of men had to be satisfied with strange and unloved women.

[1921c, 3831]

The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phyllogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the praeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1923a, 3929]
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.
This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]

For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a 'frustration', the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

[1927c, 4422]
With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the ‘fraternal alliance’. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.
This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

[1939a, 4938]

Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

[1939a, 4940]
In 1912 I attempted, in my Totem and Taboo, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.
[1939a, 4948]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tut comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlistting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]

I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain that society will reward this renunciation by offering me one of the permitted methods - even after a certain amount of postponement? What these jokes whisper may be said aloud: that the wishes and desires of men have a right to make themselves acceptable alongside of exacting and ruthless morality. And in our days it has been said in forceful and stirring sentences that this morality is only a selfish regulation laid down by the few who are rich and powerful and who can satisfy their wishes at any time without any postponement. So long as the art of healing has not gone further in making our life safe and so long as social arrangements do no more to make it more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the demands of morality. Every honest man will end by making this admission, at least to himself. The decision in this conflict can only be reached by the roundabout path of fresh insight. One must bind one's own life to that of others so closely and be able to identify oneself with others so intimately that the brevity of one's own life can be overcome; and one must not fulfil the demands of one's own needs illegitimately, but must leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to change the order of society. But not every personal need can be postponed in this way and transferred to other people, and there is no general and final solution of the conflict.

[1905c, 1704]

A similar application of its points of view, its hypotheses and its findings has enabled psycho-analysis to throw light on the origins of our great cultural institutions - on religion, morality, justice and philosophy.² By examining the primitive psychological situations which were able to provide the motive for creations of this kind, it has been in a position to reject certain attempts at an explanation that were based on too superficial a psychology and to replace them by a more penetrating insight.

[1913], 2821
In the four essays with the title *Totem and Taboo* I have made an attempt to deal with the problems of social anthropology in the light of analysis; this line of investigation leads direct to the origins of the most important institutions of our civilization, of the structure of the state, of morality and religion, and, moreover, of the prohibition against incest and of conscience. It is no doubt too early to decide how far the conclusions thus reached will be able to withstand criticism.

[1914d, 2903]

There can be no doubt that the Oedipus complex may be looked upon as one of the most important sources of the sense of guilt by which neurotics are so often tormented. But more than this: in a study of the beginnings of human religion and morality which I published in 1913 under the title of *Totem and Taboo* I put forward a suggestion that mankind as a whole may have acquired its sense of guilt, the ultimate source of religion and morality, at the beginning of its history, in connection with the Oedipus complex. I should be very glad to tell you more about this, but I had better leave it on one side. Once one has begun on that topic it is hard to break off; and we must go back to individual psychology.

[1916-1917, 3399]

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

[1919g, 3705]

In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organization, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers.¹ To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times - a 'Just-So Story', as it was amusingly called by a not unkind English critic; but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.

[1921c, 3814]
The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one’s own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1923a, 3929]

It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal.

[1923b, 3971]

Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

[1923b, 3971]
From the point of view of instinctual control, of morality, it may be said of the id that it is totally non-moral, of the ego that it strives to be moral, and of the super-ego that it can be super-moral and then become as cruel as only the id can be. It is remarkable that the more a man checks his aggressiveness towards the exterior the more severe - that is aggressive - he becomes in his ego ideal. The ordinary view sees the situation the other way round: the standard set up by the ego ideal seems to be the motive for the suppression of aggressiveness. The fact remains, however, as we have stated it: the more a man controls his aggressiveness, the more intense becomes his ideal's inclination to aggressiveness against his ego. It is like a displacement, a turning round upon his own ego. But even ordinary normal morality has a harshly restraining, cruelly prohibiting quality. It is from this, indeed, that the conception arises of a higher being who deals out punishment inexorably.

[1923b, 3988]

But since the ego's work of sublimation results in a defusion of the instincts and a liberation of the aggressive instincts in the super-ego, its struggle against the libido exposes it to the danger of maltreatment and death. In suffering under the attacks of the super-ego or perhaps even succumbing to them, the ego is meeting with a fate like that of the protista which are destroyed by the products of decomposition that they themselves have created. From the economic point of view the morality that functions in the super-ego seems to be a similar product of decomposition.

[1923b, 3990]

In this way the Oedipus complex proves to be - as has already been conjectured in a historical sense¹ - the source of our individual ethical sense, our morality. The course of childhood development leads to an ever-increasing detachment from parents, and their personal significance for the super-ego recedes into the background. To the imagos they leave behind there are then linked the influences of teachers and authorities, self-chosen models and publicly recognized heroes, whose figures need no longer be introjected by an ego which has become more resistant. The last figure in the series that began with the parents is the dark power of Destiny which only the fewest of us are able to look upon as impersonal. There is little to be said against the Dutch writer Multatuli² when he replaces the Μοία [Destiny] of the Greeks by the divine pair 'Λόγος χαί Αύαγχη [Reason and necessity]; but all who transfer the guidance of the world to Providence, to God, or to God and Nature, arouse a suspicion that they still look upon these ultimate and remotest powers as a parental couple, in a mythological sense, and believe themselves linked to them by libidinal ties. In The Ego and the Id I made an attempt to derive mankind's realistic fear of death, too, from the same parental view of fate. It seems very hard to free oneself from it.

[1924c, 4080]

After these preliminaries we can return to our consideration of moral masochism. We have said that, by their behaviour during treatment and in life, the individuals in question give an impression of being morally inhibited to an excessive degree, of being under the domination of an especially sensitive conscience, although they are not conscious of any of this ultra-morality. On closer inspection, we can see the difference there is between an unconscious extension of morality of this kind and moral masochism. In the former, the accent falls on the heightened sadism of the super-ego to which the ego submits; in the latter, it falls on the ego's own masochism which seeks punishment, whether from the super-ego or from the parental powers outside. We may be forgiven for having confused the two to begin with; for in both cases it is a question of a relationship between the ego and the super-ego (or powers that are equivalent to it), and in both cases what is involved is a need which is satisfied by punishment and suffering. It can hardly be an insignificant detail, then, that the sadism of the super-ego becomes for the most part glaringly conscious, whereas the masochistic trend of the ego remains as a rule concealed from the subject and has to be inferred from his behaviour.

[1924c, 4081]
The fact that moral masochism is unconscious leads us to an obvious clue. We were able to translate the expression 'unconscious sense of guilt' as meaning a need for punishment at the hands of a parental power. We now know that the wish, which so frequently appears in phantasies, to be beaten by the father stands very close to the other wish, to have a passive (feminine) sexual relation to him and is only a regressive distortion of it. If we insert this explanation into the content of moral masochism, its hidden meaning becomes clear to us. Conscience and morality have arisen through the overcoming, the desexualization, of the Oedipus complex; but through moral masochism morality becomes sexualized once more, the Oedipus complex is revived and the way is opened for a regression from morality to the Oedipus complex. This is to the advantage neither of morality nor of the person concerned. An individual may, it is true, have preserved the whole or some measure of ethical sense alongside of his masochism; but, alternatively, a large part of his conscience may have vanished into his masochism. Again, masochism creates a temptation to perform 'sinful' actions, which must then be expiated by the reproaches of the sadistic conscience (as is exemplified in so many Russian character-types) or by chastisement from the great parental power of Destiny. In order to provoke punishment from this last representative of the parents, the masochist must do what is inexpedient, must act against his own interests, must ruin the prospects which open out to him in the real world and must, perhaps, destroy his own real existence.

[1924c, 4081]

The turning back of sadism against the self regularly occurs where a cultural suppression of the instincts holds back a large part of the subject's destructive instinctual components from being exercised in life. We may suppose that this portion of the destructive instinct which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the super-ego, without any such transformation, and increases its sadism against the ego. The sadism of the super-ego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of an instinct can - frequently or quite generally - result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others. One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of instinct followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first instinctual renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of instinct.

[1924c, 4082]
And now, as a third point, psycho-analysis has shown us, to our growing astonishment, the enormously important part played by what is known as the 'Oedipus complex' - that is, the emotional relation of a child to its two parents - in the mental life of human beings. Our astonishment diminishes when we realize that the Oedipus complex is the psychical correlate of two fundamental biological facts: the long period of the human child's dependence, and the remarkable way in which its sexual life reaches a first climax in the third to fifth years of life, and then, after a period of inhibition, sets in again at puberty. And here, the discovery was made that a third and extremely serious part of human intellectual activity, the part which has created the great institutions of religion, law, ethics, and all forms of civic life, has as its fundamental aim the enabling of the individual to master his Oedipus complex and to divert his libido from its infantile attachments into the social ones that are ultimately desired. The applications of psycho-analysis to the science of religion and sociology (e. g. by the present writer, Theodor Reik and Oskar Pfister), which have led to these findings, are still young and insufficiently appreciated; but it cannot be doubted that further studies will only confirm the certainty of these important conclusions.

[1924f, 4117]

But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

[1925e, 4127]
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

The Oedipus complex, however, is such an important thing that the manner in which one enters and leaves it cannot be without its effects. In boys (as I have shown at length in the paper to which I have just referred and to which all of my present remarks are closely related) the complex is not simply repressed, it is literally smashed to pieces by the shock of threatened castration. Its libidinal cathexes are abandoned, desexualized and in part sublimated; its objects are incorporated into the ego, where they form the nucleus of the super-ego and give that new structure its characteristic qualities. In normal, or, it is better to say, in ideal cases, the Oedipus complex exists no longer, even in the unconscious; the super-ego has become its heir. Since the penis (to follow Ferenczi) owes its extraordinarily high narcissistic cathexis to its organic significance for the propagation of the species, the catastrophe to the Oedipus complex (the abandonment of incest and the institution of conscience and morality) may be regarded as a victory of the race over the individual. This is an interesting point of view when one considers that neurosis is based upon a struggle of the ego against the demands of the sexual function. But to leave the standpoint of individual psychology is not of any immediate help in clarifying this complicated situation.
I had already made attempts at earlier stages of my work to arrive at some more general points of view on the basis of psycho-analytic observation. In a short essay, 'Formulations on the Two Principles of Mental Functioning', I drew attention (and there was, of course, nothing original in this) to the domination of the pleasure-unpleasure principle in mental life and to its displacement by what is called the reality principle. Later on I made an attempt to produce a 'Metapsychology'. By this I meant a method of approach according to which every mental process is considered in relation to three co-ordinates, which I described as dynamic, topographical, and economic respectively; and this seemed to me to represent the furthest goal that psychology could attain. The attempt remained no more than a torso; after writing two or three papers - 'Instincts and their Vicissitudes', 'Repression', 'The Unconscious', 'Mourning and Melancholia', etc. - I broke off, wisely perhaps, since the time for theoretical predications of this kind had not yet come. In my latest speculative works I have set about the task of dissecting our mental apparatus on the basis of the analytic view of pathological facts and have divided it into an ego, an id, and a super-ego.' The super-ego is the heir of the Oedipus complex and represents the ethical standards of mankind.

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

[1925d, 4234]
This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of præmaeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth. [1925d, 4244]
These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

But within these functions there is a gradual displacement of accent. It was observed that the phenomena of nature developed automatically according to internal necessities. Without doubt the gods were the lords of nature; they had arranged it to be as it was and now they could leave it to itself. Only occasionally, in what are known as miracles, did they intervene in its course, as though to make it plain that they had relinquished nothing of their original sphere of power. As regards the apportioning of destinies, an unpleasant suspicion persisted that the perplexity and helplessness of the human race could not be remedied. It was here that the gods were most apt to fail. If they themselves created Fate, then their counsels must be deemed inscrutable. The notion dawned on the most gifted people of antiquity that Moira stood above the gods and that the gods themselves had their own destinies. And the more autonomous nature became and the more the gods withdrew from it, the more earnestly were all expectations directed to the third function of the gods - the more did morality become their true domain. It now became the task of the gods to even out the defects and evils of civilization, to attend to the sufferings which men inflict on one another in their life together and to watch over the fulfilment of the precepts of civilization, which men obey so imperfectly. Those precepts themselves were credited with a divine origin; they were elevated beyond human society and were extended to nature and the universe.
And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid.

With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.
As to the origin of the sense of guilt, the analyst has different views from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually done the bad thing but has only recognized in himself an intention to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger only sets in if and when the authority discovers it, and in either case the authority would behave in the same way.

[1930a, 4514]

This state of mind is called a 'bad conscience'; but actually it does not deserve this name, for at this stage the sense of guilt is clearly only a fear of loss of love, 'social' anxiety. In small children it can never be anything else, but in many adults, too, it has only changed to the extent that the place of the father or the two parents is taken by the larger human community. Consequently, such people habitually allow themselves to do any bad thing which promises them enjoyment, so long as they are sure that the authority will not know anything about it or cannot blame them for it; they are afraid only of being found out.¹ Present-day society has to reckon in general with this state of mind.

[1930a, 4515]
The moralist in Dostoevsky is the most readily assailable. If we seek to rank him high as a moralist on the plea that only a man who has gone through the depths of sin can reach the highest summit of morality, we are neglecting a doubt that arises. A moral man is one who reacts to temptation as soon as he feels it in his heart, without yielding to it. A man who alternately sins and then in his remorse erects high moral standards lays himself open to the reproach that he has made things too easy for himself. He has not achieved the essence of morality, renunciation, for the moral conduct of life is a practical human interest. He reminds one of the barbarians of the great migrations, who murdered and did penance for it, till penance became an actual technique for enabling murder to be done. Ivan the Terrible behaved in exactly this way; indeed this compromise with morality is a characteristic Russian trait. Nor was the final outcome of Dostoevsky's moral strivings anything very glorious. After the most violent struggles to reconcile the instinctual demands of the individual with the claims of the community, he landed in the retrograde position of submission both to temporal and spiritual authority, of veneration both for the Tsar and for the God of the Christians, and of a narrow Russian nationalism - a position which lesser minds have reached with smaller effort. This is the weak point in that great personality. Dostoevsky threw away the chance of becoming a teacher and liberator of humanity and made himself one with their gaolers. The future of human civilization will have little to thank him for. It seems probable that he was condemned to this failure by his neurosis. The greatness of his intelligence and the strength of his love for humanity might have opened to him another, an apostolic, way of life.
[1928b, 4553]

Hardly have we familiarized ourselves with the idea of a super-ego like this which enjoys a certain degree of autonomy, follows its own intentions and is independent of the ego for its supply of energy, than a clinical picture forces itself on our notice which throws a striking light on the severity of this agency and indeed its cruelty, and on its changing relations to the ego. I am thinking of the condition of melancholia, or, more precisely, of melancholic attacks, which you too will have heard plenty about, even if you are not psychiatrists. The most striking feature of this illness, of whose causation and mechanism we know much too little, is the way in which the super-ego - 'conscience', you may call it, quietly - treats the ego. While a melancholic can, like other people, show a greater or lesser degree of severity to himself in his healthy periods, during a melancholic attack his super-ego becomes over-severe, abuses the poor ego, humiliates it and ill-treats it, threatens it with the direst punishments, reproaches it for actions in the remotest past which had been taken lightly at the time - as though it had spent the whole interval in collecting accusations and had only been waiting for its present access of strength in order to bring them up and make a condemnatory judgement on their basis. The super-ego applies the strictest moral standard to the helpless ego which is at its mercy; in general it represents the claims of morality, and we realize all at once that our moral sense of guilt is the expression of the tension between the ego and the super-ego. It is a most remarkable experience to see morality, which is supposed to have been given us by God and thus deeply implanted in us, functioning as a periodic phenomenon. For after a certain number of months the whole moral fuss is over, the criticism of the super-ego is silent, the ego is rehabilitated and again enjoys all the rights of man till the next attack. In some forms of the disease, indeed, something of a contrary sort occurs in the intervals; the ego finds itself in a blissful state of intoxication, it celebrates a triumph, as though the super-ego had lost all its strength or had melted into the ego; and this liberated, manic ego permits itself a truly uninhibited satisfaction of all its appetites. Here are happenings rich in unsolved riddles!
[1933a, 4669]
But let us return to the super-ego. We have allotted it the functions of self-observation, of conscience and of the ideal. It follows from what we have said about its origin that it presupposes an immensely important biological fact and a fateful psychological one: namely, the human child's long dependence on its parents and the Oedipus complex, both of which, again, are intimately interconnected. The super-ego is the representative for us of every moral restriction, the advocate of a striving towards perfection - it is, in short, as much as we have been able to grasp psychologically of what is described as the higher side of human life. Since it itself goes back to the influence of parents, educators and so on, we learn still more of its significance if we turn to those who are its sources. As a rule parents and authorities analogous to them follow the precepts of their own super-egos in educating children. Whatever understanding their ego may have come to with their super-ego, they are severe and exacting in educating children. They have forgotten the difficulties of their own childhood and they are glad to be able now to identify themselves fully with their own parents who in the past laid such severe restrictions upon them. Thus a child's super-ego is in fact constructed on the model not of its parents but of its parents' super-ego; the contents which fill it are the same and it becomes the vehicle of tradition and of all the time-resisting judgements of value which have propagated themselves in this manner from generation to generation. You may easily guess what important assistance taking the super-ego into account will give us in our understanding of the social behaviour of mankind - in the problem of delinquency, for instance - and perhaps even what practical hints on education. It seems likely that what are known as materialistic views of history sin in under-estimating this factor. They brush it aside with the remark that human 'ideologies' are nothing other than the product and superstructure of their contemporary economic conditions. That is true, but very probably not the whole truth. Mankind never lives entirely in the present. The past, the tradition of the race and of the people, lives on in the ideologies of the super-ego, and yields only slowly to the influences of the present and to new changes; and so long as it operates through the super-ego it plays a powerful part in human life, independently of economic conditions.

You know how hard it is for anything to die away when once it has achieved psychical expression. So you will not be surprised to hear that many of the utterances of animism have persisted to this day, for the most part as what we call superstition, alongside of and behind religion. But more than this, you will scarcely be able to reject a judgement that the philosophy of today has retained some essential features of the animistic mode of thought - the overvaluation of the magic of words and the belief that the real events in the world take the course which our thinking seeks to impose on them. It would seem, it is true, to be an animism without magical actions. On the other hand, we may suppose that even in those days there were ethics of some sort, precepts upon the mutual relations of men; but nothing suggests that they had any intimate connection with animistic beliefs. They were probably the direct expression of men's relative powers and of their practical needs.
In summary, therefore, the judgement of science on the religious *Weltanschauung* is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity. [1933a, 4766]

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father. [1939a, 4906]
The first step away from totemism was the humanizing of the being who was worshipped. In place of the animals, human gods appear, whose derivation from the totem is not concealed. The god is still represented either in the form of an animal or at least with an animal's face, or the totem becomes the god's favourite companion, inseparable from him, or legend tells us that the god slew this precise animal, which was after all only a preliminary stage of himself. At a point in this evolution which is not easily determined great mother-goddesses appeared, probably even before the male gods, and afterwards persisted for a long time beside them. In the meantime a great social revolution had occurred. Matriarchy was succeeded by the re-establishment of a patriarchal order. The new fathers, it is true, never achieved the omnipotence of the primal father; there were many of them, who lived together in associations larger than the horde had been. They were obliged to be on good terms with one another, and remained under the limitation of social ordinances. It is likely that the mother-goddesses originated at the time of the curtailment of the matriarchy, as a compensation for the slight upon the mothers. The male deities appear first as sons beside the great mothers and only later clearly assume the features of father-figures. These male gods of polytheism reflect the conditions during the patriarchal age. They are numerous, mutually restrictive, and are occasionally subordinated to a superior high god. The next step, however, leads us to the theme with which we are here concerned - to the return of a single father-god of unlimited dominion.

[1939a, 4907]

This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

[1939a, 4938]

The essential part of this course of events is repeated in the abbreviated development of the human individual. Here, too, it is the authority of the child's parents - essentially, that of his autocratic father, threatening him with his power to punish - which calls on him for a renunciation of instinct and which decides for him what is to be allowed and what forbidden. Later on, when Society and the super-ego have taken the parents' place, what in the child was called 'well-behaved' or 'naughty' is described as 'good' and 'evil' or 'virtuous' and 'vicious'. But it is still always the same thing - instinctual renunciation under the pressure of the authority which replaces and prolongs the father.

[1939a, 4938]
Going back to ethics, we may say in conclusion that a part of its precepts are justified rationally by the necessity for delimiting the rights of society as against the individual, the rights of the individual as against society and those of individuals as against one another. But what seems to us so grandiose about ethics, so mysterious and, in a mystical fashion, so self-evident, owes these characteristics to its connection with religion, its origin from the will of the father.

[1939a, 4940]

In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]
The picture of an ego which mediates between the id and the external world, which takes over the instinctual demands of the former in order to lead them to satisfaction, which derives perceptions from the latter and uses them as memories, which, intent on its self-preservation, puts itself in defence against excessively strong claims from both sides and which, at the same time, is guided in all its decisions by the injunctions of a modified pleasure principle - this picture in fact applies to the ego only up to the end of the first period of childhood, till about the age of five. At about that time an important change has taken place. A portion of the external world has, at least partially, been abandoned as an object and has instead, by identification, been taken into the ego and thus become an integral part of the internal world. This new psychical agency continues to carry on the functions which have hitherto been performed by the people in the external world: it observes the ego, gives it orders, judges it and threatens it with punishments, exactly like the parents whose place it has taken. We call this agency the super-ego and are aware of it in its judicial functions as our conscience. It is a remarkable thing that the super-ego often displays a severity for which no model has been provided by the real parents, and moreover that it calls the ego to account not only for its deeds but equally for its thoughts and unexecuted intentions, of which the super-ego seems to have knowledge. This reminds us that the hero of the Oedipus legend too felt guilty for his deeds and submitted himself to self-punishment, although the coercive power of the oracle should have acquitted him of guilt in our judgement and his own. The super-ego is in fact the heir to the Oedipus complex and is only established after that complex has been disposed of. For that reason its excessive severity does not follow a real model but corresponds to the strength of the defence used against the temptation of the Oedipus complex. Some suspicion of this state of things lies, no doubt, at the bottom of the assertion made by philosophers and believers that the moral sense is not instilled into men by education or acquired by them in their social life but is implanted in them from a higher source.

[1940a [1938], 5010]

So long as the ego works in full harmony with the super-ego it is not easy to distinguish between their manifestations; but tensions and estrangements between them make themselves very plainly visible. The torments caused by the reproaches of conscience correspond precisely to a child's fear of loss of love, a fear the place of which has been taken by the moral agency. On the other hand, if the ego has successfully resisted a temptation to do something which would be objectionable to the super-ego, it feels raised in its self-esteem and strengthened in its pride, as though it had made some precious acquisition. In this way the super-ego continues to play the part of an external world for the ego, although it has become a portion of the internal world. Throughout later life it represents the influence of a person's childhood, of the care and education given him by his parents and of his dependence on them - a childhood which is prolonged so greatly in human beings by a family life in common. And in all this it is not only the personal qualities of these parents that is making itself felt, but also everything that had a determining effect on them themselves, the tastes and standards of the social class in which they lived and the innate dispositions and traditions of the race from which they sprang. Those who have a liking for generalizations and sharp distinctions may say that the external world, in which the individual finds himself exposed after being detached from his parents, represents the power of the present; that his id, with its inherited trends, represents the organic past; and that the super-ego, which comes to join them later, represents more than anything the cultural past, which a child has, as it were, to repeat as an after-experience during the few years of his early life. It is unlikely that such generalizations can be universally correct. Some portion of the cultural acquisitions have undoubtedly left a precipitate behind them in the id; much of what is contributed by the super-ego will awaken an echo in the id; not a few of the child's new experiences will be intensified because they are repetitions of some primaeval phylogenetic experience.

[1940a [1938], 5011]
I cannot offer any proof here that the truth is nevertheless otherwise; but I may say that I am strongly inclined to suppose that dream-wishes are more strictly determined. It is true that children's dreams prove beyond a doubt that a wish that has not been dealt with during the day can act as a dream-instigator. But it must not be forgotten that it is a child's wish, a wishful impulse of the strength proper to children. I think it is highly doubtful whether in the case of an adult a wish that has not been fulfilled during the day would be strong enough to produce a dream. It seems to me, on the contrary, that, with the progressive control exercised upon our instinctual life by our thought-activity, we are more and more inclined to renounce as unprofitable the formation or retention of such intense wishes as children know. It is possible that there are individual differences in this respect, and that some people retain an infantile type of mental process longer than others, just as there are similar differences in regard to the diminution of visual imagery, which is so vivid in early years. But in general, I think, a wish that has been left over unfulfilled from the previous day is insufficient to produce a dream in the case of an adult. I readily admit that a wishful impulse originating in the conscious will contribute to the instigation of a dream, but it will probably not do more than that. The dream would not materialize if the preconscious wish did not succeed in finding reinforcement from elsewhere. [1900a, 984]

The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help. [1905c, 1697]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tou comprendre c’est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

A progressive renunciation of constitutional instincts, whose activation might afford the ego primary pleasure, appears to be one of the foundations of the development of human civilization. Some part of this instinctual repression is effected by its religions, in that they require the individual to sacrifice his instinctual pleasure to the Deity: 'Vengeance is mine, saith the Lord.' In the development of the ancient religions one seems to discern that many things which man kind had renounced as 'iniquities' had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful instincts was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example.

In his recently published book, Sexual Ethics, Von Ehrenfels (1907) dwells on the difference between 'natural' and 'civilized' sexual morality. By natural sexual morality we are to understand, according to him, a sexual morality under whose dominance a human stock is able to remain in lasting possession of health and efficiency, while civilized sexual morality is a sexual morality obedience to which, on the other hand, spurs men on to intense and productive cultural activity. This contrast, he thinks, is best illustrated by comparing the innate character of a people with their cultural attainments. I may refer the reader to Von Ehrenfels's own work for a more extensive consideration of this significant line of thought, and I shall extract from it here only as much as I need as a starting-point for my own contribution to the subject.
It is not difficult to suppose that under the domination of a civilized sexual morality the health and efficiency of single individuals may be liable to impairment and that ultimately this injury to them, caused by the sacrifices imposed on them, may reach such a pitch that, by this indirect path, the cultural aim in view will be endangered as well. And Von Ehrenfels does in fact attribute a number of ill-effects to the sexual morality which dominates our Western society today, ill-effects for which he is obliged to make that morality responsible; and, although he fully acknowledges its high aptitude for the furtherance of civilization, he is led to convict it of standing in need of reform. In his view, what is characteristic of the civilized sexual morality that dominates us is that the demands made on women are carried over to the sexual life of men and that all sexual intercourse is prohibited except in monogamous marriage. Nevertheless, consideration of the natural difference between the sexes makes it necessary to visit men's lapses with less severity and thus in fact to admit a double morality for them. But a society which accepts this double morality cannot carry 'the love of truth, honesty and humanity' (Von Ehrenfels, ibid. 32 ff.) beyond a definite and narrow limit, and is bound to induce in its members concealment of the truth, false optimism, self-deception and deception of others. And civilized sexual morality has still worse effects, for, by glorifying monogamy, it cripples the factor of selection by virility - the factor whose influence alone can bring about an improvement of the individual's innate constitution, since in civilized peoples selection by vitality has been reduced to a minimum by humanity and hygiene (ibid., 35).

[1908d, 1948]

Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',¹ in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

[1908d, 1951]

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

[1908d, 1961]
I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1962]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]
We must not omit to consider the third of the possible outcomes of the work of psychoanalysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction and ought to find it in life. Our civilized standards make life too difficult for the majority of human organizations. Those standards consequently encourage the retreat from reality and the generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual repression. We ought not to exalt ourselves so high as completely to neglect what was originally animal in our nature. Nor should we forget that the satisfaction of the individual's happiness cannot be erased from among the aims of our civilization. The plasticity of the components of sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive for still greater cultural achievements by still further sublimation. But, just as we do not count on our machines converting more than a certain fraction of the heat consumed into useful mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual instinct from its proper ends. We cannot succeed in doing so; and if the restriction upon sexuality were to be carried too far it would inevitably bring with it all the evils of soil-exhaustion. [1910a, 2239]

We must expressly insist that we have never reckoned Leonardo as a neurotic or a 'nerve case', as the awkward phrase goes. Anyone who protests at our so much as daring to examine him in the light of discoveries gained in the field of pathology is still clinging to prejudices which we have to-day rightly abandoned. We no longer think that health and illness, normal and neurotic people, are to be sharply distinguished from each other, and that neurotic traits must necessarily be taken as proofs of a general inferiority. To-day we know that neurotic symptoms are structures which are substitutes for certain achievements of repression that we have to carry out in the course of our development from a child to a civilized human being. We know too that we all produce such substitutive structures, and that it is only their number, intensity and distribution which justify us in using the practical concept of illness and in inferring the presence of constitutional inferiority. From the slight indications we have about Leonardo's personality we should be inclined to place him close to the type of neurotic that we describe as 'obsessional'; and we may compare his researches to the 'obsessive brooding' of neurotics, and his inhibitions to what are known as their 'abulias'. [1910c, 2300]

(2) I have said that we had much to expect from the increase in authority which must accrue to us as time goes on. I need not say much to you about the importance of authority. Only very few civilized people are capable of existing without reliance on others or are even capable of coming to an independent opinion. You cannot exaggerate the intensity of people's inner lack of resolution and craving for authority. The extraordinary increase in neuroses since the power of religions has waned may give you a measure of it. The impoverishment of the ego due to the large expenditure of energy on repression demanded of every individual by civilization may be one of the principal causes of this state of things. [1910d, 2311]
Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psychoanalysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

[1910d, 2311]

The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education for cultural reasons, between sexual maturity and sexual activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life.

[1912d, 2344]

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]
Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - *inter unrinas et faeces* - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]
If we take instinctual repression as a measure of the level of civilization that has been reached, we shall have to admit that even under the animistic system advances and developments took place which are unjustly despised on account of their superstitious basis. When we are told that the warriors in a savage tribe practise the greatest continence and cleanliness when they go on the war-path, the explanation is put forward that their motive is ‘a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic’ (Frazer, 1911b, 157); and an analogous superstitious reason could be suggested for their continence. None the less the fact remains that they have made an instinctual renunciation; and we can understand the position better if we suppose that the savage warrior submits to these restrictions as a counter-measure because he is on the point of yielding completely to the satisfaction of cruel and hostile impulses which are as a rule prohibited to him. The same is true of the numerous cases of sexual restrictions being imposed on anyone who is engaged on difficult or responsible work (ibid., 200 f.). Though the grounds alleged for these prohibitions may belong to a magical context, yet the fundamental idea of gaining greater strength by renouncing some instinctual satisfaction remains unmistakable; and the hygienic root of the prohibition which lies alongside its magical rationalization must not be overlooked. When the men of a savage tribe go out on an expedition to hunt, to fish, to fight or to gather precious plants, their wives left at home are subjected to many oppressive restrictions, to which the savages themselves ascribe a favourable influence, operating at a distance upon the success of the expedition. But it requires very little penetration to see that this factor which operates at a distance is nothing other than the absent men's longing thoughts of home, and that behind these disguises lies a sound piece of psychological insight that the men will only do their best if they feel completely secure about the women whom they have left behind them unguarded. Sometimes they will even themselves declare, without alleging any magical reasons, that a wife's infidelity in marriage will bring to nothing the efforts of an absent husband engaged on some responsible work.

The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but - not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despaching their father. In this way they rescued the organization which had made them strong - and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.

A similar application of its points of view, its hypotheses and its findings has enabled psycho-analysis to throw light on the origins of our great cultural institutions - on religion, morality, justice and philosophy.² By examining the primitive psychological situations which were able to provide the motive for creations of this kind, it has been in a position to reject certain attempts at an explanation that were based on too superficial a psychology and to replace them by a more penetrating insight.

²[1913j, 2821]
I will not dwell any longer on the biological aspect of the Adlerian theory nor discuss whether either actual 'organ-inferiority' or the subjective feeling of it - one does not know which - is really capable of serving as the foundation of Adler's system. I will merely remark in passing that if it were so neurosis would appear as a by-product of every kind of physical decrepitude, whereas observation shows that an impressive majority of ugly, misshapen, crippled and miserable people fail to react to their defects by neurosis. Nor will I deal with the interesting assertion according to which inferiority is to be traced back to the feeling of being a child. It shows the disguise under which the factor of infantilism, which is so strongly emphasized by psycho-analysis, re-appears in 'Individual Psychology'. On the other hand, I must point out how all the psychological acquisitions of psycho-analysis have been thrown to the winds by Adler. In his book Über den nervösen Charakter the unconscious is still mentioned as a psychological peculiarity, without, however, any relation to his system. Later, he has consistently declared that it is a matter of indifference to him whether an idea is conscious or unconscious. Adler has never from the first shown any understanding of repression. In an abstract of a paper read by him at the Vienna Society (February, 1911) he wrote that it must be pointed out that the evidence in a particular case showed that the patient had never repressed his libido, but had been continually 'safeguarding' himself against it. Soon afterwards, in a discussion at the Vienna Society, he said: 'If you ask where repression comes from, you are told, "from civilization"; but if you go on to ask where civilization comes from, you are told "from repression". So you see it is all simply playing with words.' A tithe of the acuteness and ingenuity with which Adler has unmasked the defensive devices of the 'nervous character' would have been enough to show him the way out of this pettifogging argument. What is meant is simply that civilization is based on the repressions effected by former generations, and that each fresh generation is required to maintain this civilization by effecting the same repressions. I once heard of a child who thought people were laughing at him, and began to cry, because when he asked where eggs come from he was told 'from hens', and when he went on to ask where hens come from he was told 'from eggs'. But they were not playing with words; on the contrary, they were telling him the truth.

[1914d, 2919]
Civilized society, which demands good conduct and does not trouble itself about the instinctual basis of this conduct, has thus won over to obedience a great many people who are not in this following their own natures. Encouraged by this success, society has allowed itself to be misled into tightening the moral standard to the greatest possible degree, and it has thus forced its members into a yet greater estrangement from their instinctual disposition. They are consequently subject to an unceasing suppression of instinct, and the resulting tension betrays itself in the most remarkable phenomena of reaction and compensation. In the domain of sexuality, where such suppression is most difficult to carry out, the result is seen in the reactive phenomena of neurotic disorders. Elsewhere the pressure of civilization brings in its train no pathological results, it is true, but is shown in malformations of character, and in the perpetual readiness of the inhibited instincts to break through to satisfaction at any suitable opportunity. Anyone thus compelled to act continually in accordance with precepts which are not the expression of his instinctual inclinations, is living, psychologically speaking, beyond his means, and may objectively be described as a hypocrite, whether he is clearly aware of the incongruity or not. It is undeniable that our contemporary civilization favours the production of this form of hypocrisy to an extraordinary extent. One might venture to say that it is built up on such hypocrisy, and that it would have to submit to far-reaching modifications if people were to undertake to live in accordance with psychological truth. Thus there are very many more cultural hypocrites than truly civilized men - indeed, it is a debatable point whether a certain degree of cultural hypocrisy is not indispensable for the maintenance of civilization, because the susceptibility to culture which has hitherto been organized in the minds of present-day men would perhaps not prove sufficient for the task. On the other hand, the maintenance of civilization even on so dubious a basis offers the prospect of paving the way in each new generation for a more far-reaching transformation of instinct which shall be the vehicle of a better civilization.

[1915b, 3076]

In my experience antipathy to this outcome of psycho-analytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization has been created under the pressure of the exigencies of life at the cost of satisfaction of the instincts; and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of instinctual satisfaction for the benefit of the whole community. Among the instinctual forces which are put to this use the sexual impulses play an important part; in this process they are sublimated - that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement is unstable; the sexual instincts are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual instincts may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual instincts were to be liberated and returned to their original aims. For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual instincts or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psycho-analytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psycho-analysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them.

[1916-1917, 3135]
At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction - but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What does awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so you are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education. For society must undertake as one of its most important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical with the bidding of society. It is also concerned to postpone the full development of the instinct till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct, educability is for practical purposes at an end. Otherwise, the instinct would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, by the eternal, primaeval exigencies of life, which are with us to this day. [1916-1917, 3382]
The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as 'phantasy'. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call 'reality-testing'. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfillments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. 'We cannot do without auxiliary constructions', as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of 'reservations' or 'nature reserves' in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

[1916-1917, 3427]

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

[1916-1917, 3477]
It may be difficult, too, for many of us, to abandon the belief that there is an instinct towards perfection at work in human beings, which has brought them to their present high level of intellectual achievement and ethical sublimation and which may be expected to watch over their development into supermen. I have no faith, however, in the existence of any such internal instinct and I cannot see how this benevolent illusion is to be preserved. The present development of human beings requires, as it seems to me, no different explanation from that of animals. What appears in a minority of human individuals as an untiring impulsion towards further perfection can easily be understood as a result of the instinctual repression upon which is based all that is most precious in human civilization. The repressed instinct never ceases to strive for complete satisfaction, which would consist in the repetition of a primary experience of satisfaction. No substitutive or reactive formations and no sublimations will suffice to remove the repressed instinct's persisting tension; and it is the difference in amount between the pleasure of satisfaction which is demanded and that which is actually achieved that provides the driving factor which will permit of no halting at any position attained, but, in the poet's words, 'ungebändigt immer vorwärts dringt'.¹ The backward path that leads to complete satisfaction is as a rule obstructed by the resistances which maintain the repressions. So there is no alternative but to advance in the direction in which growth is still free - though with no prospect of bringing the process to a conclusion or of being able to reach the goal. The processes involved in the formation of a neurotic phobia, which is nothing else than an attempt at flight from the satisfaction of an instinct, present us with a model of the manner of origin of this supposititious 'instinct towards perfection' - an instinct which cannot possibly be attributed to every human being. The dynamic conditions for its development are, indeed, universally present; but it is only in rare cases that the economic situation appears to favour the production of the phenomenon.
[1920g, 3744]

I will add only a word to suggest that the efforts of Eros to combine organic substances into ever larger unities probably provide a substitute for this 'instinct towards perfection' whose existence we cannot admit. The phenomena that are attributed to it seem capable of explanation by these efforts of Eros taken in conjunction with the results of repression.
[1920g, 3744]

The turning back of sadism against the self regularly occurs where a cultural suppression of the instincts holds back a large part of the subject's destructive instinctual components from being exercised in life. We may suppose that this portion of the destructive instinct which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the super-ego, without any such transformation, and increases its sadism against the ego. The sadism of the super-ego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of an instinct can - frequently or quite generally - result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others. One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of instinct followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first instinctual renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of instinct.
[1924c, 4082]
If we leave little-known internal urges out of account, we may say that the main motive force
towards the cultural development of man has been real external exigency, which has withheld
from him the easy satisfaction of his natural needs and exposed him to immense dangers. This
external frustration drove him into a struggle with reality, which ended partly in adaptation to it
and partly in control over it; but it also drove him into working and living in common with those of
his kind, and this already involved a renunciation of a number of instinctual impulses which
could not be satisfied socially. With the further advances of civilization the demands of
repression also grew. Civilization is after all built entirely on renunciation of instinct, and every
individual on his journey from childhood to maturity has in his own person to recapitulate this
development of humanity to a state of judicious resignation. Psycho-analysis has shown that it
is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to
this cultural suppression. One portion of them, however, exhibit the valuable characteristic of
allowing themselves to be diverted from their immediate aims and of thus placing their energy at
the disposal of cultural development in the form of 'sublimated' trends. But another portion
persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted,
satisfaction.
[1924f, 4116]

Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard
to find. Human civilization rests upon two pillars, of which one is the control of natural forces
and the other the restriction of our instincts. The ruler's throne rests upon fettered slaves.
Among the instinctual components which are thus brought into service, the sexual instincts, in
the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they
should be set loose! The throne would be overturned and the ruler trampled under foot. Society
is aware of this - and will not allow the topic to be mentioned.
[1925e, 4127]

But why not? What harm could the discussion do? Psycho-analysis has never said a word in
favour of unfettering instincts that would injure our community; on the contrary it has issued a
warning and an exhortation to us to mend our ways. But society refuses to consent to the
ventilation of the question, because it has a bad conscience in more than one respect. In the
first place it has set up a high ideal of morality - morality being restriction of the instincts - and
insists that all its members shall fulfill that ideal without troubling itself with the possibility that
obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized
to be able to compensate the individual for the amount of his instinctual renunciation. It is
consequently left to the individual to decide how he can obtain, for the sacrifice he has made,
enough compensation to enable him to preserve his mental balance. On the whole, however, he
is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts
make him feel the demands of civilization as a constant pressure upon him. Thus society
maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of
insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding
criticism and discussion. This line of thought holds good for all the instinctual impulses,
including, therefore, the egoistic ones. The question whether it applies to all possible forms of
civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As
regards the sexual instincts in the narrower sense, there is the further point that in most people
they are tamed insufficiently and in a manner which is psychologically wrong and are therefore
readier than the rest to break loose.
[1925e, 4127]
Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

[1925e, 4128]

It is an odd thing that the regular and essential part of this sexual activity was not overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle.

We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.

[1926e, 4359]

Topographically, psycho-analysis regards the mental apparatus as a compound instrument, and endeavours to determine at what points in it the various mental processes take place. According to the most recent psycho-analytic views, the mental apparatus is composed of an 'id', which is the repository of the instinctual impulses, of an 'ego', which is the most superficial portion of the id and one which has been modified by the influence of the external world, and of a 'super-ego', which develops out of the id, dominates the ego and represents the inhibitions of instinct that are characteristic of man. The quality of consciousness, too, has a topographical reference; for processes in the id are entirely unconscious, while consciousness is the function of the ego's outermost layer, which is concerned with the perception of the external world.

[1926f, 4404]
One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

This psychological fact has a decisive importance for our judgement of human civilization. Whereas we might at first think that its essence lies in controlling nature for the purpose of acquiring wealth and that the dangers which threaten it could be eliminated through a suitable distribution of that wealth among men, it now seems that the emphasis has moved over from the material to the mental. The decisive question is whether and to what extent it is possible to lessen the burden of the instinctual sacrifices imposed on men, to reconcile men to those which must necessarily remain and to provide a compensation for them. It is just as impossible to do without control of the mass by a minority as it is to dispense with coercion in the work of civilization. For masses are lazy and unintelligent; they have no love for instinctual renunciation, and they are not to be convinced by argument of its inevitability; and the individuals composing them support one another in giving free rein to their indiscipline. It is only through the influence of individuals who can set an example and whom masses recognize as their leaders that they can be induced to perform the work and undergo the renunciations on which the existence of civilization depends. All is well if these leaders are persons who possess superior insight into the necessities of life and who have risen to the height of mastering their own instinctual wishes. But there is a danger that in order not to lose their influence they may give way to the mass more than it gives way to them, and it therefore seems necessary that they shall be independent of the mass by having means to power at their disposal. To put it briefly, there are two widespread human characteristics which are responsible for the fact that the regulations of civilization can only be maintained by a certain degree of coercion - namely, that men are not spontaneously fond of work and that arguments are of no avail against their passions.
We have slipped unawares out of the economic field into the field of psychology. At first we were tempted to look for the assets of civilization in the available wealth and in the regulations for its distribution. But with the recognition that every civilization rests on a compulsion to work and a renunciation of instinct and therefore inevitably provokes opposition from those affected by these demands, it has become clear that civilization cannot consist principally or solely in wealth itself and the means of acquiring it and the arrangements for its distribution; for these things are threatened by the rebelliousness and destructive mania of the participants in civilization. Alongside of wealth we now come upon the means by which civilization can be defended - measures of coercion and other measures that are intended to reconcile men to it and to recompense them for their sacrifices. These latter may be described as the mental assets of civilization.

[1927c, 4422]

For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a 'frustration', the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

[1927c, 4422]
These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

[1927c, 4423]

A different kind of satisfaction is afforded by art to the participants in a cultural unit, though as a rule it remains inaccessible to the masses, who are engaged in exhausting work and have not enjoyed any personal education. As we discovered long since, art offers substitutive satisfactions for the oldest and still most deeply felt cultural renunciations, and for that reason it serves as nothing else does to reconcile a man to the sacrifices he has made on behalf of civilization. On the other hand, the creations of art heighten his feelings of identification, of which every cultural unit stands in so much need, by providing an occasion for sharing highly valued emotional experiences. And when those creations picture the achievements of his particular culture and bring to his mind its ideals in an impressive manner, they also minister to his narcissistic satisfaction.

[1927c, 4426]

We have spoken of the hostility to civilization which is produced by the pressure that civilization exercises, the renunciations of instinct which it demands. If one imagines its prohibitions lifted - if, then, one may take any woman one pleases as a sexual object, if one may without hesitation kill one's rival for her love or anyone else who stands in one's way, if, too, one can carry off any of the other man's belongings without asking leave - how splendid, what a string of satisfactions one's life would be! True, one soon comes across the first difficulty: everyone else has exactly the same wishes as I have and will treat me with no more consideration than I treat him. And so in reality only one person could be made unreservedly happy by such a removal of the restrictions of civilization, and he would be a tyrant, a dictator, who had seized all the means to power. And even he would have every reason to wish that the others would observe at least one cultural commandment: 'thou shalt not kill'.

[1927c, 4427]
For the individual, too, life is hard to bear, just as it is for mankind in general. The civilization in which he participates imposes some amount of privation on him, and other men bring him a measure of suffering, either in spite of the precepts of his civilization or because of its imperfections. To this are added the injuries which untamed nature - he calls it Fate - inflicts on him. One might suppose that this condition of things would result in a permanent state of anxious expectation in him and a severe injury to his natural narcissism. We know already how the individual reacts to the injuries which civilization and other men inflict on him: he develops a corresponding degree of resistance to the regulations of civilization and of hostility to it. But how does he defend himself against the superior powers of nature, of Fate, which threaten him as they threaten all the rest?
[1927c, 4428]

In the course of time the first observations were made of regularity and conformity to law in natural phenomena, and with this the forces of nature lost their human traits. But man's helplessness remains and along with it his longing for his father, and the gods. The gods retain their threefold task: they must exorcize the terrors of nature, they must reconcile men to the cruelty of Fate, particularly as it is shown in death, and they must compensate them for the sufferings and privations which a civilized life in common has imposed on them.
[1927c, 4429]

We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.
[1927c, 4452]
The last, but certainly not the least important, of the characteristic features of civilization remains to be assessed: the manner in which the relationships of men to one another, their social relationships, are regulated - relationships which affect a person as a neighbour, as a source of help, as another person's sexual object, as a member of a family and of a State. Here it is especially difficult to keep clear of particular ideal demands and to see what is civilized in general. Perhaps we may begin by explaining that the element of civilization enters on the scene with the first attempt to regulate these social relationships. If the attempt were not made, the relationships would be subject to the arbitrary will of the individual: that is to say, the physically stronger man would decide them in the sense of his own interests and instinctual impulses. Nothing would be changed in this if this stronger man should in turn meet someone even stronger than he. Human life in common is only made possible when a majority comes together which is stronger than any separate individual and which remains united against all separate individuals. The power of this community is then set up as 'right' in opposition to the power of the individual, which is condemned as 'brute force'. This replacement of the power of the individual by the power of a community constitutes the decisive step of civilization. The essence of it lies in the fact that the members of the community restrict themselves in their possibilities of satisfaction, whereas the individual knew no such restrictions. The first requisite of civilization, therefore, is that of justice - that is, the assurance that a law once made will not be broken in favour of an individual. This implies nothing as to the ethical value of such a law. The further course of cultural development seems to tend towards making the law no longer an expression of the will of a small community - a caste or a stratum of the population or a racial group - which, in its turn, behaves like a violent individual towards other, and perhaps more numerous, collections of people. The final outcome should be a rule of law to which all - except those who are not capable of entering a community - have contributed by a sacrifice of their instincts, and which leaves no one - again with the same exception - at the mercy of brute force.
[1930a, 4492]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹

Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

[1930a, 4494]
The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagate
d

[1930a, 4497]

[1930a, 4498]
Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

[1930a, 4500]

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

[1930a, 4500]

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

[1930a, 4500]

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

[1930a, 4507]
When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided — when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed ‘the psychological poverty of groups’. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]

And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfill the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual’s aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of ‘eat or be eaten’ which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]
I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a Weltanschauung, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

[1933a, 4775]
And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand. [1933a, 4776]

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire-legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal driven by instinct, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced an instinct and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes an instinctual renunciation, at least it makes no secret of the resentment which the culture-hero could not fail to arouse in men driven by their instincts. And this is in accordance with what we know and expect. We know that a demand for a renunciation of instinct, and the enforcement of that demand, call out hostility and aggressiveness, which is only transformed into a sense of guilt in a later phase of psychical development. [1932a, 4783]
No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture. (Some people, I know, prefer to use the term 'civilization'.) We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind. The psychical modifications that go along with the process of civilization are striking and unambiguous. They consist in a progressive displacement of instincual aims and a restriction of instincual impulses. Sensations which were pleasurable to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization two appear to be the most important: a strengthening of the intellect, which is beginning to govern instincual life, and an internalization of the aggressive impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a constitutional intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

[1933b, 4803]

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith,.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

[1939a, 4906]
The essential part of this course of events is repeated in the abbreviated development of the human individual. Here, too, it is the authority of the child's parents - essentially, that of his autocratic father, threatening him with his power to punish - which calls on him for a renunciation of instinct and which decides for him what is to be allowed and what forbidden. Later on, when Society and the super-ego have taken the parents' place, what in the child was called 'well-behaved' or 'naughty' is described as 'good' and 'evil' or 'virtuous' and 'vicious'. But it is still always the same thing - instinctual renunciation under the pressure of the authority which replaces and prolongs the father.

[1939a, 4938]

We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

[1940a [1938], 4993]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child’s sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
As we know, it is in an attempt to bridge this gap that the assumption has been made of a special neuropathic disposition (which, incidentally, if it existed, would not leave much hope of success for the treatment of such pathological conditions). The neuropathic disposition itself is regarded as a sign of a general degeneracy, and thus this convenient technical term has come to be superabundantly used against the wretched patients whom the doctors are quite incapable of helping. Fortunately, the state of affairs is different. The neuropathic disposition does no doubt exist, but I must deny that it suffices for the creation of a psychoneurosis. I must further deny that the conjunction of a neuropathic disposition with precipitating causes occurring in later life constitutes an adequate aetiology of the psychoneuroses. In tracing back the vicissitudes of an individual's illness to the experiences of his ancestors, we have gone too far; we have forgotten that between his conception and his maturity there lies a long and important period of life - his childhood - in which the seeds of later illness may be acquired. And that - is what in fact happens with a psychoneurosis. Its true aetiology is to be found in childhood experiences, and, once again - and exclusively - in impressions concerned with sexual life. We do wrong to ignore the sexual life of children entirely; in my experience, children are capable of every psychical sexual activity, and many somatic sexual ones as well. Just as the whole human sexual apparatus is not comprised in the external genitals and the two reproductive glands, so human sexual life does not begin only with puberty, as on a rough inspection it may appear to do. Nevertheless it is true that the organization and evolution of the human species strives to avoid any great degree of sexual activity during childhood. It seems that in man the sexual instinctual forces are meant to be stored up so that, on their release at puberty, they may serve great cultural ends. (W. Fliess.) Consideration of this sort may make it possible to understand why the sexual experiences of childhood are bound to have a pathogenic effect. But they produce their effect only to a very slight degree at the time at which they occur; what is far more important is their deferred effect, which can only take place at later periods of growth. This deferred effect originates - as it can do in no other way - in the psychical traces which have been left behind by infantile sexual experiences. During the interval between the experiences of those impressions and their reproduction (or rather, the reinforcement of the libidinal impulses which proceed from them), not only the somatic sexual apparatus but the psychical apparatus as well has undergone an important development; and thus it is that the influence of these earlier sexual experiences now leads to an abnormal psychical reaction, and psychopathological structures come into existence.

[1897b, 472]

The same holds true of seeing - an activity that is ultimately derived from touching. Visual impressions remain the most frequent pathway along which libidinal excitation is aroused; indeed, natural selection counts upon the accessibility of this pathway - if such a teleological form of statement is permissible - when it encourages the development of beauty in the sexual object. The progressive concealment of the body which goes along with civilization keeps sexual curiosity awake. This curiosity seeks to complete the sexual object by revealing its hidden parts. It can, however, be diverted ('sublimated') in the direction of art, if its interest can be shifted away from the genitals on to the shape of the body as a whole.¹ It is usual for most normal people to linger to some extent over the intermediate sexual aim of a looking that has a sexual tinge to it; indeed, this offers them a possibility of directing some proportion of their libido on to higher artistic aims. On the other hand, this pleasure in looking becomes a perversion (a) if it is restricted exclusively to the genitals, or (b) if it is connected with the overriding of disgust (as in the case of voeureurs or people who look on at excretory functions), or (c) if, instead of being preparatory to the normal sexual aim, it supplants it. This last is markedly true of exhibitionists, who, if I may trust the findings of several analyses, exhibit their own genitals in order to obtain a reciprocal view of the genitals of the other person.²

[1905d, 1483]
On the other hand, these forces which act like dams upon sexual development - disgust, shame and morality - must also be regarded as historical precipitates of the external inhibitions to which the sexual instinct has been subjected during the psychogenesis of the human race. We can observe the way in which, in the development of individuals, they arise at the appropriate moment, as though spontaneously, when upbringing and external influence give the signal.

Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, desppicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

Among the institutions which cynical jokes are in the habit of attacking none is more important or more strictly guarded by moral regulations but at the same time more inviting to attack than the institution of marriage, at which, accordingly, the majority of cynical jokes are aimed. There is no more personal claim than that for sexual freedom and at no point has civilization tried to exercise severer suppression than in the sphere of sexuality. A single example will be enough for our purposes - the one mentioned on p. 1678, 'An Entry in Prince Carnival's Album':

In his recently published book, Sexual Ethics, Von Ehrenfels (1907) dwells on the difference between 'natural' and 'civilized' sexual morality. By natural sexual morality we are to understand, according to him, a sexual morality under whose dominance a human stock is able to remain in lasting possession of health and efficiency, while civilized sexual morality is a sexual morality obedience to which, on the other hand, spurs men on to intense and productive cultural activity. This contrast, he thinks, is best illustrated by comparing the innate character of a people with their cultural attainments. I may refer the reader to Von Ehrenfels's own work for a more extensive consideration of this significant line of thought, and I shall extract from it here only as much as I need as a starting-point for my own contribution to the subject.
It is not difficult to suppose that under the domination of a civilized sexual morality the health and efficiency of single individuals may be liable to impairment and that ultimately this injury to them, caused by the sacrifices imposed on them, may reach such a pitch that, by this indirect path, the cultural aim in view will be endangered as well. And Von Ehrenfels does in fact attribute a number of ill-effects to the sexual morality which dominates our Western society today, ill-effects for which he is obliged to make that morality responsible; and, although he fully acknowledges its high aptitude for the furtherance of civilization, he is led to convict it of standing in need of reform. In his view, what is characteristic of the civilized sexual morality that dominates us is that the demands made on women are carried over to the sexual life of men and that all sexual intercourse is prohibited except in monogamous marriage. Nevertheless, consideration of the natural difference between the sexes makes it necessary to visit men’s lapses with less severity and thus in fact to admit a double morality for them. But a society which accepts this double morality cannot carry ‘the love of truth, honesty and humanity’ (Von Ehrenfels, ibid. 32 ff.) beyond a definite and narrow limit, and is bound to induce in its members concealment of the truth, false optimism, self-deception and deception of others. And civilized sexual morality has still worse effects, for, by glorifying monogamy, it cripples the factor of selection by virility - the factor whose influence alone can bring about an improvement of the individual’s innate constitution, since in civilized peoples selection by vitality has been reduced to a minimum by humanity and hygiene (ibid., 35).

Among the damaging effects which are here laid at the door of civilized sexual morality, the physician will miss a particular one whose significance will be discussed in detail in the present paper. I refer to the increase traceable to it of modern nervous illness - of the nervous illness, that is, which is rapidly spreading in our present-day society. Occasionally a nervous patient will himself draw the doctor's attention to the part played in the causation of his complaint by the opposition between his constitution and the demands of civilization and will say: ‘In our family we've all become neurotic because we wanted to be something better than what, with our origin, we are capable of being.’ Often, too, the physician finds food for thought in observing that those who succumb to nervous illness are precisely the offspring of fathers who, having been born of rough but vigorous families, living in simple, healthy, country conditions, had successfully established themselves in the metropolis, and in a short space of time had brought their children to a high level of culture. But, above all, nerve specialists themselves have loudly proclaimed the connection between ‘increasing nervous illness’ and modern civilized life. The grounds to which they attribute this connection will be shown by a few extracts from statements that have been made by some eminent observers.

The fault I have to find with these and many other similarly-worded opinions is not that they are mistaken but that they prove insufficient to explain the details in the picture of nervous disturbances and that they leave out of account precisely the most important of the aetiological factors involved. If we disregard the vaguer ways of being ‘nervous’ and consider the specific forms of nervous illness, we shall find that the injurious influence of civilization reduces itself in the main to the harmful suppression of the sexual life of civilized peoples (or classes) through the ‘civilized’ sexual morality prevalent in them.
Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',[1] in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

[1908d, 1951

It is one of the obvious social injustices that the standard of civilization should demand from everyone the same conduct of sexual life - conduct which can be followed without any difficulty by some people, thanks to their organization, but which imposes the heaviest psychical sacrifices on others; though, indeed, the injustice is as a rule wiped out by disobedience to the injunctions of morality.

[1908d, 1955

These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated, the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as perverts, and a number of others, who make efforts not to be perverts whilst constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness.

[1908d, 1955

(1) What is the task that is set to the individual by the requirements of the third stage of civilization?

[1908d, 1956

(2) Can the legitimate sexual satisfaction that is permissible offer acceptable compensation for the renunciation of all other satisfactions?

[1908d, 1956
The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here - that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual instinct by any other means than satisfying it is one which can call for the whole of a man's forces. Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of to-day; for we know no better safe-guard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; instincts which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions. [1908d, 1956]
This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place only for a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure in so far as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus doomed puts both partners back in the state they were in before their marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual instinct. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them - although only with reluctance and under a veil of silence - by even the strictest sexual code. The 'double' sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their instincts, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child - experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives. (Under the cultural conditions of to-day, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual instinct of the civilized person in his youth, proves to be inadequate even to the demands of the actual period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it. [1908d, 1957]

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated. [1908d, 1958]
The retardation of sexual development and sexual activity at which our education and civilization aim is certainly not injurious to begin with. It is seen to be a necessity, when one considers the late age at which young people of the educated classes reach independence and are able to earn a living. (This reminds one, incidentally, of the intimate interconnection between all our cultural institutions and of the difficulty of altering any part of them without regard to the whole.) But abstinence continued long after the age of twenty is no longer unobjectionable for a young man; and it leads to other damage even when it does not lead to neurosis. People say, to be sure, that the struggle against such a powerful instinct, and the strengthening of all the ethical and aesthetic forces which are necessary for this struggle, ’steel’ the character; and this is true for a few specially favourably organized natures. It must also be admitted that the differentiation of individual character, which is so marked in our day, has only become possible with the existence of sexual restriction. But in the vast majority of cases the struggle against sexuality eats up the energy available in a character and this at the very time when a young man is in need of all his forces in order to win his share and place in society. The relationship between the amount of sublimation possible and the amount of sexual activity necessary naturally varies very much from person to person and even from one calling to another. An abstinent artist is hardly conceivable; but an abstinent young savant is certainly no rarity. The latter can, by his self-restraint, liberate forces for his studies; while the former probably finds his artistic achievements powerfully stimulated by his sexual experience. In general I have not gained the impression that sexual abstinence helps to bring about energetic and self-reliant men of action or original thinkers or bold emancipators and reformers. Far more often it goes to produce well-behaved weaklings who later become lost in the great mass of people that tends to follow, unwillingly, the leads given by strong individuals.
[1908d, 1958]
The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

[1908d, 1959]

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality - and also, on account of the possibilities of infection, by hygiene - what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions in love-relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient game, attended by no risk and no spiritual participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals in virtue of their organization, or who became so in their childhood, there must be reckoned the great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

[1908d, 1961]
All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulsions. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality by pointing to the important bearing of that morality upon the spread of modern nervous illness.
The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education for cultural reasons, between sexual maturity and sexual activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life.

[1912d, 2344]

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formation were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - inter unrinas et faeces - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

[1912d, 2346]
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]

At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction - but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What does awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so you are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education. For society must undertake as one of its most important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical with the bidding of society. It is also concerned to postpone the full development of the instinct till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct, educability is for practical purposes at an end. Otherwise, the instinct would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, by the eternal, primaeval exigencies of life, which are with us to this day.

[1916-1917, 3382]
Experience must no doubt have taught the educators that the task of making the sexual will of the new generation tractable could only be carried out if they began to exercise their influence very early, if they did not wait for the storm of puberty but intervened already in the sexual life of children which is preparatory to it. For this reason almost all infantile sexual activities were forbidden to children and frowned upon; an ideal was set up of making the life of children asexual, and in course of time things came to the point at which people really believed they were asexual and thereafter science pronounced this as its doctrine. To avoid contradicting their belief and their intentions, people since then overlook the sexual activities of children (no mean achievement) or are content in science to take a different view of them. Children are pure and innocent, and anyone who describes them otherwise can be charged with being an infamous blasphemer against the tender and sacred feelings of mankind.

[1916-1917, 3383]

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

[1916-1917, 3477]

I will add only a word to suggest that the efforts of Eros to combine organic substances into ever larger unities probably provide a substitute for this 'instinct towards perfection' whose existence we cannot admit. The phenomena that are attributed to it seem capable of explanation by these efforts of Eros taken in conjunction with the results of repression.

[1920g, 3744]
If we leave little-known internal urges out of account, we may say that the main motive force towards the cultural development of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of instinctual impulses which could not be satisfied socially. With the further advances of civilization the demands of repression also grew. Civilization is after all built entirely on renunciation of instinct, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psycho-analysis has shown that it is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.

[1924f, 4116]

Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization rests upon two pillars, of which one is the control of natural forces and the other the restriction of our instincts. The ruler's throne rests upon fettered slaves. Among the instinctual components which are thus brought into service, the sexual instincts, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this - and will not allow the topic to be mentioned.

[1925e, 4127]

But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

[1925e, 4127]
Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

It is an odd thing that the regular and essential part of this sexual activity was not overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle.

We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

[1925e, 4128]

[1926f, 4405]
The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

[1930a, 4497]

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]
This, of course, is an extreme picture. Everybody knows that it has proved impossible to put it into execution, even for quite short periods. Only the weaklings have submitted to such an extensive encroachment upon their sexual freedom, and stronger natures have only done so subject to a compensatory condition, which will be mentioned later. Civilized society has found itself obliged to pass over in silence many transgressions which, according to its own prescripts, it ought to have punished. But we must not err on the other side and assume that, because it does not achieve all its aims, such an attitude on the part of society is entirely innocuous. The sexual life of civilized man is notwithstanding severely impaired; it sometimes gives the impression of being in process of involution as a function, just as our teeth and hair seem to be as organs. One is probably justified in assuming that its importance as a source of feelings of happiness, and therefore in the fulfilment of our aim in life, has sensibly diminished.¹ Sometimes one seems to perceive that it is not only the pressure of civilization but something in the nature of the function itself which denies us full satisfaction and urges us along other paths. This may be wrong; it is hard to decide.²

¹ Among the works of that sensitive English writer, John Galsworthy, who enjoys general recognition today, there is a short story of which I early formed a high opinion. It is called ‘The Apple-Tree’, and it brings home to us how the life of present-day civilized people leaves no room for the simple natural love of two human beings.

² Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

³ We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.
So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

[1930a, 4500]

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

[1930a, 4504]

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

[1930a, 4507]
For a wide variety of reasons, it is very far from my intention to express an opinion upon the value of human civilization. I have endeavoured to guard myself against the enthusiastic prejudice which holds that our civilization is the most precious thing that we possess or could acquire and that its path will necessarily lead to heights of unimagined perfection. I can at least listen without indignation to the critic who is of the opinion that when one surveys the aims of cultural endeavour and the means it employs, one is bound to come to the conclusion that the whole effort is not worth the trouble, and that the outcome of it can only be a state of affairs which the individual will be unable to tolerate. My impartiality is made all the easier to me by my knowing very little about all these things. One thing only do I know for certain and that is that man's judgements of value follow directly his wishes for happiness - that, accordingly, they are an attempt to support his illusions with arguments. I should find it very understandable if someone were to point out the obligatory nature of the course of human civilization and were to say, for instance, that the tendencies to a restriction of sexual life or to the institution of a humanitarian ideal at the expense of natural selection were developmental trends which cannot be averted or turned aside and to which it is best for us to yield as though they were necessities of nature. I know, too, the objection that can be made against this, to the effect that in the history of mankind, trends such as these, which were considered unsurmountable, have often been thrown aside and replaced by other trends. Thus I have not the courage to rise up before my fellow-men as a prophet, and I bow to their reproach that I can offer them no consolation: for at bottom that is what they are all demanding - the wildest revolutionaries no less passionately than the most virtuous believers.

[1930a, 4532]

And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]
As regards the other point - the specific instinctual factor - we come upon an interesting discrepancy between theory and experience. Theoretically there is no objection to supposing that any sort of instinctual demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component instincts of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a purely erotic nature but have arisen from alloys of the erotic instinct with portions of the destructive instinct. But it cannot be doubted that the instincts which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses - whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls a victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) - that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.

[1940a [1938], 4994]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of *love* which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child’s sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual’s later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these *détours* they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
REACTION-FORMATION AND SUBLIMATION

What is it that goes to the making of these constructions which are so important for the growth of a civilized and normal individual? They probably emerge at the cost of the infantile sexual impulses themselves. Thus the activity of those impulses does not cease even during this period of latency, though their energy is diverted, wholly or in great part, from their sexual use and directed to other ends. Historians of civilization appear to be at one in assuming that powerful components are acquired for every kind of cultural achievement by this diversion of sexual instinctual forces from sexual aims and their direction to new ones - a process which deserves the name of 'sublimation'. To this we would add, accordingly, that the same process plays a part in the development of the individual and we would place its beginning in the period of sexual latency of childhood.¹

PERTINACITY OF EARLY IMPRESSIONS

The importance of all early sexual manifestations is increased by a psychical factor of unknown origin, which at the moment, it must be admitted, can only be brought forward as a provisional psychological concept. I have in mind the fact that, in order to account for the situation, it is necessary to assume that these early impressions of sexual life are characterized by an increased pertinacity or susceptibility to fixation in persons who are later to become neurotics or perverts. For the same premature sexual manifestations, when they occur in other persons, fail to make so deep an impression; they do not tend in a compulsive manner towards repetition nor do they lay down the path to be taken by the sexual instinct for a whole lifetime. Part of the explanation of this pertinacity of early impressions may perhaps lie in another psychical factor which we must not overlook in the causation of the neuroses, namely the preponderance attaching in mental life to memory-traces in comparison with recent impressions. This factor is clearly dependent on intellectual education and increases in proportion to the degree of individual culture. The savage has been described in contrast as 'das unglückselige Kind des Augenblickes' [‘The hapless child of the moment.’].¹ In consequence of the inverse relation holding between civilization and the free development of sexuality, of which the consequences can be followed far into the structure of our existences, the course taken by the sexual life of a child is just as unimportant for later life where the cultural or social level is relatively low as it is important where that level is relatively high.²

There is, however, another angle from which you may seek to understand the psycho-analytic method. The uncovering and translating of the unconscious occurs in the face of a continuous resistance on the part of the patient. The process of bringing this unconscious material to light is associated with unpleasure, and because of this the patient rejects it again and again. It is for you then to interpose in this conflict in the patient's mental life. If you succeed in persuading him to accept, by virtue of a better understanding, something that up to now, in consequence of this automatic regulation by unpleasure, he has rejected (repressed), you will have accomplished something towards his education. For it is education even to induce someone who dislikes getting up early to do so all the same. Psycho-analytic treatment may in general be conceived of as such a re-education in overcoming internal resistances. Re-education of this kind is, however, in no respect more necessary to nervous patients than in regard to the mental element in their sexual life. For nowhere else have civilization and education done so much harm as in this field, and this is the point, as experience will show you, at which to look for those aetiologies of the neuroses that are amenable to influence; for the other aetiological factor, the constitutional component, consists of something fixed and unalterable. And from this it follows that one important qualification is required of the physician in this work: not only must his own character be irreproachable - ‘As to morals, that goes without saying’, as the hero of Vischer’s novel Auch Einer was in the habit of declaring - but he must also have overcome in his own mind that mixture of prurience and prudery with which, unfortunately, so many people habitually consider sexual problems.

¹[1905d, 1500]
²[1905d, 1552]
Among the institutions which cynical jokes are in the habit of attacking none is more important or more strictly guarded by moral regulations but at the same time more inviting to attack than the institution of marriage, at which, accordingly, the majority of cynical jokes are aimed. There is no more personal claim than that for sexual freedom and at no point has civilization tried to exercise severer suppression than in the sphere of sexuality. A single example will be enough for our purposes - the one mentioned on p. 1678, 'An Entry in Prince Carnival's Album':

Further prospects are opened up when we take into consideration the fact that in man the sexual instinct does not originally serve the purposes of reproduction at all, but has as its aim the gaining of particular kinds of pleasure.¹ It manifests itself in this way in human infancy, during which it attains its aim of gaining pleasure not only from the genitals but from other parts of the body (the erotogenic zones), and can therefore disregard any objects other than these convenient ones. We call this stage the stage of auto-erotism, and the child's upbringing has, in our view, the task of restricting it, because to linger in it would make the sexual instinct uncontrollable and unserviceable later on. The development of the sexual instinct then proceeds from auto-erotism to object-love and from the autonomy of the erotogenic zones to their subordination under the primacy of the genitals, which are put at the service of reproduction. During this development a part of the sexual excitation which is provided by the subject's own body is inhibited as being unserviceable for the reproductive function and in favourable cases is brought to sublimation. The forces that can be employed for cultural activities are thus to a great extent obtained through the suppression of what are known as the perverse elements of sexual excitation.

It is one of the obvious social injustices that the standard of civilization should demand from everyone the same conduct of sexual life - conduct which can be followed without any difficulty by some people, thanks to their organization, but which imposes the heaviest psychical sacrifices on others; though, indeed, the injustice is as a rule wiped out by disobedience to the injunctions of morality.

These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated, the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as perverts, and a number of others, who make efforts not to be perverts whilst constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness.

(3) In what relation do the possible injurious effects of this renunciation stand to its exploitation in the cultural field?
But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

People will not reach a proper understanding of the activities of children's sexuality and will probably take refuge in declaring that what has been said here is incredible, so long as they cling to the attitude taken up by our civilization of depreciating the genitals and the sexual functions. To understand the mental life of children we require analogies from primitive times. Through a long series of generations the genitals have been for us the 'pudenda', objects of shame, and even (as a result of further successful sexual repression) of disgust. If one makes a broad survey of the sexual life of our time and in particular of the classes who sustain human civilization, one is tempted to declare that it is only with reluctance that the majority of those alive to-day obey the command to propagate their kind; they feel that their dignity as human beings suffers and is degraded in the process. What is to be found among us in the way of another view of sexual life is confined to the uncultivated lower strata of society; among the higher and more refined classes it is concealed, since it is considered culturally inferior, and it ventures to put itself into practice only in the face of a bad conscience. In the primaeval days of the human race it was a different story. The laborious compilations of the student of civilization provide convincing evidence that originally the genitals were the pride and hope of living beings; they were worshipped as gods and transmitted the divine nature of their functions to all newly learned human activities. As a result of the sublimation of their basic nature there arose innumerable divinities; and at the time when the connection between official religions and sexual activity was already hidden from the general consciousness, secret cults devoted themselves to keeping it alive among a number of initiates. In the course of cultural development so much of the divine and sacred was ultimately extracted from sexuality that the exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all mental traces, it is surely not surprising that even the most primitive forms of genital-worship can be shown to have existed in very recent times and that the language, customs and superstitions of mankind to-day contain survivals from every phase of this process of development.²

Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psycho-analysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.
The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on
the part of men to debase their sexual object. Both are consequences of the long period of delay,
which is demanded by education for cultural reasons, between sexual maturity and sexual
activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate
and sensual impulses to coalesce. That the effect of the same causes should be so different in
men and in women may perhaps be traced to another difference in the behaviour of the two
sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period
during which they have to wait, and thus they acquire the intimate connection between prohibition
and sexuality. Men usually break through this prohibition if they can satisfy the condition of
debasing the object, and so they carry on this condition into their love in later life.
[1912d, 2344]

The fact that the curb put upon love by civilization involves a universal tendency to debase
sexual objects will perhaps lead us to turn our attention from the object to the instincts
themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact
that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the
same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be
shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes
easy. An obstacle is required in order to heighten libido; and where natural resistances to
satisfaction have not been sufficient men have at all times erected conventional ones so as to be
able to enjoy love. This is true both of individuals and of nations. In times in which there were no
difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the
ancient civilizations, love became worthless and life empty, and strong reaction-formations were
required to restore indispensable affective values. In this connection it may be claimed that the
ascetic current in Christianity created psychical values for love which pagan antiquity was never
able to confer on it. This current assumed its greatest importance with the ascetic monks, whose
lives were almost entirely occupied with the struggle against libidinal temptation.
[1912d, 2344]

Secondly, we know that the sexual instinct is originally divided into a great number of
components - or rather, it develops out of them - some of which cannot be taken up into the
instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These
are above all the coprophilic instinctual components, which have proved incompatible with our
aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised
our organ of smell from the ground. The same is true of a large portion of the sadistic urges which
are a part of erotic life. But all such developmental processes affect only the upper layers of the
complex structure. The fundamental processes which produce erotic excitation remain unaltered.
The excremental is all too intimately and inseparably bound up with the sexual, the position of the
genitals - inter unrinas et faeces - remains the decisive and unchangeable factor. One might say
here, varying a well-known saying of the great Napoleon: ‘Anatomy is destiny.’ The genitals
themselves have not taken part in the development of the human body in the direction of beauty:
they have remained animal, and thus love, too, has remained in essence just as animal as it ever
was. The instincts of love are hard to educate; education of them achieves now too much, now
too little. What civilization aims at making out of them seems unattainable except at the price of a
sensible loss of pleasure; the persistence of the impulses that could not be made use of can be
detected in sexual activity in the form of non-satisfaction.
[1912d, 2346]
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing to-day.

[1912d, 2346]

If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]
After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to esprit de corps and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

[1911c, 2431]

The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but - not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong - and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.

[1912-1913, 2784]
In my experience antipathy to this outcome of psycho-analytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization has been created under the pressure of the exigencies of life at the cost of satisfaction of the instincts; and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of instinctual satisfaction for the benefit of the whole community. Among the instinctual forces which are put to this use the sexual impulses play an important part; in this process they are sublimated - that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement is unstable; the sexual instincts are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual instincts may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual instincts were to be liberated and returned to their original aims. For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual instincts or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psycho-analytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psycho-analysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them.

[1916-1917, 3135]
At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction - but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What does awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so you are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education. For society must undertake as one of its most important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical with the bidding of society. It is also concerned to postpone the full development of the instinct till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct, educability is for practical purposes at an end. Otherwise, the instinct would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, by the eternal, primaeval exigencies of life, which are with us to this day.

If we leave little-known internal urges out of account, we may say that the main motive force towards the cultural development of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of instinctual impulses which could not be satisfied socially. With the further advances of civilization the demands of repression also grew. Civilization is after all built entirely on renunciation of instinct, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psycho-analysis has shown that it is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.
Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization rests upon two pillars, of which one is the control of natural forces and the other the restriction of our instincts. The ruler’s throne rests upon fettered slaves. Among the instinctual components which are thus brought into service, the sexual instincts, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this - and will not allow the topic to be mentioned.

[1925e, 4127]

But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

[1925e, 4127]

Very well. I can now proceed with my exposition. Sexual life is not simply something spicy; it is also a serious scientific problem. There was much that was novel to be learnt about it, many strange things to be explained. I told you just now that analysis has to go back into the early years of the patient's childhood, because the decisive repressions have taken place then, while his ego was feeble. But surely in childhood there is no sexual life? surely it only starts at puberty? On the contrary. We have to learn that sexual instinctual impulses accompany life from birth onwards, and that it is precisely in order to fend off those instincts that the infantile ego institutes repressions. A remarkable coincidence, is it not? that small children should already be struggling against the power of sexuality, just as the speaker in the learned society was to do later, and later still my followers who have set up their own theories. How does that come about? The most general explanation would be that our civilization is built up entirely at the expense of sexuality; but there is much more to be said on the subject.

[1926e, 4352]
It is an odd thing that the regular and essential part of this sexual activity was not overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle. We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.

[1926e, 4359]

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]
This, of course, is an extreme picture. Everybody knows that it has proved impossible to put it into execution, even for quite short periods. Only the weaklings have submitted to such an extensive encroachment upon their sexual freedom, and stronger natures have only done so subject to a compensatory condition, which will be mentioned later. Civilized society has found itself obliged to pass over in silence many transgressions which, according to its own prescripts, it ought to have punished. But we must not err on the other side and assume that, because it does not achieve all its aims, such an attitude on the part of society is entirely innocuous. The sexual life of civilized man is notwithstanding severely impaired; it sometimes gives the impression of being in process of involution as a function, just as our teeth and hair seem to be as organs. One is probably justified in assuming that its importance as a source of feelings of happiness, and therefore in the fulfilment of our aim in life, has sensibly diminished.¹ Sometimes one seems to perceive that it is not only the pressure of civilization but something in the nature of the function itself which denies us full satisfaction and urges us along other paths. This may be wrong; it is hard to decide.²

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.
The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
I know that no one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my *Three Essays on the Theory of Sexuality* in 1905. I there attempted to show that the sexual instinct of man is highly complex and is put together from contributions made by numerous constituents and component instincts. Important contributions to 'sexual excitation' are furnished by the peripheral excitations of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes, nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others - a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' - i.e. from the completion of the fifth year to the first manifestations of puberty (round about the eleventh year) - reaction-formations, or counter-forces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual instincts. Now anal erotism is one of the components of the instinct which, in the course of development and in accordance with the education demanded by our present civilization, have become unserviceable for sexual aims. It is therefore plausible to suppose that these character-traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.²

Yet another circumstance facilitates this equation in neurotic thought. The original erotic interest in defaecation is, as we know, destined to be extinguished in later years. In those years the interest in money makes its appearance as a new interest which had been absent in childhood. This makes it easier for the earlier impulsion, which is in process of losing its aim, to be carried over to the newly emerging aim.

Further prospects are opened up when we take into consideration the fact that in man the sexual instinct does not originally serve the purposes of reproduction at all, but has as its aim the gaining of particular kinds of pleasure.¹ It manifests itself in this way in human infancy, during which it attains its aim of gaining pleasure not only from the genitals but from other parts of the body (the erotogenic zones), and can therefore disregard any objects other than these convenient ones. We call this stage the stage of *auto-erotism*, and the child's upbringing has, in our view, the task of restricting it, because to linger in it would make the sexual instinct uncontrollable and unserviceable later on. The development of the sexual instinct then proceeds from auto-erotism to object-love and from the autonomy of the erotogenic zones to their subordination under the primacy of the genitals, which are put at the service of reproduction. During this development a part of the sexual excitation which is provided by the subject's own body is inhibited as being unserviceable for the reproductive function and in favourable cases is brought to sublimation. The forces that can be employed for cultural activities are thus to a great extent obtained through the suppression of what are known as the *perverse* elements of sexual excitation.

[1908b, 1943]

[1908b, 1945]

[1908d, 1953]
These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated, the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as perverts, and a number of others, who make efforts not to be perverts whilst constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness.

[1908d, 1955]

(1) What is the task that is set to the individual by the requirements of the third stage of civilization?
[1908d, 1956]

(2) Can the legitimate sexual satisfaction that is permissible offer acceptable compensation for the renunciation of all other satisfactions?
[1908d, 1956]

It is inevitable and perfectly normal that a child should take his parents as the first objects of his love. But his libido should not remain fixated to these first objects; later on, it should merely take them as a model, and should make a gradual transition from them on to extraneous people when the time for the final choice of an object arrives. The detachment of the child from his parents is thus a task that cannot be evaded if the young individual's social fitness is not to be endangered. During the time at which repression is making its selection among the component instincts, and later, when there should be a slackening of the parents' influence, which is essentially responsible for the expenditure of energy on these repressions, the task of education meets with great problems, which at the present time are certainly not always dealt with in an understanding and unobjectionable manner.

[1910a, 2233]

We must expressly insist that we have never reckoned Leonardo as a neurotic or a 'nerve case', as the awkward phrase goes. Anyone who protests at our so much as daring to examine him in the light of discoveries gained in the field of pathology is still clinging to prejudices which we have to-day rightly abandoned. We no longer think that health and illness, normal and neurotic people, are to be sharply distinguished from each other, and that neurotic traits must necessarily be taken as proofs of a general inferiority. To-day we know that neurotic symptoms are structures which are substitutes for certain achievements of repression that we have to carry out in the course of our development from a child to a civilized human being. We know too that we all produce such substitutive structures, and that it is only their number, intensity and distribution which justify us in using the practical concept of illness and in inferring the presence of constitutional inferiority. From the slight indications we have about Leonardo's personality we should be inclined to place him close to the type of neurotic that we describe as 'obsessional'; and we may compare his researches to the 'obsessive brooding' of neurotics, and his inhibitions to what are known as their 'abulias'.

[1910c, 2300]
Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psychoanalysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - *inter urinias et faeces* - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

[1910d, 2311]

[1912d, 2346]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fend's them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]

It is far from being a simple matter to survey or describe the consequences involved in this way of treating the 'distressing trace of the Earth', of which the sexual and excretory functions may be considered the nucleus. It will be enough to mention a single one of these consequences, the one with which we are most concerned here: the fact that science is prohibited from dealing with these proscribed aspects of human life, so that anyone who studies such things is regarded as scarcely less 'improper' than someone who actually does improper things.

[1913k, 2640]
Nevertheless, psycho-analysis and folklore have not allowed themselves to be deterred from transgressing these prohibitions and have been able as a result to teach us all kinds of things that are indispensable for an understanding of human nature. If we limit ourselves here to what has been learnt about the excretory functions, it may be said that the chief finding from psycho-analytic research has been the fact that the human infant is obliged to recapitulate during the early part of his development the changes in the attitude of the human race towards excremental matters which probably had their start when *homo sapiens* first raised himself off Mother Earth. In the earliest years of infancy there is as yet no trace of shame about the excretory functions or of disgust at excreta. Small children show great interest in these, just as they do in others of their bodily secretions; they like occupying themselves with them and can derive many kinds of pleasure from doing so. Excreta, regarded as parts of a child's own body and as products of his own organism, have a share in the esteem - the narcissistic esteem, as we should call it - with which he regards everything relating to his self. Children are, indeed, proud of their own excretions and make use of them to help in asserting themselves against adults. Under the influence of its upbringing, the child's coprophilic instincts and inclinations gradually succumb to repression; it learns to keep them secret, to be ashamed of them and to feel disgust at their objects. Strictly speaking, however, the disgust never goes so far as to apply to a child's own excretions, but is content with repudiating them when they are the products of other people. The interest which has hitherto been attached to excrement is carried over on to other objects - for instance, from faeces on to money, which is, of course, late in acquiring significance for children. Important constituents in the formation of character are developed, or strengthened, from the repression of coprophilic inclinations.

If we examine sexuality in the adult with the help of psycho-analysis, and consider the life of children in the light of the knowledge thus gained, we perceive that sexuality is not merely a function serving the purposes of reproduction, on a par with digestion, respiration, etc. It is something far more independent, which stands in contrast to all the individual's other activities and is only forced into an alliance with the individual's economy after a complicated course of development involving the imposition of numerous restrictions. Cases, theoretically quite conceivable, in which the interests of these sexual impulses fail to coincide with the self-preservation of the individual seem actually to be presented by the group of neurotic illnesses. For the final formula which psycho-analysis has arrived at on the nature of the neuroses runs thus: The primal conflict which leads to neuroses is one between the sexual instincts and those which maintain the ego. The neuroses represent a more or less partial overpowering of the ego by sexuality after the ego's attempts at suppressing sexuality have failed.

The revolutionary discoveries of psycho-analysis in regard to the mental life of children - the part played in it by sexual impulses (von Hug-Hellmuth), and the fate of those components of sexuality which become unserviceable in the function of reproduction - were bound early to direct attention to education and to stimulate an attempt to bring analytic points of view into the foreground in that field of work. Recognition is due to Dr. Pfister for having, with sincere enthusiasm, initiated the application of psycho-analysis in this direction and brought it to the notice of ministers of religion and those concerned with education. (Cf. *The Psycho-Analytic Method*, 1913.) He has succeeded in gaining the sympathy and participation of a number of Swiss teachers in this. Other members of his profession are said to share his views but to have preferred nevertheless to remain cautiously in the background. In their retreat from psycho-analysis, a section of Vienna analysts seem to have arrived at a kind of combination of medicine and education.
In forming this opinion of sensual sucking we have already become acquainted with two decisive characteristics of infantile sexuality. It makes its appearance attached to the satisfaction of the major organic needs, and it behaves *auto-erotically* - that is, it seeks and finds its objects in the infant's own body. What has been shown most clearly in connection with the intake of nourishment is repeated in part with the excretions. We conclude that infants have feelings of pleasure in the process of evacuating urine and faeces and that they soon contrive to arrange those actions in such a way as to bring them the greatest possible yield of pleasure through the corresponding excitations of the erotogenic zones of the mucous membrane. It is here for the first time (as Lou Andreas-Salomé has subtly perceived) that they encounter the external world as an inhibiting power, hostile to their desire for pleasure, and have a glimpse of later conflicts both external and internal. An infant must not produce his excreta at whatever moment he chooses, but when other people decide that he shall. In order to induce him to forgo these sources of pleasure, he is told that everything that has to do with these functions is improper and must be kept secret. This is where he is first obliged to exchange pleasure for social respectability. To begin with, his attitude to his excreta themselves is quite different. He feels no disgust at his faeces, values them as a portion of his own body with which he will not readily part, and makes use of them as his first 'gift', to distinguish people whom he values especially highly. Even after education has succeeded in its aim of making these inclinations alien to him, he carries on his high valuation of faeces in his estimate of 'gifts' and 'money'. On the other hand he seems to regard his achievements in urinating with peculiar pride.

[1916-1917, 3385]

The things I have just been discussing, Gentlemen, compel me to enter more closely into the origin and significance of the mental activity which is described as 'phantasy'. As you are aware, it enjoys a universally high reputation, without its position in mental life having become clear. I have the following remarks to make about it. The human ego is, as you know, slowly educated by the pressure of external necessity to appreciate reality and obey the reality principle; in the course of this process it is obliged to renounce, temporarily or permanently, a variety of the objects and aims at which its striving for pleasure, and not only for sexual pleasure, is directed. But men have always found it hard to renounce pleasure; they cannot bring themselves to do it without some kind of compensation. They have therefore retained a mental activity in which all these abandoned sources of pleasure and methods of achieving pleasure are granted a further existence - a form of existence in which they are left free from the claims of reality and of what we call 'reality-testing'. Every desire takes before long the form of picturing its own fulfilment; there is no doubt that dwelling upon imaginary wish-fulfilments brings satisfaction with it, although it does not interfere with a knowledge that what is concerned is not real. Thus in the activity of phantasy human beings continue to enjoy the freedom from external compulsion which they have long since renounced in reality. They have contrived to alternate between remaining an animal of pleasure and being once more a creature of reason. Indeed, they cannot subsist on the scanty satisfaction which they can extort from reality. 'We cannot do without auxiliary constructions', as Theodor Fontane once said. The creation of the mental realm of phantasy finds a perfect parallel in the establishment of 'reservations' or 'nature reserves' in places where the requirements of agriculture, communications and industry threaten to bring about changes in the original face of the earth which will quickly make it unrecognizable. A nature reserve preserves its original state which everywhere else has to our regret been sacrificed to necessity. Everything, including what is useless and even what is noxious, can grow and proliferate there as it pleases. The mental realm of phantasy is just such a reservation withdrawn from the reality principle.

[1916-1917, 3427]
The theory of psycho-analysis (a theory based on observation) holds firmly to the view that the motive forces of repression must not be sexualized. Man's archaic heritage forms the nucleus of the unconscious mind; and whatever part of that heritage has to be left behind in the advance to later phases of development, because it is unserviceable or incompatible with what is new and harmful to it, falls a victim to the process of repression. This selection is made more successfully with one group of instincts than with the other. In virtue of special circumstances which have often been pointed out already, the latter group, that of the sexual instincts, are able to defeat the intentions of repression, and to enforce their representation by substitutive formations of a disturbing kind. For this reason infantile sexuality, which is held under repression, acts as the chief motive force in the formation of symptoms; and the essential part of its content, the Oedipus complex, is the nuclear complex of neuroses. I hope that in this paper I have raised an expectation that the sexual aberrations of childhood, as well as those of mature life, are ramifications of the same complex.

[1919e, 3662]

For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history - an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]
In 1913 Otto Rank and Hanns Sachs, in an extremely interesting work, brought together the results which had been achieved up to that time in the application of psycho-analysis to the mental sciences. The most easily accessible branches of those sciences seem to be mythology and the history of literature and religion. No final formula has yet been found enabling us to give an appropriate place to myths in this connection. Otto Rank, in a large volume on the incest complex (1912), has produced evidence of the surprising fact that the choice of subject matter, especially for dramatic works, is principally determined by the ambit of what psycho-analysis has termed the 'Oedipus complex'. By working it over with the greatest variety of modifications, distortions and disguises, the dramatist seeks to deal with his own most personal relations to this emotional theme. It is in attempting to master the Oedipus complex - that is to say, a person's emotional attitude towards his family, or in a narrower sense towards his father and mother - that individual neurotics come to grief, and for this reason that complex habitually forms the nucleus of their neuroses. It does not owe its importance to any unintelligible conjunction; the emphasis upon the relation of children to their parents is an expression of the biological facts that the young of the human race pass through a long period of dependence and are slow in reaching maturity, as well as that their capacity for love undergoes a complicated course of development. Consequently, the overcoming of the Oedipus complex coincides with the most efficient way of mastering the archaic, animal heritage of humanity. It is true that that heritage comprises all the forces that are required for the subsequent cultural development of the individual, but they must first be sorted out and worked over. This archaic heirloom is not fit to be used for the purposes of civilized social life in the form in which it is inherited by the individual.

[1919g, 3704]

There can be no doubt, however, that the replacement of the pleasure principle by the reality principle can only be made responsible for a small number, and by no means the most intense, of unpleasurable experiences. Another occasion of the release of unpleasure, which occurs with no less regularity, is to be found in the conflicts and dissensions that take place in the mental apparatus while the ego is passing through its development into more highly composite organizations. Almost all the energy with which the apparatus is filled arises from its innate instinctual impulses. But these are not all allowed to reach the same phases of development. In the course of things it happens again and again that individual instincts or parts of instincts turn out to be incompatible in their aims or demands with the remaining ones, which are able to combine into the inclusive unity of the ego. The former are then split off from this unity by the process of repression, held back at lower levels of psychical development and cut off, to begin with, from the possibility of satisfaction. If they succeed subsequently, as can so easily happen with repressed sexual instincts, in struggling through, by roundabout paths, to a direct or to a substitutive satisfaction, that event, which would in other cases have been an opportunity for pleasure, is felt by the ego as unpleasure. As a consequence of the old conflict which ended in repression, a new breach has occurred in the pleasure principle at the very time when certain instincts were endeavouring, in accordance with the principle, to obtain fresh pleasure. The details of the process by which repression turns a possibility of pleasure into a source of unpleasure are not yet clearly understood or cannot be clearly represented; but there is no doubt that all neurotic unpleasure is of that kind - pleasure that cannot be felt as such.¹

[1920g, 3717]
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹ Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

¹[1930a, 4494]
The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here - that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual instinct by any other means than satisfying it is one which can call for the whole of a man's forces. Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of to-day; for we know no better safe-guard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; instincts which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions.

[1908d, 1956]

We already know that neurotic symptoms are the outcome of a conflict which arises over a new method of satisfying the libido. The two forces which have fallen out meet once again in the symptom and are reconciled, as it were, by the compromise of the symptom that has been constructed. It is for that reason, too, that the symptom is so resistant: it is supported from both sides. We also know that one of the two partners to the conflict is the unsatisfied libido which has been repulsed by reality and must now seek for other paths to its satisfaction. If reality remains relentless even though the libido is ready to take another object in place of the one that has been refused to it, then it will finally be compelled to take the path of regression and strive to find satisfaction either in one of the organizations which it has already outgrown or from one of the objects which it has earlier abandoned. The libido is lured into the path of regression by the fixation which it has left behind it at these points in its development.

[1916-1917, 3417]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

LADIES AND GENTLEMEN, - We have repeatedly (and only recently once again) had to deal with the distinction between the ego-instincts and the sexual instincts. In the first place, repression showed us that the two can come into opposition to each other, that the sexual instincts are then ostensibly subdued and are obliged to find satisfaction for themselves along regressive and roundabout paths, and that in doing so they are able to find compensation for their defeat in their indomitability. We next learnt that the two kinds of instincts are from the first differently related to Necessity the educator, so that their course of development is not the same and they do not enter into the same connection with the reality principle. Lastly, we seem to have found that the sexual instincts are linked by much closer bonds than the ego-instincts to the affective state of anxiety - a conclusion which seems incomplete in only one important respect. In order to establish it more firmly, therefore, I will bring forward the further noteworthy fact that if hunger and thirst (the two most elementary self-preservative instincts) are unsatisfied, the result is never their transformation into anxiety, whereas the changing of unsatisfied libido into anxiety is, as we have seen, among the best known and most frequently observed of phenomena.
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them.
The theory of psycho-analysis (a theory based on observation) holds firmly to the view that the motive forces of repression must not be sexualized. Man's archaic heritage forms the nucleus of the unconscious mind; and whatever part of that heritage has to be left behind in the advance to later phases of development, because it is unserviceable or incompatible with what is new and harmful to it, falls a victim to the process of repression. This selection is made more successfully with one group of instincts than with the other. In virtue of special circumstances which have often been pointed out already, the latter group, that of the sexual instincts, are able to defeat the intentions of repression, and to enforce their representation by substitutive formations of a disturbing kind. For this reason infantile sexuality, which is held under repression, acts as the chief motive force in the formation of symptoms; and the essential part of its content, the Oedipus complex, is the nuclear complex of neuroses. I hope that in this paper I have raised an expectation that the sexual aberrations of childhood, as well as those of mature life, are ramifications of the same complex.

[1919e, 3662]

There can be no doubt, however, that the replacement of the pleasure principle by the reality principle can only be made responsible for a small number, and by no means the most intense, of unpleasurable experiences. Another occasion of the release of unpleasure, which occurs with no less regularity, is to be found in the conflicts and dissensions that take place in the mental apparatus while the ego is passing through its development into more highly composite organizations. Almost all the energy with which the apparatus is filled arises from its innate instinctual impulses. But these are not all allowed to reach the same phases of development. In the course of things it happens again and again that individual instincts or parts of instincts turn out to be incompatible in their aims or demands with the remaining ones, which are able to combine into the inclusive unity of the ego. The former are then split off from this unity by the process of repression, held back at lower levels of psychical development and cut off, to begin with, from the possibility of satisfaction. If they succeed subsequently, as can so easily happen with repressed sexual instincts, in struggling through, by roundabout paths, to a direct or to a substitutive satisfaction, that event, which would in other cases have been an opportunity for pleasure, is felt by the ego as unpleasure. As a consequence of the old conflict which ended in repression, a new breach has occurred in the pleasure principle at the very time when certain instincts were endeavouring, in accordance with the principle, to obtain fresh pleasure. The details of the process by which repression turns a possibility of pleasure into a source of unpleasure are not yet clearly understood or cannot be clearly represented; but there is no doubt that all neurotic unpleasure is of that kind - pleasure that cannot be felt as such.¹

[1920g, 3717]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction- formations, which are assurances against sexual satisfaction. [1923a, 3923]

Contrast between Sexual and Ego Instincts. - Psycho-analysis early became aware that all mental occurrences must be regarded as built on the basis of an interplay of the forces of the elementary instincts. This, however, led to a difficult predicament, since psychology included no theory of the instincts. No one could say what an instinct really was, the question was left entirely to individual caprice, and every psychologist was in the habit of postulating any instincts in any number that he chose. The first sphere of phenomena to be studied by psycho-analysis comprised what are known as the transference neuroses (hysteria and obsessional neurosis). It was found that their symptoms came about by sexual instinctual impulses being rejected (repressed) by the subject's personality (his ego) and then finding expression by circuitous paths through the unconscious. These facts could be met by drawing a contrast between the sexual instincts and ego instincts (instincts of self-preservation), which was in line with the popular saying that hunger and love are what make the world go round: libido was the manifestation of the force of love in the same sense as was hunger of the self-preservative instinct. The nature of the ego instincts remained for the time being undefined and, like all the other characteristics of the ego, inaccessible to analysis. There was no means of deciding whether, and if so what, qualitative differences were to be assumed to exist between the two classes of instincts. [1923a, 3931]

In a far greater number of cases the neurosis is more autonomous and more independent of the interests of self-preservation and self-maintenance. In the conflict which creates the neurosis, what are at stake are either solely libidinal interests or libidinal interests in intimate connections with self-preservative ones. In all three instances the dynamics of the neurosis are the same. A dammed-up libido which cannot be satisfied in reality succeeds, with the help of a regression to old fixations, in finding discharge through the repressed unconscious. The sick man's ego, in so far as it can extract a 'gain from illness' out of this process, countenances the neurosis, although there can be no doubt of its injuriousness in its economic aspect. [1923d, 4027]
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the antithesis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

It looked as though our work had been made much more difficult and complicated; but the inestimable gain was that an insight was now obtained into an interplay of forces which had been concealed from the observer by the hypnotic state. It became evident that the work of uncovering what had been pathogenically forgotten had to struggle against a constant and very intense resistance. The critical objections which the patient raised in order to avoid communicating the ideas which occurred to him, and against which the fundamental rule of psycho-analysis was directed, had themselves already been manifestations of this resistance. A consideration of the phenomena of resistance led to one of the corner-stones of the psychoanalytic theory of the neuroses - the theory of repression. It was plausible to suppose that the same forces which were now struggling against the pathogenic material being made conscious had at an earlier time made the same efforts with success. A gap in the aetiology of neurotic symptoms was thus filled. The impressions and mental impulses, for which the symptoms were now serving as substitutes, had not been forgotten without reason or on account of a constitutional incapacity for synthesis (as Janet supposed); they had, though the influence of other mental forces, met with a repression the success and evidence of which was precisely their being debarred from consciousness and excluded from memory. It was only in consequence of this repression that they had become pathogenic - that is, had succeeded in manifesting themselves along unusual paths as symptoms.
If we leave little-known internal urges out of account, we may say that the main motive force towards the cultural development of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of instinctual impulses which could not be satisfied socially. With the further advances of civilization the demands of repression also grew. Civilization is after all built entirely on renunciation of instinct, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psycho-analysis has shown that it is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.

[1924f, 4116]

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

[1926f, 4405]

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

[1930a, 4500]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instincual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instincual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instincual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
As regards the second kind of emotional reaction, which is not directed against me this time, but against my patient - supposing that my view of her is correct - and which regards the perverse nature of her phantasies as horrible, I should like to say emphatically that a medical man has no business to indulge in such passionate condemnation. I may also remark in passing that it seems to me superfluous for a physician who is writing upon the aberrations of the sexual instincts to seize every opportunity of inserting into the text expressions of his personal repugnance at such revolting things. We are faced by a fact; and it is to be hoped that we shall grow accustomed to it, when we have put our own tastes on one side. We must learn to speak without indignation of what we call the sexual perversions - instances in which the sexual function has extended its limits in respect either to the part of the body concerned or to the sexual object chosen. The uncertainty in regard to the boundaries of what is to be called normal sexual life, when we take different races and different epochs into account, should in itself be enough to cool the zealot's ardour. We surely ought not to forget that the perversion which is the most repellant to us, the sensual love of a man for a man, was not only tolerated by a people so far our superiors in cultivation as were the Greeks, but was actually entrusted by them with important social functions. The sexual life of each one of us extends to a slight degree - now in this direction, now in that - beyond the narrow lines imposed as the standard of normality. The perversions are neither bestial nor degenerate in the emotional sense of the word. They are a development of germs all of which are contained in the undifferentiated sexual disposition of the child, and which, by being suppressed or by being diverted to higher, asexual aims - by being 'sublimated' - are destined to provide the energy for a great number of our cultural achievements. When, therefore, any one has become a gross and manifest pervert, it would be more correct to say that he has remained one, for he exhibits a certain stage of inhibited development. All psychoneurotics are persons with strongly marked perverse tendencies, which have been repressed in the course of their development and have become unconscious. Consequently their unconscious phantasies show precisely the same content as the documentarily recorded actions of perverts - even though they have not read Krafft-Ebing's Psychopathia Sexualis, to which simple-minded people attribute such a large share of the responsibility for the production of perverse tendencies. Psychoneuroses are, so to speak, the negative of perversions. In neurotics their sexual constitution, under which the effects of heredity are included, operates in combination with any accidental influences in their life which may disturb the development of normal sexuality. A stream of water which meets with an obstacle in the river-bed is dammed up and flows back into old channels which had formerly seemed fated to run dry. The motive forces leading to the formation of hysterical symptoms draw their strength not only from repressed normal sexuality but also from unconscious perverse activities.¹

[1905e, 1387]
But when a group is formed the whole of this intolerance vanishes, temporarily or permanently, within the group. So long as a group formation persists or so far as it extends, individuals in the group behave as though they were uniform, tolerate the peculiarities of its other members, equate themselves with them, and have no feeling of aversion towards them. Such a limitation of narcissism can, according to our theoretical views, only be produced by one factor, a libidinal tie with other people. Love for oneself knows only one barrier - love for others, love for objects.² The question will at once be raised whether community of interest in itself, without any addition of libido, must not necessarily lead to the toleration of other people and to considerateness for them. This objection may be met by the reply that nevertheless no lasting limitation of narcissism is effected in this way, since this tolerance does not persist longer than the immediate advantage gained from the other people's collaboration. But the practical importance of this discussion is less than might be supposed, for experience has shown that in cases of collaboration libidinal ties are regularly formed between the fellow-workers which prolong and solidify the relation between them to a point beyond what is merely profitable. The same thing occurs in men's social relations as has become familiar to psycho-analytic research in the course of the development of the individual libido. The libido attaches itself to the satisfaction of the great vital needs, and chooses as its first objects the people who have a share in that process. And in the development of mankind as a whole, just as in individuals, love alone acts as the civilizing factor in the sense that it brings a change from egoism to altruism. And this is true both of sexual love for women, with all the obligations which it involves of not harming the things that are dear to women, and also of desexualized, sublimated homosexual love for other men, which springs from work in common. [1921c, 3795]

It will be noticed, however, that by introducing this other mechanism of changing love into hate, we have tacitly made another assumption which deserves to be stated explicitly. We have reckoned as though there existed in the mind - whether in the ego or in the id - a displaceable energy, which, neutral in itself, can be added to a qualitatively differentiated erotic or destructive impulse, and augment its total cathexis. Without assuming the existence of a displaceable energy of this kind we can make no headway. The only question is where it comes from, what it belongs to, and what it signifies. [1923b, 3978]
In the present discussion, moreover, I am only putting forward a hypothesis; I have no proof to offer. It seems a plausible view that this displaceable and neutral energy, which is no doubt active in both the ego and in the id, proceeds from the narcissistic store of libido - that it is desexualized Eros. (The erotic instincts appear to be altogether more plastic, more readily diverted and displaced than the destructive instincts.) From this we can easily go on to assume that this displaceable libido is employed in the service of the pleasure principle to obviate blockages and to facilitate discharge. In this connection it is easy to observe a certain indifference as to the path along which the discharge takes place, so long as it takes place somehow. We know this trait; it is characteristic of the cathetic processes in the id. It is found in erotic cathexes, where a peculiar indifference in regard to the object displays itself; and it is especially evident in the transferences arising in analysis, which develop inevitably, irrespective of the persons who are their object. Not long ago Rank published some good examples of the way in which neurotic acts of revenge can be directed against the wrong people. Such behaviour on the part of the unconscious reminds one of the comic story of the three village tailors, one of whom had to be hanged because the only village blacksmith had committed a capital offence. Punishment must be exacted even if it does not fall upon the guilty. It was in studying the dream-work that we first came upon this kind of looseness in the displacements brought about by the primary process. In that case it was the objects that were thus relegated to a position of no more than secondary importance, just as in the case we are now discussing it is the paths of discharge. It would be characteristic of the ego to be more particular about the choice both of an object and of a path of discharge.

If this displaceable energy is desexualized libido, it may also be described as sublimated energy; for it would still retain the main purpose of Eros - that of uniting and binding - in so far as it helps towards establishing the unity, or tendency to unity, which is particularly characteristic of the ego. If thought processes in the wider sense are to be included among these displacements, then the activity of thinking is also supplied from the sublimation of erotic motive forces.

Here we arrive again at the possibility which has already been discussed that sublimation may take place regularly, through the mediation of the ego. The other case will be recollected, in which the ego deals with the first object-cathexes of the id (and certainly with later ones too) by taking over the libido from them into itself and binding it to the alteration of the ego produced by means of identification. The transformation into ego-libido of course involves an abandonment of sexual aims, a desexualization. In any case this throws light upon an important function of the ego in its relation to Eros. By thus getting hold of the libido from the object-cathexes, setting itself up as sole love-object, and desexualizing or sublimating the libido of the id, the ego is working in opposition to the purposes of Eros and placing itself at the service of the opposing instinctual impulses. It has to acquiesce in some of the other object-cathexes of the id; it has, so to speak, to participate in them. We shall come back later to another possible consequence of this activity of the ego.

I cannot go further in my consideration of these questions without introducing a fresh hypothesis. The super-ego arises, as we know, from an identification with the father taken as a model. Every such identification is in the nature of a desexualization or even of a sublimation. It now seems as though when a transformation of this kind takes place, an instinctual defusion occurs at the same time. After sublimation the erotic component no longer has the power to bind the whole of the destructiveness that was combined with it, and this is released in the form of an inclination to aggression and destruction. This defusion would be the source of the general character of harshness and cruelty exhibited by the ideal - its dictatorial 'Thou shalt'.

I have described elsewhere how this turning away takes place. The object-cathexes are given up and replaced by identifications. The authority of the father or the parents is introjected into the ego, and there it forms the nucleus of the super-ego, which takes over the severity of the father and perpetuates his prohibition against incest, and so secures the ego from the return of the libidinal object-cathexis. The libidinal trends belonging to the Oedipus complex are in part desexualized and sublimated (a thing which probably happens with every transformation into an identification) and in part inhibited in their aim and changed into impulses of affection. The whole process has, on the one hand, preserved the genital organ - has averted the danger of its loss - and, on the other, has paralysed it - has removed its function. This process ushers in the latency period, which now interrupts the child's sexual development. [1924d, 4088]

In this secondary defensive struggle the ego presents two faces with contradictory expressions. The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization. It is based on the maintenance of free intercourse and of the possibility of reciprocal influence between all its parts. Its desexualized energy still shows traces of its origin in its impulsion to bind together and unify, and this necessity to synthesize grows stronger in proportion as the strength of the ego increases. It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and alien by using every possible method to bind them to itself in one way or another, and to incorporate them into its organization by means of those bonds. As we know, a tendency of this kind is already operative in the very act of forming a symptom. A classical instance of this are those hysterical symptoms which have been shown to be a compromise between the need for satisfaction and the need for punishment. Such symptoms participate in the ego from the very beginning, since they fulfil a requirement of the super-ego, while on the other hand they represent positions occupied by the repressed and points at which an irruption has been made by it into the ego-organization. They are a kind of frontier-station with a mixed garrison. (Whether all primary hysterical symptoms are constructed on these lines would be worth enquiring into very carefully.) The ego now proceeds to behave as though it recognized that the symptom had come to stay and that the only thing to do was to accept the situation in good part and draw as much advantage from it as possible. It makes an adaptation to the symptom - to this piece of the internal world which is alien to it - just as it normally does to the real external world. It can always find plenty of opportunities for doing so. The presence of a symptom may entail a certain impairment of capacity, and this can be exploited to appease some demand on the part of the super-ego or to refuse some claim from the external world. In this way the symptom gradually comes to be the representative of important interests; it is found to be useful in asserting the position of the self and becomes more and more closely merged with the ego and more and more indispensable to it. It is only very rarely that the physical process of 'healing' round a foreign body follows such a course as this. There is a danger, too, of exaggerating the importance of a secondary adaptation of this kind to a symptom, and of saying that the ego has created the symptom merely in order to enjoy its advantages. It would be equally true to say that a man who had lost his leg in the war had got it shot away so that he might thenceforward live on his pension without having to do any more work. [1926d, 4259]
The objection to this view arose from our coming to regard the ego as the sole seat of anxiety. It was one of the results of the attempt at a structural division of the mental apparatus which I made in *The Ego and the Id*. Whereas the old view made it natural to suppose that anxiety arose from the libido belonging to the repressed instinctual impulses, the new one, on the contrary, made the ego the source of anxiety. Thus it is a question of instinctual (id-) anxiety or ego-anxiety. Since the energy which the ego employs is desexualized, the new view also tended to weaken the close connection between anxiety and libido. I hope I have at least succeeded in making the contradiction plain and in giving a clear idea of the point in doubt.

[1926d, 4314]

We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of *loss of love* which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these *détours* they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
The sexual instinct - or, more correctly, the sexual instincts, for analytic investigation teaches us that the sexual instinct is made up of many separate constituents or component instincts - is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capacity for sublimation. In contrast to this displaceability, in which its value for civilization lies, the sexual instinct may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual instinct probably varies in each individual; certainly the proportion of it which is suitable for sublimation varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual instinct it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective quality of unpleasure, must be regarded as an illness.

In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or inverteds, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation.

A second outcome of the work of psycho-analysis is that it then becomes possible for the unconscious instincts revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called 'sublimation', in which the energy of the infantile wishful impulses is not cut off but remains ready for use - the unserviceable aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the sexual instinct that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed instinct impossible; when the repression is lifted, the path to sublimation becomes free once more.
Observation of men's daily lives shows us that most people succeed in directing very considerable portions of their sexual instinctual forces to their professional activity. The sexual instinct is particularly well fitted to make contributions of this kind since it is endowed with a capacity for sublimation: that is, it has the power to replace its immediate aim by other aims which may be valued more highly and which are not sexual. We accept this process as proved whenever the history of a person's childhood - that is, the history of his mental development - shows that in childhood this over-powerful instinct was in the service of sexual interests. We find further confirmation if a striking atrophy occurs in the sexual life of maturity, as though a portion of sexual activity had now been replaced by the activity of the over-powerful instinct.

In virtue of a special disposition, the third type, which is the rarest and most perfect, escapes both inhibition of thought and neurotic compulsive thinking. It is true that here too sexual repression comes about, but it does not succeed in relegating a component instinct of sexual desire to the unconscious. Instead, the libido evades the fate of repression by being sublimated from the very beginning into curiosity and by becoming attached to the powerful instinct for research as a reinforcement. Here, too, the research becomes to some extent compulsive and a substitute for sexual activity; but owing to the complete difference in the underlying psychical processes (sublimation instead of an irruption from the unconscious ) the quality of neurosis is absent; there is no attachment to the original complexes of infantile sexual research, and the instinct can operate freely in the service of intellectual interest. Sexual repression, which has made the instinct so strong through the addition to it of sublimated libido, is still taken into account by the instinct, in that it avoids any concern with sexual themes.

A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual instinct could be sublimated into a general urge to know, and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual instinct made to Leonardo's mental life.
But even if the historical material at our disposal were very abundant, and if the psychical mechanisms could be dealt with with the greatest assurance, there are two important points at which a psycho-analytic enquiry would not be able to make us understand how inevitable it was that the person concerned should have turned out in the way he did and in no other way. In Leonardo’s case we have had to maintain the view that the accident of his illegitimate birth and the excessive tenderness of his mother had the most decisive influence on the formation of his character and on his later fortune, since the sexual repression which set in after this phase of childhood caused him to sublimate his libido into the urge to know, and established his sexual inactivity for the whole of his later life. But this repression after the first erotic satisfactions of childhood need not necessarily have taken place; in someone else it might perhaps not have taken place or might have assumed much less extensive proportions. We must recognize here a degree of freedom which cannot be resolved any further by psycho-analytic means. Equally, one has no right to claim that the consequence of this wave of repression was the only possible one. It is probable that another person would not have succeeded in withdrawing the major portion of his libido from repression by sublimating it into a craving for knowledge; under the same influences he would have sustained a permanent injury to his intellectual activity or have acquired an insurmountable disposition to obsessional neurosis. We are left, then, with these two characteristics of Leonardo which are inexplicable by the efforts of psycho-analysis: his quite special tendency towards instinctual repressions, and his extraordinary capacity for sublimating the primitive instincts.

[1910c, 2303]

Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego' - a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]
Let us start with the latter, the scientific errors. The doctor’s advice to the lady shows clearly in what sense he understands the expression ‘sexual life’ - in the popular sense, namely, in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of the sexual substances. He cannot have remained unaware, however, that psycho-analysis is commonly reproached with having extended the concept of what is sexual far beyond its usual range. The fact is undisputed; I shall not discuss here whether it may justly be used as a reproach. In psycho-analysis the concept of what is sexual comprises far more; it goes lower and also higher than its popular sense. This extension is justified genetically; we reckon as belonging to ‘sexual life’ all the activities of the tender feelings which have primitive sexual impulses as their source, even when those impulses have become inhibited in regard to their original sexual aim or have exchanged this aim for another which is no longer sexual. For this reason we prefer to speak of psychosexuality, thus laying stress on the point that the mental factor in sexual life should not be overlooked or underestimated. We use the word ‘sexuality’ in the same comprehensive sense as that in which the German language uses the word *lieben* ['to love']. We have long known, too, that mental absence of satisfaction with all its consequences can exist where there is no lack of normal sexual intercourse; and as therapists we always bear in mind that the unsatisfied sexual trends (whose substitutive satisfactions in the form of nervous symptoms we combat) can often find only very inadequate outlet in coitus or other sexual acts.
[1910k, 2375]

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as ‘attached’ components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to *esprit de corps* and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.
[1911c, 2431]
In my experience antipathy to this outcome of psycho-analytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization has been created under the pressure of the exigencies of life at the cost of satisfaction of the instincts; and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of instinctual satisfaction for the benefit of the whole community. Among the instinctual forces which are put to this use the sexual impulses play an important part; in this process they are sublimated - that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement is unstable; the sexual instincts are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual instincts may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual instincts were to be liberated and returned to their original aims. For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual instincts or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psycho-analytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psycho-analysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them. [1916-1917, 3135]

In further pursuing the discussion of this thesis, are we to consider the nature of the frustration or the peculiar character of those who are affected by it? It is extremely seldom, after all, that frustration is universal and absolute. In order to operate pathogenically it must no doubt affect the mode of satisfaction which alone the subject desires, of which alone he is capable. There are in general very many ways of tolerating deprivation of libidinal satisfaction without falling ill as a result. In the first place, we know people who are able to put up with a deprivation of this kind without being injured: they are not happy, they suffer from longing, but they do not fall ill. Next, we must bear in mind that the sexual instinctual impulses in particular are extraordinarily plastic, if I may so express it. One of them can take the place of another, one of them can take over another's intensity; if the satisfaction of one of them is frustrated by reality, the satisfaction of another can afford complete compensation. They are related to one another like a network of intercommunicating channels filled with a liquid; and this is so in spite of their being subject to the primacy of the genitals - a state of affairs that is not at all easily combined in a single picture. Further, the component instincts of sexuality, as well as the sexual current which is compounded from them, exhibit a large capacity for changing their object, for taking another in its place - and one, therefore, that is more easily attainable. This displaceability and readiness to accept a substitute must operate powerfully against the pathogenic effect of a frustration. Among these protective processes against falling ill owing to deprivation there is one which has gained special cultural significance. It consists in the sexual trend abandoning its aim of obtaining a component or a reproductive pleasure and taking on another which is related genetically to the abandoned one but is itself no longer sexual and must be described as social. We call this process 'sublimation', in accordance with the general estimate that places social aims higher than the sexual ones, which are at bottom self-interested. Sublimation is, incidentally, only a special case of the way in which sexual trends are attached to other, non-sexual ones. We shall have to discuss it again in another connection. [1916-1917, 3408]
You will no doubt have observed that in these last discussions I have introduced a fresh factor into the structure of the aetiological chain - namely the quantity, the magnitude, of the energies concerned. We have still to take this factor into account everywhere. A purely qualitative analysis of the aetiological determinants is not enough. Or, to put it another way, a merely dynamic view of these mental processes is insufficient; an economic line of approach is also needed. We must tell ourselves that the conflict between two trends does not break out till certain intensities of cathexis have been reached, even though the determinants for it have long been present so far as their subject-matter is concerned. In the same way, the pathogenic significance of the constitutional factors must be weighed according to how much more of one component instinct than of another is present in the inherited disposition. It may even be supposed that the disposition of all human beings is qualitatively alike and that they differ only owing to these quantitative conditions. The quantitative factor is no less decisive as regards capacity to resist neurotic illness. It is a matter of what quota of unemployed libido a person is able to hold in suspension and of how large a fraction of his libido he is able to divert from sexual to sublimated aims. The ultimate aim of mental activity, which may be described qualitatively as an endeavour to obtain pleasure and avoid unpleasure, emerges, looked at from the economic point of view, as the task of mastering the amounts of excitation (mass of stimuli) operating in the mental apparatus and of keeping down their accumulation which creates unpleasure.

[1916-1917, 3429]

Of course, the sexual abstinence now so warmly recommended by doctors only has the same importance in generating anxiety states when the libido which is prevented from finding a satisfying discharge is correspondingly strong and has not been dealt with for the greater part by sublimation. Indeed, the decision on whether the outcome is to be illness or not always lies with quantitative factors. Even where what is in question is not illness but the form assumed by a person's character, it is easy to recognize that sexual restriction goes hand in hand with some kind of anxiousness and hesitancy, while intrepidity and impudent daring bring along with them a free indulgence of sexual needs. However much these relations are altered and complicated by a variety of cultural influences, it nevertheless remains true of the average of mankind that anxiety has a close connection with sexual limitation.

[1916-1917, 3449]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in \textit{unconscious} psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history - , an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]
We are justified in saying that they have been diverted from these sexual aims, even though there is some difficulty in giving a description of such a diversion of aim which will conform to the requirements of metapsychology. Moreover, those instincts which are inhibited in their aims always preserve some few of their original sexual aims; even an affectionate devotee, even a friend or an admirer, desires the physical proximity and the sight of the person who is now loved only in the 'Pauline' sense. If we choose, we may recognize in this diversion of aim a beginning of the sublimation of the sexual instincts, or on the other hand we may fix the limits of sublimation at some more distant point. Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited. Since they are not capable of really complete satisfaction, they are especially adapted to create permanent ties; while those instincts which are directly sexual incur a loss of energy each time they are satisfied, and must wait to be renewed by a fresh accumulation of sexual libido, so that meanwhile the object may have been changed. The inhibited instincts are capable of any degree of admixture with the uninhibited; they can be transformed back into them, just as they arose out of them. It is well known how easily erotic wishes develop out of emotional relations of a friendly character, based upon appreciation and admiration (compare Molière's 'Kiss me for the love of Greek'), between a master and a pupil, between a performer and a delighted listener, and especially in the case of women. In fact the growth of emotional ties of this kind, with their purposeless beginnings, provides a much frequented pathway to sexual object-choice. Pfister, in his Frömmigkeit des Grafen von Zinzendorf (1910), has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement. On the other hand it is also very usual for directly sexual impulsions, short-lived in themselves, to be transformed into a lasting and purely affectionate tie; and the consolidation of a passionate love marriage rests to a large extent upon this process.

Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.
The transformation of object-libido into narcissistic libido which thus takes place obviously implies an abandonment of sexual aims, a desexualization - a kind of sublimation, therefore. Indeed, the question arises, and deserves careful consideration, whether this is not the universal road to sublimation, whether all sublimation does not take place though the mediation of the ego, which begins by changing sexual object-libido into narcissistic libido and then, perhaps, goes on to give it another aim.¹ We shall later on have to consider whether other instinctual vicissitudes may not also result from this transformation, whether, for instance, it may not bring about a defusion of the various instincts that are fused together.

If this displaceable energy is desexualized libido, it may also be described as sublimated energy; for it would still retain the main purpose of Eros - that of uniting and binding - in so far as it helps towards establishing the unity, or tendency to unity, which is particularly characteristic of the ego. If thought processes in the wider sense are to be included among these displacements, then the activity of thinking is also supplied from the sublimation of erotic motive forces.

Here we arrive again at the possibility which has already been discussed that sublimation may take place regularly, through the mediation of the ego. The other case will be recollected, in which the ego deals with the first object-cathexes of the id (and certainly with later ones too) by taking over the libido from them into itself and binding it to the alteration of the ego produced by means of identification. The transformation into ego-libido of course involves an abandonment of sexual aims, a desexualization. In any case this throws light upon an important function of the ego in its relation to Eros. By thus getting hold of the libido from the object-cathexes, setting itself up as sole love-object, and desexualizing or sublimating the libido of the id, the ego is working in opposition to the purposes of Eros and placing itself at the service of the opposing instinctual impulses. It has to acquiesce in some of the other object-cathexes of the id; it has, so to speak, to participate in them. We shall come back later to another possible consequence of this activity of the ego.

And from the struggle against Eros! It can hardly be doubted that the pleasure principle serves the id as a compass in its struggle against the libido - the force that introduces disturbances into the process of life. If it is true that Fechner's principle of constancy governs life, which thus consists of a continuous descent towards death, it is the claims of Eros, of the sexual instincts, which, in the form of instinctual needs, hold up the falling level and introduce fresh tensions. The id, guided by the pleasure principle - that is, by the perception of unpleasure - fends off these tensions in various ways. It does so in the first place by complying as swiftly as possible with the demands of the non-deseualized libido - by striving for the satisfaction of the directly sexual trends. But it does so in a far more comprehensive fashion in relation to one particular form of satisfaction in which all component demands converge - by discharge of the sexual substances, which are saturated vehicles, so to speak, of the erotic tensions. The ejection of the sexual substances in the sexual act corresponds in a sense to the separation of soma and germ-plasm. This accounts for the likeness of the condition that follows complete sexual satisfaction to dying, and for the fact that death coincides with the act of copulation in some of the lower animals. These creatures die in the act of reproduction because, after Eros has been eliminated through the process of satisfaction, the death instinct has a free hand for accomplishing its purposes. Finally, as we have seen, the ego, by sublimating some of the libido for itself and its purposes, assists the id in its work of mastering the tensions.
I cannot go further in my consideration of these questions without introducing a fresh hypothesis. The super-ego arises, as we know, from an identification with the father taken as a model. Every such identification is in the nature of a desexualization or even of a sublimation. It now seems as though when a transformation of this kind takes place, an instinctual defusion occurs at the same time. After sublimation the erotic component no longer has the power to bind the whole of the destructiveness that was combined with it, and this is released in the form of an inclination to aggression and destruction. This defusion would be the source of the general character of harshness and cruelty exhibited by the ideal - its dictatorial 'Thou shalt'.

Towards the two classes of instincts the ego's attitude is not impartial. Through its work of identification and sublimation it gives the death instincts in the id assistance in gaining control over the libido, but in so doing it runs the risk of becoming the object of the death instincts and of itself perishing. In order to be able to help in this way it has had itself to become filled with libido; it thus itself becomes the representative of Eros and henceforward desires to live and to be loved.

I have described elsewhere how this turning away takes place. The object-cathexes are given up and replaced by identifications. The authority of the father or the parents is introjected into the ego, and there it forms the nucleus of the super-ego, which takes over the severity of the father and perpetuates his prohibition against incest, and so secures the ego from the return of the libidinal object-cathexis. The libidinal trends belonging to the Oedipus complex are in part desexualized and sublimated (a thing which probably happens with every transformation into an identification) and in part inhibited in their aim and changed into impulses of affection. The whole process has, on the one hand, preserved the genital organ - has averted the danger of its loss - and, on the other, has paralysed it - has removed its function. This process ushers in the latency period, which now interrupts the child's sexual development.

If we leave little-known internal urges out of account, we may say that the main motive force towards the cultural development of man has been real external exigency, which has withheld from him the easy satisfaction of his natural needs and exposed him to immense dangers. This external frustration drove him into a struggle with reality, which ended partly in adaptation to it and partly in control over it; but it also drove him into working and living in common with those of his kind, and this already involved a renunciation of a number of instinctual impulses which could not be satisfied socially. With the further advances of civilization the demands of repression also grew. Civilization is after all built entirely on renunciation of instinct, and every individual on his journey from childhood to maturity has in his own person to recapitulate this development of humanity to a state of judicious resignation. Psycho-analysis has shown that it is predominantly, though not exclusively, sexual instinctual impulses that have succumbed to this cultural suppression. One portion of them, however, exhibit the valuable characteristic of allowing themselves to be diverted from their immediate aims and of thus placing their energy at the disposal of cultural development in the form of 'sublimated' trends. But another portion persist in the unconscious as unsatisfied wishes and press for some, even if it is distorted, satisfaction.

[1924f, 4116]
This state of affairs is enough to account for the reluctant and hesitant reception of analysis in scientific quarters. But it does not explain the outbursts of indignation, derision and scorn which, in disregard of every standard of logic and good taste, have characterized the controversial methods of its opponents. A reaction of such a kind suggests that resistances other than purely intellectual ones were stirred up and that powerful emotional forces were aroused. And there are indeed plenty of things to be found in the theory of psycho-analysis calculated to produce such an effect as this upon the passions of men of every kind and not of scientists alone. Above all there is the very important place in the mental life of human beings which psycho-analysis assigns to what are known as the sexual instincts. Psycho-analytic theory maintained that the symptoms of neuroses are distorted substitutive satisfactions of sexual instinctual forces, the direct satisfaction of which has been frustrated by internal resistances. Later on, when analysis had extended beyond its original field of work and began to be applied to normal mental life, it sought to show that these same sexual components, which could be diverted from their immediate aims and directed to other things, made the most important contributions to the cultural achievements of the individual and of society. These views were not entirely new. The incomparable significance of sexual life had been proclaimed by the philosopher Schopenhauer in an intensely impressive passage. Moreover, what psycho-analysis called sexuality was by no means identical with the impulsion towards a union of the two sexes or towards producing a pleasurable sensation in the genitals; it had far more resemblance to the all-inclusive and all-preserving Eros of Plato’s *Symposium*.

[1925e, 4125]

The second of my alleged extensions of the concept of sexuality finds its justification in the fact revealed by psycho-analytic investigation that all of these affectionate impulses were originally of a completely sexual nature but have become *inhibited in their aim or sublimated*. The manner in which the sexual instincts can thus be influenced and diverted enables them to be employed for cultural activities of every kind, to which indeed they bring the most important contributions.

[1925d, 4214]

In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called *narcissism* or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object-cathexes are sent out and into which the libido can stream back again from the objects. Thus narcissistic libido is constantly being transformed into object-libido, and *vice versa*. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had only been paid to what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the instincts of self-preservation operating in the ego (the ‘ego-instincts’) and that it was brought to bear upon the libidinal instincts. But since the instincts of self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object-libido, the interest of self-preservation was defending itself against the demands of object-love, and therefore against the demands of sexuality in the narrower sense as well.

[1925d, 4231]
This is not very illuminating. We can only note that disturbances of the sexual function are brought about by a great variety of means. (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple); (2) the function may be less well carried out; (3) it may be hampered by having conditions attached to it, or modified by being diverted to other aims; (4) it may be prevented by security measures; (5) if it cannot be prevented from starting, it may be immediately interrupted by the appearance of anxiety; and (6), if it is nevertheless carried out, there may be a subsequent reaction of protest against it and an attempt to undo what has been done.

Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the 'sublimation' of instincts, the part played by symbolism, the problem of 'ambivalence', etc. Nor has there been space to allude to the applications of psycho-analysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Social Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psycho-analysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these other branches of mental science.

Another technique for fending off suffering is the employment of the displacements of libido which our mental apparatus permits of and through which its function gains so much in flexibility. The task here is that of shifting the instinctual aims in such a way that they cannot come up against frustration from the external world. In this, sublimation of the instincts lends its assistance. One gains the most if one can sufficiently heighten the yield of pleasure from the sources of psychical and intellectual work. When that is so, fate can do little against one. A satisfaction of this kind, such as an artist's joy in creating, in giving his phantasies body, or a scientist's in solving problems or discovering truths, has a special quality which we shall certainly one day be able to characterize in metapsychological terms. At present we can only say figuratively that such satisfactions seem 'finer and higher'. But their intensity is mild as compared with that derived from the satiating of crude and primary instinctual impulses; it does not convulse our physical being. And the weak point of this method is that it is not applicable generally: it is accessible to only a few people. It presupposes the possession of special dispositions and gifts which are far from being common to any practical degree. And even to the few who do possess them, this method cannot give complete protection from suffering. It creates no impenetrable armour against the arrows of fortune, and it habitually fails when the source of suffering is a person's own body.¹

¹ When there is no special disposition in a person which imperatively prescribes what direction his interests in life shall take, the ordinary professional work that is open to everyone can play the part assigned to it by Voltaire's wise advice. It is not possible, within the limits of a short survey, to discuss adequately the significance of work for the economics of the libido. No other technique for the conduct of life attaches the individual so firmly to reality as laying emphasis on work; for his work at least gives him a secure place in a portion of reality, in the human community. The possibility it offers of displacing a large amount of libidinal components, whether narcissistic, aggressive or even erotic, on to professional work and on to the human relations connected with it lends it a value by no means second to what it enjoys as something indispensable to the preservation and justification of existence in society. Professional activity is a source of special satisfaction if it is a freely chosen one - if, that is to say, by means of sublimation, it makes possible the use of existing inclinations, of persisting or constitutionally reinforced instinctual impulses. And yet, as a path to happiness, work is not highly prized by men. They do not strive after it as they do after other possibilities of satisfaction. The great majority of people only work under the stress of necessity, and this natural human aversion to work raises most difficult social problems.
While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

[1930a, 4480]

In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

[1930a, 4482]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹ Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

[1930a, 4494]
The conjecture which goes deepest, however, is the one which takes its start from what I have said above (p. 4495) in my footnote. It is to the effect that, with the assumption of an erect posture by man and with the depreciation of his sense of smell, it was not only his anal erotism which threatened to fall a victim to organic repression, but the whole of his sexuality; so that since this, the sexual function has been accompanied by a repugnance which cannot further be accounted for, and which prevents its complete satisfaction and forces it away from the sexual aim into sublimations and libidinal displacements. I know that Bleuler (1913) once pointed to the existence of a primary repelling attitude like this towards sexual life. All neurotics, and many others besides, take exception to the fact that ‘inter urinas et faeces nascimur’.

The genitals, too, give rise to strong sensations of smell which many people cannot tolerate and which spoil sexual intercourse for them. Thus we should find that the deepest root of the sexual repression which advances along with civilization is the organic defence of the new form of life achieved with man's erect gait against his earlier animal existence. This result of scientific research coincides in a remarkable way with commonplace prejudices that have often made themselves heard. Nevertheless, these things are at present no more than unconfirmed possibilities which have not been substantiated by science. Nor should we forget that, in spite of the undeniable depreciation of olfactory stimuli, there exist even in Europe people among whom the strong genital odours which are so repellent to us are highly prized as sexual stimulants and who refuse to give them up. (Cf. the collections of folklore obtained from Iwan Bloch's questionnaire on the sense of smell in sexual life published in different volumes of Friedrich S. Krauss's *Anthropophyteia*.)

An instinct, then, is distinguished from a stimulus by the fact that it arises from sources of stimulation within the body, that it operates as a constant force and that the subject cannot avoid it by flight, as is possible with an external stimulus. We can distinguish an instinct's source, object and aim. Its source is a state of excitation in the body, its aim is the removal of that excitation; on its path from its source to its aim the instinct becomes operative psychically. We picture it as a certain quota of energy which presses in a particular direction. It is from this pressing that it derives its name of ‘Trieb’. People speak of 'active' and 'passive' instincts, but it would be more correct to speak of instincts with active and passive aims: for an expenditure of activity is needed to achieve a passive aim as well. The aim can be achieved in the subject's own body; as a rule an external object is brought in, in regard to which the instinct achieves its external aim; its internal aim invariably remains the bodily change which is felt as satisfaction. It has not become clear to us whether the relation of the instinct to its somatic source gives it a specific quality and if so what. The evidence of analytic experience shows that it is an undoubted fact that instinctual impulses from one source attach themselves to those from other sources and share their further vicissitudes and that in general one instinctual satisfaction can be replaced by another. But it must be admitted that we do not understand this very well. The relations of an instinct to its aim and object are also open to alterations; both can be exchanged for other ones, though its relation to its object is nevertheless the more easily loosened. A certain kind of modification of the aim and change of the object, in which our social valuation is taken into account, is described by us as 'sublimation'. Besides this, we have grounds for distinguishing instincts which are 'inhibited in their aim'- instinctual impulses from sources well known to us with an unambiguous aim, but which come to a stop on their way to satisfaction, so that a lasting object-cathexis comes about and a permanent trend. Such, for instance, is the relation of tenderness, which undoubtedly originates from the sources of sexual need and invariably renounces its satisfaction.
It would be a mistake to suppose that these three phases succeed one another in a clear-cut fashion. One may appear in addition to another; they may overlap one another, may be present alongside of one another. In the early phases the different component instincts set about their pursuit of pleasure independently of one another; in the phallic phase there are the beginnings of an organization which subordinates the other urges to the primacy of the genitals and signifies the start of a co-ordination of the general urge towards pleasure into the sexual function. The complete organization is only achieved at puberty, in a fourth, genital phase. A state of things is then established in which (1) some earlier libidinal catheces are retained, (2) others are taken into the sexual function as preparatory, auxiliary acts, the satisfaction of which produces what is known as fore-pleasure, and (3) other urges are excluded from the organization, and are either suppressed altogether (repressed) or are employed in the ego in another way, forming character-traits or undergoing sublimation with a displacement of their aims.

[1940a [1938], 4966]
As regards the second kind of emotional reaction, which is not directed against me this time, but against my patient - supposing that my view of her is correct - and which regards the perverse nature of her phantasies as horrible, I should like to say emphatically that a medical man has no business to indulge in such passionate condemnation. I may also remark in passing that it seems to me superfluous for a physician who is writing upon the aberrations of the sexual instincts to seize every opportunity of inserting into the text expressions of his personal repugnance at such revolting things. We are faced by a fact; and it is to be hoped that we shall grow accustomed to it, when we have put our own tastes on one side. We must learn to speak without indignation of what we call the sexual perversions - instances in which the sexual function has extended its limits in respect either to the part of the body concerned or to the sexual object chosen. The uncertainty in regard to the boundaries of what is to be called normal sexual life, when we take different races and different epochs into account, should in itself be enough to cool the zealot's ardour. We surely ought not to forget that the perversion which is the most repelent to us, the sensual love of a man for a man, was not only tolerated by a people so far our superiors in cultivation as were the Greeks, but was actually entrusted by them with important social functions. The sexual life of each one of us extends to a slight degree - now in this direction, now in that - beyond the narrow lines imposed as the standard of normality. The perversions are neither bestial nor degenerate in the emotional sense of the word. They are a development of germs all of which are contained in the undifferentiated sexual disposition of the child, and which, by being suppressed or by being diverted to higher, asexual aims - by being 'sublimated' - are destined to provide the energy for a great number of our cultural achievements. When, therefore, any one has become a gross and manifest pervert, it would be more correct to say that he has remained one, for he exhibits a certain stage of inhibited development. All psychoneurotics are persons with strongly marked perverse tendencies, which have been repressed in the course of their development and have become unconscious. Consequently their unconscious phantasies show precisely the same content as the documentarily recorded actions of perverts - even though they have not read Krafft-Ebing's *Psychopathia Sexualis*, to which simple-minded people attribute such a large share of the responsibility for the production of perverse tendencies. Psychoneuroses are, so to speak, the negative of perversions. In neurotics their sexual constitution, under which the effects of heredity are included, operates in combination with any accidental influences in their life which may disturb the development of normal sexuality. A stream of water which meets with an obstacle in the river-bed is dammed up and flows back into old channels which had formerly seemed fated to run dry. The motive forces leading to the formation of hysterical symptoms draw their strength not only from repressed normal sexuality but also from unconscious perverse activities.¹

[1905e, 1387]

REACTION-FORMATION AND SUBLIMATION  What is it that goes to the making of these constructions which are so important for the growth of a civilized and normal individual? They probably emerge at the cost of the infantile sexual impulses themselves. Thus the activity of those impulses does not cease even during this period of latency, though their energy is diverted, wholly or in great part, from their sexual use and directed to other ends. Historians of civilization appear to be at one in assuming that powerful components are acquired for every kind of cultural achievement by this diversion of sexual instinctual forces from sexual aims and their direction to new ones - a process which deserves the name of 'sublimation'. To this we would add, accordingly, that the same process plays a part in the development of the individual and we would place its beginning in the period of sexual latency of childhood.¹

[1905d, 1500]
Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw', in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

[1908d, 1951]

The sexual instinct - or, more correctly, the sexual instincts, for analytic investigation teaches us that the sexual instinct is made up of many separate constituents or component instincts - is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capacity for sublimation. In contrast to this displaceability, in which its value for civilization lies, the sexual instinct may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual instinct probably varies in each individual; certainly the proportion of it which is suitable for sublimation varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual instinct it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective quality of unpleasure, must be regarded as an illness.

[1908d, 1952]

Further prospects are opened up when we take into consideration the fact that in man the sexual instinct does not originally serve the purposes of reproduction at all, but has as its aim the gaining of particular kinds of pleasure. It manifests itself in this way in human infancy, during which it attains its aim of gaining pleasure not only from the genitals but from other parts of the body (the erotogenic zones), and can therefore disregard any objects other than these convenient ones. We call this stage the stage of auto-erotism, and the child's upbringing has, in our view, the task of restricting it, because to linger in it would make the sexual instinct uncontrollable and unserviceable later on. The development of the sexual instinct then proceeds from auto-erotism to object-love and from the autonomy of the erotogenic zones to their subordination under the primacy of the genitals, which are put at the service of reproduction. During this development a part of the sexual excitation which is provided by the subject's own body is inhibited as being unserviceable for the reproductive function and in favourable cases is brought to sublimation. The forces that can be employed for cultural activities are thus to a great extent obtained through the suppression of what are known as the perverse elements of sexual excitation.

[1908d, 1953]
In the first place (disregarding people whose sexual instinct is altogether excessive and uninhibitable) there are the different varieties perverts, in whom an infantile fixation to a preliminary sexual aim has prevented the primacy of the reproductive function from being established, and the homosexuals or invert, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be ascribed precisely to the complex way in which the sexual instinct is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the instinct have been shut off from development. The constitution of people suffering from inversion - the homosexuals - is, indeed, often distinguished by their sexual instinct's possessing a special aptitude for cultural sublimation. [1908d, 1953]

(3) In what relation do the possible injurious effects of this renunciation stand to its exploitation in the cultural field? [1908d, 1956]

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated. [1908d, 1958]

A second outcome of the work of psycho-analysis is that it then becomes possible for the unconscious instincts revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called 'sublimation', in which the energy of the infantile wishful impulses is not cut off but remains ready for use - the unserviceable aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the sexual instinct that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed instinct impossible; when the repression is lifted, the path to sublimation becomes free once more. [1910a, 2238]
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to esprit de corps and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

[1911c, 2431]

You cannot have any notion, either, of what an intimate connection there is between this first piece of audacity on the part of psycho-analysis and the second one, which I must now tell you of. This second thesis, which psycho-analysis puts forward as one of its findings, is an assertion that instinctual impulses which can only be described as sexual, both in the narrower and wider sense of the word, play an extremely large and never hitherto appreciated part in the causation of nervous and mental diseases. It asserts further that these same sexual impulses also make contributions that must not be underestimated to the highest cultural, artistic and social creations of the human spirit.

[1916-1917, 3134]
The psycho-analytic explanation of the neuroses does not, however, call for such far-ranging considerations. The separate following-up of the sexual and ego-instincts has helped us to find the key to an understanding of the group of transference neuroses. We have been able to trace them back to the basic situation in which the sexual instincts have come into a dispute with the self-preservative instincts, or, to put it in biological (though less precise) terms, a situation in which one aspect of the ego, as an independent individual organism, comes into conflict with its other aspect, as a member of a succession of generations. A dissension of this kind may perhaps only occur in human beings, and on that account neurosis may, generally speaking, constitute their prerogative over the animals. The excessive development of their libido and - what is perhaps made possible precisely by that - their development of a richly articulated mental life seem to have created the determinants for the occurrence of such a conflict. It is at once obvious that these are also the determinants for the great advances that human beings have made beyond what they have in common with the animals; so that their susceptibility to neurosis would only be the reverse side of their other endowments. But these too are only speculations, which are diverting us from our immediate task.

I will add only a word to suggest that the efforts of Eros to combine organic substances into ever larger unities probably provide a substitute for this 'instinct towards perfection' whose existence we cannot admit. The phenomena that are attributed to it seem capable of explanation by these efforts of Eros taken in conjunction with the results of repression.

Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1916-1917, 3460]

[1920g, 3744]

[1923a, 3928]
This state of affairs is enough to account for the reluctant and hesitant reception of analysis in scientific quarters. But it does not explain the outbursts of indignation, derision and scorn which, in disregard of every standard of logic and good taste, have characterized the controversial methods of its opponents. A reaction of such a kind suggests that resistances other than purely intellectual ones were stirred up and that powerful emotional forces were aroused. And there are indeed plenty of things to be found in the theory of psycho-analysis calculated to produce such an effect as this upon the passions of men of every kind and not of scientists alone. Above all there is the very important place in the mental life of human beings which psycho-analysis assigns to what are known as the sexual instincts. Psycho-analytic theory maintained that the symptoms of neuroses are distorted substitutive satisfactions of sexual instinctual forces, the direct satisfaction of which has been frustrated by internal resistances. Later on, when analysis had extended beyond its original field of work and began to be applied to normal mental life, it sought to show that these same sexual components, which could be diverted from their immediate aims and directed to other things, made the most important contributions to the cultural achievements of the individual and of society. These views were not entirely new. The incomparable significance of sexual life had been proclaimed by the philosopher Schopenhauer in an intensely impressive passage. Moreover, what psycho-analysis called sexuality was by no means identical with the impulsion towards a union of the two sexes or towards producing a pleasurable sensation in the genitals; it had far more resemblance to the all-inclusive and all-preserving Eros of Plato's *Symposium*.

But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pansexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.

The second of my alleged extensions of the concept of sexuality finds its justification in the fact revealed by psycho-analytic investigation that all of these affectionate impulses were originally of a completely sexual nature but have become *inhibited in their aim or sublimated*. The manner in which the sexual instincts can thus be influenced and diverted enables them to be employed for cultural activities of every kind, to which indeed they bring the most important contributions.
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.
[1933a, 4714]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life - sexual excitations and needs and a kind of satisfaction - but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What does awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education. For society must undertake as one of its most important educative tasks to tame and restrict the sexual instinct when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical with the bidding of society. It is also concerned to postpone the full development of the instinct till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual instinct, educability is for practical purposes at an end. Otherwise, the instinct would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, by the eternal, primaeval exigencies of life, which are with us to this day.

[1916-1917, 3382]

Experience must no doubt have taught the educators that the task of making the sexual will of the new generation tractable could only be carried out if they began to exercise their influence very early, if they did not wait for the storm of puberty but intervened already in the sexual life of children which is preparatory to it. For this reason almost all infantile sexual activities were forbidden to children and frowned upon; an ideal was set up of making the life of children asexual, and in course of time things came to the point at which people really believed they were asexual and thereafter science pronounced this as its doctrine. To avoid contradicting their belief and their intentions, people since then overlook the sexual activities of children (no mean achievement) or are content in science to take a different view of them. Children are pure and innocent, and anyone who describes them otherwise can be charged with being an infamous blasphemer against the tender and sacred feelings of mankind.

[1916-1917, 3383]
The tendency on the part of civilization to restrict sexual life is no less clear than its other
tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition
against an incestuous choice of object, and this is perhaps the most drastic mutilation which
man's erotic life has in all time experienced. Taboos, laws and customs impose further
restrictions, which affect both men and women. Not all civilizations go equally far in this; and the
economic structure of the society also influences the amount of sexual freedom that remains.
Here, as we already know, civilization is obeying the laws of economic necessity, since a large
amount of the psychical energy which it uses for its own purposes has to be withdrawn from
sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its
population does which has subjected another one to its exploitation. Fear of a revolt by the
suppressed elements drives it to stricter precautionary measures. A high-water mark in such a
development has been reached in our Western European civilization. A cultural community is
perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of
children, for there would be no prospect of curbing the sexual lusts of adults if the ground had
not been prepared for it in childhood. But such a community cannot in any way be justified in
going to the length of actually disavowing such easily demonstrable, and, indeed, striking
phenomena. As regards the sexually mature individual, the choice of an object is restricted to
the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The
requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life
for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual
constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so
becomes the source of serious injustice. The result of such restrictive measures might be that in
people who are normal - who are not prevented by their constitution - the whole of their sexual
interests would flow without loss into the channels that are left open. But heterosexual genital
love, which has remained exempt from outlawry, is itself restricted by further limitations, in the
shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that
it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one
man and one woman, and that it does not like sexuality as a source of pleasure in its own right
and is only prepared to tolerate it because there is so far no substitute for it as a means of
propagating the human race.
[1930a, 4498]

So far, we can quite well imagine a cultural community consisting of double individuals like
this, who, libidinally satisfied in themselves, are connected with one another through the bonds
of common work and common interests. If this were so, civilization would not have to withdraw
any energy from sexuality. But this desirable state of things does not, and never did, exist.
Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at
binding the members of the community together in a libidinal way as well and employs every
means to that end. It favours every path by which strong identifications can be established
between the members of the community, and it summons up aim-inhibited libido on the largest
scale so as to strengthen the communal bond by relations of friendship. In order for these aims
to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand
what the necessity is which forces civilization along this path and which causes its antagonism
to sexuality. There must be some disturbing factor which we have not yet discovered.
[1930a, 4500]
The clue may be supplied by one of the ideal demands, as we have called them, of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naïve attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too - I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earth-worm or a grass-snake, then I fear that only a small modicum of my love will fall to his share - not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable? [1930a, 4501]

On closer inspection, I find still further difficulties. Not merely is this stranger in general unworthy of my love; I must honestly confess that he has more claim to my hostility and even my hatred. He seems not to have the least trace of love for me and shows me not the slightest consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask himself whether the amount of advantage he gains bears any proportion to the extent of the harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his superior power; and the more secure he feels and the more helpless I am, the more certainly I can expect him to behave like this to me. If he behaves differently, if he shows me consideration and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as thy neighbour loves thee', I should not take exception to it. And there is a second commandment, which seems to me even more incomprehensible and arouses still stronger opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in treating it as a greater imposition. At bottom it is the same thing.¹ [1930a, 4502]
The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

[1930a, 4504]
This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place only for a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure in so far as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus doomed puts both partners back in the state they were in before their marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual instinct. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them - although only with reluctance and under a veil of silence - by even the strictest sexual code. The 'double' sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their instincts, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child - experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives. (Under the cultural conditions of to-day, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual instinct of the civilized person in his youth, proves to be inadequate even to the demands of the actual period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it.

[1908d, 1957]

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

[1908d, 1958]
The fact that the sexual instinct behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the instinct temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression often goes too far, with the unwished-for result that when the instinct is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

[1908d, 1959]

All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage - marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulsions. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal, develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

[1908d, 1961]
I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

[1908d, 1961]

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1962]
The sadistic theory of coitus which, taken in isolation, is misleading where it might have provided confirmatory evidence, is, once again, the expression of one of the innate components of the sexual instinct, any of which may be strongly marked to a greater or lesser degree in each particular child. For this reason the theory is correct up to a certain point; it has in part divined the nature of the sexual act and the 'sex-battle' that precedes it. Not infrequently, too, the child is in a position to support this view by accidental observations which he understands in part correctly, but also in part incorrectly and indeed in a reversed sense. In many marriages the wife does in fact recoil from her husband's embraces, which bring her no pleasure, but the risk of a fresh pregnancy. And so the child who is believed to be asleep (or who is pretending to be asleep) may receive an impression from his mother which he can only interpret as meaning that she is defending herself against an act of violence. At other times the whole marriage offers an observant child the spectacle of an unceasing quarrel, expressed in loud words and unfriendly gestures; so that he need not be surprised if the quarrel is carried on at night as well, and finally settled by the same method which he himself is accustomed to use in his relations with his brothers and sisters or playmates. [1908c, 1975]

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation. [1912d, 2344]

The expression 'sexual bondage' was chosen by von Krafft Ebing (1892) to describe the phenomenon of a person's acquiring an unusually high degree of dependence and lack of self-reliance in relation to another person with whom he has a sexual relationship. This bondage can on occasion extend very far, as far as the loss of all independence will and as far as causing a person to suffer the greatest sacrifices of his own interests; the author, however, does not fail to remark that a certain measure of such dependence 'is absolutely necessary, if the tie is to last for any length of time'. Some such measure of sexual bondage is, indeed, indispensable to the maintenance of civilized marriage and to holding at bay the polygamous tendencies which threaten it, and in our social communities this factor is regularly reckoned upon. [1918a, 2349]
However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.

[1918a, 2358]

After this enumeration of the motives for the paradoxical reaction of women to defloration, traces of which persist in frigidity, we may sum up by saying that a woman's immature sexuality, is discharged on to the man who first makes her acquainted with the sexual act. This being so, the taboo of virginity is reasonable enough and we can understand the rule which decrees that precisely the man who is to enter upon a life shared with this woman shall avoid these dangers. At higher stages of civilization the importance attributed to this danger diminishes in face of her promise of bondage and no doubt of other motives and inducements; virginity is looked upon as a possession which the husband is not called upon to renounce. But analysis of disturbed marriages teaches us that the motives which seek to drive a woman to take vengeance for her defloration are not completely extinguished even in the mental life of civilized women. I think it must strike the observer in how uncommonly large a number of cases the woman remains frigid and feels unhappy in a first marriage, whereas after it has been dissolved she becomes a tender wife, able to make her second husband happy. The archaic reaction has, so to speak, exhausted itself on the first object.

[1918a, 2361]

We may say, then, in conclusion that defloration has not only the one, civilized consequence of binding the woman lastingly to the man; it also unleashes an archaic reaction of hostility towards him, which can assume pathological forms that are frequently enough expressed in the appearance of inhibitions in the erotic side of married life, and to which we may ascribe the fact that second marriages so often turn out better than first. The taboo of virginity, which seems so strange to us, the horror with which, among primitive peoples, the husband avoids the act of defloration, are fully justified by this hostile reaction.

[1918a, 2363]
It is interesting that in one’s capacity as analyst one can meet with women in whom the opposed reactions of bondage and hostility both find expression and remain intimately associated with each other. There are women of this kind who seem to have fallen out with their husbands completely and who all the same can only make vain efforts to free themselves. As often as they try to direct their love towards some other man, the image of the first, although he is no longer loved, intervenes with inhibiting effect. Analysis then teaches us that these women, it is true, still cling to their first husbands in a state of bondage, but no longer through affection. They cannot get away from them, because they have not completed their revenge upon them, and in pronounced cases they have not even brought the impulses for vengeance to consciousness.

[1918a, 2363]

The jealousy of the second layer, projected jealousy, is derived in both men and women either from their own actual unfaithfulness in real life or from impulses towards it which have succumbed to repression. It is a matter of everyday experience that fidelity, especially that degree of it required in marriage, is only maintained in the face of continual temptations. Anyone who denies these temptations in himself will nevertheless feel their pressure so strongly that he will be glad enough to make use of an unconscious mechanism to alleviate his situation. He can obtain this alleviation - and, indeed, acquittal by his conscience - if he projects his own impulses to faithlessness on to the partner to whom he owes faith. This strong motive can then make use of the perceptual material which betrays unconscious impulses of the same kind in the partner, and the subject can justify himself with the reflection that the other is probably not much better than he is himself.¹

[1922b, 3901]

Social conventions have wisely taken this universal state of things into account, by granting a certain amount of latitude to the married woman's craving to attract and the married man's thirst to make conquests, in the expectation that this inevitable tendency to unfaithfulness will thus find a safety valve and be rendered innocuous. Convention has laid down that neither partner is to hold the other accountable for these little excursions in the direction of unfaithfulness, and they usually result in the desire that has been awakened by the new object finding satisfaction in some kind of return to faithfulness to the original object. A jealous person, however, does not recognize this convention of tolerance; he does not believe in any such thing as a halt or a turning-back once the path has been trodden, nor that a flirtation may be a safeguard against actual infidelity. In the treatment of a jealous person like this, one must refrain from disputing with him the material on which he bases his suspicions; one can only aim at bringing him to regard the matter in a different light.

[1922b, 3901]

_Aim-inhibited Sexual Impulses._ - The social instincts belong to a class of instinctual impulses which need not be described as sublimated, though they are closely related to these. They have not abandoned their directly sexual aims, but they are held back by internal resistances from attaining them; they rest content with certain approximations to satisfaction and for that very reason lead to especially firm and permanent attachments between human beings. To this class belong in particular the affectionate relations between parents and children, which were originally fully sexual, feelings of friendship, and the emotional ties in marriage which had their origin in sexual attraction.

[1923a, 3934]
The tendency on the part of civilization to restrict sexual life is no less clear than its other
tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition
against an incestuous choice of object, and this is perhaps the most drastic mutilation which
man's erotic life has in all time experienced. Taboos, laws and customs impose further
restrictions, which affect both men and women. Not all civilizations go equally far in this; and the
economic structure of the society also influences the amount of sexual freedom that remains.
Here, as we already know, civilization is obeying the laws of economic necessity, since a large
amount of the psychical energy which it uses for its own purposes has to be withdrawn from
sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its
population does which has subjected another one to its exploitation. Fear of a revolt by the
suppressed elements drives it to stricter precautionary measures. A high-water mark in such a
development has been reached in our Western European civilization. A cultural community is
perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of
children, for there would be no prospect of curbing the sexual lusts of adults if the ground had
not been prepared for it in childhood. But such a community cannot in any way be justified in
going to the length of actually disavowing such easily demonstrable, and, indeed, striking
phenomena. As regards the sexually mature individual, the choice of an object is restricted to
the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The
requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life
for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual
constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so
becomes the source of serious injustice. The result of such restrictive measures might be that in
people who are normal - who are not prevented by their constitution - the whole of their sexual
interests would flow without loss into the channels that are left open. But heterosexual genital
love, which has remained exempt from outlawry, is itself restricted by further limitations, in the
shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that
it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one
man and one woman, and that it does not like sexuality as a source of pleasure in its own right
and is only prepared to tolerate it because there is so far no substitute for it as a means of
propagating the human race.

[1930a, 4498]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tous comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]

But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context¹ but it was suppressed sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

[1909b, 2097]
Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

[1918a, 2355]

The enjoyment of this common civilization was disturbed from time to time by warning voices, which declared that old traditional differences made wars inevitable, even among the members of a community such as this. We refused to believe it; but if such a war were to happen, how did we picture it? We saw it as an opportunity for demonstrating the progress of comity among men since the era when the Greek Amphictyonic Council proclaimed that no city of the league might be destroyed, nor its olive-groves cut down, nor its water-supply stopped; we pictured it as a chivalrous passage of arms, which would limit itself to establishing the superiority of one side in the struggle, while as far as possible avoiding acute suffering that could contribute nothing to the decision, and granting complete immunity for the wounded who had to withdraw from the contest, as well as for the doctors and nurses who devoted themselves to their recovery. There would, of course, be the utmost consideration for the non-combatant classes of the population - for women who take no part in war-work, and for the children who, when they are grown up, should become on both sides one another's friends and helpers. And again, all the international undertakings and institutions in which the common civilization of peace-time had been embodied would be maintained.

[1915b, 3070]

Moreover, it has brought to light an almost incredible phenomenon: the civilized nations know and understand one another so little that one can turn against the other with hate and loathing. Indeed, one of the great civilized nations is so universally unpopular that the attempt can actually be made to exclude it from the civilized community as 'barbaric', although it has long proved its fitness by the magnificent contributions to that community which it has made. We live in hopes that the pages of an impartial history will prove that that nation, in whose language we write and for whose victory our dear ones are fighting, has been precisely the one which has least transgressed the laws of civilization. But at such a time who dares to set himself up as judge in his own cause?

[1915b, 3071]

There is something to be said, however, in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. We welcome illusions because they spare us unpleasurable feelings, and enable us to enjoy satisfactions instead. We must not complain, then, if now and again they come into collision with some portion of reality, and are shattered against it.

[1915b, 3072]
Pious souls, no doubt, who would like to believe that our nature is remote from any contact with what is evil and base, will not fail to use the early appearance and the urgency of the prohibition against murder as the basis for gratifying conclusions as to the strength of the ethical impulses which must have been implanted in us. Unfortunately this argument proves even more for the opposite view. So powerful a prohibition can only be directed against an equally powerful impulse. What no human soul desires stands in no need of prohibition;¹ it is excluded automatically. The very emphasis laid on the commandment 'Thou shalt not kill' makes it certain that we spring from an endless series of generations of murderers, who had the lust for killing in their blood, as, perhaps, we ourselves have to-day. Mankind's ethical strivings, whose strength and significance we need not in the least depreciate, were acquired in the course of man's history; since then they have become, though unfortunately only in a very variable amount, the inherited property of contemporary men.

[1915b, 3088]

This sounds so simple and seductive that it has a claim on our attention. It is true that it would involve a displacement of the riddle of the neurotic state. The continued existence of the sense of inferiority - and thus, of what determine anxiety and the formation of symptoms - seems so well assured that what calls for an explanation is rather how, as an exception, what we know as health can come about. But what is revealed by a careful examination of apprehensiveness in children? At the very beginning, what children are afraid of is strange people; situations only become important because they include people, and impersonal things do not come into account at all until later. But a child is not afraid of these strangers because he attributes evil intentions to them and compares his weakness with their strength, and accordingly assesses them as dangers to his existence, safety and freedom from pain. A child who is mistrustful in this way and terrified of the aggressive instinct which dominates the world is a theoretical construction that has quite miscarried. A child is frightened of a strange face because he is adjusted to the sight of a familiar and beloved figure - ultimately of his mother. It is his disappointment and longing that are transformed into anxiety - his libido, in fact, which has become unemployable, which cannot at that time be held in suspense and is discharged as anxiety. And it can scarcely be a matter of chance, either, that in this situation which is the prototype of the anxiety of children there is a repetition of the determinant of the first state of anxiety during the act of birth - namely, separation from the mother.

[1916-1917, 3453]

When this hostility is directed against people who are otherwise loved we describe it as ambivalence of feeling; and we explain the fact, in what is probably far too rational a manner, by means of the numerous occasions for conflicts of interest which arise precisely in such intimate relations. In the undisguised antipathies and aversions which people feel towards strangers with whom they have to do we may recognize the expression of self-love - of narcissism. This self-love works for the preservation of the individual, and behaves as though the occurrence of any divergence from his own particular lines of development involved a criticism of them and a demand for their alteration. We do not know why such sensitiveness should have been directed to just these details of differentiation; but it is unmistakable that in this whole connection men give evidence of a readiness for hatred, an aggressiveness, the source of which is unknown, and to which one is tempted to ascribe an elementary character.¹

[1921c, 3795]
One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

² The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being displays both male and female instinctual impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psycho-analysis that it has not yet found any link with the theory of the instincts. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life, we are prepared for the possibility that those demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love-object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week.

[1927c, 4419]

[1930a, 4499]
The element of truth behind all this, which people are so ready to disavow, is that men are not gentle creatures who want to be loved, and who at the most can defend themselves if they are attacked; they are, on the contrary, creatures among whose instinctual endowments is to be reckoned a powerful share of aggressiveness. As a result, their neighbour is for them not only a potential helper or sexual object, but also someone who tempts them to satisfy their aggressiveness on him, to exploit his capacity for work without compensation, to use him sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to torture and to kill him. *Homo homini lupus*. Who, in the face of all his experience of life and of history, will have the courage to dispute this assertion? As a rule this cruel aggressiveness waits for some provocation or puts itself at the service of some other purpose, whose goal might also have been reached by milder measures. In circumstances that are favourable to it, when the mental counter-forces which ordinarily inhibit it are out of action, it also manifests itself spontaneously and reveals man as a savage beast to whom consideration towards his own kind is something alien. Anyone who calls to mind the atrocities committed during the racial migrations or the invasions of the Huns, or by the people known as Mongols under Jenghiz Khan and Tamerlane, or at the capture of Jerusalem by the pious Crusaders, or even, indeed, the horrors of the recent World War - anyone who calls these things to mind will have to bow humbly before the truth of this view.

[1930a, 4503]

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an *occasion* for enmity.

[1930a, 4504]
The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nurture almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

[1930a, 4505]

It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]
In none of my previous writings have I had so strong a feeling as now that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive instinct means an alteration of the psychoanalytic theory of the instincts.

[1930a, 4508]

The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.

[1930a, 4510]
In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an
original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes
the greatest impediment to civilization. At one point in the course of this enquiry I was led to the
idea that civilization was a special process which mankind undergoes, and I am still under the
influence of that idea. I may now add that civilization is a process in the service of Eros, whose
purpose is to combine single human individuals, and after that families, then races, peoples and
nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the
work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one
another. Necessity alone, the advantages of work in common, will not hold them together. But
man's natural aggressive instinct, the hostility of each against all and of all against each,
opposes this programme of civilization. This aggressive instinct is the derivative and the main
representative of the death instinct which we have found alongside of Eros and which shares
world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer
obscure to us. It must present the struggle between Eros and Death, between the instinct of life
and the instinct of destruction, as it works itself out in the human species. This struggle is what
all life essentially consists of, and the evolution of civilization may therefore be simply described
as the struggle for life of the human species.¹ And it is this battle of the giants that our nurse-
maids try to appease with their lullaby about Heaven.
[1930a, 4512]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [1930a, 4530]

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result? [1930a, 4532]
We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

[1933a, 4707]

Unfortunately what history tells us and what we ourselves have experienced does not speak in this sense but rather justifies a judgement that belief in the 'goodness' of human nature is one of those evil illusions by which mankind expect their lives to be beautified and made easier while in reality they only cause damage. We need not continue this controversy, since we have argued in favour of a special aggressive and destructive instinct in men not on account of the teachings of history or of our experience in life but on the basis of general considerations to which we were led by examining the phenomena of sadism and masochism. As you know, we call it sadism when sexual satisfaction is linked to the condition of the sexual object's suffering pain, ill-treatment and humiliation, and masochism when the need is felt of being the ill-treated object oneself. As you know too, a certain admixture of these two trends is included in normal sexual relations, and we speak of perversions when they push the other sexual aims into the background and replace them by their own aims. And you will scarcely have failed to notice that sadism has a more intimate relation with masculinity and masochism with femininity, as though there were a secret kinship present; though I must add that we have made no progress along that path. Both phenomena, sadism and masochism alike, but masochism quite especially, present a truly puzzling problem to the libido theory; and it is only proper if what was a stumbling-block for the one theory should become the cornerstone of the theory replacing it.

[1933a, 4708]
I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a Weltanschauung, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

[1933a, 4775]

I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions that there is something at work in them - an instinct for hatred and destruction - which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of an instinct of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the instincts which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psycho-analysis?

[1933b, 4798]
With a view to answering this question, I should like to begin with a few remarks on the conditions which govern the wearing-away of the contents of our ideational life. We will start from a thesis that may be stated in the following terms. If a person experiences a psychical impression, something in his nervous system which we will for the moment call the sum of excitation is increased. Now in every individual there exists a tendency to diminish this sum of excitation once more, in order to preserve his health. The increase of the sum of excitation takes place along sensory paths, and its diminution along motor ones. So we may say that if anything impinges on someone he reacts in a motor fashion. We can now safely assert that it depends on this reaction how much of the initial psychical impression is left. Let us consider this in relation to a particular example. Let us suppose that a man is insulted, is given a blow or something of the kind. This psychical trauma is linked with an increase in the sum of excitation of his nervous system. There then instinctively arises an inclination to diminish this increased excitation immediately. He hits back, and then feels easier; he may perhaps have reacted adequately—that is, he may have got rid of as much as had been introduced into him. Now this reaction may take various forms. For quite slight increases in excitation, alterations in his own body may perhaps be enough: weeping, abusing, raging, and so on. The more intense the trauma, the greater is the adequate reaction. The most adequate reaction, however, is always a deed. But, as an English writer has wittily remarked, the man who first flung a word of abuse at his enemy instead of a spear was the founder of civilization. Thus words are substitutes for deeds, and in some circumstances (e.g. in Confession) the only substitutes. Accordingly, alongside the adequate reaction there is one that is less adequate. If, however, there is no reaction whatever to a psychical trauma, the memory of it retains the affect which it originally had. So that if someone who has been insulted cannot avenge the insult either by a retaliatory blow or by a word of abuse, the possibility arises that the memory of the event may call up in him once more the affect which was originally present. An insult that has been repaid, even if only in words, is recollected quite differently from one that has had to be accepted; and linguistic usage characteristically describes an insult that has been suffered in silence as a ‘mortification’. Thus, if for any reason there can be no reaction to a psychical trauma, it retains its original affect, and when someone cannot get rid of the increase in stimulation by ‘abreacting’ it, we have the possibility of the event in question remaining a psychical trauma. Incidentally, a healthy psychical mechanism has other methods of dealing with the affect of a psychical trauma even if motor reaction and reaction by words are denied to it—namely by working it over associatively and by producing contrasting ideas. Even if the person who has been insulting neither hits back nor replies with abuse, he can nevertheless reduce the affect attaching to the insult by calling up such contrasting ideas as those of his own worthiness, of his enemy’s worthlessness, and so on. Whether a healthy man deals with an insult in one way or the other, he always succeeds in achieving the result that the affect which was originally strong in his memory eventually loses intensity and that finally the recollection, having lost its affect, falls a victim to forgetfulness and the process of wearing-away.

[1893a, 296]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]

Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',¹ in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

[1908d, 1951]
I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.
The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.

[1912-1913, 2784]

Peoples are more or less represented by the states which they form, and these states by the governments which rule them. The individual citizen can with horror convince himself in this war of what would occasionally cross his mind in peace-time - that the state has forbidden to the individual the practice of wrong doing, not because it desires to abolish it, but because it desires to monopolize it, like salt and tobacco. A belligerent state permits itself every such misdeed, every such act of violence, as would disgrace the individual. It makes use against the enemy not only of the accepted *ruses de guerre*, but of deliberate lying and deception as well - and to a degree which seems to exceed the usage of former wars. The state exacts the utmost degree of obedience and sacrifice from its citizens, but at the same time it treats them like children by an excess of secrecy and a censorship upon news and expressions of opinion which leaves the spirits of those whose intellects it thus suppresses defenceless against every unfavourable turn of events and every sinister rumour. It absolves itself from the guarantees and treaties by which it was bound to other states, and confesses shamelessly to its own rapacity and lust for power, which the private individual has then to sanction in the name of patriotism.

[1915b, 3071]

Pious souls, no doubt, who would like to believe that our nature is remote from any contact with what is evil and base, will not fail to use the early appearance and the urgency of the prohibition against murder as the basis for gratifying conclusions as to the strength of the ethical impulses which must have been implanted in us. Unfortunately this argument proves even more for the opposite view. So powerful a prohibition can only be directed against an equally powerful impulse. What no human soul desires stands in no need of prohibition;¹ it is excluded automatically. The very emphasis laid on the commandment 'Thou shalt not kill' makes it certain that we spring from an endless series of generations of murderers, who had the lust for killing in their blood, as, perhaps, we ourselves have to-day. Mankind's ethical strivings, whose strength and significance we need not in the least depreciate, were acquired in the course of man's history; since then they have become, though unfortunately only in a very variable amount, the inherited property of contemporary men.

[1915b, 3088]
The turning back of sadism against the self regularly occurs where a cultural suppression of the instincts holds back a large part of the subject's destructive instinctual components from being exercised in life. We may suppose that this portion of the destructive instinct which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the super-ego, without any such transformation, and increases its sadism against the ego. The sadism of the super-ego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of an instinct can - frequently or quite generally - result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others. One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of instinct followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first instinctual renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of instinct.

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

Another question concerns us more nearly. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from - that is, it is directed towards his own ego. There it is taken over by a portion of the ego, which sets itself over against the rest of the ego as super-ego, and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh super-ego and the ego that is subjected to it, is called by us the sense of guilt; it expresses itself as a need for punishment. Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]

No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture. (Some people, I know, prefer to use the term 'civilization'.) We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind. The psychical modifications that go along with the process of civilization are striking and unambiguous. They consist in a progressive displacement of instinctual aims and a restriction of instinctual impulses. Sensations which were pleasurable to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization two appear to be the most important: a strengthening of the intellect, which is beginning to govern instinctual life, and an internalization of the aggressive impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a constitutional intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

[1933b, 4803]
If we recognize the case we are discussing as an expression of the destructive or aggressive instinct, the question at once arises whether this view should not be extended to other instances of conflict, and, indeed, whether all that we know about psychical conflict should not be revised from this new angle. After all, we assume that in the course of man's development from a primitive state to a civilized one his aggressiveness undergoes a very considerable degree of internalization or turning inwards; if so, his internal conflicts would certainly be the proper equivalent for the external struggles which have then ceased. I am well aware that the dualistic theory according to which an instinct of death or of destruction or aggression claims equal rights as a partner with Eros as manifested in the libido, has found little sympathy and has not really been accepted even among psycho-analysts. This made me all the more pleased when not long ago I came upon this theory of mine in the writings of one of the great thinkers of ancient Greece. I am very ready to give up the prestige of originality for the sake of such a confirmation, especially as I can never be certain, in view of the wide extent of my reading in early years, whether what I took for a new creation might not be an effect of cryptomnesia. [1937c, 5038]
There is yet another alternative way in which the dream-work can deal with affects in the dream-thoughts, in addition to allowing them through or reducing them to nothing. It can turn them into their opposite. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: ‘dream books’ very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like my other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish-fulfilment, for wish-fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the affects attaching to dream-thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream-censorship. In social life, which has provided us with our familiar analogy with the dream-censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my affect from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the opposite affect - smile when I am angry and seem affectionate when I wish to destroy.

[1900a, 914]

But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:¹ but it was suppressed sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

[1909b, 2097]
Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

[1918a, 2355]

When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

[1915b, 3068]
It should not be objected that the state cannot refrain from wrong-doing, since that would place it at a disadvantage. It is no less disadvantageous, as a general rule, for the individual man to conform to the standards of morality and refrain from brutal and arbitrary conduct; and the state seldom proves able to indemnify him for the sacrifices it exacts. Nor should it be a matter for surprise that this relaxation of all the moral ties between the collective individuals of mankind should have had repercussions on the morality of individuals; for our conscience is not the inflexible judge that ethical teachers declare it, but in its origin is 'social anxiety' and nothing else. When the community no longer raises objections, there is an end, too, to the suppression of evil passions, and men perpetrate deeds of cruelty, fraud, treachery and barbarity so incompatible with their level of civilization that one would have thought them impossible. [1915b, 3072]

It is well known that a good number of homosexuals are characterized by a special development of their social instinctual impulses and by their devotion to the interests of the community. It would be tempting, as a theoretical explanation of this, to say that the behaviour towards men in general of a man who sees in other men potential love-objects must be different from that of a man who looks upon other men in the first instance as rivals in regard to women. The only objection to this is that jealousy and rivalry play their part in homosexual love as well, and that the community of men also includes these potential rivals. Apart from this speculative explanation, however, the fact that homosexual object-choice not infrequently proceeds from an early overcoming of rivalry with men cannot be without a bearing on the connection between homosexuality and social feeling. [1922b, 3909]

Now the case in which someone first loves and then hates the same person (or the reverse) because that person has given him cause for doing so, has obviously nothing to do with our problem. Nor has the other case, in which feelings of love that have not yet become manifest express themselves to begin with by hostility and aggressive tendencies; for it may be that here the destructive component in the object-cathexis has hurried on ahead and is only later on joined by the erotic one. But we know of several instances in the psychology of the neuroses in which it is more plausible to suppose that a transformation does take place. In persecutory paranoia the patient fends off an excessively strong homosexual attachment to some particular person in a special way; and as a result this person whom he loved most becomes a persecutor, against whom the patient directs an often dangerous aggressiveness. Here we have a right to interpolate a previous phase which has transformed the love into hate. In the case of the origin of homosexuality, and of desexualized social feelings as well, analytic investigation has only recently taught us to recognize that violent feelings of rivalry are present which lead to aggressive inclinations, and that it is only after these have been surmounted that the formerly hated object becomes the loved one or gives rise to an identification. The question arises whether in these instances we are to assume a direct transformation of hate into love. It is clear that here the changes are purely internal and an alteration in the behaviour of the object plays no part in them. [1923b, 3977]
The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

[1930a, 4504]
So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

[1930a, 4500]

The clue may be supplied by one of the ideal demands, as we have called them, of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naïve attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too - I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earth-worm or a grass-snake, then I fear that only a small modicum of my love will fall to his share - not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable?

[1930a, 4501]
On closer inspection, I find still further difficulties. Not merely is this stranger in general unworthy of my love; I must honestly confess that he has more claim to my hostility and even my hatred. He seems not to have the least trace of love for me and shows me not the slightest consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask himself whether the amount of advantage he gains bears any proportion to the extent of the harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his superior power; and the more secure he feels and the more helpless I am, the more certainly I can expect him to behave like this to me. If he behaves differently, if he shows me consideration and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as thy neighbour loves thee', I should not take exception to it. And there is a second commandment, which seems to me even more incomprehensible and arouses still stronger opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in treating it as a greater imposition. At bottom it is the same thing.¹

[1930a, 4502]

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable, But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity. [1930a, 4504]
In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nurse-maids try to appease with their lullaby about Heaven.

[1930a, 4512]

Another question concerns us more nearly. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from - that is, it is directed towards his own ego. There it is taken over by a portion of the ego, which sets itself over against the rest of the ego as super-ego, and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh super-ego and the ego that is subjected to it, is called by us the sense of guilt; it expresses itself as a need for punishment. Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.

[1930a, 4513]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands.

Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

[1930a, 4530]

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result?

[1930a, 4532]
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

Our mythological theory of instincts makes it easy for us to find a formula for indirect methods of combating war. If willingness to engage in war is an effect of the destructive instinct, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psycho-analysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done. The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure of human society is to a large extent based on them.
A progressive renunciation of constitutional instincts, whose activation might afford the ego primary pleasure, appears to be one of the foundations of the development of human civilization. Some part of this instinctual repression is effected by its religions, in that they require the individual to sacrifice his instinctual pleasure to the Deity: ‘Vengeance is mine, saith the Lord.’ In the development of the ancient religions one seems to discern that many things which man kind had renounced as ‘iniquities’ had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful instincts was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example.

Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',¹ in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

Apart from these pathological phenomena, it may be said that in the present case religion achieved all the aims for the sake of which it is included in the education of the individual. It put a restraint on his sexual impulsions by affording them a sublimation and a safe mooring; it lowered the importance of his family relationships, and thus protected him from the threat of isolation by giving him access to the great community of mankind. The untamed and fear-ridden child became social, well-behaved, and amenable to education.

[1907b, 1909]

[1908d, 1951]

[1918b, 3590]
Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1927c, 4453]

In summary, therefore, the judgement of science on the religious Weltanschauung is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.

[1933a, 4766]
I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain that society will reward this renunciation by offering me one of the permitted methods - even after a certain amount of postponement? What these jokes whisper may be said aloud: that the wishes and desires of men have a right to make themselves acceptable alongside of exacting and ruthless morality. And in our days it has been said in forceful and stirring sentences that this morality is only a selfish regulation laid down by the few who are rich and powerful and who can satisfy their wishes at any time without any postponement. So long as the art of healing has not gone further in making our life safe and so long as social arrangements do no more to make it more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the demands of morality. Every honest man will end by making this admission, at least to himself. The decision in this conflict can only be reached by the roundabout path of fresh insight. One must bind one's own life to that of others so closely and be able to identify oneself with others so intimately that the brevity of one's own life can be overcome; and one must not fulfil the demands of one's own needs illegitimately, but must leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to change the order of society. But not every personal need can be postponed in this way and transferred to other people, and there is no general and final solution of the conflict.

More pronounced forms of the perversions and of homosexuality, especially if they are exclusive, do, it is true, make those subject to them socially useless and unhappy, so that it must be recognized that the cultural requirements even of the second stage are a source of suffering for a certain proportion of mankind. The fate of these people who differ constitutionally from the rest varies, and depends on whether they have been born with a sexual instinct which by absolute standards is strong or comparatively weak. In the latter case - where the sexual instinct is in general weak - perverts succeed in totally suppressing the inclinations which bring them into conflict with the moral demands of their stage of civilization. But this, from the ideal point of view, is also the only thing they succeed in achieving; for, in order to effect this suppression of their sexual instinct, they use up the forces which they would otherwise employ in cultural activities. They are, as it were, inwardly inhibited and outwardly paralysed. What we shall be saying again later on about the abstinence demanded of men and women in the third stage of civilization applies to them too.
Where the sexual instinct is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse instincts is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual instincts are, it is true, no longer expressed as such - and this constitutes the success of the process - but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless for society as satisfaction of the suppressed instincts in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the instinct amount to what we call nervous illness, or, more precisely, the psychoneuroses.¹ Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their instincts which is apparent and which becomes increasingly unsuccessful. They therefore only carry on their collaboration with cultural activities by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the ‘negative’ of the perversions because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind - because the neuroses contain the same tendencies, though in a state of ‘repression’, as do the positive perversions.

[1908d, 1954]

Let us remember, however, that our attitude to life ought not to be that of a fanatic for hygiene or therapy. We must admit that the ideal prevention of neurotic illnesses which we have in mind would not be of advantage to every individual. A good number of those who now take flight into illness would not, under the conditions we have assumed, support the conflict but would rapidly succumb or would cause a mischief greater than their own neurotic illness. Neuroses have in fact their biological function as a protective contrivance and they have their social justification: the ‘gain from illness’ they provide is not always a purely subjective one. Is there one of you who has not at some time looked into the causation of a neurosis and had to allow that it was the mildest possible outcome of the situation? And should such heavy sacrifices be made in order to eradicate the neuroses in particular, when the world is full of other unavoidable misery?

[1910d, 2314]
When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

But why do we look for a psycho-analytic interpretation at all instead of contenting ourselves with the more accessible anagogic one? The answer to this is linked up with many other problems - with the existence in general of neurosis and the explanations it inevitably demands - with the fact that virtue does not reward a man with as much joy and strength in life as one would expect, as though it brought with it too much of its origin (our dreamer, too, had not been well rewarded for her virtue), and with other things which I need not discuss before this audience.

[1915b, 3068]

[1922a, 3894]
But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of *cultural hypocrisy* which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.

[1925e, 4127]

Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of beasts - and I scorn to distinguish between culture and civilization -, presents, as we know, two aspects to the observer. It includes on the one hand all the knowledge and capacity that men have acquired in order to control the forces of nature and extract its wealth for the satisfaction of human needs, and, on the other hand, all the regulations necessary in order to adjust the relations of men to one another and especially the distribution of the available wealth. The two trends of civilization are not independent of each other: firstly, because the mutual relations of men are profoundly influenced by the amount of instinctual satisfaction which the existing wealth makes possible; secondly, because an individual man can himself come to function as wealth in relation to another one, in so far as the other person makes use of his capacity for work, or chooses him as a sexual object; and thirdly, moreover, because every individual is virtually an enemy of civilization, though civilization is supposed to be an object of universal human interest. It is remarkable that, little as men are able to exist in isolation, they should nevertheless feel as a heavy burden the sacrifices which civilization expects of them in order to make a communal life possible. Thus civilization has to be defended against the individual, and its regulations, institutions and commands are directed to that task. They aim not only at effecting a certain distribution of wealth but at maintaining that distribution; indeed, they have to protect everything that contributes to the conquest of nature and the production of wealth against men's hostile impulses. Human creations are easily destroyed, and science and technology, which have built them up, can also be used for their annihilation.

[1927c, 4418]
One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

If we turn to those restrictions that apply only to certain classes of society, we meet with a state of things which is flagrant and which has always been recognized. It is to be expected that these underprivileged classes will envy the favoured ones their privileges and will do all they can to free themselves from their own surplus of privation. Where this is not possible, a permanent measure of discontent will persist within the culture concerned and this can lead to dangerous revolts. If, however, a culture has not got beyond a point at which the satisfaction of one portion of its participants depends upon the suppression of another, and perhaps larger, portion - and this is the case in all present day cultures - it is understandable that the suppressed people should develop an intense hostility towards a culture whose existence they make possible by their work, but in whose wealth they have too small a share. In such conditions an internalization of the cultural prohibitions among the suppressed people is not to be expected. On the contrary, they are not prepared to acknowledge the prohibitions, they are intent on destroying the culture itself, and possibly even on doing away with the postulates on which it is based. The hostility of these classes to civilization is so obvious that it has caused the more latent hostility of the social strata that are better provided for to be overlooked. It goes without saying that a civilization which leaves so large a number of its participants unsatisfied and drives them into revolt neither has nor deserves the prospect of a lasting existence.

For the individual, too, life is hard to bear, just as it is for mankind in general. The civilization in which he participates imposes some amount of privation on him, and other men bring him a measure of suffering, either in spite of the precepts of his civilization or because of its imperfections. To this are added the injuries which untamed nature - he calls it Fate - inflicts on him. One might suppose that this condition of things would result in a permanent state of anxious expectation in him and a severe injury to his natural narcissism. We know already how the individual reacts to the injuries which civilization and other men inflict on him: he develops a corresponding degree of resistance to the regulations of civilization and of hostility to it. But how does he defend himself against the superior powers of nature, of Fate, which threaten him as they threaten all the rest?
And now to proceed with our defence. Religion has clearly performed great services for human civilization. It has contributed much towards the taming of the asocial instincts. But not enough. It has ruled human society for many thousands of years and has had time to show what it can achieve. If it had succeeded in making the majority of mankind happy, in comforting them, in reconciling them to life and in making them into vehicles of civilization, no one would dream of attempting to alter the existing conditions. But what do we see instead? We see that an appallingly large number of people are dissatisfied with civilization and unhappy in it, and feel it as a yoke which must be shaken off; and that these people either do everything in their power to change that civilization, or else go so far in their hostility to it that they will have nothing to do with civilization or with a restriction of instinct. At this point it will be objected against us that this state of affairs is due to the very fact that religion has lost a part of its influence over human masses precisely because of the deplorable effect of the advances of science. We will note this admission and the reason given for it, and we shall make use of it later for our own purposes; but the objection itself has no force.

It is doubtful whether men were in general happier at a time when religious doctrines held unrestricted sway; more moral they certainly were not. They have always known how to externalize the precepts of religion and thus to nullify their intentions. The priests, whose duty it was to ensure obedience to religion, met them half-way in this. God's kindness must lay a restraining hand on His justice. One sinned, and then one made a sacrifice or did penance and then one was free to sin once more. Russian introspectiveness has reached the pitch of concluding that sin is indispensable for the enjoyment of all the blessings of divine grace, so that, at bottom, sin is pleasing to God. It is no secret that the priests could only keep the masses submissive to religion by making such large concessions as these to the instinctual nature of man. Thus it was agreed: God alone is strong and good, man is weak and sinful. In every age immorality has found no less support in religion than morality has. If the achievements of religion in respect to man's happiness, susceptibility to culture and moral control are no better than this, the question cannot but arise whether we are not overrating its necessity for mankind, and whether we do wisely in basing our cultural demands upon it.

This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We cannot do without auxiliary constructions', as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends Candide with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

¹
As we see, what decides the purpose of life is simply the programme of the pleasure principle. This principle dominates the operation of the mental apparatus from the start. There can be no doubt about its efficacy, and yet its programme is at loggerheads with the whole world, with the macrocosm as much as with the microcosm. There is no possibility at all of its being carried through; all the regulations of the universe run counter to it. One feels inclined to say that the intention that man should be 'happy' is not included in the plan of 'Creation'. What we call happiness in the strictest sense comes from the (preferably sudden) satisfaction of needs which have been dammed up to a high degree, and it is from its nature only possible as an episodic phenomenon. When any situation that is desired by the pleasure principle is prolonged, it only produces a feeling of mild contentment. We are so made that we can derive intense enjoyment only from a contrast and very little from a state of things.¹ Thus our possibilities of happiness are already restricted by our constitution. Unhappiness is much less difficult to experience. We are threatened with suffering from three directions: from our own body, which is doomed to decay and dissolution and which cannot even do without pain and anxiety as warning signals; from the external world, which may rage against us with overwhelming and merciless forces of destruction; and finally from our relations to other men. The suffering which comes from this last source is perhaps more painful to us than any other. We tend to regard it as a kind of gratuitous addition, although it cannot be any less fatefully inevitable than the suffering which comes from elsewhere.

¹930a, 4475

The complicated structure of our mental apparatus admits, however, of a whole number of other influences. Just as a satisfaction of instinct spells happiness for us, so severe suffering is caused us if the external world lets us starve, if it refuses to sate our needs. One may therefore hope to be freed from a part of one's sufferings by influencing the instinctual impulses. This type of defence against suffering is no longer brought to bear on the sensory apparatus; it seeks to master the internal sources of our needs. The extreme form of this is brought about by killing off the instincts, as is prescribed by the worldly wisdom of the East and practised by Yoga. If it succeeds, then the subject has, it is true, given up all other activities as well - he has sacrificed his life; and, by another path, he has once more only achieved the happiness of quietness. We follow the same path when our aims are less extreme and we merely attempt to control our instinctual life. In that case, the controlling elements are the higher psychical agencies, which have subjected themselves to the reality principle. Here the aim of satisfaction is not by any means relinquished; but a certain amount of protection against suffering is secured, in that non-satisfaction is not so painfully felt in the case of instincts kept in dependence as in the case of uninhibited ones. As against this, there is an undeniable diminution in the potentialities of enjoyment. The feeling of happiness derived from the satisfaction of a wild instinctual impulse untamed by the ego is incomparably more intense than that derived from sating an instinct that has been tamed. The irresistibility of perverse instincts, and perhaps the attraction in general of forbidden things, finds an economic explanation here.

¹930a, 4478
While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

[1930a, 4480]

In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding displeasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

[1930a, 4482]
Our enquiry concerning happiness has not so far taught us much that is not already common knowledge. And even if we proceed from it to the problem of why it is so hard for men to be happy, there seems no greater prospect of learning anything new. We have given the answer already by pointing to the three sources from which our suffering comes: the superior power of nature, the feebleness of our own bodies and the inadequacy of the regulations which adjust the mutual relationships of human beings in the family, the state and society. In regard to the first two sources, our judgement cannot hesitate long. It forces us to acknowledge those sources of suffering and to submit to the inevitable. We shall never completely master nature; and our bodily organism, itself a part of that nature, will always remain a transient structure with a limited capacity for adaptation and achievement. This recognition does not have a paralysing effect. On the contrary, it points the direction for our activity. If we cannot remove all suffering, we can remove some, and we can mitigate some: the experience of many thousands of years has convinced us of that. As regards the third source, the social source of suffering, our attitude is a different one. We do not admit it at all; we cannot see why the regulations made by ourselves should not, on the contrary, be a protection and a benefit for every one of us. And yet, when we consider how unsuccessful we have been in precisely this field of prevention of suffering, a suspicion dawns on us that here, too, a piece of unconquerable nature may lie behind it - this time a piece of our own psychical constitution.

When we start considering this possibility, we come upon a contention which is so astonishing that we must dwell upon it. This contention holds that what we call our civilization is largely responsible for our misery, and that we should be much happier if we gave it up and returned to primitive conditions. I call this contention astonishing because, in whatever way we may define the concept of civilization, it is a certain fact that all the things with which we seek to protect ourselves against the threats that emanate from the sources of suffering are part of that very civilization.

How has it happened that so many people have come to take up this strange attitude of hostility to civilization? I believe that the basis of it was a deep and long-standing dissatisfaction with the then existing state of civilization and that on that basis a condemnation of it was built up, occasioned by certain specific historical events. I think I know what the last and the last but one of those occasions were. I am not learned enough to trace the chain of them far back enough in the history of the human species; but a factor of this kind hostile to civilization must already have been at work in the victory of Christendom over the heathen religions. For it was very closely related to the low estimation put upon earthly life by the Christian doctrine. The last but one of these occasions was when the progress of voyages of discovery led to contact with primitive peoples and races. In consequence of insufficient observation and a mistaken view of their manners and customs, they appeared to Europeans to be leading a simple, happy life with few wants, a life such as was unattainable by their visitors with their superior civilization. Later experience has corrected some of those judgements. In many cases the observers had wrongly attributed to the absence of complicated cultural demands what was in fact due to the bounty of nature and the ease with which the major human needs were satisfied. The last occasion is especially familiar to us. It arose when people came to know about the mechanism of the neuroses, which threaten to undermine the modicum of happiness enjoyed by civilized men. It was discovered that a person becomes neurotic because he cannot tolerate the amount of frustration which society imposes on him in the service of its cultural ideals, and it was inferred from this that the abolition or reduction of those demands would result in a return to possibilities of happiness.
There is also an added factor of disappointment. During the last few generations mankind has made an extraordinary advance in the natural sciences and in their technical application and has established his control over nature in a way never before imagined. The single steps of this advance are common knowledge and it is unnecessary to enumerate them. Men are proud of those achievements, and have a right to be. But they seem to have observed that this newly-won power over space and time, this subjugation of the forces of nature, which is the fulfilment of a longing that goes back thousands of years, has not increased the amount of pleasurable satisfaction which they may expect from life and has not made them feel happier. From the recognition of this fact we ought to be content to conclude that power over nature is not the only precondition of human happiness, just as it is not the only goal of cultural endeavour; we ought not to infer from it that technical progress is without value for the economics of our happiness. One would like to ask: is there, then, no positive gain in pleasure, no unequivocal increase in my feeling of happiness, if I can, as often as I please, hear the voice of a child of mine who is living hundreds of miles away or if I can learn in the shortest possible time after a friend has reached his destination that he has come through the long and difficult voyage unharmed? Does it mean nothing that medicine has succeeded in enormously reducing infant mortality and the danger of infection for women in childbirth, and, indeed, in considerably lengthening the average life of a civilized man? And there is a long list that might be added to benefits of this kind which we owe to the much-despised era of scientific and technical advances. But here the voice of pessimistic criticism makes itself heard and warns us that most of these satisfactions follow the model of the ‘cheap enjoyment’ extolled in the anecdote - the enjoyment obtained by putting a bare leg from under the bedclothes on a cold winter night and drawing it in again. If there had been no railway to conquer distances, my child would never have left his native town and I should need no telephone to hear his voice; if travelling across the ocean by ship had not been introduced, my friend would not have embarked on his sea-voyage and I should not need a cable to relieve my anxiety about him. What is the use of reducing infantile mortality when it is precisely that reduction which imposes the greatest restraint on us in the begetting of children, so that, taken all round, we nevertheless rear no more children than in the days before the reign of hygiene, while at the same time we have created difficult conditions for our sexual life in marriage, and have probably worked against the beneficial effects of natural selection? And, finally, what good to us is a long life if it is difficult and barren of joys, and if it is so full of misery that we can only welcome death as a deliverer?

It seems certain that we do not feel comfortable in our present-day civilization, but it is very difficult to form an opinion whether and in what degree men of an earlier age felt happier and what part their cultural conditions played in the matter. We shall always tend to consider people's distress objectively - that is, to place ourselves, with our own wants and sensibilities, in their conditions, and then to examine what occasions we should find in them for experiencing happiness or unhappiness. This method of looking at things, which seems objective because it ignores the variations in subjective sensibility, is, of course, the most subjective possible, since it puts one's own mental states in the place of any others, unknown though they may be. Happiness, however, is something essentially subjective. No matter how much we may shrink with horror from certain situations - of a galley-slave in antiquity, of a peasant during the Thirty Years' War, of a victim of the Holy Inquisition, of a Jew awaiting a pogrom - it is nevertheless impossible for us to feel our way into such people - to divine the changes which original obtuseness of mind, a gradual stupefying process, the cessation of expectations, and cruder or more refined methods of narcotization have produced upon their receptivity to sensations of pleasure and unpleasure. Moreover, in the case of the most extreme possibility of suffering, special mental protective devices are brought into operation. It seems to me unprofitable to pursue this aspect of the problem any further.
It is time for us to turn our attention to the nature of this civilization on whose value as a means to happiness doubts have been thrown. We shall not look for a formula in which to express that nature in a few words, until we have learned something by examining it. We shall therefore content ourselves with saying once more that the word 'civilization' describes the whole sum of the achievements and the regulations which distinguish our lives from those of our animal ancestors and which serve two purposes - namely to protect men against nature and to adjust their mutual relations.¹ In order to learn more, we will bring together the various features of civilization individually, as they are exhibited in human communities. In doing so, we shall have no hesitation in letting ourselves be guided by linguistic usage or, as it is also called, linguistic feeling, in the conviction that we shall thus be doing justice to inner discernments which still defy expression in abstract terms.

¹[1930a, 4487]

These things that, by his science and technology, man has brought about on this earth, on which he first appeared as a feeble animal organism and on which each individual of his species must once more make its entry ('oh inch of nature!') as a helpless suckling - these things do not only sound like a fairy tale, they are an actual fulfilment of every - or of almost every - fairy-tale wish. All these assets he may lay claim to as his cultural acquisition. Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods. To these gods he attributed everything that seemed unattainable to his wishes, or that was forbidden to him. One may say, therefore, that these gods were cultural ideals. To-day he has come very close to the attainment of this ideal, he has almost become a god himself. Only, it is true, in the fashion in which ideals are usually attained according to the general judgement of humanity. Not completely; in some respects not at all, in others only half way. Man has, as it were, become a kind of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times. Nevertheless, he is entitled to console himself with the thought that this development will not come to an end precisely with the year 1930 A.D. Future ages will bring with them new and probably unimaginably great advances in this field of civilization and will increase man's likeness to God still more. But in the interests of our investigations, we will not forget that present-day man does not feel happy in his Godlike character.

²[1930a, 4489]

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

³[1930a, 4500]

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

⁴[1930a, 4507]
When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.
[1930a, 4507]

Thus we know of two origins of the sense of guilt: one arising from fear of an authority, and the other, later on, arising from fear of the super-ego. The first insists upon a renunciation of instinctual satisfactions; the second, as well as doing this, presses for punishment, since the continuance of the forbidden wishes cannot be concealed from the super-ego. We have also learned how the severity of the super-ego - the demands of conscience - is to be understood. It is simply a continuation of the severity of the external authority, to which it has succeeded and which it has in part replaced. We now see in what relationship the renunciation of instinct stands to the sense of guilt. Originally, renunciation of instinct was the result of fear of an external authority: one renounced one's satisfactions in order not to lose its love. If one has carried out this renunciation, one is, as it were, quits with the authority and no sense of guilt should remain. But with fear of the super-ego the case is different. Here, instinctual renunciation is not enough, for the wish persists and cannot be concealed from the super-ego. Thus, in spite of the renunciation that has been made, a sense of guilt comes about. This constitutes a great economic disadvantage in the erection of a super-ego, or, as we may put it, in the formation of a conscience. Instinctual renunciation now no longer has a completely liberating effect; virtuous continence is no longer rewarded with the assurance of love. A threatened external unhappiness - loss of love and punishment on the part of the external authority - has been exchanged for a permanent internal unhappiness, for the tension of the sense of guilt.
[1930a, 4517]
These interrelations are so complicated and at the same time so important that, at the risk of repeating myself, I shall approach them from yet another angle. The chronological sequence, then, would be as follows. First comes renunciation of instinct owing to fear of aggression by the external authority. (This is, of course, what fear of the loss of love amounts to, for love is a protection against this punitive aggression.) After that comes the erection of an internal authority, and renunciation of instinct owing to fear of it - owing to fear of conscience. In this second situation bad intentions are equated with bad actions, and hence come a sense of guilt and a need for punishment. The aggressiveness of conscience keeps up the aggressiveness of the authority. So far things have no doubt been made clear; but where does this leave room for the reinforcing influence of misfortune (of renunciation imposed from without), and for the extraordinary severity of conscience in the best and most tractable people? We have already explained both these peculiarities of conscience, but we probably still have an impression that those explanations do not go to the bottom of the matter, and leave a residue still unexplained. And here at last an idea comes in which belongs entirely to psycho-analysis and which is foreign to people's ordinary way of thinking. This idea is of a sort which enables us to understand why the subject-matter was bound to seem so confused and obscure to us. For it tells us that conscience (or more correctly, the anxiety which later becomes conscience) is indeed the cause of instinctual renunciation to begin with, but that later the relationship is reversed. Every renunciation of instinct now becomes a dynamic source of conscience and every fresh renunciation increases the latter's severity and intolerance. If we could only bring it better into harmony with what we already know about the history of the origin of conscience, we should be tempted to defend the paradoxical statement that conscience is the result of instinctual renunciation, or that instinctual renunciation (imposed on us from without) creates conscience, which then demands further instinctual renunciation.

[1930a, 4518]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoiled the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt. Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

[1930a, 4523]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

[1930a, 4530]
For a wide variety of reasons, it is very far from my intention to express an opinion upon the value of human civilization. I have endeavoured to guard myself against the enthusiastic prejudice which holds that our civilization is the most precious thing that we possess or could acquire and that its path will necessarily lead to heights of unimagined perfection. I can at least listen without indignation to the critic who is of the opinion that when one surveys the aims of cultural endeavour and the means it employs, one is bound to come to the conclusion that the whole effort is not worth the trouble, and that the outcome of it can only be a state of affairs which the individual will be unable to tolerate. My impartiality is made all the easier to me by my knowing very little about all these things. One thing only do I know for certain and that is that man's judgements of value follow directly his wishes for happiness - that, accordingly, they are an attempt to support his illusions with arguments. I should find it very understandable if someone were to point out the obligatory nature of the course of human civilization and were to say, for instance, that the tendencies to a restriction of sexual life or to the institution of a humanitarian ideal at the expense of natural selection were developmental trends which cannot be averted or turned aside and to which it is best for us to yield as though they were necessities of nature. I know, too, the objection that can be made against this, to the effect that in the history of mankind, trends such as these, which were considered unsurmountable, have often been thrown aside and replaced by other trends. Thus I have not the courage to rise up before my fellow-men as a prophet, and I bow to their reproach that I can offer them no consolation: for at bottom that is what they are all demanding - the wildest revolutionaries no less passionately than the most virtuous believers.

[1930a, 4532]

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire-legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal driven by instinct, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced an instinct and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes an instinctual renunciation, at least it makes no secret of the resentment which the culture-hero could not fail to arouse in men driven by their instincts. And this is in accordance with what we know and expect. We know that a demand for a renunciation of instinct, and the enforcement of that demand, call out hostility and aggressiveness, which is only transformed into a sense of guilt in a later phase of psychical development.

[1932a, 4783]
No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture. (Some people, I know, prefer to use the term 'civilization'.) We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind. The *psychical* modifications that go along with the process of civilization are striking and unambiguous. They consist in a progressive displacement of instinctual aims and a restriction of instinctual impulses. Sensations which were pleasurable to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization two appear to be the most important: a strengthening of the intellect, which is beginning to govern instinctual life, and an internalization of the aggressive impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a *constitutional* intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

[1933b, 4803]
More pronounced forms of the perversions and of homosexuality, especially if they are exclusive, do, it is true, make those subject to them socially useless and unhappy, so that it must be recognized that the cultural requirements even of the second stage are a source of suffering for a certain proportion of mankind. The fate of these people who differ constitutionally from the rest varies, and depends on whether they have been born with a sexual instinct which by absolute standards is strong or comparatively weak. In the latter case - where the sexual instinct is in general weak - perverts succeed in totally suppressing the inclinations which bring them into conflict with the moral demands of their stage of civilization. But this, from the ideal point of view, is also the only thing they succeed in achieving; for, in order to effect this suppression of their sexual instinct, they use up the forces which they would otherwise employ in cultural activities. They are, as it were, inwardly inhibited and outwardly paralysed. What we shall be saying again later on about the abstinence demanded of men and women in the third stage of civilization applies to them too.

Where the sexual instinct is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse instincts is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual instincts are, it is true, no longer expressed as such - and this constitutes the success of the process - but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless for society as satisfaction of the suppressed instincts in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the instinct amount to what we call nervous illness, or, more precisely, the psychoneuroses.¹ Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their instincts which is apparent and which becomes increasingly unsuccessful. They therefore only carry on their collaboration with cultural activities by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the ‘negative’ of the perversions because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind - because the neuroses contain the same tendencies, though in a state of 'repression', as do the positive perversions.

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.
If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

[1930a, 4507]

And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]
Similarly, the term masochism comprises any passive attitude towards sexual life and the sexual object, the extreme instance of which appears to be that in which satisfaction is conditional upon suffering physical or mental pain at the hands of the sexual object. Masochism, in the form of a perversion, seems to be further removed from the normal sexual aim than its counterpart; it may be doubted at first whether it can ever occur as a primary phenomenon or whether, on the contrary, it may not invariably arise from a transformation of sadism.¹ It can often be shown that masochism is nothing more than an extension of sadism turned round upon the subject's own self, which thus, to begin with, takes the place of the sexual object. Clinical analysis of extreme cases of masochistic perversion show that a great number of factors (such as the castration complex and the sense of guilt) have combined to exaggerate and fixate the original passive sexual attitude.

¹ [Footnote added 1924:] My opinion of masochism has been to a large extent altered by later reflection, based upon certain hypotheses as to the structure of the apparatus of the mind and the classes of instincts operating in it. I have been led to distinguish a primary or erotogenic masochism, out of which two later forms, feminine and moral masochism, have developed. Sadism which cannot find employment in actual life is turned round upon the subject's own self and so produces a secondary masochism, which is superadded to the primary kind. (Cf. Freud, 1924c.)

Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent "tout comprendre c'est tout pardonner" - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905d, 1484]

[1905c, 1697]
I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.¹ If, however, we inquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always psychical realities and never factual ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.
When I speak of disillusionment, everyone will know at once what I mean. One need not be a
sentimentalist; one may perceive the biological and psychological necessity for suffering in the
economy of human life, and yet condemn war both in its means and ends and long for the
cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as
nations live under such widely differing conditions, so long as the value of individual life is so
variously assessed among them, and so long as the animosities which divide them represent
such powerful motive forces in the mind. We were prepared to find that wars between the
primitive and the civilized peoples, between the races who are divided by the colour of their skin
- wars, even, against and among the nationalities of Europe whose civilization is little developed
or has been lost - would occupy mankind for some time to come. But we permitted ourselves to
have other hopes. We had expected the great world-dominating nations of white race upon
whom the leadership of the human species has fallen, who were known to have world-wide
interests as their concern, to whose creative powers were due not only our technical advances
towards the control of nature but the artistic and scientific standards of civilization - we had
expected these peoples to succeed in discovering another way of settling misunderstandings
and conflicts of interest. Within each of these nations high norms of moral conduct were laid
down for the individual, to which his manner of life was bound to conform if he desired to take
part in a civilized community. These ordinances, often too stringent, demanded a great deal of
him - much self-restraint, much renunciation of instinctual satisfaction. He was above all
forbidden to make use of the immense advantages to be gained by the practice of lying and
deception in the competition with his fellow-men. The civilized states regarded these moral
standards as the basis of their existence. They took serious steps if anyone ventured to tamper
with them, and often declared it improper even to subject them to examination by a critical
intelligence. It was to be assumed, therefore, that the state itself would respect them, and would
not think of undertaking anything against them which would contradict the basis of its own
existence. Observation showed, to be sure, that embedded in these civilized states there were
remnants of certain other peoples, which were universally unpopular and had therefore been
only reluctantly, and even so not fully, admitted to participation in the common work of
civilization, for which they had shown themselves suitable enough. But the great nations
themselves, it might have been supposed, would have acquired so much comprehension of
what they had in common, and so much tolerance for their differences, that 'foreigner' and
'enemy' could no longer be merged, as they still were in classical antiquity, into a single
concept.

[1915b, 3068]

The enjoyment of this common civilization was disturbed from time to time by warning voices,
which declared that old traditional differences made wars inevitable, even among the members
of a community such as this. We refused to believe it; but if such a war were to happen, how did
we picture it? We saw it as an opportunity for demonstrating the progress of comity among men
since the era when the Greek Amphictyonic Council proclaimed that no city of the league might
be destroyed, nor its olive-groves cut down, nor its water-supply stopped; we pictured it as a
chivalrous passage of arms, which would limit itself to establishing the superiority of one side in
the struggle, while as far as possible avoiding acute suffering that could contribute nothing to
the decision, and granting complete immunity for the wounded who had to withdraw from the
contest, as well as for the doctors and nurses who devoted themselves to their recovery. There
would, of course, be the utmost consideration for the non-combatant classes of the population -
for women who take no part in war-work, and for the children who, when they are grown up,
should become on both sides one another's friends and helpers. And again, all the international
undertakings and institutions in which the common civilization of peace-time had been
embodied would be maintained.

[1915b, 3070]
Moreover, it has brought to light an almost incredible phenomenon: the civilized nations know and understand one another so little that one can turn against the other with hate and loathing. Indeed, one of the great civilized nations is so universally unpopular that the attempt can actually be made to exclude it from the civilized community as 'barbaric', although it has long proved its fitness by the magnificent contributions to that community which it has made. We live in hopes that the pages of an impartial history will prove that that nation, in whose language we write and for whose victory our dear ones are fighting, has been precisely the one which has least transgressed the laws of civilization. But at such a time who dares to set himself up as judge in his own cause?

Peoples are more or less represented by the states which they form, and these states by the governments which rule them. The individual citizen can with horror convince himself in this war of what would occasionally cross his mind in peace-time - that the state has forbidden to the individual the practice of wrong doing, not because it desires to abolish it, but because it desires to monopolize it, like salt and tobacco. A belligerent state permits itself every such misdeed, every such act of violence, as would disgrace the individual. It makes use against the enemy not only of the accepted ruses de guerre, but of deliberate lying and deception as well - and to a degree which seems to exceed the usage of former wars. The state exacts the utmost degree of obedience and sacrifice from its citizens, but at the same time it treats them like children by an excess of secrecy and a censorship upon news and expressions of opinion which leaves the spirits of those whose intellects it thus suppresses defenceless against every unfavourable turn of events and every sinister rumour. It absolves itself from the guarantees and treaties by which it was bound to other states, and confesses shamelessly to its own rapacity and lust for power, which the private individual has then to sanction in the name of patriotism.

Hence the primateval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book Totem and Taboo (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.
Pious souls, no doubt, who would like to believe that our nature is remote from any contact with what is evil and base, will not fail to use the early appearance and the urgency of the prohibition against murder as the basis for gratifying conclusions as to the strength of the ethical impulses which must have been implanted in us. Unfortunately this argument proves even more for the opposite view. So powerful a prohibition can only be directed against an equally powerful impulse. What no human soul desires stands in no need of prohibition;¹ it is excluded automatically. The very emphasis laid on the commandment 'Thou shalt not kill' makes it certain that we spring from an endless series of generations of murderers, who had the lust for killing in their blood, as, perhaps, we ourselves have to-day. Mankind's ethical strivings, whose strength and significance we need not in the least depreciate, were acquired in the course of man's history; since then they have become, though unfortunately only in a very variable amount, the inherited property of contemporary men.
[1915b, 3088]

And so, if we are to be judged by our unconscious wishful impulses, we ourselves are, like primaeval man, a gang of murderers. It is fortunate that all these wishes do not possess the potency that was attributed to them in primaeval times;¹ in the cross-fire of mutual curses mankind would long since have perished, the best and wisest of men and the loveliest and fairest of women with the rest.
[1915b, 3089]

It is easy to see how war impinges on this dichotomy. It strips us of the later accretions of civilization, and lays bare the primal man in each of us. It compels us once more to be heroes who cannot believe in their own death; it stamps strangers as enemies, whose death is to be brought about or desired; it tells us to disregard the death of those we love. But war cannot be abolished; so long as the conditions of existence among nations are so different and their mutual repulsion so violent, there are bound to be wars. The question then arises: Is it not we who should give in, who should adapt ourselves to war? Should we not confess that in our civilized attitude towards death we are once again living psychologically beyond our means, and should we not rather turn back and recognize the truth? Would it not be better to give death the place in reality and in our thoughts which is its due, and to give a little more prominence to the unconscious attitude towards death which we have hitherto so carefully suppressed? This hardly seems an advance to higher achievement, but rather in some respects a backward step - a regression; but it has the advantage of taking the truth more into account, and of making life more tolerable for us once again. To tolerate life remains, after all, the first duty of all living beings. Illusion becomes valueless if it makes this harder for us.
[1915b, 3091]

And now turn your eyes away from individuals and consider the Great War which is still laying Europe waste. Think of the vast amount of brutality, cruelty and lies which are able to spread over the civilized world. Do you really believe that a handful of ambitious and deluding men without conscience could have succeeded in unleashing all these evil spirits if their millions of followers did not share their guilt? Do you venture, in such circumstances, to break a lance on behalf of the exclusion of evil from the mental constitution of mankind?
[1916-1917, 3241]

The dangerous death instincts are dealt with in the individual in various ways: in part they are rendered harmless by being fused with erotic components, in part they are diverted towards the external world in the form of aggression, while to a large extent they undoubtedly continue their internal work unhindered. How is it then that in melancholia the super-ego can become a kind of gathering-place for the death instincts?
[1923b, 3988]
From the point of view of instinctual control, of morality, it may be said of the id that it is totally non-moral, of the ego that it strives to be moral, and of the super-ego that it can be super-moral and then become as cruel as only the id can be. It is remarkable that the more a man checks his aggressiveness towards the exterior the more severe - that is aggressive - he becomes in his ego ideal. The ordinary view sees the situation the other way round: the standard set up by the ego ideal seems to be the motive for the suppression of aggressiveness. The fact remains, however, as we have stated it: the more a man controls his aggressiveness, the more intense becomes his ideal's inclination to aggressiveness against his ego. It is like a displacement, a turning round upon his own ego. But even ordinary normal morality has a harshly restraining, cruelly prohibiting quality. It is from this, indeed, that the conception arises of a higher being who deals out punishment inexorably.

Moreover, if I were to give way to my moral pride and tried to decree that for purposes of moral valuation I might disregard the evil in the id and need not make my ego responsible for it, what use would that be to me? Experience shows me that I nevertheless do take that responsibility, that I am somehow compelled to do so. Psycho-analysis has made us familiar with a pathological condition, obsessional neurosis, in which the poor ego feels itself responsible for all sorts of evil impulses of which it knows nothing, impulses which are brought up against it in consciousness but which it is unable to acknowledge. Something of this is present in every normal person. It is a remarkable fact that the more moral he is the more sensitive is his 'conscience'. It is just as though we could say that the healthier a man is, the more liable he is to contagions and to the effects of injuries. This is no doubt because conscience is itself a reaction-formation against the evil that is perceived in the id. The more strongly the latter is suppressed, the more active is the conscience.

The turning back of sadism against the self regularly occurs where a cultural suppression of the instincts holds back a large part of the subject's destructive instinctual components from being exercised in life. We may suppose that this portion of the destructive instinct which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the super-ego, without any such transformation, and increases its sadism against the ego. The sadism of the super-ego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of an instinct can - frequently or quite generally - result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others. One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of instinct followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first instinctual renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of instinct.

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of instinct. Its danger lies in the fact that it originates from the death instinct and corresponds to the part of that instinct which has escaped being turned outwards as an instinct of destruction. But since, on the other hand, it has the significance of an erotic component, even the subject's destruction of himself cannot take place without libidinal satisfaction.
Another question concerns us more nearly. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from - that is, it is directed towards his own ego. There it is taken over by a portion of the ego, which sets itself over against the rest of the ego as super-ego, and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh super-ego and the ego that is subjected to it, is called by us the sense of guilt; it expresses itself as a need for punishment. Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.

[1930a, 4513]

As to the origin of the sense of guilt, the analyst has different views from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually done the bad thing but has only recognized in himself an intention to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger only sets in if and when the authority discovers it, and in either case the authority would behave in the same way.

[1930a, 4514]
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.
[1930a, 4516]
These interrelations are so complicated and at the same time so important that, at the risk of repeating myself, I shall approach them from yet another angle. The chronological sequence, then, would be as follows. First comes renunciation of instinct owing to fear of aggression by the external authority. (This is, of course, what fear of the loss of love amounts to, for love is a protection against this punitive aggression.) After that comes the erection of an internal authority, and renunciation of instinct owing to fear of it - owing to fear of conscience. In this second situation bad intentions are equated with bad actions, and hence come a sense of guilt and a need for punishment. The aggressiveness of conscience keeps up the aggressiveness of the authority. So far things have no doubt been made clear; but where does this leave room for the reinforcing influence of misfortune (of renunciation imposed from without), and for the extraordinary severity of conscience in the best and most tractable people? We have already explained both these peculiarities of conscience, but we probably still have an impression that those explanations do not go to the bottom of the matter, and leave a residue still unexplained. And here at last an idea comes in which belongs entirely to psycho-analysis and which is foreign to people's ordinary way of thinking. This idea is of a sort which enables us to understand why the subject-matter was bound to seem so confused and obscure to us. For it tells us that conscience (or more correctly, the anxiety which later becomes conscience) is indeed the cause of instinctual renunciation to begin with, but that later the relationship is reversed. Every renunciation of instinct now becomes a dynamic source of conscience and every fresh renunciation increases the latter's severity and intolerance. If we could only bring it better into harmony with what we already know about the history of the origin of conscience, we should be tempted to defend the paradoxical statement that conscience is the result of instinctual renunciation, or that instinctual renunciation (imposed on us from without) creates conscience, which then demands further instinctual renunciation.

[1930a, 4518]

The contradiction between this statement and what we have previously said about the genesis of conscience is in point of fact not so very great, and we see a way of further reducing it. In order to make our exposition easier, let us take as our example the aggressive instinct, and let us assume that the renunciation in question is always a renunciation of aggression. (This, of course, is only to be taken as a temporary assumption.) The effect of instinctual renunciation on the conscience then is that every piece of aggression whose satisfaction the subject gives up is taken over by the super-ego and increases the latter's aggressiveness (against the ego). This does not harmonize well with the view that the original aggressiveness of conscience is a continuance of the severity of the external authority and therefore has nothing to do with renunciation. But the discrepancy is removed if we postulate a different derivation for this first instalment of the super-ego's aggressivity. A considerable amount of aggressiveness must be developed in the child against the authority which prevents him from having his first, but none the less his most important, satisfactions, whatever the kind of instinctual deprivation that is demanded of him may be; but he is obliged to renounce the satisfaction of this revengeful aggressiveness. He finds his way out of this economically difficult situation with the help of familiar mechanisms. By means of identification he takes the unattackable authority into himself. The authority now turns into his super-ego and enters into possession of all the aggressiveness which a child would have liked to exercise against it. The child's ego has to content itself with the unhappy role of the authority - the father - who has been thus degraded. Here, as so often, the situation is reversed: 'If I were the father and you were the child, I should treat you badly.' The relationship between the super-ego and the ego is a return, distorted by a wish, of the real relationships between the ego, as yet undivided, and an external object. That is typical, too. But the essential difference is that the original severity of the super-ego does not - or does not so much - represent the severity which one has experienced from it, or which one attributes to it; it represents rather one's own aggressiveness towards it. If this is correct, we may assert truly that in the beginning conscience arises through the suppression of an aggressive impulse, and that it is subsequently reinforced by fresh suppressions of the same kind.

[1930a, 4519]
The two main types of pathogenic methods of upbringing - over-strictness and spoiling - have been accurately assessed by Franz Alexander in his book *The Psychoanalysis of the Total Personality* (1927) in connection with Aichhorn's study of delinquency. The 'unduly lenient and indulgent father' is the cause of children's forming an over-severe super-ego, because, under the impression of the love that they receive, they have no other outlet for their aggressiveness but turning it inwards. In delinquent children, who have been brought up without love, the tension between ego and super-ego is lacking, and the whole of their aggressiveness can be directed outwards. Apart from a constitutional factor which may be supposed to be present, it can be said, therefore, that a severe conscience arises from the joint operation of two factors: the frustration of instinct, which unleashes aggressiveness, and the experience of being loved, which turns the aggressiveness inwards and hands it over to the super-ego.

But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':- [1930a, 4522]
In the first place, I suspect that the reader has the impression that our discussions on the
sense of guilt disrupt the framework of this essay: that they take up too much space, so that the
rest of its subject-matter, with which they are not always closely connected, is pushed to one
side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention
to represent the sense of guilt as the most important problem in the development of civilization
and to show that the price we pay for our advance in civilization is a loss of happiness through
the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement,
which is the final conclusion of our investigation, can probably be traced to the quite peculiar
relationship - as yet completely unexplained - which the sense of guilt has to our
consciousness. In the common case of remorse, which we regard as normal, this feeling makes
itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a
'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all
we owe the most valuable pointers to an understanding of normal conditions, brings us up
against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt
makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life
as well, and it hardly allows anything else to appear alongside of it. But in most other cases and
forms of neurosis it remains completely unconscious, without on that account producing any
less important effects. Our patients do not believe us when we attribute an 'unconscious sense
of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an
unconscious need for punishment, in which the sense of guilt finds expression. But its
connection with a particular form of neurosis must not be over-estimated. Even in obsessional
neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it
as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain
actions. It ought to be possible eventually to understand these things; but as yet we cannot.
Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing
else but a topographical variety of anxiety; in its later phases it coincides completely with fear of
the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary
variations. Anxiety is always present somewhere or other behind every symptom; but at one
time it takes noisy possession of the whole of consciousness, while at another it conceals itself
so completely that we are obliged to speak of unconscious anxiety or, if we want to have a
clearer psychological conscience, since anxiety is in the first instance simply a feeling, of
possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by
civilization is not perceived as such either, and remains to a large extent unconscious, or
appears as a sort of malaise, a dissatisfaction, for which people seek other motivations.
Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt.
Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind
from this sense of guilt, which they call sin. From the manner in which, in Christianity, this
redemption is achieved - by the sacrificial death of a single person, who in this manner takes
upon himself a guilt that is common to everyone - we have been able to infer what the first
occasion may have been on which this primal guilt, which was also the beginning of civilization,
was acquired.³
[1930a, 4523]
The second contradiction concerned the aggressive energy with which we suppose the super-ego to be endowed. According to one view, that energy merely carries on the punitive energy of the external authority and keeps it alive in the mind; while, according to another view, it consists, on the contrary, of one's own aggressive energy which has not been used and which one now directs against that inhibiting authority. The first view seemed to fit in better with the history, and the second with the theory, of the sense of guilt. Closer reflection has resolved this apparently irreconcilable contradiction almost too completely; what remained as the essential and common factor was that in each case we were dealing with an aggressiveness which had been displaced inwards. Clinical observation, moreover, allows us in fact to distinguish two sources for the aggressiveness which we attribute to the super-ego; one or the other of them exercises the stronger effect in any given case, but as a general rule they operate in unison. [1930a, 4526]

This is, I think, the place at which to put forward for serious consideration a view which I have earlier recommended for provisional acceptance. In the most recent analytic literature a predilection is shown for the idea that any kind of frustration, any thwarted instinctual satisfaction, results, or may result, in a heightening of the sense of guilt.¹ A great theoretical simplification will, I think, be achieved if we regard this as applying only to the aggressive instincts, and little will be found to contradict this assumption. For how are we to account, on dynamic and economic grounds, for an increase in the sense of guilt appearing in place of an unfulfilled erotic demand? This only seems possible in a round-about way - if we suppose, that is, that the prevention of an erotic satisfaction calls up a piece of aggressiveness against the person who has interfered with the satisfaction, and that this aggressiveness has itself to be suppressed in turn. But if this is so, it is after all only the aggressiveness which is transformed into a sense of guilt, by being suppressed and made over to the super-ego. I am convinced that many processes will admit of a simpler and clearer exposition if the findings of psycho-analysis with regard to the derivation of the sense of guilt are restricted to the aggressive instincts. Examination of the clinical material gives us no unequivocal answer here, because, as our hypothesis tells us, the two classes of instinct hardly ever appear in a pure form, isolated from each other; but an investigation of extreme cases would probably point in the direction I anticipate. [1930a, 4526]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [1930a, 4530]

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result? [1930a, 4532]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinclual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!
[1933a, 4709]

There is, as we think, no doubt about the origin of this unconscious need for punishment. It behaves like a piece of conscience, like a prolongation of our conscience into the unconscious; and it must have the same origin as conscience and correspond, therefore, to a piece of aggressiveness that has been internalized and taken over by the super-ego. If only the words went together better, we should be justified for all practical purposes in calling it an 'unconscious sense of guilt'. Theoretically we are in fact in doubt whether we should suppose that all the aggressiveness that has returned from the external world is bound by the super-ego and accordingly turned against the ego, or that a part of it is carrying on its mute and uncanny activity as a free destructive instinct in the ego and the id. A distribution of the latter kind is the more probable; but we know nothing more about it. There is no doubt that, when the super-ego was first instituted, in equipping that agency use was made of the piece of the child's aggressiveness towards his parents for which he was unable to effect a discharge outwards on account of his erotic fixation as well as of external difficulties; and for that reason the severity of the super-ego need not simply correspond to the strictness of the upbringing. It is very possible that, when there are later occasions for suppressing aggressiveness, the instinct may take the same path that was opened to it at that decisive point of time.
[1933a, 4713]
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]

The other opposition has to be taken far more seriously, and in this instance I feel the liveliest regret at the inadequacy of my information. I suspect that you know more about this business than I do and that you took up your position long ago in favour of Marxism or against it. Karl Marx's investigations into the economic structure of society and into the influence of different economic systems upon every department of human life have in our days acquired an undeniable authority. How far his views in detail are correct or go astray, I cannot of course tell. I understand that this is not an easy matter even for others better instructed than I am. There are assertions contained in Marx's theory which have struck me as strange: such as that the development of forms of society is a process of natural history, or that the changes in social stratification arise from one another in the manner of a dialectical process. I am far from sure that I understand these assertions aright; nor do they sound to me 'materialistic' but, rather, like a precipitate of the obscure Hegelian philosophy in whose school Marx graduated. I do not know how I can shake off my lay opinion that the class structure of society goes back to the struggles which, from the beginning of history, took place between human hordes only slightly differing from each other. Social distinctions, so I thought, were originally distinctions between clans or races. Victory was decided by psychological factors, such as the amount of constitutional aggressiveness, but also by the firmness of the organization within the horde, and by material factors, such as the possession of superior weapons. Living together in the same area, the victors became the masters and the vanquished the slaves. There is no sign to be seen in this of a natural law or of a conceptual evolution. On the other hand the influence exercised upon the social relations of mankind by progressive control over the forces of Nature is unmistakable. For men always put their newly acquired instruments of power at the service of their aggressiveness and use them against one another. The introduction of metals - bronze and iron - made an end to whole epochs of civilization and their social institutions. I really believe that it was gunpowder and fire-arms that abolished chivalry and aristocratic rule, and that the Russian despotism was already doomed before it lost the War, because no amount of inbreeding among the ruling families of Europe could have produced a race of Tsars capable of withstanding the explosive force of dynamite.

[1933a, 4774]
And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire-legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal driven by instinct, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced an instinct and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes an instinctual renunciation, at least it makes no secret of the resentment which the culture-hero could not fail to arouse in men driven by their instincts. And this is in accordance with what we know and expect. We know that a demand for a renunciation of instinct, and the enforcement of that demand, call out hostility and aggressiveness, which is only transformed into a sense of guilt in a later phase of psychical development.

[1932a, 4783]
It is a general principle, then, that conflicts of interest between men are settled by the use of violence. This is true of the whole animal kingdom, from which men have no business to exclude themselves. In the case of men, no doubt, conflicts of opinion occur as well which may reach the highest pitch of abstraction and which seem to demand some other technique for their settlement. That, however, is a later complication. To begin with, in a small human horde, it was superior muscular strength which decided who owned things or whose will should prevail. Muscular strength was soon supplemented and replaced by the use of tools: the winner was the one who had the better weapons or who used them the more skilfully. From the moment at which weapons were introduced, intellectual superiority already began to replace brute muscular strength; but the final purpose of the fight remained the same - one side or the other was to be compelled to abandon his claim or his objection by the damage inflicted on him and by the crippling of his strength. That purpose was most completely achieved if the victor's violence eliminated his opponent permanently - that is to say, killed him. This had two advantages: he could not renew his opposition and his fate deterred others from following his example. In addition to this, killing an enemy satisfied an instinctual inclination which I shall have to mention later. The intention to kill might be countered by a reflection that the enemy could be employed in performing useful services if he were left alive in an intimidated condition. In that case the victor's violence was content with subjugating him instead of killing him. This was a first beginning of the idea of sparing an enemy's life, but thereafter the victor had to reckon with his defeated opponent's lurking thirst for revenge and sacrificed some of his own security.

Such, then, was the original state of things: domination by whoever had the greater might - domination by brute violence or by violence supported by intellect. As we know, this régime was altered in the course of evolution. There was a path that led from violence to right or law. What was that path? It is my belief that there was only one: the path which led by way of the fact that the superior strength of a single individual could be rivalled by the union of several weak ones. 'L'union fait la force.' Violence could be broken by union, and the power of those who were united now represented law in contrast to the violence of the single individual. Thus we see that right is the might of a community. It is still violence, ready to be directed against any individual who resists it; it works by the same methods and follows the same purposes. The only real difference lies in the fact that what prevails is no longer the violence of an individual but that of a community. But in order that the transition from violence to this new right or justice may be effected, one psychological condition must be fulfilled. The union of the majority must be a stable and lasting one. If it were only brought about for the purpose of combating a single dominant individual and were dissolved after his defeat, nothing would have been accomplished. The next person who thought himself superior in strength would once more seek to set up a dominion by violence and the game would be repeated ad infinitum. The community must be maintained permanently, must be organized, must draw up regulations to anticipate the risk of rebellion and must institute authorities to see that those regulations - the laws - are respected and to superintend the execution of legal acts of violence. The recognition of a community of interests such as these leads to the growth of emotional ties between the members of a united group of people - communal feelings which are the true source of its strength.

[1933b, 4794]
Thus we see that the violent solution of conflicts of interest is not avoided even inside a community. But the everyday necessities and common concerns that are inevitable where people live together in one place tend to bring such struggles to a swift conclusion and under such conditions there is an increasing probability that a peaceful solution will be found. Yet a glance at the history of the human race reveals an endless series of conflicts between one community and another or several others, between larger and smaller units - between cities, provinces, races, nations, empires - which have almost always been settled by force of arms. Wars of this kind end either in the spoliation or in the complete overthrow and conquest of one of the parties. It is impossible to make any sweeping judgement upon war of conquest. Some, such as those waged by the Mongols and Turks, have brought nothing but evil. Others, on the contrary, have contributed to the transformation of violence into law by establishing larger units within which the use of violence was made impossible and in which a fresh system of law led to the solution of conflicts. In this way the conquests of the Romans gave the countries round the Mediterranean the priceless pax Romana, and the greed of the French kings to extend their dominions created a peacefully united and flourishing France. Paradoxical as it may sound, it must be admitted that war might be a far from inappropriate means of establishing the eagerly desired reign of 'everlasting' peace, since it is in a position to create the large units within which a powerful central government makes further wars impossible. Nevertheless it fails in this purpose, for the results of conquest are as a rule short-lived: the newly created units fall apart once again, usually owing to a lack of cohesion between the portions that have been united by violence. Hitherto, moreover, the unifications created by conquest, though of considerable extent, have only been partial, and the conflicts between these have called out more than ever for violent solution. Thus the result of all these warlike efforts has only been that the human race has exchanged numerous, and indeed unending, minor wars for wars on a grand scale that are rare but all the more destructive.
[1933b, 4796]
If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians - an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games - was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist to-day which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one to-day, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force by the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute violence and that even to-day it cannot do without the support of violence.

[1933b, 4797]

I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions that there is something at work in them - an instinct for hatred and destruction - which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of an instinct of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the instincts which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psycho-analysis?

[1933b, 4798]
If you will follow me a little further, you will see that human actions are subject to another complication of a different kind. It is very rarely that an action is the work of a single instinctual impulse (which must in itself be compounded of Eros and destructiveness). In order to make an action possible there must be as a rule a combination of such compounded motives. This was perceived long ago by a specialist in your own subject, a Professor G. C. Lichtenberg who taught physics at Göttingen during our classical age - though perhaps he was even more remarkable as a psychologist than as a physicist. He invented a Compass of Motives, for he wrote: 'The motives that lead us to do anything might be arranged like the thirty-two winds and might be given names in a similar way: for instance, "bread-bread-fame" or "fame-fame-bread".'

So that when human beings are incited to war they may have a whole number of motives for assenting - some noble and some base, some which are openly declared and others which are never mentioned. There is no need to enumerate them all. A lust for aggression and destruction is certainly among them: the countless cruelties in history and in our everyday lives vouch for its existence and its strength. The satisfaction of these destructive impulses is of course facilitated by their admixture with others of an erotic and idealistic kind. When we read of the atrocities of the past, it sometimes seems as though the idealistic motives served only as an excuse for the destructive appetites; and sometimes - in the case, for instance, of the cruelties of the Inquisition - it seems as though the idealistic motives had pushed themselves forward in consciousness, while the destructive ones lent them an unconscious reinforcement. Both may be true.

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4799]
For our immediate purpose then, this much follows from what has been said: there is no use in trying to get rid of men's aggressive inclinations. We are told that in certain happy regions of the earth, where nature provides in abundance everything that man requires, there are races whose life is passed in tranquillity and who know neither coercion nor aggression. I can scarcely believe it and I should be glad to hear more of these fortunate beings. The Russian Communists, too, hope to be able to cause human aggressiveness to disappear by guaranteeing the satisfaction of all material needs and by establishing equality in other respects among all the members of the community. That, in my opinion, is an illusion. They themselves are armed to-day with the most scrupulous care and not the least important of the methods by which they keep their supporters together is hatred of everyone beyond their frontiers. In any case, as you yourself have remarked, there is no question of getting rid entirely of human aggressive impulses; it is enough to try to divert them to such an extent that they need not find expression in war.

Our mythological theory of instincts makes it easy for us to find a formula for indirect methods of combating war. If willingness to engage in war is an effect of the destructive instinct, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psycho-analysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done. The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure of human society is to a large extent based on them.
The result, as you see, is not very fruitful when an unworldly theoretician is called in to advise on an urgent practical problem. It is a better plan to devote oneself in every particular case to meeting the danger with whatever means lie to hand. I should like, however, to discuss one more question, which you do not mention in your letter but which specially interests me. Why do you and I and so many other people rebel so violently against war? Why do we not accept it as another of the many painful calamities of life? After all, it seems to be quite a natural thing, to have a good biological basis and in practice to be scarcely avoidable. There is no need to be shocked at my raising this question. For the purpose of an investigation such as this, one may perhaps be allowed to wear a mask of assumed detachment. The answer to my question will be that we react to war in this way because everyone has a right to his own life, because war puts an end to human lives that are full of hope, because it brings individual men into humiliating situations, because it compels them against their will to murder other men, and because it destroys precious material objects which have been produced by the labours of humanity. Other reasons besides might be given, such as that in its present-day form war is no longer an opportunity for achieving the old ideals of heroism and that owing to the perfection of instruments of destruction a future war might involve the extermination of one or perhaps both of the antagonists. All this is true, and so incontestably true that one can only feel astonished that the waging of war has not yet been unanimously repudiated. No doubt debate is possible upon one or two of these points. It may be questioned whether a community ought not to have a right to dispose of individual lives; every war is not open to condemnation to an equal degree; so long as there exist countries and nations that are prepared for the ruthless destruction of others, those others must be armed for war. But I will not linger over any of these issues; they are not what you want to discuss with me, and I have something different in mind. It is my opinion that the main reason why we rebel against war is that we cannot help doing so. We are pacifists because we are obliged to be for organic reasons. And we then find no difficulty in producing arguments to justify our attitude.

[1933b, 4802]

No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture. (Some people, I know, prefer to use the term 'civilization'.) We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind. The psychical modifications that go along with the process of civilization are striking and unambiguous. They consist in a progressive displacement of instinctual aims and a restriction of instinctual impulses. Sensations which were pleasurable to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization two appear to be the most important: a strengthening of the intellect, which is beginning to govern instinctual life, and an internalization of the aggressive impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a constitutional intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

[1933b, 4803]
So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
For the individual, too, life is hard to bear, just as it is for mankind in general. The civilization in which he participates imposes some amount of privation on him, and other men bring him a measure of suffering, either in spite of the precepts of his civilization or because of its imperfections. To this are added the injuries which untamed nature - he calls it Fate - inflicts on him. One might suppose that this condition of things would result in a permanent state of anxious expectation in him and a severe injury to his natural narcissism. We know already how the individual reacts to the injuries which civilization and other men inflict on him: he develops a corresponding degree of resistance to the regulations of civilization and of hostility to it. But how does he defend himself against the superior powers of nature, of Fate, which threaten him as they threaten all the rest?

[1927c, 4428]
¹ [Footnote added 1914:] Is this the only function that can be assigned to dreams? I know of no other. It is true that Maeder has attempted to show that dreams have other, 'secondary', functions. He started out from the correct observation that some dreams contain attempts at solving conflicts, attempts which are later carried out in reality and which thus behave as though they were trial practices for waking actions. He therefore drew a parallel between dreams and the play of animals and children, which may be regarded as practice in the operation of innate instincts and as preparation for serious activity later on, and put forward the hypothesis that dreams have a 'fonction ludique' ['play function']. Shortly before Maeder, Alfred Adler, too, had insisted that dreams possessed a function of 'thinking ahead.' (In an analysis which I published in 1905, a dream, which could only be regarded as expressing an intention, was repeated every night until it was carried out.)
[1900a, 1007]

(8) 'A man', Brill relates, 'was urged by his wife to attend a social function in which he really took no interest . . . Yielding to his wife's entreaties, he began to take his dress-suit from the trunk when he suddenly thought of shaving. After accomplishing this he returned to the trunk and found it locked. Despite a long, earnest search the key could not be discovered. No locksmith was available on Sunday evening, so that the couple had to send their regrets. When he had the trunk opened the next morning the lost key was found within. The husband had absent-mindedly dropped the key into the trunk and sprung the lock. He assured me that this was wholly unintentional and unconscious, but we know that he did not wish to go to this social affair. The mislaying of the key therefore lacked no motive.'
[1901b, 1226]

¹ For the sake of preserving the unity of the subject I may perhaps interrupt the general arrangement I have adopted, and, in addition to what I have said above, point out that people's memories show a particular partiality in money matters. Paramnesias of having already paid for something can often be very obstinate, as I know from my own experience. When free play is given to avaricious aims apart from the serious interests of life - for fun, in fact -, as in card-playing, the most honourable men show an inclination to make errors and mistakes in memory and counting, and, without quite knowing how, they even find themselves involved in petty cheating. The psychically refreshing nature of these games is partly due to liberties of this kind. We must admit the truth of the saying that in play we can get to know a person's character - that is, if we are not thinking of his manifest character. - If waiters still make unintentional mistakes in the bill, the same explanation obviously applies to them. - In commercial circles a certain delay can frequently be observed in paying out sums of money (for settling accounts and so on) which in point of fact brings the owner no profit and can only be understood in psychological terms - as an expression of a counter-will against paying out money. - [The next sentence was added in 1912:] Brill puts the matter with epigrammatic brevity: 'We are more apt to mislay letters containing bills than cheques.' - The fact that women in particular evince a special amount of displeasure at paying their doctor is connected with the most intimate impulses, which are very far from having been elucidated. Women patients have usually forgotten their purse and so cannot pay at the time of consultation; they then regularly forget to send the fee after they reach home, and thus arrange things so that one has treated them for nothing - 'for the sake of their beaux yeux'. They pay one, as it were, by the sight of their countenance.
[1901b, 1238]
For the doctor, ethical motives unite with the technical ones to restrain him from giving the patient his love. The aim he has to keep in view is that this woman, whose capacity for love is impaired by infantile fixations, should gain free command over a function which is of such inestimable importance to her; that she should not, however, dissipate it in the treatment, but keep it ready for the time when, after her treatment, the demands of real life make themselves felt. He must not stage the scene of a dog-race in which the prize was to be a garland of sausages but which some humorist spoilt by throwing a single sausage on to the track. The result was, of course, that the dogs threw themselves upon it and forgot all about the race and about the garland that was luring them to victory in the far distance. I do not mean to say that it is always easy for the doctor to keep within the limits prescribed by ethics and technique. Those who are still youngish and not yet bound by strong ties may in particular find it a hard task. Sexual love is undoubtedly one of the chief things in life, and the union of mental and bodily satisfaction in the enjoyment of love is one of its culminating peaks. Apart from a few queer fanatics, all the world knows this and conducts its life accordingly; science alone is too delicate to admit it. Again, when a woman sues for love, to reject and refuse is a distressing part for a man to play; and, in spite of neurosis and resistance, there is an incomparable fascination in a woman of high principles who confesses her passion. It is not a patient's crudely sensual desires which constitute the temptation. These are more likely to repel, and it will call for all the doctor's tolerance if he is to regard them as natural phenomenon. It is rather, perhaps, a woman's subtler and aim-inhibited wishes which bring with them the danger of making a man forget his technique and his medical task for the sake of a fine experience.

Civilization relieves him of this task; it performs it in the same way for all alike; and it is noteworthy that in this almost all civilizations act alike. Civilization does not call a halt in the task of defending man against nature, it merely pursues it by other means. The task is a manifold one. Man's self-regard, seriously menaced, calls for consolation; life and the universe must be robbed of their terrors; moreover his curiosity, moved, it is true, by the strongest practical interest, demands an answer.

A great deal is already gained with the first step: the humanization of nature. Impersonal forces and destinies cannot be approached; they remain eternally remote. But if the elements have passions that rage as they do in our own souls, if death itself is not something spontaneous but the violent act of an evil Will, if everywhere in nature there are Beings around us of a kind that we know in our own society, then we can breathe freely, can feel at home in the uncanny and can deal by psychical means with our senseless anxiety. We are still defenceless, perhaps, but we are no longer helplessly paralysed; we can at least react. Perhaps, indeed, we are not even defenceless. We can apply the same methods against these violent supermen outside that we employ in our own society; we can try to adjure them, to appease them, to bribe them, and, by so influencing them, we may rob them of a part of their power. A replacement like this of natural science by psychology not only provides immediate relief, but also points the way to a further mastering of the situation.
This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We cannot do without auxiliary constructions', as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends Candide with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

[1930a, 4474]

We will therefore turn to the less ambitious question of what men themselves show by their behaviour to be the purpose and intention of their lives. What do they demand of life and wish to achieve in it? The answer to this can hardly be in doubt. They strive after happiness; they want to become happy and to remain so. This endeavour has two sides, a positive and a negative aim. It aims, on the one hand, at an absence of pain and unpleasure, and, on the other, at the experiencing of strong feelings of pleasure. In its narrower sense the word 'happiness' only relates to the last. In conformity with this dichotomy in his aims, man's activity develops in two directions, according as it seeks to realize - in the main, or even exclusively - the one or the other of these aims.

[1930a, 4475]

As we see, what decides the purpose of life is simply the programme of the pleasure principle. This principle dominates the operation of the mental apparatus from the start. There can be no doubt about its efficacy, and yet its programme is at loggerheads with the whole world, with the macrocosm as much as with the microcosm. There is no possibility at all of its being carried through; all the regulations of the universe run counter to it. One feels inclined to say that the intention that man should be 'happy' is not included in the plan of 'Creation'. What we call happiness in the strictest sense comes from the (preferably sudden) satisfaction of needs which have been dammed up to a high degree, and it is from its nature only possible as an episodic phenomenon. When any situation that is desired by the pleasure principle is prolonged, it only produces a feeling of mild contentment. We are so made that we can derive intense enjoyment only from a contrast and very little from a state of things.¹ Thus our possibilities of happiness are already restricted by our constitution. Unhappiness is much less difficult to experience. We are threatened with suffering from three directions: from our own body, which is doomed to decay and dissolution and which cannot even do without pain and anxiety as warning signals; from the external world, which may rage against us with overwhelming and merciless forces of destruction; and finally from our relations to other men. The suffering which comes from this last source is perhaps more painful to us than any other. We tend to regard it as a kind of gratuitous addition, although it cannot be any less fatefully inevitable than the suffering which comes from elsewhere.

[1930a, 4475]
It is no wonder if, under the pressure of these possibilities of suffering, men are accustomed to moderate their claims to happiness - just as the pleasure principle itself, indeed, under the influence of the external world, changed into the more modest reality principle -; if a man thinks himself happy merely to have escaped unhappiness or to have survived his suffering, and if in general the task of avoiding suffering pushes that of obtaining pleasure into the background. Reflection shows that the accomplishment of this task can be attempted along very different paths; and all these paths have been recommended by the various schools of worldly wisdom and put into practice by men. An unrestricted satisfaction of every need presents itself as the most enticing method of conducting one's life, but it means putting enjoyment before caution, and soon brings its own punishment. The other methods, in which avoidance of unpleasure is the main purpose, are differentiated according to the source of unpleasure to which their attention is chiefly turned. Some of these methods are extreme and some moderate; some are one-sided and some attack the problem simultaneously at several points. Against the suffering which may come upon one from human relationships the readiest safeguard is voluntary isolation, keeping oneself aloof from other people. The happiness which can be achieved along this path is, as we see, the happiness of quietness. Against the dreaded external world one can only defend oneself by some kind of turning away from it, if one intends to solve the task by oneself. There is, indeed, another and better path: that of becoming a member of the human community, and, with the help of a technique guided by science, going over to the attack against nature and subjecting her to the human will. Then one is working with all for the good of all. But the most interesting methods of averting suffering are those which seem to influence our own organism. In the last analysis, all suffering is nothing else than sensation; it only exists in so far as we feel it, and we only feel it in consequence of certain ways in which our organism is regulated. [1930a, 4476]

The complicated structure of our mental apparatus admits, however, of a whole number of other influences. Just as a satisfaction of instinct spells happiness for us, so severe suffering is caused us if the external world lets us starve, if it refuses to sate our needs. One may therefore hope to be freed from a part of one's sufferings by influencing the instinctual impulses. This type of defence against suffering is no longer brought to bear on the sensory apparatus; it seeks to master the internal sources of our needs. The extreme form of this is brought about by killing off the instincts, as is prescribed by the worldly wisdom of the East and practised by Yoga. If it succeeds, then the subject has, it is true, given up all other activities as well - he has sacrificed his life; and, by another path, he has once more only achieved the happiness of quietness. We follow the same path when our aims are less extreme and we merely attempt to control our instinctual life. In that case, the controlling elements are the higher psychical agencies, which have subjected themselves to the reality principle. Here the aim of satisfaction is not by any means relinquished; but a certain amount of protection against suffering is secured, in that non-satisfaction is not so painfully felt in the case of instincts kept in dependence as in the case of uninhibited ones. As against this, there is an undeniable diminution in the potentialities of enjoyment. The feeling of happiness derived from the satisfaction of a wild instinctual impulse untamed by the ego is incomparably more intense than that derived from sating an instinct that has been tamed. The irresistibility of perverse instincts, and perhaps the attraction in general of forbidden things, finds an economic explanation here. [1930a, 4478]
Another technique for fending off suffering is the employment of the displacements of libido which our mental apparatus permits of and through which its function gains so much in flexibility. The task here is that of shifting the instinctual aims in such a way that they cannot come up against frustration from the external world. In this, sublimation of the instincts lends its assistance. One gains the most if one can sufficiently heighten the yield of pleasure from the sources of psychical and intellectual work. When that is so, fate can do little against one. A satisfaction of this kind, such as an artist's joy in creating, in giving his phantasies body, or a scientist's in solving problems or discovering truths, has a special quality which we shall certainly one day be able to characterize in metapsychological terms. At present we can only say figuratively that such satisfactions seem 'finer and higher'. But their intensity is mild as compared with that derived from the satiating of crude and primary instinctual impulses; it does not convulse our physical being. And the weak point of this method is that it is not applicable generally: it is accessible to only a few people. It presupposes the possession of special dispositions and gifts which are far from being common to any practical degree. And even to the few who do possess them, this method cannot give complete protection from suffering. It creates no impenetrable armour against the arrows of fortune, and it habitually fails when the source of suffering is a person's own body.¹

¹ When there is no special disposition in a person which imperatively prescribes what direction his interests in life shall take, the ordinary professional work that is open to everyone can play the part assigned to it by Voltaire's wise advice. It is not possible, within the limits of a short survey, to discuss adequately the significance of work for the economics of the libido. No other technique for the conduct of life attaches the individual so firmly to reality as laying emphasis on work; for his work at least gives him a secure place in a portion of reality, in the human community. The possibility it offers of displacing a large amount of libido components, whether narcissistic, aggressive or even erotic, onto professional work and onto the human relations connected with it lends it a value by no means second to what it enjoys as something indispensable to the preservation and justification of existence in society. Professional activity is a source of special satisfaction if it is a freely chosen one - if, that is to say, by means of sublimation, it makes possible the use of existing inclinations, of persisting or constitutionally reinforced instinctual impulses. And yet, as a path to happiness, work is not highly prized by men. They do not strive after it as they do after other possibilities of satisfaction. The great majority of people only work under the stress of necessity, and this natural human aversion to work raises most difficult social problems.

While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.
Another procedure operates more energetically and more thoroughly. It regards reality as the sole enemy and as the source of all suffering, with which it is impossible to live, so that one must break off all relations with it if one is to be in any way happy. The hermit turns his back on the world and will have no truck with it. But one can do more than that; one can try to re-create the world, to build up in its stead another world in which its most unbearable features are eliminated and replaced by others that are in conformity with one's own wishes. But whoever, in desperate defiance, sets out upon this path to happiness will as a rule attain nothing. Reality is too strong for him. He becomes a madman, who for the most part finds no one to help him in carrying through his delusion. It is asserted, however, that each one of us behaves in some one respect like a paranoic, corrects some aspect of the world which is unbearable to him by the construction of a wish and introduces this delusion into reality. A special importance attaches to the case in which this attempt to procure a certainty of happiness and a protection against suffering through a delusional remoulding of reality is made by a considerable number of people in common. The religions of mankind must be classed among the mass delusions of this kind. No one, needless to say, who shares a delusion ever recognizes it as such.

[1930a, 4480]

I do not think that I have made a complete enumeration of the methods by which men strive to gain happiness and keep suffering away and I know, too, that the material might have been differently arranged. One procedure I have not yet mentioned - not because I have forgotten it but because it will concern us later in another connection. And how could one possibly forget, of all others, this technique in the art of living? It is conspicuous for a most remarkable combination of characteristic features. It, too, aims of course at making the subject independent of Fate (as it is best to call it), and to that end it locates satisfaction in internal mental processes, making use, in so doing, of the displaceability of the libido of which we have already spoken. But it does not turn away from the external world; on the contrary, it clings to the objects belonging to that world and obtains happiness from an emotional relationship to them. Nor is it content to aim at an avoidance of unpleasure - a goal, as we might call it, of weary resignation; it passes this by without heed and holds fast to the original, passionate striving for a positive fulfilment of happiness. And perhaps it does in fact come nearer to this goal than any other method. I am, of course, speaking of the way of life which makes love the centre of everything, which looks for all satisfaction in loving and being loved. A psychical attitude of this sort comes naturally enough to all of us; one of the forms in which love manifests itself - sexual love - has given us our most intense experience of an overwhelming sensation of pleasure and has thus furnished us with a pattern for our search for happiness. What is more natural than that we should persist in looking for happiness along the path on which we first encountered it? The weak side of this technique of living is easy to see; otherwise no human being would have thought of abandoning this path to happiness for any other. It is that we are never so defenceless against suffering as when we love, never so helplessly unhappy as when we have lost our loved object or its love. But this does not dispose of the technique of living based on the value of love as a means to happiness. There is much more to be said about it.

[1930a, 4481]
We may go on from here to consider the interesting case in which happiness in life is predominantly sought in the enjoyment of beauty, wherever beauty presents itself to our senses and our judgement - the beauty of human forms and gestures, of natural objects and landscapes and of artistic and even scientific creations. This aesthetic attitude to the goal of life offers little protection against the threat of suffering, but it can compensate for a great deal. The enjoyment of beauty has a peculiar, mildly intoxicating quality of feeling. Beauty has no obvious use; nor is there any clear cultural necessity for it. Yet civilization could not do without it. The science of aesthetics investigates the conditions under which things are felt as beautiful, but it has been unable to give any explanation of the nature and origin of beauty, and, as usually happens, lack of success is concealed beneath a flood of resounding and empty words. Psycho-analysis, unfortunately, has scarcely anything to say about beauty either. All that seems certain is its derivation from the field of sexual feeling. The love of beauty seems a perfect example of an impulse inhibited in its aim. 'Beauty' and 'attraction' are originally attributes of the sexual object. It is worth remarking that the genitals themselves, the sight of which is always exciting, are nevertheless hardly ever judged to be beautiful; the quality of beauty seems, instead, to attach to certain secondary sexual characters.

In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

[1930a, 4481]

[1930a, 4482]
Before we go on to enquire from what quarter an interference might arise, this recognition of love as one of the foundations of civilization may serve as an excuse for a digression which will enable us to fill in a gap which we left in an earlier discussion. We said there that man's discovery that sexual (genital) love afforded him the strongest experiences of satisfaction, and in fact provided him with the prototype of all happiness, must have suggested to him that he should continue to seek the satisfaction of happiness in his life along the path of sexual relations and that he should make genital erotism the central point of his life. We went on to say that in doing so he made himself dependent in a most dangerous way on a portion of the external world, namely, his chosen love-object, and exposed himself to extreme suffering if he should be rejected by that object or should lose it through unfaithfulness or death. For that reason the wise men of every age have warned us most emphatically against this way of life; but in spite of this it has not lost its attraction for a great number of people.

A small minority are enabled by their constitution to find happiness, in spite of everything, along the path of love. But far-reaching mental changes in the function of love are necessary before this can happen. These people make themselves independent of their object's acquiescence by displacing what they mainly value from being loved on to loving; they protect themselves against the loss of the object by directing their love, not to single objects but to all men alike; and they avoid the uncertainties and disappointments of genital love by turning away from its sexual aims and transforming the instinct into an impulse with an inhibited aim. What they bring about in themselves in this way is a state of evenly suspended, steadfast, affectionate feeling, which has little external resemblance any more to the stormy agitations of genital love, from which it is nevertheless derived. Perhaps St. Francis of Assisi went furthest in thus exploiting love for the benefit of an inner feeling of happiness. Moreover, what we have recognized as one of the techniques for fulfilling the pleasure principle has often been brought into connection with religion; this connection may lie in the remote regions where the distinction between the ego and objects or between objects themselves is neglected. According to one ethical view, whose deeper motivation will become clear to us presently, this readiness for a universal love of mankind and the world represents the highest standpoint which man can reach. Even at this early stage of the discussion I should like to bring forward my two main objections to this view. A love that does not discriminate seems to me to forfeit a part of its own value, by doing an injustice to its object; and secondly, not all men are worthy of love.

These last two features - the rejection of the claims of reality and the putting through of the pleasure principle - bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off of the possibility of suffering places it among the great series of methods which the human mind has constructed in order to evade the compulsion to suffer - a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy. Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle - and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible.
We will therefore turn to the less ambitious question of what men themselves show by their behaviour to be the purpose and intention of their lives. What do they demand of life and wish to achieve in it? The answer to this can hardly be in doubt. They strive after happiness; they want to become happy and to remain so. This endeavour has two sides, a positive and a negative aim. It aims, on the one hand, at an absence of pain and unpleasure, and, on the other, at the experiencing of strong feelings of pleasure. In its narrower sense the word ‘happiness’ only relates to the last. In conformity with this dichotomy in his aims, man's activity develops in two directions, according as it seeks to realize - in the main, or even exclusively - the one or the other of these aims.

It is no wonder if, under the pressure of these possibilities of suffering, men are accustomed to moderate their claims to happiness - just as the pleasure principle itself, indeed, under the influence of the external world, changed into the more modest reality principle - , if a man thinks himself happy merely to have escaped unhappiness or to have survived his suffering, and if in general the task of avoiding suffering pushes that of obtaining pleasure into the background. Reflection shows that the accomplishment of this task can be attempted along very different paths; and all these paths have been recommended by the various schools of worldly wisdom and put into practice by men. An unrestricted satisfaction of every need presents itself as the most enticing method of conducting one's life, but it means putting enjoyment before caution, and soon brings its own punishment. The other methods, in which avoidance of unpleasure is the main purpose, are differentiated according to the source of unpleasure to which their attention is chiefly turned. Some of these methods are extreme and some moderate; some are one-sided and some attack the problem simultaneously at several points. Against the suffering which may come upon one from human relationships the readiest safeguard is voluntary isolation, keeping oneself aloof from other people. The happiness which can be achieved along this path is, as we see, the happiness of quietness. Against the dreaded external world one can only defend oneself by some kind of turning away from it, if one intends to solve the task by oneself. There is, indeed, another and better path: that of becoming a member of the human community, and, with the help of a technique guided by science, going over to the attack against nature and subjecting her to the human will. Then one is working with all for the good of all. But the most interesting methods of averting suffering are those which seem to influence our own organism. In the last analysis, all suffering is nothing else than sensation; it only exists in so far as we feel it, and we only feel it in consequence of certain ways in which our organism is regulated.
In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

[1930a, 4482]
In view of these considerations it is even possible to doubt the very existence of such a thing as innate inversion. It can be argued (cf. Havelock Ellis) that, if the cases of allegedly innate inversion were more closely examined, some experience of their early childhood would probably come to light which had a determining effect upon the direction taken by their libido. This experience would simply have passed out of the subject's conscious recollection, but could be recalled to his memory under appropriate influence. In the opinion of these writers inversion can only be described as a frequent variation of the sexual instinct, which can be determined by a number of external circumstances in the subject's life.

We will therefore turn to the less ambitious question of what men themselves show by their behaviour to be the purpose and intention of their lives. What do they demand of life and wish to achieve in it? The answer to this can hardly be in doubt. They strive after happiness; they want to become happy and to remain so. This endeavour has two sides, a positive and a negative aim. It aims, on the one hand, at an absence of pain and unpleasure, and, on the other, at the experiencing of strong feelings of pleasure. In its narrower sense the word ‘happiness’ only relates to the last. In conformity with this dichotomy in his aims, man's activity develops in two directions, according as it seeks to realize - in the main, or even exclusively - the one or the other of these aims.

It is no wonder if, under the pressure of these possibilities of suffering, men are accustomed to moderate their claims to happiness - just as the pleasure principle itself, indeed, under the influence of the external world, changed into the more modest reality principle -, if a man thinks himself happy merely to have escaped unhappiness or to have survived his suffering, and if in general the task of avoiding suffering pushes that of obtaining pleasure into the background. Reflection shows that the accomplishment of this task can be attempted along very different paths; and all these paths have been recommended by the various schools of worldly wisdom and put into practice by men. An unrestricted satisfaction of every need presents itself as the most enticing method of conducting one's life, but it means putting enjoyment before caution, and soon brings its own punishment. The other methods, in which avoidance of unpleasure is the main purpose, are differentiated according to the source of unpleasure to which their attention is chiefly turned. Some of these methods are extreme and some moderate; some are one-sided and some attack the problem simultaneously at several points. Against the suffering which may come upon one from human relationships the readiest safeguard is voluntary isolation, keeping oneself aloof from other people. The happiness which can be achieved along this path is, as we see, the happiness of quietness. Against the dreaded external world one can only defend oneself by some kind of turning away from it, if one intends to solve the task by oneself. There is, indeed, another and better path: that of becoming a member of the human community, and, with the help of a technique guided by science, going over to the attack against nature and subjecting her to the human will. Then one is working with all for the good of all. But the most interesting methods of averting suffering are those which seem to influence our own organism. In the last analysis, all suffering is nothing else than sensation; it only exists in so far as we feel it, and we only feel it in consequence of certain ways in which our organism is regulated.
I do not think that I have made a complete enumeration of the methods by which men strive to gain happiness and keep suffering away and I know, too, that the material might have been differently arranged. One procedure I have not yet mentioned - not because I have forgotten it but because it will concern us later in another connection. [1930a, 4482]
The *Bierschwefel* and the *Kneipzeitung* give evidence by their names to the fact that the criticism which has repressed pleasure in nonsense has already grown so powerful that it cannot be put aside even temporarily without toxic assistance. A change in mood is the most precious thing that alcohol achieves for mankind, and on that account this 'poison' is not equally indispensable for everyone. A cheerful mood, whether it is produced endogenously or toxically, reduces the inhibiting forces, criticism among them, and makes accessible once again sources of pleasure which were under the weight of suppression. It is most instructive to observe how the standards of joking sink as spirits rise. For high spirits replace jokes, just as jokes must try to replace high spirits, in which possibilities of enjoyment which are otherwise inhibited - among them the pleasure in nonsense - can come into their own: 'Mit wenig Witz und viel Behagen.'¹ Under the influence of alcohol the grown man once more becomes a child, who finds pleasure in having the course of his thoughts freely at his disposal without paying regard to the compulsion of logic.

[1905c, 1718]

This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us: it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We cannot do without auxiliary constructions', as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends *Candide* with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

[1930a, 4474]
It is no wonder if, under the pressure of these possibilities of suffering, men are accustomed to moderate their claims to happiness - just as the pleasure principle itself, indeed, under the influence of the external world, changed into the more modest reality principle -, if a man thinks himself happy merely to have escaped unhappiness or to have survived his suffering, and if in general the task of avoiding suffering pushes that of obtaining pleasure into the background. Reflection shows that the accomplishment of this task can be attempted along very different paths; and all these paths have been recommended by the various schools of worldly wisdom and put into practice by men. An unrestricted satisfaction of every need presents itself as the most enticing method of conducting one’s life, but it means putting enjoyment before caution, and soon brings its own punishment. The other methods, in which avoidance of unpleasure is the main purpose, are differentiated according to the source of unpleasure to which their attention is chiefly turned. Some of these methods are extreme and some moderate; some are one-sided and some attack the problem simultaneously at several points. Against the suffering which may come upon one from human relationships the readiest safeguard is voluntary isolation, keeping oneself aloof from other people. The happiness which can be achieved along this path is, as we see, the happiness of quietness. Against the dreaded external world one can only defend oneself by some kind of turning away from it, if one intends to solve the task by oneself. There is, indeed, another and better path: that of becoming a member of the human community, and, with the help of a technique guided by science, going over to the attack against nature and subjecting her to the human will. Then one is working with all for the good of all. But the most interesting methods of averting suffering are those which seem to influence our own organism. In the last analysis, all suffering is nothing else than sensation; it only exists in so far as we feel it, and we only feel it in consequence of certain ways in which our organism is regulated.

[1930a, 4476]

The crudest, but also the most effective among these methods of influence is the chemical one - intoxication. I do not think that anyone completely understands its mechanism, but it is a fact that there are foreign substances which, when present in the blood or tissues, directly cause us pleasurable sensations; and they also so alter the conditions governing our sensibility that we become incapable of receiving unpleasurable impulses. The two effects not only occur simultaneously, but seem to be intimately bound up with each other. But there must be substances in the chemistry of our own bodies which have similar effects, for we know at least one pathological state, mania, in which a condition similar to intoxication arises without the administration of any intoxicating drug. Besides this, our normal mental life exhibits oscillations between a comparatively easy liberation of pleasure and a comparatively difficult one, parallel with which there goes a diminished or an increased receptivity to unpleasure. It is greatly to be regretted that this toxic side of mental processes has so far escaped scientific examination. The service rendered by intoxicating media in the struggle for happiness and in keeping misery at a distance is so highly prized as a benefit that individuals and peoples alike have given them an established place in the economics of their libido. We owe to such media not merely the immediate yield of pleasure, but also a greatly desired degree of independence from the external world. For one knows that, with the help of this ‘drowner of cares’ one can at any time withdraw from the pressure of reality and find refuge in a world of one's own with better conditions of sensibility. As is well known, it is precisely this property of intoxicants which also determines their danger and their injuriousness. They are responsible, in certain circumstances, for the useless waste of a large quota of energy which might have been employed for the improvement of the human lot.

[1930a, 4477]
In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

These last two features - the rejection of the claims of reality and the putting though of the pleasure principle - bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off of the possibility of suffering places it among the great series of methods which the human mind has constructed in order to evade the compulsion to suffer - a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy. Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle - and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible.

[1930a, 4482]

[1927d, 4543]
'Archaeological interests are no doubt most praiseworthy, but no one undertakes an excavation if by doing so he is going to undermine the habitations of the living so that they collapse and bury people under their ruins. The doctrines of religion are not a subject one can quibble about like any other. Our civilization is built up on them, and the maintenance of human society is based on the majority of men's believing in the truth of those doctrines. If men are taught that there is no almighty and all-just God, no divine world-order and no future life, they will feel exempt from all obligation to obey the precepts of civilization. Everyone will, without inhibition or fear, follow his asocial, egoistic instincts and seek to exercise his power; Chaos, which we have banished through many thousands of years of the work of civilization, will come again. Even if we knew, and could prove, that religion was not in possession of the truth, we ought to conceal the fact and behave in the way prescribed by the philosophy of "As if" - and this in the interest of the preservation of us all. And apart from the danger of the undertaking, it would be a purposeless cruelty. Countless people find their one consolation in religious doctrines, and can only bear life with their help. You would rob them of their support, without having anything better to give them in exchange. It is admitted that so far science has not achieved much, but even if it had advanced much further it would not suffice for man. Man has imperative needs of another sort, which can never be satisfied by cold science; and it is very strange - indeed, it is the height of inconsistency - that a psychologist who has always insisted on what a minor part is played in human affairs by the intelligence as compared with the life of the instincts - that such a psychologist should now try to rob mankind of a precious wish-fulfilment and should propose to compensate them for it with intellectual nourishment.'

This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We cannot do without auxiliary constructions', as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends Candide with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

The question of the purpose of human life has been raised countless times; it has never yet received a satisfactory answer and perhaps does not admit of one. Some of those who have asked it have added that if it should turn out that life has no purpose, it would lose all value for them. But this threat alters nothing. It looks, on the contrary, as though one had a right to dismiss the question, for it seems to derive from the human presumptuousness, many other manifestations of which are already familiar to us. Nobody talks about the purpose of the life of animals, unless, perhaps, it may be supposed to lie in being of service to man. But this view is not tenable either, for there are many animals of which man can make nothing, except to describe, classify and study them; and innumerable species of animals have escaped even this use, since they existed and became extinct before man set eyes on them. Once again, only religion can answer the question of the purpose of life. One can hardly be wrong in concluding that the idea of life having a purpose stands and falls with the religious system.
Religion restricts this play of choice and adaptation, since it imposes equally on everyone its own path to the acquisition of happiness and protection from suffering. Its technique consists in depressing the value of life and distorting the picture of the real world in a delusional manner - which presupposes an intimidation of the intelligence. At this price, by forcibly fixing them in a state of psychical infantilism and by drawing them into a mass-delusion, religion succeeds in sparing many people an individual neurosis. But hardly anything more. There are, as we have said, many paths which may lead to such happiness as is attainable by men, but there is none which does so for certain. Even religion cannot keep its promise. If the believer finally sees himself obliged to speak of God's 'inscrutable decrees', he is admitting that all that is left to him as a last possible consolation and source of pleasure in his suffering is an unconditional submission. And if he is prepared for that, he could probably have spared himself the détourn he has made.

[1930a, 4483]
Another procedure operates more energetically and more thoroughly. It regards reality as the sole enemy and as the source of all suffering, with which it is impossible to live, so that one must break off all relations with it if one is to be in any way happy. The hermit turns his back on the world and will have no truck with it. But one can do more than that; one can try to re-create the world, to build up in its stead another world in which its most unbearable features are eliminated and replaced by others that are in conformity with one’s own wishes. But whoever, in desperate defiance, sets out upon this path to happiness will as a rule attain nothing. Reality is too strong for him. He becomes a madman, who for the most part finds no one to help him in carrying through his delusion. It is asserted, however, that each one of us behaves in some one respect like a paranoic, corrects some aspect of the world which is unbearable to him by the construction of a wish and introduces this delusion into reality. A special importance attaches to the case in which this attempt to procure a certainty of happiness and a protection against suffering through a delusional remoulding of reality is made by a considerable number of people in common. The religions of mankind must be classed among the mass delusions of this kind. No one, needless to say, who shares a delusion ever recognizes it as such.

In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.
These last two features - the rejection of the claims of reality and the putting through of the pleasure principle - bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off of the possibility of suffering places it among the great series of methods which the human mind has constructed in order to evade the compulsion to suffer - a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy. Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle - and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible.
[1927d, 4543]
I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - *inter unrinas et faeces* - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

[1908d, 1962]

[1912d, 2346]
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

[1912d, 2346]

Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as 'real frustration' - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clutching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by 'living a full life' sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]
But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

Such a display of unfairness and lack of logic cries out for an explanation. Its origin is not hard to find. Human civilization rests upon two pillars, of which one is the control of natural forces and the other the restriction of our instincts. The ruler's throne rests upon fettered slaves. Among the instinctual components which are thus brought into service, the sexual instincts, in the narrower sense of the word, are conspicuous for their strength and savagery. Woe, if they should be set loose! The throne would be overturned and the ruler trampled under foot. Society is aware of this - and will not allow the topic to be mentioned.

But why not? What harm could the discussion do? Psycho-analysis has never said a word in favour of unfettering instincts that would injure our community; on the contrary it has issued a warning and an exhortation to us to mend our ways. But society refuses to consent to the ventilation of the question, because it has a bad conscience in more than one respect. In the first place it has set up a high ideal of morality - morality being restriction of the instincts - and insists that all its members shall fulfil that ideal without troubling itself with the possibility that obedience may bear heavily upon the individual. Nor is it sufficiently wealthy or well-organized to be able to compensate the individual for the amount of his instinctual renunciation. It is consequently left to the individual to decide how he can obtain, for the sacrifice he has made, enough compensation to enable him to preserve his mental balance. On the whole, however, he is obliged to live psychologically beyond his means, while the unsatisfied claims of his instincts make him feel the demands of civilization as a constant pressure upon him. Thus society maintains a condition of cultural hypocrisy which is bound to be accompanied by a sense of insecurity and a necessity for guarding what is an undeniably precarious situation by forbidding criticism and discussion. This line of thought holds good for all the instinctual impulses, including, therefore, the egoistic ones. The question whether it applies to all possible forms of civilization, and not merely to those which have evolved hitherto, cannot be discussed here. As regards the sexual instincts in the narrower sense, there is the further point that in most people they are tamed insufficiently and in a manner which is psychologically wrong and are therefore readier than the rest to break loose.
Psycho-analysis has revealed the weaknesses of this system and has recommended that it should be altered. It proposes that there should be a reduction in the strictness with which instincts are repressed and that correspondingly more play should be given to truthfulness. Certain instinctual impulses, with whose suppression society has gone too far, should be permitted a greater amount of satisfaction; in the case of certain others the inefficient method of suppressing them by means of repression should be replaced by a better and securer procedure. As a result of these criticisms psycho-analysis is regarded as 'inimical to culture' and has been put under a ban as a 'social danger'. This resistance cannot last for ever. No human institution can in the long run escape the influence of fair criticism; but men's attitude to psycho-analysis is still dominated by this fear, which gives rein to their passions and diminishes their power of logical argument.

Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of beasts - and I scorn to distinguish between culture and civilization -, presents, as we know, two aspects to the observer. It includes on the one hand all the knowledge and capacity that men have acquired in order to control the forces of nature and extract its wealth for the satisfaction of human needs, and, on the other hand, all the regulations necessary in order to adjust the relations of men to one another and especially the distribution of the available wealth. The two trends of civilization are not independent of each other: firstly, because the mutual relations of men are profoundly influenced by the amount of instinctual satisfaction which the existing wealth makes possible; secondly, because an individual man can himself come to function as wealth in relation to another one, in so far as the other person makes use of his capacity for work, or chooses him as a sexual object; and thirdly, moreover, because every individual is virtually an enemy of civilization, though civilization is supposed to be an object of universal human interest. It is remarkable that, little as men are able to exist in isolation, they should nevertheless feel as a heavy burden the sacrifices which civilization expects of them in order to make a communal life possible. Thus civilization has to be defended against the individual, and its regulations, institutions and commands are directed to that task. They aim not only at effecting a certain distribution of wealth but at maintaining that distribution; indeed, they have to protect everything that contributes to the conquest of nature and the production of wealth against men's hostile impulses. Human creations are easily destroyed, and science and technology, which have built them up, can also be used for their annihilation.

[1925e, 4128]

[1927c, 4418]
One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

[1927c, 4419]

For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a 'frustration', the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

[1927c, 4422]
If we turn to those restrictions that apply only to certain classes of society, we meet with a state of things which is flagrant and which has always been recognized. It is to be expected that these underprivileged classes will envy the favoured ones their privileges and will do all they can to free themselves from their own surplus of privation. Where this is not possible, a permanent measure of discontent will persist within the culture concerned and this can lead to dangerous revolts. If, however, a culture has not got beyond a point at which the satisfaction of one portion of its participants depends upon the suppression of another, and perhaps larger, portion - and this is the case in all present day cultures - it is understandable that the suppressed people should develop an intense hostility towards a culture whose existence they make possible by their work, but in whose wealth they have too small a share. In such conditions an internalization of the cultural prohibitions among the suppressed people is not to be expected. On the contrary, they are not prepared to acknowledge the prohibitions, they are intent on destroying the culture itself, and possibly even on doing away with the postulates on which it is based. The hostility of these classes to civilization is so obvious that it has caused the more latent hostility of the social strata that are better provided for to be overlooked. It goes without saying that a civilization which leaves so large a number of its participants unsatisfied and drives them into revolt neither has nor deserves the prospect of a lasting existence.

[1927c, 4424]

The liberty of the individual is no gift of civilization. It was greatest before there was any civilization, though then, it is true, it had for the most part no value, since the individual was scarcely in a position to defend it. The development of civilization imposes restrictions on it, and justice demands that no one shall escape those restrictions. What makes itself felt in a human community as a desire for freedom may be their revolt against some existing injustice, and so may prove favourable to a further development of civilization; it may remain compatible with civilization. But it may also spring from the remains of their original personality, which is still untamed by civilization and may thus become the basis in them of hostility to civilization. The urge for freedom, therefore, is directed against particular forms and demands of civilization or against civilization altogether. It does not seem as though any influence could induce a man to change his nature into a termite's. No doubt he will always defend his claim to individual liberty against the will of the group. A good part of the struggles of mankind centre round the single task of finding an expedient accommodation - one, that is, that will bring happiness - between this claim of the individual and the cultural claims of the group; and one of the problems that touches the fate of humanity is whether such an accommodation can be reached by means of some particular form of civilization or whether this conflict is irreconcilable.

[1930a, 4493]
By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹ Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the sublimation (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This ‘cultural frustration’ dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

[1930a, 4494]
The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

[1930a, 4497]

This rift between them seems unavoidable. The reason for it is not immediately recognizable. It expresses itself at first as a conflict between the family and the larger community to which the individual belongs. We have already perceived that one of the main endeavours of civilization is to bring people together into large unities. But the family will not give the individual up. The more closely the members of a family are attached to one another, the more often do they tend to cut themselves off from others, and the more difficult is it for them to enter into the wider circle of life. The mode of life in common which is phylogenetically the older, and which is the only one that exists in childhood, will not let itself be superseded by the cultural mode of life which has been acquired later. Detaching himself from his family becomes a task that faces every young person, and society often helps him in the solution of it by means of puberty and initiation rites. We get the impression that these are difficulties which are inherent in all psychical - and, indeed, at bottom, in all organic - development.

[1930a, 4497]

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

[1930a, 4500]
So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

[1930a, 4500]

In view of its exceptional importance, we must not long postpone the mention of one feature which distinguishes between the two processes. In the developmental process of the individual, the programme of the pleasure principle, which consists in finding the satisfaction of happiness, is retained as the main aim. Integration in, or adaptation to, a human community appears as a scarcely avoidable condition which must be fulfilled before this aim of happiness can be achieved. If it could be done without that condition, it would perhaps be preferable. To put it in other words, the development of the individual seems to us to be a product of the interaction between two urges, the urge towards happiness, which we usually call 'egoistic', and the urge towards union with others in the community, which we call 'altruistic'. Neither of these descriptions goes much below the surface. In the process of individual development, as we have said, the main accent falls mostly on the egoistic urge (or the urge towards happiness); while the other urge, which may be described as a 'cultural' one, is usually content with the role of imposing restrictions. But in the process of civilization things are different. Here by far the most important thing is the aim of creating a unity out of the individual human beings. It is true that the aim of happiness is still there, but it is pushed into the background. It almost seems as if the creation of a great human community would be most successful if no attention had to be paid to the happiness of the individual. The developmental process of the individual can thus be expected to have special features of its own which are not reproduced in the process of human civilization. It is only in so far as the first of these processes has union with the community as its aim that it need coincide with the second process.

[1930a, 4528]

Just as a planet revolves around a central body as well as rotating on its own axis, so the human individual takes part in the course of development of mankind at the same time as he pursues his own path in life. But to our dull eyes the play of forces in the heavens seems fixed in a never-changing order; in the field of organic life we can still see how the forces contend with one another, and how the effects of the conflict are continually changing. So, also, the two urges, the one towards personal happiness and the other towards union with other human beings, must struggle with each other in every individual; and so, also, the two processes of individual and of cultural development must stand in hostile opposition to each other and mutually dispute the ground. But this struggle between the individual and society is not a derivative of the contradiction - probably an irreconcilable one - between the primal instincts of Eros and death. It is a dispute within the economics of the libido, comparable to the contest concerning the distribution of libido between ego and objects; and it does admit of an eventual accommodation in the individual, as, it may be hoped, it will also do in the future of civilization, however much that civilization may oppress the life of the individual to-day.

[1930a, 4529]
The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulses has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual.

[1930a, 4529]

The moralist in Dostoevsky is the most readily assailable. If we seek to rank him high as a moralist on the plea that only a man who has gone through the depths of sin can reach the highest summit of morality, we are neglecting a doubt that arises. A moral man is one who reacts to temptation as soon as he feels it in his heart, without yielding to it. A man who alternately sins and then in his remorse erects high moral standards lays himself open to the reproach that he has made things too easy for himself. He has not achieved the essence of morality, renunciation, for the moral conduct of life is a practical human interest. He reminds one of the barbarians of the great migrations, who murdered and did penance for it, till penance became an actual technique for enabling murder to be done. Ivan the Terrible behaved in exactly this way; indeed this compromise with morality is a characteristic Russian trait. Nor was the final outcome of Dostoevsky's moral strivings anything very glorious. After the most violent struggles to reconcile the instinctual demands of the individual with the claims of the community, he landed in the retrograde position of submission both to temporal and spiritual authority, of veneration both for the Tsar and for the God of the Christians, and of a narrow Russian nationalism - a position which lesser minds have reached with smaller effort. This is the weak point in that great personality. Dostoevsky threw away the chance of becoming a teacher and liberator of humanity and made himself one with their gaolers. The future of human civilization will have little to thank him for. It seems probable that he was condemned to this failure by his neurosis. The greatness of his intelligence and the strength of his love for humanity might have opened to him another, an apostolic, way of life.

[1928b, 4553]
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created. [1933a, 4714]
The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice.

[1933a, 4749]
I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a *Weltanschauung*, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

[1933a, 4775]
There is no doubt of how Bolshevism will reply to these objections. It will say that so long as men's nature has not yet been transformed it is necessary to make use of the means which affect them to-day. It is impossible to do without compulsion in their education, without the prohibition of thought and without the employment of force to the point of bloodshed; and if the illusions were not awakened in them, they could not be brought to acquiesce in this compulsion. And we should be politely asked to say how things could be managed differently. This would defeat us. I could think of no advice to give. I should admit that the conditions of this experiment would have deterred me and those like me from undertaking it; but we are not the only people concerned. There are men of action, unshakable in their convictions, inaccessible to doubt, without feeling for the sufferings of others if they stand in the way of their intentions. We have to thank men of this kind for the fact that the tremendous experiment of producing a new order of this kind is now actually being carried out in Russia. At a time when the great nations announce that they expect salvation only from the maintenance of Christian piety, the revolution in Russia - in spite of all its disagreeable details - seems nonetheless like the message of a better future. Unluckily neither our scepticism nor the fanatical faith of the other side gives a hint as to how the experiment will turn out. The future will tell us; perhaps it will show that the experiment was undertaken prematurely, that a sweeping alteration of the social order has little prospect of success until new discoveries have increased our control over the forces of Nature and so made easier the satisfaction of our needs. Only then perhaps may it become possible for a new social order not only to put an end to the material need of the masses but also to give a hearing to the cultural demands of the individual. Even then, to be sure, we shall still have to struggle for an incalculable time with the difficulties which the untameable character of human nature presents to every kind of social community.

[1933a, 4777]

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire-legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal driven by instinct, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced an instinct and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes an instinctual renunciation, at least it makes no secret of the resentment which the culture-hero could not fail to arouse in men driven by their instincts. And this is in accordance with what we know and expect. We know that a demand for a renunciation of instinct, and the enforcement of that demand, call out hostility and aggressiveness, which is only transformed into a sense of guilt in a later phase of psychical development.

[1932a, 4783]
The sexual causes, too, are the ones which most readily offer the physician a foothold for his therapeutic influence. Heredity is no doubt an important factor, when it is present; it enables a strong pathological effect to come about where otherwise only a very slight one would have resulted. But heredity is inaccessible to the physician's influence; everyone is born with his own hereditary tendencies to illness, and we can do nothing to change them. Nor should we forget that it is precisely in regard to the aetiology of the neurasthenias that we must necessarily deny the first place to heredity. Neurasthenia (in both its forms) is one of those affections which anyone may easily acquire without having any hereditary taint. If it were otherwise, the enormous increase in neurasthenia, of which all the authorities complain, would be unthinkable. In what concerns civilization, among whose sins people so often include responsibility for neurasthenia, these authorities may indeed be right (although the way in which this comes about is probably quite different from what they imagine). Yet the state of our civilization is, once again, something that is unalterable for the individual. Moreover this factor, being common to all the members of the same society, can never explain the fact of selectivity in the incidence of the illness. The physician who is not neurasthenic is exposed to the same influence of an allegedly detrimental civilization as the neurasthenic patient whom he has to treat. Subject to these limitations, the factors of exhaustion retain their significance. But the element of 'overwork', which physicians are so fond of producing to their patients as the cause of their neurosis, is too often unduly misused. It is quite true that anyone who, owing to sexual noxae, has made himself disposed to neurasthenia, tolerates intellectual work and the psychical exigencies of life badly; but no one ever becomes neurotic through work or excitement alone. Intellectual work is rather a protection against falling ill of neurasthenia; it is precisely the most unremitting intellectual workers who remain exempt from neurasthenia, and what neurasthenics complain of as 'overwork that is making them ill' does not as a rule deserve to be called 'intellectual work' at all, either in its quality or quantity. Physicians will have to become accustomed to explaining to an office-worker who has been 'overworked' at his desk or to a housewife for whom her domestic activities have become too heavy, that they have fallen ill, not because they have tried to carry out duties which are in fact easily performed by a civilized brain, but because all the while they have been grossly neglecting and damaging their sexual life.

It is not difficult to suppose that under the domination of a civilized sexual morality the health and efficiency of single individuals may be liable to impairment and that ultimately this injury to them, caused by the sacrifices imposed on them, may reach such a pitch that, by this indirect path, the cultural aim in view will be endangered as well. And Von Ehrenfels does in fact attribute a number of ill-effects to the sexual morality which dominates our Western society to-day, ill-effects for which he is obliged to make that morality responsible; and, although he fully acknowledges its high aptitude for the furtherance of civilization, he is led to convict it of standing in need of reform. In his view, what is characteristic of the civilized sexual morality that dominates us is that the demands made on women are carried over to the sexual life of men and that all sexual intercourse is prohibited except in monogamous marriage. Nevertheless, consideration of the natural difference between the sexes makes it necessary to visit men's lapses with less severity and thus in fact to admit a double morality for them. But a society which accepts this double morality cannot carry 'the love of truth, honesty and humanity' (Von Ehrenfels, ibid. 32 ff.) beyond a definite and narrow limit, and is bound to induce in its members concealment of the truth, false optimism, self-deception and deception of others. And civilized sexual morality has still worse effects, for, by glorifying monogamy, it cripples the factor of selection by virility - the factor whose influence alone can bring about an improvement of the individual's innate constitution, since in civilized peoples selection by vitality has been reduced to a minimum by humanity and hygiene (ibid., 35).
Among the damaging effects which are here laid at the door of civilized sexual morality, the physician will miss a particular one whose significance will be discussed in detail in the present paper. I refer to the increase traceable to it of modern nervous illness - of the nervous illness, that is, which is rapidly spreading in our present-day society. Occasionally a nervous patient will himself draw the doctor’s attention to the part played in the causation of his complaint by the opposition between his constitution and the demands of civilization and will say: 'In our family we've all become neurotic because we wanted to be something better than what, with our origin, we are capable of being.' Often, too, the physician finds food for thought in observing that those who succumb to nervous illness are precisely the offspring of fathers who, having been born of rough but vigorous families, living in simple, healthy, country conditions, had successfully established themselves in the metropolis, and in a short space of time had brought their children to a high level of culture. But, above all, nerve specialists themselves have loudly proclaimed the connection between 'increasing nervous illness' and modern civilized life. The grounds to which they attribute this connection will be shown by a few extracts from statements that have been made by some eminent observers.

W. Erb (1893): 'The original question, then, is whether the causes of nervous illness that have been put before you are present in modern life to such a heightened degree as to account for a marked increase in that form of illness. The question can be answered without hesitation in the affirmative, as a cursory glance at our present-day existence and its features will show.

Binswanger (1896): 'Neurasthenia in particular has been described as an essentially modern disorder, and Beard, to whom we are indebted for a first comprehensive account of it believed that he had discovered a new nervous disease which had developed specifically on American soil. This supposition was of course a mistaken one; nevertheless, the fact that it was an American physician who was first able to grasp and describe the peculiar features of this illness, as the fruit of a wide experience, indicates, no doubt, the close connections which exist between it and modern life, with its unbridled pursuit of money and possessions, and its immense advances in the field of technology which have rendered illusory every obstacle, whether temporal or spatial, to our means of intercommunication.'

Von Krafft-Ebing (1895): 'The mode of life of countless civilized people exhibits nowadays an abundance of anti-hygienic factors which make it easy to understand the fateful increase of nervous illness; for those injurious factors take effect first and foremost on the brain. In the course of the last decades changes have taken place in the political and social - and especially in the mercantile, industrial and agricultural - conditions of civilized nations which have brought about great changes in people’s occupations, social position and property, and this at the cost of the nervous system, which is called upon to meet the increased social and economic demands by a greater expenditure of energy, often with quite inadequate opportunity for recuperation.'

The fault I have to find with these and many other similarly-worded opinions is not that they are mistaken but that they prove insufficient to explain the details in the picture of nervous disturbances and that they leave out of account precisely the most important of the aetiological factors involved. If we disregard the vaguer ways of being 'nervous' and consider the specific forms of nervous illness, we shall find that the injurious influence of civilization reduces itself in the main to the harmful suppression of the sexual life of civilized peoples (or classes) through the 'civilized' sexual morality prevalent in them.
Careful clinical observation allows us to distinguish two groups of nervous disorders: the neuroses proper and the psychoneuroses. In the former the disturbances (the symptoms), whether they show their effects in somatic or mental functioning, appear to be of a toxic nature. They behave exactly like the phenomena accompanying an excess or a deprivation of certain nerve poisons. These neuroses - which are commonly grouped together as 'neurasthenia' - can be induced by certain injurious influences in sexual life, without any hereditary taint being necessarily present; indeed, the form taken by the disease corresponds to the nature of these noxae, so that often enough the particular sexual aetiology can at once be deduced from the clinical picture. There is a total absence, on the other hand, of any such regular correspondence between the form of a nervous illness and the other injurious influences of civilization which are blamed by the authorities. We may, therefore, regard the sexual factor as the essential one in the causation of the neuroses proper.

[1908d, 1950]

If we take the second of these stages as an average, we must point out that a number of people are, on account of their organization, not equal to meeting its demands. In whole classes of individuals the development of the sexual instinct, as we have described it above, from auto-erotism to object-love with its aim of uniting the genitals, has not been carried out correctly and sufficiently fully. As a result of these disturbances of development two kinds of harmful deviation from normal sexuality - that is, sexuality which is serviceable to civilization - come about; and the relation between these two is almost that of positive and negative.¹

[1908d, 1953]

Experience teaches us that for most people there is a limit beyond which their constitution cannot comply with the demands of civilization. All who wish to be more noble-minded than their constitution allows fall victims to neurosis; they would have been more healthy if it could have been possible for them to be less good. The discovery that perversions and neuroses stand in the relation of positive and negative is often unmistakably confirmed by observations made on the members of one generation of a family. Quite frequently a brother is a sexual pervert, while his sister, who, being a woman, possesses a weaker sexual instinct, is a neurotic whose symptoms express the same inclinations as the perversions of her sexually more active brother. And correspondingly, in many families the men are healthy, but from a social point of view immoral to an undesirable degree, while the women are high-minded and over-refined, but severely neurotic.

[1908d, 1955]

It is one of the obvious social injustices that the standard of civilization should demand from everyone the same conduct of sexual life - conduct which can be followed without any difficulty by some people, thanks to their organization, but which imposes the heaviest psychical sacrifices on others; though, indeed, the injustice is as a rule wiped out by disobedience to the injunctions of morality.

[1908d, 1955]
These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated, the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as perverts, and a number of others, who make efforts not to be perverts whilst constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness.

[1908d, 1955]

The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here - that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual instinct by any other means than satisfying it is one which can call for the whole of a man's forces. Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of to-day; for we know no better safe-guard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; instincts which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions.

[1908d, 1956]
I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1961]

[1908d, 1962]
Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality by pointing to the important bearing of that morality upon the spread of modern nervous illness.

[1908d, 1963]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]

We must not omit to consider the third of the possible outcomes of the work of psycho-analysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction and ought to find it in life. Our civilized standards make life too difficult for the majority of human organizations. Those standards consequently encourage the retreat from reality and the generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual repression. We ought not to exalt ourselves so high as completely to neglect what was originally animal in our nature. Nor should we forget that the satisfaction of the individual's happiness cannot be erased from among the aims of our civilization. The plasticity of the components of sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive for still greater cultural achievements by still further sublimation. But, just as we do not count on our machines converting more than a certain fraction of the heat consumed into useful mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual instinct from its proper ends. We cannot succeed in doing so; and if the restriction upon sexuality were to be carried too far it would inevitably bring with it all the evils of soil-exhaustion.

[1910a, 2239]
Now, however, I must once more damp your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power too - a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths which we psychoanalysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education for cultural reasons, between sexual maturity and sexual activity. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life.

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of the erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - \textit{inter urinas et faeces} - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.
Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual instinct to the demands of civilization; that in consequence of its cultural development renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization is the necessary consequence of certain peculiarities which the sexual instinct has assumed under the pressure of culture. The very incapacity of the sexual instinct to yield complete satisfaction as soon as it submits to the first demands of civilization becomes the source, however, of the noblest cultural achievements which are brought into being by ever more extensive sublimation of its instinctual components. For what motive would men have for putting sexual instinctual forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two instincts - the sexual and the egoistic - has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.
[1912d, 2346]

This single comparison between taboo and obsessional neurosis is enough to enable us to gather the nature of the relation between the different forms of neurosis and cultural institutions, and to see how it is that the study of the psychology of the neuroses is important for an understanding of the growth of civilization.
[1912-1913, 2717]

Our knowledge of the neurotic illnesses of individuals has been of much assistance to our understanding of the great social institutions. For the neuroses themselves have turned out to be attempts to find individual solutions for the problems of compensating for unsatisfied wishes, while the institutions seek to provide social solutions for these same problems. The recession of the social factor and the predominance of the sexual one turns these neurotic solutions of the psychological problem into caricatures which are of no service except to help us in explaining such important questions.
[1913j, 2822]

For the rest, most of the problems of artistic creation and appreciation await further study, which will throw the light of analytic knowledge on them and assign them their place in the complex structure presented by the compensation for human wishes. Art is a conventionally accepted reality in which, thanks to artistic illusion, symbols and substitutes are able to provoke real emotions. Thus art constitutes a region half-way between a reality which frustrates wishes and the wish-fulfilling world of the imagination - a region in which, as it were, primitive man's strivings for omnipotence are still in full force.
[1913j, 2823]
On the other hand, psycho-analysis has fully demonstrated the part played by social conditions and requirements in the causation of neurosis. The forces which, operating from the ego, bring about the restriction and repression of instinct owe their origin essentially to compliance with the demands of civilization. A constitution and a set of childhood experiences which, in other cases, would inevitably lead to a neurosis will produce no such result where this compliance is absent or where these demands are not made by the social circle in which the particular individual is placed. The old assertion that the increase in nervous disorders is a product of civilization is at least a half-truth. Young people are brought into contact with the demands of civilization by upbringing and example; and if instinctual repression occurs independently of these two factors, it is a plausible hypothesis to suppose that a primaeval and prehistoric demand has at last become part of the organized and inherited endowment of mankind. A child who produces instinctual repressions spontaneously is thus merely repeating a part of the history of civilization. What is to-day an act of internal restraint was once an external one, imposed, perhaps, by the necessities of the moment; and, in the same way, what is now brought to bear upon every growing individual as an external demand of civilization may some day become an internal disposition to repression.

Civilized society, which demands good conduct and does not trouble itself about the instinctual basis of this conduct, has thus won over to obedience a great many people who are not in this following their own natures. Encouraged by this success, society has allowed itself to be misled into tightening the moral standard to the greatest possible degree, and it has thus forced its members into a yet greater estrangement from their instinctual disposition. They are consequently subject to an unceasing suppression of instinct, and the resulting tension betrays itself in the most remarkable phenomena of reaction and compensation. In the domain of sexuality, where such suppression is most difficult to carry out, the result is seen in the reactive phenomena of neurotic disorders. Elsewhere the pressure of civilization brings in its train no pathological results, it is true, but is shown in malformations of character, and in the perpetual readiness of the inhibited instincts to break through to satisfaction at any suitable opportunity. Anyone thus compelled to act continually in accordance with precepts which are not the expression of his instinctual inclinations, is living, psychologically speaking, beyond his means, and may objectively be described as a hypocrite, whether he is clearly aware of the incongruity or not. It is undeniable that our contemporary civilization favours the production of this form of hypocrisy to an extraordinary extent. One might venture to say that it is built up on such hypocrisy, and that it would have to submit to far-reaching modifications if people were to undertake to live in accordance with psychological truth. Thus there are very many more cultural hypocrites than truly civilized men - indeed, it is a debatable point whether a certain degree of cultural hypocrisy is not indispensable for the maintenance of civilization, because the susceptibility to culture which has hitherto been organized in the minds of present-day men would perhaps not prove sufficient for the task. On the other hand, the maintenance of civilization even on so dubious a basis offers the prospect of paving the way in each new generation for a more far-reaching transformation of instinct which shall be the vehicle of a better civilization.

[1915b, 3076]
I will dwell for a little to-day on yet another point in ego development, partly because I have some remoter aims in view, but also because what follows is precisely calculated to justify the sharp separation between the ego-instincts and the sexual instincts which we favour but which is not self-evident. In forming our judgement of the two courses of development both of the ego and of the libido - we must lay emphasis on a consideration which has not often hitherto been taken into account. For both of them are at bottom heritages, abbreviated recapitulations of the development which all mankind has passed through from its primaeval days over long periods of time. In the case of the development of the libido, this phylogenetic origin is, I venture to think, immediately obvious. Consider how in one class of animals the genital apparatus is brought into the closest relation to the mouth, while in another it cannot be distinguished from the excretory apparatus, and in yet others it is linked to the motor organs - all of which you will find attractively set out in W. Bölsche's valuable book. Among animals one can find, so to speak in petrified form, every species of perversion of the sexual organization. In the case of human beings, however, this phylogenetic point of view is partly veiled by the fact that what is at bottom inherited is nevertheless freshly acquired in the development of the individual, probably because the same conditions which originally necessitated its acquisition persist and continue to operate upon each individual. I should like to add that originally the operation of these conditions was creative but that it is now evocative. Besides this, there is no doubt that the prescribed course of development can be disturbed and altered in each individual by recent external influences. But we know the power which forced a development of this kind upon humanity and maintains its pressure in the same direction to-day. It is, once again, frustration by reality, or, if we are to give it its true, grand name, the pressure of vital needs - Necessity (Άνάγκη). She has been a strict educator and has made much out of us. The neurotics are among those of her children to whom her strictness has brought evil results; but that is a risk with all education. This appreciation of the necessities of life need not, incidentally, weigh against the importance, of 'internal developmental trends', if such can be shown to be present. [1916-1917, 3414]

The psycho-analytic explanation of the neuroses does not, however, call for such far-ranging considerations. The separate following-up of the sexual and ego-instincts has helped us to find the key to an understanding of the group of transference neuroses. We have been able to trace them back to the basic situation in which the sexual instincts have come into a dispute with the self-preservative instincts, or, to put it in biological (though less precise) terms, a situation in which one aspect of the ego, as an independent individual organism, comes into conflict with its other aspect, as a member of a succession of generations. A dissension of this kind may perhaps only occur in human beings, and on that account neurosis may, generally speaking, constitute their prerogative over the animals. The excessive development of their libido and - what is perhaps made possible precisely by that - their development of a richly articulated mental life seem to have created the determinants for the occurrence of such a conflict. It is at once obvious that these are also the determinants for the great advances that human beings have made beyond what they have in common with the animals; so that their susceptibility to neurosis would only be the reverse side of their other endowments. But these too are only speculations, which are diverting us from our immediate task. [1916-1917, 3460]
Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as 'real frustration' - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clenching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by 'living a full life' sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.
[1916-1917, 3475]

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.
[1916-1917, 3477]
If human beings too possessed an instinctive endowment such as this, it would not be surprising that it should be very particularly concerned with the processes of sexual life, even though it could not be by any means confined to them. This instinctive factor would then be the nucleus of the unconscious, a primitive kind of mental activity, which would later be dethroned and overlaid by human reason, when that faculty came to be acquired, but which in some people, perhaps in every one, would retain the power of drawing down to it the higher mental processes. Repression would be the return to this instinctive stage, and man would thus be paying for his great new acquisition with his liability to neurosis, and would be bearing witness by the possibility of the neuroses to the existence of those earlier, instinct-like, preliminary stages. The significance of the traumas of early childhood would lie in their contributing material to this unconscious which would save it from being worn away by the subsequent course of development.

[1918b, 3595]

I must begin by adding that increasing experience showed more and more plainly that the Oedipus complex was the nucleus of the neurosis. It was at once the climax of infantile sexual life and the point of junction from which all of its later developments proceeded. But if so, it was no longer possible to expect analysis to discover a factor that was specific in the aetiology of the neuroses. It must be true, as Jung expressed it so well in the early days when he was still an analyst, that neuroses have no peculiar content which belongs exclusively to them but that neurotics break down at the same difficulties that are successfully overcome by normal people. This discovery was very far from being a disappointment. It was in complete harmony with another one: that the depth-psychology revealed by psycho-analysis was in fact the psychology of the normal mind. Our path had been like that of chemistry: the great qualitative differences between substances were traced back to quantitative variations in the proportions in which the same elements were combined.

[1925d, 4230]

Moreover, to return to our question of the analytic treatment of adult neurotics, even there we have not yet exhausted every line of approach. Our civilization imposes an almost intolerable pressure on us and it calls for a corrective. Is it too fantastic to expect that psycho-analysis in spite of its difficulties may be destined to the task of preparing mankind for such a corrective? Perhaps once more an American may hit on the idea of spending a little money to get the 'social workers' of his country trained analytically and to turn them into a band of helpers for combating the neuroses of civilization.

[1926e, 4390]
For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a 'frustration', the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

[1927c, 4422]

These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the moral demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

[1927c, 4423]
How has it happened that so many people have come to take up this strange attitude of hostility to civilization? I believe that the basis of it was a deep and long-standing dissatisfaction with the then existing state of civilization and that on that basis a condemnation of it was built up, occasioned by certain specific historical events. I think I know what the last and the last but one of those occasions were. I am not learned enough to trace the chain of them far back enough in the history of the human species; but a factor of this kind hostile to civilization must already have been at work in the victory of Christendom over the heathen religions. For it was very closely related to the low estimation put upon earthly life by the Christian doctrine. The last but one of these occasions was when the progress of voyages of discovery led to contact with primitive peoples and races. In consequence of insufficient observation and a mistaken view of their manners and customs, they appeared to Europeans to be leading a simple, happy life with few wants, a life such as was unattainable by their visitors with their superior civilization. Later experience has corrected some of those judgements. In many cases the observers had wrongly attributed to the absence of complicated cultural demands what was in fact due to the bounty of nature and the ease with which the major human needs were satisfied. The last occasion is especially familiar to us. It arose when people came to know about the mechanism of the neuroses, which threaten to undermine the modicum of happiness enjoyed by civilized men. It was discovered that a person becomes neurotic because he cannot tolerate the amount of frustration which society imposes on him in the service of its cultural ideals, and it was inferred from this that the abolition or reduction of those demands would result in a return to possibilities of happiness.

[1930a, 4485]

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

[1930a, 4500]

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

[1930a, 4500]
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual’s aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of ‘eat or be eaten’ which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]
The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice.
[1933a, 4749]
We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses. [1940a [1938], 4993]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
There is no longer anything contradictory to us in the notion that a psychical process which
develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained
by the fact that the wish belongs to one system, the Ucs., while it has been repudiated and
suppressed by the other system, the Pcs.¹ Even where psychical health is perfect, the
subjugation of the Ucs. by the Pcs. is not complete; the measure of suppression indicates the
degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict
with each other; they are the products of a compromise which brings the conflict to an end for
the time being. On the one hand, they allow the Ucs. an outlet for the discharge of its excitation,
and provide it with a kind of sally-port, while, on the other hand they make it possible for the
Pcs. to control the Ucs. to some extent. It is instructive to consider, for instance, the significance
of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to
cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this
symptom by compelling him to carry out the act of which he believes himself incapable, the
consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the
street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that
the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is
erected like a frontier fortification against the anxiety.
[1900a, 1009]

Actions and consciously expressed opinions are as a rule enough for practical purposes in
judging men's characters. Actions deserve to be considered first and foremost; for many
impulses which force their way through to consciousness are then brought to nothing by the real
forces of mental life before they can mature into deeds. In fact, such impulses often meet with
no psychical obstacles to their progress, for the very reason that the unconscious is certain that
they will be stopped at some other stage. It is in any case instructive to get to know the much
trampled soil from which our virtues proudly spring. Very rarely does the complexity of a human
character, driven hither and thither by dynamic forces, submit to a choice between simple
alternatives, as our antiquated morality would have us believe.
[1900a, 1045]

It is, as we have seen, debatable whether the perversions go back to innate determinants or
arise, as Binet assumed was the case with fetishism, owing to chance experiences. The
conclusion now presents itself to us that there is indeed something innate lying behind the
perversions but that it is something innate in everyone, though as a disposition it may vary in its
intensity and may be increased by the influences of actual life. What is in question are the
innate constitutional roots of the sexual instinct. In one class of cases (the perversions) these
roots may grow into the actual vehicles of sexual activity; in others they may be submitted to an
insufficient suppression (repression) and thus be able in a roundabout way to attract a
considerable proportion of sexual energy to themselves as symptoms; while in the most
favourable cases, which lie between these two extremes, they may by means of effective
restriction and other kinds of modification bring about what is known as normal sexual life.
[1905d, 1495]
REACTION-FORMATION AND SUBLIMATION

What is it that goes to the making of these constructions which are so important for the growth of a civilized and normal individual? They probably emerge at the cost of the infantile sexual impulses themselves. Thus the activity of those impulses does not cease even during this period of latency, though their energy is diverted, wholly or in great part, from their sexual use and directed to other ends. Historians of civilization appear to be at one in assuming that powerful components are acquired for every kind of cultural achievement by this diversion of sexual instinctual forces from sexual aims and their direction to new ones - a process which deserves the name of 'sublimation'. To this we would add, accordingly, that the same process plays a part in the development of the individual and we would place its beginning in the period of sexual latency of childhood.¹

SUBLIMATION

The third alternative result of an abnormal constitutional disposition is made possible by the process of sublimation. This enables excessively strong excitations arising from particular sources of sexuality to find an outlet and use in other fields, so that a not inconsiderable increase in psychical efficiency results from a disposition which is itself perilous. Here we have one of the origins of artistic activity; and, according to the completeness or incompleteness of the sublimation, a characterological analysis of a highly gifted individual, and in particular of one with an artistic disposition, may reveal a mixture, in every proportion, of efficiency, perversion and neurosis. A sub-species of sublimation is to be found in suppression by reaction-formation, which, as we have seen, begins during a child's period of latency and continues in favourable cases throughout his whole life. What we describe as a person's 'character' is built up to a considerable extent from the material of sexual excitations and is composed of instincts that have been fixed since childhood, of constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse impulses which have been recognized as being unutilizable.² The multifariously perverse sexual disposition of childhood can accordingly be regarded as the source of a number of our virtues, in so far as through reaction-formation it stimulates their development.²

I could not further elucidate this part of my theory without a detailed discussion of my views on repression. It will be enough here to refer to my *Three Essays* (1905d), in which I have attempted to throw some light - if only a feeble one - on the somatic processes in which the essential nature of sexuality is to be looked for. I have there shown that the constitutional sexual disposition of children is incomparably more variegated than might have been expected, that it deserves to be described as 'polymorphously perverse' and that what is spoken of as the normal behaviour of the sexual function emerges from this disposition after certain of its components have been repressed. By pointing out the infantile elements in sexuality I was able to establish a simple correlation between health, perversion and neurosis. I showed that normality is a result of the repression of certain component instincts and constituents of the infantile disposition and of the subordination of the remaining constituents under the primacy of the genital zones in the service of the reproductive function. I showed that perversions correspond to disturbances of this coalescence owing to the overpowering and compulsive development of certain of the component instincts, while neuroses can be traced back to an excessive repression of the libidinal trends. Since almost all the perverse instincts of the infantile disposition can be recognized as the forces concerned in the formation of symptoms in neuroses, though in a state of repression, I was able to describe neurosis as being the 'negative' of perversion.

[1905d, 1500]

[1905d, 1549]

[1906a, 1581]
But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion from the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is not neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an enjoyment of the liberation but a resistance to it as well.

[1905, 1610]

I know that no one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my Three Essays on the Theory of Sexuality in 1905. I there attempted to show that the sexual instinct of man is highly complex and is put together from contributions made by numerous constituents and component instincts. Important contributions to 'sexual excitation' are furnished by the peripheral excitations of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes, nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others - a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' - i.e. from the completion of the fifth year to the first manifestations of puberty (round about the eleventh year) - reaction-formations, or counter-forces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual instincts. Now anal erotism is one of the components of the instinct which, in the course of development and in accordance with the education demanded by our present civilization, have become unserviceable for sexual aims. It is therefore plausible to suppose that these character-traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.

[1908b, 1943]

We ought in general to consider whether other character complexes, too, do not exhibit a connection with the excitations of particular erotogenic zones. At present I only know of the intense 'burning' ambition of people who earlier suffered from enuresis. We can at any rate lay down a formula for the way in which character in its final shape is formed out of the constituent instincts: the permanent character-traits are either unchanged prolongations of the original instincts, or sublimations of those instincts, or reaction-formations against them.

[1908b, 1945]
He then went on to say that he would like to speak of a criminal act, whose author he did not recognize as himself, though he quite clearly recollected committing it. He quoted a saying of Nietzsche’s:² "I did this," says my Memory. "I cannot have done this," says my Pride and remains inexorable. In the end - Memory yields.' 'Well,' he continued, 'my memory has not yielded on this point.' - 'That is because you derive pleasure from your self-reproaches as a means of self-punishment.' - 'My younger brother - I am really very fond of him now, and he is causing me a great deal of worry just at present, for he wants to make what I consider a preposterous match; I have thought before now of going and killing the person concerned so as to prevent his marrying her -well, my younger brother and I used to fight a lot when we were children. We were very fond of each other at the same time, and were inseparable; but I was plainly filled with jealousy, as he was the stronger and better-looking of the two and consequently the favourite.' - 'Yes. You have already given me a description of a scene of jealousy in connection with Fräulein Lina.' - 'Very well then, on some such occasion (it was certainly before I was eight years old, for I was not going to school yet, which I began to do when I was eight) - on some such occasion, this is what I did. We both had toy guns of the usual make. I loaded mine with the ram rod and told him that if he looked up the barrel he would see something. Then, while he was looking in, I pulled the trigger. He was hit on the forehead and not hurt; but I had meant to hurt him very much indeed. Afterwards I was quite beside myself, and threw myself on the ground and asked myself however I could have done such a thing. But I did do it.' - I took the opportunity of urging my case. If he had preserved the recollection of an action so foreign to him as this, he could not, I maintained, deny the possibility of something similar, which he had now forgotten entirely, having happened at a still earlier age in relation to his father. - He then told me he was aware of having felt other vindictive impulses, this time towards the lady he admired so much, of whose character he painted a glowing picture. It might be true, he said, that she could not love easily; but she was reserving her whole self for the one man to whom she would some day belong. She did not love him. When he had become certain of that, a conscious phantasy had taken shape in his mind of how he should grow very rich and marry some one else, and should then take her to call on the lady in order to hurt her feelings. But at that point the phantasy had broken down, for he had been obliged to own to himself that the other woman, his wife, was completely indifferent to him; then his thoughts had become confused, till finally it had been clearly borne in upon him that this other woman would have to die. In this phantasy, just as in his attempt upon his brother, he recognized the quality of cowardice which was so particularly horrible to him.³ - In the further course of our conversation I pointed out to him that he ought logically to consider himself as in no way responsible for any of these traits in his character; for all of these reprehensible impulses originated from his infancy, and were only derivatives of his infantile character surviving in his unconscious; and he must know that moral responsibility could not be applied to children. It was only by a process of development, I added, that a man, with his moral responsibility, grew up out of the sum of his infantile predispositions.⁴ He expressed a doubt, however, whether all his evil impulses had originated from that source. But I promised to prove it to him in the course of the treatment.
To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to the history of the masturbatory side of our patient's sexual activities. There is a conflict between the opinions of doctors and patients on this subject which has not hitherto been properly appreciated. The patients are unanimous in their belief that masturbation, by which they mean masturbation during puberty, is the root and origin of all their troubles. The doctors are, upon the whole, unable to decide what line to take; but, influenced by the knowledge that not only neurotics but most normal people pass through a period of masturbation during their puberty, the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In my opinion the patients are once again nearer to a correct view than the doctors, for the patients have some glimmering notion of the truth, while the doctors are in danger of overlooking an essential point. The thesis propounded by the patients certainly does not correspond to the facts in the sense in which they themselves construe it, namely, that masturbation during puberty (which may almost be described as a typical occurrence) is responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule, between the ages of three and four or five; and it is the clearest expression of a child's sexual constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality; and they are perfectly right in doing so. On the other hand, the problem of masturbation becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the discharge of every variety of sexual component and of every sort of phantasy to which such components can give rise. The injurious effects of masturbation are only in a very small degree autonomous - that is to say, determined by its own nature. They are in substance merely part and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so many people can tolerate masturbation - that is, a certain amount of it - without injury merely shows that their sexual constitution and the course of development of their sexual life have been such as to allow them to exercise the sexual function within the limits of what is culturally permissible; whereas other people, because their sexual constitution has been less favourable or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that is, achieve the necessary suppression or sublimation of their sexual components without having recourse to inhibitions or substitutes.¹

[1909d, 2159]

You will also learn with astonishment from the analysis of dreams (and most convincingly from that of your own) what an unsuspectedly great part is played in human development by impressions and experiences of early childhood. In dream-life the child that is in man pursues its existence, as it were, and retains all its characteristics and wishful impulses, even such as have become unserviceable in later life. There will be brought home to you with irresistible force the many developments, repressions, sublimations and reaction-formations, by means of which a child with a quite other innate endowment grows into what we call a normal man, the bearer, and in part the victim, of the civilization that has been so painfully acquired.

[1910a, 2223]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]

Psycho-analysis has inferred from the dreams and parapraxes of healthy people, as well as from the symptoms of neurotics, that the primitive, savage and evil impulses of mankind have not vanished in any of its individual members but persist, although in a repressed state, in the unconscious (to use our technical terms), and lie wait for opportunities of becoming active once more. It has further taught us that our intellect is a feeble and dependent thing, a plaything and tool of our instincts and affects, and that we are all compelled to behave cleverly or stupidly according to the commands of our attitudes and internal resistances.

[1915b, 3092]
But the dreams of neurotics do not differ in any important respect from those of normal people; it is possible, indeed, that they cannot be distinguished from them at all. It would be absurd to give an account of the dreams of neurotics which could not also apply to the dreams of normal people. We must therefore say that the difference between neurosis and health holds only during the day; it is not prolonged into dream-life. We are obliged to carry over to healthy people a number of hypotheses which arise in connection with neurotics as a result of the link between the latter's dreams and their symptoms. We cannot deny that healthy people as well possess in their mental life what alone makes possible the formation both of dreams and of symptoms, and we must conclude that they too have carried out repressions, that they expend a certain amount of energy in order to maintain them, that their unconscious system conceals repressed impulses which are still cathexed with energy, and that a portion of their libido is withdrawn from their ego's disposal. Thus a healthy person, too, is virtually a neurotic; but dreams appear to be the only symptoms which he is capable of forming. It is true that if one subjects his waking life to a closer examination one discovers something that contradicts this appearance - namely that this ostensibly healthy life is interspersed with a great number of trivial and in practice unimportant symptoms.

A little reflection was bound to show that it would be impossible to restrict to the provinces of dreams and nervous disorders a view such as this of the life of the human mind. If that view has hit upon a truth, it must apply equally to normal mental events, and even the highest achievements of the human spirit must bear a demonstrable relation to the factors found in pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself pointed persistently in the direction of this new task, for it was obvious that the forms assumed by the different neuroses echoed the most highly admired productions of our culture. Thus hysterics are undoubtedly imaginative artists, even if they express their phantasies mimetically in the main and without considering their intelligibility to other people; the ceremonials and prohibitions of obsessional neurotics drive us to suppose that they have created a private religion of their own; and the delusions of paranoics have an unpalatable external similarity and internal kinship to the systems of our philosophers. It is impossible to escape the conclusion that these patients are, in an asocial fashion, making the very attempts at solving their conflicts and appeasing their pressing needs which, when those attempts are carried out in a fashion that is acceptable to the majority, are known as poetry, religion and philosophy.

The ethical narcissism of humanity should rest content with the knowledge that the fact of distortion in dreams, as well as the existence of anxiety-dreams and punishment-dreams, afford just as clear evidence of his moral nature as dream-interpretation gives of the existence and strength of his evil nature. If anyone is dissatisfied with this and would like to be 'better' than he was created, let him see whether he can attain anything more in life than hypocrisy or inhibition.
There is, therefore, a further analogy between a neurosis and a psychosis, in that in both of them the task which is undertaken in the second step is partly unsuccessful. For the repressed instinct is unable to procure a full substitute (in neurosis); and the representation of reality cannot be remoulded into satisfying forms (not, at least, in every species of mental illness). But the emphasis is different in the two cases. In a psychosis it falls entirely on the first step, which is pathological in itself and cannot but lead to illness. In a neurosis, on the other hand, it falls on the second step, on the failure of the repression, whereas the first step may succeed, and does succeed in innumerable instances without overstepping the bounds of health - even though it does so at a certain price and not without leaving behind traces of the psychical expenditure it has called for. These distinctions, and perhaps many others as well, are a result of the topographical difference in the initial situation of the pathogenic conflict - namely whether in it the ego yielded to its allegiance to the real world or to its dependence on the id.

If we may assume that the most general features of unconscious mental life (conflicts between instinctual impulses, repressions and substitutive satisfactions) are present everywhere, and if there is a depth-psychology which leads to a knowledge of those features, then we may reasonably expect that the application of psycho-analysis to the most varied spheres of human mental activity will everywhere bring to light important and hitherto unattainable results. In an exceedingly valuable study, Otto Rank and Hanns Sachs (1913) have tried to bring together what the work of psycho-analysts had been able to achieve up to that time towards fulfilling these expectations. Lack of space prevents me from attempting to complete their enumeration here. I can only select for mention the most important findings with the addition of a few details.

Now, if we leave psychological terminology out of account, this was the very same explanation of dream-distortion that I had arrived at from my study of dreams. Distortion was a compromise, something in its very nature disingenuous, the product of a conflict between thought and feeling, or, as I had put it, between what is conscious and what is repressed. Where a conflict of this kind was not present and repression was unnecessary, dreams could not be strange or senseless. The man who dreamed in a way no different from that in which he thought while awake was granted by Popper the very condition of internal harmony which, as a social reformer, he aimed at producing in the body politic. And if Science informs us that such a man, wholly without evil and falseness and devoid of all repressions, does not exist and could not survive, yet we may guess that, so far as an approximation to this ideal is possible, it had found its realization in the person of Popper himself.
I intended to draw the sum of 300 kronen from the Post Office Savings Bank, which I wanted to send to an absent relative for purposes of medical treatment. At the same time I noticed that my account stood at 4,380 kronen and decided to bring it down on this occasion to the round sum of 4,000 kronen which was not to be touched in the near future. After I had duly written out the cheque and cut off the figures corresponding to the sum, I suddenly noticed that I had not asked for 380 kronen as I intended, but for exactly 438 kronen and I took alarm at the unreliability of my conduct. I soon realized that my alarm was not called for; I was not now any poorer than I had been before. But it took me a good deal of reflection to discover what influence had disturbed my first intention, without making itself known to my consciousness. To begin with I started on the wrong line; I tried subtracting 380 from 438, but I had no idea afterwards what to do with the difference. Finally a thought suddenly struck me which showed me the true connection. Why, 438 was ten per cent of the total account, 4,380 kronen! Now a ten per cent discount is given by booksellers. I recalled that a few days earlier I had picked out a number of medical books in which I was no longer interested in order to offer them to a bookseller for precisely 300 kronen. He thought the price I was asking was too high, and promised to give me a definite answer within the next few days. If he accepted my offer he would replace the exact sum which I was to spend on the invalid. There is no doubt that I regretted this expenditure. My affect on perceiving my error can be understood better as a fear of growing poor as a result of such expenditures. But both these feelings, my regret at the expenditure and my anxiety over becoming poor that was connected with it, were entirely foreign to my consciousness; I did not have a feeling of regret when I promised the sum of money, and would have found the reason for it laughable. I should probably not have believed myself in any way capable of such an impulse had I not become fairly familiar, through my psycho-analytic practice with patients, with the part played by the repressed in mental life, and had I not had a dream a few days before which called for the same solution.¹

In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

[1921c, 3821]
Here is some further interpretative material. Handing him the glass reminded me of the story of the peasant at the optician's, trying glass after glass and still not being able to read. - (Peasant-catcher [Bauerfänger, 'sharper']: girl-catcher [Mädchenfänger] in the preceding episode of the dream.) - The way in which the father in Zola's La terre was treated among the peasants after he had grown feeble-minded. - The tragic requital that lay in my father's soiling his bed like a child during the last days of his life; hence my appearance in the dream as a sick-nurse. - 'Here it was as though thinking and experiencing were one and the same thing.' This recalled a strongly revolutionary literary play by Oskar Panizza, in which God the Father is ignominiously treated as a paralytic old man. In his case will and deed were represented as one and the same thing, and he had to be restrained from cursing and swearing by one of his archangels, a kind of Ganymede, because his imprecations would be promptly fulfilled. - My making plans was a reproach against my father dating from a later period. And indeed the whole rebellious content of the dream, with its lèse majesté and its derision of the higher authorities, went back to rebellion against my father. A Prince is known as the father of his country; the father is the oldest, first, and for children the only authority, and from his autocratic power the other social authorities have developed in the course of the history of human civilization - except in so far as the 'matriarchy' calls for a qualification of this assertion. - The phrase 'thinking and experiencing were one and the same thing' had a reference to the explanation of hysterical symptoms, and the 'male urinal' belonged in the same connection. I need not explain to a Viennese the principle of the 'Gschnas'. It consists in constructing what appear to be rare, and precious objects out of trivial and preferably comic and worthless materials (for instance, in making armour out of saucepans, wisps of straw and dinner rolls) - a favourite pastime at bohemian parties here in Vienna. I had observed that this is precisely what hysterical subjects do: alongside what has really happened to them, they unconsciously build up frightful or perverse imaginary events which they construct out of the most innocent and everyday material of their experience. It is to these phantasies that their symptoms are in the first instance attached and not to their recollections of real events, whether serious or equally innocent. This revelation had helped me over a number of difficulties and had given me particular pleasure. What made it possible for me to refer to this by means of the dream-element of the 'male urinal' was as follows. I had been told that at the latest 'Gschnas'-night a poisoned chalice belonging to Lucrezia Borgia had been exhibited; its central and principal constituent had been a male urinal of the type used in hospitals.

Everyone who has passed the matriculation examination at the end of his school studies complains of the obstinacy with which he is pursued by anxiety-dreams of having failed, or of being obliged to take the examination again, etc. In the case of those who have obtained a University degree this typical dream is replaced by another one which represents them as having failed in their University Finals; and it is in vain that they object, even while they are still asleep, that for years they have been practising medicine or working as University lecturers or heads of offices. The ineradicable memories of the punishments that we suffered for our evil deeds in childhood become active within us once more and attach themselves to the two crucial points in our studies - the 'dies irae, dies illa' of our stiffest examinations. The 'examination anxiety' of neurotics owes its intensification to these same childhood fears. After we have ceased to be school-children, our punishments are no longer inflicted on us by our parents or by those who brought us up or later by our schoolmasters. The relentless causal chains of real life take charge of our further education, and now we dream of Matriculation or Finals (and who has not trembled on those occasions, even if he was well-prepared for the examination?) whenever, having done something wrong or failed to do something properly, we expect to be punished by the event - whenever, in short, we feel the burden of responsibility.
The question of why the emotional attitude towards rulers includes such a powerful unconscious element of hostility raises a very interesting problem, but one that lies outside the limits of the present study. I have already hinted at the fact that the child's complex of emotions towards his father - the father-complex - has a bearing on the subject, and I may add that more information on the early history of the kingship would throw a decisive light on it. Frazer (1911a) has put forward impressive reasons, though, as he himself admits, not wholly conclusive ones, for supposing that the earliest kings were foreigners who, after a brief reign, were sacrificed with solemn festivities as representatives of the deity. It is possible that the course taken by the evolution of kings may also have had an influence upon the myths of Christendom. [1912-1913, 2697]

The essential part of this course of events is repeated in the abbreviated development of the human individual. Here, too, it is the authority of the child's parents - essentially, that of his autocratic father, threatening him with his power to punish - which calls on him for a renunciation of instinct and which decides for him what is to be allowed and what forbidden. Later on, when Society and the super-ego have taken the parents' place, what in the child was called 'well-behaved' or 'naughty' is described as 'good' and 'evil' or 'virtuous' and 'vicious'. But it is still always the same thing - instinctual renunciation under the pressure of the authority which replaces and prolongs the father. [1939a, 4938]
A little reflection was bound to show that it would be impossible to restrict to the provinces of dreams and nervous disorders a view such as this of the life of the human mind. If that view has hit upon a truth, it must apply equally to normal mental events, and even the highest achievements of the human spirit must bear a demonstrable relation to the factors found in pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself pointed persistently in the direction of this new task, for it was obvious that the forms assumed by the different neuroses echoed the most highly admired productions of our culture. Thus hysterics are undoubtedly imaginative artists, even if they express their phantasies mimetically in the main and without considering their intelligibility to other people; the ceremonials and prohibitions of obsessional neurotics drive us to suppose that they have created a private religion of their own; and the delusions of paranoics have an unpalatable external similarity and internal kinship to the systems of our philosophers. It is impossible to escape the conclusion that these patients are, in an asocial fashion, making the very attempts at solving their conflicts and appeasing their pressing needs which, when those attempts are carried out in a fashion that is acceptable to the majority, are known as poetry, religion and philosophy.

[1919g, 3704]

This hypothesis, which is founded on the observations of Robertson Smith and was developed by me in Totem and Taboo, has been taken by Theodor Reik as the basis of his studies on the problems of the psychology of religion, of which this is the first volume. In accordance with psycho-analytic technique these studies start out from hitherto unexplained details of religious life, and by means of their elucidation gain access to the fundamental postulates and ultimate aims of religions; moreover they keep steadily in view the relation between prehistoric man and contemporary primitive societies as well as the connection between the products of civilization and the substitutive structures of neurotics. In conclusion, I would draw attention to the author's own introduction and express my belief that his work will recommend itself to the notice of specialists in the branch of knowledge with which it deals.

[1919g, 3705]
(19) We are however far from having outlined all the characteristics of this phenomenon. There is a further point I wish to make. The forgetting of names is highly contagious. In a conversation between two people it is often sufficient for one of them merely to mention that he has forgotten such and such a name, and the result will be that it slips the other's mind as well. In cases like these, however, where the forgetting is induced, the forgotten name returns more readily. - This 'collective' forgetting, strictly speaking a phenomenon of group psychology, has not yet been made the subject of psycho-analytic study. In a single instance (but an especially neat one) Reik (1920) has been able to offer a good explanation of this curious phenomenon. [1901b, 1134]

There is no need, however, to bring forward anything other than mental forces in order to explain miraculous cures. Even under conditions such as these, nothing happens that can be considered as beyond our understanding. Everything proceeds naturally. Indeed, the power of religious faith is reinforced in these cases by a number of eminently human motive forces. The individual's pious belief is intensified by the enthusiasm of the crowd of people in whose midst he makes his way as a rule to the sacred locality. All the mental impulses of an individual can be enormously magnified by group influence such as this. In cases in which someone proceeds to the holy place by himself, the reputation of the place and the respect in which it is held act as substitutes for the influence of the group, so that in fact the power of a group is once more in operation. And there is yet another way in which this influence makes itself felt. Since it is well known that divine mercy is always shown only to a few of the many who seek it, each of these is eager to be among the chosen few; the ambition that lies hidden in everyone comes to the help of pious faith. Where so many powerful forces converge, we need feel no surprise if the goal is sometimes really reached. [1890a, 1592]

The individual in the relations which have already been mentioned - to his parents and to his brothers and sisters, to the person he is in love with, to his friend, and to his physician - comes under the influence of only a single person, or of a very small number of persons, each one of whom has become enormously important to him. Now in speaking of social or group psychology it has become usual to leave these relations on one side and to isolate as the subject of inquiry the influencing of an individual by a large number of people simultaneously, people with whom he is connected by something, though otherwise they may in many respects be strangers to him. Group psychology is therefore concerned with the individual man as a member of a race, of a nation, of a caste, of a profession, of an institution, or as a component part of a crowd of people who have been organized into a group at some particular time for some definite purpose. When once natural continuity has been severed in this way, if a breach is thus made between things which are by nature interconnected, it is easy to regard the phenomena that appear under these special conditions as being expressions of a special instinct that is not further reducible - the social instinct ('herd instinct', 'group mind'), which does not come to light in any other situations. But we may perhaps venture to object that it seems difficult to attribute to the factor of number a significance so great as to make it capable by itself of arousing in our mental life a new instinct that is otherwise not brought into play. Our expectation is therefore directed towards two other possibilities: that the social instinct may not be a primitive one and insusceptible of dissection, and that it may be possible to discover the beginnings of its development in a narrower circle, such as that of the family. [1921c, 3766]
Let us make the matter clear once again. If a psychology, concerned with exploring the predispositions, the instinctual impulses, the motives and the aims of an individual man down to his actions and his relations with those who are nearest to him, had completely achieved its task, and had cleared up the whole of these matters with their interconnections, it would then suddenly find itself confronted by a new task which would lie before it unachieved. It would be obliged to explain the surprising fact that under a certain condition this individual, whom it had come to understand, thought, felt and acted in quite a different way from what would have been expected. And this condition is his insertion into a collection of people which has acquired the characteristic of a 'psychological group'. What, then, is a 'group'? How does it acquire the capacity for exercising such a decisive influence over the mental life of the individual? And what is the nature of the mental change which it forces upon the individual?

From our point of view we need not attribute so much importance to the appearance of new characteristics. For us it would be enough to say that in a group the individual is brought under conditions which allow him to throw off the repressions of his unconscious instinctual impulses. The apparently new characteristics which he then displays are in fact the manifestations of this unconscious, in which all that is evil in the human mind is contained as a predisposition. We can find no difficulty in understanding the disappearance of conscience or of a sense of responsibility in these circumstances. It has long been our contention that 'social anxiety' is the essence of what is called conscience.¹

Some other features in Le Bon's description show in a clear light how well justified is the identification of the group mind with the mind of primitive people. In groups the most contradictory ideas can exist side by side and tolerate each other, without any conflict arising from the logical contradiction between them. But this is also the case in the unconscious mental life of individuals, of children and of neurotics, as psycho-analysis has long pointed out.¹

We have pointed out that this predominance of the life of phantasy and of the illusion born of an unfulfilled wish is the ruling factor in the psychology of neuroses. We have found that what neurotics are guided by is not ordinary objective reality but psychological reality. A hysterical symptom is based upon phantasy instead of upon the repetition of real experience, and the sense of guilt in an obsessional neurosis is based upon the fact of an evil intention which was never carried out. Indeed, just as in dreams and in hypnosis, in the mental operations of a group the function for testing the reality of things falls into the background in comparison with the strength of wishful impulses with their affective cathexis.

We may recall from what we know of the morphology of groups that it is possible to distinguish very different kinds of groups and opposing lines in their development. There are very fleeting groups and extremely lasting ones; homogeneous ones, made up of the same sorts of individuals, and unhomogeneous ones; natural groups, and artificial ones, requiring an external force to keep them together; primitive groups, and highly organized ones with a definite structure. But for reasons which remain to be explained we should like to lay particular stress upon a distinction to which writers on the subject have been inclined to give too little attention; I refer to that between leaderless groups and those with leaders. And, in complete opposition to the usual practice, we shall not choose a relatively simple group formation as our point of departure, but shall begin with highly organized, lasting and artificial groups. The most interesting example of such structures are Churches - communities of believers - and armies.
A Church and an army are artificial groups - that is, a certain external force is employed to prevent them from disintegrating¹ and to check alterations in their structure. As a rule a person is not consulted, or is given no choice, as to whether he wants to enter such a group; any attempt at leaving it is usually met with persecution or with severe punishment, or has quite definite conditions attached to it. It is quite outside our present interest to enquire why these associations need such special safeguards. We are only attracted by one circumstance, namely that certain facts, which are far more concealed in other cases, can be observed very clearly in those highly organized groups which are protected from dissolution in the manner that has been mentioned.

[1921c, 3787]

It is to be noticed that in these two artificial groups each individual is bound by libidinal ties on the one hand to the leader (Christ, the Commander-in-Chief) and on the other hand to the other members of the group. How these two ties are related to each other, whether they are of the same kind and the same value, and how they are to be described psychologically - these questions must be reserved for subsequent enquiry. But we shall venture even now upon a mild reproach against earlier writers for not having sufficiently appreciated the importance of the leader in the psychology of the group, while our own choice of this as a first subject for investigation has brought us into a more favourable position. It would appear as though we were on the right road towards an explanation of the principal phenomenon of group psychology - the individual's lack of freedom in a group. If each individual is bound in two directions by such an intense emotional tie, we shall find no difficulty in attributing to that circumstance the alteration and limitation which have been observed in his personality.

[1921c, 3789]

A hint to the same effect, that the essence of a group lies in the libidinal ties existing in it, is also to be found in the phenomenon of panic, which is best studied in military groups. A panic arises if a group of that kind becomes disintegrated. Its characteristics are that none of the orders given by superiors are any longer listened to, and that each individual is only solicitous on his own account, and without any consideration for the rest. The mutual ties have ceased to exist, and a gigantic and senseless fear is set free. At this point, again, the objection will naturally be made that it is rather the other way round; and that the fear has grown so great as to be able to disregard all ties and all feelings of consideration for others. McDougall (1920a, 24) has even made use of panic (though not of military panic) as a typical instance of that intensification of emotion by contagion ("primary induction") on which he lays so much emphasis. But nevertheless this rational method of explanation is here quite inadequate. The very question that needs explanation is why the fear has become so gigantic. The greatness of the danger cannot be responsible, for the same army which now falls a victim to panic may previously have faced equally great or greater danger with complete success; it is of the very essence of panic that it bears no relation to the danger that threatens, and often breaks out on the most trivial occasions. If an individual in panic fear begins to be solicitous only on his own account, he bears witness in so doing to the fact that the emotional ties, which have hitherto made the danger seem small to him, have ceased to exist. Now that he is by himself in facing the danger, he may surely think it greater. The fact is, therefore, that panic fear presupposes a relaxation in the libidinal structure of the group and reacts to that relaxation in a justifiable manner, and the contrary view - that the libidinal ties of the group are destroyed owing to fear in the face of the danger - can be refuted.

[1921c, 3790]
We thus have an impression of a state in which an individual's private emotional impulses and intellectual acts are too weak to come to anything by themselves and are entirely dependent for this on being reinforced by being repeated in a similar way in the other members of the group. We are reminded of how many of these phenomena of dependence are part of the normal constitution of human society, of how little originality and personal courage are to be found in it, of how much every individual is ruled by those attitudes of the group mind which exhibit themselves in such forms as racial characteristics, class prejudices, public opinion, etc. The influence of suggestion becomes a greater riddle for us when we admit that it is not exercised only by the leader, but by every individual upon every other individual; and we must reproach ourselves with having unfairly emphasized the relation to the leader and with having kept the other factor of mutual suggestion too much in the background.

[1921c, 3809]

If we survey the life of an individual man of to-day, bearing in mind the mutually complementary accounts of group psychology given by the authorities, we may lose the courage, in face of the complications that are revealed, to attempt a comprehensive exposition. Each individual is a component part of numerous groups, he is bound by ties of identification in many directions, and he has built up his ego ideal upon the most various models. Each individual therefore has a share in numerous group minds - those of his race, of his class, of his creed, of his nationality, etc. - and he can also raise himself above them to the extent of having a scrap of independence and originality. Such stable and lasting group formations, with their uniform and constant effects, are less striking to an observer than the rapidly formed and transient groups from which Le Bon has made his brilliant psychological character sketch of the group mind. And it is just in these noisy ephemeral groups, which are as it were superimposed upon the others, that we are met by the prodigy of the complete, even though only temporary, disappearance of exactly what we have recognized as individual acquirements.

[1921c, 3820]

When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry through such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]
We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon? It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or less ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a generation for it to be recognized as a great step forward towards truth. Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a process in group psychology.

This fact is so remarkable that we feel justified in looking at it once again. Our problem is comprised in it. The Jewish people had abandoned the Aten religion brought to them by Moses and had turned to the worship of another god who differed little from the Baalim of the neighbouring peoples. All the tendentious efforts of later times failed to disguise this shameful fact. But the Mosaic religion had not vanished without leaving a trace; some sort of memory of it had kept alive - a possibly obscured and distorted tradition. And it was this tradition of a great past which continued to operate (from the background, as it were), which gradually acquired more and more power over people's minds and which in the end succeeded in changing the god Yahweh into the Mosaic god and in re-awakening into life the religion of Moses that had been introduced and then abandoned long centuries before. That a tradition thus sunk in oblivion should exercise such a powerful effect on the mental life of a people is an unfamiliar idea to us. We find ourselves here in the field of group psychology, where we do not feel at home. We shall look about for analogies, for facts that are at least of a similar nature, even though in different fields. And facts of that sort are, I believe, to be found.

This analogy is met with in psychopathology, in the genesis of human neuroses - in a field, that is to say, belonging to the psychology of individuals, while religious phenomena have of course to be reckoned as part of group psychology. We shall see that this analogy is not so surprising as might at first be thought - indeed that it is more like a postulate.
But Trotter's exposition is open, with even more justice than the others, to the objection that it takes too little account of the leader's part in a group, while we incline rather to the opposite judgement, that it is impossible to grasp the nature of a group if the leader is disregarded. The herd instinct leaves no room at all for the leader; he is merely thrown in along with the herd, almost by chance; it follows, too, that no path leads from this instinct to the need for a God; the herd is without a herdsman. But besides this, Trotter's exposition can be undermined psychologically; that is to say, it can be made at all events probable that the herd instinct is not irreducible, that it is not primary in the same sense as the instinct of self-preservation and the sexual instinct.

[1921c, 3811]

It is naturally no easy matter to trace the ontogenesis of the herd instinct. The fear which is shown by small children when they are left alone, and which Trotter claims as being already a manifestation of the instinct, nevertheless suggests more readily another interpretation. The fear relates to the child's mother, and later to other familiar people, and it is the expression of an unfulfilled desire, which the child does not yet know how to deal with in any way except by turning it into anxiety.¹ Nor is the child's fear when it is alone pacified by the sight of any haphazard 'member of the herd', but on the contrary it is brought into existence by the approach of a 'stranger' of this sort. Then for a long time nothing in the nature of herd instinct or group feeling is to be observed in children. Something like it first grows up, in a nursery containing many children, out of the children's relation to their parents, and it does so as a reaction to the initial envy with which the elder child receives the younger one. The elder child would certainly like to put his successor jealously aside, to keep it away from the parents, and to rob it of all its privileges; but in the face of the fact that this younger child (like all that come later) is loved by the parents as much as he himself is, and in consequence of the impossibility of his maintaining his hostile attitude without damaging himself, he is forced into identifying himself with the other children. So there grows up in the troop of children a communal or group feeling, which is then further developed at school. The first demand made by this reaction-formation is for justice, for equal treatment for all. We all know how loudly and implacably this claim is put forward at school. If one cannot be the favourite oneself, at all events nobody else shall be the favourite. This transformation - the replacing of jealousy by a group feeling in the nursery and classroom - might be considered improbable, if the same process could not later on be observed again in other circumstances. We have only to think of the troop of women and girls, all of them in love in an enthusiastically sentimental way, who crowd round a singer or pianist after his performance. It would certainly be easy for each of them to be jealous of the rest; but, in the face of their numbers and the consequent impossibility of their reaching the aim of their love, they renounce it, and, instead of pulling out one another's hair, they act as a united group, do homage to the hero of the occasion with their common actions, and would probably be glad to have a share of his flowing locks. Originally rivals, they have succeeded in identifying themselves with one another by means of a similar love for the same object. When, as is usual, an instinctual situation is capable of various outcomes, we shall not be surprised that the actual outcome is one which brings with it the possibility of a certain amount of satisfaction, whereas some other outcome, in itself more obvious, is passed over because the circumstances of life prevent its leading to any such satisfaction.

[1921c, 3812]

The Herd Instinct. - It has been maintained in many quarters that there is a special innate and not further analysable 'herd instinct', which determines the social behaviour of human beings and impels individuals to come together into larger communities. Psycho-analysis finds itself in contradiction to this view. Even if the social instinct is innate, it may without any difficulty be traced back to what were originally libidinal object-cathexes and may have developed in the childhood of the individual as a reaction-formation against hostile attitudes of rivalry. It is based on a peculiar kind of identification with other people.

[1923a, 3933]
Thus social feeling is based upon the reversal of what was first a hostile feeling into a positively-toned tie in the nature of an identification. So far as we have hitherto been able to follow the course of events, this reversal seems to occur under the influence of a common affectionate tie with a person outside the group. We do not ourselves regard our analysis of identification as exhaustive, but it is enough for our present purpose that we should revert to this one feature - its demand that equalization shall be consistently carried through. We have already heard in the discussion of the two artificial groups, Church and army, that their necessary precondition is that all their members should be loved in the same way by one person, the leader. Do not let us forget, however, that the demand for equality in a group applies only to its members and not to the leader. All the members must be equal to one another, but they all want to be ruled by one person. Many equals, who can identify themselves with one another, and a single person superior to them all - that is the situation that we find realized in groups which are capable of subsisting. Let us venture, then, to correct Trotter's pronouncement that man is a herd animal and assert that he is rather a horde animal, an individual creature in a horde led by a chief.

[1921c, 3813]

Thus the group appears to us as a revival of the primal horde. Just as primitive man survives potentially in every individual, so the primal horde may arise once more out of any random collection; in so far men are habitually under the sway of group formation we recognize in it the survival of the primal horde. We must conclude that the psychology of groups is the oldest human psychology; what we have isolated as individual psychology, by neglecting all traces of the group, has only since come into prominence out of the old group psychology, by a gradual process which may still, perhaps, be described as incomplete. We shall later venture upon an attempt at specifying the point of departure of this development.

[1921c, 3815]

Further reflection will show us in what respect this statement requires correction. Individual psychology must, on the contrary, be just as old as group psychology, for from the first there were two kinds of psychologies, that of the individual members of the group and that of the father, chief, or leader. The members of the group were subject to ties just as we see them to-day, but the father of the primal horde was free. His intellectual acts were strong and independent even in isolation, and his will needed no reinforcement from others. Consistency leads us to assume that his ego had few libidinal ties; he loved no one but himself, or other people only in so far as they served his needs. To objects his ego gave away no more than was barely necessary.

[1921c, 3815]

He, at the very beginning of the history of mankind, was the 'superman' whom Nietzsche only expected from the future. Even to-day the members of a group stand in need of the illusion that they are equally and justly loved by their leader; but the leader himself need love no one else, he may be of a masterful nature, absolutely narcissistic, self-confident and independent. We know that love puts a check upon narcissism, and it would be possible to show how, by operating in this way, it became a factor of civilization.

[1921c, 3815]
The primal father of the horde was not yet immortal, as he later became by deification. If he died, he had to be replaced; his place was probably taken by a youngest son, who had up to then been a member of the group like any other. There must therefore be a possibility of transforming group psychology into individual psychology; a condition must be discovered under which such a transformation is easily accomplished, just as it is possible for bees in case of necessity to turn a larva into a queen instead of into a worker. One can imagine only one possibility: the primal father had prevented his sons from satisfying their directly sexual impulsions; he forced them into abstinence and consequently into the emotional ties with him and with one another which could arise out of those of their impulsions that were inhibited in their sexual aim. He forced them, so to speak, into group psychology. His sexual jealousy and intolerance became in the last resort the causes of group psychology.1

This missing element was supplied when I became acquainted with W. Robertson Smith’s work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called ‘totem meal’ as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin’s conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another’s way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man’s sense of guilt (or ‘original sin’) and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]
The other opposition has to be taken far more seriously, and in this instance I feel the liveliest regret at the inadequacy of my information. I suspect that you know more about this business than I do and that you took up your position long ago in favour of Marxism or against it. Karl Marx's investigations into the economic structure of society and into the influence of different economic systems upon every department of human life have in our days acquired an undeniable authority. How far his views in detail are correct or go astray, I cannot of course tell. I understand that this is not an easy matter even for others better instructed than I am. There are assertions contained in Marx's theory which have struck me as strange: such as that the development of forms of society is a process of natural history, or that the changes in social stratification arise from one another in the manner of a dialectical process. I am far from sure that I understand these assertions aright; nor do they sound to me 'materialistic' but, rather, like a precipitate of the obscure Hegelian philosophy in whose school Marx graduated. I do not know how I can shake off my lay opinion that the class structure of society goes back to the struggles which, from the beginning of history, took place between human hordes only slightly differing from each other. Social distinctions, so I thought, were originally distinctions between clans or races. Victory was decided by psychological factors, such as the amount of constitutional aggressiveness, but also by the firmness of the organization within the horde, and by material factors, such as the possession of superior weapons. Living together in the same area, the victors became the masters and the vanquished the slaves. There is no sign to be seen in this of a natural law or of a conceptual evolution. On the other hand the influence exercised upon the social relations of mankind by progressive control over the forces of Nature is unmistakable. For men always put their newly acquired instruments of power at the service of their aggressiveness and use them against one another. The introduction of metals - bronze and iron - made an end to whole epochs of civilization and their social institutions. I really believe that it was gunpowder and fire-arms that abolished chivalry and aristocratic rule, and that the Russian despotism was already doomed before it lost the War, because no amount of inbreeding among the ruling families of Europe could have produced a race of Tsars capable of withstanding the explosive force of dynamite.

[1933a, 4774]

It is a general principle, then, that conflicts of interest between men are settled by the use of violence. This is true of the whole animal kingdom, from which men have no business to exclude themselves. In the case of men, no doubt, conflicts of opinion occur as well which may reach the highest pitch of abstraction and which seem to demand some other technique for their settlement. That, however, is a later complication. To begin with, in a small human horde, it was superior muscular strength which decided who owned things or whose will should prevail. Muscular strength was soon supplemented and replaced by the use of tools: the winner was the one who had the better weapons or who used them the more skilfully. From the moment at which weapons were introduced, intellectual superiority already began to replace brute muscular strength; but the final purpose of the fight remained the same - one side or the other was to be compelled to abandon his claim or his objection by the damage inflicted on him and by the crippling of his strength. That purpose was most completely achieved if the victor's violence eliminated his opponent permanently - that is to say, killed him. This had two advantages: he could not renew his opposition and his fate deterred others from following his example. In addition to this, killing an enemy satisfied an instinctual inclination which I shall have to mention later. The intention to kill might be countered by a reflection that the enemy could be employed in performing useful services if he were left alive in an intimidated condition. In that case the victor's violence was content with subjugating him instead of killing him. This was a first beginning of the idea of sparing an enemy's life, but thereafter the victor had to reckon with his defeated opponent's lurking thirst for revenge and sacrificed some of his own security.

[1933b, 4793]
I put forward these assertions as much as a quarter of a century ago in my *Totem and Taboo* (1912-13) and I need only repeat them here. My construction starts out from a statement of Darwin's and takes in a hypothesis of Atkinson's. It asserts that in primaeval times primitive man lived in small hordes, each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men - that is, to all our ancestors. The story is told in an enormously condensed form, as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property - wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

[1939a, 4905]

The first step away from totemism was the humanizing of the being who was worshipped. In place of the animals, human gods appear, whose derivation from the totem is not concealed. The god is still represented either in the form of an animal or at least with an animal's face, or the totem becomes the god's favourite companion, inseparable from him, or legend tells us that the god slew this precise animal, which was after all only a preliminary stage of himself. At a point in this evolution which is not easily determined great mother-goddesses appeared, probably even before the male gods, and afterwards persisted for a long time beside them. In the meantime a great social revolution had occurred. Matriarchy was succeeded by the re-establishment of a patriarchal order. The new fathers, it is true, never achieved the omnipotence of the primal father; there were many of them, who lived together in associations larger than the horde had been. They were obliged to be on good terms with one another, and remained under the limitation of social ordinances. It is likely that the mother-goddesses originated at the time of the curtailment of the matriarchy, as a compensation for the slight upon the mothers. The male deities appear first as sons beside the great mothers and only later clearly assume the features of father-figures. These male gods of polytheism reflect the conditions during the patriarchal age. They are numerous, mutually restrictive, and are occasionally subordinated to a superior high god. The next step, however, leads us to the theme with which we are here concerned - to the return of a single father-god of unlimited dominion.

[1939a, 4907]
In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]
We have hitherto considered two artificial groups and have found that both are dominated by emotional ties of two kinds. One of these, the tie with the leader, seems (at all events for these cases) to be more of a ruling factor than the other, which holds between the members of the group.

[1921c, 3793]

Now much else remains to be examined and described in the morphology of groups. We should have to start from the ascertained fact that a mere collection of people is not a group, so long as these ties have not been established in it; but we should have to admit that in any collection of people the tendency to form a psychological group may very easily come to the fore. We should have to give our attention to the different kinds of groups, more or less stable, that arise spontaneously, and to study the conditions of their origin and of their dissolution. We should above all be concerned with the distinction between groups which have a leader and leaderless groups. We should consider whether groups with leaders may not be the more primitive and complete, whether in the others an idea, an abstraction, may not take the place of the leader (a state of things to which religious groups, with their invisible head, form a transitional stage), and whether a common tendency, a wish in which a number of people can have a share, may not in the same way serve as a substitute. This abstraction, again, might be more or less completely embodied in the figure of what we might call a secondary leader, and interesting varieties would arise from the relation between the idea and the leader. The leader or the leading idea might also, so to speak, be negative; hatred against a particular person or institution might operate in just the same unifying way, and might call up the same kind of emotional ties as positive attachment. Then the question would also arise whether a leader is really indispensable to the essence of a groups - and other questions besides.

[1921c, 3793]

But all these questions, which may, moreover, have been dealt with in part in the literature of group psychology, will not succeed in diverting our interest from the fundamental psychological problems that confront us in the structure of a group. And our attention will first be attracted by a consideration which promises to bring us in the most direct way to a proof that libidinal ties are what characterize a group.

[1921c, 3793]
But when a group is formed the whole of this intolerance vanishes, temporarily or permanently, within the group. So long as a group formation persists or so far as it extends, individuals in the group behave as though they were uniform, tolerate the peculiarities of its other members, equate themselves with them, and have no feeling of aversion towards them. Such a limitation of narcissism can, according to our theoretical views, only be produced by one factor, a libidinal tie with other people. Love for oneself knows only one barrier - love for others, love for objects.² The question will at once be raised whether community of interest in itself, without any addition of libido, must not necessarily lead to the toleration of other people and to considerateness for them. This objection may be met by the reply that nevertheless no lasting limitation of narcissism is effected in this way, since this tolerance does not persist longer than the immediate advantage gained from the other people's collaboration. But the practical importance of this discussion is less than might be supposed, for experience has shown that in cases of collaboration libidinal ties are regularly formed between the fellow-workers which prolong and solidify the relation between them to a point beyond what is merely profitable. The same thing occurs in men's social relations as has become familiar to psycho-analytic research in the course of the development of the individual libido. The libido attaches itself to the satisfaction of the great vital needs, and chooses as its first objects the people who have a share in that process. And in the development of mankind as a whole, just as in individuals, love alone acts as the civilizing factor in the sense that it brings a change from egoism to altruism. And this is true both of sexual love for women, with all the obligations which it involves of not harming the things that are dear to women, and also of desexualized, sublimated homosexual love for other men, which springs from work in common. [1921c, 3795]

But after the preceding discussions we are quite in a position to give the formula for the libidinal constitution of groups, or at least of such groups as we have hitherto considered - namely, those that have a leader and have not been able by means of too much 'organization' to acquire secondarily the characteristics of an individual. A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego. This condition admits of graphic representation:

Human groups exhibit once again the familiar picture of an individual of superior strength among a troop of equal companions, a picture which is also contained in our idea of the primal horde. The psychology of such a group, as we know it from the descriptions to which we have so often referred - the dwindling of the conscious individual personality, the focusing of thoughts and feelings into a common direction, the predominance of the affective side of the mind and of unconscious psychical life, the tendency to the immediate carrying out of intentions as they emerge - all this corresponds to a state of regression to a primitive mental activity, of just such a sort as we should be inclined to ascribe to the primal horde.² [1921c, 3814]
The uncanny and coercive characteristics of group formations, which are shown in the phenomena of suggestion that accompany them, may therefore with justice be traced back to the fact of their origin from the primal horde. The leader of the group is still the dreaded primal father; the group still wishes to be governed by unrestricted force; it has an extreme passion for authority; in Le Bon’s phrase, it has a thirst for obedience. The primal father is the group ideal, which governs the ego in the place of the ego ideal. Hypnosis has a good claim to being described as a group of two. There remains as a definition for suggestion: a conviction which is not based upon perception and reasoning but upon an erotic tie.¹

We have interpreted this prodigy as meaning that the individual gives up his ego ideal and substitutes for it the group ideal as embodied in the leader. And we must add by way of correction that the prodigy is not equally great in every case. In many individuals the separation between the ego and the ego ideal is not very far advanced; the two still coincide readily; the ego has often preserved its earlier narcissistic self-complacency. The selection of the leader is very much facilitated by this circumstance. He need often only possess the typical qualities of the individuals concerned in a particularly clearly marked and pure form, and need only give an impression of greater force and of more freedom of libido; and in that case the need for a strong chief will often meet him half-way and invest him with a predominance to which he would otherwise perhaps have had no claim. The other members of the group, whose ego ideal would not, apart from this, have become embodied in his person without some correction, are then carried away with the rest by 'suggestion', that is to say, by means of identification.

We are aware that what we have been able to contribute towards the explanation of the libidinal structure of groups leads back to the distinction between the ego and the ego ideal and to the double kind of tie which this makes possible - identification, and putting the object in the place of the ego ideal. The assumption of this kind of differentiating grade in the ego as a first step in an analysis of the ego must gradually establish its justification in the most various regions of psychology. In my paper on narcissism I have put together all the pathological material that could at the moment be used in support of this differentiation. But it may be expected that when we penetrate deeper into the psychology of the psychoses its significance will be discovered to be far greater. Let us reflect that the ego now enters into the relation of an object to the ego ideal which has been developed out of it, and that all the interplay between an external object and the ego as a whole, with which our study of the neuroses has made us acquainted, may possibly be repeated upon this new scene of action within the ego.

The group multiplies this process; it agrees with hypnosis in the nature of the instincts which hold it together, and in the replacement of the ego ideal by the object; but to this it adds identification with other individuals, which was perhaps originally made possible by their having the same relation to the object.

The Herd Instinct. - It has been maintained in many quarters that there is a special innate and not further analysable 'herd instinct', which determines the social behaviour of human beings and impels individuals to come together into larger communities. Psycho-analysis finds itself in contradiction to this view. Even if the social instinct is innate, it may without any difficulty be traced back to what were originally libidinal object-cathexes and may have developed in the childhood of the individual as a reaction-formation against hostile attitudes of rivalry. It is based on a peculiar kind of identification with other people.
Aim-inhibited Sexual Impulses. - The social instincts belong to a class of instinctual impulses which need not be described as sublimated, though they are closely related to these. They have not abandoned their directly sexual aims, but they are held back by internal resistances from attaining them; they rest content with certain approximations to satisfaction and for that very reason lead to especially firm and permanent attachments between human beings. To this class belong in particular the affectionate relations between parents and children, which were originally fully sexual, feelings of friendship, and the emotional ties in marriage which had their origin in sexual attraction.

[1923a, 3934]

It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal.

[1923b, 3971]

In 1921 I endeavoured to make use of the differentiation between the ego and the super-ego in a study of group psychology. I arrived at a formula such as this: a psychological group is a collection of individuals who have introduced the same person into their super-ego and, on the basis of this common element, have identified themselves with one another in their ego. This applies, of course, only to groups that have a leader. If we possessed more applications of this kind, the hypothesis of the super-ego would lose its last touch of strangeness for us, and we should become completely free of the embarrassment that still comes over us when, accustomed as we are to the atmosphere of the underworld, we move in the more superficial, higher strata of the mental apparatus. We do not suppose, of course, that with the separation off of the super-ego we have said the last word on the psychology of the ego. It is rather a first step; but in this case it is not only the first step that is hard.

[1933a, 4676]
Such, then, was the original state of things: domination by whoever had the greater might - domination by brute violence or by violence supported by intellect. As we know, this régime was altered in the course of evolution. There was a path that led from violence to right or law. What was that path? It is my belief that there was only one: the path which led by way of the fact that the superior strength of a single individual could be rivalled by the union of several weak ones. 'L’union fait la force.' Violence could be broken by union, and the power of those who were united now represented law in contrast to the violence of the single individual. Thus we see that right is the might of a community. It is still violence, ready to be directed against any individual who resists it; it works by the same methods and follows the same purposes. The only real difference lies in the fact that what prevails is no longer the violence of an individual but that of a community. But in order that the transition from violence to this new right or justice may be effected, one psychological condition must be fulfilled. The union of the majority must be a stable and lasting one. If it were only brought about for the purpose of combating a single dominant individual and were dissolved after his defeat, nothing would have been accomplished. The next person who thought himself superior in strength would once more seek to set up a dominion by violence and the game would be repeated ad infinitum. The community must be maintained permanently, must be organized, must draw up regulations to anticipate the risk of rebellion and must institute authorities to see that those regulations - the laws - are respected and to superintend the execution of legal acts of violence. The recognition of a community of interests such as these leads to the growth of emotional ties between the members of a united group of people - communal feelings which are the true source of its strength.

Here, I believe, we already have all the essentials: violence overcome by the transference of power to a larger unity, which is held together by emotional ties between its members. What remains to be said is no more than an expansion and a repetition of this.

The situation is simple so long as the community consists only of a number of equally strong individuals. The laws of such an association will determine the extent to which, if the security of communal life is to be guaranteed, each individual must surrender his personal liberty to turn his strength to violent uses. But a state of rest of that kind is only theoretically conceivable. In actuality the position is complicated by the fact that from its very beginning the community comprises elements of unequal strength - men and women, parents and children - and soon, as a result of war and conquest, it also comes to include victors and vanquished, who turn into masters and slaves. The justice of the community then becomes an expression of the unequal degrees of power obtaining within it; the laws are made by and for the ruling members and find little room for the rights of those in subjection. From that time forward there are two factors at work in the community which are sources of unrest over matters of law but tend at the same time to a further growth of law. First, attempts are made by certain of the rulers to set themselves above the prohibitions which apply to everyone - they seek, that is, to go back from a dominion of law to a dominion of violence. Secondly, the oppressed members of the group make constant efforts to obtain more power and to have any changes that are brought about in that direction recognized in the laws - they press forward, that is, from unequal justice to equal justice for all. This second tendency becomes especially important if a real shift of power occurs within a community, as may happen as a result of a number of historical factors. In that case right may gradually adapt itself to the new distribution of power; or, as is more frequent, the ruling class is unwilling to recognize the change, and rebellion and civil war follow, with a temporary suspension of law and new attempts at a solution by violence, ending in the establishment of a fresh rule of law. There is yet another source from which modifications of law may arise, and one of which the expression is invariably peaceful: it lies in the cultural transformation of the members of the community. This, however, belongs properly in another connection and must be considered later.
Thus we see that the violent solution of conflicts of interest is not avoided even inside a community. But the everyday necessities and common concerns that are inevitable where people live together in one place tend to bring such struggles to a swift conclusion and under such conditions there is an increasing probability that a peaceful solution will be found. Yet a glance at the history of the human race reveals an endless series of conflicts between one community and another or several others, between larger and smaller units - between cities, provinces, races, nations, empires - which have almost always been settled by force of arms. Wars of this kind end either in the spoliation or in the complete overthrow and conquest of one of the parties. It is impossible to make any sweeping judgement upon war of conquest. Some, such as those waged by the Mongols and Turks, have brought nothing but evil. Others, on the contrary, have contributed to the transformation of violence into law by establishing larger units within which the use of violence was made impossible and in which a fresh system of law led to the solution of conflicts. In this way the conquests of the Romans gave the countries round the Mediterranean the priceless *pax Romana*, and the greed of the French kings to extend their dominions created a peacefully united and flourishing France. Paradoxical as it may sound, it must be admitted that war might be a far from inappropriate means of establishing the eagerly desired reign of 'everlasting' peace, since it is in a position to create the large units within which a powerful central government makes further wars impossible. Nevertheless it fails in this purpose, for the results of conquest are as a rule short-lived: the newly created units fall apart once again, usually owing to a lack of cohesion between the portions that have been united by violence. Hitherto, moreover, the unifications created by conquest, though of considerable extent, have only been *partial*, and the conflicts between these have called out more than ever for violent solution. Thus the result of all these warlike efforts has only been that the human race has exchanged numerous, and indeed unending, minor wars for wars on a grand scale that are rare but all the more destructive. [1933b, 4796]
If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians - an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games - was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist to-day which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one to-day, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force by the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute violence and that even to-day it cannot do without the support of violence.

[1933b, 4797]
D. The last two remarks will have prepared us for finding that directly sexual impulsions are unfavourable to the formation of groups. In the history of the development of the family there have also, it is true, been group relations of sexual love (group marriages); but the more important sexual love became for the ego, and the more it developed the characteristics of being in love, the more urgently it required to be limited to two people - *una cum uno* - as is prescribed by the nature of the genital aim. Polygamous inclinations had to be content to find satisfaction in a succession of changing objects.

Two people coming together for the purpose of sexual satisfaction, in so far as they seek for solitude, are making a demonstration against the herd instinct, the group feeling. The more they are in love, the more completely they suffice for each other. Their rejection of the group's influence is expressed in the shape of a sense of shame. Feelings of jealousy of the most extreme violence are summoned up in order to protect the choice of a sexual object from being encroached upon by a group tie. It is only when the affectionate, that is, personal, factor of a love relation gives place entirely to the sensual one, that it is possible for two people to have sexual intercourse in the presence of others or for there to be simultaneous sexual acts in a group, as occurs at an orgy. But at that point a regression has taken place to an early stage in sexual relations, at which being in love as yet played no part, and all sexual objects were judged to be of equal value, somewhat in the sense of Bernard Shaw's malicious aphorism to the effect that being in love means greatly exaggerating the difference between one woman and another.

There are abundant indications that being in love only made its appearance late on in the sexual relations between men and women; so that the opposition between sexual love and group ties is also a late development. Now it may seem as though this assumption were incompatible with our myth of the primal family. For it was after all by their love for their mothers and sisters that the mob of brothers was, as we have supposed, driven to parricide; and it is difficult to imagine this love as being anything but undivided and primitive - that is, as an intimate union of the affectionate and sensual. But further consideration resolves this objection to our theory into a confirmation of it. One of the reactions to the parricide was after all the institution of totemic exogamy, the prohibition of any sexual relation with those women of the family who had been tenderly loved since childhood. In this way a wedge was driven in between a man's affectionate and sensual feelings, one still firmly fixed in his erotic life to-day. As a result of this exogamy the sensual needs of men had to be satisfied with strange and unloved women.

*Being in love* is based on the simultaneous presence of directly sexual impulsions and of sexual impulsions that are inhibited in their aims, while the object draws a part of the subject's narcissistic ego-libido to itself. It is a condition in which there is only room for the ego and the object.

Both states, hypnosis and group formation, are an inherited deposit from the phylogenesis of the human libido - hypnosis in the form of a predisposition, and the group, besides this, as a direct survival. The replacement of the directly sexual impulsions by those that are inhibited in their aims promotes in both states a separation between the ego and the ego ideal, a separation with which a beginning has already been made in the state of being in love.
We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

The fact that women must be regarded as having little sense of justice is no doubt related to the predominance of envy in their mental life; for the demand for justice is a modification of envy and lays down the condition subject to which one can put envy aside. We also regard women as weaker in their social interests and as having less capacity for sublimating their instincts than men. The former is no doubt derived from the dissocial quality which unquestionably characterizes all sexual relations. Lovers find sufficiency in each other, and families too resist inclusion in more comprehensive associations. The aptitude for sublimation is subject to the greatest individual variations. On the other hand I cannot help mentioning an impression that we are constantly receiving during analytic practice. A man of about thirty strikes us as a youthful, somewhat unformed individual, whom we expect to make powerful use of the possibilities for development opened up to him by analysis. A woman of the same age, however, often frightens us by her psychical rigidity and unchangeability. Her libido has taken up final positions and seems incapable of exchanging them for others. There are no paths open to further development; it is as though the whole process had already run its course and remains thenceforward insusceptible to influence - as though, indeed, the difficult development to femininity had exhausted the possibilities of the person concerned. As therapists we lament this state of things, even if we succeed in putting an end to our patient's ailment by doing away with her neurotic conflict.
Let us start with the latter, the *scientific* errors. The doctor’s advice to the lady shows clearly in what sense he understands the expression ‘sexual life’ - in the popular sense, namely, in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of the sexual substances. He cannot have remained unaware, however, that psycho-analysis is commonly reproached with having extended the concept of what is sexual far beyond its usual range. The fact is undisputed; I shall not discuss here whether it may justly be used as a reproach. In psycho-analysis the concept of what is sexual comprises far more; it goes lower and also higher than its popular sense. This extension is justified genetically; we reckon as belonging to ‘sexual life’ all the activities of the tender feelings which have primitive sexual impulses as their source, even when those impulses have become inhibited in regard to their original sexual aim or have exchanged this aim for another which is no longer sexual. For this reason we prefer to speak of *psychosexuality*, thus laying stress on the point that the mental factor in sexual life should not be overlooked or underestimated. We use the word ‘sexuality’ in the same comprehensive sense as that in which the German language uses the word *lieben* ['to love']. We have long known, too, that mental absence of satisfaction with all its consequences can exist where there is no lack of normal sexual intercourse; and as therapists we always bear in mind that the unsatisfied sexual trends (whose substitutive satisfactions in the form of nervous symptoms we combat) can often find only very inadequate outlet in coitus or other sexual acts.

These considerations therefore lend an added weight to the circumstance that we are in point of fact driven by experience to attribute to homosexual wishful phantasies an intimate (perhaps an invariable) relation to this particular form of disease. Distrusting my own experience on the subject, I have during the last few years joined with my friends C. G. Jung of Zurich and Sándor Ferenczi of Budapest in investigating upon this single point a number of cases of paranoid disorder which have come under observation. The patients whose histories provided the material for this enquiry included both men and women, and varied in race, occupation, and social standing. Yet we were astonished to find that in all of these cases defence against a homosexual wish was clearly recognizable at the very centre of the conflict which underlay the disease and that it was in an attempt to master an unconsciously reinforced current of homosexuality that they had all of them come to grief.¹ This was certainly not what we had expected. Paranoia is precisely a disorder in which a sexual aetiology is by no means obvious; far from this, the strikingly prominent features in the causation of paranoia, especially among males, are social humiliations and slights. But if we go into the matter only a little more deeply, we shall be able to see that the really operative factor in these social injuries lies in the part played in them by the homosexual components of emotional life. So long as the individual is functioning normally and it is consequently impossible to see into the depths of his mental life, we may doubt whether his emotional relations to his neighbours in society have anything to do with sexuality, either actually or in their genesis. But delusions never fail to uncover these relations and to trace back the social feelings to their roots in a directly sensual erotic wish. So long as he was healthy, Dr. Schreber, too, whose delusions culminated in a wishful phantasy of an unmistakably homosexual nature, had, by all accounts, shown no signs of homosexuality in the ordinary sense of the word.

¹[1910k, 2375]

[1911c, 2429]
After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to *esprit de corps* and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

[1911c, 2431]

The answer to the question which has been repeated so often in these pages is not to be reached by further reflection but by what we discover when we examine individual transference resistances occurring during treatment. We find in the end that we cannot understand the employment of transference as resistance so long as we think simply of 'transference'. We must make up our minds to distinguish a 'positive' transference from a 'negative' one, the transference of affectionate feelings from that of hostile ones, and to treat the two sorts of transference to the doctor separately. Positive transference is then further divisible into transference of friendly or affectionate feelings which are admissible to consciousness and transference of prolongations of those feelings into the unconscious. As regards the latter, analysis shows that they invariably go back to erotic sources. And we are thus led to the discovery that all the emotional relations of sympathy, friendship, trust, and the like, which can be turned to good account in our lives, are genetically linked with sexuality and have developed from purely sexual desires through a softening of their sexual aim, however pure and unsensual they may appear to our conscious self-perception. Originally we knew only sexual objects; and psycho-analysis shows us that people who in our real life are merely admired or respected may still be sexual objects for our unconscious.

[1912b, 2462]

It is true that psycho-analysis has taken the individual mind as its subject, but in investigating the individual it could not avoid dealing with the emotional basis of the relation of the individual to society. It has found that the social feelings invariably contain an erotic element - an element which, if it is over-emphasized and then repressed, becomes one of the marks of a particular group of mental disorders. Psycho-analysis has recognized that in general the neuroses are asocial in their nature and that they always aim at driving the individual out of society and at replacing the safe monastic seclusion of earlier days by the isolation of illness. The intense feeling of guilt which dominates so many neuroses has been shown to be a social modification of neurotic anxiety.

[1913j, 2824]
Libido is an expression taken from the theory of the emotions. We call by that name the energy, regarded as a quantitative magnitude (though not at present actually measurable), of those instincts which have to do with all that may be comprised under the word 'love'. The nucleus of what we mean by love naturally consists (and this is what is commonly called love, and what the poets sing of) in sexual love with sexual union as its aim. But we do not separate from this - what in any case has a share in the name 'love' - on the one hand, self-love, and on the other, love for parents and children, friendship and love for humanity in general, and also devotion to concrete objects and to abstract ideas. Our justification lies in the fact that psychoanalytic research has taught us that all these tendencies are an expression of the same instinctual impulses; in relations between the sexes these impulses force their way towards sexual union, but in other circumstances they are diverted from this aim or are prevented from reaching it, though always preserving enough of their original nature to keep their identity recognizable (as in such features as the longing for proximity, and self-sacrifice).

[1921c, 3784]

It is interesting to see that it is precisely those sexual impulsions that are inhibited in their aims which achieve such lasting ties between people. But this can easily be understood from the fact that they are not capable of complete satisfaction, while sexual impulsions which are uninhibited in their aims suffer an extraordinary reduction through the discharge of energy every time the sexual aim is attained. It is the fate of sensual love to become extinguished when it is satisfied; for it to be able to last, it must from the beginning be mixed with purely affectionate components - with such, that is, as are inhibited in their aims - or it must itself undergo a transformation of this kind.

[1921c, 3807]

We are justified in saying that they have been diverted from these sexual aims, even though there is some difficulty in giving a description of such a diversion of aim which will conform to the requirements of metapsychology. Moreover, those instincts which are inhibited in their aims always preserve some few of their original sexual aims; even an affectionate devotee, even a friend or an admirer, desires the physical proximity and the sight of the person who is now loved only in the 'Pauline' sense. If we choose, we may recognize in this diversion of aim a beginning of the sublimation of the sexual instincts, or on the other hand we may fix the limits of sublimation at some more distant point. Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited. Since they are not capable of really complete satisfaction, they are especially adapted to create permanent ties; while those instincts which are directly sexual incur a loss of energy each time they are satisfied, and must wait to be renewed by a fresh accumulation of sexual libido, so that meanwhile the object may have been changed. The inhibited instincts are capable of any degree of admixture with the uninhibited; they can be transformed back into them, just as they arose out of them. It is well known how easily erotic wishes develop out of emotional relations of a friendly character, based upon appreciation and admiration (compare Molière's 'Kiss me for the love of Greek'), between a master and a pupil, between a performer and a delighted listener, and especially in the case of women. In fact the growth of emotional ties of this kind, with their purposeless beginnings, provides a much frequented pathway to sexual object-choice. Pfister, in his Frömmigkeit des Grafen von Zinzendorf (1910), has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement. On the other hand it is also very usual for directly sexual impulsions, short-lived in themselves, to be transformed into a lasting and purely affectionate tie; and the consolidation of a passionate love marriage rests to a large extent upon this process.

[1921c, 3830]
It is well known that even in a normal person it takes a certain time before the decision in regard to the sex of the love object is finally made. Homosexual enthusiasms, exaggeratedly strong friendships tinged with sensuality, are common enough in both sexes during the first years after puberty. This was also so with our patient, but in her these tendencies undoubtedly showed themselves to be stronger, and lasted longer, than with others. In addition, these presages of later homosexuality had always occupied her conscious life, while the attitude arising from the Oedipus complex had remained unconscious and had appeared only in such signs as her tender behaviour to the little boy. As a school-girl she had been for a long time in love with a strict and unapproachable mistress, obviously a substitute mother. She had taken a specially lively interest in a number of young mothers long before her brother's birth and therefore all the more certainly long before the first reprimand from her father. From very early years, therefore, her libido had flowed in two currents, the one on the surface being one that we may unhesitatingly designate as homosexual. This latter was probably a direct and unchanged continuation of an infantile fixation on her mother. Possibly the analysis described here actually revealed nothing more than the process by which, on an appropriate occasion, the deeper heterosexual current of libido, too, was deflected into the manifest homosexual one.

[1920a, 3857]

Aim-inhibited Sexual Impulses. - The social instincts belong to a class of instinctual impulses which need not be described as sublimated, though they are closely related to these. They have not abandoned their directly sexual aims, but they are held back by internal resistances from attaining them; they rest content with certain approximations to satisfaction and for that very reason lead to especially firm and permanent attachments between human beings. To this class belong in particular the affectionate relations between parents and children, which were originally fully sexual, feelings of friendship, and the emotional ties in marriage which had their origin in sexual attraction.

[1923a, 3934]

In order to make this condensed account of my discoveries upon the sexual life of man more intelligible, I have brought together conclusions which I reached at different dates and incorporated by way of supplement or correction in the successive editions of my Three Essays on the Theory of Sexuality (1905d). I hope it will have been easy to gather the nature of my extension (on which so much stress has been laid and which has excited so much opposition) of the concept of sexuality. That extension is of a twofold kind. In the first place sexuality is divorced from its too close connection with the genitals and is regarded as a more comprehensive bodily function, having pleasure as its goal and only secondarily coming to serve the ends of reproduction. In the second place the sexual impulses are regarded as including all of those merely affectionate and friendly impulses to which usage applies the exceedingly ambiguous word 'love'. I do not, however, consider that these extensions are innovations but rather restorations: they signify the removal of inexpedient limitations of the concept into which we had allowed ourselves to be led.

[1925d, 4213]
The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.
THE BARRIER AGAINST INCEST  We see, therefore, that the parents' affection for their child may awaken his sexual instinct prematurely (i.e. before the somatic conditions of puberty are present) to such a degree that the mental excitation breaks through in an unmistakable fashion to the genital system. If, on the other hand, they are fortunate enough to avoid this, then their affection can perform its task of directing the child in his choice of a sexual object when he reaches maturity. No doubt the simplest course for the child would be to choose as his sexual objects the same persons whom, since his childhood, he has loved with what may be described as damped-down libido.¹ But, by the postponing of sexual maturation, time has been gained in which the child can erect, among other restraints on sexuality, the barrier against incest, and can thus take up into himself the moral precepts which expressly exclude from his object-choice, as being blood relations, the persons whom he has loved in his childhood. Respect for this barrier is essentially a cultural demand made by society. Society must defend itself against the danger that the interests which it needs for the establishment of higher social units may be swallowed up by the family; and for this reason, in the case of every individual, but in particular of adolescent boys, it seeks by all possible means to loosen their connection with their family - a connection which, in their childhood, is the only important one.²

These considerations therefore lend an added weight to the circumstance that we are in point of fact driven by experience to attribute to homosexual wishful phantasies an intimate (perhaps an invariable) relation to this particular form of disease. Distrusting my own experience on the subject, I have during the last few years joined with my friends C. G. Jung of Zurich and Sándor Ferenczi of Budapest in investigating upon this single point a number of cases of paranoid disorder which have come under observation. The patients whose histories provided the material for this enquiry included both men and women, and varied in race, occupation, and social standing. Yet we were astonished to find that in all of these cases defence against a homosexual wish was clearly recognizable at the very centre of the conflict which underlay the disease and that it was in an attempt to master an unconsciously reinforced current of homosexuality that they all of them come to grief.¹ This was certainly not what we had expected. Paranoia is precisely a disorder in which a sexual aetiology is by no means obvious; far from this, the strikingly prominent features in the causation of paranoia, especially among males, are social humiliations and slights. But if we go into the matter only a little more deeply, we shall be able to see that the really operative factor in these social injuries lies in the part played in them by the homosexual components of emotional life. So long as the individual is functioning normally and it is consequently impossible to see into the depths of his mental life, we may doubt whether his emotional relations to his neighbours in society have anything to do with sexuality, either actually or in their genesis. But delusions never fail to uncover these relations and to trace back the social feelings to their roots in a directly sensual erotic wish. So long as he was healthy, Dr. Schreber, too, whose delusions culminated in a wishful phantasy of an unmistakably homosexual nature, had, by all accounts, shown no signs of homosexuality in the ordinary sense of the word.³

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to esprit de corps and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

³ [1911c, 2431]
The answer to the question which has been repeated so often in these pages is not to be reached by further reflection but by what we discover when we examine individual transference resistances occurring during treatment. We find in the end that we cannot understand the employment of transference as resistance so long as we think simply of ‘transference’. We must make up our minds to distinguish a ‘positive’ transference from a ‘negative’ one, the transference of affectionate feelings from that of hostile ones, and to treat the two sorts of transference to the doctor separately. Positive transference is then further divisible into transference of friendly or affectionate feelings which are admissible to consciousness and transference of prolongations of those feelings into the unconscious. As regards the latter, analysis shows that they invariably go back to erotic sources. And we are thus led to the discovery that all the emotional relations of sympathy, friendship, trust, and the like, which can be turned to good account in our lives, are genetically linked with sexuality and have developed from purely sexual desires through a softening of their sexual aim, however pure and unsensual they may appear to our conscious self-perception. Originally we knew only sexual objects; and psycho-analysis shows us that people who in our real life are merely admired or respected may still be sexual objects for our unconscious.

[1912b, 2462]

It is true that psycho-analysis has taken the individual mind as its subject, but in investigating the individual it could not avoid dealing with the emotional basis of the relation of the individual to society. It has found that the social feelings invariably contain an erotic element - an element which, if it is over-emphasized and then repressed, becomes one of the marks of a particular group of mental disorders. Psycho-analysis has recognized that in general the neuroses are asocial in their nature and that they always aim at driving the individual out of society and at replacing the safe monastic seclusion of earlier days by the isolation of illness. The intense feeling of guilt which dominates so many neuroses has been shown to be a social modification of neurotic anxiety.

[1913j, 2824]

Instead of this I shall make an attempt at using the concept of libido for the purpose of throwing light upon group psychology, a concept which has done us such good service in the study of psychoneuroses.

[1921c, 3784]

We will try our fortune, then, with the supposition that love relationships (or, to use a more neutral expression, emotional ties) also constitute the essence of the group mind. Let us remember that the authorities make no mention of any such relations. What would correspond to them is evidently concealed behind the shelter, the screen, of suggestion. Our hypothesis finds support in the first instance from two passing thoughts. First, that a group is clearly held together by a power of some kind: and to what power could this feat be better ascribed than to Eros, which holds together everything in the world? Secondly, that if an individual gives up his distinctiveness in a group and lets its other members influence him by suggestion, it gives one the impression that he does it because he feels the need of being in harmony with them rather than in opposition to them - so that perhaps after all he does it ‘ihnen zu Liebe’.

[1921c, 3786]
It is to be noticed that in these two artificial groups each individual is bound by libidinal ties on the one hand to the leader (Christ, the Commander-in-Chief) and on the other hand to the other members of the group. How these two ties are related to each other, whether they are of the same kind and the same value, and how they are to be described psychologically - these questions must be reserved for subsequent enquiry. But we shall venture even now upon a mild reproach against earlier writers for not having sufficiently appreciated the importance of the leader in the psychology of the group, while our own choice of this as a first subject for investigation has brought us into a more favourable position. It would appear as though we were on the right road towards an explanation of the principal phenomenon of group psychology - the individual's lack of freedom in a group. If each individual is bound in two directions by such an intense emotional tie, we shall find no difficulty in attributing to that circumstance the alteration and limitation which have been observed in his personality. [1921c, 3789]

A hint to the same effect, that the essence of a group lies in the libidinal ties existing in it, is also to be found in the phenomenon of panic, which is best studied in military groups. A panic arises if a group of that kind becomes disintegrated. Its characteristics are that none of the orders given by superiors are any longer listened to, and that each individual is only solicitous on his own account, and without any consideration for the rest. The mutual ties have ceased to exist, and a gigantic and senseless fear is set free. At this point, again, the objection will naturally be made that it is rather the other way round; and that the fear has grown so great as to be able to disregard all ties and all feelings of consideration for others. McDougall (1920a, 24) has even made use of panic (though not of military panic) as a typical instance of that intensification of emotion by contagion ('primary induction') on which he lays so much emphasis. But nevertheless this rational method of explanation is here quite inadequate. The very question that needs explanation is why the fear has become so gigantic. The greatness of the danger cannot be responsible, for the same army which now falls a victim to panic may previously have faced equally great or greater danger with complete success; it is of the very essence of panic that it bears no relation to the danger that threatens, and often breaks out on the most trivial occasions. If an individual in panic fear begins to be solicitous only on his own account, he bears witness in so doing to the fact that the emotional ties, which have hitherto made the danger seem small to him, have ceased to exist. Now that he is by himself in facing the danger, he may surely think it greater. The fact is, therefore, that panic fear presupposes a relaxation in the libidinal structure of the group and reacts to that relaxation in a justifiable manner, and the contrary view - that the libidinal ties of the group are destroyed owing to fear in the face of the danger - can be refuted. [1921c, 3790]
The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialistic tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

But all these questions, which may, moreover, have been dealt with in part in the literature of group psychology, will not succeed in diverting our interest from the fundamental psychological problems that confront us in the structure of a group. And our attention will first be attracted by a consideration which promises to bring us in the most direct way to a proof that libidinal ties are what characterize a group.

But when a group is formed the whole of this intolerance vanishes, temporarily or permanently, within the group. So long as a group formation persists or so far as it extends, individuals in the group behave as though they were uniform, tolerate the peculiarities of its other members, equate themselves with them, and have no feeling of aversion towards them. Such a limitation of narcissism can, according to our theoretical views, only be produced by one factor, a libidinal tie with other people. Love for oneself knows only one barrier - love for others, love for objects.² The question will at once be raised whether community of interest in itself, without any addition of libido, must not necessarily lead to the toleration of other people and to considerateness for them. This objection may be met by the reply that nevertheless no lasting limitation of narcissism is effected in this way, since this tolerance does not persist longer than the immediate advantage gained from the other people’s collaboration. But the practical importance of this discussion is less than might be supposed, for experience has shown that in cases of collaboration libidinal ties are regularly formed between the fellow-workers which prolong and solidify the relation between them to a point beyond what is merely profitable. The same thing occurs in men’s social relations as has become familiar to psycho-analytic research in the course of the development of the individual libido. The libido attaches itself to the satisfaction of the great vital needs, and chooses as its first objects the people who have a share in that process. And in the development of mankind as a whole, just as in individuals, love alone acts as the civilizing factor in the sense that it brings a change from egoism to altruism. And this is true both of sexual love for women, with all the obligations which it involves of not harming the things that are dear to women, and also of desexualized, sublimated homosexual love for other men, which springs from work in common.

If therefore in groups narcissistic self-love is subject to limitations which do not operate outside them, that is cogent evidence that the essence of a group formation consists in new kinds of libidinal ties among the members of the group.
Our interest now leads us on to the pressing question as to what may be the nature of these ties which exist in groups. In the psycho-analytic study of neuroses we have hitherto been occupied almost exclusively with ties with objects made by love instincts which still pursue directly sexual aims. In groups there can evidently be no question of sexual aims of that kind. We are concerned here with love instincts which have been diverted from their original aims, though they do not operate with less energy on that account. Now, within the range of the usual sexual object-cathexis, we have already observed phenomena which represent a diversion of the instinct from its sexual aim. We have described them as degrees of being in love, and have recognized that they involve a certain encroachment upon the ego. We shall now turn our attention more closely to these phenomena of being in love, in the firm expectation of finding in them conditions which can be transferred to the ties that exist in groups. But we should also like to know whether this kind of object-cathexis, as we know it in sexual life, represents the only manner of emotional tie with other people, or whether we must take other mechanisms of the sort into account. As a matter of fact we learn from psycho-analysis that there do exist other mechanisms for emotional ties, the so-called identifications, insufficiently-known processes and hard to describe, the investigation of which will for some time keep us away from the subject of group psychology. [1921c, 3796]

It is interesting to see that it is precisely those sexual impulsions that are inhibited in their aims which achieve such lasting ties between people. But this can easily be understood from the fact that they are not capable of complete satisfaction, while sexual impulsions which are uninhibited in their aims suffer an extraordinary reduction through the discharge of energy every time the sexual aim is attained. It is the fate of sensual love to become extinguished when it is satisfied; for it to be able to last, it must from the beginning be mixed with purely affectionate components - with such, that is, as are inhibited in their aims - or it must itself undergo a transformation of this kind. [1921c, 3807]

Hypnosis would solve the riddle of the libidinal constitution of groups for us straight away, if it were not that it itself exhibits some features which are not met by the rational explanation we have hitherto given of it as a state of being in love with the directly sexual trends excluded. There is still a great deal in it which we must recognize as unexplained and mysterious. It contains an additional element of paralysis derived from the relation between someone with superior power and someone who is without power and helpless - which may afford a transition to the hypnosis of fright which occurs in animals. The manner in which it is produced and its relationship to sleep are not clear; and the puzzling way in which some people are subject to it, while others resist it completely, points to some factor still unknown which is realized in it and which perhaps alone makes possible the purity of the attitudes of the libido which it exhibits. It is noticeable that, even when there is complete suggestive compliance in other respects, the moral conscience of the person hypnotized may show resistance. But this may be due to the fact that in hypnosis as it is usually practised some knowledge may be retained that what is happening is only a game, an untrue reproduction of another situation of far more importance to life. [1921c, 3807]

But after the preceding discussions we are quite in a position to give the formula for the libidinal constitution of groups, or at least of such groups as we have hitherto considered - namely, those that have a leader and have not been able by means of too much 'organization' to acquire secondarily the characteristics of an individual. A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego. This condition admits of graphic representation: [1921c, 3808]
We are justified in saying that they have been diverted from these sexual aims, even though there is some difficulty in giving a description of such a diversion of aim which will conform to the requirements of metapsychology. Moreover, those instincts which are inhibited in their aims always preserve some few of their original sexual aims; even an affectionate devotee, even a friend or an admirer, desires the physical proximity and the sight of the person who is now loved only in the 'Pauline' sense. If we choose, we may recognize in this diversion of aim a beginning of the sublimation of the sexual instincts, or on the other hand we may fix the limits of sublimation at some more distant point. Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited. Since they are not capable of really complete satisfaction, they are especially adapted to create permanent ties; while those instincts which are directly sexual incur a loss of energy each time they are satisfied, and must wait to be renewed by a fresh accumulation of sexual libido, so that meanwhile the object may have been changed. The inhibited instincts are capable of any degree of admixture with the uninhibited; they can be transformed back into them, just as they arose out of them. It is well known how easily erotic wishes develop out of emotional relations of a friendly character, based upon appreciation and admiration (compare Molière's 'Kiss me for the love of Greek'), between a master and a pupil, between a performer and a delighted listener, and especially in the case of women. In fact the growth of emotional ties of this kind, with their purposeless beginnings, provides a much frequented pathway to sexual object-choice. Pfister, in his Frömmigkeit des Grafen von Zinzendorf (1910), has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement. On the other hand it is also very usual for directly sexual impulsons, short-lived in themselves, to be transformed into a lasting and purely affectionate tie; and the consolidation of a passionate love marriage rests to a large extent upon this process.

We shall naturally not be surprised to hear that the sexual impulsons that are inhibited in their aims arise out of the directly sexual ones when internal or external obstacles make the sexual aims unattainable. The repression during the period of latency is an internal obstacle of this kind - or rather one which has become internal. We have assumed that the father of the primal horde owing to his sexual intolerance compelled all his sons to be abstinent, and thus forced them into ties that were inhibited in their aims, while he reserved for himself freedom of sexual enjoyment and in this way remained without ties. All the ties upon which a group depends are of the character of instincts that are inhibited in their aims. But here we have approached the discussion of a new subject, which deals with the relation between directly sexual instincts and the formation of groups.

D. The last two remarks will have prepared us for finding that directly sexual impulsons are unfavourable to the formation of groups. In the history of the development of the family there have also, it is true, been group relations of sexual love (group marriages); but the more important sexual love became for the ego, and the more it developed the characteristics of being in love, the more urgently it required to be limited to two people - una cum uno - as is prescribed by the nature of the genital aim. Polygamous inclinations had to be content to find satisfaction in a succession of changing objects.
Two people coming together for the purpose of sexual satisfaction, in so far as they seek for solitude, are making a demonstration against the herd instinct, the group feeling. The more they are in love, the more completely they suffice for each other. Their rejection of the group’s influence is expressed in the shape of a sense of shame. Feelings of jealousy of the most extreme violence are summoned up in order to protect the choice of a sexual object from being encroached upon by a group tie. It is only when the affectionate, that is, personal, factor of a love relation gives place entirely to the sensual one, that it is possible for two people to have sexual intercourse in the presence of others or for there to be simultaneous sexual acts in a group, as occurs at an orgy. But at that point a regression has taken place to an early stage in sexual relations, at which being in love as yet played no part, and all sexual objects were judged to be of equal value, somewhat in the sense of Bernard Shaw’s malicious aphorism to the effect that being in love means greatly exaggerating the difference between one woman and another.

[1921c, 3831]

There are abundant indications that being in love only made its appearance late on in the sexual relations between men and women; so that the opposition between sexual love and group ties is also a late development. Now it may seem as though this assumption were incompatible with our myth of the primal family. For it was after all by their love for their mothers and sisters that the mob of brothers was, as we have supposed, driven to parricide; and it is difficult to imagine this love as being anything but undivided and primitive - that is, as an intimate union of the affectionate and sensual. But further consideration resolves this objection to our theory into a confirmation of it. One of the reactions to the parricide was after all the institution of totemic exogamy, the prohibition of any sexual relation with those women of the family who had been tenderly loved since childhood. In this way a wedge was driven in between a man’s affectionate and sensual feelings, one still firmly fixed in his erotic life to-day.¹ As a result of this exogamy the sensual needs of men had to be satisfied with strange and unloved women.

[1921c, 3831]

In the great artificial groups, the Church and the army, there is no room for woman as a sexual object. The love relation between men and women remains outside these organizations. Even where groups are formed which are composed of both men and women the distinction between the sexes plays no part. There is scarcely any sense in asking whether the libido which keeps groups together is of a homosexual or of a heterosexual nature, for it is not differentiated according to the sexes, and particularly shows a complete disregard for the aims of the genital organization of the libido.

[1921c, 3832]

Even in a person who has in other respects become absorbed in a group, the directly sexual impulses preserve a little of his individual activity. If they become too strong they disintegrate every group formation. The Catholic Church had the best of motives for recommending its followers to remain unmarried and for imposing celibacy upon its priests; but falling in love has often driven even priests to leave the Church. In the same way love for women breaks through the group ties of race, of national divisions, and of the social class system, and it thus produces important effects as a factor in civilization. It seems certain that homosexual love is far more compatible with group ties, even when it takes the shape of uninhibited sexual impulses - a remarkable fact, the explanation of which might carry us far.

[1921c, 3832]
The psycho-analytic investigation of the psychoneuroses has taught us that their symptoms are to be traced back to directly sexual impulsions which are repressed but still remain active. We can complete this formula by adding - 'or, to aim-inhibited impulsions, whose inhibition has not been entirely successful or has made room for a return to the repressed sexual aim'. It is in accordance with this that a neurosis should make its victim asocial and should remove him from the usual group formations. It may be said that a neurosis has the same disintegrating effect upon a group as being in love. On the other hand it appears that where a powerful impetus has been given to group formation neuroses may diminish and, at all events temporarily, disappear. Justifiable attempts have also been made to turn this antagonism between neuroses and group formation to therapeutic account. Even those who do not regret the disappearance of religious illusions from the civilized world of to-day will admit that so long as they were in force they offered those who were bound by them the most powerful protection against the danger of neurosis. Nor is it hard to discern that all the ties that bind people to mystico-religious or philosophico-religious sects and communities are expressions of crooked cures of all kinds of neuroses. All of this is correlated with the contrast between directly sexual impulsions and those which are inhibited in their aims.

The group multiplies this process; it agrees with hypnosis in the nature of the instincts which hold it together, and in the replacement of the ego ideal by the object; but to this it adds identification with other individuals, which was perhaps originally made possible by their having the same relation to the object.

Both states, hypnosis and group formation, are an inherited deposit from the phylogenesis of the human libido - hypnosis in the form of a predisposition, and the group, besides this, as a direct survival. The replacement of the directly sexual impulsions by those that are inhibited in their aims promotes in both states a separation between the ego and the ego ideal, a separation with which a beginning has already been made in the state of being in love.

The Herd Instinct. - It has been maintained in many quarters that there is a special innate and not further analysable 'herd instinct', which determines the social behaviour of human beings and impels individuals to come together into larger communities. Psycho-analysis finds itself in contradiction to this view. Even if the social instinct is innate, it may without any difficulty be traced back to what were originally libidinal object-cathexes and may have developed in the childhood of the individual as a reaction-formation against hostile attitudes of rivalry. It is based on a peculiar kind of identification with other people.

Aim-inhibited Sexual Impulses. - The social instincts belong to a class of instinctual impulses which need not be described as sublimated, though they are closely related to these. They have not abandoned their directly sexual aims, but they are held back by internal resistances from attaining them; they rest content with certain approximations to satisfaction and for that very reason lead to especially firm and permanent attachments between human beings. To this class belong in particular the affectionate relations between parents and children, which were originally fully sexual, feelings of friendship, and the emotional ties in marriage which had their origin in sexual attraction.
The narcissistic satisfaction provided by the cultural ideal is also among the forces which are successful in combating the hostility to culture within the cultural unit. This satisfaction can be shared in not only by the favoured classes, which enjoy the benefits of the culture, but also by the suppressed ones, since the right to despise the people outside compensates them for the wrongs they suffer within their own unit. No doubt one is a wretched plebeian, harassed by debts and military service; but, to make up for it, one is a Roman citizen, one has one's share in the task of ruling other nations and dictating their laws. This identification of the suppressed classes with the class who rules and exploits them is, however, only part of a larger whole. For, on the other hand, the suppressed classes can be emotionally attached to their masters; in spite of their hostility to them they may see in them their ideals; unless such relations of a fundamentally satisfying kind subsisted, it would be impossible to understand how a number of civilizations have survived so long in spite of the justifiable hostility of large human masses.

[1927c, 4425]

The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

[1930a, 4497]

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

[1930a, 4500]
The existence of this inclination to aggression, which we can detect in ourselves and justly
assume to be present in others, is the factor which disturbs our relations with our neighbour and
which forces civilization into such a high expenditure. In consequence of this primary mutual
hostility of human beings, civilized society is perpetually threatened with disintegration. The
interest of work in common would not hold it together; instinctual passions are stronger than
reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's
aggressive instincts and to hold the manifestations of them in check by psychical reaction-
formations. Hence, therefore, the use of methods intended to incite people into identifications and
aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the
ideal's commandment to love one's neighbour as oneself - a commandment which is really
justified by the fact that nothing else runs so strongly counter to the original nature of man. In
spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes
to prevent the crudest excesses of brutal violence by itself assuming the right to use violence
against criminals, but the law is not able to lay hold of the more cautious and refined
manifestations of human aggressiveness. The time comes when each one of us has to give up as
illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may
learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it
would be unfair to reproach civilization with trying to eliminate strife and competition from human
activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it
is merely misused and made an occasion for enmity.
[1930a, 4504]

It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do
not feel comfortable without it. The advantage which a comparatively small cultural group offers of
allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is
always possible to bind together a considerable number of people in love, so long as there are
other people left over to receive the manifestations of their aggressiveness. I once discussed the
phenomenon that it is precisely communities with adjoining territories, and related to each other in
other ways as well, who are engaged in constant feuds and in ridiculing each other - like the
Spaniards and Portuguese, for instance, the North Germans and South Germans, the English
and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences',
a name which does not do much to explain it. We can now see that it is a convenient and
relatively harmless satisfaction of the inclination to aggression, by means of which cohesion
between the members of the community is made easier. In this respect the Jewish people,
scattered everywhere, have rendered most useful services to the civilizations of the countries that
have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not
suffice to make that period more peaceful and secure for their Christian fellows. When once the
Apostle Paul had posited universal love between men as the foundation of his Christian
community, extreme intolerance on the part of Christendom towards those who remained outside
it became the inevitable consequence. To the Romans, who had not founded their communal life
as a State upon love, religious intolerance was something foreign, although with them religion
was a concern of the State and the State was permeated by religion. Neither was it an
unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as
its complement; and it is intelligible that the attempt to establish a new, communist civilization in
Russia should find its psychological support in the persecution of the bourgeoisie. One only
wonders, with concern, what the Soviets will do after they have wiped out their bourgeoisie.
[1930a, 4506]
In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nurse-maids try to appease with their lullaby about Heaven.

[1930a, 4512]

Some readers of this work may further have an impression that they have heard the formula of the struggle between Eros and the death instinct too often. It was alleged to characterize the process of civilization which mankind undergoes but it was also brought into connection with the development of the individual, and, in addition, it was said to have revealed the secret of organic life in general. We cannot, I think, avoid going into the relations of these three processes to one another. The repetition of the same formula is justified by the consideration that both the process of human civilization and of the development of the individual are also vital processes - which is to say that they must share in the most general characteristic of life. On the other hand, evidence of the presence of this general characteristic fails, for the very reason of its general nature, to help us to arrive at any differentiation, so long as it is not narrowed down by special qualifications. We can only be satisfied, therefore, if we assert that the process of civilization is a modification which the vital process experiences under the influence of a task that is set it by Eros and instigated by Ananke - by the exigencies of reality; and that this task is one of uniting separate individuals into a community bound together by libidinal ties. When, however, we look at the relation between the process of human civilization and the developmental or educative process of individual human beings, we shall conclude without much hesitation that the two are very similar in nature, if not the very same process applied to different kinds of object. The process of the civilization of the human species is, of course, an abstraction of a higher order than is the development of the individual and it is therefore harder to apprehend in concrete terms, nor should we pursue analogies to an obsessional extreme; but in view of the similarity between the aims of the two processes - in the one case the integration of a separate individual into a human group, and in the other case the creation of a unified group out of many individuals - we cannot be surprised at the similarity between the means employed and the resultant phenomena.

[1930a, 4527]
Our mythological theory of instincts makes it easy for us to find a formula for indirect methods of combating war. If willingness to engage in war is an effect of the destructive instinct, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psycho-analysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done. The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure of human society is to a large extent based on them.

[1933b, 4801]
These considerations therefore lend an added weight to the circumstance that we are in point of fact driven by experience to attribute to homosexual wishful phantasies an intimate (perhaps an invariable) relation to this particular form of disease. Distrusting my own experience on the subject, I have during the last few years joined with my friends C. G. Jung of Zurich and Sándor Ferenczi of Budapest in investigating upon this single point a number of cases of paranoid disorder which have come under observation. The patients whose histories provided the material for this enquiry included both men and women, and varied in race, occupation, and social standing. Yet we were astonished to find that in all of these cases defence against a homosexual wish was clearly recognizable at the very centre of the conflict which underlay the disease and that it was in an attempt to master an unconsciously reinforced current of homosexuality that they had all of them come to grief.¹ This was certainly not what we had expected. Paranoia is precisely a disorder in which a sexual aetiology is by no means obvious; far from this, the strikingly prominent features in the causation of paranoia, especially among males, are social humiliations and slights. But if we go into the matter only a little more deeply, we shall be able to see that the really operative factor in these social injuries lies in the part played in them by the homosexual components of emotional life. So long as the individual is functioning normally and it is consequently impossible to see into the depths of his mental life, we may doubt whether his emotional relations to his neighbours in society have anything to do with sexuality, either actually or in their genesis. But delusions never fail to uncover these relations and to trace back the social feelings to their roots in a directly sensual erotic wish. So long as he was healthy, Dr. Schreber, too, whose delusions culminated in a wishful phantasy of an unmistakably homosexual nature, had, by all accounts, shown no signs of homosexuality in the ordinary sense of the word.

[1911c, 2429]

After the stage of heterosexual object-choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego-instincts and, as 'attached' components, help to constitute the social instincts, thus contributing an erotic factor to friendship and comradeship, to esprit de corps and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity - interests which have themselves sprung from a sublimation of erotic instincts.

[1911c, 2431]

It is true that psycho-analysis has taken the individual mind as its subject, but in investigating the individual it could not avoid dealing with the emotional basis of the relation of the individual to society. It has found that the social feelings invariably contain an erotic element - an element which, if it is over-emphasized and then repressed, becomes one of the marks of a particular group of mental disorders. Psycho-analysis has recognized that in general the neuroses are asocial in their nature and that they always aim at driving the individual out of society and at replacing the safe monastic seclusion of earlier days by the isolation of illness. The intense feeling of guilt which dominates so many neuroses has been shown to be a social modification of neurotic anxiety.

[1913], 2824]
It would, however, be a great mistake to suppose that after the removal of the obsessional symptoms no permanent effects of the obsessional neurosis remained behind. The process had led to a victory for the faith of piety over the rebelliousness of critical research, and had had the repression of the homosexual attitude as its necessary condition. Lasting disadvantages resulted from both these factors. His intellectual activity remained seriously impaired after this first great defeat. He developed no zeal for learning, he showed no more of the acuteness with which at the tender age of five he had criticized and dissected the doctrines of religion. The repression of his over-powerful homosexuality, which was accomplished during the anxiety-dream, reserved that important impulse for the unconscious, kept it directed towards its original aim, and withdrew it from all the sublimations to which it is susceptible in other circumstances. For this reason the patient was without all those social interests which give a content to life. It was only when, during the analytic treatment, it became possible to liberate his shackled homosexuality that this state of affairs showed any improvement; and it was a most remarkable experience to see how (without any direct advice from the physician) each piece of homosexual libido which was set free sought out some application in life and some attachment to the great common concerns of mankind.

But when a group is formed the whole of this intolerance vanishes, temporarily or permanently, within the group. So long as a group formation persists or so far as it extends, individuals in the group behave as though they were uniform, tolerate the peculiarities of its other members, equate themselves with them, and have no feeling of aversion towards them. Such a limitation of narcissism can, according to our theoretical views, only be produced by one factor, a libidinal tie with other people. Love for oneself knows only one barrier - love for others, love for objects.² The question will at once be raised whether community of interest in itself, without any addition of libido, must not necessarily lead to the toleration of other people and to considerateness for them. This objection may be met by the reply that nevertheless no lasting limitation of narcissism is effected in this way, since this tolerance does not persist longer than the immediate advantage gained from the other people's collaboration. But the practical importance of this discussion is less than might be supposed, for experience has shown that in cases of collaboration libidinal ties are regularly formed between the fellow-workers which prolong and solidify the relation between them to a point beyond what is merely profitable. The same thing occurs in men's social relations as has become familiar to psycho-analytic research in the course of the development of the individual libido. The libido attaches itself to the satisfaction of the great vital needs, and chooses as its first objects the people who have a share in that process. And in the development of mankind as a whole, just as in individuals, love alone acts as the civilizing factor in the sense that it brings a change from egoism to altruism. And this is true both of sexual love for women, with all the obligations which it involves of not harming the things that are dear to women, and also of desexualized, sublimated homosexual love for other men, which springs from work in common.

Even in a person who has in other respects become absorbed in a group, the directly sexual impulsions preserve a little of his individual activity. If they become too strong they disintegrate every group formation. The Catholic Church had the best of motives for recommending its followers to remain unmarried and for imposing celibacy upon its priests; but falling in love has often driven even priests to leave the Church. In the same way love for women breaks through the group ties of race, of national divisions, and of the social class system, and it thus produces important effects as a factor in civilization. It seems certain that homosexual love is far more compatible with group ties, even when it takes the shape of uninhibited sexual impulsions - a remarkable fact, the explanation of which might carry us far.

[1918b, 3553]

[1921c, 3795]

[1921c, 3832]
In the light of psycho-analysis we are accustomed to regard social feeling as a sublimation of homosexual attitudes towards objects. In the homosexuals with marked social interests, it would seem that the detachment of social feeling from object choice has not been fully carried through.

[1922b, 3909]
Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

[1918a, 2355]

The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialistic tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

[1921c, 3792]

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

[1930a, 4504]
And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand. [1933a, 4776]
It is naturally no easy matter to trace the ontogenesis of the herd instinct. The fear which is shown by small children when they are left alone, and which Trotter claims as being already a manifestation of the instinct, nevertheless suggests more readily another interpretation. The fear relates to the child's mother, and later to other familiar people, and it is the expression of an unfulfilled desire, which the child does not yet know how to deal with in any way except by turning it into anxiety.¹ Nor is the child's fear when it is alone pacified by the sight of any haphazard 'member of the herd', but on the contrary it is brought into existence by the approach of a 'stranger' of this sort. Then for a long time nothing in the nature of herd instinct or group feeling is to be observed in children. Something like it first grows up, in a nursery containing many children, out of the children's relation to their parents, and it does so as a reaction to the initial envy with which the elder child receives the younger one. The elder child would certainly like to put his successor jealously aside, to keep it away from the parents, and to rob it of all its privileges; but in the face of the fact that this younger child (like all that come later) is loved by the parents as much as he himself is, and in consequence of the impossibility of his maintaining his hostile attitude without damaging himself, he is forced into identifying himself with the other children. So there grows up in the troop of children a communal or group feeling, which is then further developed at school. The first demand made by this reaction-formation is for justice, for equal treatment for all. We all know how loudly and implacably this claim is put forward at school. If one cannot be the favourite oneself, at all events nobody else shall be the favourite. This transformation - the replacing of jealousy by a group feeling in the nursery and classroom - might be considered improbable, if the same process could not later on be observed again in other circumstances. We have only to think of the troop of women and girls, all of them in love in an enthusiastically sentimental way, who crowd round a singer or pianist after his performance. It would certainly be easy for each of them to be jealous of the rest; but, in the face of their numbers and the consequent impossibility of their reaching the aim of their love, they renounce it, and, instead of pulling out one another's hair, they act as a united group, do homage to the hero of the occasion with their common actions, and would probably be glad to have a share of his flowing locks. Originally rivals, they have succeeded in identifying themselves with one another by means of a similar love for the same object. When, as is usual, an instinctual situation is capable of various outcomes, we shall not be surprised that the actual outcome is one which brings with it the possibility of a certain amount of satisfaction, whereas some other outcome, in itself more obvious, is passed over because the circumstances of life prevent its leading to any such satisfaction.

What appears later on in society in the shape of Gemeingeist, esprit de corps, 'group spirit', etc., does not belie its derivation from what was originally envy. No one must want to put himself forward, every one must be the same and have the same. Social justice means that we deny ourselves many things so that others may have to do without them as well, or, what is the same thing, may not be able to ask for them. This demand for equality is the root of social conscience and the sense of duty. It reveals itself unexpectedly in the syphilitic's dread of infecting other people, which psycho-analysis has taught us to understand. The dread exhibited by these poor wretches corresponds to their violent struggles against the unconscious wish to spread their infection on to other people; for why should they alone be infected and cut off from so much? why not other people as well? And the same germ is to be found in the apt story of the judgement of Solomon. If one woman's child is dead, the other shall not have a live one either. The bereaved woman is recognized by this wish.
Thus social feeling is based upon the reversal of what was first a hostile feeling into a positively-toned tie in the nature of an identification. So far as we have hitherto been able to follow the course of events, this reversal seems to occur under the influence of a common affectionate tie with a person outside the group. We do not ourselves regard our analysis of identification as exhaustive, but it is enough for our present purpose that we should revert to this one feature - its demand that equalization shall be consistently carried through. We have already heard in the discussion of the two artificial groups, Church and army, that their necessary precondition is that all their members should be loved in the same way by one person, the leader. Do not let us forget, however, that the demand for equality in a group applies only to its members and not to the leader. All the members must be equal to one another, but they all want to be ruled by one person. Many equals, who can identify themselves with one another, and a single person superior to them all - that is the situation that we find realized in groups which are capable of subsisting. Let us venture, then, to correct Trotter's pronouncement that man is a herd animal and assert that he is rather a horde animal, an individual creature in a horde led by a chief.

[1921c, 3813]

The Herd Instinct. - It has been maintained in many quarters that there is a special innate and not further analysable 'herd instinct', which determines the social behaviour of human beings and impels individuals to come together into larger communities. Psycho-analysis finds itself in contradiction to this view. Even if the social instinct is innate, it may without any difficulty be traced back to what were originally libidinal object-cathexes and may have developed in the childhood of the individual as a reaction-formation against hostile attitudes of rivalry. It is based on a peculiar kind of identification with other people.

[1923a, 3933]

Religion, morality, and a social sense - the chief elements in the higher side of man⁷ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.⁵

[1923b, 3971]
Now the case in which someone first loves and then hates the same person (or the reverse) because that person has given him cause for doing so, has obviously nothing to do with our problem. Nor has the other case, in which feelings of love that have not yet become manifest express themselves to begin with by hostility and aggressive tendencies; for it may be that here the destructive component in the object-cathexis has hurried on ahead and is only later on joined by the erotic one. But we know of several instances in the psychology of the neuroses in which it is more plausible to suppose that a transformation does take place. In persecutory paranoia the patient fends off an excessively strong homosexual attachment to some particular person in a special way; and as a result this person whom he loved most becomes a persecutor, against whom the patient directs an often dangerous aggressiveness. Here we have a right to interpolate a previous phase which has transformed the love into hate. In the case of the origin of homosexuality, and of desexualized social feelings as well, analytic investigation has only recently taught us to recognize that violent feelings of rivalry are present which lead to aggressive inclinations, and that it is only after these have been surmounted that the formerly hated object becomes the loved one or gives rise to an identification. The question arises whether in these instances we are to assume a direct transformation of hate into love. It is clear that here the changes are purely internal and an alteration in the behaviour of the object plays no part in them. [1923b, 3977]

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity. [1930a, 4504]
The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

¹[1930a, 4505]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c’est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]

The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialistic tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

[1921c, 3792]
The evidence of psycho-analysis shows that almost every intimate emotional relation between two people which lasts for some time - marriage, friendship, the relations between parents and children - contains a sediment of feelings of aversion and hostility, which only escapes perception as a result of repression. This is less disguised in the common wrangles between business partners or in the grumbles of a subordinate at his superior. The same thing happens when men come together in larger units. Every time two families become connected by a marriage, each of them thinks itself superior to or of better birth than the other. Of two neighbouring towns each is the other's most jealous rival; every little canton looks down upon the others with contempt. Closely related races keep one another at arm's length; the South German cannot endure the North German, the Englishman casts every kind of aspersion upon the Scot, the Spaniard despises the Portuguese. We are no longer astonished that greater differences should lead to an almost insuperable repugnance, such as the Gallic people feel for the German, the Aryan for the Semite, and the white races for the coloured.

[1921c, 3794]

The narcissistic satisfaction provided by the cultural ideal is also among the forces which are successful in combating the hostility to culture within the cultural unit. This satisfaction can be shared in not only by the favoured classes, which enjoy the benefits of the culture, but also by the suppressed ones, since the right to despise the people outside it compensates them for the wrongs they suffer within their own unit. No doubt one is a wretched plebeian, harassed by debts and military service; but, to make up for it, one is a Roman citizen, one has one's share in the task of ruling other nations and dictating their laws. This identification of the suppressed classes with the class who rules and exploits them is, however, only part of a larger whole. For, on the other hand, the suppressed classes can be emotionally attached to their masters; in spite of their hostility to them they may see in them their ideals; unless such relations of a fundamentally satisfying kind subsisted, it would be impossible to understand how a number of civilizations have survived so long in spite of the justifiable hostility of large human masses.

[1927c, 4425]

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

[1930a, 4504]
The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

¹[1930a, 4505]

It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestatons of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand. [1933a, 4776]
For our immediate purpose then, this much follows from what has been said: there is no use in trying to get rid of men's aggressive inclinations. We are told that in certain happy regions of the earth, where nature provides in abundance everything that man requires, there are races whose life is passed in tranquillity and who know neither coercion nor aggression. I can scarcely believe it and I should be glad to hear more of these fortunate beings. The Russian Communists, too, hope to be able to cause human aggressiveness to disappear by guaranteeing the satisfaction of all material needs and by establishing equality in other respects among all the members of the community. That, in my opinion, is an illusion. They themselves are armed to-day with the most scrupulous care and not the least important of the methods by which they keep their supporters together is hatred of everyone beyond their frontiers. In any case, as you yourself have remarked, there is no question of getting rid entirely of human aggressive impulses; it is enough to try to divert them to such an extent that they need not find expression in war.

[1933b, 4800]

The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]
Crawley, in language which differs only slightly from the current terminology of psycho-analysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.
[1918a, 2355]

The evidence of psycho-analysis shows that almost every intimate emotional relation between two people which lasts for some time - marriage, friendship, the relations between parents and children - contains a sediment of feelings of aversion and hostility, which only escapes perception as a result of repression. This is less disguised in the common wrangles between business partners or in the grumbles of a subordinate at his superior. The same thing happens when men come together in larger units. Every time two families become connected by a marriage, each of them thinks itself superior to or of better birth than the other. Of two neighbouring towns each is the other's most jealous rival; every little canton looks down upon the others with contempt. Closely related races keep one another at arm's length; the South German cannot endure the North German, the Englishman casts every kind of aspersion upon the Scot, the Spaniard despises the Portuguese. We are no longer astonished that greater differences should lead to an almost insuperable repugnance, such as the Gallic people feel for the German, the Aryan for the Semite, and the white races for the coloured.
[1921c, 3794]

When this hostility is directed against people who are otherwise loved we describe it as ambivalence of feeling; and we explain the fact, in what is probably far too rational a manner, by means of the numerous occasions for conflicts of interest which arise precisely in such intimate relations. In the undisguised antipathies and aversions which people feel towards strangers with whom they have to do we may recognize the expression of self-love - of narcissism. This self-love works for the preservation of the individual, and behaves as though the occurrence of any divergence from his own particular lines of development involved a criticism of them and a demand for their alteration. We do not know why such sensitiveness should have been directed to just these details of differentiation; but it is unmistakable that in this whole connection men give evidence of a readiness for hatred, an aggressiveness, the source of which is unknown, and to which one is tempted to ascribe an elementary character.¹
[1921c, 3795]
It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]
The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).’ There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]
(2) I have said that we had much to expect from the increase in authority which must accrue to us as time goes on. I need not say much to you about the importance of authority. Only very few civilized people are capable of existing without reliance on others or are even capable of coming to an independent opinion. You cannot exaggerate the intensity of people's inner lack of resolution and craving for authority. The extraordinary increase in neuroses since the power of religions has waned may give you a measure of it. The impoverishment of the ego due to the large expenditure of energy on repression demanded of every individual by civilization may be one of the principal causes of this state of things.

[1910d, 2311]

It is to be noticed that in these two artificial groups each individual is bound by libidinal ties on the one hand to the leader (Christ, the Commander-in-Chief) and on the other hand to the other members of the group. How these two ties are related to each other, whether they are of the same kind and the same value, and how they are to be described psychologically - these questions must be reserved for subsequent enquiry. But we shall venture even now upon a mild reproach against earlier writers for not having sufficiently appreciated the importance of the leader in the psychology of the group, while our own choice of this as a first subject for investigation has brought us into a more favourable position. It would appear as though we were on the right road towards an explanation of the principal phenomenon of group psychology - the individual's lack of freedom in a group. If each individual is bound in two directions by such an intense emotional tie, we shall find no difficulty in attributing to that circumstance the alteration and limitation which have been observed in his personality.

[1921c, 3789]

The typical occasion of the outbreak of a panic is very much as it is represented in Nestroy's parody of Hebbel's play about Judith and Holofernes. A soldier cries out: 'The general has lost his head!' and thereupon all the Assyrians take to flight. The loss of the leader in some sense or other, the birth of misgivings about him, brings on the outbreak of panic, though the danger remains the same; the mutual ties between the members of the group disappear, as a rule, at the same time as the tie with their leader. The group vanishes in dust, like a Prince Rupert's drop when its tail is broken off.

[1921c, 3791]

The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialist tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

[1921c, 3792]
We have hitherto considered two artificial groups and have found that both are dominated by emotional ties of two kinds. One of these, the tie with the leader, seems (at all events for these cases) to be more of a ruling factor than the other, which holds between the members of the group.

Now much else remains to be examined and described in the morphology of groups. We should have to start from the ascertained fact that a mere collection of people is not a group, so long as these ties have not been established in it; but we should have to admit that in any collection of people the tendency to form a psychological group may very easily come to the fore. We should have to give our attention to the different kinds of groups, more or less stable, that arise spontaneously, and to study the conditions of their origin and of their dissolution. We should above all be concerned with the distinction between groups which have a leader and leaderless groups. We should consider whether groups with leaders may not be the more primitive and complete, whether in the others an idea, an abstraction, may not take the place of the leader (a state of things to which religious groups, with their invisible head, form a transitional stage), and whether a common tendency, a wish in which a number of people can have a share, may not in the same way serve as a substitute. This abstraction, again, might be more or less completely embodied in the figure of what we might call a secondary leader, and interesting varieties would arise from the relation between the idea and the leader. The leader or the leading idea might also, so to speak, be negative; hatred against a particular person or institution might operate in just the same unifying way, and might call up the same kind of emotional ties as positive attachment. Then the question would also arise whether a leader is really indispensable to the essence of a group - and other questions besides.

We already begin to divine that the mutual tie between members of a group is in the nature of an identification of this kind, based upon an important emotional common quality; and we may suspect that this common quality lies in the nature of the tie with the leader. Another suspicion may tell us that we are far from having exhausted the problem of identification, and that we are faced by the process which psychology calls 'empathy' and which plays the largest part in our understanding of what is inherently foreign to our ego in other people. But we shall here limit ourselves to the immediate emotional effects of identification, and shall leave on one side its significance for our intellectual life.

But on the other hand we may also say that the hypnotic relation is (if the expression is permissible) a group formation with two members. Hypnosis is not a good object for comparison with a group formation, because it is truer to say that it is identical with it. Out of the complicated fabric of the group it isolates one element for us - the behaviour of the individual to the leader. Hypnosis is distinguished from a group formation by this limitation of number, just as it is distinguished from being in love by the absence of directly sexual trends. In this respect it occupies a middle position between the two.

But after the preceding discussions we are quite in a position to give the formula for the libidinal constitution of groups, or at least of such groups as we have hitherto considered - namely, those that have a leader and have not been able by means of too much 'organization' to acquire secondarily the characteristics of an individual. A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego. This condition admits of graphic representation:
We thus have an impression of a state in which an individual's private emotional impulses and intellectual acts are too weak to come to anything by themselves and are entirely dependent for this on being reinforced by being repeated in a similar way in the other members of the group. We are reminded of how many of these phenomena of dependence are part of the normal constitution of human society, of how little originality and personal courage are to be found in it, of how much every individual is ruled by those attitudes of the group mind which exhibit themselves in such forms as racial characteristics, class prejudices, public opinion, etc. The influence of suggestion becomes a greater riddle for us when we admit that it is not exercised only by the leader, but by every individual upon every other individual; and we must reproach ourselves with having unfairly emphasized the relation to the leader and with having kept the other factor of mutual suggestion too much in the background. [1921c, 3809]

But Trotter's exposition is open, with even more justice than the others, to the objection that it takes too little account of the leader's part in a group, while we incline rather to the opposite judgement, that it is impossible to grasp the nature of a group if the leader is disregarded. The herd instinct leaves no room at all for the leader; he is merely thrown in along with the herd, almost by chance; it follows, too, that no path leads from this instinct to the need for a God; the herd is without a herdsman. But besides this, Trotter's exposition can be undermined psychologically; that is to say, it can be made at all events probable that the herd instinct is not irreducible, that it is not primary in the same sense as the instinct of self-preservation and the sexual instinct. [1921c, 3811]

Thus social feeling is based upon the reversal of what was first a hostile feeling into a positively-toned tie in the nature of an identification. So far as we have hitherto been able to follow the course of events, this reversal seems to occur under the influence of a common affectionate tie with a person outside the group. We do not ourselves regard our analysis of identification as exhaustive, but it is enough for our present purpose that we should revert to this one feature - its demand that equalization shall be consistently carried through. We have already heard in the discussion of the two artificial groups, Church and army, that their necessary precondition is that all their members should be loved in the same way by one person, the leader. Do not let us forget, however, that the demand for equality in a group applies only to its members and not to the leader. All the members must be equal to one another, but they all want to be ruled by one person. Many equals, who can identify themselves with one another, and a single person superior to them all - that is the situation that we find realized in groups which are capable of subsisting. Let us venture, then, to correct Trotter's pronouncement that man is a herd animal and assert that he is rather a horde animal, an individual creature in a horde led by a chief. [1921c, 3813]

He, at the very beginning of the history of mankind, was the 'superman' whom Nietzsche only expected from the future. Even to-day the members of a group stand in need of the illusion that they are equally and justly loved by their leader; but the leader himself need love no one else, he may be of a masterful nature, absolutely narcissistic, self-confident and independent. We know that love puts a check upon narcissism, and it would be possible to show how, by operating in this way, it became a factor of civilization. [1921c, 3815]
We may further emphasize, as being specially instructive, the relation that holds between the contrivance by means of which an artificial group is held together and the constitution of the primal horde. We have seen that with an army and a Church this contrivance is the illusion that the leader loves all of the individuals equally and justly. But this is simply an idealistic remodelling of the state of affairs in the primal horde, where all of the sons knew that they were equally persecuted by the primal father, and feared him equally. This same recasting upon which all social duties are built up is already presupposed by the next form of human society, the totemic clan. The indestructible strength of the family as a natural group formation rests upon the fact that this necessary presupposition of the father's equal love can have a real application in the family.

[1921c, 3816]

The uncanny and coercive characteristics of group formations, which are shown in the phenomena of suggestion that accompany them, may therefore with justice be traced back to the fact of their origin from the primal horde. The leader of the group is still the dreaded primal father; the group still wishes to be governed by unrestricted force; it has an extreme passion for authority; in Le Bon's phrase, it has a thirst for obedience. The primal father is the group ideal, which governs the ego in the place of the ego ideal. Hypnosis has a good claim to being described as a group of two. There remains as a definition for suggestion: a conviction which is not based upon perception and reasoning but upon an erotic tie.¹

[1921c, 3819]

We have interpreted this prodigy as meaning that the individual gives up his ego ideal and substitutes for it the group ideal as embodied in the leader. And we must add by way of correction that the prodigy is not equally great in every case. In many individuals the separation between the ego and the ego ideal is not very far advanced; the two still coincide readily; the ego has often preserved its earlier narcissistic self-complacency. The selection of the leader is very much facilitated by this circumstance. He need often only possess the typical qualities of the individuals concerned in a particularly clearly marked and pure form, and need only give an impression of greater force and of more freedom of libido; and in that case the need for a strong chief will often meet him half-way and invest him with a predominance to which he would otherwise perhaps have had no claim. The other members of the group, whose ego ideal would not, apart from this, have become embodied in his person without some correction, are then carried away with the rest by 'suggestion', that is to say, by means of identification.

[1921c, 3820]

It is obvious that a soldier takes his superior, that is, in fact, the leader of the army, as his ideal, while he identifies himself with his equals, and derives from this community of their egos the obligations for giving mutual help and for sharing possessions which comradeship implies. But he becomes ridiculous if he tries to identify himself with the general. The soldier in Wallenstein's Lager laughs at the sergeant for this very reason:

[1921c, 3825]
It is otherwise in the Catholic Church. Every Christian loves Christ as his ideal and feels himself united with all other Christians by the tie of identification. But the Church requires more of him. He has also to identify himself with Christ and love all other Christians as Christ loved them. At both points, therefore, the Church requires that the position of the libido which is given by group formation should be supplemented. Identification has to be added where object-choice has taken place, and object-love where there is identification. This addition evidently goes beyond the constitution of the group. One can be a good Christian and yet be far from the idea of putting oneself in Christ's place and of having like him an all-embracing love for mankind. One need not think oneself capable, weak mortal that one is, of the Saviour's largeness of soul and strength of love. But this further development in the distribution of libido in the group is probably the factor upon which Christianity bases its claim to have reached a higher ethical level.

[1921c, 3825]

When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]

In 1921 I endeavoured to make use of the differentiation between the ego and the super-ego in a study of group psychology. I arrived at a formula such as this: a psychological group is a collection of individuals who have introduced the same person into their super-ego and, on the basis of this common element, have identified themselves with one another in their ego. This applies, of course, only to groups that have a leader. If we possessed more applications of this kind, the hypothesis of the super-ego would lose its last touch of strangeness for us, and we should become completely free of the embarrassment that still comes over us when, accustomed as we are to the atmosphere of the underworld, we move in the more superficial, higher strata of the mental apparatus. We do not suppose, of course, that with the separation off of the super-ego we have said the last word on the psychology of the ego. It is rather a first step; but in this case it is not only the first step that is hard.

[1933a, 4676]
Let us, therefore, take it for granted that a great man influences his fellow-men in two ways: by his personality and by the idea which he puts forward. That idea may stress some ancient wishful image of the masses, or it may point out a new wishful aim to them, or it may cast its spell over them in some other way. Occasionally - and this is undoubtedly the more primary case - the personality works by itself and the idea plays a quite trivial part. Not for a moment are we in the dark as to why a great man ever becomes important. We know that in the mass of mankind there is a powerful need for an authority who can be admired, before whom one bows down, by whom one is ruled and perhaps even ill-treated. We have learnt from the psychology of individual men what the origin is of this need of the masses. It is a longing for the father felt by everyone from his childhood onwards, for the same father whom the hero of legend boasts he has overcome. And now it may begin to dawn on us that all the characteristics with which we equipped the great man are paternal characteristics, and that the essence of great men for which we vainly searched lies in this conformity. The decisiveness of thought, the strength of will, the energy of action are part of the picture of a father - but above all the autonomy and independence of the great man, his divine unconcern which may grow into ruthlessness. One must admire him, one may trust him, but one cannot avoid being afraid of him too. We should have been led to realize this from the word itself: who but the father can have been the 'great man' in childhood?

[1939a, 4930]

What help does this explanation of the satisfaction arising from instinctual renunciation give us towards understanding the processes that we want to study - the elevation of self-regard when there are advances in intellectuality? Very little, it seems. The circumstances are quite different. There is no question of any instinctual renunciation and there is no second person or agency for whose sake the sacrifice is made. We shall soon feel doubts about this last assertion. It can be said that the great man is precisely the authority for whose sake the achievement is carried out; and, since the great man himself operates by virtue of his similarity to the father, there is no need to feel surprise if in group psychology the role of the super-ego falls to him. So that this would apply too to the man Moses in relation to the Jewish people. As regards the other point, however, no proper analogy can be established. An advance in intellectuality consists in deciding against direct sense-perception in favour of what are known as the higher intellectual processes - that is, memories, reflections and inferences. It consists, for instance, in deciding that paternity is more important than maternity, although it cannot, like the latter, be established by the evidence of the senses, and that for that reason the child should bear his father's name and be his heir. Or it declares that our God is the greatest and mightiest, although he is invisible like a gale of wind or like the soul. The rejection of a sexual or aggressive instinctual demand seems to be something quite different from this. Moreover, in the case of some advances in intellectuality - for instance, in the case of the victory of patriarchy - we cannot point to the authority which lays down the standard which is to be regarded as higher. It cannot in this case be the father, since he is only elevated into an authority by the advance itself. Thus we are faced by the phenomenon that in the course of the development of humanity sensuality is gradually overpowered by intellectuality and that men feel proud and exalted by every such advance. But we are unable to say why this should be so. It further happens later on that intellectuality itself is overpowered by the very puzzling emotional phenomenon of faith. Here we have the celebrated 'credo quia absurdum', and, once more, anyone who has succeeded in this regards it as a supreme achievement. Perhaps the common element in all these psychological situations is something else. Perhaps men simply pronounce that what is more difficult is higher, and their pride is merely their narcissism augmented by the consciousness of a difficulty overcome.

[1939a, 4937]
It is naturally no easy matter to trace the ontogenesis of the herd instinct. The fear which is shown by small children when they are left alone, and which Trotter claims as being already a manifestation of the instinct, nevertheless suggests more readily another interpretation. The fear relates to the child's mother, and later to other familiar people, and it is the expression of an unfulfilled desire, which the child does not yet know how to deal with in any way except by turning it into anxiety.¹ Nor is the child's fear when it is alone pacified by the sight of any haphazard 'member of the herd', but on the contrary it is brought into existence by the approach of a 'stranger' of this sort. Then for a long time nothing in the nature of herd instinct or group feeling is to be observed in children. Something like it first grows up, in a nursery containing many children, out of the children's relation to their parents, and it does so as a reaction to the initial envy with which the elder child receives the younger one. The elder child would certainly like to put his successor jealously aside, to keep it away from the parents, and to rob it of all its privileges; but in the face of the fact that this younger child (like all that come later) is loved by the parents as much as he himself is, and in consequence of the impossibility of his maintaining his hostile attitude without damaging himself, he is forced into identifying himself with the other children. So there grows up in the troop of children a communal or group feeling, which is then further developed at school. The first demand made by this reaction-formation is for justice, for equal treatment for all. We all know how loudly and implacably this claim is put forward at school. If one cannot be the favourite oneself, at all events nobody else shall be the favourite. This transformation - the replacing of jealousy by a group feeling in the nursery and classroom - might be considered improbable, if the same process could not later on be observed again in other circumstances. We have only to think of the troop of women and girls, all of them in love in an enthusiastically sentimental way, who crowd round a singer or pianist after his performance. It would certainly be easy for each of them to be jealous of the rest; but, in the face of their numbers and the consequent impossibility of their reaching the aim of their love, they renounce it, and, instead of pulling out one another's hair, they act as a united group, do homage to the hero of the occasion with their common actions, and would probably be glad to have a share of his flowing locks. Originally rivals, they have succeeded in identifying themselves with one another by means of a similar love for the same object. When, as is usual, an instinctual situation is capable of various outcomes, we shall not be surprised that the actual outcome is one which brings with it the possibility of a certain amount of satisfaction, whereas some other outcome, in itself more obvious, is passed over because the circumstances of life prevent its leading to any such satisfaction.

[1921c, 3812]

Thus social feeling is based upon the reversal of what was first a hostile feeling into a positively-toned tie in the nature of an identification. So far as we have hitherto been able to follow the course of events, this reversal seems to occur under the influence of a common affectionate tie with a person outside the group. We do not ourselves regard our analysis of identification as exhaustive, but it is enough for our present purpose that we should revert to this one feature - its demand that equalization shall be consistently carried through. We have already heard in the discussion of the two artificial groups, Church and army, that their necessary precondition is that all their members should be loved in the same way by one person, the leader. Do not let us forget, however, that the demand for equality in a group applies only to its members and not to the leader. All the members must be equal to one another, but they all want to be ruled by one person. Many equals, who can identify themselves with one another, and a single person superior to them all - that is the situation that we find realized in groups which are capable of subsisting. Let us venture, then, to correct Trotter's pronouncement that man is a herd animal and assert that he is rather a horde animal, an individual creature in a horde led by a chief.

[1921c, 3813]
Our interest now leads us on to the pressing question as to what may be the nature of these ties which exist in groups. In the psycho-analytic study of neuroses we have hitherto been occupied almost exclusively with ties with objects made by love instincts which still pursue directly sexual aims. In groups there can evidently be no question of sexual aims of that kind. We are concerned here with love instincts which have been diverted from their original aims, though they do not operate with less energy on that account. Now, within the range of the usual sexual object-cathexis, we have already observed phenomena which represent a diversion of the instinct from its sexual aim. We have described them as degrees of being in love, and have recognized that they involve a certain encroachment upon the ego. We shall now turn our attention more closely to these phenomena of being in love, and have described them as degrees of being in love, and have recognized that they involve a certain encroachment upon the ego. We shall now turn our attention more closely to these phenomena of being in love, in the firm expectation of finding in them conditions which can be transferred to the ties that exist in groups. But we should also like to know whether this kind of object-cathexis, as we know it in sexual life, represents the only manner of emotional tie with other people, or whether we must take other mechanisms of the sort into account. As a matter of fact we learn from psycho-analysis that there do exist other mechanisms for emotional ties, the so-called identifications, insufficiently-known processes and hard to describe, the investigation of which will for some time keep us away from the subject of group psychology.

We already begin to divine that the mutual tie between members of a group is in the nature of an identification of this kind, based upon an important emotional common quality; and we may suspect that this common quality lies in the nature of the tie with the leader. Another suspicion may tell us that we are far from having exhausted the problem of identification, and that we are faced by the process which psychology calls 'empathy' and which plays the largest part in our understanding of what is inherently foreign to our ego in other people. But we shall here limit ourselves to the immediate emotional effects of identification, and shall leave on one side its significance for our intellectual life.

¹ We are very well aware that we have not exhausted the nature of identification with these examples taken from pathology, and that we have consequently left part of the riddle of group formations untouched. A far more fundamental and comprehensive psychological analysis would have to intervene at this point. A path leads from identification by way of imitation to empathy, that is, to the comprehension of the mechanism by means of which we are enabled to take up any attitude at all towards another mental life. Moreover there is still much to be explained in the manifestations of existing identifications. These result among other things in a person limiting his aggressiveness towards those with whom he has identified himself, and in his sparing them and giving them help. The study of such identifications, like those, for instance which lie at the root of clan feeling, led Robertson Smith (Kinship and Marriage, 1885) to the surprising discovery that they rest upon the acknowledgement of the possession of a common substance, and may even therefore be created by a meal eaten in common. This feature makes it possible to connect this kind of identification with the early history of the human family which I constructed in Totem and Taboo.

But after the preceding discussions we are quite in a position to give the formula for the libidinal constitution of groups, or at least of such groups as we have hitherto considered - namely, those that have a leader and have not been able by means of too much 'organization' to acquire secondarily the characteristics of an individual. A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego. This condition admits of graphic representation:
It is naturally no easy matter to trace the ontogenesis of the herd instinct. The fear which is shown by small children when they are left alone, and which Trotter claims as being already a manifestation of the instinct, nevertheless suggests more readily another interpretation. The fear relates to the child's mother, and later to other familiar people, and it is the expression of an unfulfilled desire, which the child does not yet know how to deal with in any way except by turning it into anxiety.¹ Nor is the child's fear when it is alone pacified by the sight of any haphazard 'member of the herd', but on the contrary it is brought into existence by the approach of a 'stranger' of this sort. Then for a long time nothing in the nature of herd instinct or group feeling is to be observed in children. Something like it first grows up, in a nursery containing many children, out of the children's relation to their parents, and it does so as a reaction to the initial envy with which the elder child receives the younger one. The elder child would certainly like to put his successor jealously aside, to keep it away from the parents, and to rob it of all its privileges; but in the face of the fact that this younger child (like all that come later) is loved by the parents as much as he himself is, and in consequence of the impossibility of his maintaining his hostile attitude without damaging himself, he is forced into identifying himself with the other children. So there grows up in the troop of children a communal or group feeling, which is then further developed at school. The first demand made by this reaction-formation is for justice, for equal treatment for all. We all know how loudly and implacably this claim is put forward at school. If one cannot be the favourite oneself, at all events nobody else shall be the favourite. It would certainly be easy for each of them to be jealous of the rest; but, in the face of their numbers and the consequent impossibility of their reaching the aim of their love, they renounce it, and, instead of pulling out one another's hair, they act as a united group, do homage to the hero of the occasion with their common actions, and would probably be glad to have a share of his flowing locks. Originally rivals, they have succeeded in identifying themselves with one another by means of a similar love for the same object. When, as is usual, an instinctual situation is capable of various outcomes, we shall not be surprised that the actual outcome is one which brings with it the possibility of a certain amount of satisfaction, whereas some other outcome, in itself more obvious, is passed over because the circumstances of life prevent its leading to any such satisfaction.

Thus social feeling is based upon the reversal of what was first a hostile feeling into a positively-toned tie in the nature of an identification. So far as we have hitherto been able to follow the course of events, this reversal seems to occur under the influence of a common affectionate tie with a person outside the group. We do not ourselves regard our analysis of identification as exhaustive, but it is enough for our present purpose that we should revert to this one feature - its demand that equalization shall be consistently carried through. We have already heard in the discussion of the two artificial groups, Church and army, that their necessary precondition is that all their members should be loved in the same way by one person, the leader. Do not let us forget, however, that the demand for equality in a group applies only to its members and not to the leader. All the members must be equal to one another, but they all want to be ruled by one person. Many equals, who can identify themselves with one another, and a single person superior to them all - that is the situation that we find realized in groups which are capable of subsisting. Let us venture, then, to correct Trotter's pronouncement that man is a herd animal and assert that he is rather a horde animal, an individual creature in a horde led by a chief.

¹[1921c, 3812]
We have interpreted this prodigy as meaning that the individual gives up his ego ideal and substitutes for it the group ideal as embodied in the leader. And we must add by way of correction that the prodigy is not equally great in every case. In many individuals the separation between the ego and the ego ideal is not very far advanced; the two still coincide readily; the ego has often preserved its earlier narcissistic self-complacency. The selection of the leader is very much facilitated by this circumstance. He need often only possess the typical qualities of the individuals concerned in a particularly clearly marked and pure form, and need only give an impression of greater force and of more freedom of libido; and in that case the need for a strong chief will often meet him half-way and invest him with a predominance to which he would otherwise perhaps have had no claim. The other members of the group, whose ego ideal would not, apart from this, have become embodied in his person without some correction, are then carried away with the rest by 'suggestion', that is to say, by means of identification.

We are aware that what we have been able to contribute towards the explanation of the libidinal structure of groups leads back to the distinction between the ego and the ego ideal and to the double kind of tie which this makes possible - identification, and putting the object in the place of the ego ideal. The assumption of this kind of differentiating grade in the ego as a first step in an analysis of the ego must gradually establish its justification in the most various regions of psychology. In my paper on narcissism I have put together all the pathological material that could at the moment be used in support of this differentiation. But it may be expected that when we penetrate deeper into the psychology of the psychoses its significance will be discovered to be far greater. Let us reflect that the ego now enters into the relation of an object to the ego ideal which has been developed out of it, and that all the interplay between an external object and the ego as a whole, with which our study of the neuroses has made us acquainted, may possibly be repeated upon this new scene of action within the ego.

It is obvious that a soldier takes his superior, that is, in fact, the leader of the army, as his ideal, while he identifies himself with his equals, and derives from this community of their egos the obligations for giving mutual help and for sharing possessions which comradeship implies. But he becomes ridiculous if he tries to identify himself with the general. The soldier in Wallenstein's Lager laughs at the sergeant for this very reason:

It is otherwise in the Catholic Church. Every Christian loves Christ as his ideal and feels himself united with all other Christians by the tie of identification. But the Church requires more of him. He has also to identify himself with Christ and love all other Christians as Christ loved them. At both points, therefore, the Church requires that the position of the libido which is given by group formation should be supplemented. Identification has to be added where object-choice has taken place, and object-love where there is identification. This addition evidently goes beyond the constitution of the group. One can be a good Christian and yet be far from the idea of putting oneself in Christ's place and of having like him an all-embracing love for mankind. One need not think oneself capable, weak mortal that one is, of the Saviour's largeness of soul and strength of love. But this further development in the distribution of libido in the group is probably the factor upon which Christianity bases its claim to have reached a higher ethical level.

The group multiplies this process; it agrees with hypnosis in the nature of the instincts which hold it together, and in the replacement of the ego ideal by the object; but to this it adds identification with other individuals, which was perhaps originally made possible by their having the same relation to the object.
The Herd Instinct. - It has been maintained in many quarters that there is a special innate and not further analysable 'herd instinct', which determines the social behaviour of human beings and impels individuals to come together into larger communities. Psycho-analysis finds itself in contradiction to this view. Even if the social instinct is innate, it may without any difficulty be traced back to what were originally libidinal object-cathexes and may have developed in the childhood of the individual as a reaction-formation against hostile attitudes of rivalry. It is based on a peculiar kind of identification with other people.

[1923a, 3933]

It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal.

[1923b, 3971]

Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in *Totem and Taboo* they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

[1923b, 3971]

The narcissistic satisfaction provided by the cultural ideal is also among the forces which are successful in combating the hostility to culture within the cultural unit. This satisfaction can be shared in not only by the favoured classes, which enjoy the benefits of the culture, but also by the suppressed ones, since the right to despise the people outside it compensates them for the wrongs they suffer within their own unit. No doubt one is a wretched plebeian, harassed by debts and military service; but, to make up for it, one is a Roman citizen, one has one's share in the task of ruling other nations and dictating their laws. This identification of the suppressed classes with the class who rules and exploits them is, however, only part of a larger whole. For, on the other hand, the suppressed classes can be emotionally attached to their masters; in spite of their hostility to them they may see in them their ideals; unless such relations of a fundamentally satisfying kind subsisted, it would be impossible to understand how a number of civilizations have survived so long in spite of the justifiable hostility of large human masses.

[1927c, 4425]
A different kind of satisfaction is afforded by art to the participants in a cultural unit, though as a rule it remains inaccessible to the masses, who are engaged in exhausting work and have not enjoyed any personal education. As we discovered long since, art offers substitutive satisfactions for the oldest and still most deeply felt cultural renunciations, and for that reason it serves as nothing else does to reconcile a man to the sacrifices he has made on behalf of civilization. On the other hand, the creations of art heighten his feelings of identification, of which every cultural unit stands in so much need, by providing an occasion for sharing highly valued emotional experiences. And when those creations picture the achievements of his particular culture and bring to his mind its ideals in an impressive manner, they also minister to his narcissistic satisfaction.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.
When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry though such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

[1930a, 4507]

In 1921 I endeavoured to make use of the differentiation between the ego and the super-ego in a study of group psychology. I arrived at a formula such as this: a psychological group is a collection of individuals who have introduced the same person into their super-ego and, on the basis of this common element, have identified themselves with one another in their ego. This applies, of course, only to groups that have a leader. If we possessed more applications of this kind, the hypothesis of the super-ego would lose its last touch of strangeness for us, and we should become completely free of the embarrassment that still comes over us when, accustomed as we are to the atmosphere of the underworld, we move in the more superficial, higher strata of the mental apparatus. We do not suppose, of course, that with the separation off of the super-ego we have said the last word on the psychology of the ego. It is rather a first step; but in this case it is not only the first step that is hard.

[1933a, 4676]
If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians - an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games - was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist to-day which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one to-day, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force by the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute violence and that even to-day it cannot do without the support of violence.

[1933b, 4797]

Our mythological theory of instincts makes it easy for us to find a formula for indirect methods of combating war. If willingness to engage in war is an effect of the destructive instinct, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psycho-analysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done. The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure of human society is to a large extent based on them.

[1933b, 4801]
In 1921 I endeavoured to make use of the differentiation between the ego and the super-ego in a study of group psychology. I arrived at a formula such as this: a psychological group is a collection of individuals who have introduced the same person into their super-ego and, on the basis of this common element, have identified themselves with one another in their ego. This applies, of course, only to groups that have a leader. If we possessed more applications of this kind, the hypothesis of the super-ego would lose its last touch of strangeness for us, and we should become completely free of the embarrassment that still comes over us when, accustomed as we are to the atmosphere of the underworld, we move in the more superficial, higher strata of the mental apparatus. We do not suppose, of course, that with the separation off of the super-ego we have said the last word on the psychology of the ego. It is rather a first step; but in this case it is not only the first step that is hard.
[1933a, 4676]
The ego ideal opens up an important avenue for the understanding of group psychology. In addition to its individual side, this ideal has a social side; it is also the common ideal of a family, a class or a nation. It binds not only a person's narcissistic libido, but also a considerable amount of his homosexual libido, which is in this way turned back into the ego. The want of satisfaction which arises from the non-fulfilment of this ideal liberates homosexual libido, and this is transformed into a sense of guilt (social anxiety). Originally this sense of guilt was a fear of punishment by the parents, or, more correctly, the fear of losing their love; later the parents are replaced by an indefinite number of fellow-men. The frequent causation of paranoia by an injury to the ego, by a frustration of satisfaction within the sphere of the ego ideal, is thus made more intelligible, as is the convergence of ideal-formation and sublimation in the ego ideal, as well as the involution of sublimations and the possible transformation of ideals in paraphrenic disorders.

[1914c, 2954]

But after the preceding discussions we are quite in a position to give the formula for the libidinal constitution of groups, or at least of such groups as we have hitherto considered - namely, those that have a leader and have not been able by means of too much 'organization' to acquire secondarily the characteristics of an individual. A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego. This condition admits of graphic representation:

[1921c, 3808]

The uncanny and coercive characteristics of group formations, which are shown in the phenomena of suggestion that accompany them, may therefore with justice be traced back to the fact of their origin from the primal horde. The leader of the group is still the dreaded primal father; the group still wishes to be governed by unrestricted force; it has an extreme passion for authority; in Le Bon's phrase, it has a thirst for obedience. The primal father is the group ideal, which governs the ego in the place of the ego ideal. Hypnosis has a good claim to being described as a group of two. There remains as a definition for suggestion: a conviction which is not based upon perception and reasoning but upon an erotic tie.¹

[1921c, 3819]

We have interpreted this prodigy as meaning that the individual gives up his ego ideal and substitutes for it the group ideal as embodied in the leader. And we must add by way of correction that the prodigy is not equally great in every case. In many individuals the separation between the ego and the ego ideal is not very far advanced; the two still coincide readily; the ego has often preserved its earlier narcissistic self-complacency. The selection of the leader is very much facilitated by this circumstance. He need often only possess the typical qualities of the individuals concerned in a particularly clearly marked and pure form, and need only give an impression of greater force and of more freedom of libido; and in that case the need for a strong chief will often meet him half-way and invest him with a predominance to which he would otherwise perhaps have had no claim. The other members of the group, whose ego ideal would not, apart from this, have become embodied in his person without some correction, are then carried away with the rest by 'suggestion', that is to say, by means of identification.

[1921c, 3820]
We are aware that what we have been able to contribute towards the explanation of the libidinal structure of groups leads back to the distinction between the ego and the ego ideal and to the double kind of tie which this makes possible - identification, and putting the object in the place of the ego ideal. The assumption of this kind of differentiating grade in the ego as a first step in an analysis of the ego must gradually establish its justification in the most various regions of psychology. In my paper on narcissism I have put together all the pathological material that could at the moment be used in support of this differentiation. But it may be expected that when we penetrate deeper into the psychology of the psychoses its significance will be discovered to be far greater. Let us reflect that the ego now enters into the relation of an object to the ego ideal which has been developed out of it, and that all the interplay between an external object and the ego as a whole, with which our study of the neuroses has made us acquainted, may possibly be repeated upon this new scene of action within the ego.

[1921c, 3821]

A. The distinction between identification of the ego with an object and replacement of the ego ideal by an object finds an interesting illustration in the two great artificial groups which we began by studying, the army and the Christian Church.

[1921c, 3825]

It is obvious that a soldier takes his superior, that is, in fact, the leader of the army, as his ideal, while he identifies himself with his equals, and derives from this community of their egos the obligations for giving mutual help and for sharing possessions which comradeship implies. But he becomes ridiculous if he tries to identify himself with the general. The soldier in Wallenstein's Lager laughs at the sergeant for this very reason:

[1921c, 3825]

It is otherwise in the Catholic Church. Every Christian loves Christ as his ideal and feels himself united with all other Christians by the tie of identification. But the Church requires more of him. He has also to identify himself with Christ and love all other Christians as Christ loved them. At both points, therefore, the Church requires that the position of the libido which is given by group formation should be supplemented. Identification has to be added where object-choice has taken place, and object-love where there is identification. This addition evidently goes beyond the constitution of the group. One can be a good Christian and yet be far from the idea of putting oneself in Christ's place and of having like him an all-embracing love for mankind. One need not think oneself capable, weak mortal that one is, of the Saviour's largeness of soul and strength of love. But this further development in the distribution of libido in the group is probably the factor upon which Christianity bases its claim to have reached a higher ethical level.

[1921c, 3825]

The group multiplies this process; it agrees with hypnosis in the nature of the instincts which hold it together, and in the replacement of the ego ideal by the object; but to this it adds identification with other individuals, which was perhaps originally made possible by their having the same relation to the object.

[1921c, 3834]
It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal. [1923b, 3971]
(2) I have said that we had much to expect from the increase in authority which must accrue to us as time goes on. I need not say much to you about the importance of authority. Only very few civilized people are capable of existing without reliance on others or are even capable of coming to an independent opinion. You cannot exaggerate the intensity of people's inner lack of resolution and craving for authority. The extraordinary increase in neuroses since the power of religions has waned may give you a measure of it. The impoverishment of the ego due to the large expenditure of energy on repression demanded of every individual by civilization may be one of the principal causes of this state of things.
[1910d, 2311]

As regards intellectual work it remains a fact, indeed, that great decisions in the realm of thought and momentous discoveries and solutions of problems are only possible to an individual working in solitude. But even the group mind is capable of creative genius in the field of intelligence, as is shown above all by language itself, as well as by folk-song, folklore and the like. It remains an open question, moreover, how much the individual thinker or writer owes to the stimulation of the group in which he lives, and whether he does more than perfect a mental work in which the others have had a simultaneous share.
[1921c, 3778]

We thus have an impression of a state in which an individual's private emotional impulses and intellectual acts are too weak to come to anything by themselves and are entirely dependent for this on being reinforced by being repeated in a similar way in the other members of the group. We are reminded of how many of these phenomena of dependence are part of the normal constitution of human society, of how little originality and personal courage are to be found in it, of how much every individual is ruled by those attitudes of the group mind which exhibit themselves in such forms as racial characteristics, class prejudices, public opinion, etc. The influence of suggestion becomes a greater riddle for us when we admit that it is not exercised only by the leader, but by every individual upon every other individual; and we must reproach ourselves with having unfairly emphasized the relation to the leader and with having kept the other factor of mutual suggestion too much in the background.
[1921c, 3809]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual ‘fetishism’ which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong *détour* through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of præmaeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth. [1925d, 4244]
The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulsions has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual. [1930a, 4529]

I believe the line of thought which seeks to trace in the phenomena of cultural development the part played by a super-ego promises still further discoveries. I hasten to come to a close. But there is one question which I can hardly evade. If the development of civilization has such a far-reaching similarity to the development of the individual and if it employs the same methods, may we not be justified in reaching the diagnosis that, under the influence of cultural urges, some civilizations, or some epochs of civilization - possibly the whole of mankind - have become 'neurotic'? An analytic dissection of such neuroses might lead to therapeutic recommendations which could lay claim to great practical interest. I would not say that an attempt of this kind to carry psycho-analysis over to the cultural community was absurd or doomed to be fruitless. But we should have to be very cautious and not forget that, after all, we are only dealing with analogies and that it is dangerous, not only with men but also with concepts, to tear them from the sphere in which they have originated and been evolved. Moreover, the diagnosis of communal neuroses is faced with a special difficulty. In an individual neurosis we take as our starting-point the contrast that distinguishes the patient from his environment, which is assumed to be 'normal'. For a group all of whose members are affected by one and the same disorder no such background could exist; it would have to be found elsewhere. And as regards the therapeutic application of our knowledge, what would be the use of the most correct analysis of social neuroses, since no one possesses authority to impose such a therapy upon the group? But in spite of all these difficulties, we may expect that one day someone will venture to embark upon a pathology of cultural communities. [1930a, 4531]
Early trauma - defence - latency - outbreak of neurotic illness - partial return of the repressed. Such is the formula which we have laid down for the development of a neurosis. The reader is now invited to take the step of supposing that something occurred in the life of the human species similar to what occurs in the life of individuals: of supposing, that is, that here too events occurred of a sexually aggressive nature, which left behind them permanent consequences but were for the most part fended off and forgotten, and which after a long latency came into effect and created phenomena similar to symptoms in their structure and purpose.

[1939a, 4905]
I believe the line of thought which seeks to trace in the phenomena of cultural development the part played by a super-ego promises still further discoveries. I hasten to come to a close. But there is one question which I can hardly evade. If the development of civilization has such a far-reaching similarity to the development of the individual and if it employs the same methods, may we not be justified in reaching the diagnosis that, under the influence of cultural urges, some civilizations, or some epochs of civilization - possibly the whole of mankind - have become ‘neurotic’? An analytic dissection of such neuroses might lead to therapeutic recommendations which could lay claim to great practical interest. I would not say that an attempt of this kind to carry psycho-analysis over to the cultural community was absurd or doomed to be fruitless. But we should have to be very cautious and not forget that, after all, we are only dealing with analogies and that it is dangerous, not only with men but also with concepts, to tear them from the sphere in which they have originated and been evolved. Moreover, the diagnosis of communal neuroses is faced with a special difficulty. In an individual neurosis we take as our starting-point the contrast that distinguishes the patient from his environment, which is assumed to be ‘normal’. For a group all of whose members are affected by one and the same disorder no such background could exist; it would have to be found elsewhere. And as regards the therapeutic application of our knowledge, what would be the use of the most correct analysis of social neuroses, since no one possesses authority to impose such a therapy upon the group? But in spite of all these difficulties, we may expect that one day someone will venture to embark upon a pathology of cultural communities.

[1930a, 4531]
Nevertheless, on closer consideration this delusion of Hanold's seems to me to lose the greater part of its improbability. The author, indeed, has made himself responsible for one part of it by basing his story on the premiss that Zoe was in every detail a duplicate of the relief. We must therefore avoid shifting the improbability of this premiss on to its consequence - that Hanold took the girl for Gradiva come to life. Greater value is given to the delusional explanation by the fact that the author has put no rational one at our disposal. Moreover the author has adduced contributory and mitigating circumstances on behalf of his hero's excesses in the shape of the glare of the campagna sunlight and the intoxicating magic of the wine grown on the slopes of Vesuvius. But the most important of all the explanatory and exculpatory factors remains the ease with which our intellect is prepared to accept something absurd provided it satisfies powerful emotional impulses. It is an astonishing fact, and one that is too generally overlooked, how readily and frequently under these psychological conditions people of even the most powerful intelligence react as though they were feeble-minded; and anyone who is not too conceited may see this happening in himself as often as he pleases. And this is far more so if some of the mental processes concerned are linked with unconscious or repressed motives. In this connection I am happy to quote the words of a philosopher, who writes to me: 'I have been noting down the instances I myself experience of striking mistakes and unthinking actions, for which one finds motives afterwards (in a most unreasonable way). It is an alarming thing, but typical, to find how much folly this brings to light.' It must be remembered, too, that the belief in spirits and ghosts and the return of the dead, which finds so much support in the religions to which we have all been attached, at least in our childhood, is far from having disappeared among educated people, and that many who are sensible in other respects find it possible to combine spiritualism with reason. A man who has grown rational and sceptical, even, may be ashamed to discover how easily he may for a moment return to a belief in spirits under the combined impact of strong emotion and perplexity. I know of a doctor who had once lost one of his women patients suffering from Graves' disease, and who could not get rid of a faint suspicion that he might perhaps have contributed to the unhappy outcome by a thoughtless prescription. One day, several years later, a girl entered his consulting-room, who, in spite of all his efforts, he could not help recognizing as the dead one. He could frame only a single thought: 'So after all it's true that the dead can come back to life.' His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves' disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold's temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities.

[1907a, 1865]
The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psycho-analysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'.² But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life.³ We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats [Dukatenscheisser]'⁴ Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = ilu manmans). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.

Generally speaking, our civilization is built up on the suppression of instincts. Each individual has surrendered some part of his possessions - some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common possession of material and ideal property. Besides the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of instinctual satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'sacred'. The man who, in consequence of his unyielding constitution, cannot fall in with this suppression of instinct, becomes a 'criminal', an 'outlaw',¹ in the face of society - unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

These false sexual theories, which I shall now discuss, all have one very curious characteristic. Although they go astray in a grotesque fashion, yet each one of them contains a fragment of real truth; and in this they are analogous to the attempts of adults, which are looked at as strokes of genius, at solving the problems of the universe which are too hard for human comprehension. What is correct and hits the mark in such theories is to be explained by their origin from the components of the sexual instinct which are already stirring in the childish organism. For it is not owing to any arbitrary mental act or to chance impressions that those notions arise, but to the necessities of the child's psychosexual constitution; and this is why we can speak of sexual theories in children as being typical, and why we find the same mistaken beliefs in every child whose sexual life is accessible to us.
When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

[1910c, 2256]

When anyone has, like Leonardo, escaped being intimidated by his father during his earliest childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psycho-analysis has made us familiar with the intimate connection between the father-complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather, as revivals and restorations of the young child's ideas of them. Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neurotic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.

[1910c, 2294]
There is a second explanation, also unconcerned with sexuality, which has, however, a much more general scope than the first. It suggests that primitive man is prey to a perpetual lurking apprehensiveness, just as in the psycho-analytic theory of the neuroses we claim to be the case with people suffering from anxiety neurosis. This apprehensiveness will appear most strongly on all occasions which differ in any way from the usual, which involve something new or unexpected, something not understood or uncanny. This is also the origin of the ceremonial practices, widely adopted in later religions, which are connected with the beginning of every new undertaking, the start of every new period of time, the first-fruits of human, animal and plant life. The dangers which the anxious man believes to be threatening him never appear more vivid in his expectation than on the threshold of a dangerous situation, and then, too, is the only time when protecting himself against them is of any use. The first act of intercourse in marriage can certainly claim, on grounds of importance, to be preceded by such precautionary measures. These two attempts at explanation, based on horror of blood and on fear of first occurrences, do not contradict but rather reinforce each other. The first occasion of sexual intercourse is certainly a critical action, all the more so if it is to involve a flow of blood.

It seems plausible to explain the complicated and contradictory attitude of primitive peoples to their rulers in some such way as the following. For superstitious and other reasons, a variety of different impulses find expression in relation to kings; and each of these impulses is developed to an extreme point without regard to the others. This gives rise to contradictions - by which, incidentally, a savage intellect is as little disturbed as is a highly civilized one when it comes to such matters as religion or 'loyalty'.

If we are prepared to accept the account given above of the evolution of human views of the universe - an animistic phase followed by a religious phase and this in turn by a scientific one - it will not be difficult to follow the vicissitudes of the 'omnipotence of thoughts' through these different phases. At the animistic stage men ascribe omnipotence to themselves. At the religious stage they transfer it to the gods but do not seriously abandon it themselves, for they reserve the power of influencing the gods in a variety of ways according to their wishes. The scientific view of the universe no longer affords any room for human omnipotence; men have acknowledged their smallness and submitted resignedly to death and to the other necessities of nature. None the less some of the primitive belief in omnipotence still survives in men's faith in the power of the human mind, which grapples with the laws of reality.

There are no grounds for fearing that psycho-analysis, which first discovered that psychical acts and structures are invariably overdetermined, will be tempted to trace the origin of anything so complicated as religion to a single source. If psycho-analysis is compelled - and is, indeed, in duty bound - to lay all the emphasis upon one particular source, that does not mean it is claiming either that that source is the only one or that it occupies first place among the numerous contributory factors. Only when we can synthesize the findings in the different fields of research will it become possible to arrive at the relative importance of the part played in the genesis of religion by the mechanism discussed in these pages. Such a task lies beyond the means as well as beyond the purposes of a psycho-analyst.
I cannot suggest at what point in this process of development a place is to be found for the
great mother-goddesses, who may perhaps in general have preceded the father-gods. It seems
certain, however, that the change in attitude to the father was not restricted to the sphere of
religion but that it extended in a consistent manner to that other side of human life which had
been affected by the father's removal - to social organization. With the introduction of father-
deities a fatherless society gradually changed into one organized on a patriarchal basis. The
family was a restoration of the former primal horde and it gave back to fathers a large portion of
their former rights. There were once more fathers, but the social achievements of the fraternal
clan had not been abandoned; and the gulf between the new fathers of a family and the
unrestricted primal father of the horde was wide enough to guarantee the continuance of the
religious craving, the persistence of an unappeased longing for the father.
[1912-1913, 2789]

Nevertheless it would be a mistake to suppose that the hostile impulses inherent in the father-
complex were completely silenced during this period of revived paternal authority. On the
contrary, the first phases of the dominance of the two new father surrogates - gods and kings -
show the most energetic signs of the ambivalence that remains a characteristic of religion.
[1912-1913, 2791]

Philosophers have declared that the intellectual enigma presented to primaeval man by the
picture of death forced him to reflection, and thus became the starting-point of all speculation. I
believe that here the philosophers are thinking too philosophically, and giving too little
consideration to the motives that were primarily operative. I should like therefore to limit and
correct their assertion. In my view, primaeval man must have triumphed beside the body of his
slain enemy, without being led to rack his brains about the enigma of life and death. What
released the spirit of enquiry in man was not the intellectual enigma, and not every death, but
the conflict of feeling at the death of loved yet alien and hated persons. Of this conflict of feeling
psychology was the first offspring. Man could no longer keep death at a distance, for he had
tasted it in his pain about the dead; but he was nevertheless unwilling to acknowledge it, for he
could not conceive of himself as dead. So he devised a compromise: he conceded the fact of
his own death as well, but denied it the significance of annihilation - a significance which he had
had no motive for denying where the death of his enemy was concerned. It was beside the dead
body of someone he loved that he invented spirits, and his sense of guilt at the satisfaction
mingled with his sorrow turned these new-born spirits into evil demons that had to be dreaded.
The changes brought about by death suggested to him the division of the individual into a body
and a soul - originally several souls. In this way his train of thought ran parallel with the process
of disintegration which sets in with death. His persisting memory of the dead became the basis
for assuming other forms of existence and gave him the conception of a life continuing after
apparent death.
[1915b, 3085]
Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole Weltanschauung of science. Even the Weltanschauung of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over things as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in Fliegende Blätter who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

Apart from these pathological phenomena, it may be said that in the present case religion achieved all the aims for the sake of which it is included in the education of the individual. It put a restraint on his sexual impulsions by affording them a sublimation and a safe mooring; it lowered the importance of his family relationships, and thus protected him from the threat of isolation by giving him access to the great community of mankind. The untamed and fear-ridden child became social, well-behaved, and amenable to education.
A little reflection was bound to show that it would be impossible to restrict to the provinces of dreams and nervous disorders a view such as this of the life of the human mind. If that view has hit upon a truth, it must apply equally to normal mental events, and even the highest achievements of the human spirit must bear a demonstrable relation to the factors found in pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself pointed persistently in the direction of this new task, for it was obvious that the forms assumed by the different neuroses echoed the most highly admired productions of our culture. Thus hysterics are undoubtedly imaginative artists, even if they express their phantasies mimetically in the main and without considering their intelligibility to other people; the ceremonials and prohibitions of obsessional neurotics drive us to suppose that they have created a private religion of their own; and the delusions of paranoics have an unpalatable external similarity and internal kinship to the systems of our philosophers. It is impossible to escape the conclusion that these patients are, in an asocial fashion, making the very attempts at solving their conflicts and appeasing their pressing needs which, when those attempts are carried out in a fashion that is acceptable to the majority, are known as poetry, religion and philosophy.

[1919g, 3704]

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths. [1919g, 3705]
The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses toward other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialistic tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

¹[1921c, 3792]

Now much else remains to be examined and described in the morphology of groups. We should have to start from the ascertained fact that a mere collection of people is not a group, so long as these ties have not been established in it; but we should have to admit that in any collection of people the tendency to form a psychological group may very easily come to the fore. We should have to give our attention to the different kinds of groups, more or less stable, that arise spontaneously, and to study the conditions of their origin and of their dissolution. We should above all be concerned with the distinction between groups which have a leader and leaderless groups. We should consider whether groups with leaders may not be the more primitive and complete, whether in the others an idea, an abstraction, may not take the place of the leader (a state of things to which religious groups, with their invisible head, form a transitional stage), and whether a common tendency, a wish in which a number of people can have a share, may not in the same way serve as a substitute. This abstraction, again, might be more or less completely embodied in the figure of what we might call a secondary leader, and interesting varieties would arise from the relation between the idea and the leader. The leader or the leading idea might also, so to speak, be negative; hatred against a particular person or institution might operate in just the same unifying way, and might call up the same kind of emotional ties as positive attachment. Then the question would also arise whether a leader is really indispensable to the essence of a groups - and other questions besides.

[1921c, 3793]

Even in a person who has in other respects become absorbed in a group, the directly sexual impulses preserve a little of his individual activity. If they become too strong they disintegrate every group formation. The Catholic Church had the best of motives for recommending its followers to remain unmarried and for imposing celibacy upon its priests; but falling in love has often driven even priests to leave the Church. In the same way love for women breaks through the group ties of race, of national divisions, and of the social class system, and it thus produces important effects as a factor in civilization. It seems certain that homosexual love is far more compatible with group ties, even when it takes the shape of uninhibited sexual impulsions - a remarkable fact, the explanation of which might carry us far.

[1921c, 3832]
The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psychoanalysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaevial ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal.

Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

[1923a, 3929]

[1923b, 3971]

[1923b, 3971]
From the point of view of instinctual control, of morality, it may be said of the id that it is totally non-moral, of the ego that it strives to be moral, and of the super-ego that it can be super-moral and then become as cruel as only the id can be. It is remarkable that the more a man checks his aggressiveness towards the exterior the more severe - that is aggressive - he becomes in his ego ideal. The ordinary view sees the situation the other way round: the standard set up by the ego ideal seems to be the motive for the suppression of aggressiveness. The fact remains, however, as we have stated it: the more a man controls his aggressiveness, the more intense becomes his ideal's inclination to aggressiveness against his ego. It is like a displacement, a turning round upon his own ego. But even ordinary normal morality has a harshly restraining, cruelly prohibiting quality. It is from this, indeed, that the conception arises of a higher being who deals out punishment inexorably.

² The fact that in our analyses we so seldom succeed in finding the Devil as a father-substitute may be an indication that for those who come to us for analysis this figure from mediaeval mythology has long since played out its part. For the pious Christian of earlier centuries belief in the Devil was no less a duty than belief in God. In point of fact, he needed the Devil in order to be able to keep hold of God. The later decrease in faith has, for various reasons, first and foremost affected the figure of the Devil.

If we are bold enough to apply this idea of the Devil as a father substitute to cultural history, we may also be able to see the witch-trials of the Middle Ages in a new light.

In this way the Oedipus complex proves to be - as has already been conjectured in a historical sense¹ - the source of our individual ethical sense, our morality. The course of childhood development leads to an ever-increasing detachment from parents, and their personal significance for the super-ego recedes into the background. To the imagoes they leave behind there are then linked the influences of teachers and authorities, self-chosen models and publicly recognized heroes, whose figures need no longer be introjected by an ego which has become more resistant. The last figure in the series that began with the parents is the dark power of Destiny which only the fewest of us are able to look upon as impersonal. There is little to be said against the Dutch writer Multatuli² when he replaces the Μοία [Destiny] of the Greeks by the divine pair 'Λόγος χαί Αύγχη' [Reason and necessity]; but all who transfer the guidance of the world to Providence, to God, or to God and Nature, arouse a suspicion that they still look upon these ultimate and remotest powers as a parental couple, in a mythological sense, and believe themselves linked to them by libidinal ties. In The Ego and the Id I made an attempt to derive mankind's realistic fear of death, too, from the same parental view of fate. It seems very hard to free oneself from it.

[1923d, 4011]

[1924c, 4080]
And now, as a third point, psycho-analysis has shown us, to our growing astonishment, the enormously important part played by what is known as the 'Oedipus complex' - that is, the emotional relation of a child to its two parents - in the mental life of human beings. Our astonishment diminishes when we realize that the Oedipus complex is the psychical correlate of two fundamental biological facts: the long period of the human child's dependence, and the remarkable way in which its sexual life reaches a first climax in the third to fifth years of life, and then, after a period of inhibition, sets in again at puberty. And here, the discovery was made that a third and extremely serious part of human intellectual activity, the part which has created the great institutions of religion, law, ethics, and all forms of civic life, has as its fundamental aim the enabling of the individual to master his Oedipus complex and to divert his libido from its infantile attachments into the social ones that are ultimately desired. The applications of psycho-analysis to the science of religion and sociology (e.g. by the present writer, Theodor Reik and Oskar Pfister), which have led to these findings, are still young and insufficiently appreciated; but it cannot be doubted that further studies will only confirm the certainty of these important conclusions.

But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources.
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détourn through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primaeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

In the course of time the first observations were made of regularity and conformity to law in natural phenomena, and with this the forces of nature lost their human traits. But man’s helplessness remains and along with it his longing for his father, and the gods. The gods retain their threefold task: they must exorcize the terrors of nature, they must reconcile men to the cruelty of Fate, particularly as it is shown in death, and they must compensate them for the sufferings and privations which a civilized life in common has imposed on them.
But within these functions there is a gradual displacement of accent. It was observed that the phenomena of nature developed automatically according to internal necessities. Without doubt the gods were the lords of nature; they had arranged it to be as it was and now they could leave it to itself. Only occasionally, in what are known as miracles, did they intervene in its course, as though to make it plain that they had relinquished nothing of their original sphere of power. As regards the apportioning of destinies, an unpleasant suspicion persisted that the perplexity and helplessness of the human race could not be remedied. It was here that the gods were most apt to fail. If they themselves created Fate, then their counsels must be deemed inscrutable. The notion dawned on the most gifted people of antiquity that Moira stood above the gods and that the gods themselves had their own destinies. And the more autonomous nature became and the more the gods withdrew from it, the more earnestly were all expectations directed to the third function of the gods - the more did morality become their true domain. It now became the task of the gods to even out the defects and evils of civilization, to attend to the sufferings which men inflict on one another in their life together and to watch over the fulfilment of the precepts of civilization, which men obey so imperfectly. Those precepts themselves were credited with a divine origin; they were elevated beyond human society and were extended to nature and the universe.

[1927c, 4430]

And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid.

[1927c, 4431]
The religious ideas that have been summarized above have of course passed through a long process of development and have been adhered to in various phases by various civilizations. I have singled out one such phase, which roughly corresponds to the final form taken by our present-day white Christian civilization. It is easy to see that not all the parts of this picture tally equally well with one another, that not all the questions that press for an answer receive one, and that it is difficult to dismiss the contradiction of daily experience. Nevertheless, such as they are, those ideas - ideas which are religious in the widest sense - are prized as the most precious possession of civilization, as the most precious thing it has to offer its participants. It is far more highly prized than all the devices for winning treasures from the earth or providing men with sustenance or preventing their illnesses, and so forth. People feel that life would not be tolerable if they did not attach to these ideas the value that is claimed for them. And now the question arises: what are these ideas in the light of psychology? Whence do they derive the esteem in which they are held? And, to take a further timid step, what is their real worth?

[1927c, 4432]

I think, all the same, that I am justified in expressing myself in this way. I have tried to show that religious ideas have arisen from the same need as have all the other achievements of civilization: from the necessity of defending oneself against the crushingly superior force of nature. To this a second motive was added - the urge to rectify the shortcomings of civilization which made themselves painfully felt. Moreover, it is especially apposite to say that civilization gives the individual these ideas, for he finds them there already; they are presented to him ready-made, and he would not be able to discover them for himself. What he is entering into is the heritage of many generations, and he takes it over as he does the multiplication table, geometry, and similar things. There is indeed a difference in this, but that difference lies elsewhere and I cannot examine it yet. The feeling of strangeness that you mention may be partly due to the fact that this body of religious ideas is usually put forward as a divine revelation. But this presentation of it is itself a part of the religious system, and it entirely ignores the known historical development of these ideas and their differences in different epochs and civilizations.

[1927c, 4433]

Let us now take up the thread of our enquiry. What, then, is the psychological significance of religious ideas and under what heading are we to classify them? The question is not at all easy to answer immediately. After rejecting a number of formulations, we will take our stand on the following one. Religious ideas are teachings and assertions about facts and conditions of external (or internal) reality which tell one something one has not discovered for oneself and which lay claim to one's belief. Since they give us information about what is most important and interesting to us in life, they are particularly highly prized. Anyone who knows nothing of them is very ignorant; and anyone who has added them to his knowledge may consider himself much the richer.

[1927c, 4437]

Let us try to apply the same test to the teachings of religion. When we ask on what their claim to be believed is founded, we are met with three answers, which harmonize remarkably badly with one another. Firstly, these teachings deserve to be believed because they were already believed by our primal ancestors; secondly, we possess proofs which have been handed down to us from those same primal times; and thirdly, it is forbidden to raise the question of their authentication at all. In former days anything so presumptuous was visited with the severest penalties, and even to-day society looks askance at any attempt to raise the question again.

[1927c, 4438]
This third point is bound to rouse our strongest suspicions. After all, a prohibition like this can only be for one reason - that society is very well aware of the insecurity of the claim it makes on behalf of its religious doctrines. Otherwise it would certainly be very ready to put the necessary data at the disposal of anyone who wanted to arrive at conviction. This being so, it is with a feeling of mistrust which it is hard to allay that we pass on to an examination of the other two grounds of proof. We ought to believe because our forefathers believed. But these ancestors of ours were far more ignorant than we are. They believed in things we could not possibly accept to-day; and the possibility occurs to us that the doctrines of religion may belong to that class too. The proofs they have left us are set down in writings which themselves bear every mark of untrustworthiness. They are full of contradictions, revisions and falsifications, and where they speak of factual confirmations they are themselves unconfirmed. It does not help much to have it asserted that their wording, or even their content only, originates from divine revelation; for this assertion is itself one of the doctrines whose authenticity is under examination, and no proposition can be a proof of itself.

Thus we arrive at the singular conclusion that of all the information provided by our cultural assets it is precisely the elements which might be of the greatest importance to us and which have the task of solving the riddles of the universe and of reconciling us to the sufferings of life - it is precisely those elements that are the least well authenticated of any. We should not be able to bring ourselves to accept anything of so little concern to us as the fact that whales bear young instead of laying eggs, if it were not capable of better proof than this.

This state of affairs is in itself a very remarkable psychological problem. And let no one suppose that what I have said about the impossibility of proving the truth of religious doctrines contains anything new. It has been felt at all times - undoubtedly, too, by the ancestors who bequeathed us this legacy. Many of them probably nourished the same doubts as ours, but the pressure imposed on them was too strong for them to have dared to utter them. And since then countless people have been tormented by similar doubts, and have striven to suppress them, because they thought it was their duty to believe; many brilliant intellects have broken down over this conflict, and many characters have been impaired by the compromises with which they have tried to find a way out of it.

If all the evidence put forward for the authenticity of religious teachings originates in the past, it is natural to look round and see whether the present, about which it is easier to form judgements, may not also be able to furnish evidence of the sort. If by this means we could succeed in clearing even a single portion of the religious system from doubt, the whole of it would gain enormously in credibility. The proceedings of the spiritualists meet us at this point; they are convinced of the survival of the individual soul and they seek to demonstrate to us beyond doubt the truth of this one religious doctrine. Unfortunately they cannot succeed in refuting the fact that the appearance and utterances of their spirits are merely the products of their own mental activity. They have called up the spirits of the greatest men and of the most eminent thinkers, but all the pronouncements and information which they have received from them have been so foolish and so wretchedly meaningless that one can find nothing credible in them but the capacity of the spirits to adapt themselves to the circle of people who have conjured them up.
